Hydrogen and Fuel Cell Showcase

June 2011

Board Member Briefing

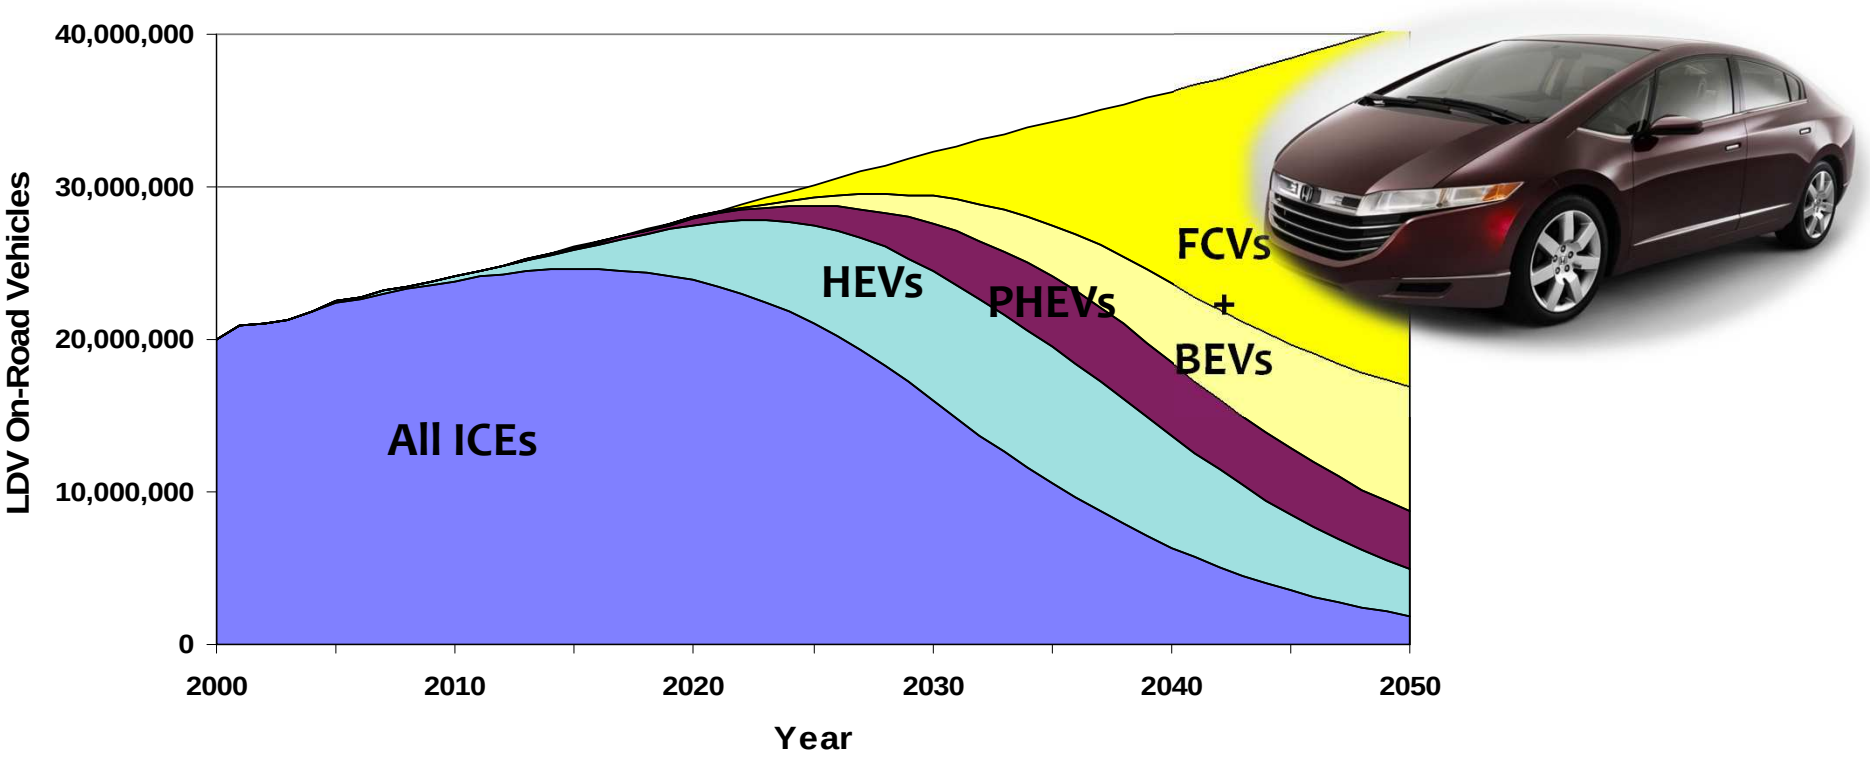
Analisa Bevan, Chief, Sustainable Transportation Technology Branch,
Mobile Source Control Division

Overview of Hydrogen and Fuel Cell Showcase

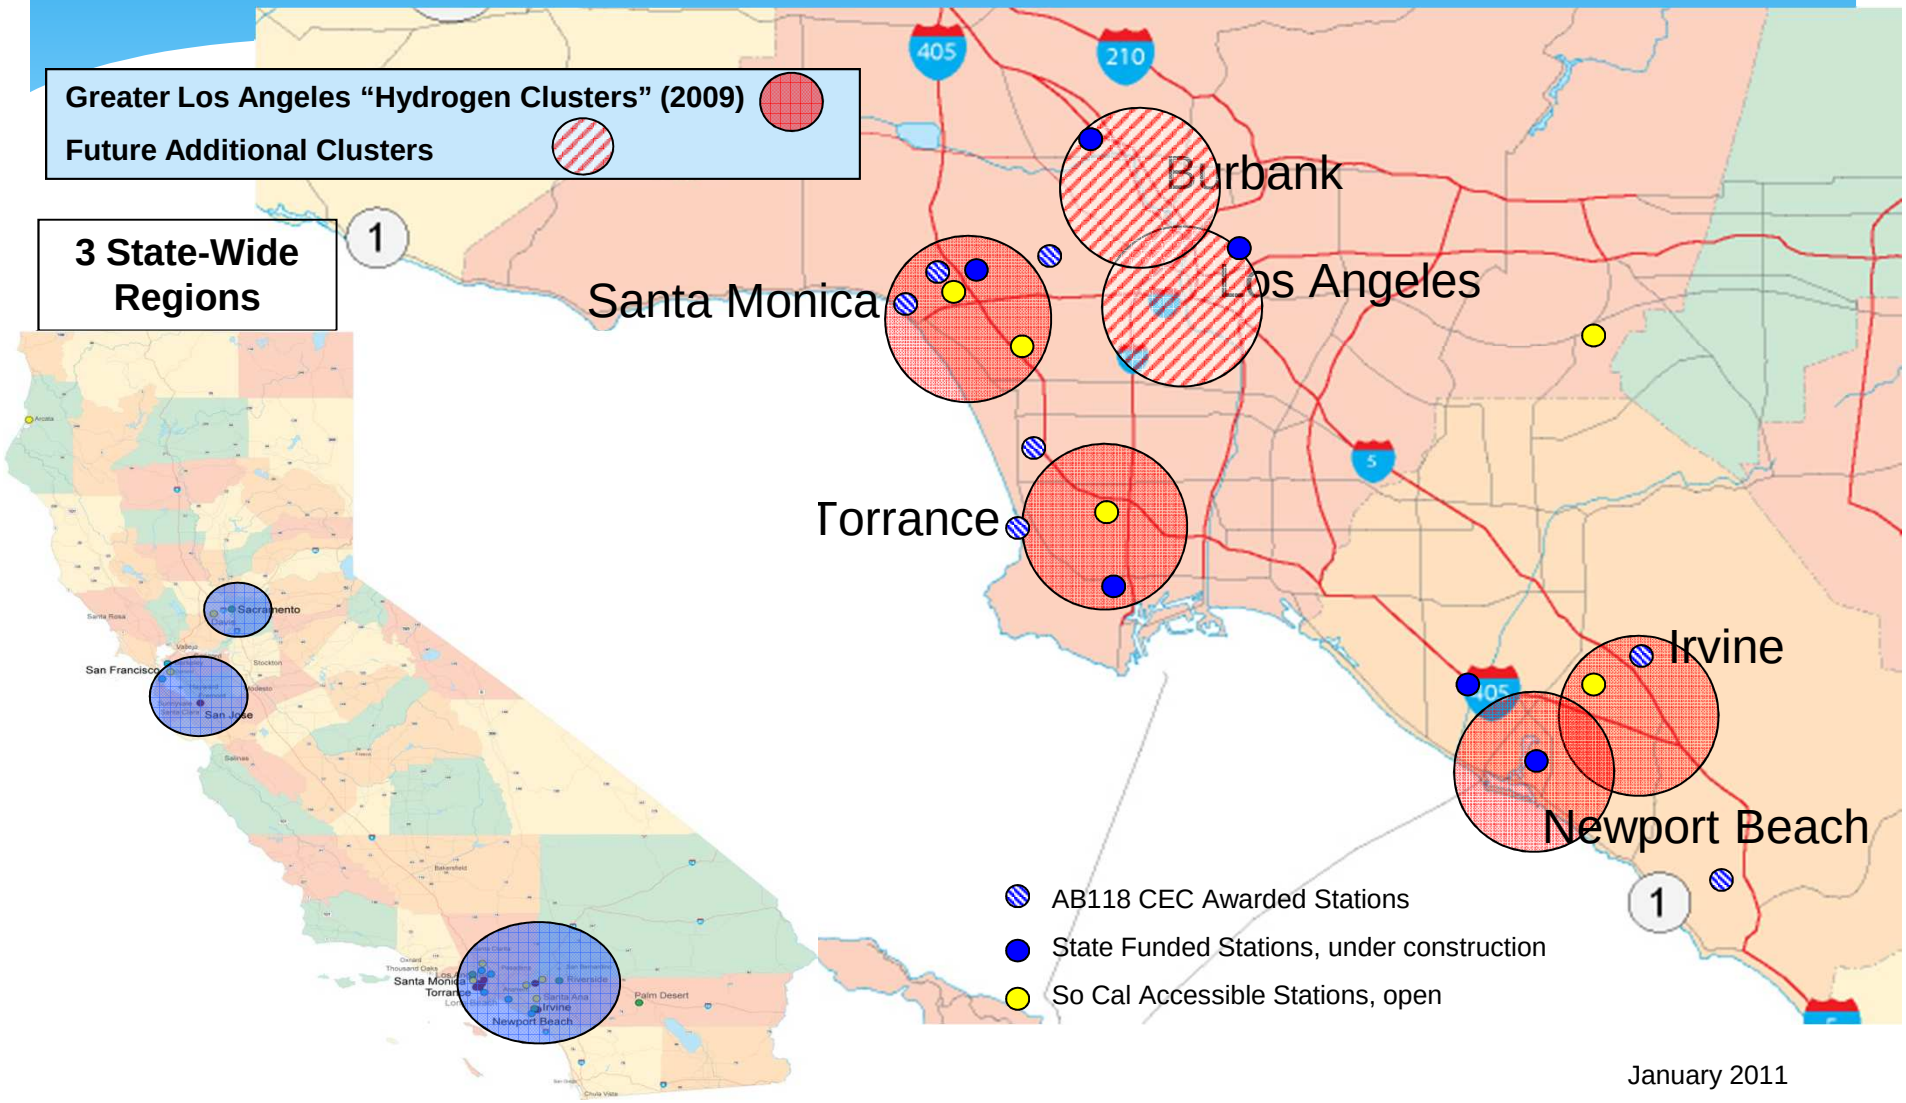
* Why hydrogen and fuel cell matter
* Industry to provide:
  * Overview of technology
  * How it works, what fuel cells are used for
  * Technology Status
  * Economic and business case
  * What is needed for success

Why Fuel Cells and Hydrogen?

* Fuel cell vehicles are the technology that allows us to reach a vehicle fleet utilizing nearly 100% electric drive



Southern California Hydrogen Highway Network
Region/Cluster Station Development



January 2011

Advanced Clean Cars

* Package of regulations to be presented in November including GHG and Criteria pollutant standards for light-duty cars and trucks
  * Zero Emission Vehicle Regulation
    * Regulation will push volumes to commercial levels by 2025
    * Fuel cell vehicles expected to fulfill a significant part of the obligation
  * Clean Fuels Outlet Regulation
    * The backstop we need to ensure success

Showcase Agenda

1. Introduction
   1. Energy
   2. Environment
2. Stationary Applications
   1. Stationary Fuel Cells
   2. Stationary Fuel Cell Case Study
3. Fuel Cell Vehicles
   1. State of Fuel Cell Technology
   2. Honda, Daimler. General Motors
   3. Alameda-Contra Costa Transit District
4. Infrastructure
   1. CaFCP Roadmap
   2. Infrastructure Modeling
   3. Linde, Air Products
5. Conclusions

Panel 1

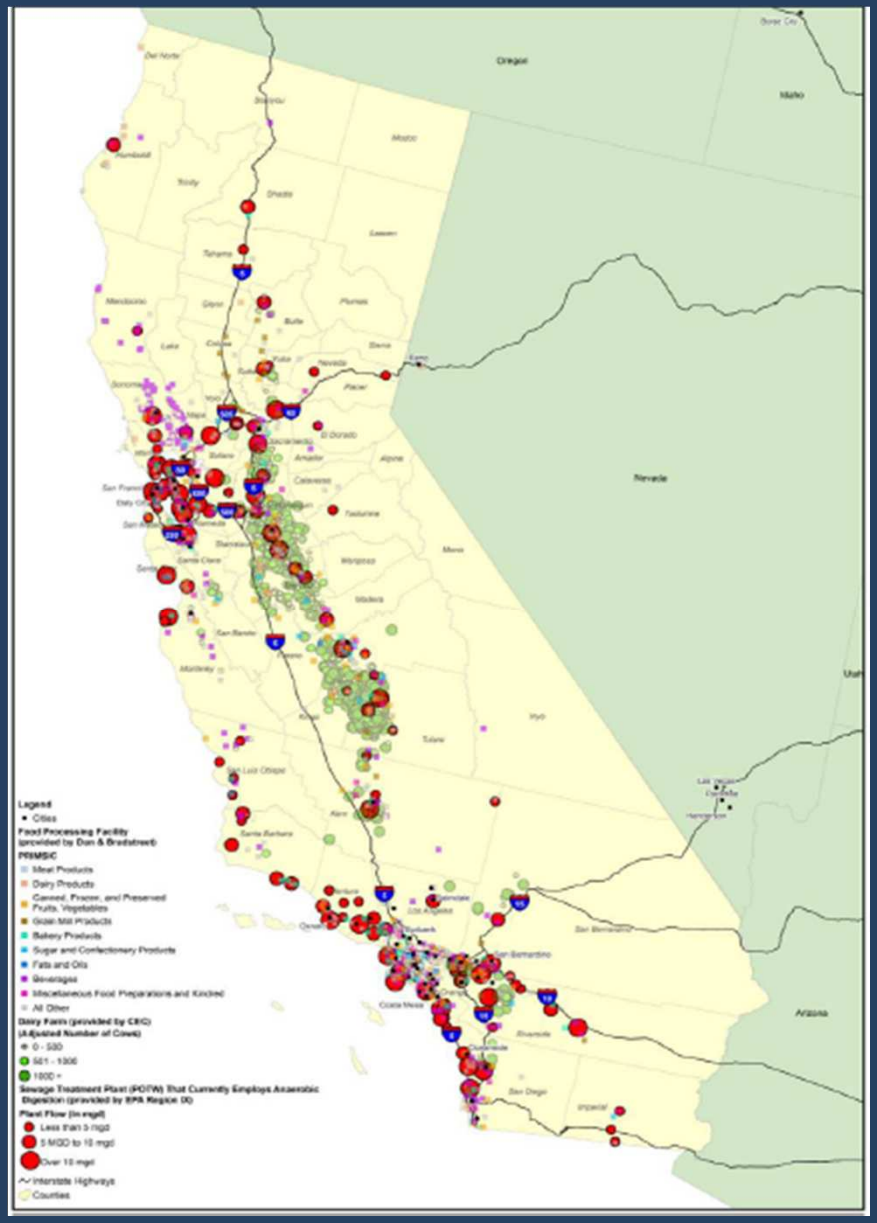
Center for Energy Efficiency and Renewable Technologies

Potential for Synergies?



Source: CEC

Governor Brown's call for 12,000 MW of renewable power generated from Local Energy Generation Resources (aka Distributed Generation)

1000 MW of Potential
(including wastewater & dairy waste manure)

Locations of California's

1) **Large Waste Water Treatment Plants**
2) **Dairy Operations,**
3) **Food Processing Facilities , , etc.**

2008 GHG Emissions
(*million metric tons of CO2 equivalent*)

Manure Management (predominantly methane)	7.6
Wastewater Treatment (methane)	1.9
Industrial (Food) Wastewater Treatment (methane)	0.7

Source: CARB GHG Inventory

Why Encourage Biogas Fuel Cells?

- Problem: Methane acts as a greenhouse gas with 20+ times the global warming power of carbon dioxide. Combustion of methane creates air pollutants such as Black Carbon and NOx. (Fuel Cells do not use combustion.)
- California is largest Dairy State. There are over 1.8 million producing cows.
- Solution: Biogas production and use in fuel cells can reduces the CO2E released by 95%. It is a “low hanging” renewable energy.
- Renewable energy produced by biogas digester/fuel cell projects is predictable and can be base-load or scheduled to compliment other renewables.

A Renewable H_2 Ecosystem

Why Fuel Cell Vehicles (FCVs)?

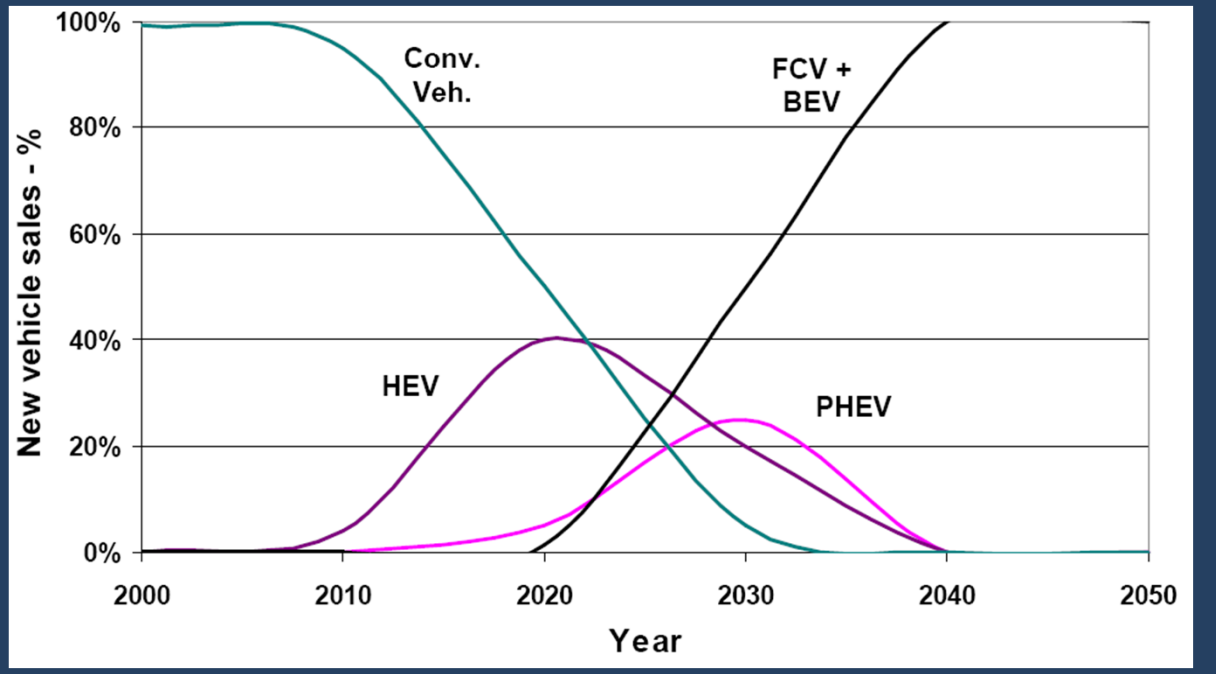
- Both Electric vehicles (EVs) and FCVs offer great promise but also face their own unique challenges
- FCVs are an important electric drive technology that will be critical to California achieving both its air quality and climate goals
- Like EVs, FCVs still face the challenges of reducing costs, size and weight (fuel stack vs battery) while continuing to improve durability … and these improvements are happening for FCVs
- BEVs are ideally suited to smaller cars and shorter trips ≤100miles, i.e. urban driving (including new approaches to mobility such as car sharing) due to limited battery capacity
- FCVs can achieve trip ranges similar to conventional passenger vehicles of all size classes (longer trips in larger vehicles)
    - Fueling convenience for FCVs is similar to conventional vehicles
- Fuel Cells have a broader scope of applications extending into the medium-duty and heavy-duty vehicle sectors
    - EV applications are limited to delivery vehicles and in hybrid configurations
- In recent CEC-CARB surveys automanufacturers have indicated that they will begin delivering FCVs in commercial quantities during 2015-2017
    - Total cost of ownership is expected to begin converging for all passenger vehicle technologies (ICE, PHEV, EV, FCV) by 2025

Sources: CEC, CARB, McKinsey & Co, DOE

Why Fuel Cell Vehicles (FCVs)?

