Subject: CA's Global Warming Program

Comment:

Thank you for taking global warming seriously and developing a plan to reduce global warming pollution while at the same time creating jobs and making California a healthier and more prosperous place to live.

I will appreciate your strengthening California's global warming program by requiring more of the state's largest polluters to pay for their global warming emissions instead of giving permits away for free. By forcing polluters to pay for the emissions they generate by purchasing permits in an auction, we can then re-invest the auction funds into efforts that will help us transition to a cleaner economy and help lower energy costs for Californians—such as making homes and businesses more energy efficient, increasing public transit options, and developing wind and solar projects in California.

Comment:

* Thank state officials for taking global warming seriously and developing a plan to reduce global warming pollution while at the same time creating jobs and making California a healthier and more prosperous place to live. The proposed program will decrease global warming emissions from the state's largest polluters and establish a market price on these emissions. This program is one of many policies CARB is using to reach the state's goal of reducing global warming emissions to 1990 levels by 2020, along with renewable energy, energy efficiency, and cleaner transportation standards.

* Note that parts of the proposal are strong, such as setting a limit that declines each year, and setting a minimum price on carbon pollution. This steady price signal will help businesses make long-term investments in strategies to reduce global warming emissions.

* Recommend that the program be strengthened by requiring more of the state's largest polluters to pay for their global warming emissions instead of giving permits away for free. By forcing polluters to pay for the emissions they generate by purchasing permits in an auction, we can then re-invest the auction funds into efforts that will help us transition to a cleaner economy and help lower energy costs for Californians—such as making homes and businesses more energy efficient, increasing public transit options, and developing wind and solar projects in California.

Comment:

First thank you for having the vision to accept global warming as fact, not fiction. Second, please require that polluters to pay and not get credit for not polluting. There are too many factors such as health costs, soil and water pollution, use of water that CA is short of to begin with, et al. We need a cleaner economy along with clean energy now, or future generations will not be able to rectify the damage done in today's world.

This is the 21st century, we cannot solve our problems with 19th or 20th solutions.

Comment:

Thanks for working against global warming, the biggest current threat to mankind. These efforts should create jobs and set a positive example for the rest of the country. The declining limit on carbon emission and minimum price should enable businesses to plan rationally to save our planet.

An improvement to the plan would be to auction carbon permits, to set a market price and generate money to ease the transition.

Thanks for your attention.

Sincerely,

Wilson Ross

Subject: Strengthen California's Global Warming Program
Comment:

Dear Air Resources Board:

Thank you for taking global warming seriously and developing a plan to reduce global warming pollution while at the same time creating jobs and making California a healthier and more prosperous place to live.

Setting a limit that declines each year, and setting a minimum price on carbon pollution is certainly helpful, but the program should be strengthened by requiring more of the state's largest polluters to pay for their global warming emissions instead of giving permits away for free. By forcing polluters to pay for the emissions they generate by purchasing permits in an auction, we can then re-invest the auction funds into efforts that will help us transition to a cleaner economy and help lower energy costs for Californians—such as making homes and businesses more energy efficient, increasing public transit options, and developing wind and solar projects in California.

I urge you to adopt the strongest policy on capping California's greenhouse emissions. This means requiring the largest polluters to pay the state government for the emissions they generate.

Thank you.

Sincerely,

Margaret Honda
Los Angeles, CA

Subject: Please strengthen climate change legislation.

Comment:

Dear Air Resources Board,

I agree and support the official comments by the Union of Concerned Scientists.

Thank you for helping to establish standards that will reduce global warming in our world. Many California citizens mistakenly believe that the standards you are helping to set are a handicap for California but as has been shown in the past with the state leading the way with anti-pollution laws over 30 years ago the rest of the world has always had to catch up with us and this places our economy at the lead in technology and manufacturing capability.

The proposed program will decrease global warming emissions from the state's largest polluters and establish a market price on these emissions. This program is one of many policies CARB is using to reach the state's goal of reducing global warming emissions to 1990 levels by 2020, along with renewable energy, energy efficiency, and cleaner transportation standards.

Some parts of the proposal are strong, such as setting a limit that declines each year, and setting a minimum price on carbon pollution. This steady price signal will help businesses make long-term investments in strategies to reduce global warming emissions.

The program can be strengthened by requiring more of the state's largest polluters to pay for their global warming emissions instead of giving permits away for free. By forcing polluters to pay for the emissions they generate by purchasing permits in an auction, we can then re-invest the auction funds into efforts that will help us transition to a cleaner economy and help lower energy costs for Californians—such as making homes and businesses more energy efficient, increasing public transit options, and developing wind and solar projects in California.

Thank you for considering my opinion.

Peace, Hugh Moore

Subject: Please Strengthen California's Global Warming Program

Comment:

Thank you for taking global warming seriously and developing a plan to reduce global warming pollution while at the same time creating jobs and making California a healthier and more prosperous place to live. The proposed program will decrease global warming emissions from the state's largest polluters and establish a market price on these emissions. I am very proud and have been a strong supporter of California's program to reach the state's goal of reducing global warming emissions to 1990 levels by 2020, along with renewable energy, energy efficiency, and cleaner transportation standards.

Parts of the proposal are strong, such as setting a limit that declines each year, and setting a minimum price on carbon pollution. This steady price signal will help businesses make long-term investments in strategies to reduce global warming emissions.

I would like to recommend that the program be strengthened by requiring more of the state's largest polluters to pay for their global warming emissions instead of giving permits away for free. By forcing polluters to pay for the emissions they generate by purchasing permits in an auction, we can then re-invest the auction funds into efforts that will help us transition to a cleaner economy and help lower energy costs for Californians—such as making homes and businesses more energy efficient, increasing public transit options, and developing wind and solar projects in California.

I also urge that the language that would allow carbon offsets through clear cutting and burning biomass be deleted from the program. Clear cutting weakens our forests and not only makes them susceptible to erosion and wild fires, but severely reduces the lands ability to hold carbon in the soil, and for that matter, water, which is so precious in California. Using methods to offset carbon that decimate our forests and belch smoke from burning biomass seems like an oxymoron to me.

Thank you for hearing me on an issue that is extremely important to me.

