Subject: TRU Electric Operation

Comment:

With the well publicized intentional blackouts happening, seemingly more frequently, I think it is very important to address the challenges that exist for plugging multiple TRUs in at a facility. What happens if there is no electricity.

Subject: Carbon Credits and Refrigerants?

Comment:

About how much damage do refrigerants R123A and R123 and R410 cause? How is it determined? What are its units metric? How do carbon credits relate to what I am asking?

Subject: Clarification of truck TRU proposed regulatory concept
Comment:

Concept as shown on slide:
Starting in 2025, all truck TRU fleets phase in full zero-emissions at 15 percent each year (over 7 years).

Can you confirm that the chart below accurately represents the draft regulatory concept?

Proposed requirement for percent of new TRU sales on trucks in California per year with full zero-emissions operation of the TRU:

2025 = 15%
2026 = 30%
2027 = 45%
2028 = 60%
2029 = 75%
2030 = 90%
2031 = 100%

Can you confirm the proposed regulatory concept requires zero emissions operation of the TRU. It does not require zero emissions operation of the entire truck during propulsion.

Thank you,

Joe

Subject: TRU Emission
Comment:

I would first like to say that the report is exceptional in its details and content and the approach by the CARB is world leading.

I have spent the last 35yrs in the transport refrigeration community and I have a number of comments about the report.

1 - I would highly recommend that the all TRU's engines are subject to confirmation of service cycles on the engine and then a confirmation via emission testing that the engine is fit for purpose. (I.e. is performing to OEM set standards) If it failed then the TRU should be quarantined until fit for purpose.

2 - You talk about NOX - PM emitters but you must also consider the HFC gas emission and Global Warming Potential. Again an annual certified check of the refrigeration equipment should be carried out and recorded and units that fail are again quarantined until corrected and retested.

3 - You talk about retrofitting the TRU equipment with DPF filters and total equipment replacement. Whats is the plan to promote NON diesel driven equipment. In the UK and EMEA area both Thermo King and Carrier promote ZERO emission equipment with low GWP gases. Why is this not in California it would work and do what you need for all distributions needs. But there are plenty of alternative types of TRU equipment in the UK and EU markets that would perform the tasks needed.

You have taken some great steps towards getting to the ultimate prize of Zero emissions and Zero GWP potential don't stop the momentum and don't allow the OEMs to control the market. Please get in touch if I can help you further.

Subject: CGA and CRA comments on TRU regulation draft
Comment:

We appreciate the ability to comment on the proposed Transportation refrigeration unit (TRU) regulations. Representing the foremost retail and food industries in California, the California Grocers Association and the California Retailers Association request that the Board pursue the most cost-effective options for emissions reductions while maintaining availability and access for consumers to fresh and healthy food options which often require refrigeration.
