Comment 2 for Public Workshop Series to Commence Development of the 2022 Scoping Plan Update (sp22-kickoff-ws) - 1st Workshop.

First Name: Cyndi

Last Name: Dawson

Email Address: cyndi.dawson@castaliaenvironmental.com

Affiliation: The Pew Charitable Trusts

Subject: Improving the carbon accounting in wetlands

Comment:

How is CARB interacting with the recently released National Greenhouse Gas Inventory? Specifically we are interested in the process the will be used to improve and integrate emerging science and data for the wetlands inventory. The last state carbon inventory had wetlands in California designated as a carbon source and the most recent National Greenhouse Gas Inventory has California wetlands as a sink. Pew stands ready to assist to connect CARB with the many scientists we have been working with directly including the lead scientists for the wetland section of the national greenhouse gas inventory.

Subject: EV adoption and charging rates

Comment:

PUC presentation leaves me feeling cold about EV adoption. They and the IOUs seem to be designing a system that makes it impossible for most people (and businesses) to figure out what actually works. Something relatively affordable and simpler is needed, at least for smaller loads. Frankly, a system where rates are partially unbundled, with basic connection costs covered by a fixed charge (perhaps variable by service capacity) and variable charges primarily covering energy. Some municipal utilities have such a residential rate structure.

A big issue seems to be that lower usage by those who can afford building improvement and EV/solar/storage options impacts lower-income customers who can't afford that, or are renters and simply can't do it. That assumes, of course, that EVs will be mostly charged at home (or possibly at work). There are both rate and incentive programs that can help with that, without significantly harming the rate of installation of rooftop solar.

Rooftops are a good place for solar - the land is already developed, so the environmental impact (compared to greenfield solar) is minimal. It also distributes the generation so large investments in new transmission should be less necessary. And solar by itself is **almost** affordable for building owners now.

The biggest issue is storage. EVs are an obvious source for that - big batteries sitting in the garage or driveway most of the time. But most EVs currently do not support 2-way charging, so they can't be used as local storage. 2-way charging is a well-known technology - many Nissan Leaf EVs had it as standard initially - but with no grid or even BTM support it hasn't been included in most EVs. That needs to change - ARB should require that all new EVs support 2-way charging, and should require that equipment for solar energy systems support it (including retrofit options).

Storage otherwise is still way too expensive for wide adoption. Incentives for development of affordable and grid-manageable storage (so it's not entirely BTM) might help, and storage clearly has a major role in taming the duck curve. But for now, "solar" storage is cost-effective only for cases where the grid is unreliable or rates are punitive. For small systems (as might be purchased by an individual homeowner or small-property landlord), a modest amount of battery storage costs more than the solar panels that might feed it.

I'd also suggest looking at how rooftop solar is handled elsewhere.

Discouraging it, as is currently being done by new rate structures in most utilities (municipal as well as IOU), is not a good approach considering the need for maximum development of renewable generation. South Australia's approach might be worth looking at in some depth, where they encourage rooftop solar with batteries and grid-manageable/curtailable.

Comment 4 for Public Workshop Series to Commence Development of the 2022 Scoping Plan Update (sp22-kickoff-ws) - 1st Workshop.

First Name: Gladwyn

Last Name: d'Souza

Email Address: godsouza@yahoo.com

Affiliation: Sierra Club

Subject: Walkable communities, jobs housing balance, and committed emissions

Comment:

Committed emissions from carbon pollution already put in the air will push global temperatures to about 2.3 degrees Celsius (4.1 degrees Fahrenheit) of warming since pre-industrial times.

<https://www.nature.com/articles/s41558-020-00955-x>

Can we make the mobile strategies move faster to zero to accommodate the science? The presentations on 6/10 included walkable communities on transit hubs and a jobs housing balance. How do we get cities to meet existing VMT reduction targets? A measure of permitted per capita metric tons of carbon emission by project required to meet the targets would be helpful in assessing development.

Comment 6 for Public Workshop Series to Commence Development of the 2022 Scoping Plan Update (sp22-kickoff-ws) - 1st Workshop.

First Name: Tom

Last Name: Lent

Email Address: tom.d.lent@gmail.com

Affiliation: Walk Bike Berkeley

Subject: Transport emission reduction thru e-bikes & safe & connected walk & bike infrastructure

Comment:

I appreciate the acknowledgement that while it is critical to continue to push adoptions of ZEVs as rapidly as possible, the shift to electric cars and trucks will not get us to the emission goals required to avert the predicted climate catastrophes. It is clear from the analysis that the time it will take to turn over the fleet even under the most optimistic circumstances will result in our not getting anywhere near sufficient reductions in emissions by 2045.

I also heard strong acknowledgement that due to this problem, we also need to seek dramatic vehicle miles traveled (VMT) reductions soon in parallel with our EV work. Two policy options can help bridge this gap and are currently under represented or entirely missing from current Scoping planning as presented:

1) E-bikes

2) Safe and connected walking & biking infrastructure

Simply put, California can not drive its transportation emissions to zero in a time without e-bikes and better walk & bike infrastructure.

