Subject: GHG Reductions from Concrete & Cement

Comment:

We recommend that CARB add a Low Carbon Concrete Standard in the 2021 Scoping Plan. As operating emissions from buildings drops due to efficiency and clean energy, the embedded carbon will be increasingly important. We need to significantly reduce the embedded carbon in building materials. We believe it is technically and economically feasible to significantly reduce the emissions from concrete by creating a declining emissions standard as outlined in the attached document. Currently, only the cement industry is regulated via the cap and trade program. The concrete industry has many ways to innovate and concrete standard would stimulate innovation.

The concrete industry can reduce emissions in part by reducing the amount of portland cement needed. The portland cement industry has various ways of reducing their emissions but ultimately the industry needs to capture the CO2 emissions. We believe our proposal will accelerate the timeframe to capture CO2. As outlined in the staff report, California needs a multi-sector, vibrant CO2 capture, reuse and sequestration system in place before the end of the decade. The cement industry can play a major role in establishing such a system.
