

Fog Processing of atmospheric organic compounds during the California Regional PM10/PM2.5 Air Quality Study (CRPAQS)

P. Herckes, T. Lee, L. Trenary, G. Kang, and J.L. Collett, Jr.
Colorado State University

A photograph of an outdoor field experiment during a foggy day. Several tall, thin poles with horizontal arms are spaced out across the field, likely for sampling. In the foreground, a piece of equipment is mounted on a sawhorse. To the left, there are several black plastic cases stacked together. The ground is dark and appears to be covered in a layer of fog or mist. The overall scene is dimly lit due to the weather conditions.

Total and Dissolved Organic Matter Characterization

Total vs Dissolved Organic Carbon

fog-Angiola (SJV, Ca)

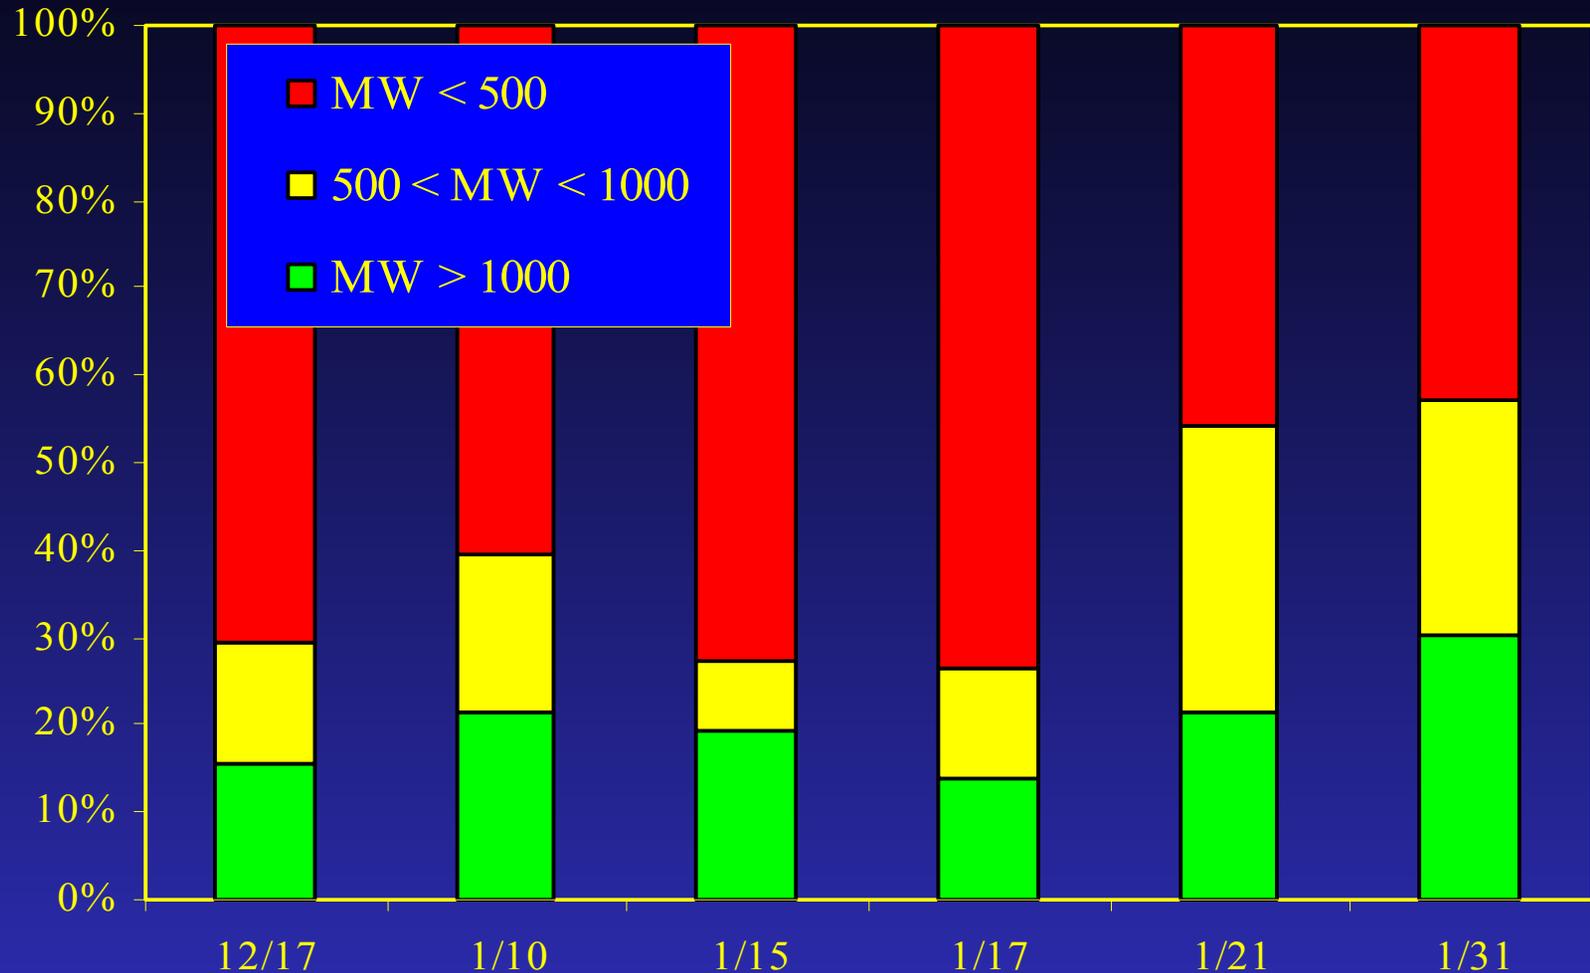

25% insoluble
(0-64%)