Sincerely,
Bonnie Breckenridge
San Diego, CA

Comment:

I am thankful that state officials are taking global warming seriously and that CA. is leading the nation in this area. Setting a limit on emissions that declines each year and setting a minimum price on carbon pollution is an excellent start, but I do not feel that we should give the discussed permits away for free. The funds garnered from the sale of the permits should go to both helping with our transition to a cleaner economy and lowering energy costs for Californians.

Subject: CA Cap on Greenhouse Gas Emissions

Comment:

Thank you for all your work on improving our environment here in California. As you know from the recent election, the voters in CA are very strong on keeping CA as the leader of environmental regulations which keep our state clean and very green. The current proposal could be made stronger by insisting that those companies who pollute our air and water be made to pay penalties. The very act of doing this will serve as a deterrent to companies who think they can get away with polluting our beautiful state. Please make this proposal stronger by making all corporations and companies in CA pay penalties if they pollute.

Comment:

Thanks for taking global warming seriously.

However, please strengthen the proposed program by requiring more of the state's largest polluters to pay for their global warming emissions instead of giving permits away for free.

Thank you.

Comment:

Dear Sirs and Madams,

I recommend that the program be strengthened by requiring more of the state's largest polluters to pay for their global warming emissions instead of giving permits away for free.

By forcing polluters to pay for the emissions they generate by purchasing permits in an auction, we can then re-invest the auction funds into efforts that will help us transition to a cleaner economy and help lower energy costs for Californians—such as making homes and businesses more energy efficient, increasing public transit options, and developing wind and solar projects in California.

Thank you.

NL

Subject: Adoption of California Cap on Greenhouse Gas Emissions
Comment:

Dear Members of the California Air Resources Board:

Thank you for taking global warming seriously and developing a plan to reduce global warming pollution while at the same time creating jobs and making California a healthier and more prosperous place to live. The proposed program will decrease global warming emissions from the state's largest polluters and establish a market price on these emissions. This program is one of many policies CARB is using to reach the state's goal of reducing global warming emissions to 1990 levels by 2020, along with renewable energy, energy efficiency, and cleaner transportation standards.

Parts of the proposal are strong, such as setting a limit that declines each year, and setting a minimum price on carbon pollution. This steady price signal will help businesses make long-term investments in strategies to reduce global warming emissions.

I would like to recommend that the program be strengthened by requiring more of the state's largest polluters to pay for their global warming emissions instead of giving permits away for free. By forcing polluters to pay for the emissions they generate by purchasing permits in an auction, we can then re-invest the auction funds into efforts that will help us transition to a cleaner economy and help lower energy costs for Californians—such as making homes and businesses more energy efficient, increasing public transit options, and developing wind and solar projects in California.

Respectfully,
Laura Lynch

Comment:

I am proud to be a Californian helping to lead the way on some of the most important issues we as a nation and the world have faced. Strengthening the proposed program for decreasing global warming emissions from the state's largest polluters is our next challenge. It is also the most important issue facing us today. Radically reducing greenhouse gas emissions is good for the environment on which we depend for food and water and it is good economic policy (don't let any tell you otherwise).

Thank you for taking global climate change seriously and for thoughtfully devising the best course of action for our state. Let's put together the nation's most comprehensive program to limit global warming emissions; let's lead the way.

California Environmental Protection Agency
Air Resources Board

Dear Board Members:

I want to thank you for taking global warming seriously and developing a plan to reduce global warming pollution while at the same time creating jobs and making California a healthier and more prosperous place to live. The proposed program will decrease global warming emissions from the state's largest polluters and establish a market price on these emissions. This program is one of many policies CARB is using to reach the state's goal of reducing global warming emissions to 1990 levels by 2020, along with renewable energy, energy efficiency, and cleaner transportation standards.

I duly note that parts of the proposal are strong, such as setting a limit that declines each year, and setting a minimum price on carbon pollution. This steady price signal will help businesses make long-term investments in strategies to reduce global warming emissions. I particularly applaud this approach.

We who voted against Proposition 23 recommend that the program be strengthened by requiring more of the state's largest polluters to pay for their global warming emissions instead of giving permits away for free. By forcing polluters to pay for the emissions they generate by purchasing permits in an auction, we can then re-invest the auction funds into efforts that will help us transition to a cleaner economy and help lower energy costs for Californians—such as making homes and businesses more energy efficient, increasing public transit options, and developing wind and solar projects in California.

Your efforts will be followed with continuing interest by those of us committed to a cleaner and safer California. Thank you for your efforts on this issue. Please keep all of us informed on your progress insofar as that is possible.

Very truly yours,

Gloria A. Fitzgerald

Comment:

First I want to thank the CARB for taking climate change seriously enough to consider the ramifications. There's a lot of bad science floating around out there, and a lot of confusing and contradictory information even from the people who aren't denying the problem outright.

This proposal takes a few steps in the right direction. The floating limit that adjusts over time, the minimum price on the emissions, these allow businesses to make incremental changes rather than forcing a drastic, immediate, expensive shift that will force businesses to change quickly, relocate in a hurry, or die.

I think it might be worthwhile to consider making gross polluters pay for their permits, rather than just handing them out to anyone who wants one. That revenue can be earmarked for a specific purpose (public transit, alternative energy, maybe even a fund for cleaning up environmental disasters like the oil spill that devastated the Gulf of Mexico not long past) or just stuffed into the general fund if no consensus can be reached on a more fitting option.

If we're going to do this, then let's do it right.

Subject: Proposal to Cap Greenhouse Gas Emissions, etc.
Comment:

Thank you for for taking global warming seriously and developing a plan to reduce global warming pollution while creating jobs and improving public health in California.

There are several components of the proposal that are strong, such as setting a limit that declines each year, and setting a minimum price on carbon pollution. This steady price signal will help businesses make long-term investments in strategies to reduce global warming emissions.

However, there are some ways in which the proposed program could be strengthened. For example, by requiring more of the state's largest polluters to pay for their global warming emissions instead of giving permits away for free. Also, by forcing polluters to pay for the emissions they generate by purchasing permits in an auction, we can then re-invest the auction funds into efforts that will help us transition to a cleaner economy and help lower energy costs for Californians—such as making homes and businesses more energy efficient, increasing public transit options, and developing wind and solar projects in California.

These additions would make a good proposed program much better and should be give serious consideration.

Thank you for your time.

