Subject: Low Carbon Standard

Comment:

If I was to write a kind response to your Low Carbon Standard initiative I would say, "Shucks, looks like you missed the mark again."

The problem with that response is that I would be dishonest. The honest response is to say that once again the California government and it's self-interested appointee organizations is about to level another scam that milks and bilks the working public of its hard-earned income.

If CARB or CALSTART really had any interest in low-carbon fuels; freeing us from foreign oil dependency; and trying to make the environment healthier; they would have long ago mandated the use of the two fuels that are available to do the job. These two fuels are compressed natural gas (CNG) and ethanol. Instead, they continue to favor electric power, a solution that won't be affordable and in meaningful availability for 2, 3, 4, 5 maybe 6 decades from now.

CNG and ethanol is available right now - today - and can be used by the overwhelming majority of passenger vehicles that are currently on the road; and in the case of ethanol, these vehicles would not even require any engine conversions to use the fuel. Starting immediately we could make an enormous reduction in harmful emissions, while saving the public billions of dollars.

Nearly three years ago, to the day, California's Air Resources Board unanimously approved a package of new emissions rules that they claimed would save drivers money, create jobs, and cut smog and greenhouse gases under what was labeled "The Advanced Clean Car Program."

This program only referred to electric. They never talked about the contribution that ethanol and CNG could make. What was particularly ironic was that the report from CARB stated that they relied in part on Ron Cogan and his GREEN CAR JOURNAL to help them make their decision to support their electric car program. But there was a problem with this: they never consulted Ron Cogan, and Mr. Cogan was not in favor of CARB's program. I know this because I discussed it with him at the Los Angeles Auto Show that convened a few months later.

Even more interesting was the fact that just prior to CARB unveiling this program, Mr. Cogan had bestowed (one again) his company's Green Car Of The Year Award on the Honda Civic GX, car powered exclusively by CNG. Honda won this award for virtually the same vehicle just a few years earlier.

In addition, although CNG has received great press in the past couple of years, California continues its refusal to allow existing gasoline-powered passenger vehicles to be converted to CNG. If you purchase a vehicle that was legally converted to CNG in another state, and bring it into California, you can not register the vehicle. CNG conversions are performed everyday around the rest of the world. If there was a danger in doing so, we would be hearing terrible stories about this everyday, rather than the terrible stories we do hear everyday caused by people who are supported by oil dictators.

Moreover, although today's CALSTART article finally does mention CNG, they never said anything about the dearth of available new CNG powered cars. For the past several years only Honda is regularly producing CNG-powered vehicles - that is, if you can describe annual production runs of about 2,000 vehicles to be regular. The auto manufacturers make more electric vehicles per year than that, and that low number is just a totally meaningless. If California (and the EPA) removed their unjustified restrictions on CNG conversions, at least millions of cars could be converted even if there is no increase in the production of new CNG vehicles.

Not only is the number of electric cars being produced meaningless, they are too expensive: for the consumers and for the auto manufacturers. Consumers who purchase an electric car are paying a significant premium over the true value of the car, and auto manufacturers lose thousands of dollars on every electric car they sell. Sergio Marchione, CEO of Chrysler-Fiat says it best: "Our electric Fiat 500 is great, but please don't buy them; we lose too much money."

Added to the cost and availability problems with electric cars is the fact that battery production makes us dependent on China. At present, there's little to suggest that reliance on China is any better than reliance on foreign petroleum oil.

Incidentally, 100% of our CNG and ethanol supply is produced domestically, and none of the ethanol producers are owned by foreign or terrorist controlled regimes. No American serviceman or woman have ever been killed defending the domestic production and distribution of ethanol.

So when CARB, CALSTART, Jerry Brown and the California Legislature say "Let's Keep Going," what they mean is let's keep milking and bilking the working public; let's keep padding our staffs with additional friends, relatives and campaign donors.

