Subject: HRA - Use of defensible input assumptions (do not blindly use 2006 study inputs)

Comment:

The modeling files do not appear to provide reasonable accurate inputs by vessel type, including providing for appropriate vessel structure x,y,z parameters necessary to include stack downwash effects. Disagree with using the noted 2006 study approach and assumptions that does not factor in downwash, the previous modeling methods that can be improved on should be improved. OGVs at berth are obviously stationary and many or most of the stacks with these OGVs are connected to or are closely associated with other tall structures on these OGVs (primarily the bridge structures). Not including appropriate downwash parameters will clearly affect the results of the modeling analysis and this certainly would not be allowed for the modeling of other "stationary" sources and should not be allowed here. Other old 2006 study critical input assumptions including the stack height, the stack velocity, and stack diameter should have been confirmed/revised as necessary. These factors can be related to the size/type of vessel more explicitly, including the use of assumed engine size and load factors available from POLA/POLB emissions inventory documents to relate to appropriate diameter/velocity (total flow/plume rise) and assumed stack height by vessel type can be better reasoned using many available data sources...not improving on these old and most likely inaccurate and overly static 2006 study input data assumptions means the HRA analysis is severely flawed before running the model.

Subject: HRA - POLB Berth Locations and Meteorological Data

Comment:

The Berth locations figure appears to show berth locations at the Port of Long Beach (at Pier F, perhaps others) that are no longer used/available for use. The modeled berth locations should be coordinated with the Ports to ensure currently used berths are modeled.

The HRA doesn't note that the Port of Long Beach also has two meteorological data sites, with ready to go formatted AERMOD meteorological data, that should have been considered for use. The Port of Long Beach outer harbor (Gull Park) site likely would not be considered the most representative/best site for the HRA modeling; however, the inner harbor site, which is the site closest to many sensitive receptor locations should have been considered and potentially used in the modeling analysis.

Subject: Cruise Ship Emissions

Comment:

I do not believe the emissions from the cruise ships is a Major contributor to our air quality and we live within a block of the Cruise Terminal (for over 7 years) and have not noticed any Soot/Dirt from the ships. There is however dirt and dust from all the building in the area which is essential to the growth of our city.

With the budget shortage we have and are experiencing and with the huge amount of money the ships bring into the city we believe a stricter air quality control could reduce the number of ships and as such the amount of money that is brought into the area.

Also, we are not sure how the determination was made that they have excessive emissions when there is no official measurement method currently.

Thank you

On another point, 100 feet below my bedroom are locomotives that run for extended periods while parked. I can smell and see the diesel fumes from the engines. They do not need to run the engines, there is power available.

Please remedy this situation.

Subject: Ships at berth/at anchor/ws

Comment:

Dear CARB Staff;

These comments are Workshop/General in nature.

I favor CARB intervention in the operation of ships at anchor and berth. The fuel used for ship engines is the lowest, most polluting form of diesel fuel we use; calledd bunker oil. Norwegian scientists have been studying ways to reduce the emissions pollution of ships at sea. The difficulty, (I digress here, but stay with me)is that there is little that has been accomplished in International waters. I urge CARB to look at what could be described as "California Waters" The one solution that emerged, without changing any existing shipboard technology, was for ships to slow down. Reducing their speed by 1/3 saves 1/2 the fuel. That means 1/2 the pollution coupled with savings, both on fuel, wear and tear. The fuel savings help mitigate schedule losses, manpower costs, etc.

Could this be applied in National water off California? This would reduce the contamination of on-shore winds hitting California.

We're talking speed limits for ships.

Obviously, this revisits the same topic for automobiles, trucks on the highways. I remember driving 55 during the gas crisis. The speed limit was to save gas; but it also, by extension, reduced pollution. A lot. I believe CARB would receive broad support for reducing speed limits in our state. Would do much more, tangibly, than recycling our peanut butter jars.

One of the unexpected pleasures of visiting Maui recently, was the modest speed limits on their highways. Initially I was frustrated; then I understood. Where are we going and how are we getting there? What does our hurry cost?

Mahalo!

Bill Mayben
