Subject: important concepts missing from plan

Comment:

I applaud the state for recognizing the serious state our lands are in and taking steps to heal the situation.

What has become glaringly apparent are some missing components of healthy ecosystems that nature has shown us.

1. The inclusion of herds of animals on the land and their vitally important impact on the health of the soils and entire system.
2. Biodiversity. It has been shown that both trees, shrubs, pasture and crops in between, all grow better and are more healthy than any grown alone. Silvoforest, agroforest and related concepts are getting there but do not compare with multistory, multi species plant communities. Annual crops between rows of multistory agro producing plant groups will also benefit from the improved fertility in the soil.

There are many working with these important realizations.

Included are two that are helping make tremendous land fertility and economic restoration.

It would be a benefit to the state to include their concepts in training and implementation of these concepts.

michael kersten

Comment 2 for Natural and Working Lands Joint Agency Workshop (nat-workinglands-ws) - 1st Workshop.

First Name: Dan

Last Name: Silver

Email Address: dsilverla@me.com

Affiliation: Endangered Habitats League

Subject: California Natural and Working Lands Climate Change Implementation Plan Concept Paper.

Comment:

Gentlepersons:

Endangered Habitats League (EHL) support this component of California's GHG reduction program and urges an ambitious effort that goes far behind baseline trends. We particularly stress the importance of natural lands protection, which has the important co-benefit of climate adaption, for example in the preservation environmental gradients and movement corridors.

However, while we agree that avoided conversion is a key factor in many part of the state, such as Southern California, there should be greater emphasis on the role of natural lands in sequestering carbon per se. Sequestration in soil is the major form of sequestration in scrub systems.

The concept paper refers to "rangelands" rather than listing the more specific habitat types. Please clarify that rangelands include coastal sage scrub, chaparral, and oak woodland. This is very important.

We support setting acreage targets.

There is much emphasis on restoration. While EHL supports this goal, restoration is also expensive. It will be important to look at the cost effectiveness of preservation/avoided conversion in this context.

Thank you for your consideration.

Subject: Land Life // Planting Trees Without Irrigation

Comment:

Hello,

Thank you for this paper, and plan. Land Life is excited to be a part of this conversation and effort in fighting climate change.

We work with many of the stakeholders in this plan (RCDs, Caltrans, etc), and I've attached an intro brochure for those unfamiliar with our work. We use our biodegradable Cocoon to plant trees at scale in degraded soils and in areas looking to conserve water, and our survival rates average above 70%.

Thank you again for your time and great work. I'm available to help however I can.

Cheers,
Andrew

Subject: Key water related restoration opportunities unaddressed

Comment:

Two particular areas of concern to me as a water specialist for a land management agency are ground water recharge and protection and accessibility of aquatic habitats.

If we are concerned about ecosystem resilience beyond humans it would be good to acknowledge that extensive aquatic habitats have been isolated due to historic road infrastructure that does not allow passage into habitats that could be used for refugia as stream waters get progressively warmer. The aging undersized infrastructure also leads to water quality impacts such as aggradation above road crossing pipes and cutting below. Investing in restoring road crossings would help to restore a hydrologic regime that is less flashy and that promote healthy stream systems.

The other key area to protect are the numerous springs throughout California that are still generously contributing to surface water quantity. These areas are providing key habitat for numerous sensitive species as well which are important to overall ecosystem health.

Spring data for the state of California is in a state of dismay. Investments in the National Hydrologic Data (NHD) set has excluded updates that are much needed to protect these springs. Old USGS maps and the NHD have significant variation in spring numbers and locations. Why? They are small and easily forgotten unless you are Nestle trying to develop and export the waters. Inventorying, understanding and protecting these resources is key to better understanding and protecting ground water resources.

Fuel and biomass reduction as well as wildfires will play a key role in restoring many springs however it is important to protect these key areas as part of the climate change plan.