- However, ensuring that there will be sufficient hydrogen fueling infrastructure available for FCVs through the initial commercial launch phase will be key to long-term market success for the vehicles … and to establishing the business conditions necessary to foster a self-sustaining market for hydrogen as a transportation fuel

The CEC and CARB need to continue to work together - with stakeholders and other agencies - to insure that their complimentary efforts will lead to a robust self-sustaining market for hydrogen fueling.



CARB Hindcasted Scenario for Emissions 80% below 1990 levels by 2050

CEERT

June 23, 2011

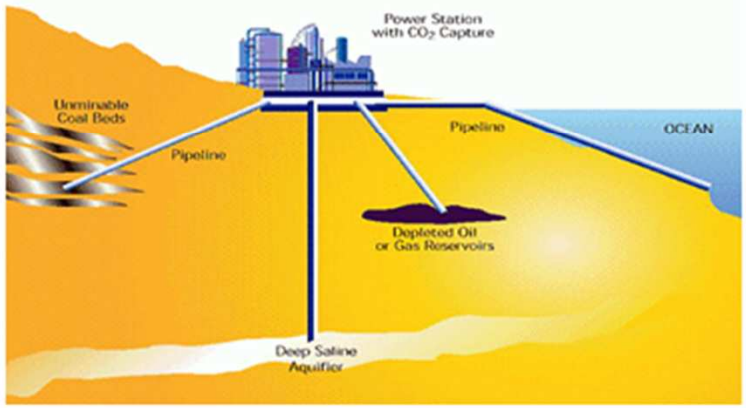
H_2 Supply Pathways

Like electricity, hydrogen is an **energy carrier** that can be produced from widely available **primary energy resources**

Wind

Solar

Biomass



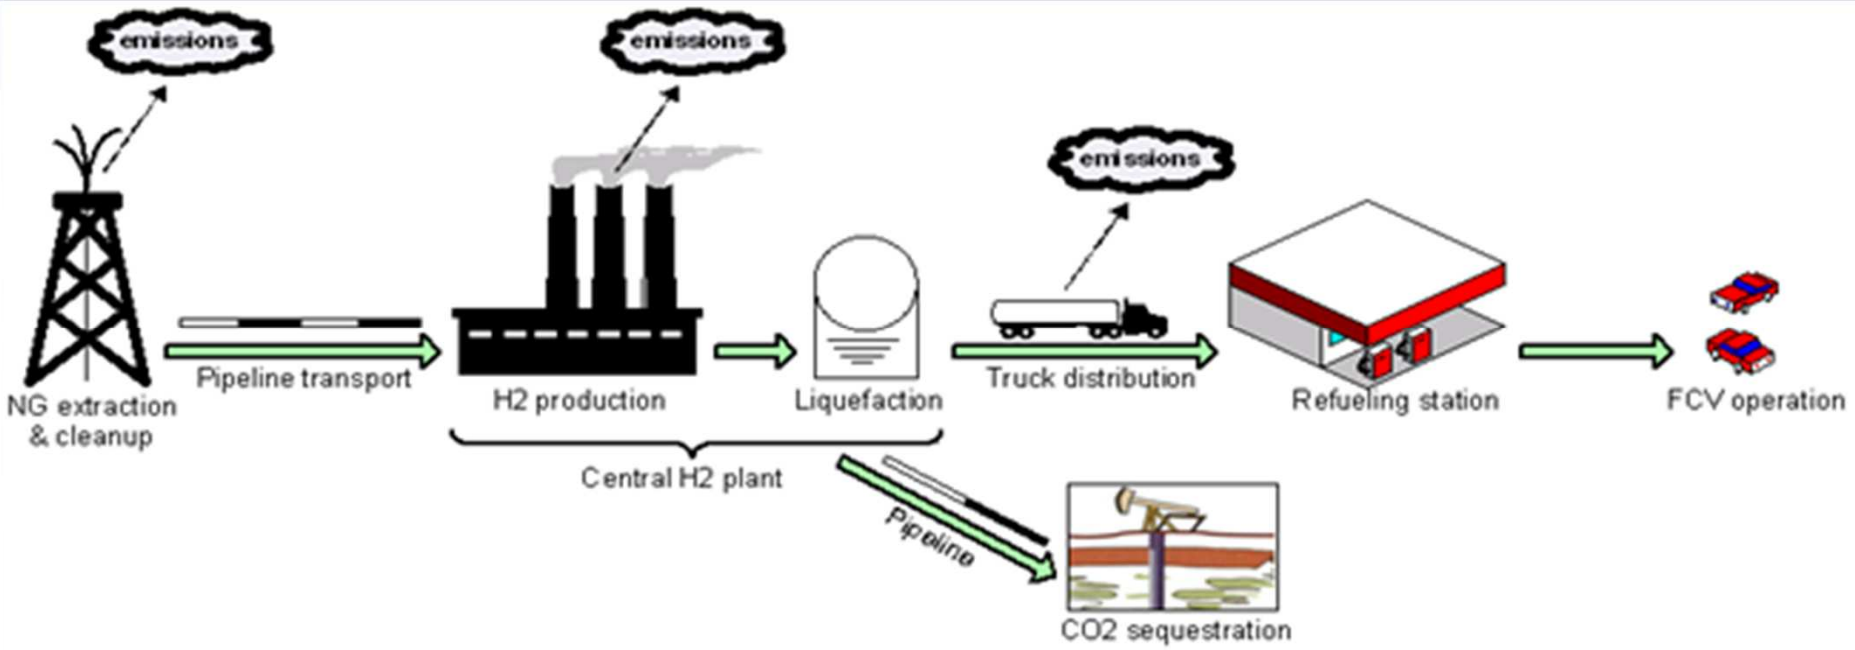
Coal w/CO2 Sequestration

Natural Gas

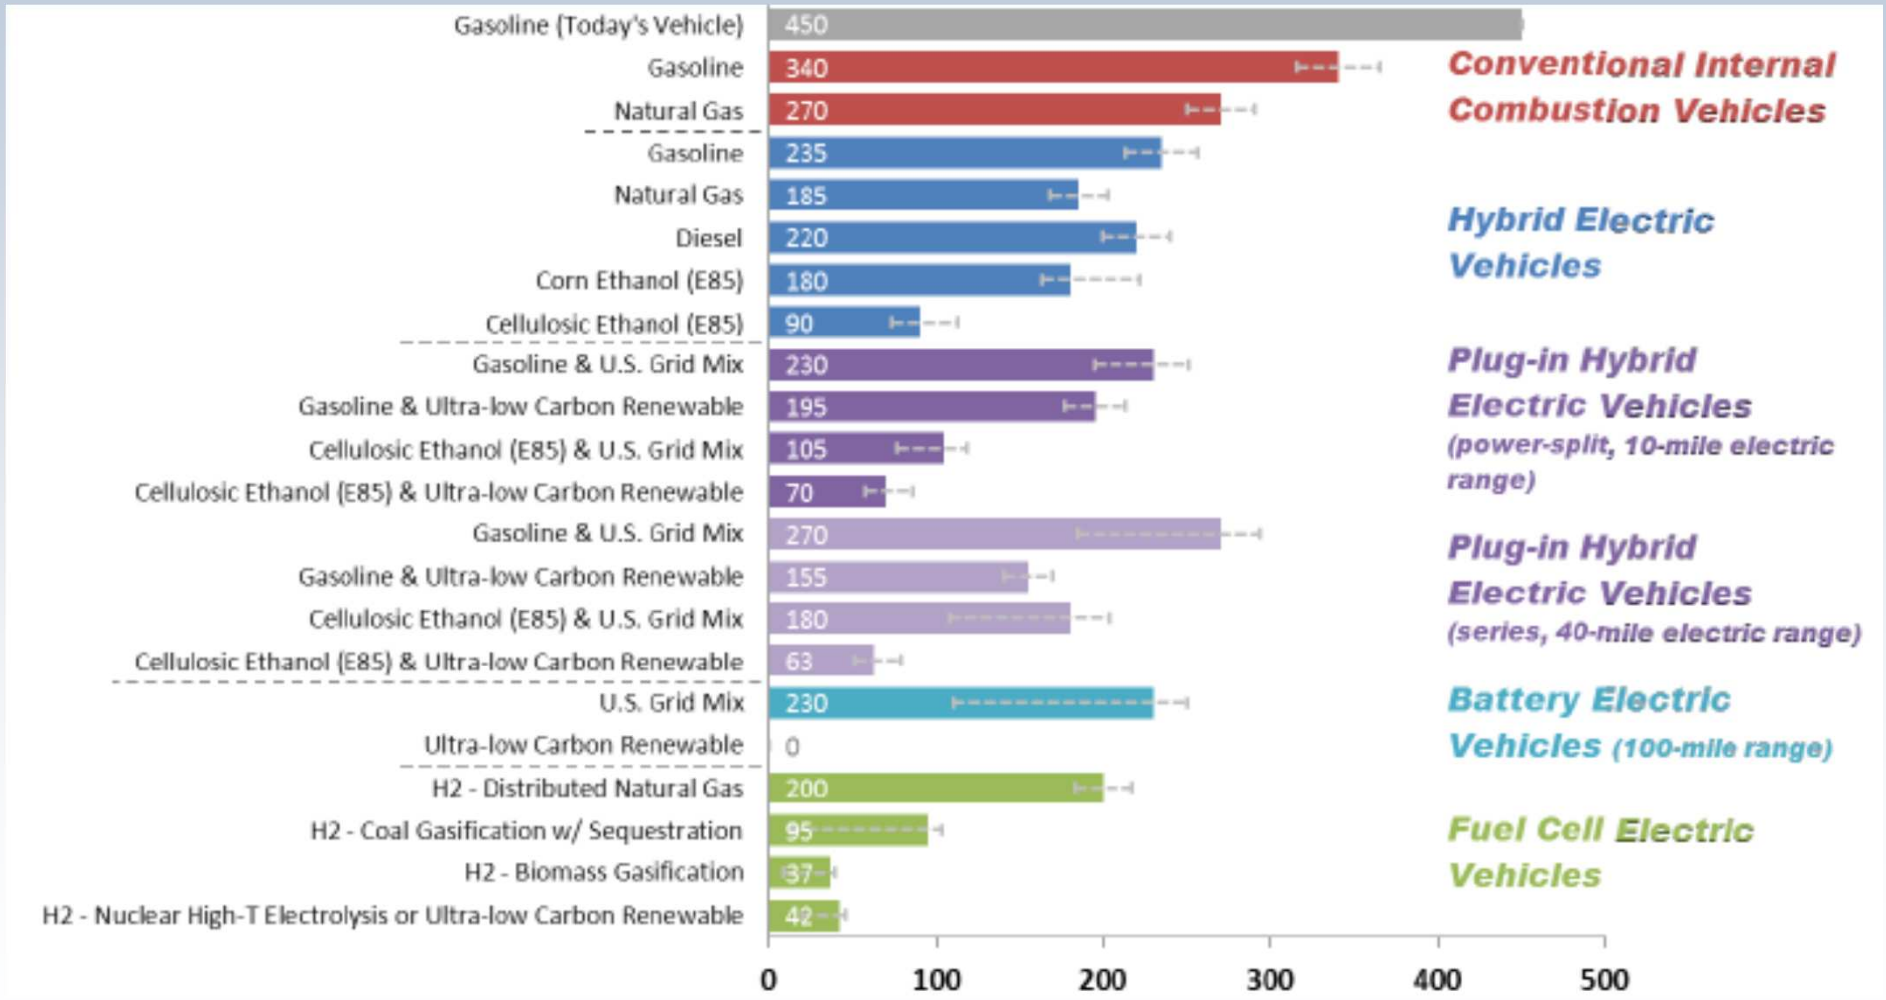
Nuclear

Emissions & Energy Use depend on the fuel/vehicle pathway

Consider “well to wheels” (wtw) incl. primary energy extraction, fuel production, transport & use



Well to Wheels GHG emissions for mid-sized cars



Source: US Department of Energy

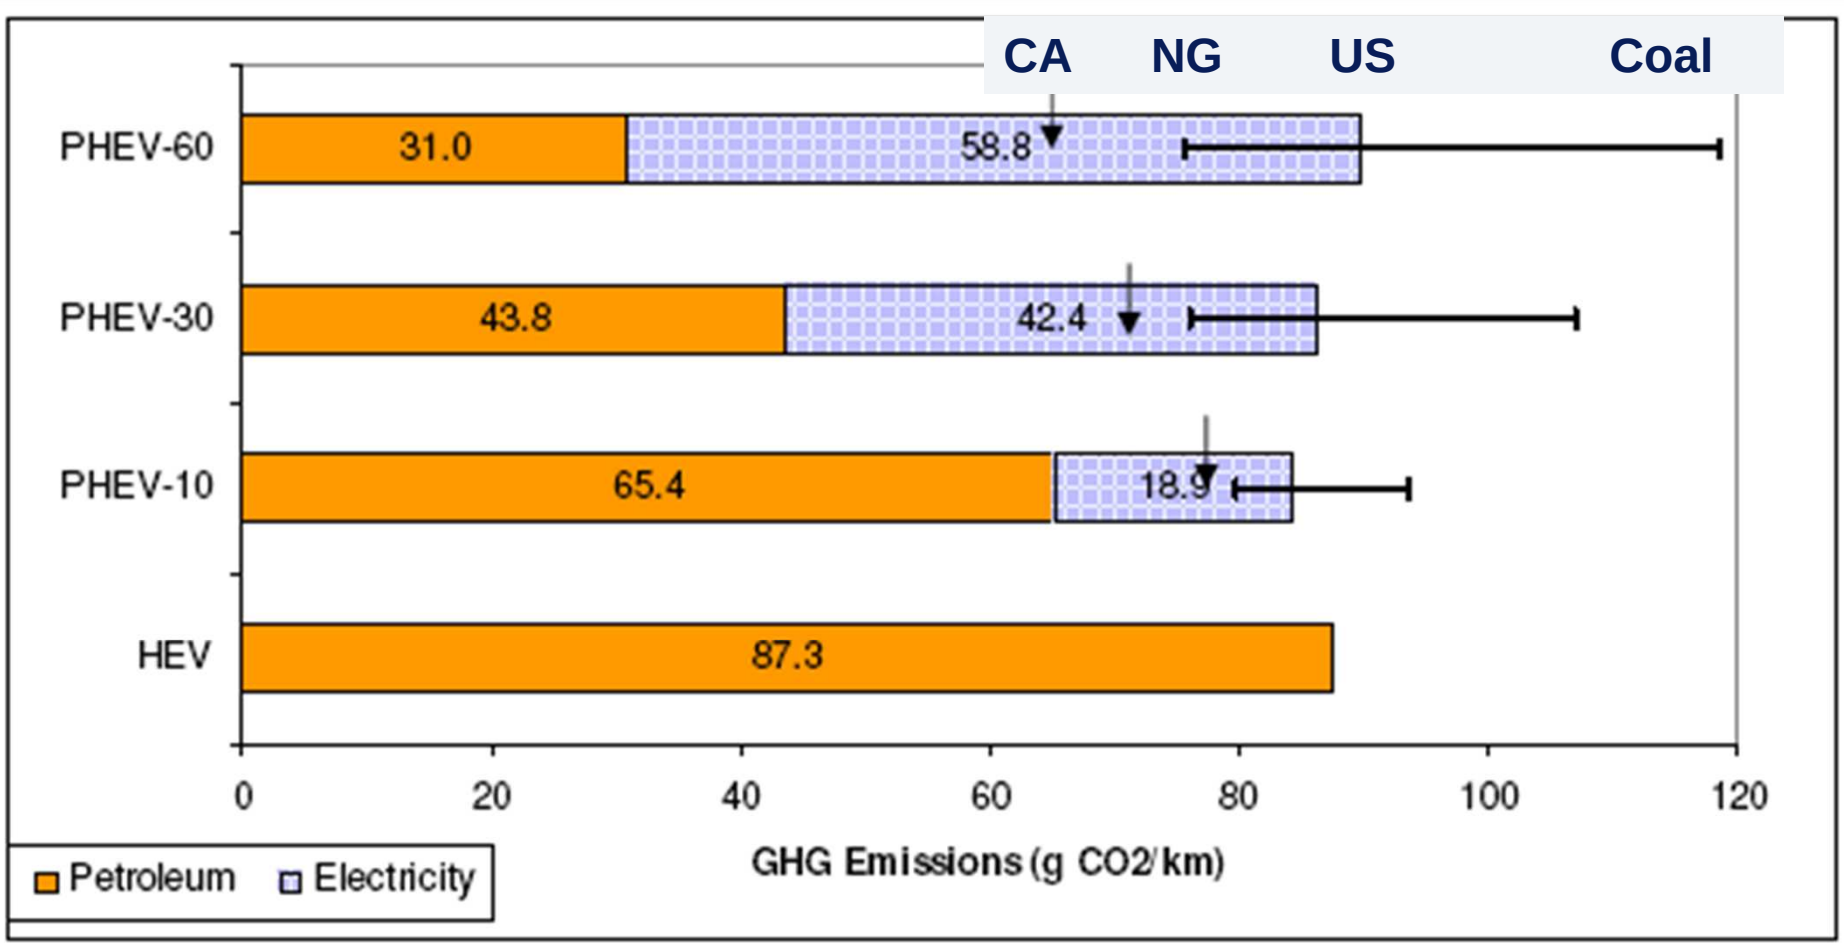
http://www.hydrogen.energy.gov/pdfs/10001_well_to_wheels_gge_petroleum_use.pdf

GHG Emissions Comparison: LDV

- With H2 from Natural Gas, wtw GHG emissions from H2 FCV are ~40-55%% less than gasoline ICEV, ~10-20% less than gasoline HEV; ~15-25% less than CNG vehicle
- With US grid mix and H2 from NG, Battery EVs have similar wtw GHG emissions to gasoline HEVs & greater emissions than H2 FCVs.
- With California's (low-C) grid mix, wtw GHG emissions w/battery EVs are less than those for H2 FCVs w/ H2 from NG; higher than for biomass H2

ICEV = internal combustion engine vehicle
HEV = hybrid electric vehicle
CNG = compressed natural gas vehicle
NG = natural gas; LDV = light duty vehicle;
EV = electric vehicle
FCV = fuel cell electric vehicle
wtw = well to wheels
GHG = greenhouse gas

GHG emissions from PHEVs depend on grid mix

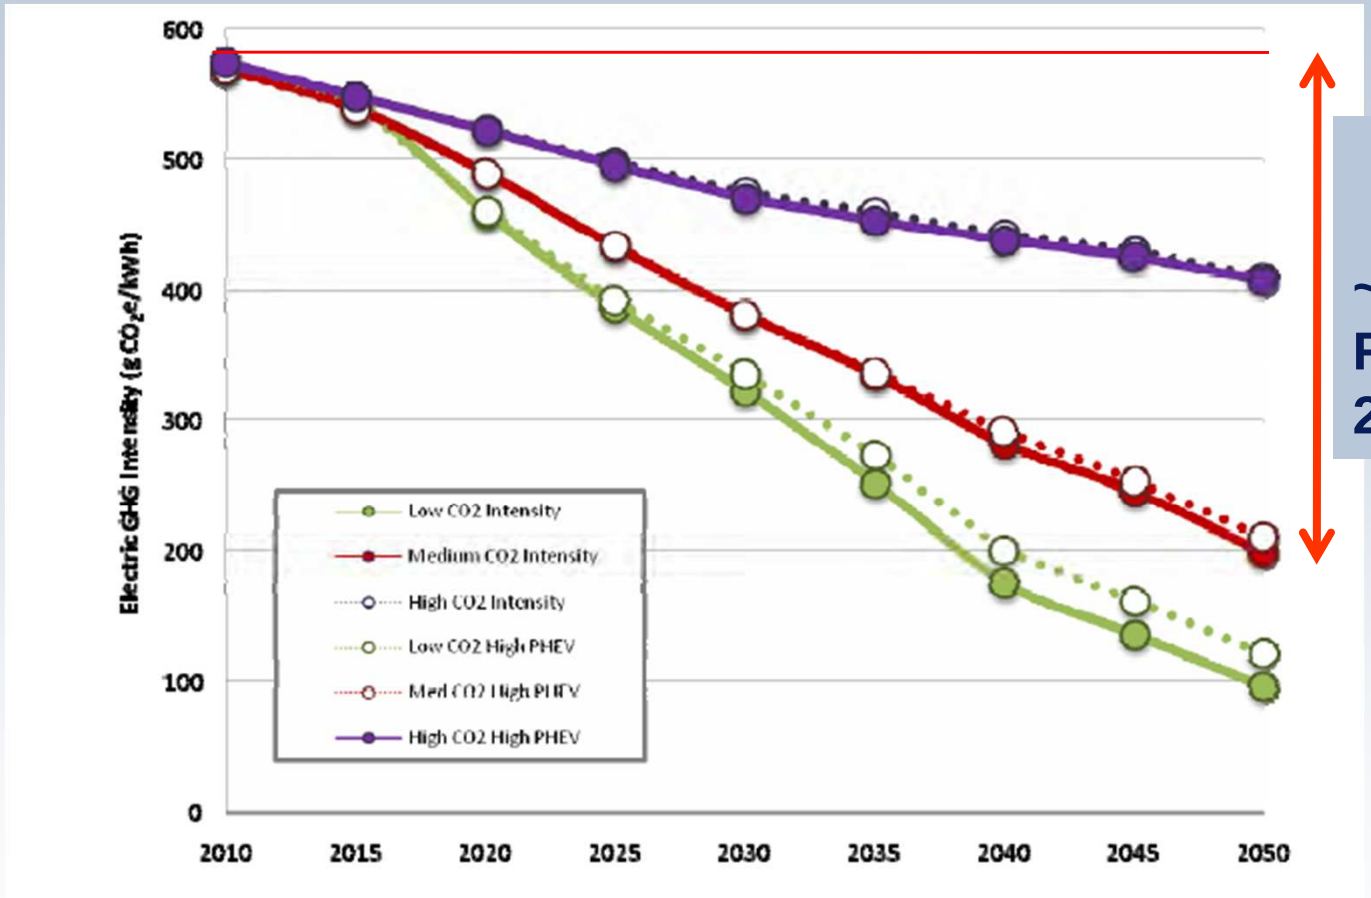


GHG Emissions depend on the primary energy source

- FCVs: Emissions depend on source of H2
- PHEVs, Pure battery EVs: Emissions depend on the source of electricity

Both EVs and H2 FCVs can reach near zero wtw GHG emissions if made from low-Carbon primary energy sources like renewables (wind, solar, biomass) or fossil w/CCS. It will take time to decarbonize primary sources.

