Subject: 19 Aug webinar: C3 presentation

Comment:

19 Aug 20 0900: "CA C-neutral by 2045" Good analysis, good presentation. Thank you.

Two questions, please: First, related to Tim's & Bud's earlier questions. Bud forgot to mention Alaska-source CO2-emission-free energy, perhaps as tanker-loads of C-neutral Hydrogen carrier liquids, such as ammonia (NH3) and methyl cyclohexane (C7H14) .

1. Have you considered, and should we all consider and develop as a case, alternatives to assuming "high electrification", which I assume means that the electricity Grid is the primary decarb vector ? Given CA's large transportation energy demand, and that a dedicated gaseous hydrogen pipeline system will probably be required by 2045, and that "packing" the pipeline network provides a large amount of free energy storage, and that hydrogen will be used for industrial feedstocks as well as for energy, then perhaps the optimized C-free CA economy in 2045 will be an [energy + feedstocks] economy, using the hydrogen infrastructure system of generation, gathering, transmission, storage, distribution and end-use, as the backbone infrastructure -- much of it underground -- with electricity limited to the "first and last km, or few km" of the total CA C-free [energy + feedstocks] system ? Should you, and we, develop this as a case ?

2. Should you, we, assume that by 2045 CA's transportation modal mix will be the same as today's ? By 2045, to accommodate millions fleeing rapid sea level rise, CA may need to overlay on its low-density urbanized areas novel, high-density modules of 100,000 people or more, entirely excluding personal vehicles from the urbanized area, a topology based on new fixed-guideway closed loops -- i.e donut, torus. Should you, and we, develop this likely "CarFree" trend as a case, as an alternative ?

I've spent the past 20 years researching renewables-source, CO2-emission-free, energy systems based on hydrogen, and "the other hydrogen", anhydrous ammonia, presenting the results at energy conferences worldwide and in USA, so I hope I have some useful insights. Presentations are available at [www.leightyfoundation.org/earth.php](http://www.leightyfoundation.org/earth.php) Thank you.

Subject: Achieving Carbon Neutrality

Comment:

Thanks for the webinar featuring the E3 report.

Of the 3 options, I favor Zero Carbon Energy (ZCE) most because it is likely to be most effective and the lowest risk.

CDR is the most risky and is likely to be less effective than the ZCE and Balanced plans. CDR technologies have the following problems.

- \* The US Dept. of Energy declared that it is not cost-effective on a commercial scale. Recently, these technologies have an operating cost of about \$100/tCO<sub>2</sub>.

- This excludes the cost of manufacture, maintenance, transportation, subterranean injection, land for equipment and storage, disposal and recycling of used equipment, and insurance.

- \* CDR technologies have been researched and developed for over 16 years and innovations have been marginal in recent years, despite burgeoning scientific understanding.

- \* CDR technologies do not remove toxic co-pollutants from combustion of fossil fuels or biomass. Worldwide, annually, 8.8 million people are killed by air pollution.

- Such mass homicide is primarily due to toxic co-pollutants rather than GHGs.

- \* The feasibility of long-term subterranean storage and leak prevention is unknown.

In contrast, natural sequestration by marine and terrestrial botanicals has been well-proven. Old-growth forests store more carbon than any other habitat. They have been shown to remove many co-pollutants including sulphur oxides, nitrogen oxides, particulate matter, and ground-level ozone. Forests provide an impressive array of ecosystem services. Expanded protection of ocean and land in CA has been proposed in AB3030, which has passed the Assembly and is proceeding through Senate committees. Legislation to preserve the ecological integrity of working lands is also making headway in the Senate. Organic agroecology that maximizes carbon storage is needed. Another natural measure that would significantly drive down GHGs is to replace livestock raising with crop agriculture. I look forward to the 2022 Scoping Plan re. natural sequestration

and have numerous recommendations re. policies that will facilitate this.

Replacing fossil energy (including NG) with renewable electricity for all sectors is the most important policy objective and is the core of the ZCE plan.

The renewable portfolio standard energy sources specified in SB100 are wind, solar, geothermal, and existing large-scale hydro. It excludes fossil, biomass, biofuels, and nuclear energy.

Since passage of SB100, it has been discovered that electrolytic hydrogen may be produced with 100% renewable energy, e.g., wind. It is likely that it meets the RPS definition.

A major problem with biofuels and biomass is that they remove plant material from the environment. We need every botanical that is not grown as a crop for humans to be preserved so it may continue to store carbon. And expired plants must be naturally recycled into the earth to enrich the soil and store carbon in the soil. Combustion of botanicals immediately loads the atmosphere with GHGs and toxic co-pollutants. There are 22 biomass facilities in CA. All are 3 to 4 decades old lack state of the art CDR technologies. Emissions from biomass incineration equal that of thermal coal combustion. The cost of biomass electricity is more than double that of fossil electricity. Though woody biomass, even when imported, is classified as renewable energy in Europe, it in fact is far from renewable or zero carbon.

Efficiency, heat pumps, and concrete that has a cement substitute are keen ideas.

Curbing GHGs via carbon pricing may be effective for decreasing GHGs only if numerous policy provisions are followed. I have lots of research on this if you are interested.

Let me know if you wish clarification or citations.

Thanks,

David Bezanson, Ph.D.  
CA resident and voter