Subject: comment on Conceot Paper for N&W Lands Implementation Plan

Comment:

Comment 1

p 2 Overview - land types scope

The first sentence states the land type scope of this plan "forests, farmland, ranchland, grasslands, wetlands and urban land".

A similar listing of land types occurs in the first paragraph of the Introduction on page 4, the first sentence of Plan Scope on page 5

This scope misses out many natural lands in southern California and the deserts that are very important for carbon sequestration. Examples are coastal sage scrub, chaparral, oak woodlands and a wide range of desert scrub types. They are not covered by "ranchland" because no ranching occurs. In many cases they are threatened by development that would release much sequestered carbon and eliminate future carbon sequestration programs, or by degradation that reduces carbon sequestration benefits. There are various state programs and state-funded projects to secure conservation and restoration of key areas (such as Natural Communities Conservation Plans and the Wildlife Conservation Board's climate change adaptation program) for which these southern Californian and desert lands are very important.

Comment 2

p 7 Paragraph 1. Natural and Working Lands GHG flux

To the extent that solid scientific data is available, this should encompass the full suite of land types as per comment 1 , not the constrained list stated repeatedly in this document. It will help to indicate scientific uncertainties, as well as future modeling and data needs.

Comment 3

p7 Paragraph 2. Setting path for deeper (GHG) reductions by 2050. We strongly support setting this deeper, longer term path in this implementation plan, irrespective of the results of the NWL inventory A zero or negative

Comment 4

General comment on modeling, goal setting, implementation plan components

Essential to address the broader array of land types, as per comment 1.

Comment 5

Ecological restoration - table on page 12.

We note that the table only addresses mountain meadow and oak

woodland restoration but that text near top of the page suggests the final Implementation Plan will include additional ;and types. Important that it do so.

Comment 6

Rangeland compost application, page 14.

It is necessary that this important management practice be used selectively. There may be areas important for conservation of biodiversity, imperiled species and ecological functions where compost application would be deleterious. Additional scientific research on this issue needed

Comment 7

Riparian restoration, page 14

Land types are broader than grasslands and cultivated lands, and suite of species much more than oaks, depending on the location

Comment 8

Note from conversation at May 18 Sacramento workshop

We are very appreciative of Ashley Conrad-Saydeh's comment understanding the importance of Natural Community Conservation Plans and Habitat Conservation Plans and that full funding these plans is an important GHG reduction activity.

Also we note Ashley Conrad-Saydeh's additional comments that activities in the Implementation Plan are limited by available modeling and that items which are state-funded but not in the model are important for meeting the state's climate goals. We strongly support this statement and trust that the final Implementation Plan will include additional modeling needs.

First Name: Paul

Last Name: Kirk

Email Address: pkirk@landconservation.org

Affiliation: Northern CA Regional Land Trust

Subject: Comments on Natural and Working Land Implementation Concept Paper

Comment:

Dear Shelby Livingston,

Thank you for this opportunity to comment on the Natural Working Land (NWL) Implementation Plan Concept Paper.

The Northern California Regional Land Trust (NCRLT) services the tri-county region of Butte, Glenn, and Tehama from the western slopes of the southern Cascade Range and northern Sierra Nevada Range to the eastern slopes of the Coast Range. NCRLT holds conservation easements on over 24,000 acres in the region and the majority of the acreage is rangelands and oak woodlands. NCRLT staff prepared the following comments addressing the development and implementation of the NWL Plan.

Oak woodland restoration acreage potential in Tehama County alone is at least an order of magnitude higher than the Sierra/Cascade acreage target (Ambitious = 750 acres) that was presented at the joint-agency meeting in Auburn.

Soil conservation practices of mulching and composting within oak woodlands could have unintended effects of creating soil conditions that increase favor increased pressure of non-natives in native plant habitat (e.g., thin soils on volcanic substrates). Restoration of perennial grasses could be considered as an alternative method of increasing carbon sequestration in some rangeland habitats.

