

DOORS Populations in the Off-Road Diesel Emissions Inventory

Raw population data from the Diesel Off-Road On-line Reporting System (DOORS) is provided in the Microsoft Access Database: Doors Populations.mdb. These data represent the population of vehicles in DOORS as it appeared April 14th 2010.

Within the database, users can find a list of the DOORS vehicles in the table: DOORS Data 04142010). Within this table, equipment types are listed by rated horsepower, horsepower group and engine model year. All agricultural vehicles have been removed from this list.

In addition to the raw population data, users can also find a final summary table: Final Adjusted Populations. This table contains a summary of the total population by equipment type with adjustments made to remove electric vehicles and test vehicles. In addition, the final adjusted population contains an adjustment factor that was applied to account for fleets that had not yet reported to DOORS. As described in the Technical Support Document for the Diesel Off-Road Rule, this non-compliance factor was estimated to be 10%. As a result, the final population was increased 10%.
