DATE: November 5, 2008

SUBJECT: UPDATE TO THE PESTICIDE VOLATILE ORGANIC INVENTORY:

ESTIMATED EMISSIONS 1990-2006, AND PRELIMINARY ESTIMATES FOR

2007

### I. OVERVIEW

This memorandum summarizes the Department of Pesticide Regulation's (DPR's) update of estimated pesticide volatile organic compound (VOC) emission data, for the May-October "ozone season" in California's five nonattainment areas (NAAs): (1) Sacramento Metro, (2) San Joaquin Valley, (3) Southeast Desert, (4) Ventura, and (5) South Coast. An electronic file containing detailed statewide 1990–2006 data is available by download from DPR's Web page at <a href="http://www.cdpr.ca.gov/docs/pur/vocproj/vocmenu.htm">http://www.cdpr.ca.gov/docs/pur/vocproj/vocmenu.htm</a> along with a variety of VOC documentation.

The 1990–2007 VOC inventories incorporate new emission potential (EP) data for several hundred products, and DPR's 2007 pesticide use data. Inventory calculations for 2005–2006 are based on the final report of pesticide use data for those years. Data for 2007 has yet to be finalized and should be, for the purposes of this memorandum, considered draft. These EP data reflect new thermogravimetric analyses (TGA) requested by DPR in 2005. Thermogravimetric analysis is currently the most accurate method for estimating the VOC content of pesticide products. DPR requested the data for most liquid products included in the inventory that had not been tested previously. The VOC emissions described here incorporate the TGA data submitted, reviewed, and approved as of August 2007.

The emissions are compared to two sets of NAA goals (Table 1). The first set of goals are those required by an April 26, 2006, federal district court order (now overturned), and reflected in Title 3, California Code of Regulations section 6452.2. These are the goals shown as the "VOC regulation benchmarks" and represent a 20 percent reduction from the pesticide VOC emissions in 1991 for all NAAs. The VOC regulations also show benchmarks specific to Ventura that incorporate a phase-in of the 20 percent VOC reductions from 1991 levels between 2008 and 2012. On August 20, 2008, the Ninth Circuit Court of Appeals reversed the district court action, finding that it had no jurisdiction to issue its order. The second set goals are those described in the 1994

1001 I Street • P.O. Box 4015 • Sacramento, California 95812-4015 • www.cdpr.ca.gov

California's State Implementation Plan (SIP) (62 Fed. Reg. at 1170,1997) and Appendix H to the 2007 SIP (73 Fed. Reg. 41277, 2008). These "SIP goals" are a 20 percent reduction from 1990 for the Sacramento Metro, Southeast Desert, and South Coast NAAs; a 12 percent reduction from 1990 for the San Joaquin Valley NAA; and a phase-in of the reductions for the Ventura NAA, with a final reduction for Ventura of 20 percent from 1990 by 2012.

**Table 1:** Nonattainment Area Goals for 2009–2012.

| NAA                       | VOC Regulation Benchmark<br>(tons/day)<br>2009–2012 |      |       | SIP Goal<br>(tons/day)<br>2009–2012 |       |       |      |      |

To date, DPR has reported an unadjusted emission inventory that assumes the entire volatile portion of a fumigant product eventually volatilizes, contributing to atmospheric VOC loadings. However, field studies have shown that actual emissions from soil-applied fumigants such as methyl bromide vary by application method and are generally less than 100 percent. DPR has developed an adjustment procedure to account for the effect of application method on reducing fumigant VOC emissions.

# Procedure for Calculating Unadjusted and Adjusted Volatile Organic Compound Emissions

The unadjusted inventory is based on the premise that the VOC emission from a single application of fumigant or nonfumigant product is equal to the amount used times the EP (Spurlock, 2002; 2006).

$$emission = lbs$$
  $use \times EP$ 

In the adjusted inventory the emission from a single application of a **fumigant** active ingredient (AI) is equal to the amount of AI used times the EP times the Application Method Adjustment Factor (AMAF), also referred to as the emission rating. AMAFs have been determined from field study data and are AI and application method specific (Barry et al., 2007). Since the AMAFs are application method- and fumigant-specific they yield more refined estimates of fumigant VOC emissions than

previous (unadjusted) assumptions. Emission ratings for application methods not found on Tables A1-2 through A1-6 pertaining to the 1990 application methods may be modified based on more recent data.

$$emission = lbs$$
  $use \times EP \times AMAF$ 

At this time **nonfumigant** product emissions calculations use the same procedure as in the unadjusted inventory.

