Will there any revisiting of the 365 MMT cap for capped sectors in 2020 or is that a final decision?

It seems that this number was arrived at based on an assessment of the future emissions and reductions in non-capped sector.

Could you talk a little bit about the methodology used for this? It seems to me that there is uncertainty about the assessment of trends and reductions in non-capped sectors, and it would be a concern if this isn't being sufficiently considered.

In particular, if emissions are higher than expected in non-capped sectors in 2020, that would mean that the overall AB 32 emission reduction mandate would not be met.

Wouldn't it make sense to revisit the assessment of expected future emissions and reductions in non-capped sectors as part of a comprehensive evaluation of future trends?