Comment:

Hello,

I'm writing because I want to make sure that global warming is curbed. I am happy that these mechanisms and regulations are being put into place. I think they can and should be stronger. Large polluters should be made to pay for their emissions rather than getting a free opportunity to trade them off. Let them buy their trading option. We can use this money to promote alternative energies and it will hopefully make them pollute less, and have to charge more for their dirty product.

Our economy is in bad shape, but to make it a little worse and save our planet is definitely a trade we can all afford.

Subject: Implement strong clean air regulations

Comment:

Thanks for advancing California's clean air regulations with the goal of reducing global warming. I believe that strong regulatory actions are needed, even if unpopular, to actually reduce carbon emissions and to demonstrate that we Californians are serious about fighting global warming.

I am pleased to see that CARB has proposed strong regulations to reduce greenhouse gas emissions. However, I believe the proposed regulations could be stronger. Large industrial facilities that emit greenhouse gases can do more than your proposed regulations ask. Large industries have the most potential for implementing procedures and practices to reduce their greenhouse gas emissions.

Please strengthen your regulations to make large industries more responsible for reducing their greenhouse gas emissions.

Comment:

I am glad you are taking global warming seriously. It is a source of pride when California is the leader in innovative new approaches to environmental problems. It is also nice to hear "As California goes, so goes the nation" even if the nation is frequently much slower than we are.

Setting declining limits on the emissions that can be released is a great idea. It does seem that auctioning emission permits off could be a great source of income to help the state convert to cleaner sources of energy, with public transit, and with increasing the energy efficiency of homes and businesses. That way polluters know exactly how much their dirty habits are costing them, and they are paying for the costs of alleviating the damage their emissions causes.

Thank you for heeding my comments.

While the newly proposed air quality rules and regulations are strong in a number of ways, for which I am quite thankful, they could be strengthened by extending their authority over all polluting industries. It would also be a good idea to force polluting businesses and operations to purchase permits to continue operations at an auction so that the funds raised would provide the money to pursue effective enforcement.

Comment:

I am proud and pleased that state officials as well as the voters of this state are taking global warming pollution seriously. We can all look forward to the creation of green jobs and a healthier and more prosperous living environment. Establishing a market price on carbon emissions in addition to creating more renewable energy, energy efficiency and cleaner transportation standards is laudable.

I am pleased that the limit will decline each year and a steady price signal will help businesses make long-term investments toward reduction of global warming emissions.

However I recommend that no permits be given away to the larger polluters for free. If they are forced to pay for their permits we can reinvest the funds into ways to help Californians transition to a cleaner economy.

Subject: California's Global Warming Program

Comment:

First, I'd like to thank you for taking the Proposed California Cap on Greenhouse Gas Emissions and Market-Based Compliance Mechanisms Regulation, Including Compliance Offset Protocols as far as you have - good work in the face of corporate power!

Second, I'd recommend that the state's largest polluters pay for their global warming emissions instead of giving permits away for free. The more they pay, the sooner they'll reduce emissions - that's capitalism and human nature. Business can do this, but like a horse, you have to lead them.

Subject: Control Greenhouse Gas Emissions

Comment:

I am proud of what CA has done to control Greenhouse Gas Emissions--as a state we are a leader. But now is the time to go much further. I believe we even need a strong Carbon tax, but if not that then a strong cap and trade program which of course would include compliance Offset Protocols. We should do everything possible to continue to lead the way in every way to prevent the worst effects of Climate Change!

Thank you for all you do, and we count on you doing even more!

Subject: let's move forward and lead the nation in clean air innovation

Comment:

I wish to express my appreciation that the state is working to reduce the air pollution and global warming emissions that is so harmful to our public health and the environment. The proposed cap on greenhouse gas emissions and related market-based mechanisms will do much to move our state forward and lead the nation in reducing GHG emissions. With this in mind, I feel that all polluters should be treated equally based on their emissions or lack thereof, so rather than giving permits away to some as proposed, I recommend that they all pay their fair share or innovate. These new regulations will create jobs in the renewable energy sector that cannot be outsourced - and I hope the proposed measures will be fully adopted and strengthened.

Subject: Global Warning

Comment:

Please do what you can to keep California in the lead for reducing green house gases, reducing pollution and increasing the green energy mix here. When you consider legislation for a cap on greenhouse gases, please level the playing field in California the best way that you can. Make sure that polluters pay the full expense of cleaning up their pollution and the sequestration necessary. Make sure that they pay into some sort of fund to pay for increasing the tropical forests that absorb greenhouse gases.

If polluters paid their share, then green energy producers would have their fair share of the energy profits and we would move to green energy faster.

Subject: Climate change

Comment:

Thank state yoou for taking global warming seriously and developing a plan to reduce global warming pollution while at the same time creating jobs and making California a healthier and more prosperous place to live. The proposed program will decrease global warming emissions from the state's largest polluters and establish a market price on these emissions. This program is one of many policies CARB is using to reach the state's goal of reducing global warming emissions to 1990 levels by 2020, along with renewable energy, energy efficiency, and cleaner transportation standards. Parts of the proposal are strong, such as setting a limit that declines each year, and setting a minimum price on carbon pollution. This steady price signal will help businesses make long-term investments in strategies to reduce global warming emissions.

I recommend that the program be strengthened by requiring more of the state's largest polluters to pay for their global warming emissions instead of giving permits away for free. By forcing polluters to pay for the emissions they generate by purchasing permits in an auction, we can then re-invest the auction funds into efforts that will help us transition to a cleaner economy and help lower energy costs for Californians—such as making homes and businesses more energy efficient, increasing public transit options, and developing wind and solar projects in California.

Subject: Decreasing global warming emissions.

Comment:

Thank you, CARB, for taking global warming seriously and developing a plan to reduce global warming pollution. Thank you also for creating jobs and making California a healthier and more prosperous place to live. I love living in San Marcos (San Diego County) and am trying to reduce my "global footprint" by driving to 3 or 4 locations on the same day, recycling paper, plastics and aluminum, and using organic cleaners in my home.

Setting a limit that declines each year, setting a minimum price on carbon pollution; these are the kind of strong laws that I support.

In your proposed program I also support establishing a market price on gross polluters' emissions. In addition, I recommend that the program be strengthened by requiring more of the state's largest polluters to pay for their global warming emissions instead of giving permits away for free or indeed having "permits" available at all.

