Subject: CHP a GHG Benefit

Comment:

GPI is glad to see that ARB recognizes that CHP provides a greenhouse gas (GHG) benefit with efficient generation of power and steam. When many CHP facilities were built 20 years ago, government policies provided incentives to industry go beyond steam generation from a standard boiler and make a marginal additional investment into CHP to efficiently generate steam and power. Today, we are facing situation where that same level of coordinated policy from ARB/California is needed to encourage existing CHP to continue providing GHG benefits and to encourage new CHP to provide additional GHG benefits.

Subject: But For CHP Option

Comment:

GPI applauds the "But For" CHP option currently under consideration by ARB. Under this option, the facility does not hold the allowances; allowances are the responsibility of the natural gas provider. This option reflects the thinking under which our facility and others invested in CHP. We could have satisfied our steam requirement with a simple boiler. We recognized the incentives CHP could provide with an additional marginal investment. If those incentives are not preserved, we could convert our back-up boiler to full-time operation and shut down our CHP. This decision, while economically responsible for our firm, would not benefit the state, as the state would ultimately see a loss of base-load power. The "But For" CHP option helps CHP facilities preserve the incentives that allows us to continue successful operation of CHP with power to the grid.

Subject: Declining Allowances on CHP

Comment:

ARB is also considering other options where CHP facilities would hold allowances and be subject to a declining level of allowances over time. GPI believes that these options are not appropriate for CHP. In CHP operations, there are not many small changes a facility can make to reduce GHG. In short order, a facility will be faced with a major capital investment to replace the turbine, duct burners, HRSG, or all of the above. All very expensive investments. This would likely occur because a declining allowance is demanded, regardless of the size of that decline. Existing CHP will then have a choice as to whether to invest or shutdown. To avoid unnecessary shutdowns of CHP, ARB should choose the "But For" CHP option. Alternatively, ARB could choose a double-benchmark standard for CHP that would serve as the basis for allowances, adjusting the standard downward over time only when it is cost-effective retrofits are justified. This is how retrofit regulations have been implemented in California, and we would hope that ARB does not deviate from this approach for AB32.

Subject: 51% Reduction in offsets on CHP

Comment:

ARB is considering rules that require that 51% reduction of GHG comes from onsite. For CHP, this is a rule that drives facilities to consider only big capital investments they can make in the turbine, for example. It locks out CHP from inexpensive investments they could make to reduce GHG in other sectors. For this reason, GPI recommends that CHP be exempted from the 51% rule.

Subject: Use of Auction Funds

Comment:

To successfully reduce GHG, new technology will be needed across all sectors, including CHP. We request that the funds generated through allowance auctions go back to industry R&D to allow new technologies to be developed. If this is not done, the auction costs suffice only to tax industry over GHG emissions, rather than a means of improving our climate.