GHG emissions Intensity for Future Low-C Grid (gCO_2eq/kWh) (EPRI/NRDC)

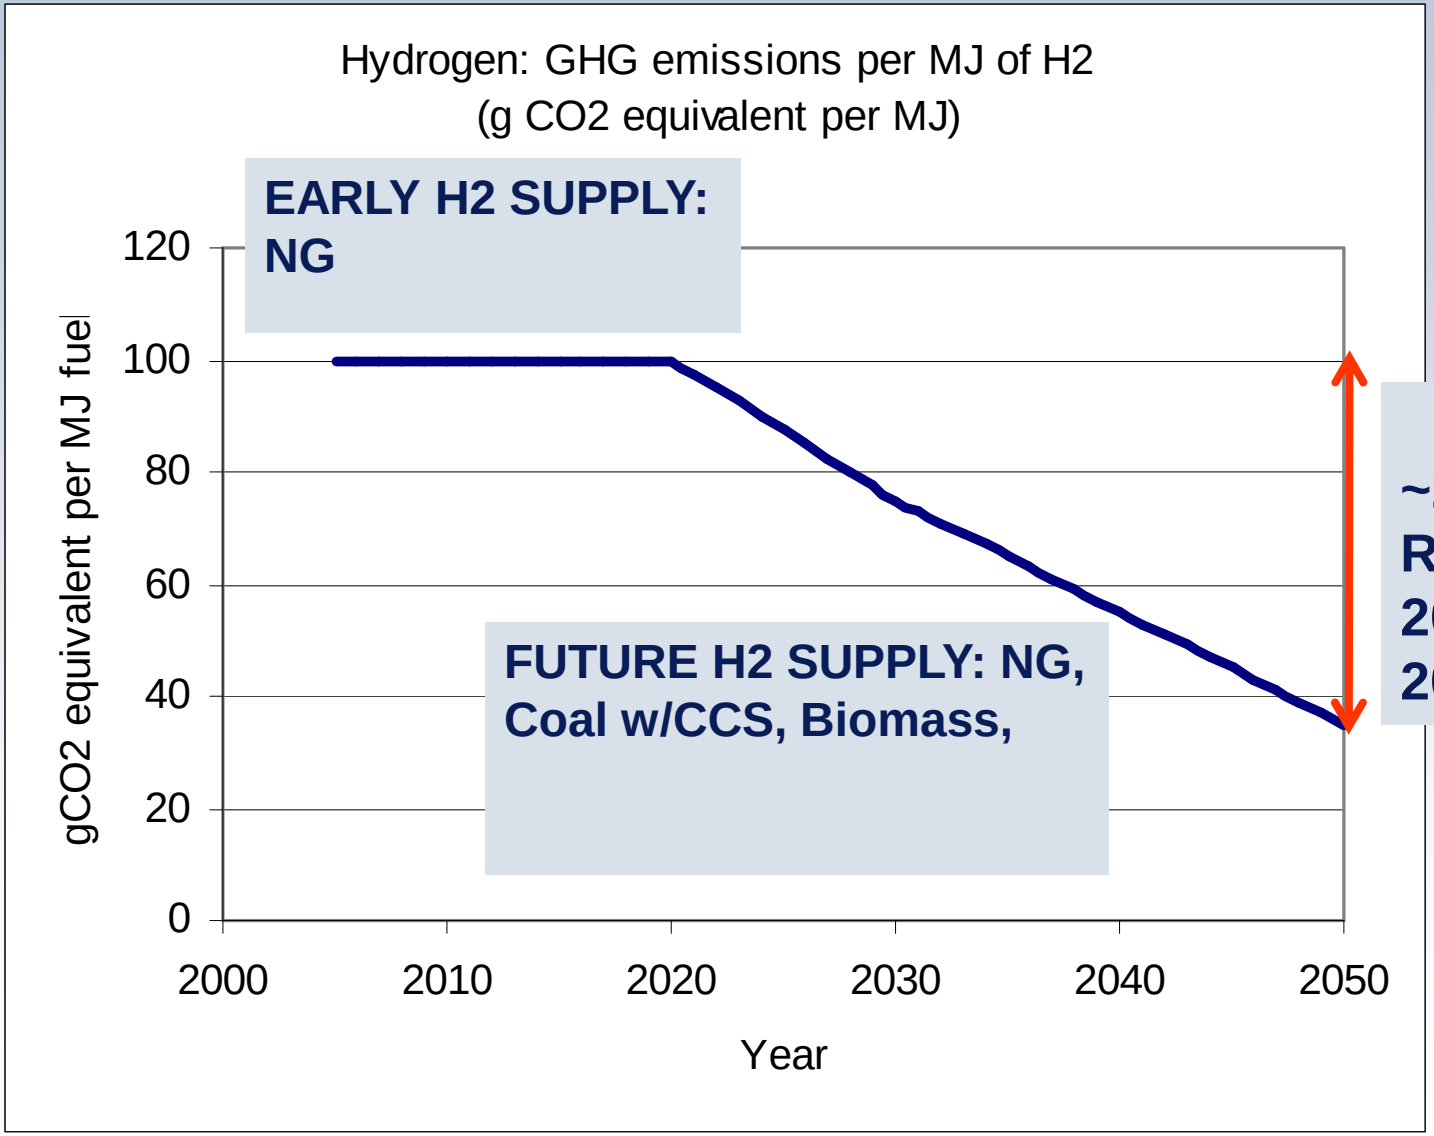


~2/3 GHG Reduction 2010-> 2050

FUTURE GRID: Coal IGCC w/CCS, New Biomass, New Nuclear, Adv. Renewables

NRC H_2 Scenario: GHG Emissions Intensity

$gCO_2/MJ\ H_2$ (NRC 2008)



Scenario for Low Carbon H2 for CA

Limited Biomass, No Coal and NG (Yang and Ogden, 2011)

- NG is phased out in 2040 in order to lower H2 carbon intensity, requires lots of renewable electricity

Large Stationary Fuel Cell Markets

Value Proposition

Energy Challenges	Fuel Cells
Rising energy costs	• Significant Energy savings through: – 80 - 90% system efficiency – Combined cooling, heat and power • Payback in 3-5 years
Strained utility grid, unreliable power	• Assured power generated on-site: – Business continuity – Risk mitigation – Can serve emergency shelters
Sustainability and carbon reduction	• Clean, quiet & virtually pollution free: – Reduced emissions – Zero water consumption – Qualifies for LEED* points

* Leadership in Energy and Environmental Design (United States Green Building Council's rating system)

Key California Enablers

- Self-Generation Incentive Program
  - Regulatory (SB412 Implementation Proceeding)
    - Most important enabler to DG fuel cells
    - Program has been suspended since January 1, 2011
    - Proposed decision expected late June/early July
    - Delays hinder CA market and cause customer concern
- Legislative (AB1150, AB864)
  - Reauthorization of collection of $80 million per year
  - Debate on length of extension
    - Program authorized through 2016
    - Assembly bill amends funding reauthorization to 2012 expiration

Key California Enablers

- CHP Feed-in Tariffs (AB1613)
  - Utilities filed updated tariff sheets and contracts for the feed-in-tariff program May 16, 2011
- Governor's Distributed Energy Goal of 12,000 MW renewable and 6,500 MW CHP
  - Include stationary fuel cells in commercial, industrial and residential applications
- Emerging Renewables Technology Program
  - Suspension delaying installations of small fuel cell replacing diesel generators

CaSFCC California Stationary Fuel Cell Collaborative

Summary of the Small Foot Print Fuel Cell

Advantages

- Highest efficiency device, most economic value
  - 90%, with over 40% as electricity
- Produces power at less than 10 cents a kWh (LCOE)
- Cleaner: Not burning of fuel
  - Addresses all areas of EPA concern

NOx	**SOx**
VOC	**Particulates**
Coal Ash	**CO_2**

- Energy generation at point of use
  - Lowers impact on the grid and future infrastructure investments
  - Picks up future loads (electric cars)
  - Reduces “choke points” on the grid

Disadvantages

- Today, runs on natural gas or directed biogas, future:
  - Renewable source hydrogen
  - Direct biogas
- Cost of Systems in Low Volume
  - Grid parity in some areas (CA/NE/HI)
  - Low volume production
  - Cost of integrating w/ heat systems
- Products relatively new to market
  - Not well understood by public and policy makers
- Need to match CHP to heat load for max efficiency

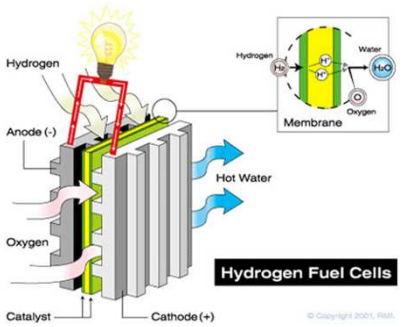
Meeting Climate /Customer Needs

AUTOMOTIVE FUEL CELL COOPERATION

1

Fuel cells are an indispensible element of the mainstream automotive powertrain portfolio.



- Zero emission - end product is just water vapor and electricity
- Oil independence through use of hydrogen
- Efficiency twice as high as internal combustion engine
- No compromise in range or refill times
- Comfort and driving pleasure of electrical driving

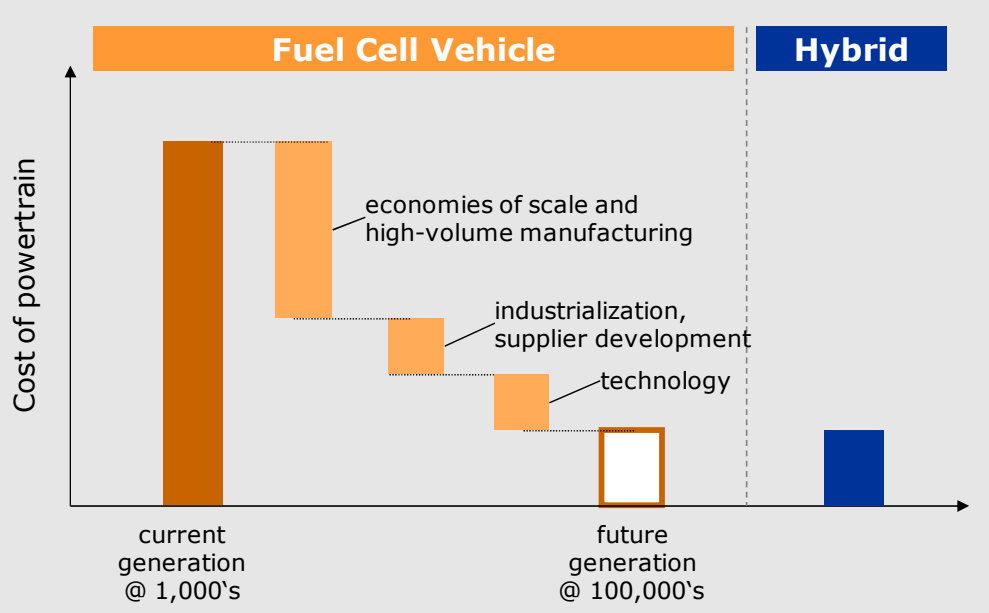
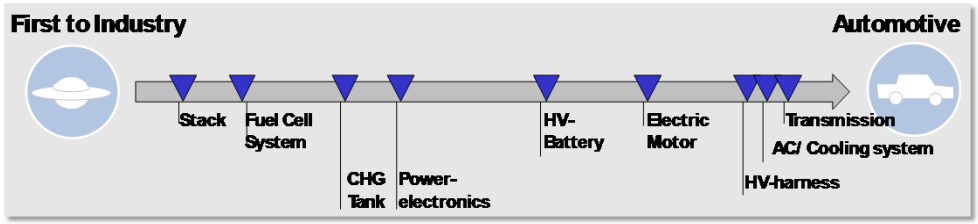
Cost Parity

AUTOMOTIVE FUEL CELL COOPERATION

3 We are on a clear and realistic path to make FCVs equal in cost to (advanced) conventional vehicles



Industrialization



Technology

- Stack Architecture
  - Increase power density
  - Reduce active area
- Catalyst
  - Reduce platinum by >50%
  - Use alternative materials with no performance impact
- Membrane - PFSA or hydrocarbon membrane
- Bipolar Plate
  - Improve forming, joining, and coating for metal plates
  - Improve conductivity, thickness, and processing time for carbon plates
  - Adopt high volume m/f technologies
- Reduction of components
  - Eliminate cell voltage monitoring
  - Eliminate H2 recirculation
  - Reduce humidification
- Hydrogen tank
  - Improved materials
  - High volume m/f technologies
- Power electronics - Compact DC/DC converter

The Power of Dreams

Vehicle Assumptions:
MidSized Sedans, EPA combined f.e. (unadj.)
BEV @3.5xEER, (100 mpg**e**), HEV (46 mpg)
FCV = Clarity, (88 mpg**e**)

Upstream Assumptions:
U.S. GREET, CA GREET (CA factors from LCFS)
GREET: DOE Argonne Nat'l Lab & University of Chicago model

HONDA

Honda Activity Today

HONDA
The Power of Dreams

Customers have been operating cars continuously since July 08 (3 years)

- "The excitement of driving has not gone away. I am so grateful to have been selected to drive this amazing car".
- "I sold my (brand X) luxury car… the Clarity is meeting all of my daily transportation needs"

  - Customers are consistently going 200 ~ 220 real-world miles between refueling
  - Varied daily commutes, several go 80 miles per day, EVERY day
  - Others "all over the LA Basin" including various trips to Victorville, Palm Springs, Santa Barbara and San Diego
  - Navigation system uses voice command to "find nearest H2 station"
    - » Honda is updating the NAVI maps after stations are commissioned, a focal point of slow station deployment
  - Collaboration with CAFCP, State of CA, Other OEM's, H2 Providers in a credible ongoing manner for H2 station planning.

Full Functionality (FCEV)

HONDA
The Power of Dreams

Range

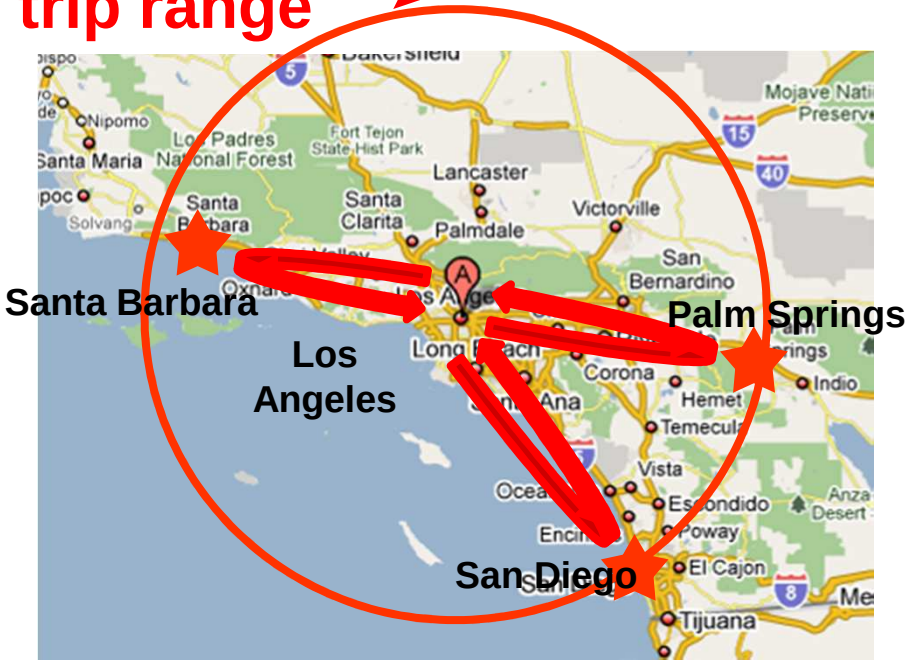
Recharge Time

240+ miles

Real World

Full in < 5 minutes

Clarity round trip range



Most recent FCEVs from OEMs ranging from 200-400+ miles
Clarity FCX range @ 240 miles label, 337 EPA miles unadjusted combined.