First Name: Lyle
Last Name: Schlyer
Email Address: lschlyer@calgren.com
Affiliation: Calgren Renewable Fuels

Subject: Comments on LCFS Readoption
Comment:

Dear Chairman:

Calgren Renewable Fuels is a California ethanol producer that desires to use more grain sorghum as feed stock. Sorghum is low-water and, we believe, will help us reduce the carbon intensity of our fuel ethanol. We are in close touch with the National Sorghum Producers (NSP) and understand they will also submit comments.

While bemoaning the fact that others in the ethanol industry saw the need to file suit against the ARB regarding the LCFS, we applaud the ARB's reaction - re-authorizing the LCFS and working to improve the accuracy of carbon intensity scores sends the right message.

As will the NSP, we thank the ARB for paying special attention to sorghum iLUC, sorghum fertilizer requirements, and nitric oxide emissions from sorghum stover. We would ask that the ARB be alert for future information on sorghum root:shoot ratios and incorporate it into future versions of CA-GREET.

Lyle Schlyer
President, Calgren Renewable Fuels

Subject: LCFS and Sorghum ILUC
Comment:

Chairman Nichols,

Western Plains Energy, LLC (WPE) is a Kansas-based sorghum ethanol producer. WPE feels that sorghum has an important role to play in helping California meet the greenhouse gas reduction goals set by the LCFS and reducing water usage on irrigated acres.

We have a strong affiliation with the National Sorghum Producers (NSP) and understand they are submitting comments as well. As NSP does, we applaud the ARB for its update of the LCFS and appreciate its special attention to sorghum iLUC, sorghum fertilizer requirements and N2O emissions from sorghum stover. We also recommend that the ARB focus attention on information related to sorghum root:shoot ratios, and as it becomes available and incorporate this information into future versions of CA-GREET.

Thank you for the opportunity to comment.

With Kindest Regards,
Derek Peine
Chief Executive Officer
Western Plains Energy

Subject: Conestoga Energy Partners Comments on LCFS Re-adoption

Comment:

Chairman Nichols,

As I stated in the previous comment period, Conestoga Energy Partners owns and operates 3 ethanol plants in Southwest Kansas and the Texas panhandle. I believe that sorghum plays an important role in helping California reach its greenhouse gas reduction goals and our company to improve the sustainability of agriculture in our production region by reducing water usage.

I would like to echo the comments of the National Sorghum Producers applauding the ARB for its update of the LCFS and am particularly supportive of the attention given to the sorghum production systems. I would however encourage ARB to continue to focus attention on sorghum root:shoot ratios and as the information becomes available incorporate it into future versions of CA-GREET.

I appreciate the opportunity to comment, and your continued efforts in GHG reduction.

Sincerely,

Matt Durler

Comment:

Dear Honorable Chairman Nichols and Members of the Board:

Please consider the attached documents supporting the California Electric Transportation Coalition comments which were submitted on February 13, 2015:

1. An assessment by ICF International characterizing the macroeconomic impacts and associated co-benefits of LCFS compliance.
2. An assessment by ICF International in cooperation with industry leaders and investors showing the alternative fuels market has evolved much faster than anticipated and the Low Carbon Fuel Standard is exceeding expectations. The report analyzes recent developments in the transportation sector and presents three scenarios that ratchet down the carbon intensity of transportation fuels 10 percent, to meet the goal of California's Low Carbon Fuel Standard by 2020. All three projections point to an increasingly diverse fuel supply, with more innovation leading to more renewable fuels and advanced vehicles.
3. An assessment by TIAX, LLC demonstrating that electricity consumption in on-road and off-road applications has the potential to produce a significant quantity of LCFS credits.
4. A powerpoint summarizing a related assessment by ICF International and E3 which demonstrates the benefits of transportation electrification for all Californians, whether or not they drive electric. These benefits extend beyond the air quality and greenhouse gas benefits to include benefits to ratepayers. The full reports are available online at www.caletc.com.

Thank you for your consideration.

