Subject: 2022 Scoping Plan Update - Engineered Carbon Removal

Comment:

Yes the scientific consensus is that carbon capture is necessary and some of it will have to be engineered. So it is worth researching and worth trying to bring the cost down.

There are three caveats. 1) Fossil fuel companies and their paid lobbyists and legislators want to use carbon capture to delay the demise of fossil fuels. This has brought about a lot of greenwashing "information." This is difficult to deal with because our politicians have not said clearly when and how fossil fuels will be phased out. The International Energy Agency has clearly said we have used up our carbon budget, so no new fossil fuel development. If fossil fuel companies use carbon capture to reduce their impact during the short time they will still be around, more power to them and I will gladly pay the extra cost. But this has to be distinguished from efforts to continue development, which are not made more tolerable by carbon capture. technology.

2) All fossil fuel processing has very negative effects on humans living nearby, including the poor and people of color near refineries and drilling sites and the millions who use gas appliances. Eliminating fossil fuels as quickly as possible (by 2030 say) will pay for itself many times over in reductions in the costs of pollution. So we must be very clear that carbon capture does not prolong or increase the climate injustice we experience due to fossil fuels. The first and second points are clearly linked.

3) The third caveat is that carbon capture should not have countervailing effects. I'm thinking particularly of carbon capture paired with biomass processing. If the biomass is waste and there is no other use for it, then we are better off capturing the carbon produce than emitting it. But harvesting biomass that sequesters carbon for purposes such as making hydrogen make no sense since we are eliminating one method of sequestering carbon (tree growth) and "compensating" for it with carbon capture. That is to say, engineered carbon capture should not replace natural lands carbon capture. They need to be additive.

Thank you for this opportunity to comment.

Subject: CCS and CCUS are safe common sense solutions

Comment:

Carbon Capture & Sequestration AND Carbon Capture Use & Sequestration are safe common sense and logical solutions for the state of California to reach its GHG targets. CCS/CCUS are the only technologies capable of reducing the absolute level of CO2 from the atmosphere. And CCUS is also a common sense win-win-win solution to allow for reliable energy production and the capturing and removing and reducing of GHS in the backend. Supporting CCS/CCUS projects in California is good for the state and its people.

Subject: carbon capture and environmental justice

Comment:

I understand the scientific consensus that carbon capture is necessary, but if carbon capture is used by Fossil fuel companies and their paid lobbyists to delay the end of fossil fuels, that is a very negative consequence. I am particularly concerned that fossil fuel processing, which will continue with carbon capture has very negative effects on people who live nearby. Poor people and people of color are the ones who live near refineries and drilling sites and are often the ones who have to live near gas appliances. Furthermore, eliminating fossil fuels as rapidly as possible will pay for itself many times over in decreases in the costs of pollution. It seems obvious to me that we must make sure that carbon capture does not contribute to the intensification of the climate injustice we experience due to fossil fuels. Environmental justice is extremely important to consider.

Comment:

Hi,

I wanted to thank you and all those who presented, for the Aug. 2nd, CARB presentations given in the 2022 Scoping Plan Update - Engineered Carbon Removal Technical Workshop

Informative, with inclusive points of view.

Excellent panels, concise presentations, and thoughtful follow-up questions/commentaries.

I would like to study up more on efforts to identify good CO2 storage sites. Dr. Sally Benson's criteria for good CO2 sites was excellent.

Really respect the work and thought she presented.

Would it be possible to get shape files of the various polygons shown on slides of her presentation.

In particular those which outline areas with suitable Saline Formations at appropriate depths, O&G fields, the 'Avoidance Areas' (Faults, Earthquakes, Sensitive habitats, High Population Density), the CO2 emissions points with identification of the facility, the large polygon of the Exclusion Zone and Notional CO2 Pipelines she recommended based on all of the above?

If the shape files are available, would really appreciate a copy as well as identification of the coordinate system those files are in (NAD27?).

