Subject: California Air Resources Board has written a proposed shore-side power or “cold ironing” r

Comment:

The CARB regulation should be Technology Neutral as to how emissions from ships are reduced.

Ø Level the playing field for all technologies to be implemented.

Ø The proposed regulation allows industry to postpone emission reductions until 2014 when utility based grid power is available.

Ø Establish equal timelines based on emissions reductions regardless of the technology.

Ø Establish an emissions credit bank for early compliance.

Ø Many solutions are available today, we shouldn't have to wait for grid power promises

Comment:

This is ridiculous. Why would you wait another 7-10 years to fix a problem when we have the resources and technology to help it now. How can we just sit here and continue to harm peoples health, and our environment when there are simple solutions to these problems now.

Stop being so political and lets get back to the basics of simple human survival.

Subject: Regulations to reduce emissions from diesel auxiliary engines on ocean going vessels ...

Comment:

This regulation as written will not reduce a single ounce of harmful emissions until January 1st, 2014 at the earliest when mandated reductions go into effect. As written the proposed regulation offers no incentive for early adopters to achieve compliance before being forced to. Lastly, compliance standards within the proposed regulation serve to thwart new technological solutions that are available today. This is because the regulation is based on a presumptive solution: port electrification. The problem is that the presumption is flawed. The costs are staggering, estimated to be \$1.2 billion statewide, and the difficulty to electrify a port means years of construction to install infrastructure to receive electrical power that is not available - and there are no plans or budgets to build new generation capacity to supply this power.

Ship-borne air pollution is well documented and proven to cause serious health problems in people from in all walks of life having serious effects on children and the elderly. One scientific report published on November 7th, 2007 by the American Chemical Society journal Environmental Science & Technology states "...the number of people dying (globally) from heart and lung disease as a result of under-regulated shipping emissions totaled 60,000 in 2002, and that death toll is estimated to grow by 40% by 2012..."

Incentives for early adoption of alternative control solutions are essential to encourage ocean carriers, vessel owners and terminal operators to use proven emissions preventative technologies that are available now. If encouraged these solutions could reduce these harmful emissions to the full extent of the regulation in every seaport in California by year-end 2012 - and at a small fraction (1/30th) of the cost of port electrification. That's 6 years sooner and more than a billion dollars cheaper. This is truly a better way.

Subject: comment to shorepwr07  
Comment:

It is in the interest of all Californians that you act to reduce pollution where ever it occurs. This is particularly true at the ports of California where there is such a high concentration of pollution. We see this as a critical step in improving the quality of life for Californians and especially for communities in and around the ports.

We do not think it wise to extend exemptions to any port users for any reason at the expense of our children and communities. These regulations need to reflect our determination to illuminate problems resulting from port pollution; if not as an enforceable solution as a goal. Most Californians are fed up with government that accomplishes nothing by appeasing polluters.

Stephen and Betty Anderson

Subject: Comment on Emission Measurement Method

Comment:

The emission measurement method for diesel PM for demonstrating control efficiencies for alternative control technologies (f)(4)(B)3. should allow CARB Test Method 5 or U.S. EPA Reference Method 5 and 202. The ISO 8178 Test Methods needlessly require a dilution tunnel, 5 stable test modes, and a different temperature (125 F) defining PM. Auxilliary engine exhaust stack diameters and gas velocity are normally within the range to allow standard isokinetic PM sampling. Accepted CARB standard methods should be utilized to provide consistency in PM measurements.

Comment:

1. On page 8, Requirements and Compliance Schedule (d)(2)(A) The sentence "...Specifically, at-berth auxiliary engine emissions must be reduced by 10 percent by January 1, 2010, 25 percent by January 1, 2012, ..."

should be modified to read... "Specifically, at-berth emissions must be reduced by...", where the words "auxiliary engines" have been deleted.

At-berth emissions include boiler emissions, and the ACTI system will reduce boiler emissions as well as auxiliary engine emissions, resulting in lower total emissions than if only the auxiliary engines were considered. Total emissions reduction should be the criterion.

2. There will be a period of time during shore power connect and also prior to shore power disconnect when the auxiliary engines will be operating. This time is not accounted for.