I believe that forcing polluters to pay for the emissions they generate, we can then have more funds available to transition to a cleaner economy, help lower energy costs for Californians—such as making homes and businesses more energy efficient, increasing public transit options, and developing wind and solar projects in California.

Again, thank you for the work you have done on this proposal and please make it even stronger.

Comment:

Dear ARB,

THank you for being in the forefront of taking action to tackle climate change. Please do not give the permits away for free, or give away too many permits.

The permits should be valued using the volume of CO2 or other global warming gases produced by each business, with the biggest polluters paying the most. It is very important that you get this right, as it will be the model for the rest of the country.

Sincerely,

Scott Weldon

Thank you for taking time to recognize what an incredibly important issue global warming is to global health. I admire the advances your bill is making in such areas as setting a minimum price for carbon pollution. However, it would benefit everyone for polluters to have to purchase their credits -- rather than having them be paid for by the taxpayer. Neither the environment nor California's economy should have to take the brunt of their pollutions. That money would be much better spent on developing systems such as alternative transportation or wind and solar energy, which not only benefit Californians by their presence and their beneficial effects to the environment, but also by providing much needed jobs.

Subject: California's Global Warming Program

Comment:

First of all, I would like to thank state officials for taking global warming seriously and developing a plan to reduce global warming pollution while at the same time creating jobs and making California a healthier and more prosperous place to live. The current proposed program will decrease global warming emissions from the state's largest polluters and establish a market price on these emissions. This program is one of many policies CARB (California Air Resources Board) is using to reach the state's goal of reducing global warming emissions to 1990 levels by 2020, along with renewable energy, energy efficiency, and cleaner transportation standards.

I am content that the current proposal is strong and sets limits that decline each year and sets a minimum price on carbon pollution. This steady price signal will help businesses make long-term investments in strategies to reduce global warming emissions.

Finally, I would like to recommend that the program be strengthened by requiring more of the state's largest polluters to pay for their global warming emissions instead of giving permits away for free. By forcing polluters to pay for the emissions they generate by purchasing permits in an auction, we can then re-invest the auction funds into efforts that will help us transition to a cleaner economy and help lower energy costs for Californians—such as making homes and businesses more energy efficient, increasing public transit options, and developing wind and solar projects in California.

Thank you for taking the time to read my comments. I look forward to many more decisions and actions by our government that will help us strive toward a healthier state, and a healthier planet.

Subject: Proposed California Cap on Greenhouse Gas Emissions and Regulation

Comment:

I want to thank California state officials for taking global warming and the future of human life on this planet seriously. You are to be congratulated for developing a plan to reduce global warming pollution while at the same time creating jobs and making California a healthier and more prosperous place to live. The proposed program will decrease global warming emissions from the state's largest polluters and establish a market price on these emissions. This program, along with renewable energy, energy efficiency, and cleaner transportation standards are exactly what we need in California, since the federal government seems unable to act.

I am pleased that parts of the proposal are strong, such as setting a limit that declines each year, and setting a minimum price on carbon pollution. With these costs in mind, it is up to businesses to make long-term investments in strategies to reduce global warming emissions. It is something they should have already done, but it is abundantly clear that businesses will not act until they must. And the program implemented in California must force businesses to act.

That is why I feel that the program needs to be strengthened by requiring more of the state's largest polluters to pay (i.e., spend actual money) for their global warming emissions. Please do not give permits away for free! We need to force polluters to pay for the emissions they generate. Then we need to re-invest these funds into efforts that will help us transition to a cleaner economy.

Subject: Cap and Trade Regulations Comments
Comment:

Dear Board Members:

I support the Cap and Trade Program that you will soon vote on as far as setting a limit that is required to decline each year, and equally important, setting a minimum price on carbon pollution. The minimum pricing will be a steady signal to help business invest in the best possible technology to clean up industry processes to reduce global warming emissions. So I strongly support both setting the limit and having it decline each year and establishing the minimum pricing.

I think that the program could be significantly strengthened by a requirement that more of the state's largest polluters pay for their global warming emissions instead of simply giving pollution permits away for free. Large polluters should buy their permits in an auction process. In this way, we can invest in a greener economy and help lower utility costs for low income californians. An auction is legal under Prop 26 which covers fees voted on by the legislature but does not cover auctions.

I hope you will add a requirement to strengthen the program through selling permits at auction for the largest polluters in the state. I believe that you as board members, all the staff and members of the working groups involved in putting together the cap and trade program as well as the legislature and the Governor have done a good job--buying permits at auction instead of giving them for free will make a great program. It will make California's cap and trade program one of the first and best in the country. Thank You,
Michael E. Bailey.

I am proud that California is attempting to address the real and desperately urgent problem of climate change. While I applaud many aspects of the plan, especially the clear pricing of permits and the steadily decreasing limits on allowable emissions, I believe that the plan is too lax in giving away permits. It should instead, auction them and use the proceeds to support implementation and enforcement of the program. Polluters are making huge profits while costing the rest of us in money and in health.

Subject: Please Strengthen CA's Global Warming Program

Comment:

Let's make it a priority to reach the state's goal of reducing global warming emissions to 1990 levels by 2020, along with renewable energy, energy efficiency, and cleaner transportation standards.

CA's Global Warming program could be strengthened by requiring more of the state's largest polluters to pay for their global warming emissions instead of giving permits away for free.

Thank you for your time and attention!

*Heather John

Subject: Help Strengthen California's Global Warming Program

Comment:

Thank you for taking global warming seriously and developing a plan to reduce global warming pollution while at the same time creating jobs and making California a healthier and more prosperous place to live. The proposed program will decrease global warming emissions from the state's largest polluters and establish a market price on these emissions. This program is one of many policies CARB is using to reach the state's goal of reducing global warming emissions to 1990 levels by 2020, along with renewable energy, energy efficiency, and cleaner transportation standards

Parts of the proposal are strong, such as setting a limit that declines each year, and setting a minimum price on carbon pollution. This steady price signal will help businesses make long-term investments in strategies to reduce global warming emissions.

However, the program should be strengthened by requiring more of the state's largest polluters to pay for their global warming emissions instead of giving permits away for free. By forcing polluters to pay for the emissions they generate by purchasing permits in an auction, we can then re-invest the auction funds into efforts that will help us transition to a cleaner economy and help lower energy costs for Californians—such as making homes and businesses more energy efficient, increasing public transit options, and developing wind and solar projects in California.

