Subject: For Natural & Working Lands

Comment:

I have an idea that will help you obtain more and cheaper land. It is to repeal or override local zoning laws which establish minimum size for houses to allow tiny houses and/or override laws that restrict the number of people allowed to live in any home or apartment. People also should be allowed to live in tents to allow more space for their organic garden. Food scraps can be buried in gardens in cities instead of thrown into the garbage & transported to the dump.

Subject: Grassland / Rangeland Plan

Comment:

The models you have shown indicate that grasslands dramatically increase in area in the future. Has any study been done to determine how the exotic annual grasses, which are dead and dry this time of year, contribute to the intensity of fire behavior? Studies have indicated that perennial grasses burn with lower intensity. Prior to European introduction of exotic annual grasses, fire behavior in California may have been different in certain areas with a large component of exotic annual grass cover. This rapid fire movement may effect neighboring forest and shrubland?

Current CDFA Healthy Soils guidelines did allow for compost application on rangelands, but did not allow for a change from annual grasses to perennial grasses. Perennial grasses may also increase carbon sequestration due to the greater below ground root mass.

Will future rangeland compost applications also include perennial grass establishment and a managed grazing component? I question the practice of adding compost to exotic annual grasses without the other components of perennial grass establishment and managed grazing.

Comment:

My comment letter from Jan 2017 with metrics and CARB emission factors was overlooked and not addressed, and was again discounted during the last public meeting.

PRC 42649.87.b from AB 1045 states that California Environmental Protection Agency shall promote a goal of reducing at least five million metric tons of greenhouse gas emissions per year through the development and application of compost. Using the adopted CARB emission factors for compost use, it would take 9.8 million tons of compost use to reach this requirement, diverting almost 17 million tons of organics from landfills. Cal-EPA should provide the metrics and needed programs to achieve this requirement. Applying compost on irrigated croplands could use 7 million tons of compost by 2030, and Caltrans and the other state agencies should be able to use the rest.

Subject: Comments on CALANDs Model

Comment:

Thank you for the opportunity to comment on the development of the CALANDs model. We believe the addition of natural and working lands to CA's climate action work is essential and will assist the entire state in supporting the development of an agricultural economy that can sequester carbon.