Total and Dissolved Organic Matter Characterization

Dissolved Organic Matter

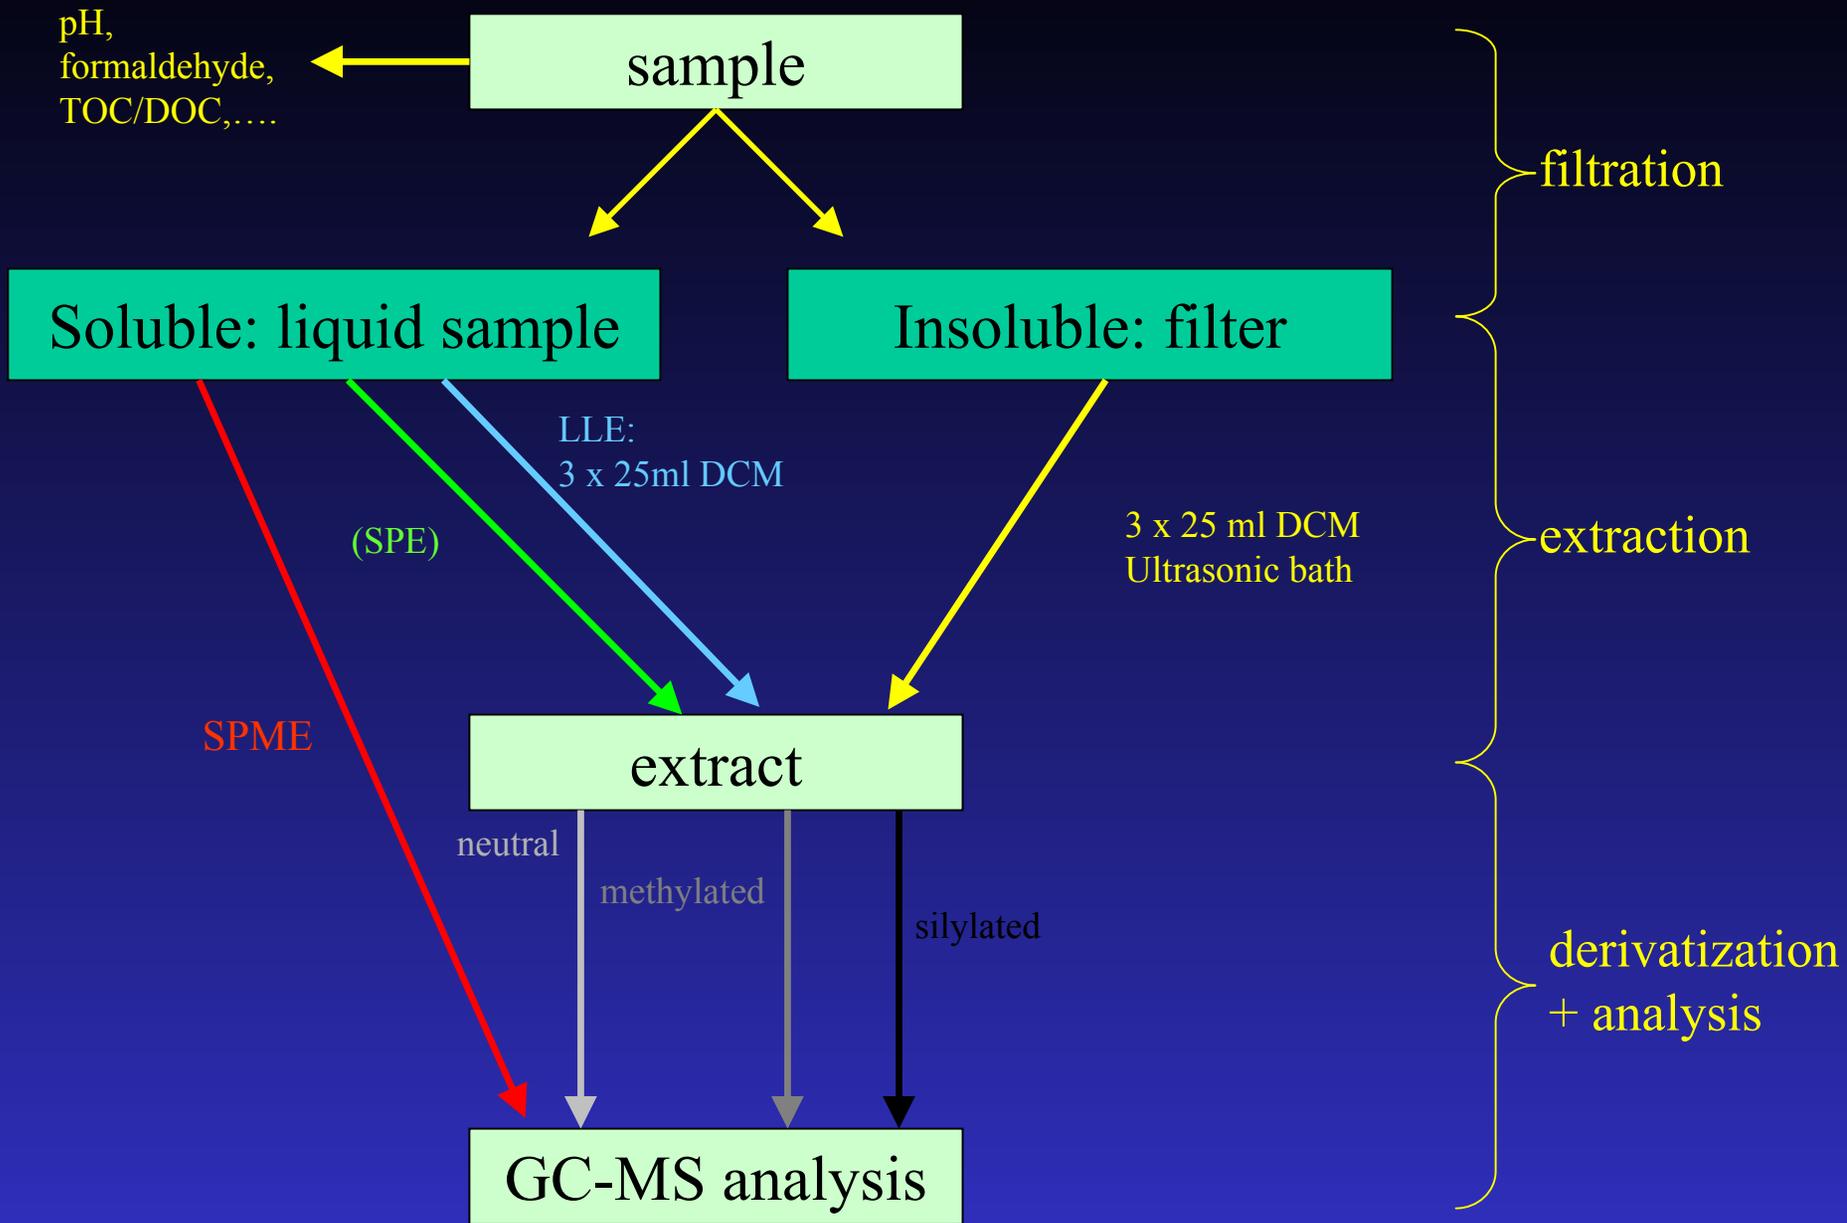

significant fraction of DOC has high Molecular Weight (MW)

Investigation of bulk properties of OM

Individual compound speciation

Variation with drop-size

Processing of carbonaceous particles

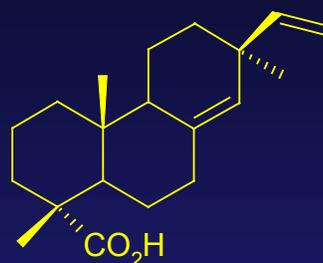

Molecular composition of organic matter in California fog

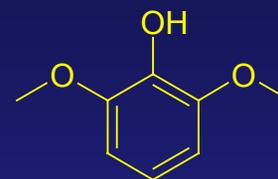

A large number of different compounds has been identified in the fogwater

Polar compounds:

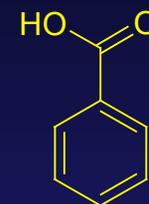

- carboxylic acids (C1-C36)
- di-carboxylic acids (C2-C9)
- aromatic acids (benzoic acid...)
- resin acids (pimaric acid,...)
- aldehydes (formaldehyde,...)
- phenols (phenol, nitro-phenol....)
- methoxyphenols (vanillin, ethyl-guaiacol,...)
- oxygenated PAH (9, 10 Anthracenedione,...)
- pesticides (Diazinon, Penoxaline,..)