Thanks you.

Subject: Strengthen California Climate Change program
Comment:

It's time to take climate change seriously.

Make California a healthier place to live. Help California become a leader in new green technology and green jobs. CARB has many policies to help the state reach its goals.

Reduce emissions to 1990 levels by 2020.

Keep the proposal strong. Set a limit that declines each year. Set a minimum price on carbon pollution. These help business to make long-term investments, not only think about short-term gain.

China is investing in high speed rail and green technology - we must be competitive in green energy. Will they be the leaders or California?

Do not give permits away for free. This program needs to be strengthened. It's logical to require California's largest polluters to pay for the emissions. Do not give these permits away for free! Then re-invest this into efforts that help transition us to a cleaner economy.

Thank you and happy holidays,

John Hamiga

Subject: Please strengthen California's Global Warming Program

Comment:

I am 52 years old. I am a 4th generation San Franciscan, my grandson is the sixth. I am concerned that my grandson may never go deep sea fishing for salmon as I did as a youngster. I am concerned the air he breathes may make him sick. I am concerned that fracking may pollute the water he drinks.

I am very concerned about the health of California as a whole. My ancestors worked very hard to make California what it is, and I intend to fight to save it from people and corporations that simply want to make a buck and don't care about the waste and pollution they leave behind.

I want to thank you for taking global warming seriously. Many parts of the program are strong, yet I want to ask you to please strengthen the program by;

- 1) forcing polluters to pay for the emissions they generate by purchasing permits at an auction;
- 2) making businesses and homes more energy efficient;
- 3) increasing public transit options (look at Europe for examples, many people don't need to own cars);
- 4) developing more wind and solar projects.

Three of the above ideas would also provide jobs and business development.

Thank you for considering my opinion.

Sincerely,

Teresa Leibert

Subject: Global Warming Program

Comment:

I am very proud to live in the state that is doing more than any other to combat global warming and climate change. Thanks for what you are helping us get done!

However, the situation we are in is far worse than almost anyone realizes. I have been studying the latest science for the past few years, and it just keeps looking more and more gloomy. We are in a far worse state than the 2007 IPCC report indicated, and that was more than bad enough. We must do everything we possibly can, and as soon as possible, if we want to have any chance of avoiding horrendous catastrophes in the coming decades and centuries.

One thing that you could do right now is make the emitters of greenhouse gases pay for their permits in an auction instead of getting them for free. If they don't have to pay, they have no incentive to reduce emissions quickly. It's as simple as that. And we can't wait another day, much less years, before making the huge changes that we must make.

Thank You for listening.

Subject: CARB improved air quality standards

Comment:

Thank you for work on improving the air quality in CA. Cleaner air standards will benefit us all, and the majority of my fellow Californians appear to agree. I am remembering the words of Chief Seattle "This we know: the earth does not belong to man, man belongs to the earth. All things are connected like the blood that unites us all. Man did not weave the web of life, he is merely a strand in it. Whatever he does to the web he does to himself." I encourage the Board to consider charging fees for permits, rather than giving them away for free. When large corporations have to be accountable to our state's air quality standards, it will reinforce State revenues. Air may be 'free,' but dirty air is costly to all of us who need to breathe it.

Subject: California Cap on Greenhouse Gas Emissions and Market based Compliance Protocols
Comment:

First of all, I would like to thank you for taking climate warming seriously and developing a plan to reduce global warming pollution while at the same time creating jobs and making California a healthier and more prosperous place to live!

Both myself and my future children will benefit from your forward thinking, thank you for caring about future generations, and creating good jobs in our present circumstance!

Setting a limit on Carbon pollution that declines each year and setting a minimum price on carbon pollution are both strong measures of this proposal by promoting long-term versus short-term investment in strategies to reduce global warming emissions.

However, the program could be better: the largest polluters should be held responsible for their current emissions; they should pay for their permits in an auction style setting rather than be given a free ride. The state can then re-invest auction funds into efforts to transition to a cleaner economy, away from carbon based energy. These funds could be used for clean energy residential and commercial retrofitting programs such as making homes and businesses more energy efficient, increasing public transit options, and developing wind and solar projects in California.

Thank you for reading my letter and taking my suggestions into serious consideration. Not only our health but the health of our children and their children hangs in the balance of our climate decisions today.

What will we leave to our children in California? A barren and polluted desert or a vibrant, balanced environment, not only to survive in, but thrive in as well! We can do this! The planet is looking to California as a beacon of innovation, lets rise to their expectations!

Sincerely,

Saoirse G. Folsom
Oakland, Ca.

Comment:

Thank you for taking action on this vital program. Climate change is the most important issue facing mankind today and it is urgent that we act quickly and decisively. The great thing about cutting carbon emissions is that we can create a green economy that will help employ local workers, cut our dependency on foreign oil, start to prepare for a future with less oil, and clean the air all at once.

I would like to see polluters pay for creating CO2 rather than having rights given away at auction. This is only being responsible for the problems you are creating. Money raised at auction can then be funneled back into research and possibly carbon reduction strategies, such as energy efficiency programs for the poor.

Above all you need to act to create stability for business, so they can plan for the future.

Comment:

Thank you for your efforts to reduce global warming pollution and make California a forward-looking state that invests in energy efficiency, renewable energy and public transportation.

The proposal has some strong elements, such as setting a minimum price on carbon pollution, but could be made stronger by requiring more of the state's largest polluters to pay for their emissions.

Money from the sale of permits can be invested in projects which move us towards a cleaner economy.

Subject: AB32 and Cap and Trade
Comment:

Thank you CARB for moving forward in promoting AB32.
However, I deeply encourage CARB to phase out free pollution
allocations to the industrial sector.

Giving these free pollution credits to industry polluters will slow
and sabotage our transition to clean energy alternatives, and to
the progress we hope to achieve with Global Warming Solutions.

We must phase out these free "cap and trade" credits as soon as
possible. We have no time to waste; our planet and its inhabitants
are owed that much respect, and urgency.

With the utmost sincerity,
Rebecca H. Pollack

Thank you for taking global warming seriously. I approve of setting a limit that declines each year, and setting a minimum price on carbon pollution. The program should be strengthened by requiring more of the state's largest polluters to pay for their global warming emissions instead of giving permits away for free, which could be a source of additional revenue for the state. There should also be limits at which money is not enough compensation for the amount of damage being done and the operation is shut down.

