APPENDIX C

EMISSION IMPACTS

EMISSION IMPACTS

This appendix presents the methodology used to estimated the CO emission reduction achieved by the implementation of the proposed wintertime oxygenated gasoline program.

A. EMISSION REDUCTIONS SUMMARY

Implementation of the proposed oxygenates program will reduce emissions of CO and VOCs from gasoline fueled vehicles. To estimate the emission reduction from the proposed program, staff used the Auto/Oil regression analysis at 2 percent oxygen by weight. The control factors were applied to the CO planning emission inventory was used to estimate 1992, 1994, and 1996 CO emission reductions in non-attainment areas. For attainment areas staff assummed that an equivalent percent emission reduction would result by the use of oxygenates during the winter months in these areas. Table 1 presents the emission reductions for CO and HC emissions. Implementation of the proposed program results in a statewide emission reduction of about 1200 tons per day (TPD) for CO and about 20 TPD for VOCs for the winter of 1992/93. These emissions represent about a 10 percent reduction in CO emissions and about a 3 percent reduction for VOC emissions in 1992. NOx emissions are not expected to be affected.

B. EMISSION REDUCTION CALCULATIONS

1) Staff used the Auto/Oil regression to estimate the effects on motor vehicle emissions of using oxygenated gasoline with an average 2% oxygen content during the winter months. Table 2 shows the control factors used to estimate the changes in emissions. Estimates of the total effects on emissions (in tons per day) for nonattainment area for 1992, 1994, and 1996 are shown in Tables 3 through 5.

2) Additionally, staff estimated the effect on emissions using the Auto/Oil regression for a 2.7% oxygen content (EPA's average minimum oxygen content is 2.7%). Table 6 shows the control factors used to estimate the changes in emissions. The changes in emissions (tons per day) for this case are shown in Table 7 through Table 9 for 1992, 1994, and 1996, respectively.

3) To evaluate the impact on the use of ethanol on evaporative emissions, staff used control factors based on data from the Phase 1 gasoline specifications report[1]. The control factors represent a 1 psi increase (from 11 to 12 RVP).

---

1. State of California, Air Resources Board, Reformulated Gasoline: Proposed Phase 1 Specifications, Staff Report and Technical Support Document, August 13, 1990.

4) Staff assumed that to meet the requirements of the proposed wintertime oxygenates program, a 75% MTBE, 25% ethanol mix would be used.

Based on these assumptions, staff estimated the emission reductions as shown in Table 1.

TABLE 1

SUMMARY OF PROJECTED TOTAL EMISSION REDUCTIONS
FOR THE MONTHS OF NOVEMBER THROUGH FEBRUARY
(Tons/Day)

Area	1992	1994	1996
CO Non-Attainment			
CO	800	700	600
VOC	21	18	15
NOx	-	-	-
CO Attainment			
CO	400	400	400
VOC	11	10	9