Regards,

Eileen Wenger Tutt, Executive Director
California Electric Transportation Coalition

Subject: Promotum Study on LCFS Compliance to 2025

Comment:

Please find attached a study by Promotum, a fuels and chemicals consultancy, that was commissioned by Natural Resources Defense Council, Union of Concerned Scientists, and Environmental Defense Fund.

The study demonstrates that a 10% target by 2020 is achievable using a variety of lower carbon fuels as well as technologies to reduce the carbon-intensity of refining and crude oil production. If the LCFS provides the credit incentive value assessed in ARB staff's proposed ISOR, a 15% reduction target could even be achieved by 2025.

First Name: Lyle

Last Name: Schlyer

Email Address: lschlyer@calgren.com

Affiliation: Calgren Renewable Fuels

Subject: CI Calculations re Fuel Ethanol

Comment:

As with the sorghum issue, Calgren Renewable Fuels applauds the ARB for its handling of the re-authorization of the LCFS. Perhaps the re-authorization was prompted by the lawsuit brought by others in the ethanol industry. If so, we applaud the ARB for its measured and appropriate response. While Calgren did not and does not support the lawsuit, it does support the ARB's attempts to strengthen the LCFS.

To be stronger, the LCFS must be based upon good science. Calculation of life-cycle carbon intensities is inherently complicated and a few anomalies are to be expected. We believe our consultant has discovered one such anomaly regarding the CI impact of denaturant. Please review his comments as reflected in the attached summary. Correcting what appear to be inconsistencies and errors regarding the CI impact of denaturant on fuel ethanol will help strengthen the LCFS.

On a somewhat related subject, we applaud the ARB for correcting the erroneous 1:1 distillers grain-to-corn displacement ratio that appears in GREET 1.8. But we firmly believe and have previously submitted data showing that the displacement ratio varies somewhat depending upon whether distillers grain is fed to hogs, poultry, feedlot cattle or dairy cows. We urge the ARB to take note of relevant research in this area and apply it where applicable.

Thank you for the opportunity to comment.

Mary Nichols and Board Members
California Air Resources Board
1001 "I" Street
P.O. Box 2815
Sacramento, CA 95812

Re: Low Carbon Fuel Standard

Dear Chairman Nichols and CARB Board Members:

ActionAid USA, a nonprofit organization working with millions of people around the world and the US to fight the causes of poverty and injustice, applauds the California Air Resources Board's (CARB) proactive approach to climate change mitigation. However, as the Board considers re-adoption of the Low Carbon Fuel Standard (LCFS), we strongly urge it not to lower the indirect land use change (ILUC) score for corn ethanol.

Attached you will find a working paper by Timothy A. Wise and Emily Cole of the Global Development and Environment Institute at Tufts University, "Mandating Food Insecurity: The Global Impacts of Rising Biofuel Mandates and Targets." This paper studies the impact of government biofuel mandates and estimates that mandates will drive a 43% growth in demand for biofuels over the next decade. This level of growth has extremely concerning implications for food security, as well as land and water use. Further incentivizing the use of corn ethanol, which undermines food security and has questionable environmental benefits, would be step in the wrong direction.

Crop-based biofuels, particularly corn ethanol, undermine food security around the world by driving up food prices and increasing price volatility.

This not only true for corn products people consume directly; corn is one of the most popular feeds for animals, so an increase in the price of corn also increases the price of meat and dairy products. A 2012 study published by ActionAid estimated that US ethanol expansion cost net corn importing countries \$11.6 billion between 2006 and 2011. \$6.8 billion of this additional cost was born by developing countries. In fact, during fiscal year 2011, the U.S. spent as much on food aid to Guatemala as the additional money Guatemala paid to import corn at the increased prices.

Corn ethanol also presents environmental concerns.