Dear California Air Resources Board Members,

As a native Californian, I have seen the worst of smog and now the effects of climate change on our otherwise beautiful state. I appreciate your recognition of the problems California faces and your efforts to find solutions.

Specifically, I hope that the program you are addressing will be strengthened by requiring more of the state's largest polluters to pay for their global warming emissions instead of giving permits away for free. By forcing polluters to pay for the emissions they generate by purchasing permits in an auction, we can then re-invest the auction funds into efforts that will help us transition to a cleaner economy and help lower energy costs for Californians—such as making homes and businesses more energy efficient, increasing public transit options, and developing wind and solar projects in California.

Thank you for all you are doing.

Sincerely,

Subject: California's global warming program is a wonderful step forward--strengthen it!

Comment:

Firstly I would like to thank you for taking the threat of global warming seriously in a time when well-documented scientific findings are constantly under attack by polluters and their allies. It is incredibly heartening that my home state has developed a plan to reduce global warming pollution while at the same time creating jobs and making California a healthier, more prosperous place to live. Much of the proposal is very strong--it is vital, for instance, to set a price on carbon pollution and a limit that declines each year. This steady price signal will help businesses make long-term investments in strategies to reduce global warming emissions.

However, the plan needs to be strengthened to be as effective as possible. More of the state's largest polluters should be required to pay for their global warming emissions, rather than permits being given away for free. Forcing polluters to pay for the emissions they generate by purchasing permits in an auction will allow us to re-invest the auction funds into efforts that will help us transition to a cleaner economy and help lower energy costs for Californians. Such efforts include making homes and businesses more energy efficient, increasing public transit options, and developing wind and solar projects in California.

Regarding the role of carbon offsets in the plan, it is vital that you ensure that offsets cannot be sold more than once through different registries, as this would negate the purpose of allowing offsets at all. CARB's role in offset decisions should, in addition, be defined more clearly in order to account for potential conflicts-of-interest in third-party offset registries which receive money from offset developers. Furthermore, over-reliance on offsets can delay investment in transforming California's heavy-polluting sectors. As such, the offset limit should be lowered and the majority of the cap and trade program's required emissions reductions should come from those polluting sectors.

In conclusion, I thank you for all the effort you have put into this program and I am encouraged by the fact that California continues to be a leader in the fight against climate change.

Subject: Require payment for carbon pollution permits; our air is very valuable

Comment:

Thank you very much for taking global warming seriously.

You make California proud as you develop plans to reduce global warming pollution, and make California a healthier place to live as well as more prosperous due to green jobs creation --and cash for pollution permits.

Please establish a stronger market price on these emissions from the state's largest polluters. I applaud your plan to set a steady minimum price for emissions, which will encourage businesses to make long-term investments in strategies to reduce global warming emissions.

Please require more of the state's largest polluters to pay (buy permits) for their global warming emissions, instead of giving permits away for free. Our air is too valuable to pollute for free!

You could apply these funds to help lower energy costs for Californians--such as making homes and businesses more energy efficient, increasing public transit options, and developing wind and solar projects in California.

Please do not give out free pollution credits to big industry polluters! Californians do not want to allow large companies to pollute more than others. It is only fair that we all share equally in working towards cleaner air.

When big polluters are no longer allowed to pollute as much, they will naturally turn to cleaner alternatives. It only makes sense!

Thank you for listening to my views.

The proposed program will decrease global warming emissions from the state's largest polluters and establish a market price on these emissions. This program is one of many policies CARB is using to reach the state's goal of reducing global warming emissions to 1990 levels by 2020, along with renewable energy, energy efficiency, and cleaner transportation standards.

These parts of the proposal are essential and strong, such as setting a limit that declines each year, and setting a minimum price on carbon pollution. This steady price signal will help businesses make long-term investments in strategies to reduce global warming emissions.

I recommend that the program be strengthened by requiring more of the state's largest polluters to pay for their global warming emissions instead of giving permits away for free. By requiring polluters to pay for the emissions they generate by purchasing permits in an auction, we can then re-invest the auction funds into efforts that will help us transition to a cleaner economy and help lower energy costs for Californians—such as making homes and businesses more energy efficient, increasing public transit options, and developing wind and solar projects in California.

Comment:

Dear CARB:

Thank you for taking global warming seriously and developing a plan to reduce global warming pollution while at the same time creating jobs and making California a healthier and more prosperous place to live.

Your proposed program will decrease global warming emissions from the state's largest polluters and establish a market price on these emissions. Having a declining limit on emissions and a price for pollution is good policy and will allow California businesses time to plan and implement necessary changes.

There should be no free permits available. All permits should be purchased at auction, with the funds derived used to strengthen the State's programs constructed to deal with climate change.

Comment:

Please, please, please do NOT give away any permits to pollute the air for free. We need to get on global warming NOW. Yes I know it will make stuff more expensive - but we really need to quit buying stuff we don't need.

I live less than a mile from the ocean and I am worried that I will not get to live out my life in my home. At some time I expect the banks to redline all the homes near the ocean and refuse to give anyone loans to buy a home. At that point my home only has value so long as I can live it it - nothing more.

Every time I hear about global warming, the scientists say they have underestimated the rate at which change is happening. I don't want my whole life, and everyone I know to be under water.

Subject: Proposed California Cap on Greenhouse Gas Emissions and Market-Based Compliance Mechanisms

Comment:

First I would like to thank all those who are responsible for making California the leader in trying to reduce greenhouse gas emissions and for showing the rest of the country the model for a way to reduce these emissions which dirty and pollute the air we breath, the water we drink, and the natural beauty we all enjoy. California must preserve CARB and go even further by setting a minimum price on emissions caused by California's biggest polluters, this will undoubtedly force these polluters to cut down on their carbon emissions, it's a "Win Win" for all.

Subject: Strengthen action against global warming
Comment:

Dear decision makers,

First off, thank you for taking global warming seriously. Global warming poses a serious threat to Earth and California. In addition to the numerous physical changes documented by the Fourth Assessment Report of the IPCC, global warming poses a national security and economic threat as documented by the U.S. Defense Department and the United Kingdom (the "Stern Report").