Usually there are several different types of application methods used for a particular fumigant in any particular NAA. Each method of use (e.g. drip, sprinkler, shank, tarp, etc.) represents a fraction of the total number of methods used and is referred to as the Method Use Fraction (MUF). The sum of all MUFs for any particular (NAA/fumigant AI) combination is one. Use practices change over time so that different MUFs are used for the baseline year (1990) as opposed to more recent inventory years. MUFs are determined in a number of different ways. For 1,3-dichloropropene (1,3-D) the MUFs are determined from use data collected by the registrant in support of DPR's township application caps; for metam sodium and metam potassium grower/applicator surveys were conducted to determine types of applications for different crops and areas. Methyl bromide and chloropicrin MUFs are based on expert opinion and regulatory history. Finally, MUFs for dazomet and sodium tetrathiocarbonate equal one because the AMAFs for each of these two fumigants are constant, independent of application method.

A detailed discussion of how MUF and AMAFs are calculated can be found in the September 29, 2007, memorandum by Barry et al. Tables detailing the AMAFs and method use fractions for 1990, 2005, 2006, and 2007 in each of the nonattainment areas are included in the appendix of this document (Tables A1–1 to A1–21). The AMAFs are unchanged from the Barry et al. memorandum.

VOC emissions were calculated for each nonattainment area and summed according to primary AI, application site, and emission category as defined by the Air Resources Board (ARB). The primary AI is defined as the pesticide AI present at the highest percentage in a product. If a pesticide product contains 20 percent of AI "A" and 10 percent of AI "B," all estimated emissions from that product are assigned to the primary AI "A." This approach prevents "double-counting" of emissions from products containing two AIs. Both unadjusted and adjusted emission inventory data for the top ten primary AIs contributing to May–October ozone in 2005, 2006 and 2007 are included in this memorandum. Emissions attributed to application sites (or commodities), however, are *unadjusted* because it is not possible to determine the adjusted emissions with the currently available data. The ARB defines four VOC emission categories: methyl bromide emissions from agricultural applications, nonmethyl bromide emissions from agricultural applications, methyl bromide emissions from structural applications, and nonmethyl bromide emissions from structural applications. Emissions were calculated for May–October, the ozone season, and are reported as U.S. tons per day (tpd).

#### **Revised Emission Potential Values**

Propylene oxide is used exclusively for post-harvest fumigation, and is widely used in the Sacramento Metro and San Joaquin Valley NAAs. In the past DPR has included these applications in its VOC inventory. Since the Air Pollution Control Districts also include these uses in their inventories emissions are being double counted. In addition, DPR has concluded that the use of propylene oxide is not an agricultural use, and therefore its products have been eliminated from DPR's VOC inventory.

EPs for all sulfur products with dust/powder formulations that do not contain any organic components have been set to zero. Most of these products had low or zero EP values in previous inventories, but recent findings by U.S. Department of Agriculture (McConnell et al., 2008) have shown that 132 products have zero EP.

Stakeholders raised concerns to an earlier draft version of this memo because the EP value assigned to a certain high use spray oil product was anomalously high. DPR re-reviewed the initial TGA of the oil products 10951-15 (Britz 415 Supreme Spray Oil and Britz Citrus Supreme Spray Oil; EP = 23.95) and 11656-97 (First Choice Narrow Range 415 Spray Oil and Leaf Life Gavicide Green 415; EP = 19.98) and determined that the TGA data were unacceptable because the TGA experimental conditions deviated significantly from DPR's experimental protocol (McKinney, 2008). In response, the EP values for these products have been set to the spray oil special default value of 1.53 until valid TGA data is received. A TGA data reporting error was also identified for product 48813-1 (Saf-T-Side products and Synergy Super Fine Spray Oil Emulsion. After correctly accounting for the water content of the product, the experimental TGA-measured VOC EP value of the product and all of its ten sub-registration products are equal to zero (water is not a VOC). The net effect of this latter change on the inventory was minor because these products have very low use.