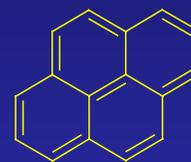

pimaric acid

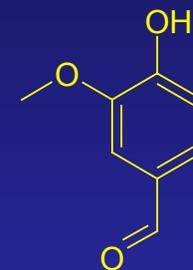

syringol

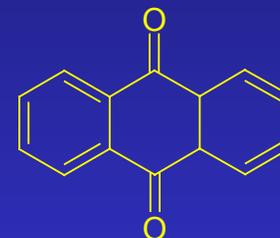

benzoic acid

pyrene

vanillin

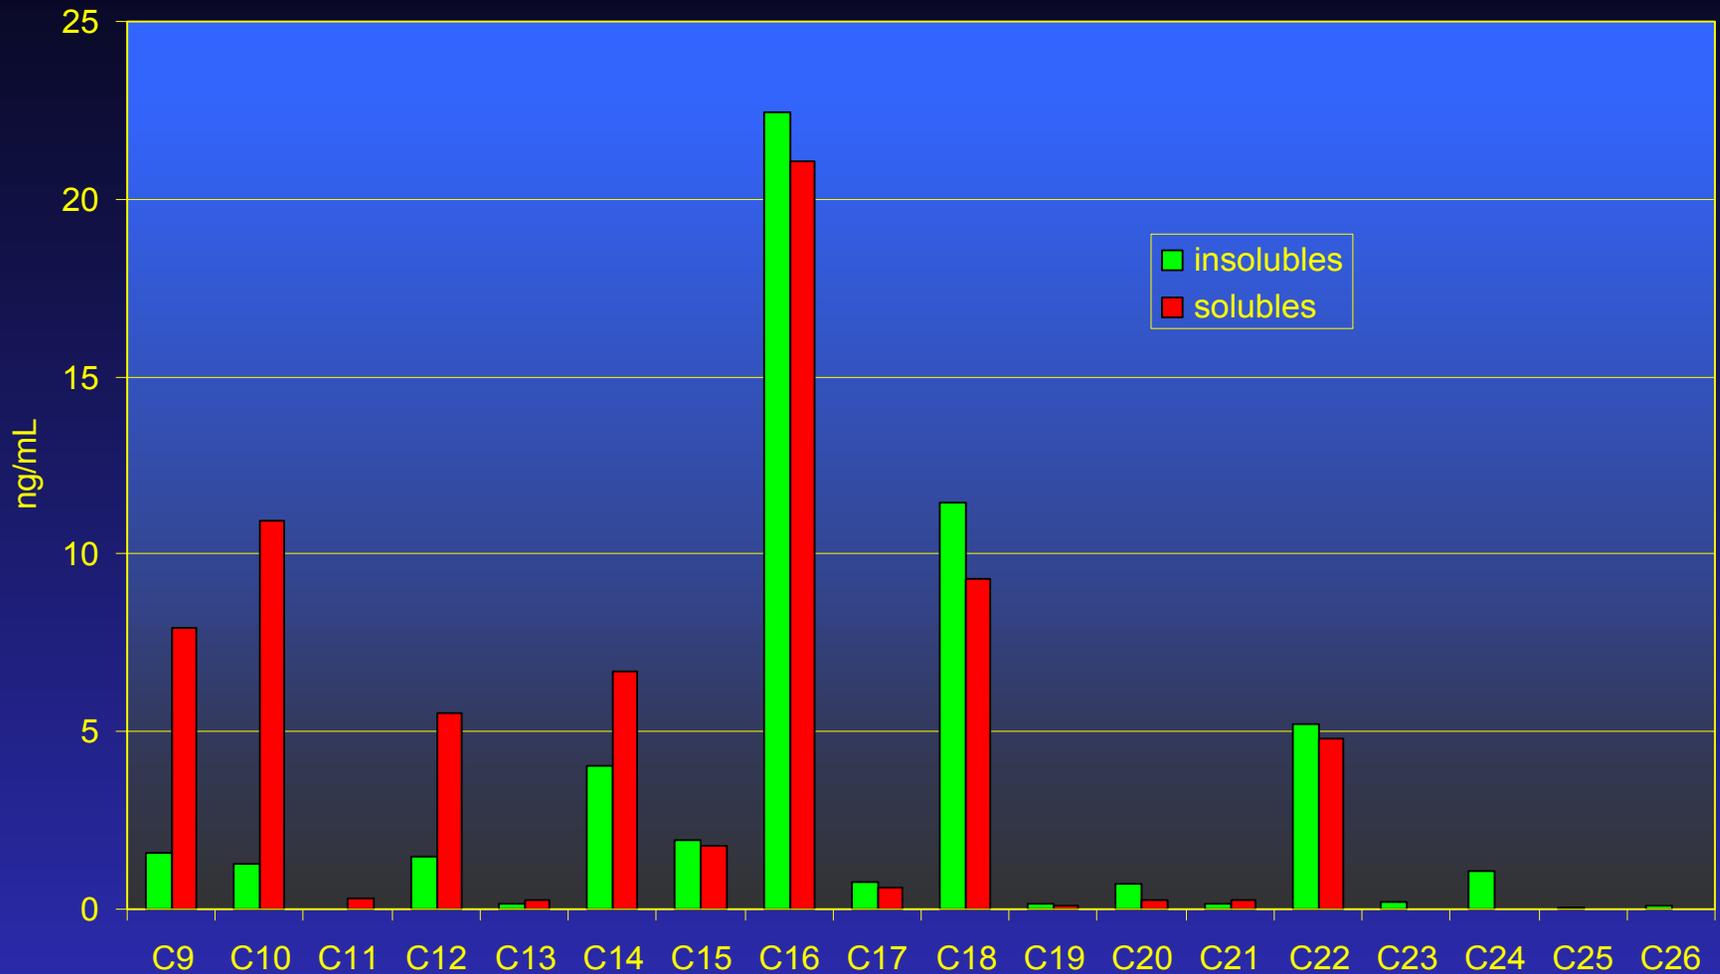

9,10 anthracenedione

Nonpolar compounds:

- n-alkanes (C20* – C39)
- Polyaromatic Hydrocarbons (PAH) (pyrene,...)

...

n-alkanoic acids (Angiola (CA), December 17, 2000)

Smaller MW compounds predominantly soluble
Larger MW compounds predominantly insoluble