I support the fixed (and declining) cap on greenhouse gas emissions and minimum prices on carbon emissions. These measures will encourage companies and individuals to adopt low carbon technologies. Furthermore, I encourage you to reduce the number of free permits granted to the largest polluters. Free permits reduces the number of permits available to other sectors of the economy and reduces incentives for transitioning to a low carbon economy.

Sincerely,

Ray Anderson
Culver City, California

Comment:

Hello,

Thank you for taking global climate change seriously, the threat to all living species is real and severe.

I strongly believe that emitters of carbon should pay for these emissions based on the volume. Be it a carbon tax or cap-and-trade. Regardless of the technique selected, the fees should create an incentive for renewable, non-carbon energy.

Coal is the worst energy severe damages to land, creeks and humans during mining. Intensive energy for shipping. Horrible air pollution and massive ash lagoons that are dangerous and toxic.

Conservation is our easiest first step. Wind, solar, public transit and smarter buildings will make a big difference too.

Thank you,
John Antaya

Comment:

Dear Sirs,
Please do not be persuaded by special interests or climate deniers to pursue weak implementation of prop 23. Strong implementation is essential and is what the people of california, myself included, have asked for. Thank you for taking climate change seriously. It is serious. Setting a strong and consistent price for carbon emissions is essential to create a consistent business climate. Progressively reducing climate emissions is also the right thing to do. I am disappointed however that so many permits will be given away to major polluters. Carbon polluters should have to pay a price for their degradation of the environment and by charging more polluters for permits, the state can generate revenues for use in promoting a clean energy economy. California has an opportunity to become a leader in the clean energy industry and supporting it's development should be a priority for the state. Thank you
-Michael Geluardi, Santa Cruz, CA

Comment:

Hello,

I am very proud of California's early adoption of programs to address global warming. Thank you for your work, it is appreciated. I also believe that the capandtrade10 program, while strong in many ways, could be improved by charging for all permits, rather than allowing a free-pass - or exceptions.

Please work to strengthen this aspect of the program, as it will improve funding and simply be fair - externalizing pollution costs is no longer a reasonable corporate policy.

Thank you

Chris Hogan

Subject: Strengthen greenhouse gas reduction regulations
Comment:

Honorable Chair Nicols and Board Members:

Thank you for your hard work. I am writing to urge you to strengthen the regulations at least in two areas: (1) Lower the offset limit. (2) Design a plan that moves towards 100% auctioning in allocating allowances. The excessive free allowance in the present proposal would undermine the goals of AB32, and would present a missed opportunity to raise funding for clean energy and energy efficiency programs. I think that studies have shown that no more than 15% free allowance is really needed to prevent any possibilities of loss of business profits.

As a concerned citizen, I understand the importance of reducing greenhouse gas emissions as well as air pollution. Air pollution means health care costs as well as a loss in productivity. I participated in the AB32 scoping plan held in San Jose in 2006. I also felt inspired by Chair Nicols' talk at the Global Climate Energy Project workshop at Stanford later that year. I hope that you will make California a true leader in curbing greenhouse gas and pollutant emissions.

Thank you.

Sincerely,
Mei-Ling Shek

Comment:

I agree with setting a limit that declines each year, and setting a minimum price on carbon pollution. This steady price signal will help businesses make long-term investments in strategies to reduce global warming emissions.

But, I believe that the program needs to be strengthened by requiring more of the state's largest polluters pay for their global warming emissions instead of giving permits away for free. By forcing polluters to pay for the emissions they generate by purchasing permits in an auction, we can then re-invest the auction funds into efforts that will help us transition to a cleaner economy and help lower energy costs for Californians—such as making homes and businesses more energy efficient, increasing public transit options, and developing wind and solar projects in California.

Thank you for taking global warming seriously and developing a plan to reduce global warming pollution while at the same time creating jobs and making California a healthier and more prosperous place to live. The proposed program will decrease global warming emissions from the state's largest polluters and establish a market price on these emissions. This program is one of many policies CARB is using to reach the state's goal of reducing global warming emissions to 1990 levels by 2020, along with renewable energy, energy efficiency, and cleaner transportation standards.

Parts of the proposal are strong, such as setting a limit that declines each year, and setting a minimum price on carbon pollution. This steady price signal will help businesses make long-term investments in strategies to reduce global warming emissions.

I recommend that the program be strengthened by requiring more of the state's largest polluters to pay for their global warming emissions instead of giving permits away for free. By forcing polluters to pay for the emissions they generate by purchasing permits in an auction, we can then re-invest the auction funds into efforts that will help us transition to a cleaner economy and help lower energy costs for Californians—such as making homes and businesses more energy efficient, increasing public transit options, and developing wind and solar projects in California.

Comment:

Thanks for your plan to slow down global warming! Much of your proposal is strong, especially the declining emissions limit and the minimum price on carbon pollution.

Could you please in addition charge large polluter for emissions and not give permits away for free? Selling permits at auction will allow us to transition to clean energy and lower energy costs for residents of California. making homes and businesses more energy efficient, increasing public transit options, and developing wind and solar projects in California will be easier to do, and they're very important.

Comment:

Dear CARB

I support the strongest possible actions to curb greenhouse emissions in CA and help stop global warming. One of the best ways to do this is to force polluters to pay directly for their emissions.

California citizens have repeatedly voted in favor of strong curbs on greenhouse emitters. Also, support for renewables is good for the economy, good for the planet, and good for my grandchildren! Please stand up for us now.

Regards,
Lee M. Anderson

Subject: Help Strengthen California's Global Warming Program

Comment:

My father, Howard Wilcox, a PhD in nuclear physics, wrote the book "Hothouse Earth" in 1975. Thank you for taking this growing problem seriously. I especially appreciate that your proposal sets a limit on carbon pollution that will decline each year, helping businesses make long-term investments to reduce global warming emissions while also creating jobs. However, we should not give any permits away for free. The state's largest polluters should pay for the global warming emissions they generate by purchasing permits in an auction, which can then be re-invested into efforts that will help transition to a cleaner economy with lower energy costs for all Californians. I would like to see a program subsidizing and encouraging solar panels and a couple of batteries at every home and business all hooked into the grid, thus decentralizing power creation, as well as programs encouraging energy efficiency and increased public transit options. Thank you again for working on strengthening California's global warming program.

