Subject: Jet Fuel & Low Carbon Standards

Comment:

CARB has a historic opportunity to correct decades of environmental racism. Not only are airlines some of the largest emitters of greenhouse gases, the emissions are toxic resulting in higher levels of chronic respiratory illnesses, Eco asthma and COPD. Black and Latino workers are most at risk because airline emissions have gone unregulated. Working at or living near an airport should not reduce our life expectancy.

Comment:

Airline fuel is one of the largest sources of greenhouse gasses in California, significantly impacting air quality, contributing to climate change and preventing California from meeting its green energy future goals. Airport workers and people who live in airport-adjacent and flight-path communities are demanding to know why the staff report's recommendation to remove exemptions to the Low Carbon Fuel Standards was taken out. Did you know, even 10 miles away from LAX the air is twice as polluted as air not impacted by air travel. Children who live within a 5-mile radius of the airport are 4x more likely to have asthma. Trains, trucks, cars are all regulated. Why aren't airlines?

Subject: Regulate the Airlines

Comment:

The airline industry has remained unregulated for far too long. Airline jet fuel is amongst the largest contributors of green house gas emissions in the State of California. This has a significant impact on our state's air quality, it contributes greatly to climate change which has greatly affected our state, and will hold back California from meeting its ambitious green energy future goals. Our union's members who work at the airports and live in the surrounding communities demand to know why the staff report's recommendation to remove exemptions to the Low Carbon Fuel Standards was taken out.

Subject: Airlines

Comment:

Why are you as a group able to have
Airlines use less toxic fuel. I'm sure
between the state and feds you can regulate
the fuel industry to make less toxic fuel.
The cost can be set to span over a time period
as not to disrupt airline travel. If California does it
then it can force all 50 states plus us territories
to use this fuel. Then it can expand over the rest of
of the world who flies to this country. Win win one for the
fuel industry and one for the people you allegedly
represent. Or do you get kickbacks for not doing
anything. Not saying you do just asking why it's not
done yet.

I am an Oakland Airport Worker for 8 years.

CARB tiene una oportunidad histórica de corredor decades de racismo ambiental. Las aerolíneas son de los emisiones de gases de efecto invernadero más grandes pero también esas emisiones son tóxicas. Esto resulta en niveles de enfermedades respiratorias crónicas más altas. Trabajadores latinos y afroamericanos estamos en un riesgo más elevado ya que las emisiones de los aviones no han sido reguladas. Trabajar en o vivir cerca de un aeropuerto no debería reducir nuestra esperanza de vida.

Comment:

My name is Armando Munoz and I am a SEIU-USWW member and has been working at the airport in LAX for the past 14 years. I'm here to share how important it is for jet fuel to be regulated. The airline industry is one of the biggest polluters in California and it's the only form of transportation that isn't regulated by carb. Why is that as an worker I am exposed to particulate matter in the air that comes from jet fuel and many of us live under the fly path, so we are exposed all day long, as our airports continue to grow increase and pollution well also, when carb staff put out their initial recommendations, they included regulated airfield for flights in California now that's gone. Where did it go, and those of us who live and communities are dying at a much higher rate than others were also mostly black and brown communities. This is definition of Environmental Racism

Last Name: Rizzo

Email Address: adria.i.rizzo@gmail.com

Affiliation: Californians for Electric Rail

Subject: Inaccuracies and pro-hydrogen bias in CARB rail policy harms environmental justice

Comment:

Electrification via overhead catenary wires (OCS) is the proven zero emissions way to power freight and passenger trains. Over 1/3 of rail worldwide is powered this way, including America's most used passenger trains in the Northeast Corridor and elsewhere, and freight railroads in the past such as the Milwaukee Road. In contrast, hydrogen trains are a new technology, with no line haul freight operating commercially, and hydrogen passenger trains in Germany and China have been abandoned due to high costs and poor performance in real world operations. Additionally, over 95% of the hydrogen currently available is produced through steam methane reformation, with production-associated CO₂ and NO_x emissions, while green hydrogen uses 3x as much electricity as overhead electrification while consuming precious fresh water. Hydrogen is also more flammable and leak prone than natural gas, posing additional hazards for transport and refueling, and is an indirect greenhouse gas.