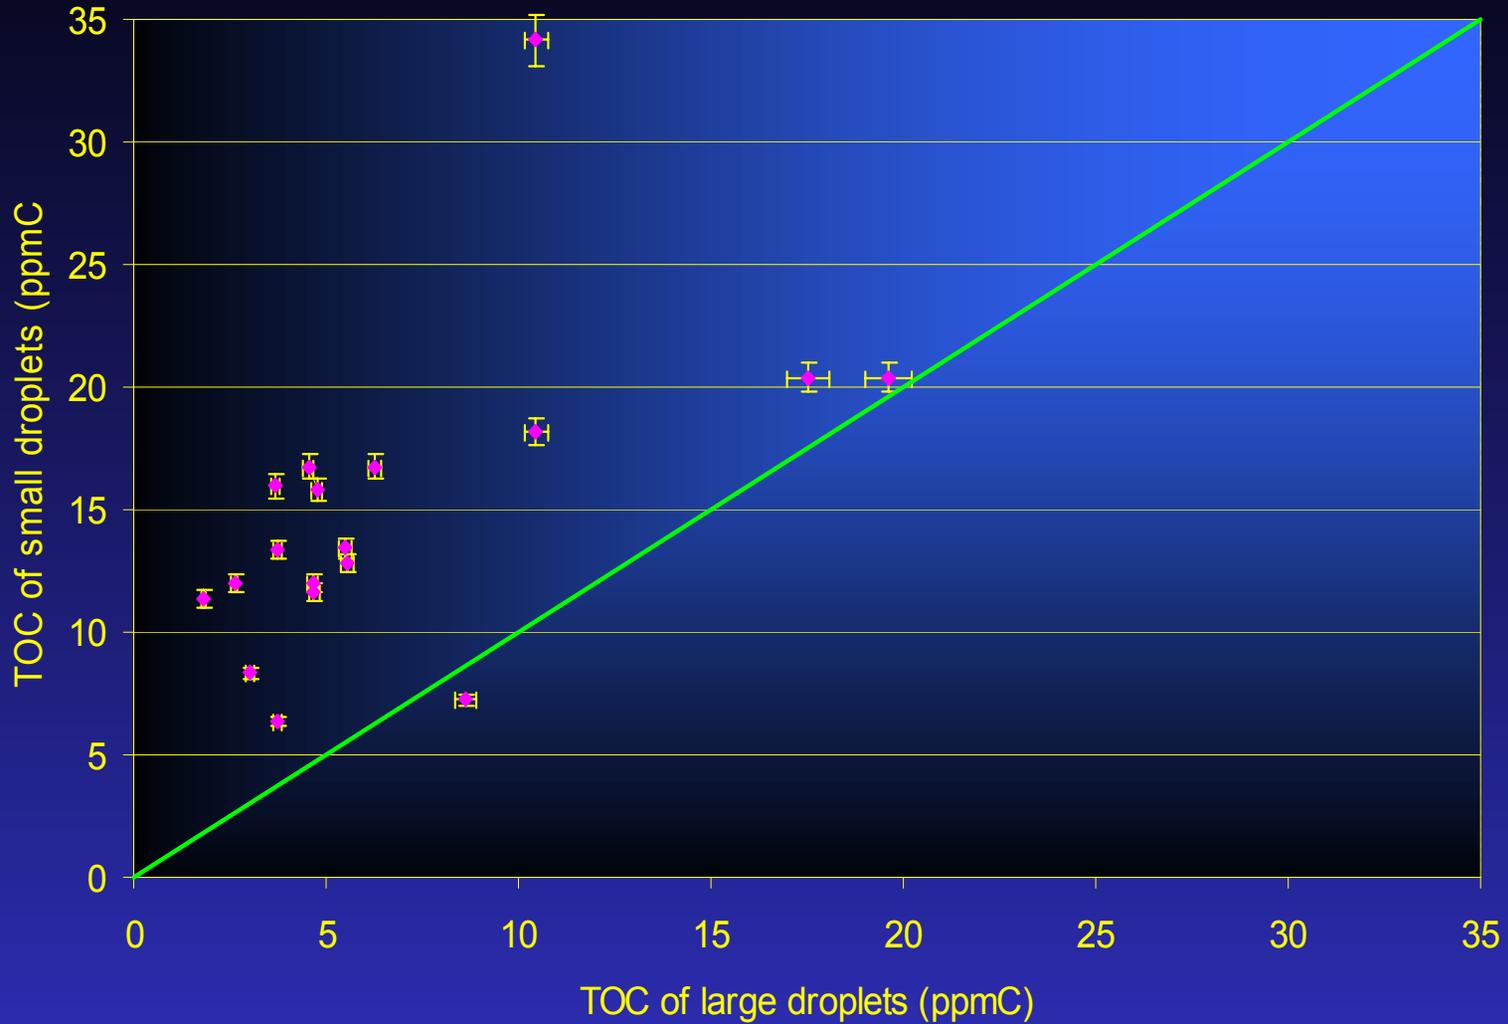

Investigation of bulk properties of OM

Individual compound speciation

