First Name: Jame

Last Name: Donath

Email Address: jame@greenscapefinancial.com

Affiliation: Greenscape Financial Group Inc.

Subject: Feedback on Proposed Elimination of Electric Forklift FSEs

Comment:

I wish to provide comment on the recent proposal by CARB to phase out the LCFS credit eligibility of electric forklifts post-2025.

Our company, Greenscape Financial, is in the business of aggregating, monetizing, and financing the credits generated by electric industrial equipment, including electric forklifts. Our business provides owner/operators of electric equipment upfront lump-sum cash payments in exchange for the right to register the credits generated from electric charging of this equipment over a multi-year period. The customers can use those upfront proceeds for any corporate purpose, including purchasing more electric equipment. Our upfront payments are effectively a financial rebate on the purchase or lease of new electric cargo handling equipment, which eases the customer's transition away from higher carbon propane lifts towards the typically more expensive zero-emission vehicles.

We formed our company in 2021 based on CARB's publicly stated commitment to the LCFS regulation. On that basis, my partner and I have made significant investments for the long-term which we believe we benefit our customers, service providers, and local communities. Unfortunately, that whole model has now been thrown into disarray as a result of CARB's recent pronouncements. As we stand today, we are not able to offer customers contracts beyond three years given the complete lack of visibility in regards to the potential for credit generation. Our customers are similarly hesitant to sign up for contracts to participate in a program that now appears to lack long-term support from California regulators.

Recent data shows that only 50-55% of California's forklift fleet is electric, leaving a huge swath of the market (~50,000 forklifts) that still run on propane and must be converted. So why pull the rug out now, particularly when this program has proven so effective to date? The decision seems rather arbitrary and more aimed at addressing low LCFS credit prices than the efficacy of a program that continues to yield results. If CARB is concerned about excess credit generation swamping the LCFS market, a much more logical solution would be to raise the stringency requirements on carbon intensity levels as it has done historically.

We would also suggest that all FSEs be required to install meters that produce empirical data, rather than the "guesstimation" method allowed by CARB and currently used by most vendors of electrical forklift credits. Market observers estimate that this method of credit calculation probably overstates credit generation by as much as 20-30% annually. Mandating metering of electric forklift credits would therefore significantly reduce the pool of credits generated from this category while preserving the integrity of the program.

We strongly encourage CARB not to interfere with a program that has been a model of public/private partnership and has produced results

that are additive to the objectives of the LCFS. At the very least, CARB needs to provide a longer-term transition period (e.g. ~10 years) for a change of this magnitude, with plenty of runway and visibility for market participants. Otherwise we fear the disruption and uncertainty created by such a precipitous move will be felt well beyond the forklift space, and will ultimately prove counterproductive to CARB's oft-stated objective of attracting and retaining private investment to facilitate California's transition to green energy.

Thank you for your attention to this matter.

Jame Donath  
Chairman  
Greenscape Financial Group, Inc.

## **Comment 20 for Public Workshop to Discuss Potential Changes to the Low Carbon Fuel Standard (lcfs-wkshp-aug18-ws) - 1st Workshop.**

First Name: Dr.Robert T.  
Last Name: Do  
Email Address: Rtdo@sgh2energy.com  
Affiliation:

Subject: Comments to the LCFS  
Comment:

September 19, 2022  
California Air Resources Board  
1001 I Street  
Sacramento, CA 95814  
Rajinder Sahota  
Deputy Executive Officer, Climate Change and Research

Reference: August 18, 2022 LCFS Workshop

Dear Ms.Sahota,

In addition to the attached Letter from SGH2 Energy Global Corp summarizing our comments to the CARB's latest workshop on potential changes to the LCFS, we are also attaching a Description of our Lancaster Clean H2 Production plant as submitted to the State of CA and the Public for comments prior to CEQA and CUP approval scheduled for November 21st, 2022.

The Technology to be deployed for the Lancaster Project is the SPEG technology system which is "Thermal Conversion" of biogenic organic waste into renewable carbon negative Hydrogen. This technology is described in more details in the attached document which was taken from the CEQA official document prepared by the City of Lancaster.

As part of the CARB's consideration of a new Tier 1 Pathway for Low CI Hydrogen, we are submitting this Technology to be considered for inclusion in the new Tier 1 low CI H2 pathways. Alternatively, we will also submit this as an application for a Tier 2 Pathway for Low CI Hydrogen production. As noted in the attachment, the Lancaster Project is a near term commercial industrial production plant to be approved for CEQA and CUP this year and will start delivering 4,500,000 Kg of Clean H2 per year to HRS in California operated by Shell and Iwatani/Chevron by early 2024.

