

Organic Gas Speciation Profiles for Headspace Vapor of E6 Summer Gasoline Fuel (OG683) & Headspace Vapor of E6 Winter Gasoline Fuel (OG684)

Wenli Yang, PhD

Planning and Technical Support Division (PTSD)

March 6, 2013

1 Introduction

The current CARB organic gas speciation profile for headspace vapor of gasoline is OG661 (Headspace vapors 1996 SSD ethanol 2.0% oxygen, MTBE phased out) [1]. This profile is widely applied to categories of *on-road gasoline vehicle resting loss*, *off-road gasoline-powered equipment evaporative loss*, and a variety of *losses from petroleum marketing and petroleum storage* for 2004 and later years. Based on the 2009 Almanac, statewide annual average TOG emissions of these categories are 228.65 tons/day for calendar year 2008, which is 2.76% of the total statewide TOG emissions [2].

The current *headspace vapor* profile OG661 was generated by applying vapor-liquid equilibrium theory to a *liquid gasoline* profile OG660 (Liquid gasoline 1996 SSD ethanol 2.0% oxygen, MTBE phased out) in 1999 [3]. It should be noted, however, that the liquid gasoline profile, OG660, upon which OG661 is based was not obtained from real source testing data; rather, it was created by adjusting a MTBE-containing gasoline profile. The updated *headspace vapor* profiles proposed in this memo, OG683 and OG684, are based on more up-to-date seasonal fuel testing results of E6 gasoline (6% vol ethanol or 2% wt oxygen) corresponding to recently-updated liquid gasoline profiles, OG681 (summer) and OG682 (winter) [4]. In 2005 and 2006, CARB conducted the Vehicle Surveillance Program (VSP) 17 to measure criteria pollutant emissions and speciated TOG emissions for vehicles representative of the California vehicle fleet after the transition to ethanol-containing gasoline fuels. Under VSP 17, E6 liquid gasoline fuel samples were collected and analyzed and two *liquid gasoline* speciation profiles were generated based on the test results: OG681 for E6 summer-grade *gasoline fuel* and OG682 for E6 winter-grade *gasoline fuel*.

This memo addresses an update to the current *headspace vapor* speciation profiles, OG683 for summer-grade gasoline fuel *vapor* and OG684 for winter-grade gasoline fuel *vapor*, which are developed based on the recently-developed E6 *liquid gasoline* profiles, OG681 and OG682. The new profiles will be used to replace OG661 for the related emission categories for calendar years 2004 to 2009. Moderate to substantial percentage changes in toxic emissions estimates (i.e. benzene and toluene) result from this update.

2 Methodology

The new gasoline headspace vapor profiles are developed by applying vapor-liquid equilibrium theory to liquid gasoline fuel profiles. The procedure is similar to the one used for developing the current profile, OG661 [3].

Partial pressures p_i of organic species i present in the gasoline headspace vapor are predicted using Equation 1:

$$p_i = \gamma_i x_i p_i^o \quad (1)$$

where γ_i is the liquid-phase activity coefficient of species i , x_i is the mole fraction of species i in the liquid fuel, and p_i^o is the vapor pressure of species i in pure liquid form. Activity coefficients γ_i for E6 fuel are listed in Attachment 1 of Allen et al [3]. Mole fractions x_i are converted from the weight fractions of the liquid fuel profile by dividing by the molecular weights for each compound. Pure liquid vapor pressures are estimated as a function of temperature using the Wagner Equation (Equation 2) [5]:

$$\ln p_r^o = \frac{a\tau + b\tau^{1.5} + c\tau^{2.5} + d\tau^5}{T_r} \quad (2)$$

where $p_r^o = p_i^o/p_c$ is the reduced vapor pressure; $T_r = T/T_c$ is the reduced temperature; p_c and T_c are critical point pressure and temperature, respectively; and $\tau = 1 - T_r$. Values of p_c , T_c , a , b , c , and d for many of the species are obtained from Appendix A of Poling et al. [5]. The Antoine Equation is also used to predict the vapor pressures for other compounds [5, 6]. In this work, a temperature of 310.9K (100F) is chosen for T in the predictions. The total vapor pressure is calculated by summing up the partial pressure of each species in the headspace vapor, p_i , calculated as described above. The headspace vapor speciation profile is then finalized by converting the mole fraction to weight fraction for each compound.

3 Results

The details of the two new profiles OG683 (E6 Summer) and OG684 (E6 Winter) are tabulated in Appendix 1. The most abundant species in the headspace vapor profiles include: isopentane (23.3-33.1%), butane (5.8-27.4%), pentane (7.7-8.8%) and ethanol (6.4-9.2%). The main components and selected toxic species in the new E6 vapor profiles are compared with E10 and current E6 vapor profiles in the following sections (Figure 1 and Figure 2). The ratios of TOG/THC (total organic gases/total hydrocarbon) are 1.09 and 1.08 for OG683 and OG684, respectively. They can be used to convert THC emission mass to actual weight TOG. The ROG/TOG ratio is 1.00 for both profiles.