Variation with drop-size

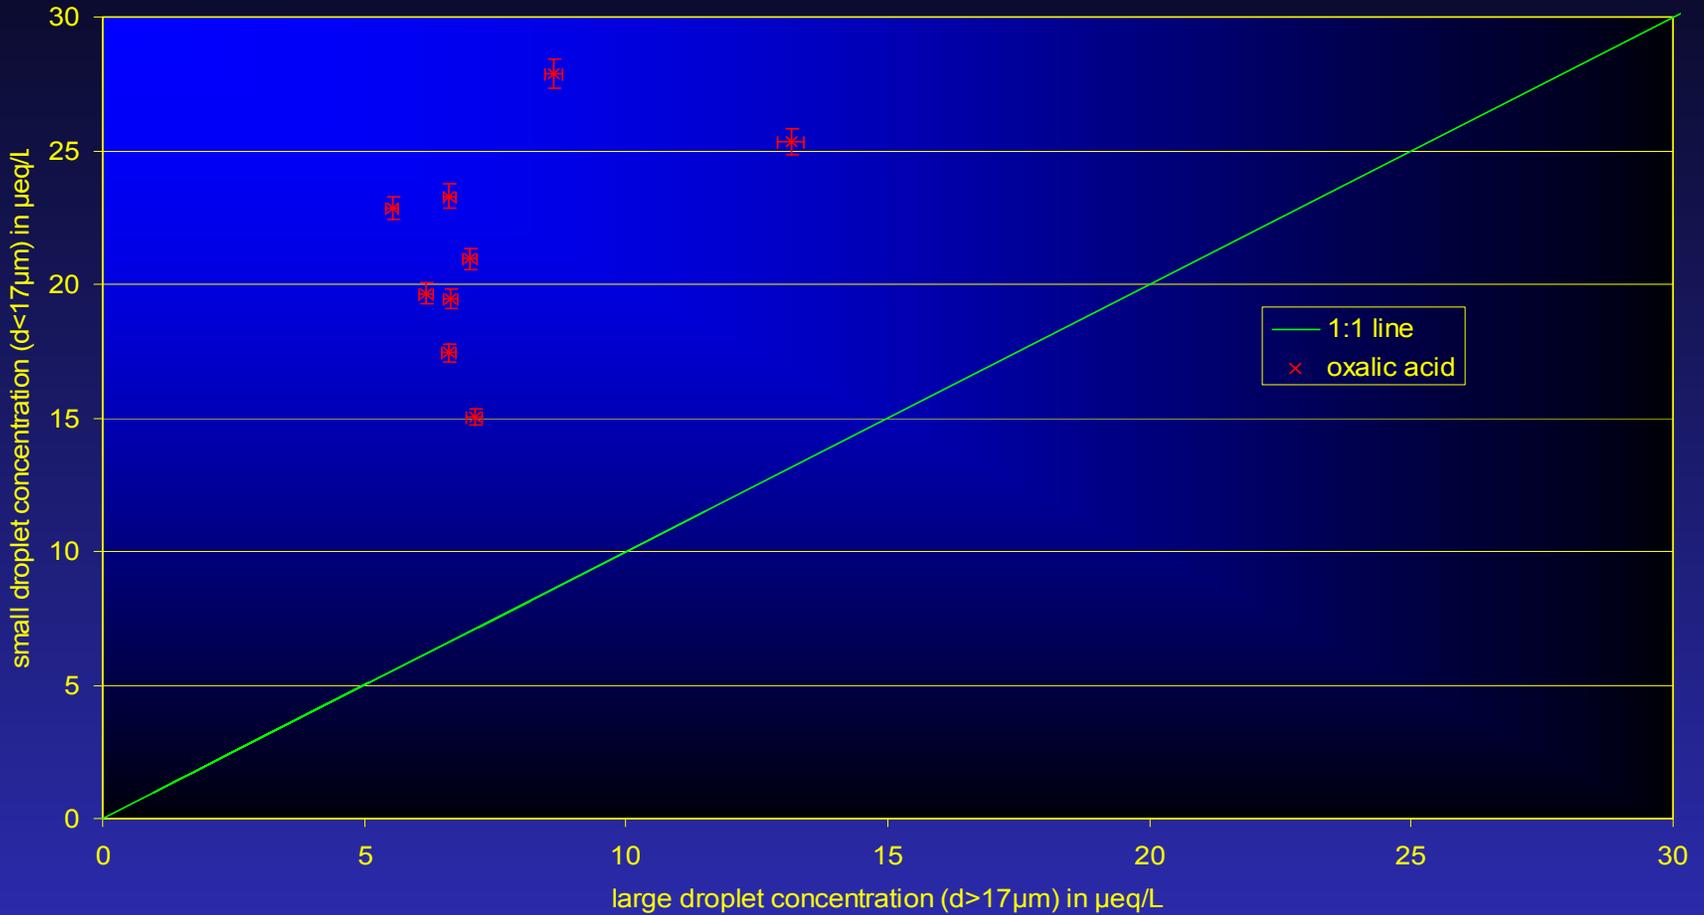

Processing of carbonaceous particles

TOC variation with droplet size