HONDA
The Power of Dreams

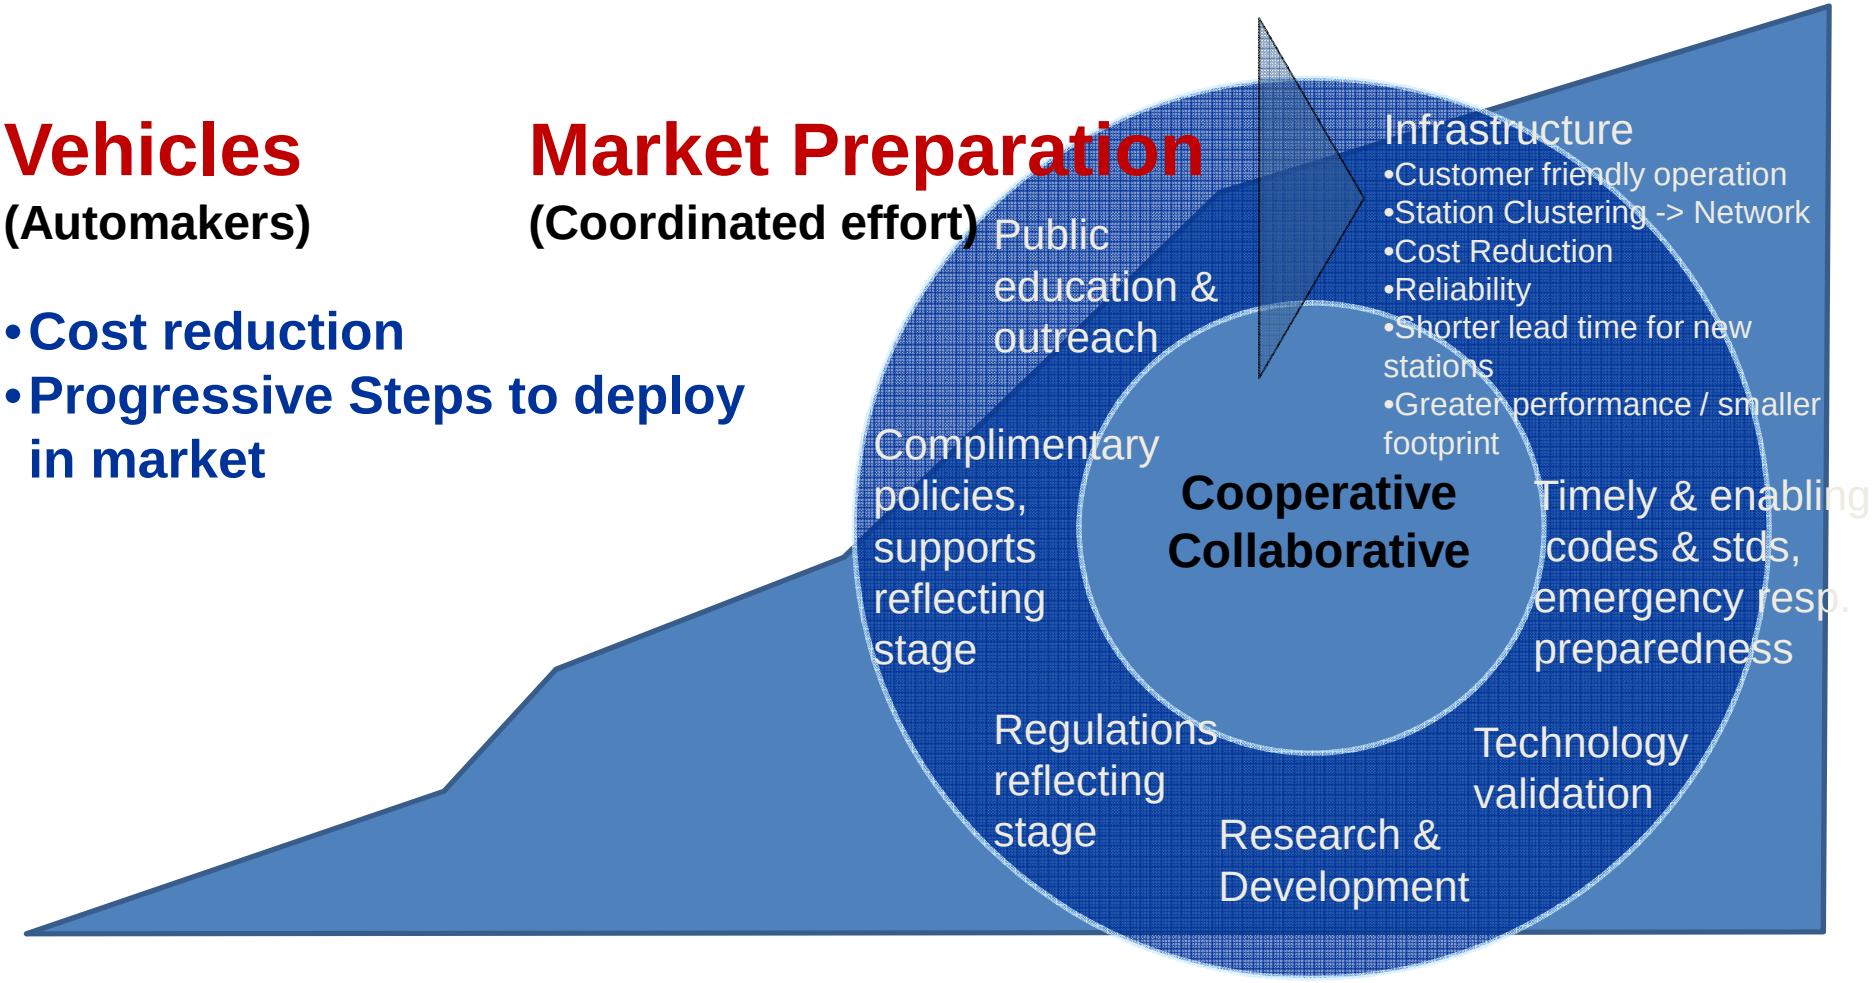
Challenges, Work in Progress

HONDA
The Power of Dreams

Vehicles
(Automakers)

- **Cost reduction**
- **Progressive Steps to deploy in market**

Market Preparation
(Coordinated effort)



CaFCP (multi-stakeholder coordination), University (research), Energy & Infrastructure Providers, Government: Fed, State & Local (programs, policy, permitting, technology validation, emergency response, etc.), Automakers (vehicles, marketing, etc.), CHBC, etc.

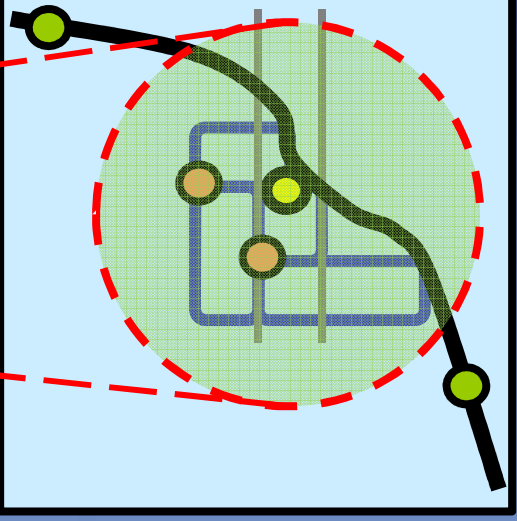
Early Markets and Infrastructure

HONDA
The Power of Dreams

2008-2012+ Focus on early introduction stage:
Early 'market-driven' cluster development

"Market Driven" Clusters

Primary & Backup stations serving early communities



2012-2015+

Next Step is critical: Prepare for early commercial stage:
Early clusters → Early H2 station network in SCAB

Honda Summary

HONDA
The Power of Dreams

- Valuable lessons from customers leases & dealerships - 3 years with FCX Clarity
- Valuable lessons from market forces
  - Economic swings
  - Oil / Gasoline price swings
- Valuable lessons from early station diversity
  - Lower Cost, Footprint smaller, Higher Capacity
  - Value of 2-dispensers / 4 hoses with “simultaneous refueling”
- California is our focal point for FCX Clarity
  - Torrance, CA base of Research and Market operations
  - Customers, Dealerships, H2 Suppliers, Private-Public Collaboration
- Customers LOVE their cars
  - Large vehicle size WITH zero emissions (Full Function / Roomy Interior)
  - 5 minute refueling
  - 240 mile range
- Customers #1 request: More H2 Stations

- Accelerated H2 station deployment is needed
  - Trust the voice of our customers
  - Trust the collaborative effort of OEM’s and H2 providers for station needs

DAIMLER

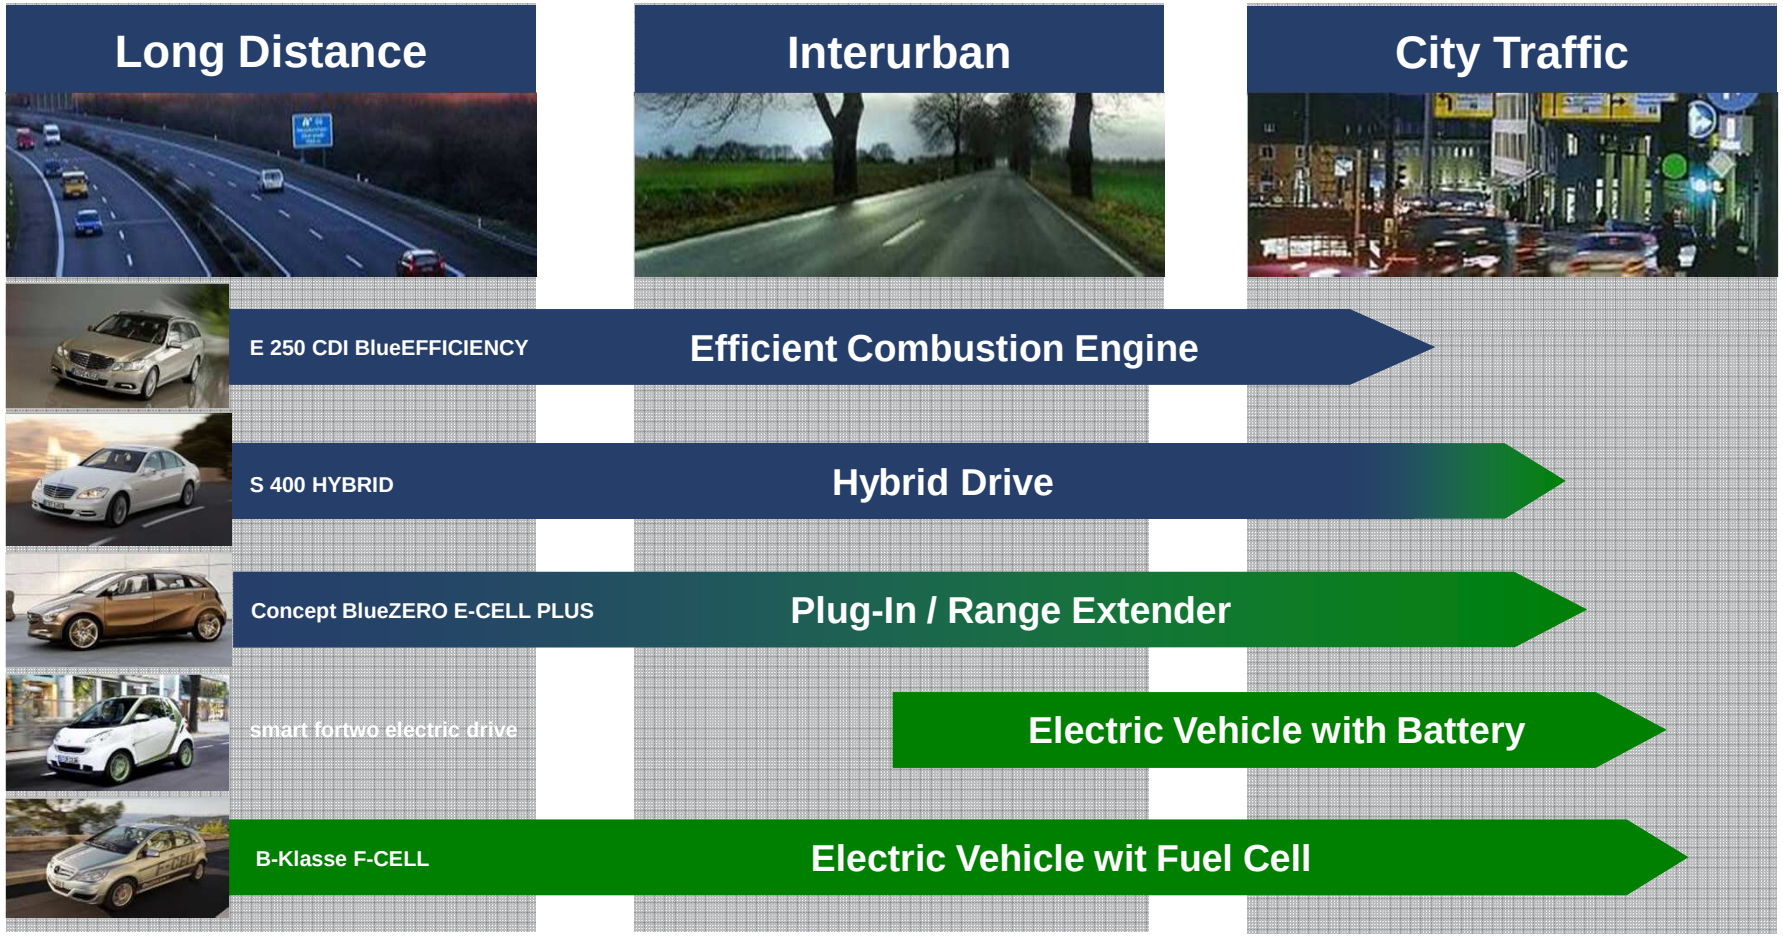
Drive Portfolio for the Mobility of Tomorrow

Different mobility scenarios



DAIMLER

B-Class F-CELL World Drive 2011

- **125 days**
- **14 countries**
- **approx 20000 miles**
- **Route defined through Scouting**
- **5 Legs**

- **Convoy with 24 vehicles**
- **over 50 people**
- **2 fueling Stops per day**
- **174/155 miles until fueling stop**

- First world tour with fuel cell (FC) vehicles
- The new B-Class F-CELL stands for MB as a reinvention of the mobility
- Demonstration of the technical maturity and performance of FC technology and their potentials for sustainable mobility
- Demonstration of a daily use of the FC technology in different climate
- Long local emission free range in combination with short refueling time
- Appeal to all involved partners to push the development of H_2-Infrastructure

Daimler and Linde jointly kick started the rollout
Project description – facts!

Motivation

Clear signal for the end customer that the technology is ready for real life environment and will be rolled out

Kick start roll out of infrastructure and generate addtl. Momentum within H2-Mobility

20 HRS will be built until the end of 2014

Stations

Twenty stations will be built jointly by Daimler and Linde.
The plan is to integrate them into existing gas stations, preferably with the H2-Mobility partners

Timing

The projects starts now; the first stations will be built and completed in 2012

Financing

The project is jointly financed by Daimler and Linde.
A subsidy by the German / European government is assumed.

Distribution of the stations across Germany

The stations shall connect existing Hydrogen clusters and at set a focus on Baden-Württemberg. The connecting stations should be highly visible and at the same time enable “cross country” travelling through select “autobahn” stations. The focus on Baden-Württemberg will enable high customer acceptance for a larger region.

Commitment to

The used Hydrogen should be as green as possible

Status Infrastructure Southern CA

35 MPa	
1	West LA

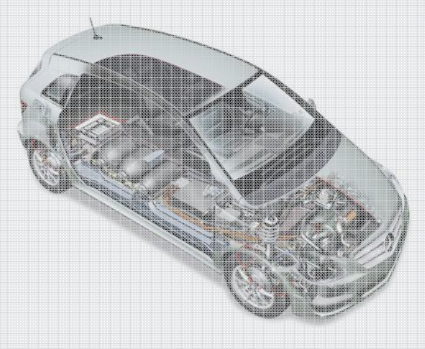
Online

Under construction

Remaining Challenges of the Fuel Cell and Hydrogen Technology

Technology



- Power density
- Cooling system
- Hydrogen storage
- Durability

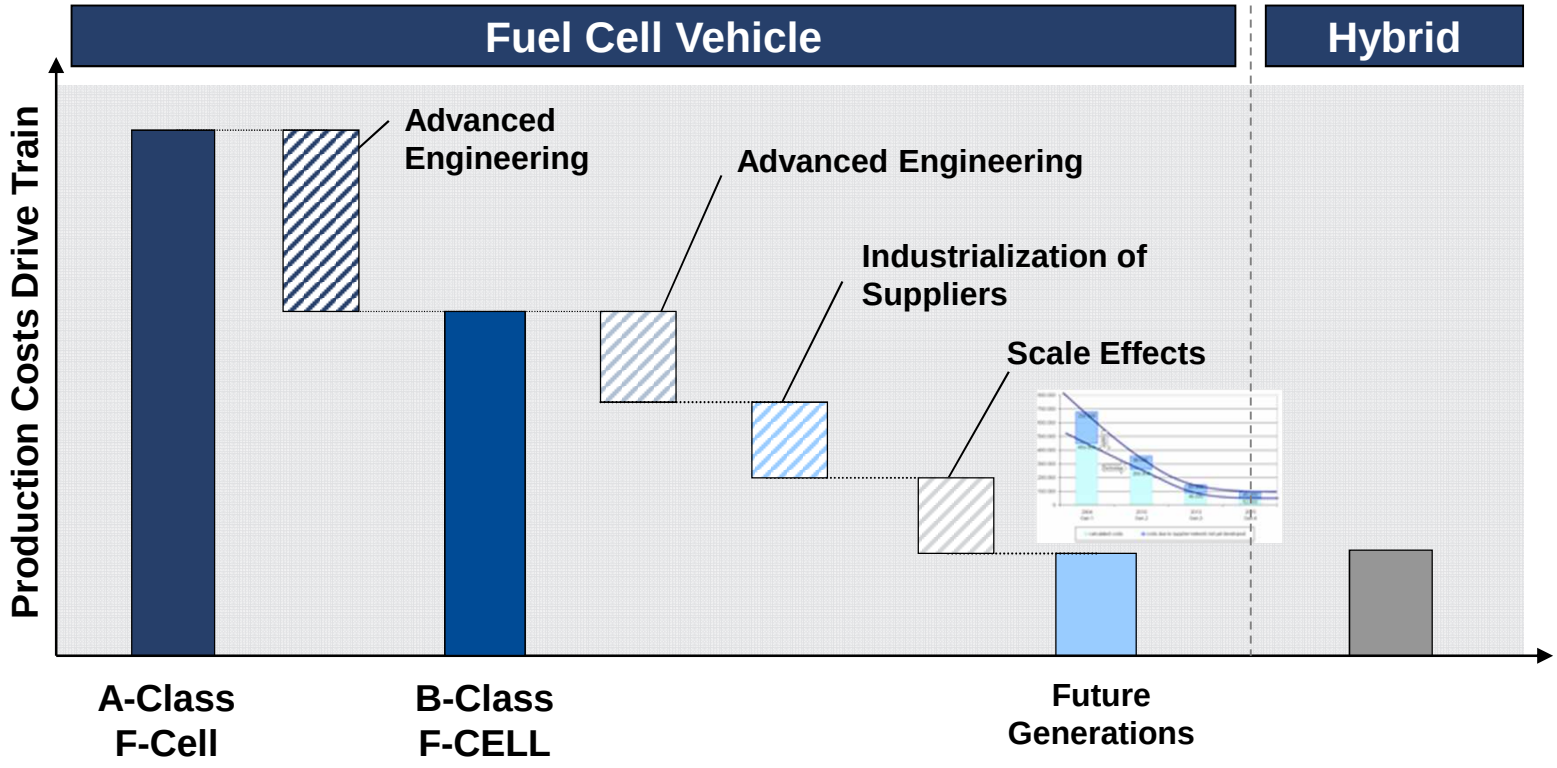
Costs

- Fuel cell system & stack
- Electric engine
- H_2 tank system
- Infrastructure
- Hydrogen costs

Infrastructure

- Reliable refueling technology
- Build-up of an area-wide infrastructure
- H_2 production at competitive prices
- Availability of renewable produced hydrogen

Cost Potentials of Fuel Cell Technology



- Production Costs can be reduced in the near future
- Total Cost of Ownership (TCO) can reach level of common hybrid vehicles

DAIMLER

Vehicles available for 24 month lease!!

