Subject: Double Counting, Discounting, Safeguards, Permanence, Shared Liability
Comment:

Dear Ms. Bamberger,

I would like to invite you to take the following comments into account for the elaboration of the Californian cap-and-trade regulation and using international REDD offsets within this mechanism:

1. Double Counting. The United States of America have assumed a voluntary economy-wide emissions reduction target. So has Mexico. A mechanism must be put in place to avoid any double counting towards UNFCCC-registered targets. Since the Mexican target is explicitly bound to external support which can be delivered through market mechanisms, it seems appropriate to allow Mexico to count the emissions reductions towards their target while not counting them towards the US target. If they were to be counted towards the US target, a previous negotiation with the Mexican government is necessary to clarify the conditions under which the Mexican government would be willing to exclude these offsets from their own accounting.

If this double counting issue were to be ignored, the offset mechanism would constitute a mechanism that reduces ambitions rather than emissions.

2. Discounting. An option to deal with double counting and also for taking the principle of common responsibility into account could be a discount of foreign offsets. With a 50% discount, double counting would be neutralized. With a further discount, the common responsibility of non-Annex I countries could be included in a standardized way. This may also be an alternative to a very ambitious crediting baseline.

3. Safeguards. Environmental and social safeguards should be required on an operational level. Proof that both relevant international and national law is respected should be required for registering any credits. This can be an incentive for implementing high social and environmental standards that have remained on paper so far. The establishment of realistic dispute resolution mechanisms should be promoted where these do not exist. Complete public transparency as to the flow of funds for initiatives resulting in credits could be required, providing a strong counterbalance to the risk of corruption.

4. Permanence. REDD+ or any forest related emissions reductions or sequestrations can and must not be equalized to emissions reductions from fossil sources without cautionary measures. If they are to be used as offsets, they must effectively guarantee that for the amount of time that the emissions they are offsetting stay in the atmosphere they effectively keep the carbon sequestered. In the face of a changing climate, this is difficult if not impossible to guarantee for trees. Therefore, robust mechanisms must be developed that can account for this risk of reversals. Without them, the offsetting mechanism will simply be an "ambition reduction

mechanism".

5. Shared Liability. One of the possible ways to deal with non-permanence in forest related emissions reductions could be to share liability for reversals among the seller and the buyer. Mechanisms which do that should be explored.

I thank you for the opportunity to comment on the draft regulation and I hope to have made a contribution that helps you write a regulation that especially serves future generations. They need our help and consideration.

kindly,

Kjell Kühne