I am attaching a memo which describes in more detail how these can help and policy options recommended for inclusion in the Scoping Plan.

Comment 7 for Public Workshop Series to Commence Development of the 2022 Scoping Plan Update (sp22-kickoff-ws) - 1st Workshop.

First Name: Mihaly

Last Name: Wekler

Email Address: mwekler@elementmarkets.com

Affiliation: Element Markets, LLC

Subject: Sustainable agriculture & fertilizers

Comment:

Element Markets is a long-time driver in various AB32 initiatives, including the supply of low-carbon transportation fuel solutions under the LCFS program. We kindly request that CARB perform an extensive evaluation of carbon intensity effects of feedstock production under the LCFS program and allow for user-specific inputs, especially as it pertains to agriculture-derived fuels. We believe it important for improvements to the agriculture value chain to be considered in GREET analysis in a comprehensive manner as opposed to the default pathways currently in mandatory use. Practices such as no-till, regenerative farming, fertilizer production alternatives and optimized fertilizer application have a tremendous effect on the sustainability of fuel production and agriculture as a whole. While we understand that some of these areas are complex with uncertainties to be mitigated, we believe there is tremendous stakeholder engagement and know-how that can achieve robust advances towards AB32's goals. Also, we believe that the vast area of farming practices and fertilizer production & use lends itself to a differentiated approach, where significant achievements may be safely reaped from "lower hanging fruits" in a short timeframe, while other topics may need more enduring work with stakeholders. Accordingly, we kindly ask that CARB identify multiple areas within the general scope of fertilizer & farming practices that can advance in parallel, independently from each other for efficiency.

Subject: Comments on 2022 Scoping Plan Update

Comment:

Thank you for the opportunity to submit these comments on the 2022 update to the Scoping Plan for climate change programs in California. Indigo Ag is committed to harnessing nature to help farmers sustainably feed the planet. We achieve this mission by connecting farmers with financial incentives to adopt more sustainable and/or regenerative agricultural management practices. Both offsets and low carbon fuels provide opportunities to create financial incentives for climate smart agriculture. We implore the ARB to consider our written comments and to adopt rules which benefit farmers who reduce their GHG emissions and/or enhance their soil carbon sequestration.

Subject: ARB leaders and staff should listen to Greta Thunberg

Comment:

We are at a precarious moment in history. With this 2022 Scoping Plan Update, ARB has one last chance to remove the "gaps and loopholes" cited by Greta Thunberg in her recent powerful speech (to the Austrian World Summit 2021). If you only heard a soundbite from this speech, it is worth watching all 7 minutes in context:
<https://youtu.be/m6eQwAi2U18>

At ~4:00 minutes she emphasizes that we should stop "leaving out emissions from imported goods, international aviation and shipping, as well as the burning of biomass".

For more on the importance of correcting the incomplete "scope" of the Scoping Plan, please see the comments filed by California River Watch.

Subject: The 2022 Scoping Plan must ensure at least 40% below 1990 levels by 2030

Comment:

CARB must treat this 2022 Scoping Plan as the final plan to ensure at least 40% below 1990 levels by 2030, because this Plan must specify quantifiable measures in sufficient detail to convince the Legislature and the public that the 2030 mandate will be achieved (including some forecasted extra reductions in case some measures underachieve). The 2022 Scoping Plan measures must include sufficient detail to form a clear basis for all the implementing regulations, including cost-benefit analyses, co-benefits, etc. The 2027 Scoping Plan can only be used to tweak some measures because there will not be enough time to draft and implement regulations to have any significant impact on 2030 emissions.

Subject: Honor EJ issues, use direct regulations, not cap-and-trade

Comment:

The plan must not rely on more reductions through cap-and-trade than currently realized because those reductions cannot be relied on as confidently as regulations. In particular, the plan cannot rely on unfunded incentives.

In addition, cap-and-trade creates huge environmental justice co-benefit issues, because it allows polluters such as refineries to continue to pollute and poison disadvantaged communities.

You must increase requirements and enforcement of elimination of fugitive methane emissions. While you are doing that, cap-and-trade must be expanded to include fugitive methane emissions, especially landfills and oil and gas operations and transmission. Currently cap-and-trade only includes delivered gas of which nearly all is transformed into CO₂. But the fugitive emissions are directly releasing methane at 84 times the impact of CO₂ over the next crucial 20 years. In fact, reducing methane emissions has the greatest short term impact of any climate measure.

Finally, you must upgrade the methane inventory to include the latest work from the JPL and other detection work. For example, the 2020 Guha, et al. report: Assessment of Regional Methane Emission Inventories through Airborne Quantification in the San Francisco Bay Area <https://dx.doi.org/10.1021/acs.est.0c01212>, shows that refineries emitted 900% more methane than in the BAAQMD inventory, landfills 123% more, wastewater treatment plants 100% more, and composting facilities previously estimated at zero were emitting 11 Gg per year. See attached spreadsheet.