# II. VOLATILE ORGANIC COMPOUND INVENTORY RESULTS

The main text of this document summarizes the *adjusted* pesticide VOC emission inventory data for 2005, 2006, and 2007. Data for the *unadjusted* emission inventory are given in Appendix 2. Previous reports included a summary of pesticide VOC emissions by commodity/site. At this time it is not possible to determine the breakdown of adjusted emissions by commodity, so only the unadjusted emissions are shown by commodity in Appendix 2. Tables 2a and 2b and Figure 1 summarize the adjusted pesticide VOC emissions for 2004 through 2007, and compare them to the 1990 base year and goals. Emissions from 1991 used to determine the regulation benchmarks are shown for comparison.

**TABLE 2a:** May-October (ozone season) *adjusted* pesticide VOC emissions and goals.

<sup>&</sup>lt;sup>a</sup> These numbers reflect the SIP goal and VOC Regulation Benchmark for 2012 in Ventura, and do not reflect the phase in of reductions between 2008 and 2012.

Since 2004, even after adjusting for field conditions (AMAFs), fumigants continue to contribute the most pesticide VOC emissions in the Southeast Desert and Ventura NAAs. Also consistent with previous years, pesticides formulated as emulsifiable concentrates are the other major pesticide VOC contributors, particularly in the San Joaquin Valley NAA. In almost all cases, it is the solvents included as inert ingredients of emulsifiable concentrates that contribute most of the VOCs, not the AIs

**TABLE 2b:** May-October (ozone season) fumigant and nonfumigant pesticide VOC emissions.

# In comparison to 2004:

- Sacramento Metro NAA: VOC emissions increased between 2004 and 2006 but decreased in 2007. Emissions remain well below the SIP goal and the VOC regulation benchmark. In 2007, 82 percent of emissions were derived from nonfumigants.
- San Joaquin Valley NAA: VOC emissions increased in 2005 and 2006 and then decreased to below 2004 levels in 2007. The 2007 emissions are below the SIP goal but exceed the VOC regulation benchmark by 1.279 tpd. Two thirds of emissions are derived from nonfumigants.
- Southeast Desert NAA: VOC emissions decreased annually through 2006, but then increased in 2007. Emissions in this NAA meet the SIP goal but exceed the VOC regulation benchmark. Emissions from fumigants account for approximately two thirds of total.
- Ventura NAA: VOC emissions have decreased, but do not meet the regulation benchmark and SIP goal for 2012, but do meet the regulation benchmark 2009 of 3.63 tpd. More than 85 percent of emissions are derived from fumigants.
- South Coast NAA: VOC emissions decreased and remain well below the emission targets.

# 1. Sacramento Metropolitan Area-NAA 1

The emissions in NAA 1 in 2007 are below those of the three previous years. Adjusted emissions in 2004 were 1.238 tpd, increased to 1.359 tpd in 2006 and decreased to 1.062 tpd in 2007 (Table 2a, Figure 1). Chlorpyrifos, a widely used insecticide, was the primary contributor and accounted for an average of 11.4 percent of the emissions over the three years (Tables 3a, 3b, and 3c). Emissions from chlorpyrifos use decreased from 0.186 tpd in 2005 to 0.116 tpd in 2007 (Tables 3a and 3c). The rice herbicide molinate accounted for the second highest amount of emissions in 2005 (0.093 tpd), down from 0.198 tpd in 2004. Molinate use is being phased out, and this is reflected by a further reduction in emissions in 2007 to 0.011 tpd. This is consistent with reported use in NAA 1, which decreased from over 150,000 pounds AI used in 2004 to 52,000 pounds in 2005, just over 30,000 lbs in 2006, and 14,000 lbs in 2007. Emissions from metam-sodium, a pre-plant fumigant, increased from 0.028 tpd in 2005 to 0.063 tpd in 2006, but decreased to 0.022 tpd in 2007 (Tables 3a and 3b). Major commodities/sites include processing tomatoes, structural pest control, walnuts, and rice (Appendix 2).

# 2. San Joaquin Valley-NAA 2

**PROPANIL** 

PENOXSULAM

ETHALFLURALIN

Adjusted emissions in 2004 were 17.327 tpd and increased in 2005 to 20.828 tpd, and 21.419 tpd in 2006. However, 2007 emissions showed a marked decline to 17.279 tpd (Table 2a). All three years' emissions are above the VOC regulation benchmark of 16 tpd (Table 2a and Figure 1), but the 2007 emissions are below the SIP goal of 18.139 tpd. Fumigants accounted for between 31.8 and 35.6 percent of adjusted emissions for the 3 years (Tables 2b, 4a, 4b and 4c). The top emission contributor for 2005 through 2007 was the nonfumigant, chlorpyrifos, which accounted for 3.868 and 3.990 tpd in 2005 and 2006, respectively, but fell to 2.263 tpd in 2007. Major commodities/sites include carrots, cotton, almonds, and oranges (Appendix 2). It should be noted that unadjusted emissions from cotton fell sharply between 2006 and 2007 from 2.609 tpd to 1.049 tpd, respectively (Tables A2-2e and A2-2f).