In addition to the emissions from direct and indirect land use change, corn ethanol undermines water quality. The nitrogen, phosphorous and other chemicals applied to corn crops are washed from those crops into drainage, local water supplies, rivers and eventually oceans. This poisons the water, and in the case of nitrogen, creates algae blooms that reduce the oxygen levels in the water. The resulting dead zones kill fish and aquatic life or force them to move elsewhere. In 2014, the dead zone in the Gulf of Mexico was 5,052 square miles. The impact of biofuel expansion on water quantity should not be ignored. Corn uses more irrigated water than any other crop in the US, even though the overwhelming majority of corn is currently rain-fed. In recent years, irrigated corn crops increased with the growth in corn production. Perhaps not surprisingly, 87% of irrigated corn crops are grown in areas already showing extremely high water stress. Considering the water demands of growing corn and the strain current corn production is placing on water levels, policy makers should be cautious about policies that encourage further demand.

One other lesson to take from "Mandating Food Insecurity," is that government policies continue to profoundly shape the biofuels industry. Government mandates have and will continue to drive demand growth for first-generation biofuels, such as corn ethanol, that undermine food security and hurt the environment. I strongly urge the Board to ensure that the LCFS does not further incentivize corn ethanol expansion.

Thank you for your consideration and please do not hesitate to contact us should you need additional information.
Sincerely,

Kelly Stone
Biofuels Policy Analyst

Dear Madams and Sirs:

We appreciate this opportunity to comment on the Air Resources Board's ("ARB") proposed readoption of and modified regulation order to the Low Carbon Fuel Standard. Attached in PDF format please find our comment.

We very much welcome ARB's comments, are available to answer any questions ARB may have on these comments, and respectfully request setting up a meeting with staff as soon as practicable.

Respectfully submitted,

Elon D. Rubin, Esq.

Subject: CI of denaturaunt

Comment:

The denaturaunt used by domestic ethanol producers is Natrua
Gasoline. This product has a lower CI than CARBOB. Brazilian
Ethanol marketers use CARBOB for their denaturant. There should
be a new default pathway for domestic ethanol denaturuant
reflecting the use of Natural Gasoline.

Subject: Comments on Low Carbon Fuel Standard's (LCFS) provisions for Low Complexity – Low Energy (Comment:

June 17, 2015

The Honorable Mary Nichols, Chairwoman
California Air Resources Board
1001 I Street
Sacramento, CA 95814

Subject: Comments on Low Carbon Fuel Standard's (LCFS) provisions for Low Complexity – Low Energy (LCLE) Refiners

Thank you for allowing us to provide our comments on the Low Carbon Fuel Standard's (LCFS) provisions for Low Complexity – Low Energy (LCLE) Refiners. These provisions recognize that not all refineries are the same. We believe that there are policy and technical justifications for a distinction in the LCFS. The Air Resources Board, as well as, the U.S. Environmental Protection Agency has traditionally recognized the unique value small refiners occupy in the oil and finished fuel markets, as well as, their unique configurations and operating constraints.

Given the value of LCLE Refiners, we were concerned that the proposed final regulatory proposal for the re-adoption of California's LCFS fails to recognize Alon's Bakersfield Refinery as a LCLE producer. The facility is configured and engineered to produce low carbon intensive base fuels. Board staff had an opportunity to make the LCFS's LCLE provisions work for all low carbon intensity refineries in California, but decided against various compromise proposals presented, including proposals to limit the benefit any single LCLE refiner could receive.

As the final LCFS regulation is before you, we ask that the Board please look again at the value of all LCLE refineries and the benefits that they provide to the state. Thank you again for allowing us to provide our comments on the re-adoption of the LCFS.

Sincerely,

ANDY VIDAK
Senator, 14th District

JEAN FULLER,
Senator, 16th District

CARB:

We have participated in and supported the CI pathways for HSAD.

Edgar & Associates, Inc. has produced the attached table taking the new CIs and EERs and placed them in one place to compare life-cycle and economic efficiencies of transportation fuels.

CARB staff should produce a similar graph for all stakeholders to use.