As a major producer of Clean Hydrogen for California 's HRS, the Lancaster project was also awarded a \$ 3 Million grant from the CEC, we request that the Pathway for Thermal Conversion of Biogenic waste and biomass to Clean carbon negative Hydrogen be officially considered and approved as part of the new "Tier 1 pathways for Low CI Hydrogen" or the existing Tier 2 pathway production for Clean Hydrogen.

Respectfully,  
Dr.Robert T.Do  
Chief Executive Officer  
SGH2 Energy Global Corp

Subject: LCFS Workshop Comment for Loci Controls Inc. RE: Reducing Landfill Gas Emissions  
Comment:

Dear Dr. Laskowski,

On behalf of Loci Controls, Inc. ("Loci"), I am writing to recommend that due to the urgent necessity of achieving short-lived climate pollutant ("SLCP") emission reductions, the California Air Resources Board ("CARB") should recognize a new methodology to reduce methane emissions from large landfills within CARB's life cycle analysis ("LCA") modeling for the Low Carbon Fuel Standard program ("LCFS"). The specific methodology recommended here has been fully approved by the American Carbon Registry ("ACR"). It is referenced as the "Methodology for the Quantification Monitoring, Reporting and Verification of Greenhouse Gas Emission Reductions and Removals from Landfill Gas Destruction and Beneficial Use Projects, version 2.0." (hereafter the "ACR LFG Methodology"). CARB's direct integration of the ACR LFG Methodology into the LCFS, or CARB's development of an analogue in the LCFS to the ACR LFG Methodology will spur the use of innovative SLCP technologies that can be broadly implemented and thereby provide substantial additional reductions of SLCP emissions. Thus this recommended integration is fully aligned with CARB's priorities, and is replicable at multiple landfills across California and the United States.

The complete comment with the ACR methodology and data is attached.  
Please contact me for any questions or follow-up.

Best Regards,

Graham Noyes

First Name: Graham

Last Name: Noyes

Email Address: graham@noyeslawcorp.com

Affiliation: NLC for Woody Biomass Policy Consortium

Subject: Utilizing the Low Carbon Fuel Standard to Reduce the Risk of Catastrophic Wildfire

Comment:

Dear Chair Randolph and Executive Officer Cliff,

We are writing to request that the California Air Resources Board (CARB) work together with other California agencies and the federal government in the current Low Carbon Fuel Standard (LCFS) rulemaking to update CARB's life cycle analysis modeling (LCA) to reflect the reductions in greenhouse gas (GHG) that result from the conversion of the woody biomass cleared during forest treatment into low carbon fuels. On a parallel track, we request that CARB update its air quality and health effects models to recognize the severe impacts of recurring and extended wildfires on fire-exposed communities. These updates are critical given the recent massive expansion of GHG and criteria pollutants generated annually by climate change induced California wildfires.

As an exhibit to this letter, we have attached a White Paper for Policy Makers entitled "Turning Wildfire Tinder Into Low Carbon Fuels." This White Paper documents the rapid expansion of California wildfires, provides a comprehensive set of state and federal policy recommendations, and provides technology overviews from the leading companies in the sector.

The complete comment is attached. Please contact me for any questions or follow up. Thank you for your consideration of this input.

Best Regards,

Comment:

September 19, 2022

California Air Resources Board  
1001 I Street  
Sacramento, CA 95814

SUBJECT: Public Workshop to Discuss Potential Changes to Low Carbon Fuel Standard

To Whom it May Concern,

On behalf of CALSTART, I want to extend our appreciation for the opportunity to submit feedback regarding the potential changes to the Low Carbon Fuel Standard (LCFS) program. Since its initial implementation 2011, the LCFS program has allowed California to decrease carbon in our state's fuel pool and accelerated new technology and alternatives to petroleum fuel. The program has also served a valuable incentive program in helping bring new companies and their ideas for zero-emission fuels and technology into the state's fuel market.

CALSTART and our Origins

CALSTART is a California-based, international nonprofit that is a recognized clean transportation technology consortium. Our 300+ members are all dedicated to the growth of the clean transportation industry, and we work with public and private sectors to drive innovation in the sustainable transportation sector. CALSTART membership is comprised of vehicle manufacturers, transit agencies, public and private fleets, mobility partners, parts and component manufacturers, EV charging station and hydrogen refueling providers, battery manufacturers, and more.