The tri-county region has a large network of ephemeral, intermittent, and non-anadromous perennial streams that extend from the valley floor to the coniferous forest. These waterways have potential for restoration perennial herbaceous and woody species through active management techniques (e.g., exclusionary fencing) that could result in carbon sequestration orders of magnitude higher than current state of the art models for project riparian restoration potential, which tends to focus on a limited aggressive restoration approach and specific larger water features (e.g., major arterials and/or anadromous streams).

Implementation of the plan should adequately address the financial support that conservation partners (i.e., nonprofits and special districts) is critical for on-the-ground regional roll out, implementation, and maintenance of plans goals and objectives. Similarly the plan should address the integral role of land managers/landowners and financial support for their participation in implementing and supporting the plan.

Sincerely,

Paul Kirk
Executive Director
Northern California Regional Land Trust

Subject: Recommended Conservation, Restoration and Management Activity - Biochar

Comment:

First and foremost, I would like to thank all of the fine folks at ARB that have done such a wonderful job with the Natural and Working Lands Climate Change Implementation Plan Concept Paper. With that being said, I would like to encourage you all to consider including in the future the GHG emission reduction potential of biochar, which is a carbon-rich material produced from the thermo-chemical conversion of biomass during gasification or pyrolysis processes (i.e. bioenergy generation). Biochar is currently a regulated soil amendment under CDFA's Food and Agriculture Code (section 14513.5).

Considering the need for developing new market opportunities for biomass removed through tree mortality and agricultural residue waste diversion programs, I am writing to express my support for the consideration of biochar production and utilization as an accepted management practice to promote greater GHG emission reductions on natural and working lands across California. The scientific literature supports the conclusion that charring biomass results in changes in material properties of biochars that confer greater persistence to mineralization than any other form of organic matter that is commonly applied to soil (Lehmann et al., 2015). Additionally, the results of a meta-analysis show that the addition of biochar decreased N2O emissions from soils by an average of 54 percent (Cayuela et al., 2014). In 2015, soil management was responsible for 5.86 MMT CO2e or 17 percent of agricultural emissions, of which N2O accounted for 96.75 percent of all soil emissions in California. For more information on the GHG emission reduction potential of biochar, see attached paper.

I look forward to discussing this topic further at your earliest convenience.

Scott Morgan

Subject: Biochar production and use in land restoration activities should be a Best Practice

Comment:

The production and use of biochar, a form of recalcitrant carbon with a number of important benefits for agricultural production and land restoration activities, should absolutely be viewed as an integral part of any natural and working lands climate change implementation plan.

The production and use of biochar can help address the following challenges facing California:

Millions of tons of surplus agricultural biomass generated in the State each year, not to mention over 125 million dead or dying trees in the Sierras caused by the changing climate, or the millions of tons of forest slash produced during fuels reduction work around the state, could be turned into a valuable soil amendment to help reduce water use by farmers in the Central Valley or to help restore degraded landscapes.

A huge side benefit of storing biochar in soils is the carbon sequestration value of the practice. A significant amount of research is ongoing around the world to quantify which types of biochars will persist for the longest time in soils, but existing research indicates the time scale for most biochars are in the century or millennia time frames.

Some forms of production can produce a renewable form of energy that can contribute baseload power to the grid that could replace fossil fuel plants, and in fact much of the biochar produced and sold in California currently comes from Co-Gen plants that have been adapted to produce a high-carbon by-product. We should be modernizing or building more efficient biomass energy plants, not simply closing down older plants.

The value of biochar production and use for enhancing forestry restoration activities specifically has been championed by Oregon-based, US Forest Service Biomass Manager James Archuleta and others. Even the NRCS has warmed up to biochar use and now includes biochar production from forest slash as an acceptable Conservation Activity as part of their Conservation Stewardship Program.

We strongly suggest that ANY California Natural and Working Lands Climate Change Implementation Plan include biochar production and use as part of its recommendations.

Raymond Baltar
Director

California Biochar Association