Best Regards,

Jeff Rayner

First Name: Victoria

Last Name: Bogdan Tejeda

Email Address: vbogdantejeda@biologicaldiversity.org

Affiliation: Center for Biological Diversity

Subject: Comments re: 2022 Scoping Plan Update - Engineered Carbon Removal

Comment:

The Center for Biological Diversity (the "Center") appreciates the opportunity to comment on the California Air Resources Board's ("CARB") August 2, 2021 Engineered Carbon Removal Technical Workshop (hereinafter, "the workshop"). The Center was disappointed that the workshop primarily featured speakers who assumed carbon capture and storage ("CCS") by the State of California is necessary to achieve carbon neutrality, and who asserted that CCS is safe and minimally disruptive to frontline communities. The Center vehemently disagrees with these assumptions.

As CARB "consider[s]" engineered carbon removal, it is essential that the agency take into account that according to the Intergovernmental Panel on Climate Change ("IPCC"), CCS is not necessary to achieve emissions reductions, nor is its effectiveness or safety proven. Moreover, the types of dirty energy CCS may prolong, and the infrastructure and energy required for CCS, will cause additional pollution in communities already suffering from unhealthy air and water quality.

We urge CARB to reevaluate its approach to CCS in its upcoming greenhouse gas emissions Scoping Plan update. CARB should focus on a rapid phase out of fossil fuels rather than seeking to entrench technologies that prolong the life of climate-damaging activities and harm frontline communities. In doing so, CARB must ensure meaningful community participation and input from the Environmental Justice Advisory Council ("EJAC"), who, as we understand, has been urging CARB throughout the Scoping Plan process to give greater weight to its recommendations.

Our full letter is attached and we've emailed our compiled references.

Comment:

I am concerned that CARB is moving forward on advancing carbon capture, utilization and storage (CCUS) technologies without fully listening and hearing the concerns of environmental and environmental justice organizations. The Scoping Plan workshop that took place on August 2, 2021 certainly gave me the impression that CARB has a bias in favor of engineered carbon capture technologies.

CARB must take into account input from the Environmental Justice Advisory Council (EJAC) as well as other environmental groups.

CCUS will be very expensive. Those resource would be better focused on eliminating the use of fossil fuels completely.

Subject: Engineered Carbon Removal

Comment:

Carbon capture and storage is a costly strategy using unproven technology. Moreover, other than carbon dioxide, it does not mitigate the harmful and air polluting gases and particles that are emitted during the extraction, transportation, refining, use and disposal of fossil fuels. It does nothing to lessen the air quality issues we suffer in the Los Angeles area, especially in the communities, often underserved communities, located in close proximity to oil and gas facilities.

Please focus your efforts on phasing out fossil fuel production and replacing fossil fuels with clean renewable energy such as solar, wind, hydropower, and geothermal energy.

Subject: do not go forward with carbon capture and underground sequestration

Comment:

I ask that you disapprove of carbon capture and underground sequestration since it only eliminates a part of carbon dioxide from burning fossil fuel, the part of its use at a point of application, but does not reduce the carbon dioxide released from drilling, transporting, and storage of the fuel, then transporting and sequestering. Also, it prolongs the time that carbon is brought up from underground. Also, it would be easy for industries to stop capturing carbon when they feel they need to make more money since the capture and sequestration costs are not part of the product of the industry. There will be sacrifices in the transition to not using fossil fuel, but are the lives of our grandchildren worth it? Of course, they are.

Subject: Community & engineered carbon removal

Comment:

As a resident of Stockton, CA - I listened with interest during the scoping workshop about the various view points represented by scientists, industry representatives, environmental justice advocates, workforce advocates, and CARB staff.

Going forward, I'd hope that EJAC members feel that they are given enough time to prepare or offer their perspectives on each panel. In particular, I am concerned that the Central Valley communities who stand to be most affected by engineered carbon removal (CCS, DAC, etc) have very little technical understanding of the implications (including benefits and drawbacks) of these technologies. That in itself is a significant impediment to a public conversation on this topic, and both can/should be rectified.