3.1 E6 Summer vs. Winter Fuel Headspace Vapor Profiles (OG683 vs. OG684)

The biggest difference between the summer and winter vapor profiles is butane. The weight percentage of butane in the E6 winter vapor profile (OG684) is 27.4%, which is 21.6% higher than that in the E6 summer vapor profile (OG683) (Figure 1). This divergence is caused by the different Reid Vapor Pressures (RVP) of the two liquid fuels. California's standards mandate summer gasoline with RVP 7.0 PSI or lower to limit ground-level ozone formation [7]. Fuels with higher RVP evaporate more easily than those with lower RVP. Although there is only 3.0% more butane in the winter-grade fuel (OG682) than the summer-grade fuel (OG681) [4], the difference in the vapor phase is much greater due to the relatively high volatility of butane. Figure 2 shows that the summer fuel vapor (OG683) has relatively higher toluene and benzene concentrations than the winter fuel vapor (OG684).

3.2 E6 vs. E10 Summer Fuel Headspace Vapor Profiles (OG683 vs. OG691)

The headspace vapor profile for E6 summer fuel (OG683) is very close to the one for E10 summer fuel (OG691) which was recently developed [8]. The biggest difference between these two profiles is the weight percentage of isopentane, which is 3.84% more in E6 (OG683) than in E10 (OG691). Although E10 liquid fuel has about 4% more ethanol than E6 fuel, the difference in their headspace vapors is quite small (0.1%) (Figure 1). The concentrations of toluene and benzene in the E6 summer fuel vapor (OG683) are higher than those in the E10 vapor (OG691) (Figure 2).

3.3 New Summer vs. Current E6 Fuel Headspace Vapor Profiles (OG683 vs. OG661)

The weight percentage of isopentane in the new E6 summer vapor profile (OG683) is 4.2% less than in the current E6 vapor profile (OG661). For all other species, the percentage differences are less than 2% between the two profiles (Figure 1). Both OG683 and OG661 were generated by applying vapor-liquid equilibrium theory to the liquid gasoline fuel profile; but OG683 was calculated from a real measured liquid fuel profile while OG661 was estimated from a ‘predicted’ profile. Therefore, the new profile (OG683) is expected to be a more accurate characterization of gasoline headspace vapors. The new profile (OG683) has higher toluene and benzene concentrations than the current one (OG661) (Figure 2).