Leasing model	only
Duration	24 Month
Pricing	849 USD/Month
Full-Service[1])	included
Fuel	included
Insurance: Full Collision	included
Deployment Area	L.A. & Orange C., Bay Area & Sac.
Vehicle hand over by	MB Dealer

[1]) Full-Service contains: maintenance, tires, wear and tear part, repairs

Technical Data	
Vehicle	Mercedes-Benz B-Class
Fuel Cell System	PEM, 90 kW (122 hp)
Engine	Output (Cont./ Peak) 70kW / 100kW (136 hp) Max. Torque: 290 Nm
Fuel	Compressed hydrogen (70 MPa)
Range	ca. 250 miles (400 km)
Top Speed	170 km/h (105 mph)
Li-Ion Battery	Output (Cont./ Peak): 24 kW / 30 kW (40 hp) Capacity: 6.8 Ah, 1.4 kWh

- **Customers are selected from a list of people who have filled out a website questionnaire.**
- **6 vehicles in customer hands and additional 20 cars will be handed–over to customer as soon more H2-stations are available.**

Thank you for the attention

David Tulauskas

General Motors

Electric Vehicle Strategy:

Fuel Cells & Hydrogen Infrastructure

Air Resources Board

June 23, 2011

Sacramento, CA

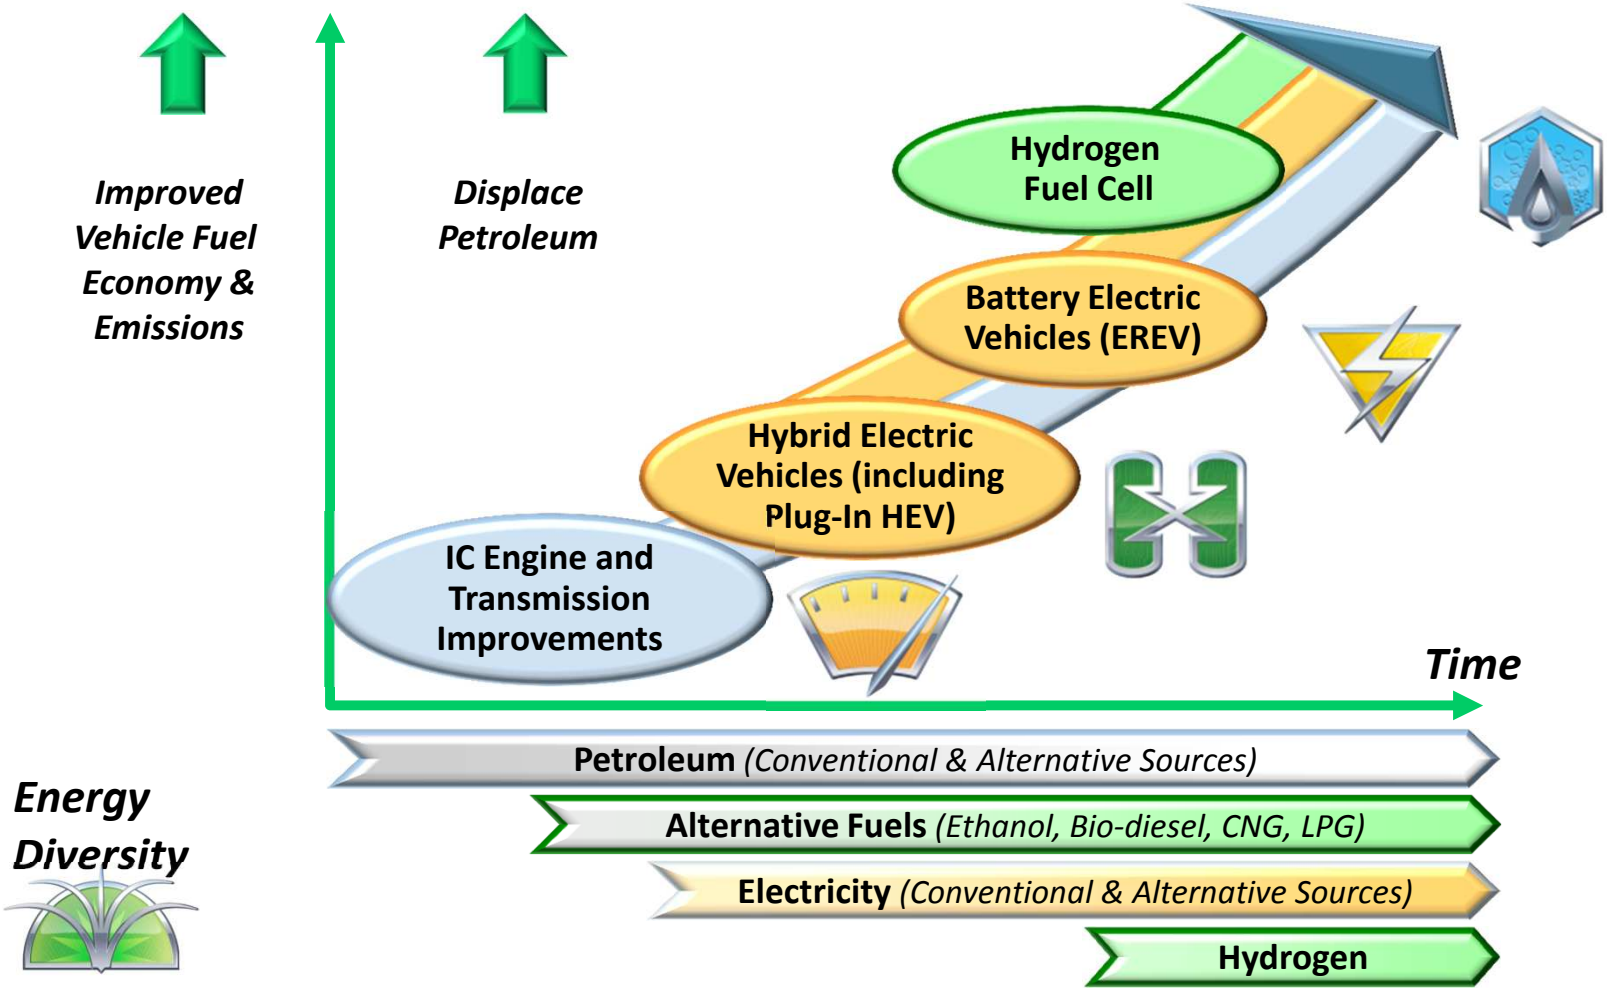
David Tulauskas

Director, State Gov't Relations

General Motors

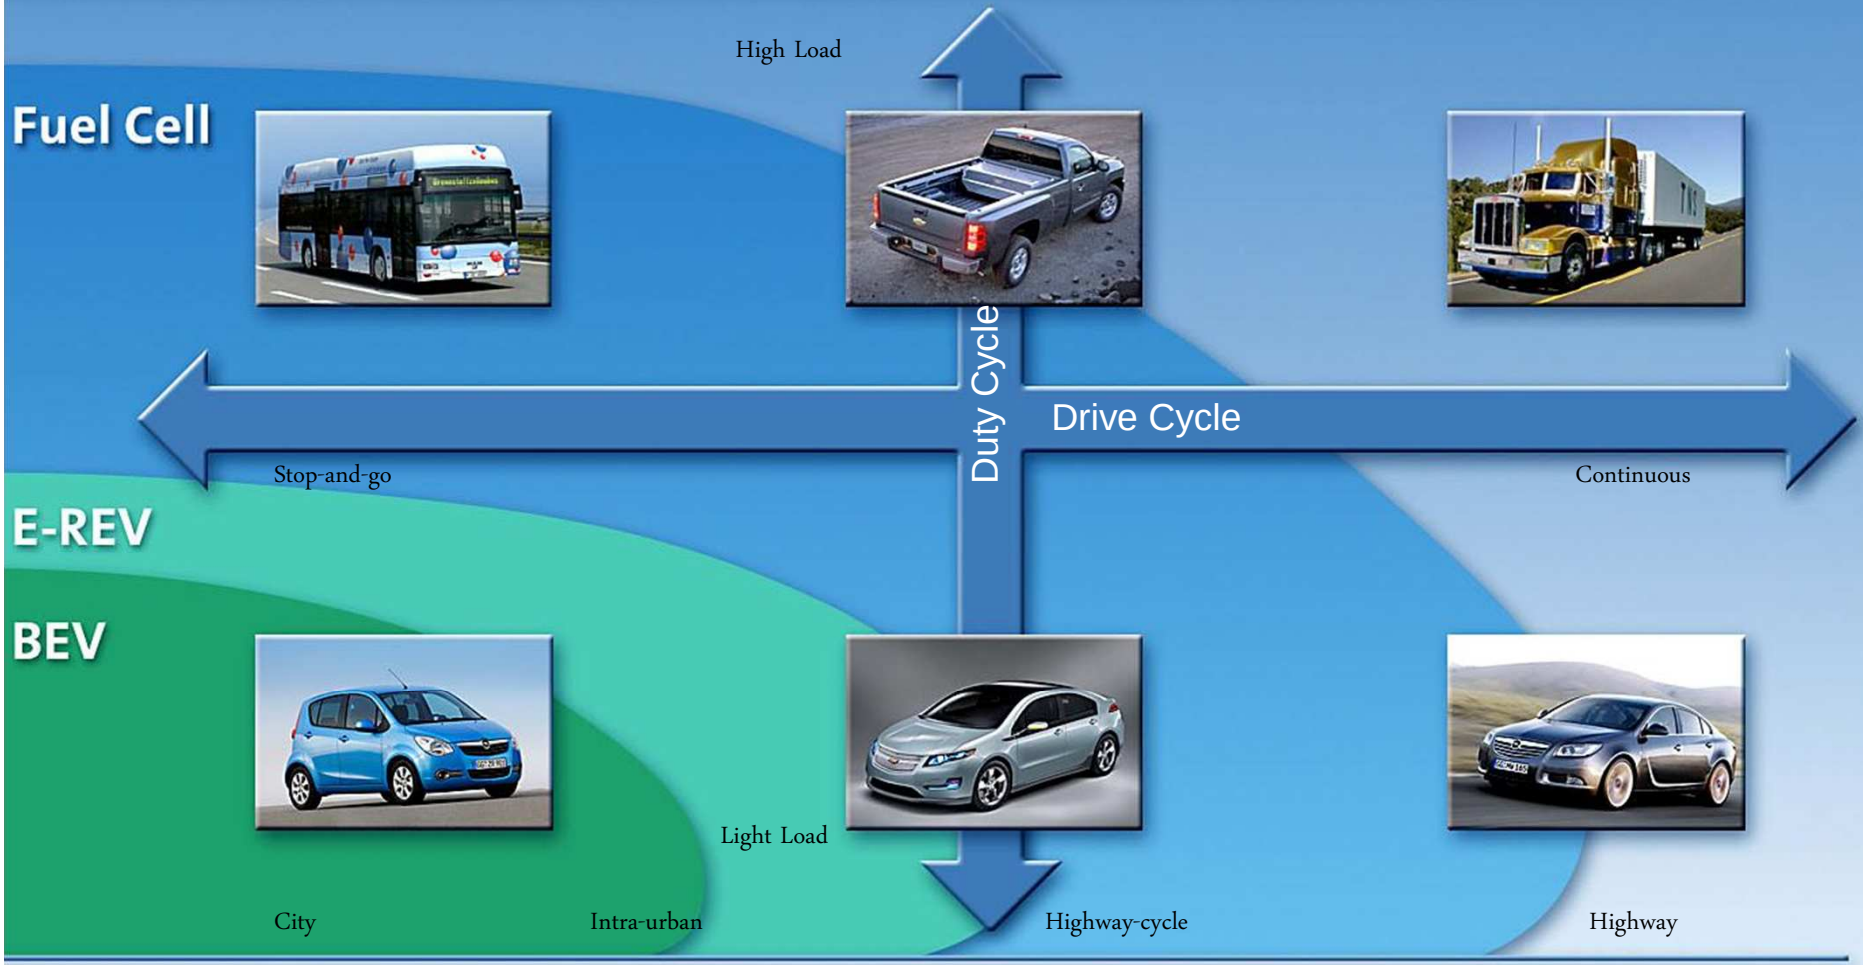
Advanced Propulsion Technology Strategy

No single silver bullet & no clear technology leader



Automotive Technology Application Map

Need to meet customer needs



Battery & Fuel Cell Technologies are both required within the portfolio

GM Project Driveway

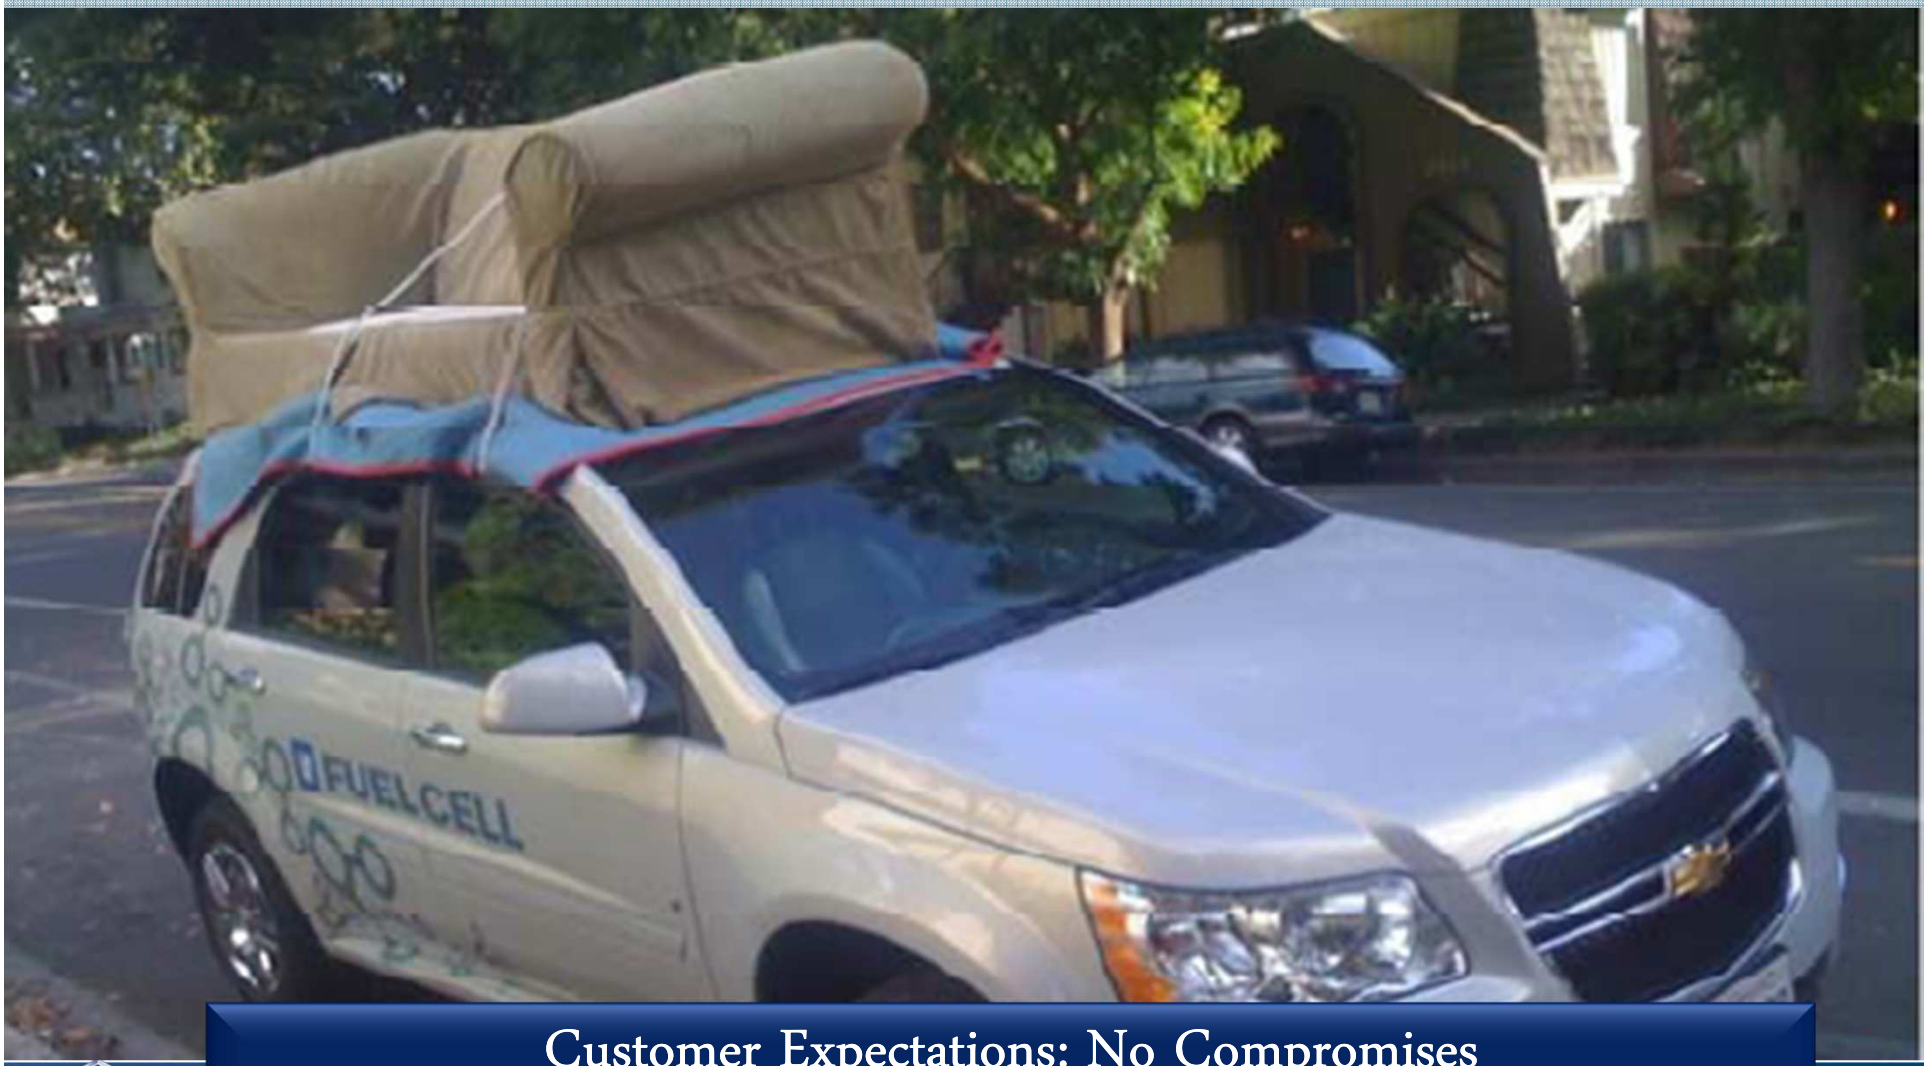
World's largest fuel cell vehicle demonstration

119 vehicles in 5 countries refueled over 25,000 times

Over 1.95 Million miles & counting

Diverse Customer Needs

Hydrogen Fuel Cell Equinox – at Work



Customer Expectations: No Compromises

GM's Advanced Technology Vehicle Center

Torrance, CA

Opened June 9, 2011

- Employs up to a dozen scientists, technicians, and engineers with expertise in all aspects of advanced technology vehicle research and development
- Launch, operate, maintain and repair GM's electric vehicle activities in California
- Operates a Hydrogen Fueling station and electric charge stations to support hydrogen storage systems maintenance and development and service battery storage systems

Production Intent Design

Fuel Cell Propulsion System

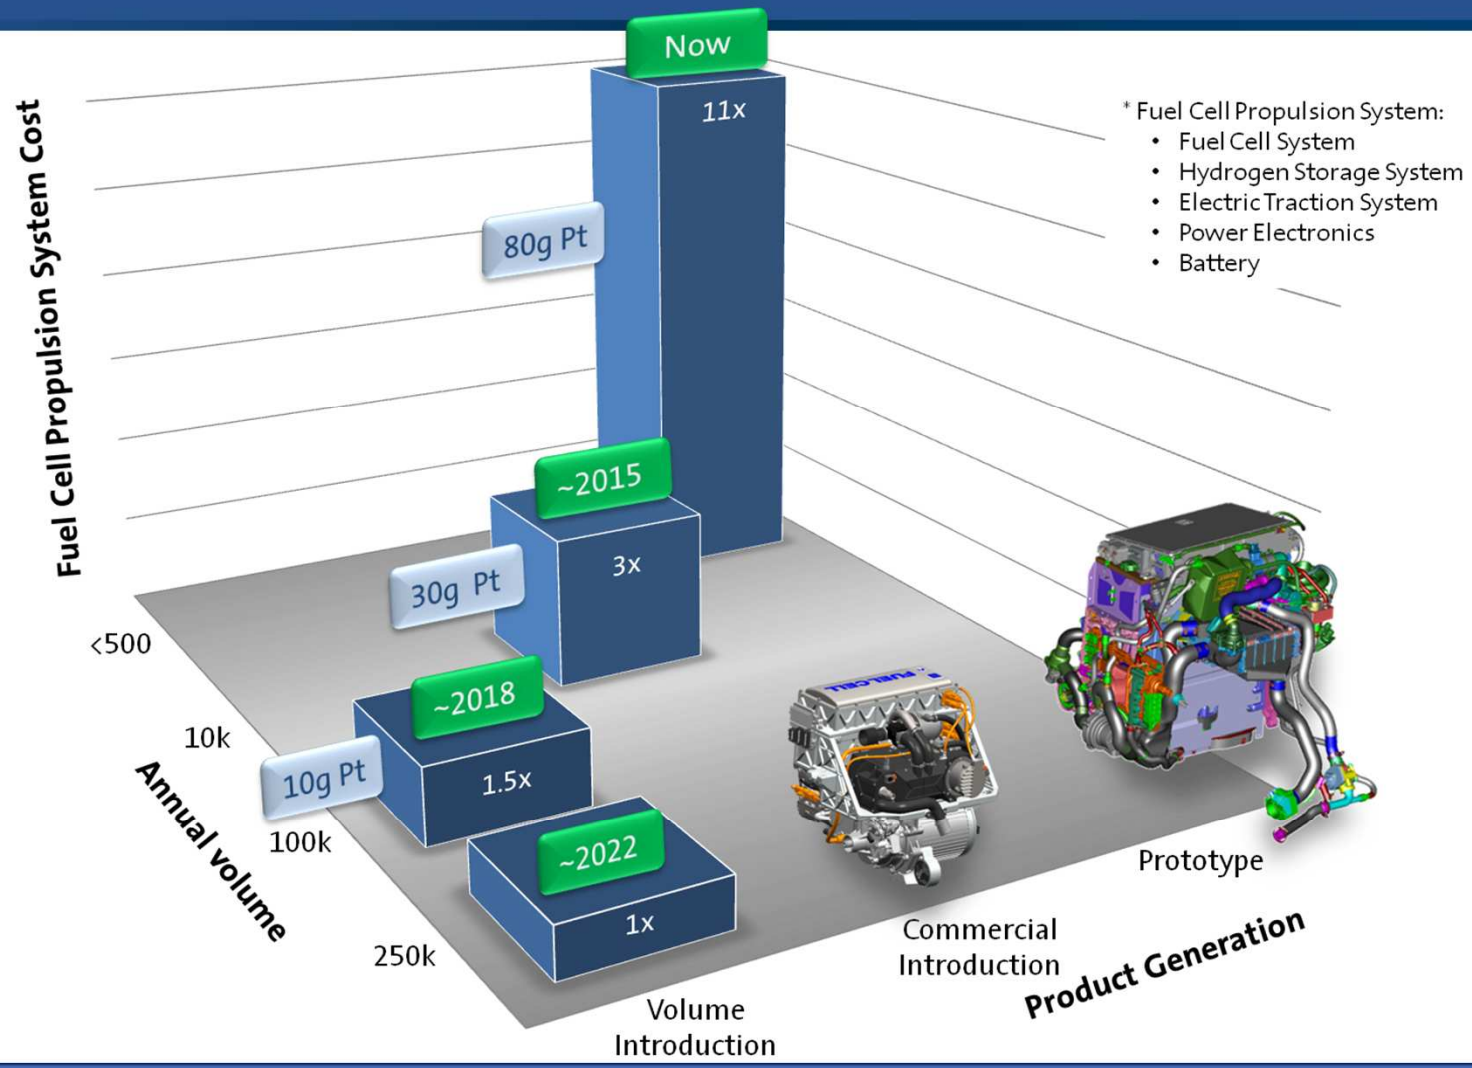
Project Driveway

- Started 2007
- 119 vehicles
- Over 6,500 drivers
- 25,000 refueling events
- 1.95 million miles & counting

Production Intent Design

- Half the size
- 220 pounds lighter
- About 1/3 the platinum
- 2X reduction in part count
- 3.7X increase in durability

Automotive Competitive Cost Glide Path



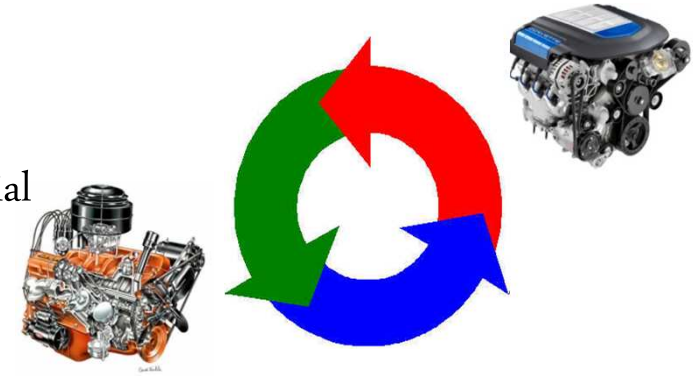
Clear roadmap to automotive competitive costs requires multiple learning cycles & scale volume

Fuel Cell Technology & Hydrogen Infrastructure

Remaining Challenges

Cycles of Learning

- 2-3 production cycles before cost effective
- Growth to scale economies required to achieve lowest cost potential



Infrastructure Investment

- Requires field infrastructure investment
- Development of manufacturing & suppliers

Government Policy

- R&D, market and infrastructure support
- Codes and standards development

Summary

H_2 Fuel cell technology is commercial ready

- Performance proven in field, durability proven in labs
- Cost pathway identified, (higher than ICE, but comparable to other adv. tech.)