Founded in Southern California in 1972, CALSTART has provided services and consulting to spur advanced transportation technologies, fuels, systems, and the companies that make them. Since our inception, CALSTART has partnered with California and several states to enact groundbreaking policies aimed at reducing and eliminating emissions from the transportation sector. We also administer several programs in California and across the country that help provide funding to fleets, companies, and manufacturers to help accelerate zero-emission vehicle adoption.

CALSTART's latest initiative, The Global Drive to Zero, has our staff working with foreign governments, sub-national governments, and industries to achieve a 100 percent zero-emission new truck and bus sales goal by 2040 with an interim 2030 mark of 30 percent zero-emission vehicles sales.

LCFS Past, Present, and Future

California's LCFS program is a model for other states in their efforts to curb the carbon intensity (CI) of transportation fuels. Currently, California's LCFS program is projected to decrease CI

below the 20 percent goal by 2030.

CALSTART recommends CARB extend the LCFS program to 2045, with interim CI targets set up every five years (2035, 2040). This timeline matches up with the Governor's Executive Order (EO N-79-20) to turn over 100 percent of the truck fleets to zero-emission by 2045. That date also would incorporate programs like Advanced Clean Cars II, Advanced Clean Trucks, and Advanced Clean Fleets.

For the near future, California should aim for the highest CI reduction target possible for 2030. Out of the options provided, CALSTART asks CARB to make Option B (30 percent CI reduction by 2030 compared to 2010) the goal.

In July, Governor Newsom wrote a letter to CARB Chair Randolph pushing for "greater opportunities to reduce our dependence on fossil fuels to achieve our air quality and climate targets," and continue the diversification of fuels away from petroleum in the transportation sector. Part of his ask was to evaluate and consider an increase in the stringency of the LCFS. With that said, CALSTART asks CARB to evaluate whether the 2030 goal can be even more aggressive than Option B and use 30 percent as the floor on what a strong and realistic CI reduction goal should be. CALSTART also encourages CARB staff to look at Oregon and their current proposals for CI reduction. A possible 2035 goal could be to align California and Oregon with 37 percent CI reduction.

Moving forward, CALSTART believes the setting of more stringent goals in 2030 and out years will send a strong signal to the marketplace and investors. A commitment to an increasingly more ambitious CI reduction would lead to more money entering the industry and helping California increase the clean fuel options available to customers.

#### Infrastructure Crediting into the Future:

CALSTART encourages CARB to expand capacity credits for Fast Charging Infrastructure (FCI) and Hydrogen Refueling Infrastructure (HRI). The medium- and heavy-duty (MHD) transportation sector disproportionately accounts for harmful emissions comparative to the number of vehicles they have on the road. CARB expanding credit pathways to support MHD trucks is a great opportunity to address high-emitting vehicles and incentivize more funding towards charging and refueling infrastructure.

A focus on MHD infrastructure is important given the need to get companies and fleets to transition to zero-emission. With potential regulations on the horizon for a full fleet transition, those looking to purchase a zero-emission truck need FCI and HRI options in place.

CALSTART encourages CARB to work with stakeholders regarding MHD public charging or public/private charging locations. These conversations are more important if the public, public/private charging location would be inclusive of light-duty (LD) in addition to MHD. Safety concerns, different infrastructure needs, and time of charge requirements are all elements needing to be addressed before construction on infrastructure begins so that the charging location can scale up as needed in the future.

CALSTART encourages CARB to work with stakeholders and manufacturers/operators regarding LD charging in multifamily units. Research in charging equity continue to show a lack of adequate charging infrastructure in multifamily locations. Consideration of reclassification from multifamily to non-residential for LCFS purposes has been a topic of discussion regarding how to incentivize more investments into charging installation and allow benefits to be received by early investing companies and operators who take larger risks with their investments.

Conclusion:

CALSTART appreciates the opportunity to submit public comment regarding several of the topics CARB is looking to address in their review of the LCFS program. Where we did not submit formal comments, we encourage CARB to engage with stakeholder and industry leaders and offer our services to arrange meetings for CARB staff.

The LCFS program continues to be one of the best drivers for reduction of carbon in fuel and opportunities to incentivize and promote investments in cleaner fuel and zero-emission infrastructure. The basis of the program should be adopted by other states in the country and CALSTART will continue to push for multi-state adoptions based on the successes of California's LCFS program.

Thank you for your time and consideration. Please feel free to reach out if there are any comments or questions.

