## In-Use Off-Road Diesel Vehicle Regulation

### Unverified Retrofit Devices

**Q – Can I get credit for installing a retrofit device that has not yet been verified by ARB?**

A – The regulation does not provide any credit for a device until it is verified (except if a fleet is putting on an experimental retrofit to gather data for verification). ARB staff recommends that fleets work with devices that have been verified by ARB and use caution when considering purchase of devices that have not been verified. Verification ensures that devices are effective, durable and warranted. For further information on ARB's verification program, see the ARB website at <http://www.arb.ca.gov/diesel/verdev/verdev/htm>

Before any device can be installed, it must receive an aftermarket parts exemption (if a device is verified, the aftermarket parts exemption comes with the verification). An aftermarket parts exemption allows a device (or aftermarket part) to be installed legally on an engine, however this does not mean the device is verified to reduce emissions. An unverified device that does not receive an aftermarket parts exemption may also be subject to additional penalties under the Federal Environmental Protection Agency Non-Road Regulations.

The verification process, which determines the device reduces emissions, is necessary before the device will provide credit toward the regulation for reducing emissions. In short, fleets should ensure the device they install is on the list of verified devices, and does not just have an aftermarket exemption. For further information on the aftermarket parts exemption program, see the ARB website at <http://www.arb.ca.gov/msprog/aftermkt/aftermkt.htm>

**Q - What happens if the fleet installs a device in the verification process, but the device is not eventually verified?**

A - If the device was installed to collect data on the experimental system, and meets the requirements of section 2449(e)(5): Experimental Diesel Emission Control Strategies, the fleet will receive credit. However, if a fleet installs a device not verified at the time of installation that is not part of data collection (Experimental Diesel Emission Control Strategy), the fleet would receive **no** credit. If a device, which was previously allowed

under section 2449(e)(5), will not be verified, credit for the device will no longer be provided.

**Q - Can I get double credit if I install such an unverified device?**

A- If a fleet installs a device that was not verified at the time of installation but the device later becomes verified, the fleet can receive credit. If the device is verified by the deadline for receiving double credit (currently January 1, 2010), a fleet would receive double credit for the retrofit. If, on the other hand, the device is verified after the deadline for receiving double credit, the fleet would receive only single credit.