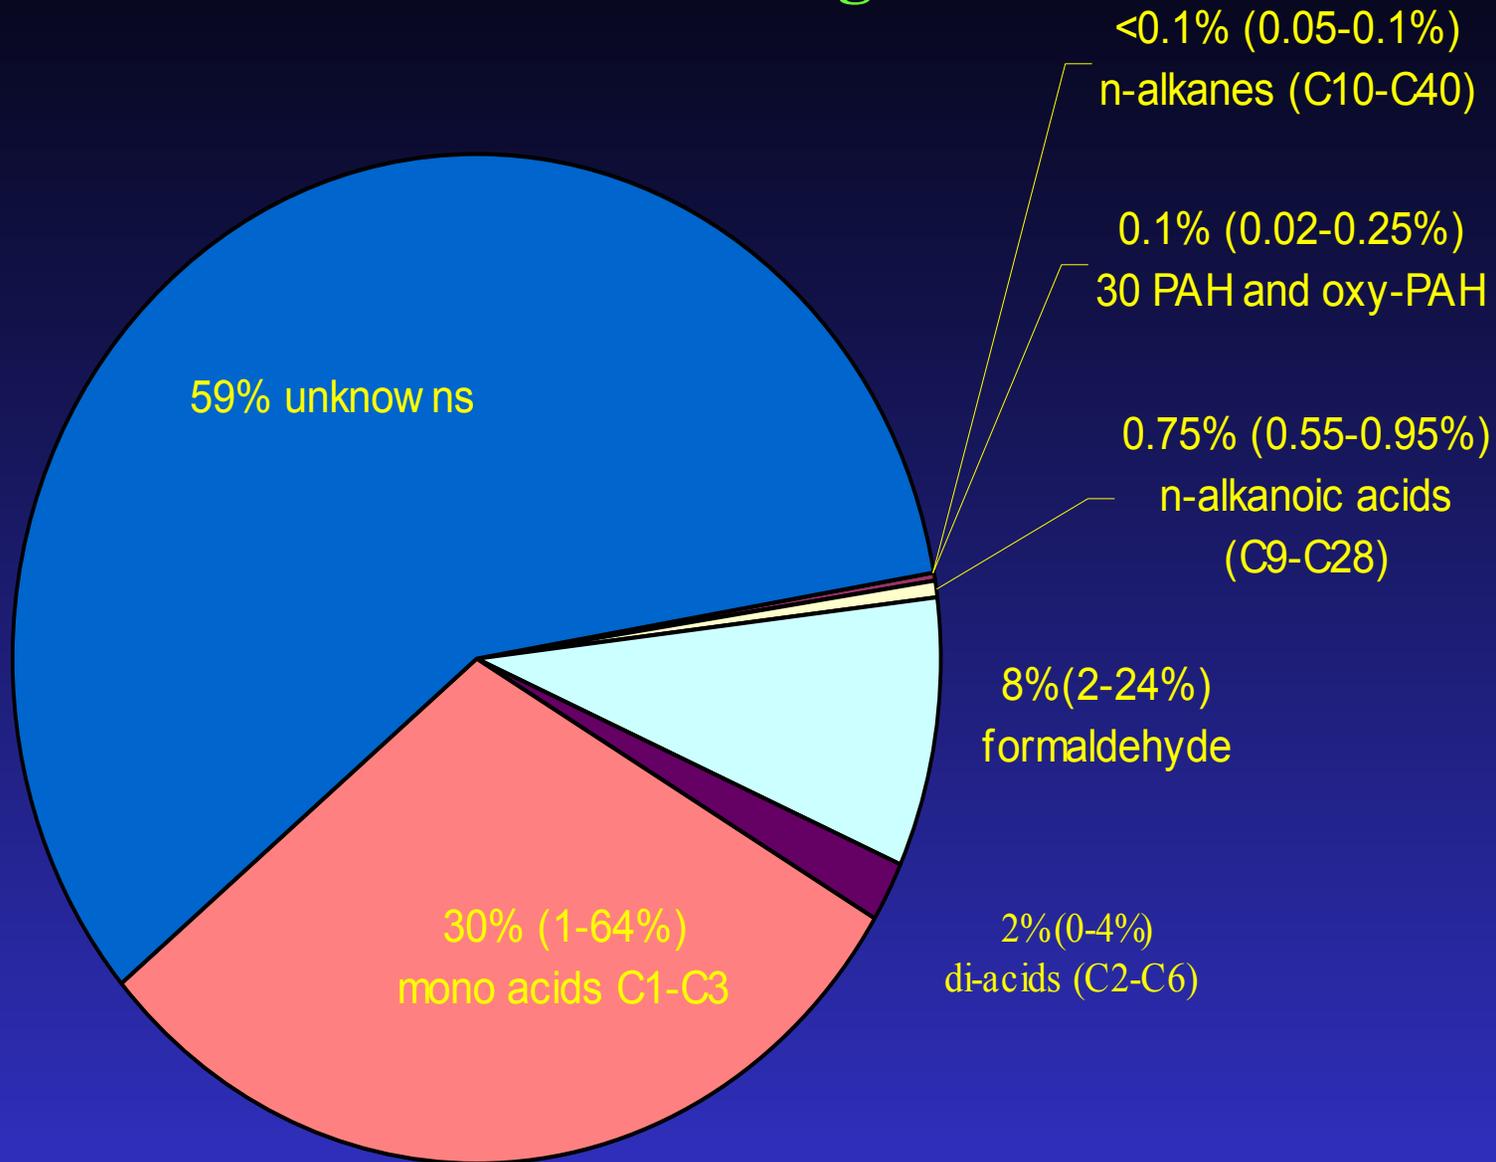

Higher concentrations in smaller droplets
Ratio 2.8 on average (0.8-6.3)

