

# Strengthening the ACF by Targeting the Most Polluting Vehicles

Class 7 and 8 tractors are responsible for a **huge share of California's overall transportation pollution**, despite comprising only **1% of vehicles on the state's roads**.

Even though the largest tractor trucks **release far more emissions**, the current version of the ACF would **consider fleets of the dirtiest trucks much in the same way as less polluting 2b trucks**.

*Compared with fleets of 50 Class 2b trucks, fleets of 50 Class 8 tractors emit far more and should regulated accordingly.*

Lowering the regulation threshold for Class 7 and 8 tractors would **counteract the disproportionate pollution** emitted from these trucks, and **bring cleaner air to communities** near ports and on industrial corridors sooner.