Sincerely,
Carol Scher

Subject: Public Hearing for Cap on greenhouse emissions

Comment:

Thanks for developing a plan to reduce global warming pollution while at the same time helping to create jobs and making California a healthier and more prosperous place to live. To speed up the transition from fossil to clean energy sources I strongly recommend that the program to cap greenhouse emissions be strengthened substantially more. It is critically required that many more of the state's largest polluters pay for their global warming emissions. The real cost of green house gases to our economy, human health and environment for current and future generations cannot be underestimated.

By mandating all polluters to pay for the emissions they generate, by purchasing permits in an auction, we can then re-invest the auction funds into efforts that will help us transition to a much needed cleaner economy resulting in improved human health and environment and helping lower energy costs for Californians—such as making homes and businesses more energy efficient, increasing public transit options, and developing wind and solar projects in California, thus creating much needed jobs to quickly transition to an economy driven by non polluting energy sources.

Under current greenhouse emission trends we simply cannot afford to continue risking the fate of future generations. The real price of green-house gases must be paid now while it is still possible to prevent substantial more economic, health and environmental damages due to greenhouse gas emissions. Please ensure that strong compliance and enforcement mechanisms are in place as soon as possible.

Comment:

Thank state officials for taking global warming seriously and developing a plan to reduce global warming pollution while at the same time creating jobs and making California a healthier and more prosperous place to live. The proposed program will decrease global warming emissions from the state's largest polluters and establish a market price on these emissions. This program is one of many policies CARB is using to reach the state's goal of reducing global warming emissions to 1990 levels by 2020, along with renewable energy, energy efficiency, and cleaner transportation standards. Note that parts of the proposal are strong, such as setting a limit that declines each year, and setting a minimum price on carbon pollution. This steady price signal will help businesses make long-term investments in strategies to reduce global warming emissions.

Recommend that the program be strengthened by requiring more of the state's largest polluters to pay for their global warming emissions instead of giving permits away for free. By forcing polluters to pay for the emissions they generate by purchasing permits in an auction, we can then re-invest the auction funds into efforts that will help us transition to a cleaner economy and help lower energy costs for Californians—such as making homes and businesses more energy efficient, increasing public transit options, and developing wind and solar projects in California.

Subject: Making the proposal stronger

Comment:

While your proposal for dealing with greenhouse gas emissions in California are strong for the most part, they could be even stronger if you would require the state's biggest polluters to pay for their permits rather than simply give them away. These funds could then be used to fund programs or purchases that would help transition California to a cleaner economy.

Thank you.

Robert Robinson

Comment:

Thank you for developing a plan to reduce global warming pollution while at the same time creating jobs and making California a healthier place. California voters have made clear that they want to push ahead with this. I applaud the proposed program that will decrease global warming emissions from the state's largest polluters and establish a market price on these emissions.

Some parts of the proposal are strong, such as setting a limit that declines each year, and setting a minimum price on carbon pollution. This steady price signal will help businesses make long-term investments in strategies to reduce global warming emissions.

Other parts of the proposal need still to be strengthened: especially the state should require more of the largest polluters to pay for their global warming emissions instead of giving permits away for free. By forcing polluters to pay for the emissions they generate by purchasing permits in an auction, the state can then re-invest the auction funds into efforts that will help us transition to a cleaner economy and help lower energy costs for Californians.

Making the polluters pay will create the right incentives for the rapid change that is needed to mitigate the most disastrous effects of climate change. Using those fees to cushion the transition for the public will also help make this change feasible.

Please do not be influenced by the entrenched interests of large polluters. Heed the voice of the citizens of California who want a cleaner energy future. Thank you.

Comment:

I would like to see the program strengthened by requiring a greater number of the state's largest polluters to pay for their global warming emissions instead of giving permits away for free. The voters were clear in their desire to see this law enacted in letter and spirit, as evidenced not only in its passage but in the rejection of the oil companies' attempts to gut it last November. I think that speaks more clearly than any number of letters you receive in this public comment period, which will undoubtedly be more well known by the corporate interests than the general population. Thank you for your time.

Comment:

Esteemed CA Air Resources Board:

First I'd like to thank you for taking global warming AND our economy seriously! Your plan to reduce global warming pollution and at the same time create jobs, making California a healthier and more prosperous place to live, is commendable. I feel that decreasing emissions from the state's largest polluters while establishing a market price on these emissions is a sound approach, along with renewable energy, energy efficiency, and cleaner transportation standards.

In my opinion the strongest parts of your plan, which guide businesses in making long-term investments in emissions control, are these:

- setting a limit that declines each year
- setting a minimum price on carbon pollution

I believe you can further strengthen the program in one very important way. Requiring more of California's largest polluters to pay for their global warming emissions, instead of giving permits away for free, moves additional burden from the taxpayer to the polluter in a variety of ways. If polluters are forced to purchase permits in an auction, funds from those auctions can support efforts to transition to a cleaner economy and help lower energy costs for Californians—through making homes and businesses more energy efficient, increasing public transit options, and developing wind and solar projects in our state.

Thank you again for your critical work in curbing global warming emissions. All of our descendants will surely appreciate it!

Sincerely,
Querido Galdo

Subject: Strengthening California's global warming program
Comment:

Thank you to the officials who are taking global warming seriously and are determined to institute a plan to reduce global warming emissions. If done right, this will create jobs while making California healthier environmentally and economically. It is critical to create program to decrease global warming emissions from the state's largest polluters and establish a market price on these emissions.

The proposal is right to establish a limit that declines each year, and to set a minimum price on carbon pollution. This steady price signal will help businesses make long-term investments and create strategies to reduce global warming emissions.

But the state's largest polluters MUST pay for their global warming emissions and MUST NOT be permitted to give permits away for free. By forcing polluters to pay their emissions by purchasing permits in an auction, we can re-invest the auction funds to transition to a cleaner economy and help lower energy costs for Californians - such as making homes and businesses more energy efficient, increasing public transit options, and developing wind and solar projects in California.

California is already suffering the consequences of global warming in the devastating firestorms and the growing droughts, heat waves and water shortages. We need to take seriously the costs to California if we ignore or make light of this issue. If handled well, we can turn this crisis into an opportunity to prepare California to lead in the next generation of a clean energy economy.

Thank you,
A Pabian