Thanks

Evan

Re: Comments on Calculating GHG Reduction Credits for the
Displacement of an Open Anaerobic Lagoon with an Anaerobic
Digester

Dear CARB Staff,

We are submitting comments regarding the credits assigned to methane emissions from an open anaerobic waste treatment lagoons. The conversion of these operations into anaerobic digestion facilities represents a significant reduction in methane emissions from these operations as methane that was emitted to the atmosphere is captured (with the exception of fugitive emissions). Correctly accounting the credits these operations receive will have an impact on whether or not open anaerobic lagoons will be converted and will divert methane from the atmosphere.

Methane is a potent greenhouse gas that has 25 times higher global warming potential than carbon dioxide, and has been generated from anaerobic waste lagoons and emitted directly to the atmosphere at many cattle operations across the country. Diverting the manure created at these facilities to an anaerobic digester avoids releasing methane emissions to the atmosphere, and reduces the negative impact of these facilities. Therefore, we believe the avoided methane emissions should be counted as a credit towards the biogas produced from anaerobic digesters used to replace these open lagoons.

The current methodology adopted by CARB and Argonne National Laboratory for the analysis of anaerobic digestion-based renewable natural gas (RNG) production assumes that CH₄ generated is flared, and that the resulting CO₂ emissions and fugitive methane are the only credits received by the biogas produced by the digester. This assumed baseline is reasonable because the original destination of these wastes would be a landfill where the collection and flaring of biogas is feasible and has already been implemented.

However, in most current open anaerobic lagoon systems, no biogas is being collected. Furthermore, once the biogas is collected from a covered lagoon and/or a bio-digester, the biogas will likely be sold or used for on-site energy generation. It is highly unlikely that biogas collected would be flared after the capital and operational costs have been put into the facility to capture and use the gas.

In a report published by US EPA in 2010, of the 157 digester projects operating on commercial scale livestock facilities, only 15 (or 9.6%) were flaring the biogas full time . Based on this information, it is at least questionable that the flaring of biogas should be used as a reference case since it does not reflect actual operations at a high percentage of digester projects.

We believe the reference case for calculating the avoided methane emissions should be that all the biogas generated from the open anaerobic lagoon is fugitive to the atmosphere. Consequently, the CH₄ emissions captured by the anaerobic digester should be accounted for as credits in the GREET model.

We would like to encourage you to take this into consideration when finalizing the GREET 2.0 model to allow for reductions based on the methane emissions that are captured and utilized. This will allow for better accounting and encourage reducing ghg emissions from these operations, and from other emerging technologies.

Thank you for the opportunity to submit these comments and to participate in the re-adoption of the LCFS. Please let us know if you need any additional information or have any questions on the above points!

Sincerely,

Dennis M. Langley

Subject: LCFS Credit Proposal
Comment:

Nuvera Fuel Cells is a provider of fuel cell systems for mobility applications and of hydrogen generation and refueling equipment. The company is owned by NACCO Materials Handling Group, a global manufacturer of industrial vehicles, including Hyster(R) and Yale(R) brand forklift trucks.

Nuvera endorses the proposed inclusion of hydrogen fuel for fuel cell-powered forklifts as a means for generating LCFS credits. We also propose extending the application beyond forklifts to other industrial vehicles, such as ground support equipment, transport refrigeration, and container handling equipment. These measures will help drive the adoption of low carbon fuel alternatives within California's large industrial vehicle sector, which includes distribution centers, warehouses, manufacturing facilities, ports, and other venues that are concentrated emissions sources.

Nuvera advises against the adoption of the proposed Provisional Credit clause that would allow companies to earn provisional LCFS credits but would not allow them to be traded for two years. This provision would be a significant disincentive for prospective producers.