Orville Thomas  
State Policy Director  
CALSTART

## **Comment 75 for Public Workshop to Discuss Potential Changes to the Low Carbon Fuel Standard (lcfs-wkshp-aug18-ws) - 1st Workshop.**

First Name: Daryl

Last Name: Maas

Email Address: daryl@maasenergy.com

Affiliation:

Subject: Public Comment - Potential Changes to the Low Carbon Fuel Standard  
Comment:

Maas Energy Works (Maas) is a family-owned digester development company committed to effectively reducing methane emissions from dairy and swine manure in order to ensure a sustainable and renewable future. We express our deepest gratitude to the California Air Resources Board (CARB) for your continued support and development of the Low Carbon Fuel Standard (LCFS).

The LCFS is a crucial player in the continued success of Renewable Natural Gas (RNG), and thus a crucial player in the possibility of an optimally clean future. As a digester developer, Maas assumes responsibility in supporting growth factors contributing to the LCFS. Therefore, Maas humbly and respectfully submits the following comments in response to CARB's LCFS Workshop (Workshop) held on August 18, 2022:

At the Workshop, CARB presented the concept of a temporary credit true up at time of Certified carbon intensity (CI) score approval. This kind of true up would rectify under crediting to pathway holders, limit unnecessary costs to producers, and reduce the urgency from pathway applicants for CARB to process Tier 2 applications quickly.

Under crediting pathway holders under temporary CI score use is not a most accurate representation of a project's carbon negative effect. Not only would reduced emissions be accurately depicted, but the incentive to pathway holders would bolster further project development within the LCFS program.

Developers typically seek time-consuming, complex, and expensive storage contracts in order to avoid use of a temporary CI score. Adoption of a temporary credit true up would eliminate a dispenser's need to accumulate large portions of storable gas inventory as well as allow for more market incorporation of smaller, local fleets that may not have access to such large fleets to dispense stored gas in bulk. A temporary credit true up would near immediately streamline and smooth the gas storage and dispensing processes.

Furthermore, Maas supports the concept of a retroactive, consistent annual credit true up between verified operational and certified CI scores.

Currently, in existing LCFS regulations CARB requires invalidated credits if a project's verified operational CI score is higher than the certified CI score. Maas recognizes and accepts the need of these invalidated credits to prevent credit overgeneration. However, if a project's verified operational CI score is lower than the certified CI score, no benefit is recognized. The result is under crediting pathway holders and therefore an unnecessary, inaccurate representation of a project's reduced emissions. Consequently, GHG benefits of the LCFS program are underrepresented. As the LCFS program's targets grow more

progressive, underrepresentation is a detriment to the program's long-term success.

Tier 2 Pathways will especially benefit from a consistent annual credit true up given the potential for factor variability. For example, a simple fluctuation in annual average temperature could serve a driving factor in carbon negativity or positivity. To offset uncontrollable variables, a dairy digester project is currently incentivized to verify conservative CI scores so as to avoid the potential for exceeding the year prior's certified CI score. There is not incentive to achieve a lower score, as maintenance of a lower score year-to-year is difficult to achieve. In that case, it is almost always inevitable that achieving a lower CI score will result in ultimate invalidated credits in future verification(s) with no credit reward to offset the loss.

Oregon's Clean Fuel Standard is considering a full annual true up. Maas partners with pathway holders to suggest language adopted from Oregon's proposal as an incorporation into the California LCFS rules:

Annual Credit True-up. CARB will automatically issue additional credits from the prior year to correct for any difference between a verified operational carbon intensity and any certified carbon intensity (including temporary and provisional) if all of the following is true: (A) The pathway holder has successfully completed annual verification by receiving a positive or qualified positive verification statement for the relevant Annual Fuel Pathway Report, (B) The verified operational carbon intensity value for a given pathway is lower than the certified carbon intensity value used for initial crediting, and (C) the credit generator has received a positive or qualified positive verification statement for the relevant Quarterly Fuel Transaction Reports.

Allowing not only a temporary credit true up, but also an annual credit true up would mitigate the tendency to certify conservative CI scores. Mitigating this tendency alongside resolving the underrepresentation of projects' annual emission reductions would serve a most realistic depiction of RNG impact. Incentivizing lower CI scores would encourage process efficiency, carbon capture, methane leakage, and all other carbon negative factors playing a crucial role in achieving CARB's and the industry's goal of carbon neutrality.

Thus, approval of both temporary and annual credit true ups is approval of optimal LCFS program success and approval of industry development. Maas thanks CARB as these comments are reviewed and considered.