Without being a technical expert in this area, it seems that while engineered carbon removal is an important tool in the decarbonization toolkit, it should not be used to justify the extended life of carbon emitting activities. To that end, the proposed implementation of these technologies should not be done at the expense of frontline communities. How then, should we think about that?

If the environmental justice communities (across the Central Valley) are in a meaningful dialogue on this topic, I imagine that CARB would glean useful insights on a range of topics - including how to think about enabling policy to drive dramatic decarbonization through both technology and natural means, alongside renewables adoption -- as well as the relationship between the financing of new technologies and community benefits agreements.

Finally, we all know that climate and workforce and jobs have to work in tandem to really accelerate towards aggressive decarbonization goals. Frontline or 'disadvantaged communities' know their community's needs best, and these conversations on technology - whatever that technology is - have to center the community's voice in determining how to create workforce pathways that bring to life what a 'just transition' should look like for incumbent workers across the state.

Every serious climate projection keeping temps below 2 degrees incorporates some amount of engineered carbon removal. These technologies, while a necessary means of advancing climate goals, must be approached with the due diligence that their affected

communities deserve. CARB should actively seek to educate those who will be most impacted by carbon removal technologies, so that they may make accurate and informed comments on their design, implementation, and regulation.

Subject: Community & engineered carbon removal

Comment:

As a resident of Stockton, CA - I listened with interest during the scoping workshop about the various view points represented by scientists, industry representatives, environmental justice advocates, workforce advocates, and CARB staff.

Going forward, I'd hope that EJAC members feel that they are given enough time to prepare or offer their perspectives on each panel. In particular, I am concerned that the Central Valley communities who stand to be most affected by engineered carbon removal (CCS, DAC, etc) have very little technical understanding of the implications (including benefits and drawbacks) of these technologies. That in itself is a significant impediment to a public conversation on this topic, and both can/should be rectified.

Without being a technical expert in this area, it seems that while engineered carbon removal is an important tool in the decarbonization toolkit, it should not be used to justify the extended life of carbon emitting activities. Subject: Re: Engineered Carbon Removal Technical Workshop

Comment:

I attended the afternoon session of the 2022 Scoping Plan Update, Engineered Carbon Removal Technical Workshop. California needs to support continued research into carbon removal, BUT only as a complement to the larger need to cut carbon emissions. Enabling technology which extends indefinitely the life of existing facilities that extract, produce, or utilize fossil fuels is not a step which California, or the planet, has time for, given the direness of the climate crisis.

Aside from prolonging the life of the fossil fuel infrastructure, carbon removal maintains a narrow focus on CO₂, leaving other heat trapping gases, notably methane, and other climate pollutants unaddressed. This omission is particularly noxious to poor communities which have long contended with the health impacts of greater levels of air pollution. To gain the support of the residents of these communities for the many future mitigations required to deal with the climate crisis, they must see tangible benefits in their environment. Removing CO₂ alone does not meet this need.

As CARB continues support for carbon removal, it should focus on technology for drawing down the existing high level of accumulated CO₂ in the atmosphere and in redoubling its efforts to transition California from fossil fuels to clean and renewable energy.

Thank you for your attention to these very challenging matters.

Comment:

As a PhD member of a team working on reversing climate change, I am supportive of prioritizing natural solutions first. Our paper shows that the combination of using wastes plus seaweed in the ocean can remove CO2 without engineered climate removal, at a lower cost. Please include this peer-reviewed paper in your planning.

Comment:

The Atmospheric carbon would reach dangerous, irreversible levels before the infrastructure is built which itself uses fossil fuels and the sequestration uses fossil fuels. Carbon capture would pollute and increase the price of fossil fuels in the short term which would create poverty in EJ communities leading to an increased Covid death rate. The recent deficiencies in monitoring programs and maintenance that led to the explosion of Aliso Canyon Gas Storage, and the Ventura Compressor station lead me to predict a similar accident with the Salt Cavern storage. Also, carbon leaks during transport to the storage. There are so many incidents of leaking oil wells that they never should be used for storage of carbon. We still need to pass a bill forbidding the use of this carbon for oil extraction.