Comment:

We appreciate this opportunity to provide the comments of ChargePoint, Inc. (ChargePoint) on proposed changes to the regulations governing California's Low Carbon Fuel Standard (LCFS) issued on June 4, 2015 pursuant to the Notice of Public Availability of Modified Text and Availability of Additional Documents and Information (Notice) relating to the Proposed Re-Adoption of the LCFS. We strongly support the goals of the LCFS program, and recognize the California Air Resources Board (ARB) as a national leader in implementing this important program as part of the state's larger effort to reduce the carbon intensity of transportation fuels and decrease greenhouse gas (GHG) emissions for the benefit of all Californians. For the reasons discussed in our attached comments, ChargePoint urges you to modify the proposed changes in the regulations addressing requirements for Regulated Parties for Electricity.

Comment:

June 19, 2015

Clerk of the Board
Air Resources Board
1001 I Street
Sacramento, CA 95814

Re: Low Carbon Fuel Standard Program Amendments for Regulated
Parties for Suppliers of Electricity Used as a Fuel Substitute.
Dear Madam or Sir:

NRG EVgo ("EVgo") appreciates the opportunity to review and comment on the referenced amendments to the Low Carbon Fuel Standard Program as they affect suppliers of electricity used as a fuel supplement.

EVgo is a leading Electric Vehicle Services Provider ("EVSP") in the state of California seeking to grow the market for the future of California's EV drivers and the environment. EVgo has a multi-faceted business model engaged in expanding both private and public access EV charging infrastructure throughout California. As a company heavily engaged in the development of EV charging infrastructure, we believe the LCFS credit program can be beneficial to the continued expansion of our business operations and the growth of the EV market in California. The proposed amendments restrict the ability of EVSPs to generate credits to public access charging alone, which unnecessarily constrains incentives for EVSPs in expanding charging opportunities at multifamily dwellings and workplaces. The success of the EVSP industry hinges on the viability of a complete ecosystem of EV charging products covering: home, public access, workplace, and multifamily. EVgo would like to see the California Air Resources Board maximize credit generating opportunities for EVSPs across all public and private access chargers.

EVgo aims to enroll in the LCFS program shortly and looks forward to working closely with the California Air Resources Board to maximize EV adoption.

Generally, EVgo objects to the elimination of the general category "electricity services supplier" as a regulated party eligible for the full suite of credit generation opportunities.

The policy objectives supporting the use of electricity in the LCFS should incentivize all market participants to increase electrification and reduce carbon intensity. Restricting certain

categories of LCFS eligibility to Electrical Distribution Utilities creates a skewed playing field that unfairly favors utilities over private market participants such as EVSPs.

EVgo respectfully objects to the proposed language of § 95483(e)(1) for failing to include EVSPs as an eligible regulated party at single- or multi-family residences.

Expanding EV charging into multi-family residences is a critical component of EV adoption in California. EVgo's business model includes contracting with apartment communities to provide turnkey charging services to its residents. The ability to generate credits through these relationships would provide a significant incentive to increasing deployment. Owners of multi-family residences have generally been hesitant to invest in EV infrastructure and manage the authentication, networking, maintenance and billing activities needed to serve residents. Permitting EVSPs to generate credits through the provision of private access residential charging services would encourage further development and lead to more opportunities for EV drivers to charge their vehicles during off-peak hours.

EVgo requests that § 95483(e)(1) be amended to include verbiage similar to § 95483(e)(2) or § 95483(e)(4) (assuming "site host" would include EVSPs) such that EVSPs who have contractual relationships with property owners or managers to provide charging services are permitted to generate credits at single- and multi-family residences.

EVgo respectfully supports the proposed language of § 95483(e)(2) including EVSPs as an eligible regulated party at public access EV charging stations.

EVgo is investing heavily in public access EV charging stations across the state of California. Generating credits through the LCFS will enable us to expand our offerings and increase the pace of deployment. Additionally, the public education requirements align closely with many of EVgo's current programs and its ultimate business objectives.

EVgo respectfully requests clarification of the term "Site Host" in § 95483(e)(4) to include EVSPs in connection with business and workplace charging.