Despite the numerous downsides to hydrogen fuel cell trains, CARB's research and other policy is unfairly biased towards hydrogen and full of inaccuracies that paint a distorted picture of the landscape of zero emissions rail. CARB's 2016 Zero Emissions Rail Reports contain many inaccuracies about the cost, power demand, and other basic facts of OCS and have been cited by the American Association of Railroads in their opposition to CARB's In-Use Locomotive Rule. CARB's Zero Emissions Rail Project Dashboard omits many successful, decades long electric rail projects as well as unsuccessful, canceled hydrogen rail projects (like Germany's LNGV), implying that both are prototype technologies on equal footing. And the April 2024 Feasibility Analysis: Zero Emission Train from the Port of Los Angeles to Barstow fails to fully analyze the feasibility of OCS, biasing the results towards hydrogen and battery locomotives. More information on the failings of CARB's rail research are included in the attached letter. CARB also provided funding for SBCTA's first in North America hydrogen train, which has suffered numerous cost overruns and now a delayed release schedule. The Low Carbon Fuel Standard has also historically undercredited electric transit and subsidized hydrogen in transportation.

The implementation and siting of hydrogen passenger trains also perpetuates environmental injustice. Hydrogen trains in California are so far planned for San Bernardino and the northern Central Valley, areas that are in the top 20% of the DOT's Disadvantaged Communities Index and suffer from high rates of poverty and some of the country's worst air quality. These communities also experience

high transportation cost burdens and long car commutes, coupled with low transit usage. Cars are the top source of CO2 and second largest source of NOx in the state. Car-free access to jobs is important to both alleviate air pollution and reduce poverty. Unfortunately, investments in hydrogen trains hinder these goals. Hydrogen trains have higher operating costs than electric trains and are considered most optimal for low frequency routes. Investment in hydrogen trains, with long rolling stock lifespans, locks in slow, low frequency service for decades, making these rail lines uncompetitive with driving for workers who value their time. Additionally, California High Speed Rail will use OCS, and rail systems that use OCS, such as Caltrain, gain connectivity with a statewide rail network. Investments in hydrogen trains, an incompatible technology with different infrastructure needs, exclude environmental justice communities from a statewide network and access to jobs while disproportionately exposing them to hazards associated with hydrogen refueling. Californians for Electric Rail requests that CARB fully evaluate OCS in future zero emissions rail studies, retract and/or update inaccurate publications, and shift funding (via the LCFS and other programs) away from hydrogen trains and towards existing and new OCS. See our attached letter and the RailPAC's whitepaper linked within for more detail.

Comment:

Good evening my name is Jennifer Cardenas. My pronouns are she/Ella. I'm with Too Grassroots, a collective of environmental justice community members who are building local power, shaping a safe and healthy future, and uniting frontline community members in the fight for an inclusive and just environment. I am here to speak about the LCFS and our disappointment with the changes that overlook urgent needs for clean air.

Between the 19th century and 20th century canaries were used as indicators of toxins in the coal mines. While technological advancement has replaced the canaries, risk management continues to be a key concern. Not only for people who work in places like airports and warehouses but also for frontline communities. Here in the inland Empire, children are the new canaries of the 21st century, children breathe faster than adults, breathing in more pollutants. We see the impact they are having everytime they go play outside or on bad pollution days. We see them having nose bleeds, weezing, or having an asthma attack. While we watch them grow we have to normalize having an inhaler if they even have the strength to play a sport. We see their year around health impacts, and yet we have the technology to have a zero-emissions and do better by these communities. The LCFS has major flaws and CARB needs to eliminate polluting biofuels and invest in electrification to achieve a zero-emissions future immediately.