Individual organic compounds

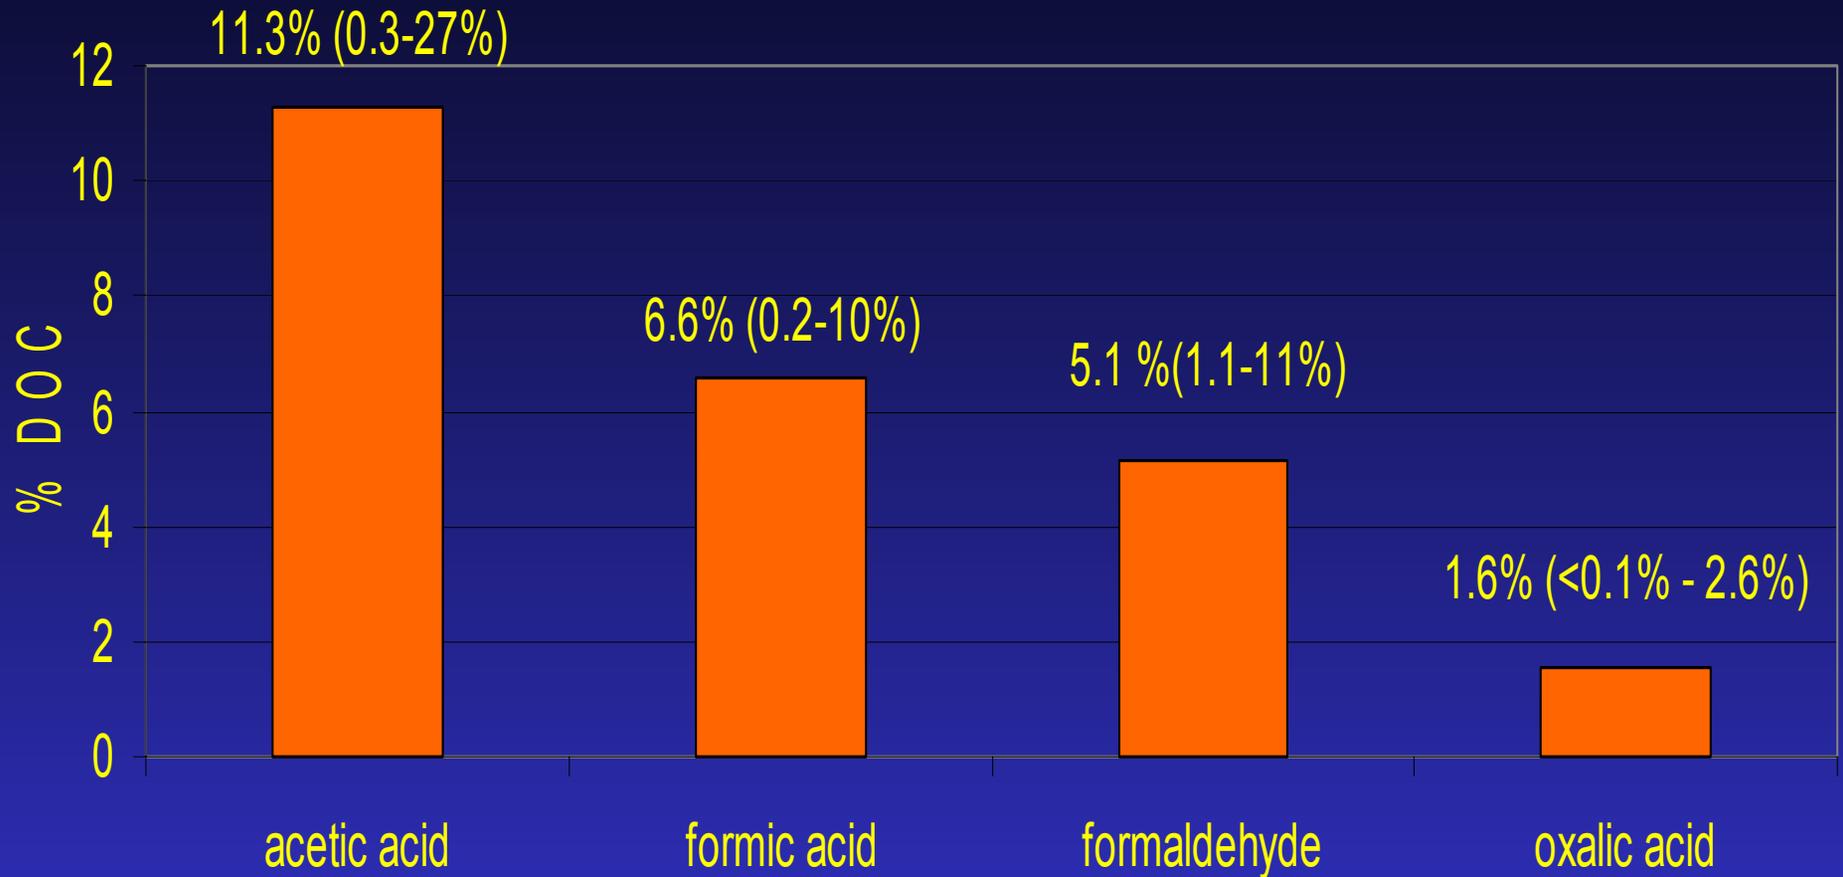

Consistent with inorganic compounds

What we learned about the organic matter

Dominant individual organic species

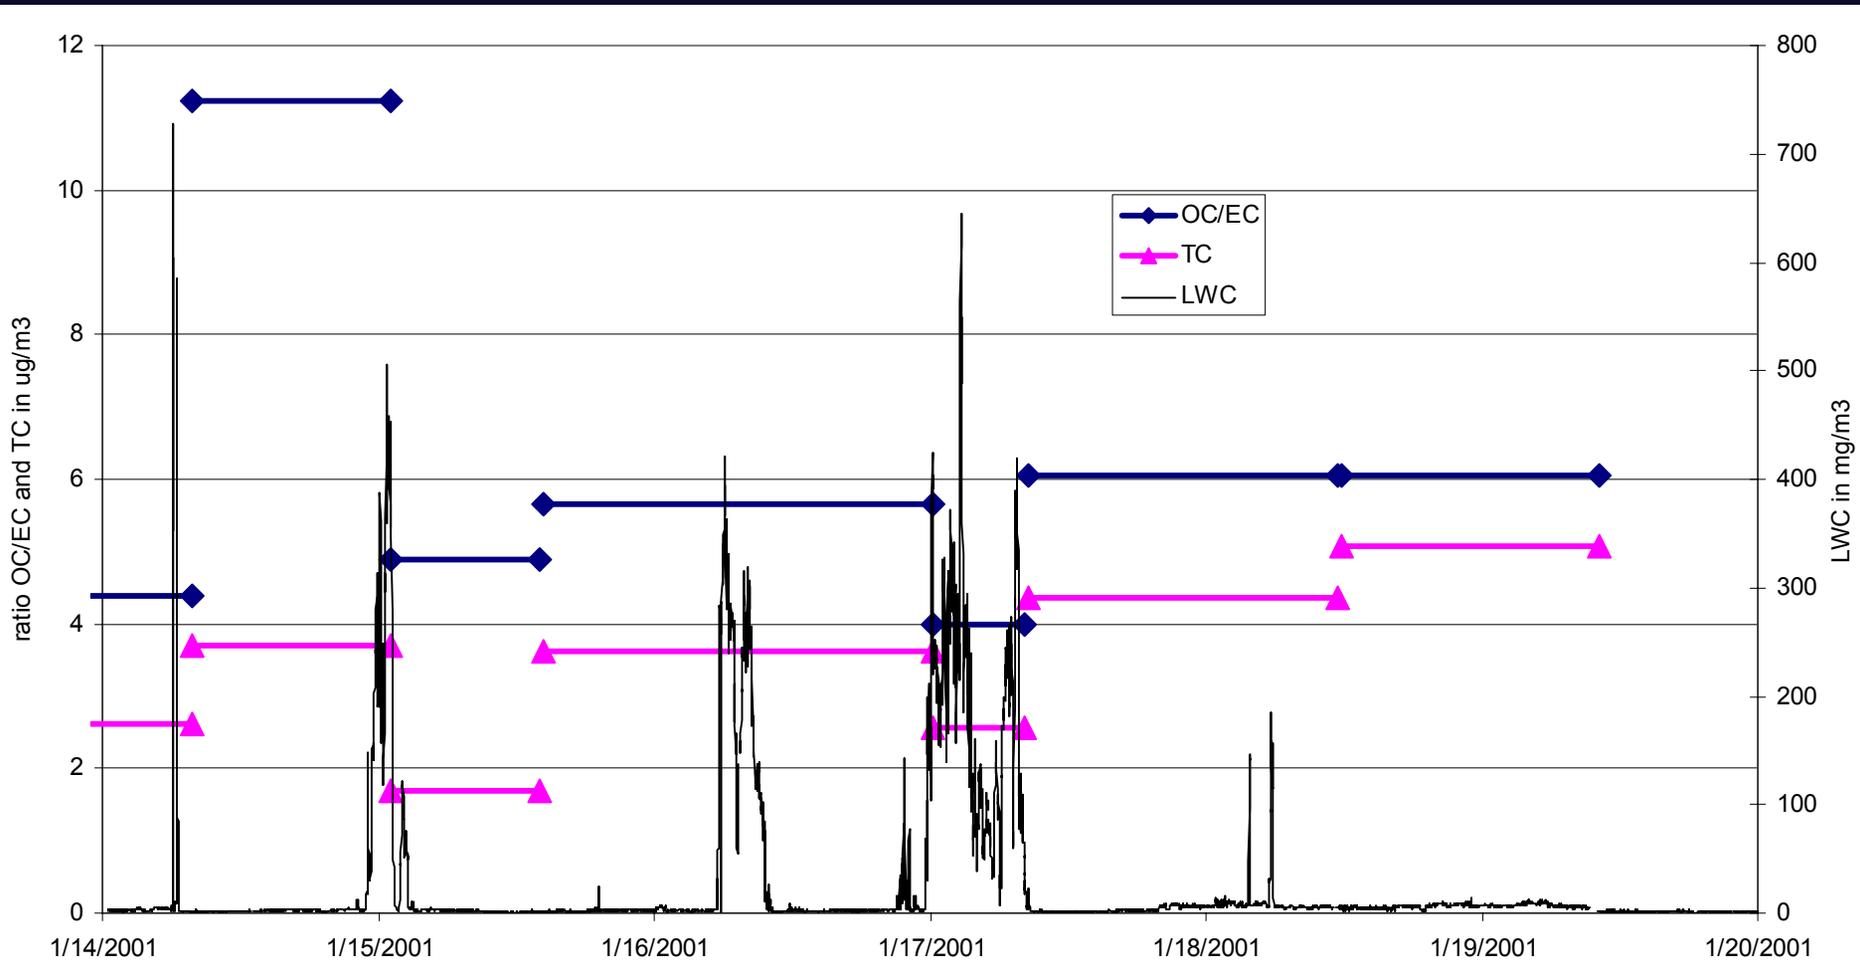

Investigation of bulk properties of OM

Individual compound speciation

Variation with drop-size

Processing of carbonaceous particles

Scavenging of organic carbon

Limited information due to low time resolution

Fog deposition flux: case example December 17/18th, 2000

13 hour fog event:

→ 294 g/m² water (1 inch =25.4kg/m²)

→ 1.2 mg of C/m²

Considering a fog layer of 100m depth

→ decrease of 12 μgC/m³

→ significant removal of ambient OC (~10μgC/m³)

- some from volatile species!

- entrainment from upper layers

Conclusions

- **organic matter (OM) is an important component of SJV fogs**
- **25% of OM is associated with insoluble material**
- **large fraction of OM has high molecular weight**
- **only a small fraction is identified at molecular level**
- **monocarboxylic acids are the dominant species**
- **small droplets are enriched in OM**
- **deposition fluxes suggest a significant removal of OM by fogs**