H_2 infrastructure is achievable – *Must Establish & Maintain Momentum*

- Germany & Japan implementing H_2 infrastructure plans
- U.S. H_2 infrastructure is achievable, with close Government-Industry cooperation
- Develop technology & business models to drive down infrastructure costs

Stable government policy is key

- Expanded Department of Energy role to support early market introduction phases
- Germany's H_2 Mobility Template
- Codes & Standards
- Market incentives

Thank You

Alameda-Contra Costa Transit District

Fuel Cell Transit Buses – State of The Technology

Jaimie Levin

1st Generation Bus

- >267,000 Miles
- >700,000 Passengers
- 1.6 to 2.0 Times Better Fuel Economy
- 43% GHG Reductions
  (Reforming Natural Gas;
  100% reduction with solar or wind hydrogen)

3rd Generation Design

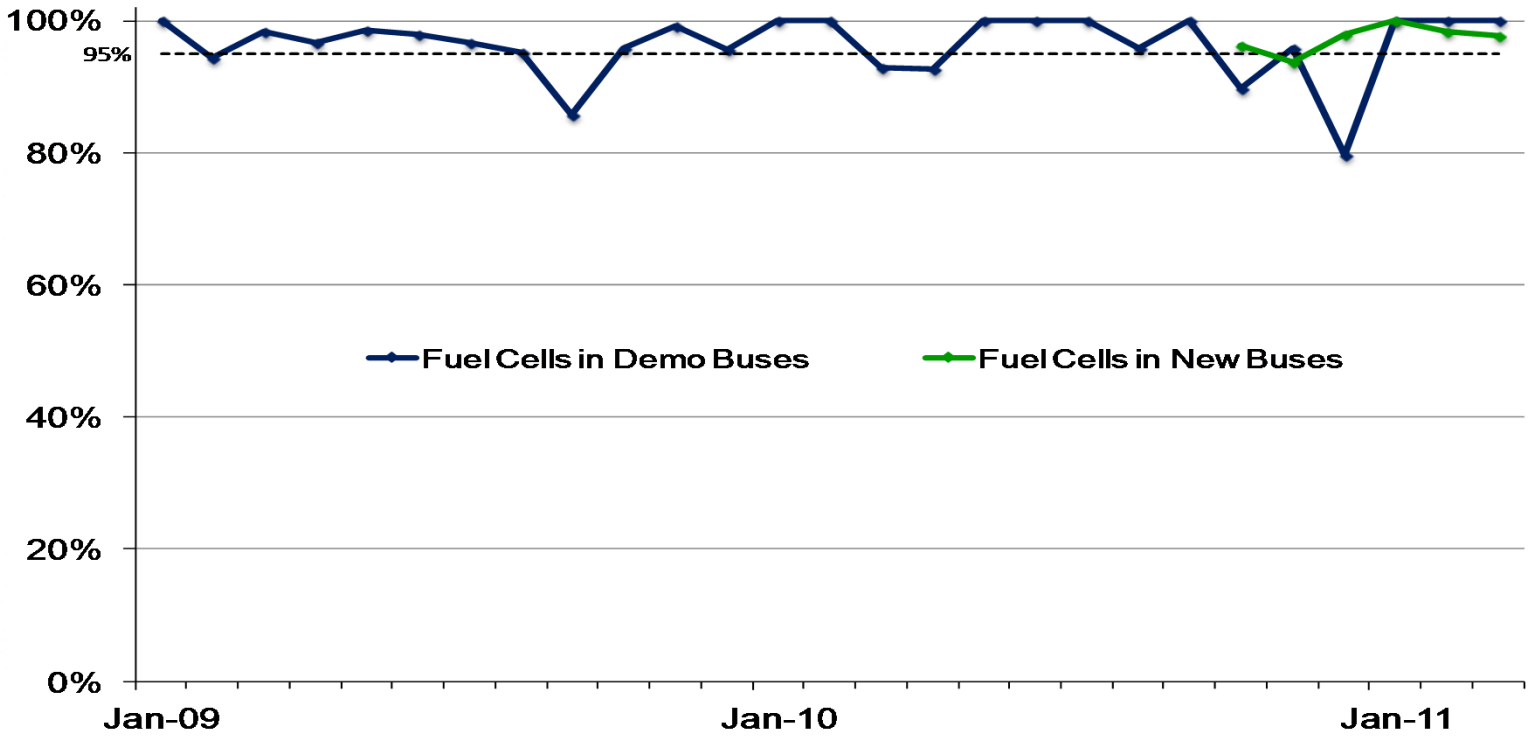
- 5,000 lbs. Lighter
- Better Batteries
- 104,000 miles (since Aug 2010)
- > 9,400 Fuel Cell Hours

- 612,890 Miles – UTC Fuel Cell Fleet
- Over 1 million passengers in the Bay Area
- Passengers, Mechanics, and Drivers Love Them

"Like Disneyland in The Real World!"

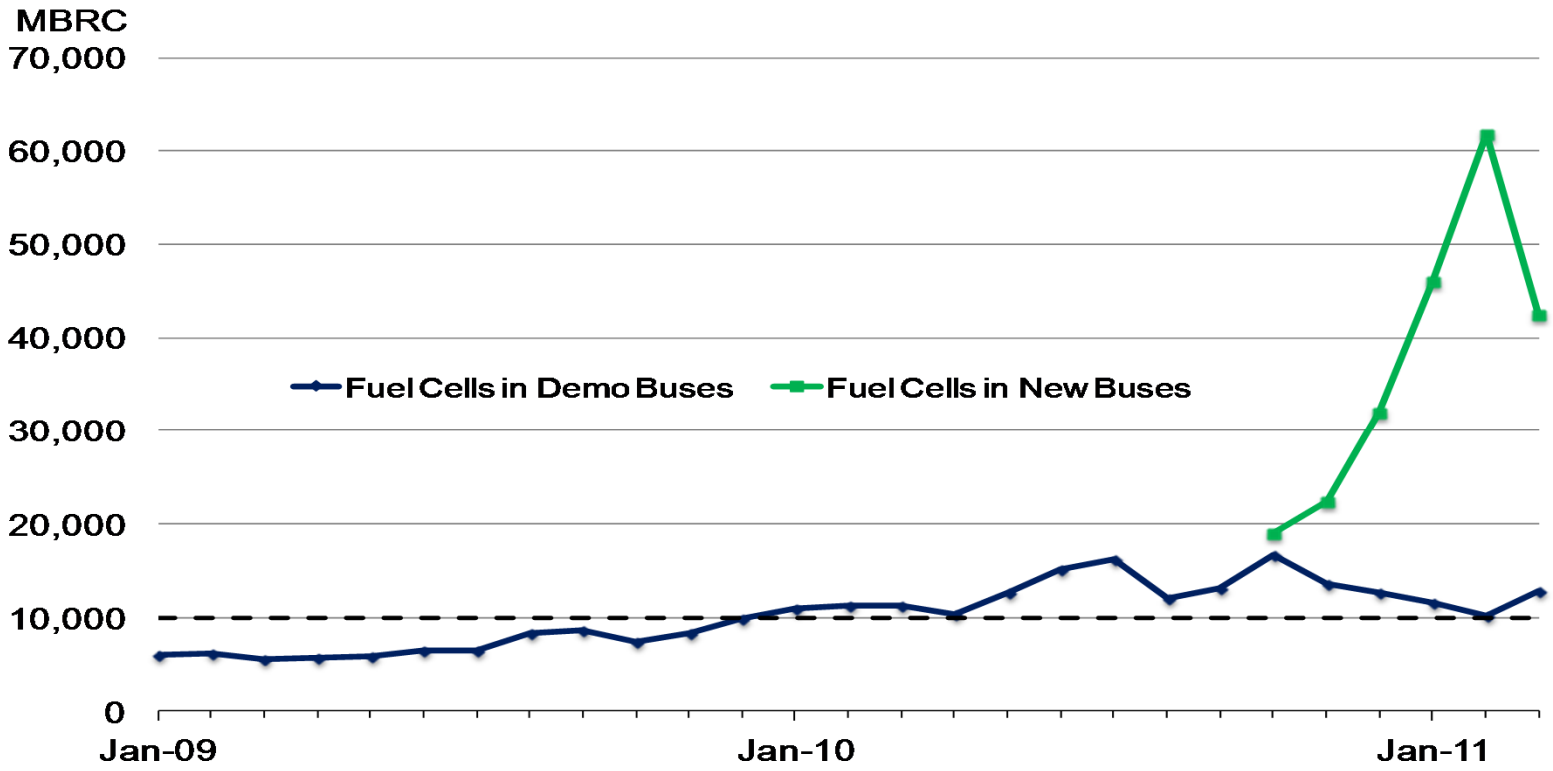
Fleet average fuel cell availability at 95% for more than 2 years

PureMotion® 120 fleet
12-month rolling average availability



Fuel cells achieving commercial levels of reliability

PureMotion® 120 fleet
12-month rolling average miles between road calls (MBRC)



FTA | United States Department of Transportation Federal Transit Administration

CALSTART

UTC Power
A United Technologies Company

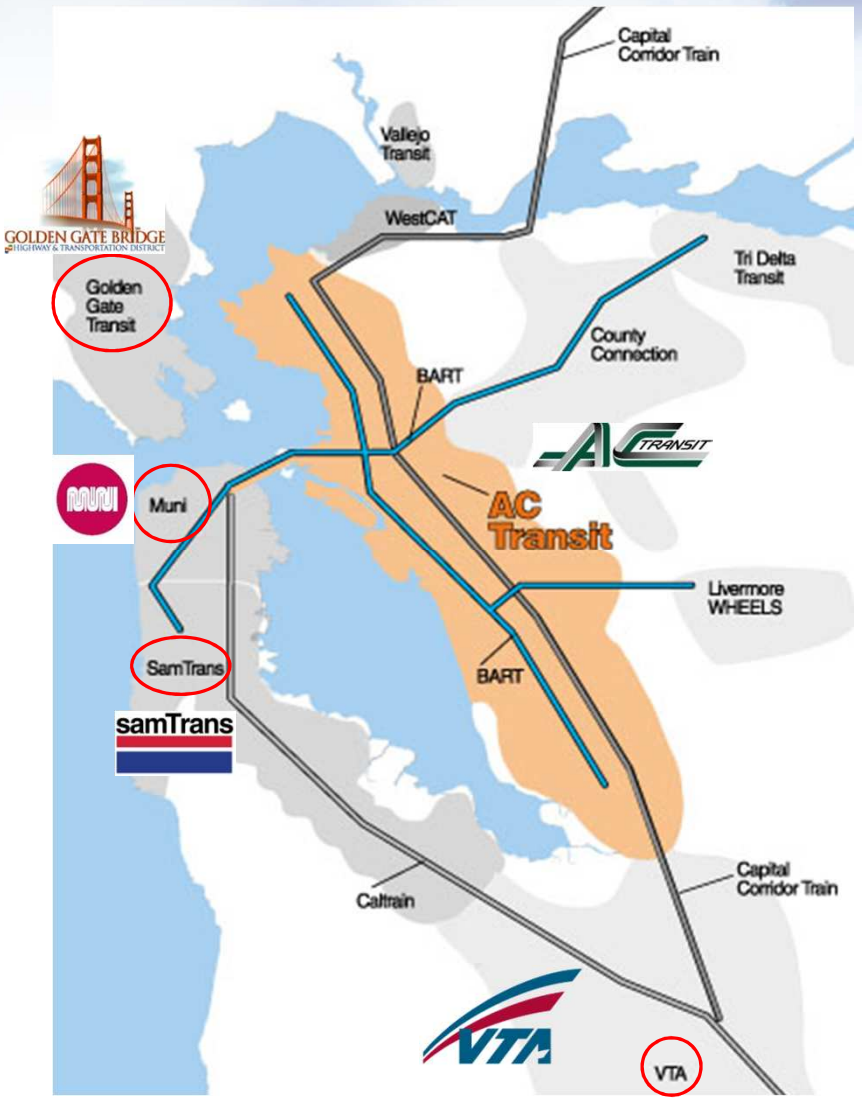
$14.2M Program for advanced fuel cell development

- Increase power density
- Increase durability
- Reduce weight, size, and cost

Focused on product optimization and cost reduction

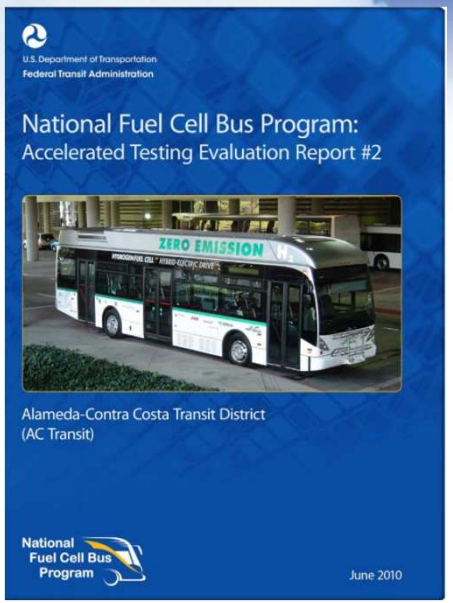
Bay Area Advanced Demo

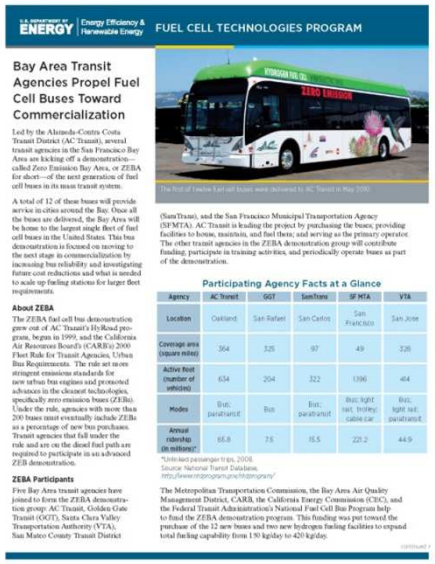
- $65 Million
- 12 New Buses
- 2 Fueling Stations
- 5 Transit Agencies (>2,500 vehicles)
- Shared Service
- Shared Training



NREL Evaluation

- In Partnership with NREL, DOE, and FTA
- **DOE has approved continued data collection** and analysis of 12 buses and new stations
- Monthly and Semi-annual Performance Reports





Technology Thresholds

1. Performance (Reliability and Durability)
2. Packaging (Weight and size)
3. Fuel Supply (Speed, Scalability, Renewable)

Affordability = Ownership

1. Can We Afford to **Buy** It?
2. Can We Afford to **Run** It?
   (Performance and Maintainability)
3. Can We Afford to **Own** It?
   (Durability and Replacement Costs)

National Program: Centers of Excellence

Next Steps	Evaluation Criteria
12 Next-Generation Buses in Regional Service by September 2011	1. Performance by different operators 2. Fuel economy **3. RELIABILITY** **4. HYDROGEN SUPPLY**
Four or Five Regional Centers of Excellence : Each Deploying 40 to 50 Buses (2013 – 2016)	1. Reliability **2. DURABILITY** **3. COST REDUCTION**

June 23, 2011

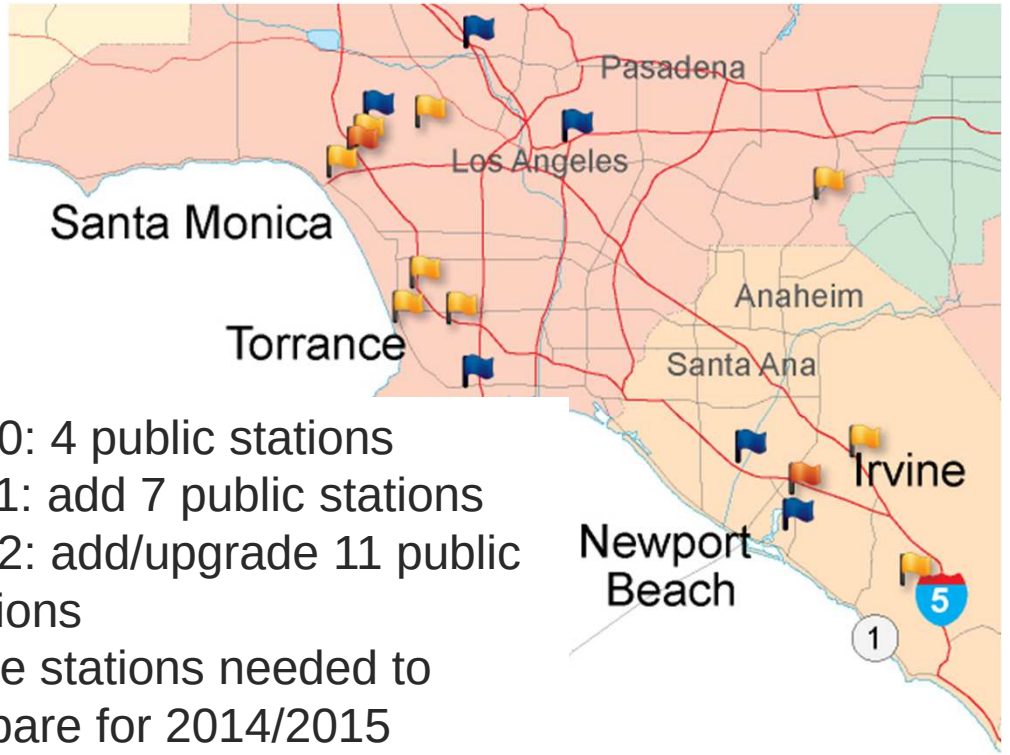
How many hydrogen stations?