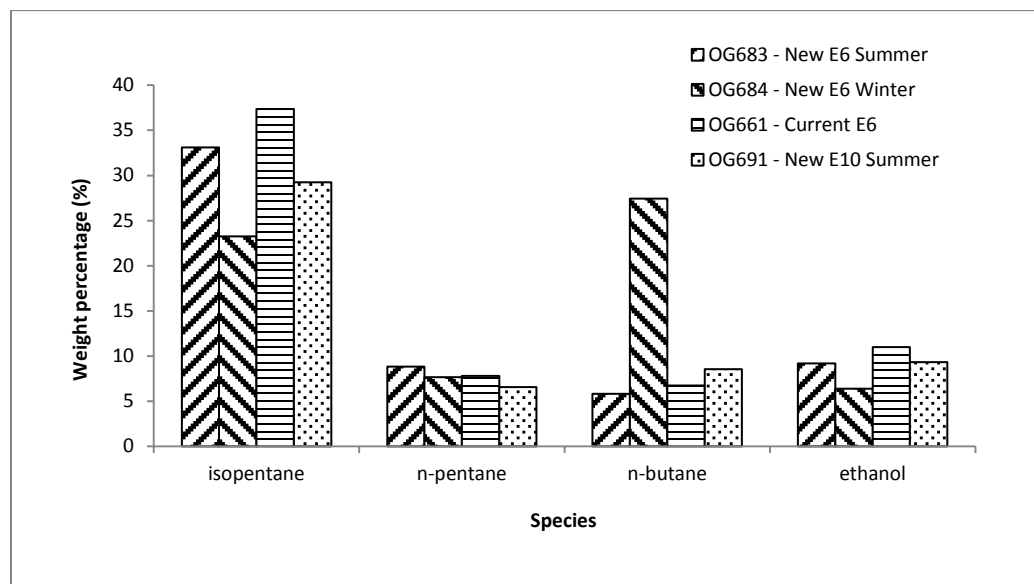

Figure 1. Comparison of major species in profiles OG683, OG684, OG661 and OG691

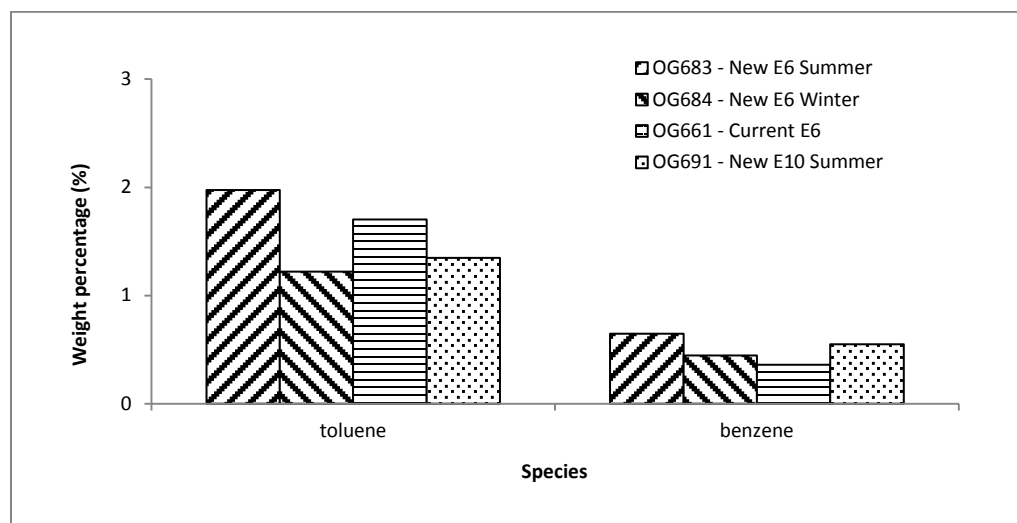

Figure 2. Comparison of toluene and benzene in profiles OG683, OG684, OG661 and OG691

4 Estimated Impacts of the Profile Update on the Emission Inventory

The newly-developed profiles will only be assigned to calendar years 2004 through 2009 (i.e. the calendar years during which E6 gasoline fuel was in use).

The summer-grade fuel headspace vapor profile (OG683) will replace the current profile (OG661) for the EICs/SCCs (Table A2-1) associated with specified RVP-7 PSI gasoline fuel.

The winter-grade fuel headspace vapor profile (OG684) will replace the current profile (OG661) for the EICs/SCCs (Table A2-2) associated with gasoline fuels specified as RVP-10 PSI or RVP-13 PSI.

For all the categories with un-specified gasoline RVP (Table A2-3), the summer-grade E6 profile OG683 will be used to replace OG661 during the months of RVP regulatory control periods; while the winter-grade E6 profile OG684 will be used for other months of the year. It should be noted that the control period varies for different air basins [7].

Based on the 2009 Almanac, statewide annual average TOG emissions for calendar year 2008 from the emission categories to which these profiles will be assigned are 228.65 tons/day, which is 2.76% of the total statewide TOG emissions [2]. Based on the ROG/TOG ratios derived from the new profiles OG683 and OG684, the statewide 2008 ROG will be 228.65 tons/day, which is 0.37% higher than the ROG estimated based on the current profile OG661 (ROG/TOG=0.9963); however, use of new summer (OG683) and winter profiles (OG684) in place of OG661 will cause a 81.7% and 23.2% increase in benzene emissions, respectively (Table 1). The ozone forming potential (OFP) calculated based on the SAPRC07 mechanism [9] is 2.22 for OG683 and 2.03 for OG684; while the one for the current profile OG661 is 2.01.

**Table 1. Changes in emissions of organic gas species for gasoline headspace vapor related categories (2008)
(a) OG683 (summer) vs. OG661**

Statewide Annual Ave. Emissions		Current OG661 (tons/day)	New OG683 (tons/day)	Change	
				Emissions(tons/day)	Percentage
ROG		227.80	228.65	+0.85	+0.4%
Ozone forming potential, MIR (g O3/g ORG)		2.01	2.22	+0.21	+10.5%
Toxics	Benzene	0.82	1.49	0.67	+81.7%
	Toluene	3.89	4.50	0.61	+15.7%

(b) OG684 (winter) vs. OG661

Statewide Annual Ave. Emissions		Current OG661 (tons/day)	New OG684 (tons/day)	Change	
				Emissions(tons/day)	Percentage
ROG		227.80	228.65	+0.85	+0.4%
Ozone forming potential, MIR (g O3/g ORG)		2.01	2.03	+0.02	+1.0%
Toxics	Benzene	0.82	1.01	+0.19	+23.2%
	Toluene	3.89	2.79	-1.10	-28.3%

5 Version Control

This section will be completed after management approval and after the CEIDARS FRACTION table and ORGPROFILE table are updated. Version information from CEIDARS FRACTION table will be copied here.