Workplace charging is an essential component of EV adoption in California. EVgo welcomes the opportunity to generate credits as the EVSP of private access charging stations at a business or workplace. The term "site host" should be clarified to include EVSPs who have contractual relationships with a business or property owner to provide charging services.

Subject: Enerkem comments on the modified text for LCFS re-adoption

Comment:

July 8, 2015

Dear Sir/Madam,

Enerkem appreciates the opportunity to submit comments on the modified text for the proposed re-adoption of the Low Carbon Fuel Standard (LCFS).

Enerkem is a leading waste-to-biofuels and chemicals company. We produce clean fuels and green chemicals from non-recyclable municipal solid waste, thus helping diversify energy sources while offering a sustainable alternative to landfilling and incineration. Our facility in Edmonton, Alberta (Canada) is the world's first commercial biorefinery to use municipal solid waste to produce biomethanol and ethanol. We are currently developing biorefineries in North America and globally, based on our modular and standardized manufacturing approach and using our proprietary biofuels technology, developed in-house since 2000.

The LCFS makes California a very attractive market for the low carbon ethanol to be produced at our Edmonton biorefinery (currently beginning operations), and also an attractive investment environment for developing future Enerkem facilities in the state.

We would first like to thank the Air Resources Board for taking low carbon fuel producers' concerns into account following the first 15-Day Modified Regulation Order by removing the limitations on the sale and transfer of credits generated under provisional pathways. Dropping this limitation removes a significant barrier to financing of projects to develop new capacity for low carbon fuel production in California and for the California market.

This change, while very important, does not resolve all issues relating to new low carbon fuel production facilities. The proposed rule still requires that facilities be in "full commercial production" for at least one full calendar quarter before even applying for a new pathway. The rule places new facilities in an extremely difficult commercial position, by effectively requiring facilities to be in commercial production but without possibility to sell the fuel produced. Considering the time from submission of a new pathway application to publishing of the CI, new facilities would, in effect, have to be in "full commercial production" for approximately one year before being able to sell fuel into the California market.

This places a significant damper on any plans to develop new low carbon fuel production facilities in California, as it is unclear how such facilities could sell fuel produced during the first year of commercial operations. The uncertainty concerning revenue streams following plant construction, and the barrier to selling fuel in the first year of operations, will undermine financing for projects utilizing innovative fuel technologies and thereby hinder attainment of the Air Resources Board's aggressive CI and petroleum reduction goals.

The provision also creates a barrier for out-of-state new production facilities that could potentially supply low carbon fuel to the California market, as without a CI it is nearly impossible to secure off-take agreements for low carbon fuel.

Enerkem urges the Air Resources Board to remove the requirement to have been in full commercial production for one quarter prior to applying for a new pathway, in order to encourage the production and commercialization of new low carbon fuels such as municipal waste to ethanol.

Enerkem believes that the power of the Executive Officer to adjust the number of credits or reverse any provisional credit in the producer's account, until the provisional CI has been successfully corroborated by operational records covering a full two years of commercial operation, is sufficient to enable verification of carbon intensity data from new production facilities. However, if the Air Resources Board considers it necessary to have operational data to verify the proposed carbon intensity of the new pathway at the time of application, greater flexibility could be afforded to companies by allowing some of this data to come from the company's existing pilot or demonstration facilities or from commissioning activities at the facility for which the pathway is being requested.

If the Air Resources Board wishes to limit pathway applications to commercial facilities that are being built, rather than leave the door open to the creation of pathways for which commercial projects have not yet been developed, Air Resources Board could consider requiring an independent engineering review and a site visit to be included with the application for a new pathway.

We thank the Air Resources Board for the opportunity to submit comments on the modified text for the proposed re-adoption of the Low Carbon Fuel Standard (LCFS), and hope that the Board will make the small changes necessary to enable low carbon fuel producers to secure the financing required to develop new production facilities, which will be needed to achieve the Board's greenhouse gas emissions reductions goals.

Sincerely,

Marie-Helene Labrie
Senior Vice-President, Government Affairs and Communications