- 2009 “Hydrogen Fuel Cell Vehicle and Station Deployment Plan: A Strategy for Meeting the Challenge Ahead”
  - This “Action Plan” identified the need for about 40 new hydrogen stations in order to prepare the market for the commercial launch of fuel cell vehicles (FCV).
- 2010 and 2011 Progress reports further defined station needs based on annual automaker survey results

Other supporting actions

- Finalize codes and standards for retail sales of hydrogen
  - Fuel metering, fuel quality, customer convenience
- Support business models developed by the private sector
  - How will early H_2 fuel retailers sustain their business?
- Outreach and educate early market communities
  - Including first responder training, permitting workshops, local leader outreach

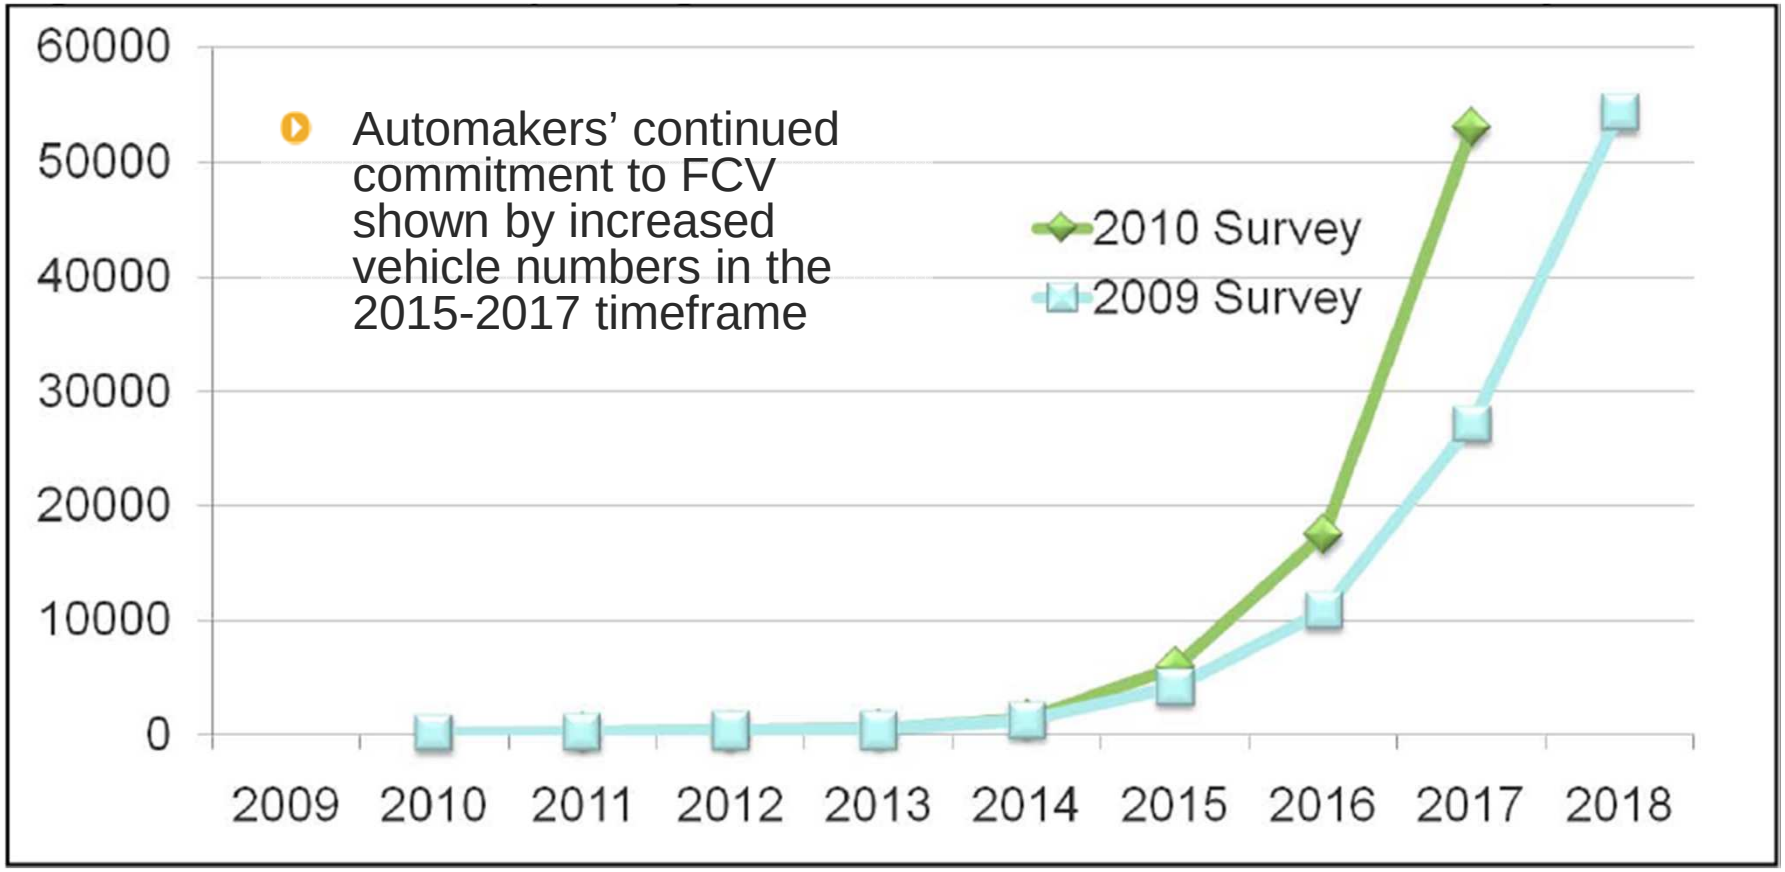
Cluster deployment in early years



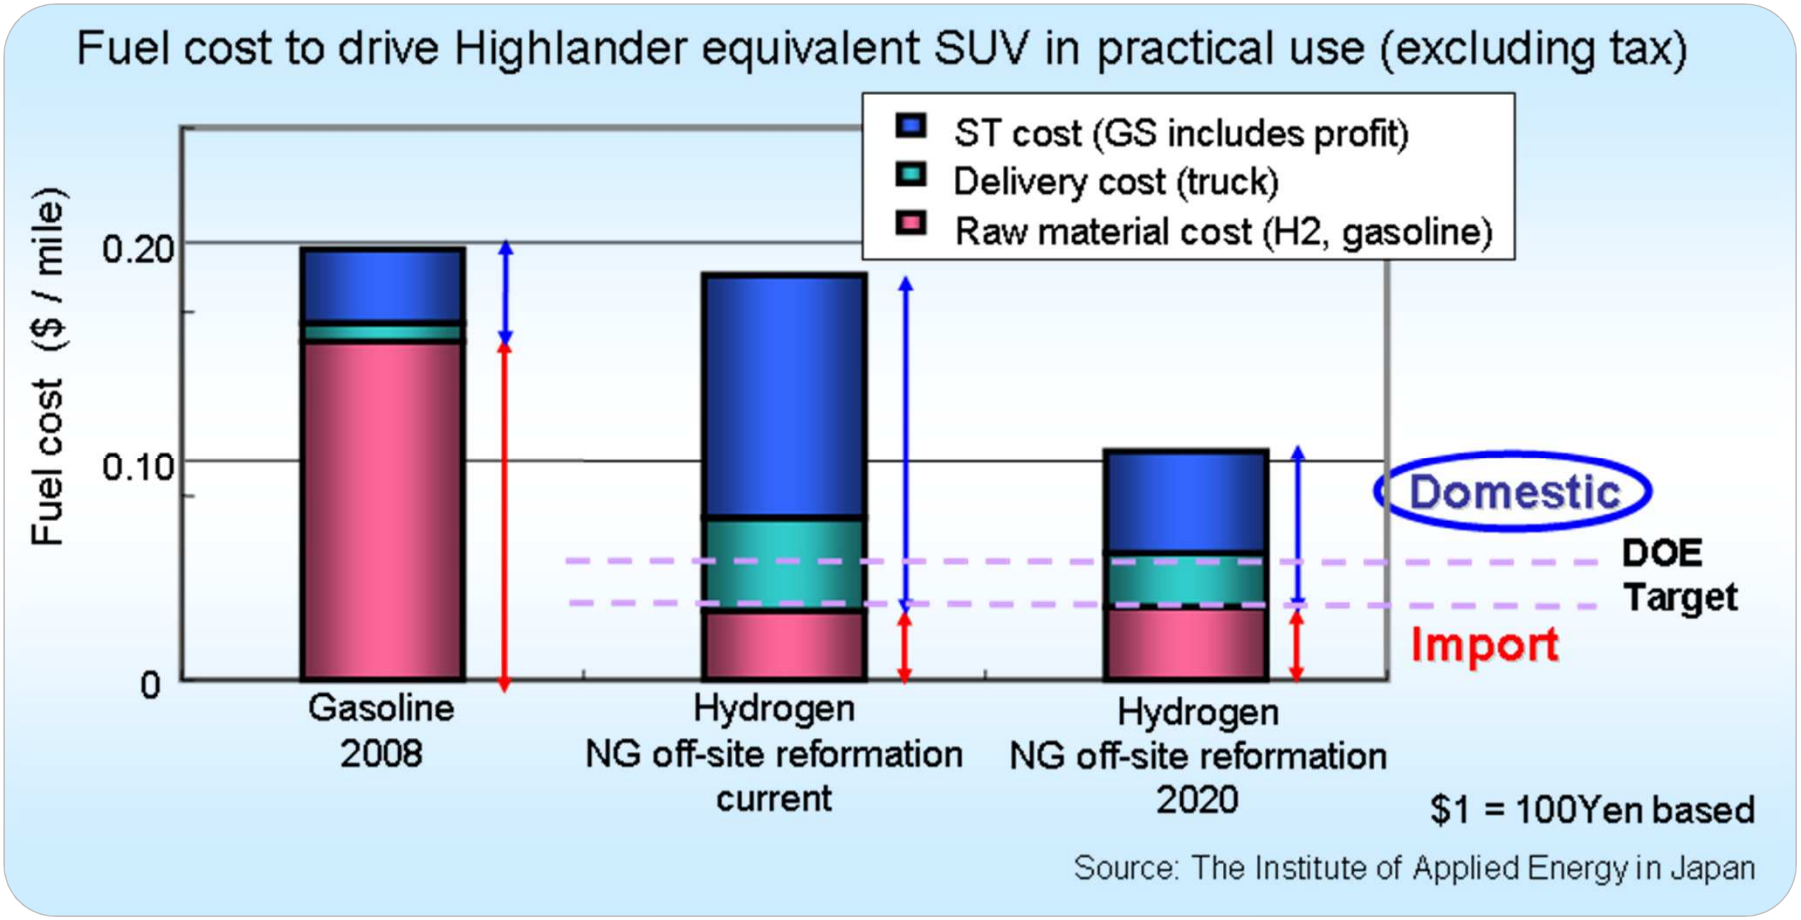
- ✓ 2010: 4 public stations
- ✓ 2011: add 7 public stations
- ✓ 2012: add/upgrade 11 public stations
- ✓ More stations needed to prepare for 2014/2015 commercial launch (tbd)

Latest Automaker FCV Survey

	Hundreds	Thousands	Tens of thousands
	Through 2013	2014	2015-2017
Total Passenger Vehicles*	430	1,400	53,000



Business Models

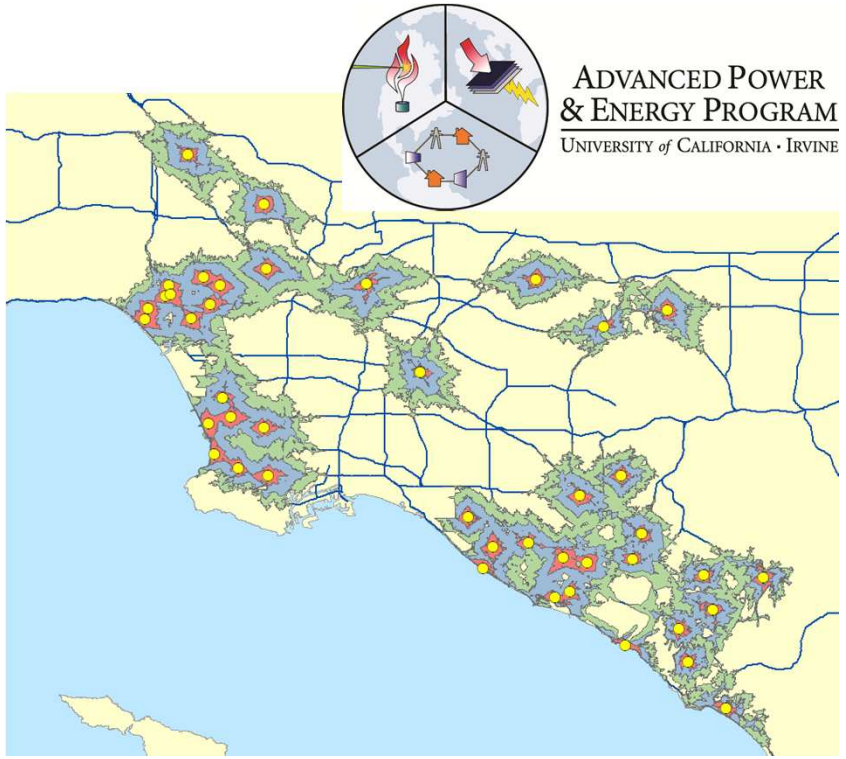


- Identify some conventional and nonconventional business models

Strategic Station Deployment

- Consider hydrogen station deployment from a more holistic point of view.
  - Identify technology needs on both the vehicle and infrastructure sides and define possible scenarios to balance the needs.
- Utilize recently developed tools / resources

  <u>For example</u>:
  - UC Irvine STREET (Spatially & Temporally Resolved Energy & Environment Tool)
  - Specialized CaFCP Working Groups and Task Forces



Summary

- CaFCP is committed to vehicle/station rollout planning using the latest information and tools available
- It is clear that additional collaborative work is needed to prepare the market for FCV commercialization
  - CaFCP is working to define a fourth phase to begin in 2013(current CaFCP phase concludes in 2012)

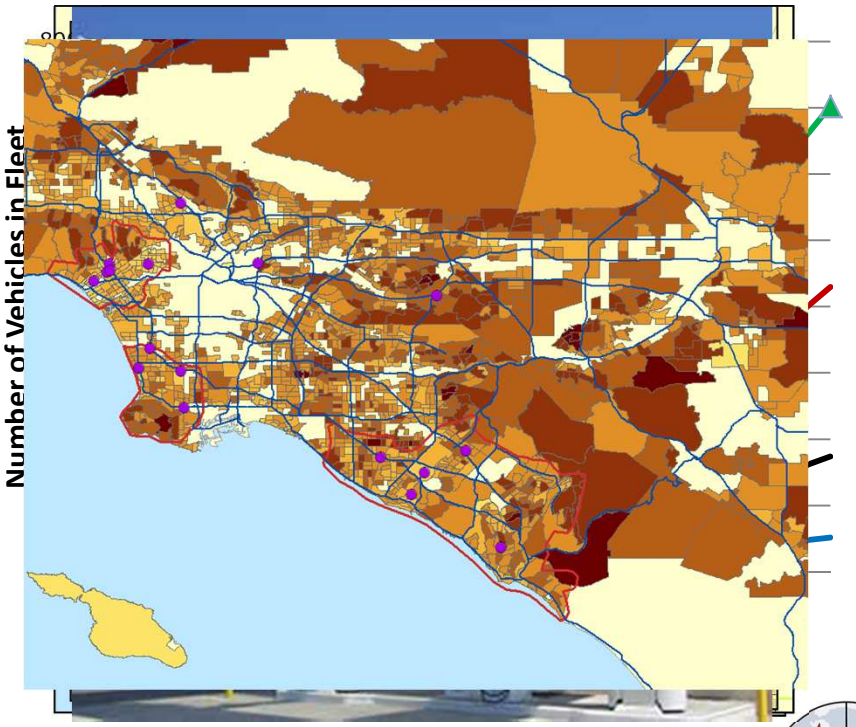
Many Factors are Considered

A sufficient refueling network must be established prior to commercial vehicle launch to alleviate early consumer concerns about hydrogen availability

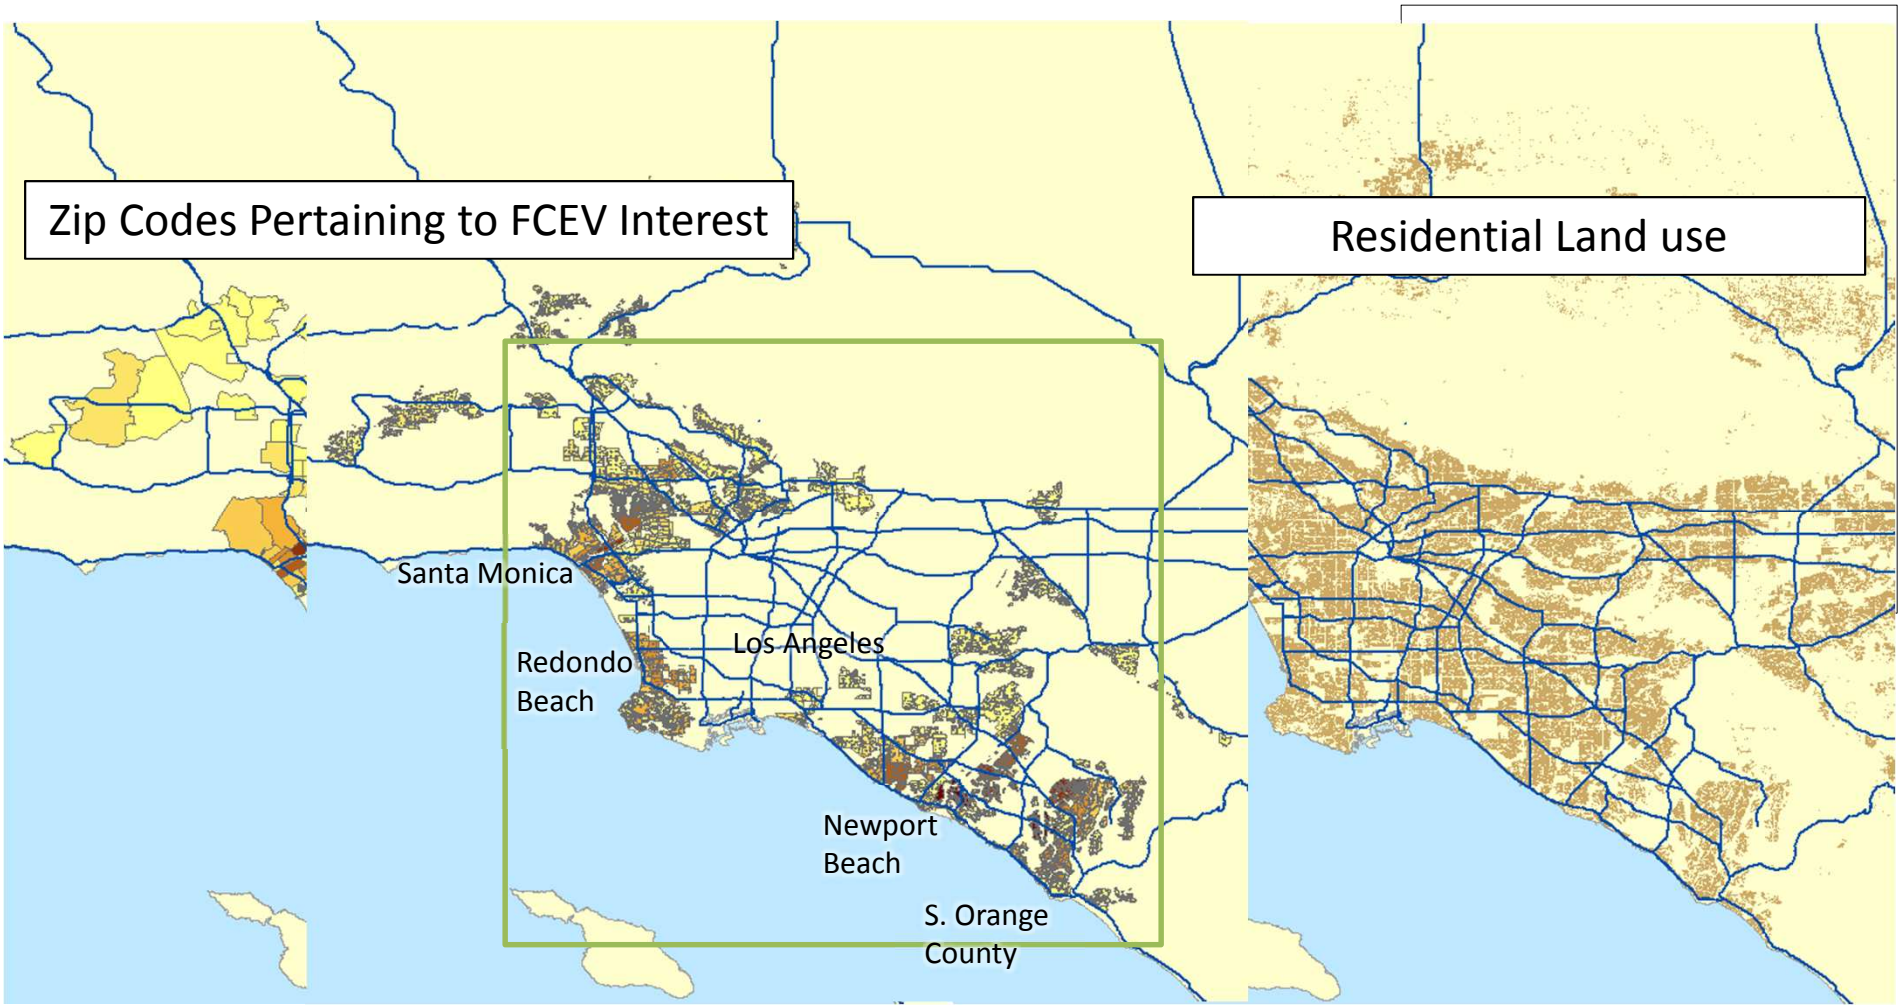
The Advanced Power and Energy Program at UC Irvine has developed the STREET methodology to optimize infrastructure placement based on:

- *Automaker market data*
- *Travel-time algorithms*
- *Station land use*
- *Vehicle travel density*
- *Service coverage*
- *FCEV deployment*
- *Existing hydrogen infrastructure*
- *Population centers and demographics*



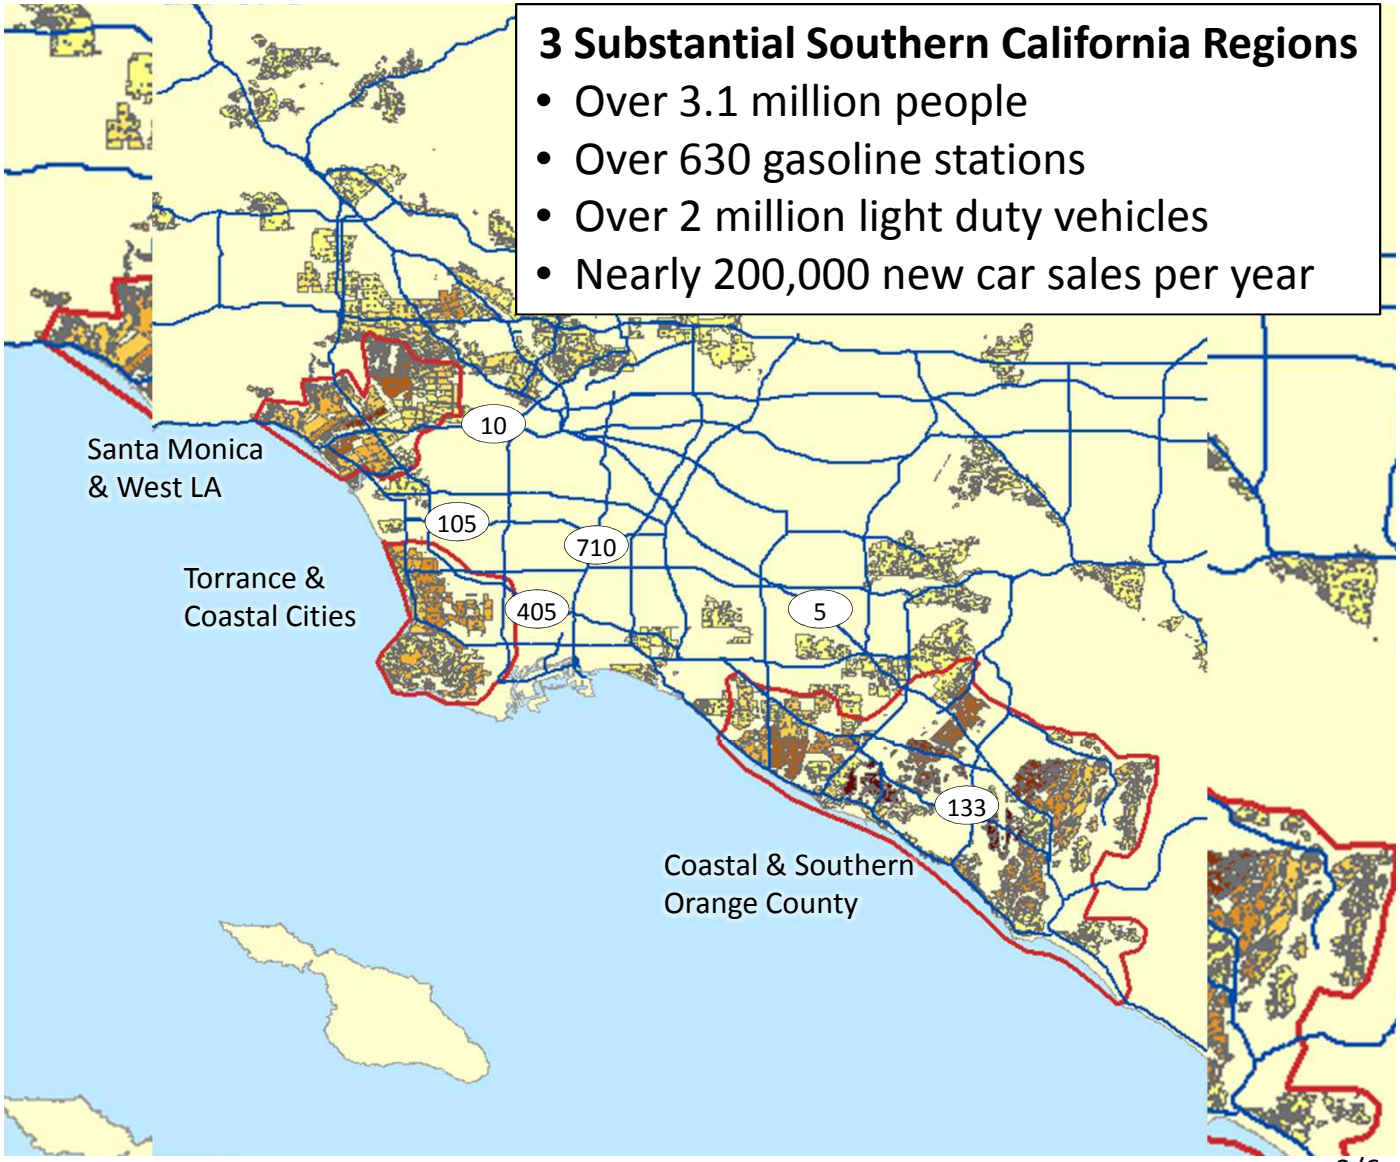
© Advanced Power and Energy Program, 2011

Defining FCEV Regions

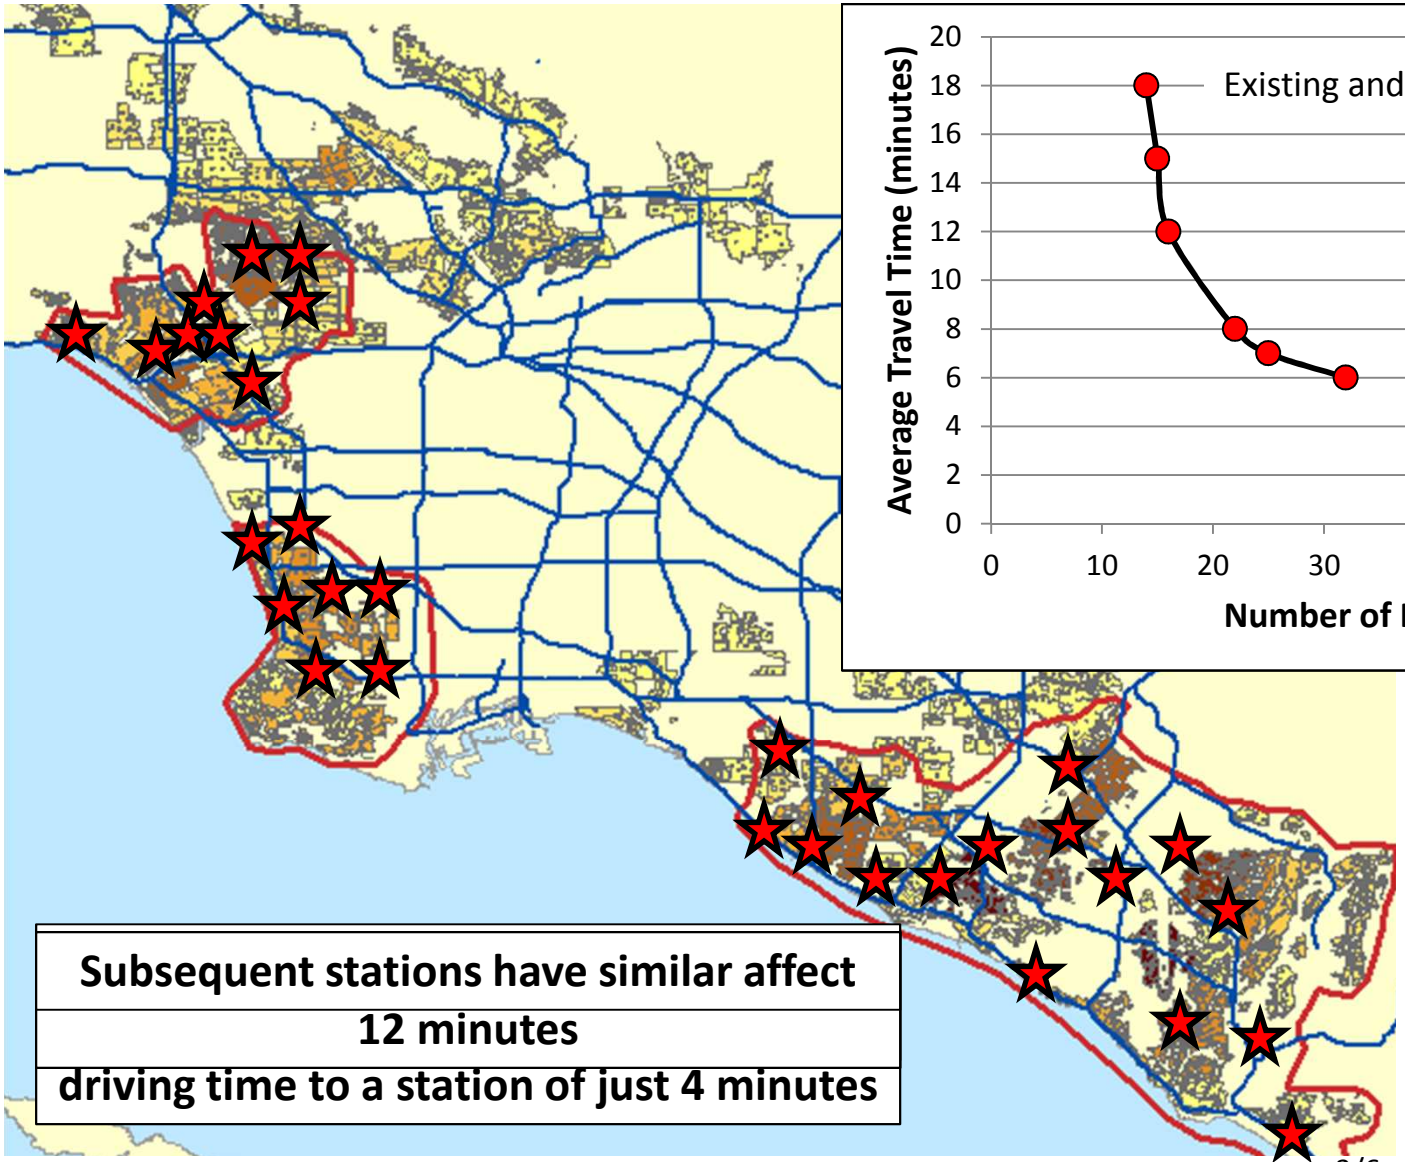


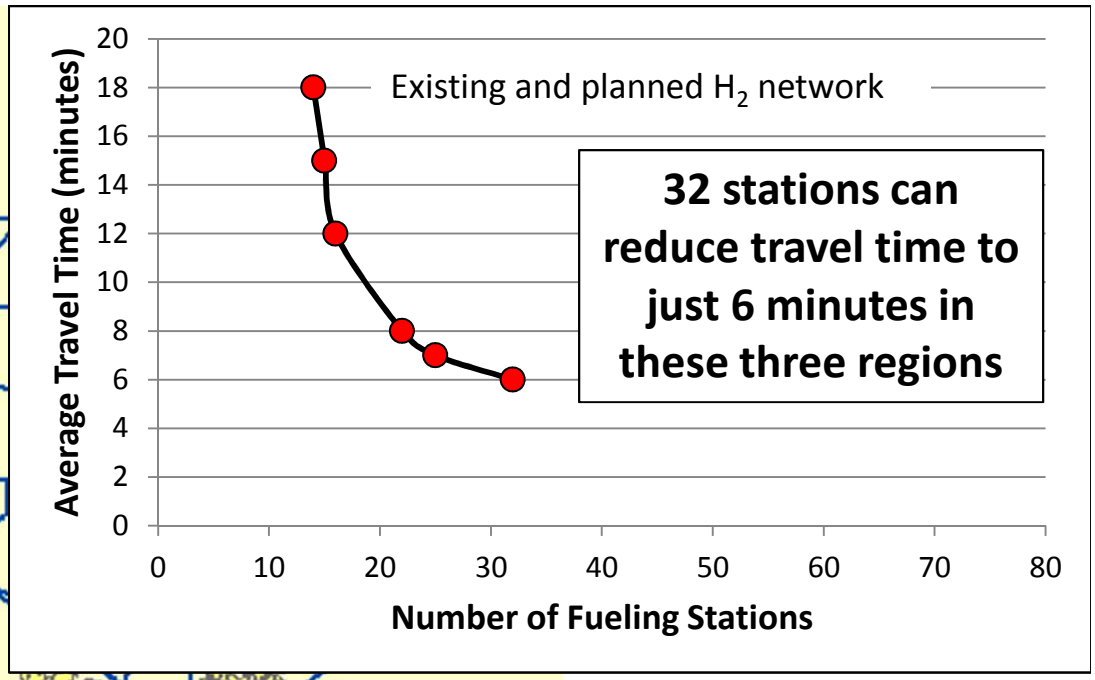
© Advanced Power and Energy Program, 2011

Southern California - Coverage



Southern California - Coverage



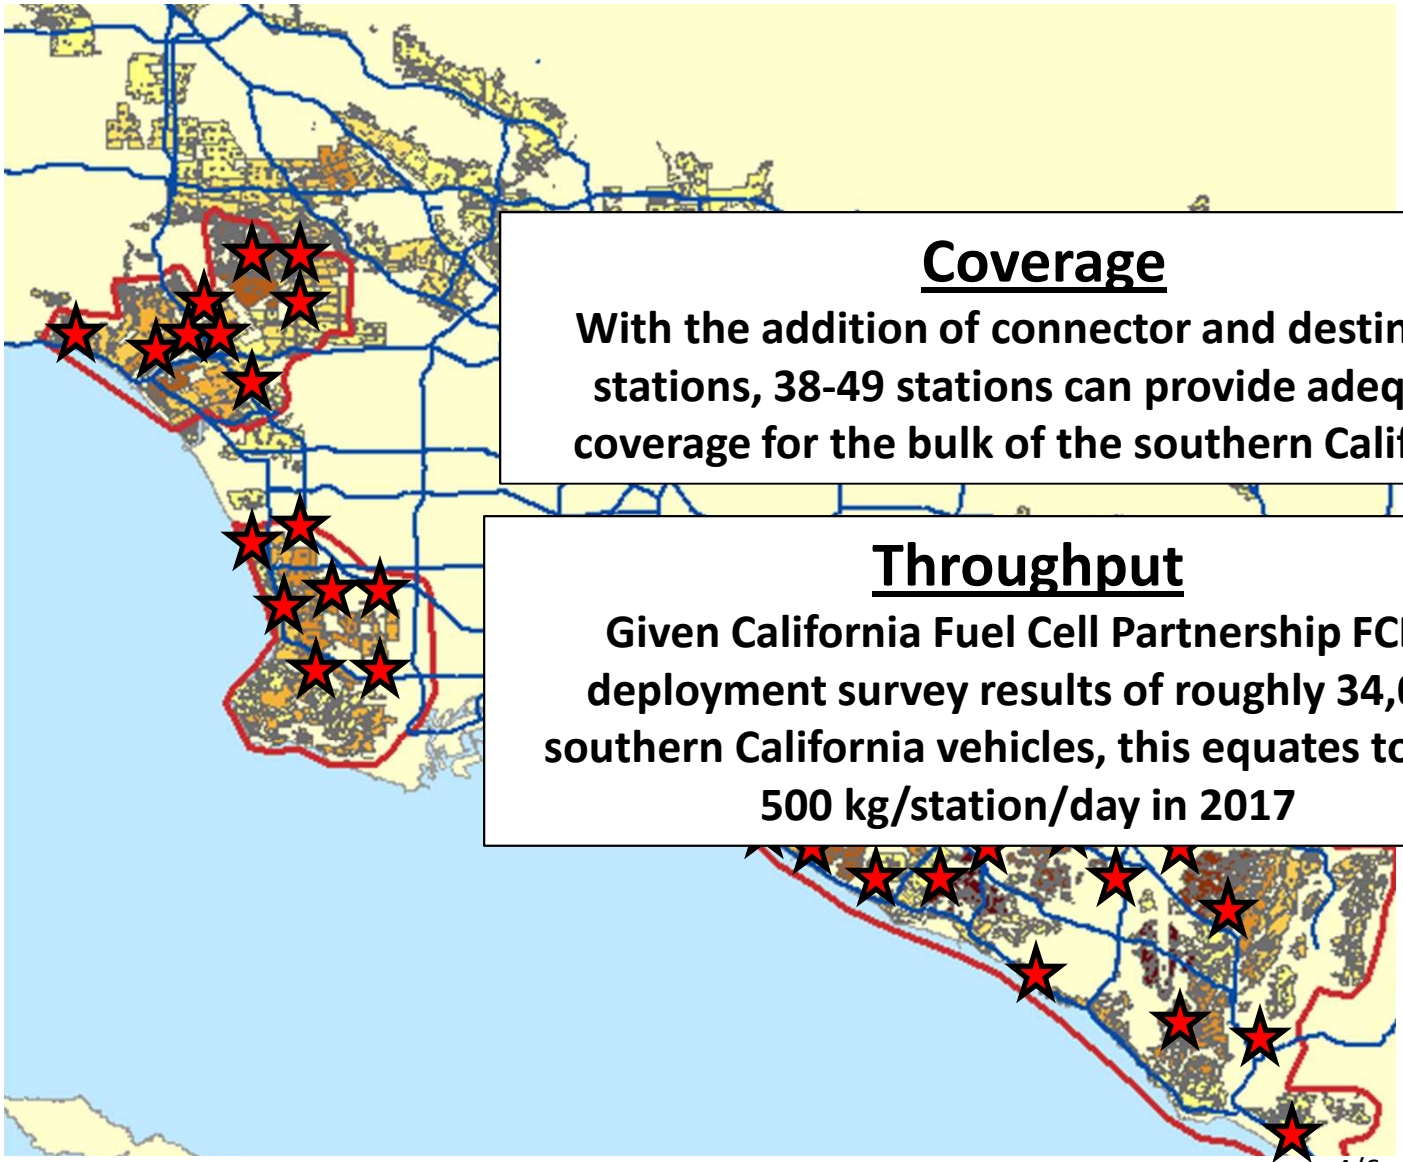


Subsequent stations have similar affect

12 minutes

driving time to a station of just 4 minutes

Southern California



Coverage

With the addition of connector and destination stations, 38-49 stations can provide adequate coverage for the bulk of the southern California

Throughput

Given California Fuel Cell Partnership FCEV deployment survey results of roughly 34,000 southern California vehicles, this equates to over 500 kg/station/day in 2017

Benefits of Careful Planning

Optimized infrastructure siting can:

- Reduce capital investment *(6%-7% of existing gasoline stations in target regions to achieve tipping point)*
- Increase network effectiveness *(travel time of 6 minutes)*
- Promote high fuel throughput *(over 500 kg/station/day in 2017)*

AIR PRODUCTS

Immediate Impact to California

- Economic benefits
  - Hydrogen sourced from upgraded CA facilities
  - Delivery systems sourced from CA suppliers
  - Station construction
- Supports ~240 jobs

© Air Products and Chemicals, Inc. 2011

AIR PRODUCTS

Challenges

- Business case for early deployments
  - Lack of volume
- 30-40 early “subsidized” stations in a region should develop the sustained business case per UCI STREET modeling.
- Sustained business case could attract:
  - $150-300MM of investment in SoCal (by 2020)
  - ~$900MM for all of CA station infrastructure
  - ~$300M in commensurate H2 production facilities

© Air Products and Chemicals, Inc. 2011

AIR PRODUCTS

Summary

- New approaches to hydrogen distribution are enabling market development of fuel cell markets. Reconfigured supply chains "fit for purpose" to supply fuel cell vehicle markets.
- Hydrogen infrastructure capital cost have been lowered to spur early commercial market development.
- Total cost of ownership of hydrogen fuel is affordable to gasoline for large percentage of light-duty vehicle market.
- Programs are underway to demonstrate robustness of our new business model and continued support is required to achieve commercial sustainability.