Subject: fully apply AB 32's requirements for reduction of ALL GHGs

Comment:

As you plan the application of AB 32's requirements on the reductions of greenhouse gasses to 40% below 1990 levels, be sure that you are using the latest measurements of sources of CO2 and methane that show that earlier estimates were only half or even a third of the actual releases. Include all sources of carbon, even those that the state does not regulate. Aviation and marine fuel is part of the state's release of GHGs. Don't use cap-and-trade as a policy for avoiding release of GHGs since this permits releasers of massive amounts of GHGs and their accompanying air and water pollution to dump these by-products of their operations on the communities least able to express their needs for relief from the substances that are causing their health to deteriorate.

Subject: Totally Transitioning California to Green Transportation & Energy

Comment:

CARB and all climate and energy related government authorities need to focus with all of the policies, strategies and programs that will get us to zero greenhouse gas emissions no later than 2045. As of 2017, the US Energy Information Agency data show that California's energy use was met about 45% from oil (mainly for transportation) and 28% from natural gas. Because of the mention by IPCC of 2050 as a target year so as to keep global average temperature rise below 1.5 Celsius, in remarks below I will address what I think we need to do by 2050, at the latest.

1. California needs a phased and time bound program to replace its natural gas power plants with solar plus battery power plants, keeping in mind hydrogen electrical power generation to produce the base load and late afternoon electric power needs.

2. Our state needs to develop solar electric service stations and highways that also produce and/or supply green hydrogen (made from renewable energy) for fuel cell vehicles.

3. Our state needs to have systematic plan to phase out all of the approximately 31 million fossil fuel vehicles (as of 2010) with zero emission vehicles by 2050. Relying on just electric vehicle sales and the ceasing of the sale of fossil fuel vehicles is not enough.

4. With its Silicon Valley leadership in the rear view mirror, California needs to encourage and implement a systematic effort (with federal help) to undertake the RDD&D (Reserch, Development, Demonstration and Deployment of Green Hydrogen - lower cost production from renewable energy (mainly solar PV), transport and large scale storage and end uses (fuel cells, internal combustion engines and gas turbines - aswell as replacing use of natural gas and oil in industrial processes) of gGreen Hydrogen.

5. With large scale use of natural gas still prevalent, the state needs to pursue electrification of all residential, commercial and industrial establishments - not only for new construction, but for all existing units through systematic retro-fits.

6. It needs to meet the expanded electrical energy needs that results from this expanded electrification, through rooftop solar, distributed in front of the meter solar and local and community micro-grids (also the latter to enhance resilience in the gas eof power failures of the main grid), and to minimize Transmission Access Charges and costs.

7. In order that wildfires do not continue to be net carbon emitters, California needs a Disaster Risk Reduction (DRR) strategy of minimizing the severity fo wildfires in older as well as newly reforested areas, and to minimize the high level of air pollution through smoke that results.

8. Our entire coast already has many marine sanctuaries, bt much

can be done to expand the coastal ecosystems by introducing fresh newly planted sea grasses (like the ell grass at Point Molate in the SF Bay Area), salt marshes and mangrove swamps, in cooperation with the Coastal Commission and local fishery organizations.

9. Instead of its reliance on higher cost mass transit and high speed rail systems that cost much more and which would require larger public subsidies, California should focus on developing a network of low, medium and high speed rail interlinked systems of the type that CyberTran International is advocating, that are more flexible, low cost, and renewable energy based. Diesel fuel based transportation systems, where planned, should be cancelled.

10. Our state needs to take care of its fossil fuel workers that may lose their jobs in this transition, by engaging in a green renewable energy based re-industrialization strategy that creates plenty of businesses and jobs, not only for them, but also for our disadvantaged communities and those at the lower rungs of the economic ladder. We also need the existing fossil fuel companies to start putting aside funds in Escrow accounts that are for environmental remediation of closed or abandoned fossil fuel related sights (whether wells or refineries).

11. Cap & Trade rules and allowances need to be tightened so that the emissions reductions from ALL covered organizations and companies are achieved significantly.

12. CARB should coordinate with CEC, CPUC and CAISO to make sure that all organizations have a joint strategy and have ALL of their focus, including those of the Investor Owned Utilities, are totally aligned with meeting California's goal to be Carbon Neutral by 2045.

I have attached a comprehensive proposed Energy, Climate & Ecosystem strategy as described in my book, "Brighter Climate Futures" for California.

I hope that CARB takes the the benefit of my suggestions as it develops the next Scoping Plan for California. I stand ready to present to CARB if you so desire it.

Subject: AB 32 scoping plan. Other harm from fossil fuels

Comment:

Governments are having difficulty getting oil companies to plug their idle wells which have leaked methane and back-flowed pollutants and are an explosion risk. There are nearly 1000 deserted wells across LA. A few years ago I smelled the leakage of hydrogen sulfide gas from the Coalinga Oilfield. Scientists also noticed it which is also accompanied with methane. Methane leakage occurred in neighborhoods of color near Culver City & Mount Saint Mary's Univ.

Climate change's drought contributed to 64% of global farmland now being toxic to humans from heavy metals & pesticides build-up; toxic algal blooms in tribal shallow waters that kill fish, pets & children, and car accidents from heat fatigue and air pollution.