### 3. Southeast Desert–NAA 3

Total adjusted emissions for the Southeast Desert declined steadily from 0.995 tpd in 2004 to 0.635 tpd in 2006 (Table 2a and Figure 1), but increased to 0.754 tpd in 2007. The 2007 rate is below the SIP goal of 0.923 tpd, but above the VOC regulation benchmark of 0.62 tpd. Metam-sodium is the primary contributor, accounting for an average of 46.3 percent of the adjusted emissions over the 3 years (Tables 5a, 5b, and 5c). The increased percentage to 53.2 percent in 2006 corresponds to a reduction in the adjusted methyl bromide emissions from 0.048 tpd in 2005 to less than 0.008 tpd in 2006. Methyl bromide emissions increased to 0.170 tpd in 2007 and are responsible for the increase in total adjusted emissions in this NAA. Major commodities/sites include carrots, strawberries, peppers, and structural pest control (Appendix 2).

**TABLE 5a:** Top ten primary AIs contributing to **2005** May–October ozone season *adjusted* VOC emissions in NAA 3, the Southeast Desert.

### 4. Ventura-NAA 4

Ozone season adjusted emissions decreased from 3.924 tpd in 2004 to 3.616 tpd in 2005, increased to 3.682 tpd in 2006 and decreased to 3.361 tpd in 2007 (Table 2a and Figure 1). Emissions did not meet the SIP goal for 2012 (3.029 tpd), but did meet the SIP goal for 2009 (4.029 tpd) and the VOC regulation benchmark for 2009 (3.63 tpd). As in previous years, fumigants dominate the pesticide inventory for this NAA, accounting for upward of 85 percent of the emissions (Table 2b, 6a, 6b, and 6c). The adjusted emissions for NAA 4 in 2004 differ significantly from those estimated by Barry, et al. (2007), due to a revision of the MUFs. For 2004 in NAA 4, the adjusted emissions changed from 4.826 tpd to 3.924 tpd. The difference is due to information indicating more frequent use of lower emission fumigation methods than previously estimated. Major commodities/sites include strawberries, tomatoes, raspberries, and lemons (Appendix 2).

# 5. South Coast-NAA 5

In the South Coast NAA, adjusted emissions have declined steadily since 2004. Adjusted emissions were 1.922 tpd in 2004, and although they increased slightly to 1.984 tpd in 2005, they declined to 1.495 tpd in 2007, well below the SIP goal of 8.672 tpd and the VOC regulation benchmark of 4.1 tpd. The fumigants methyl bromide, chloropicrin and 1,3-D, contributed to 28.96 percent of 2005 adjusted emissions, 27.46 percent of 2006 adjusted emissions and 26.04 percent of 2007 adjusted emissions (Tables 7a, 7b, and 7c). Permethrin, an insecticide used on a wide range of commodities, was the largest single contributor to the adjusted inventory accounting for approximately 20 percent of the emissions. Major commodities/sites include structural pest control, strawberries, and landscape maintenance.

# III. PRELIMINARY PROJECTION FOR 2009 VOLATILE ORGANIC COMPOUND EMISSIONS IN THE SAN JOAQUIN VALLEY, SOUTHEAST DESERT, AND VENTURA NONATTAINMENT AREAS

Regulations require DPR to establish a fumigant limit for NAAs that exceed 80 percent of the pesticide VOC benchmark. (NOTE: Benchmark is 20 percent reduction or 80 percent of 1991 emissions and a phase-in of reductions for Ventura. Trigger for fumigant limit is 64 percent [80 percent of 80 percent] of 1991 emissions). The regulations also require DPR to determine the fumigant limit for the upcoming year by subtracting the nonfumigant emissions from the regulatory benchmark. DPR proposes to determine nonfumigant emissions for the upcoming year by using the data from the single most recent year. For example, DPR proposes to use the nonfumigant emissions for 2007 to determine the fumigant limit for 2009. At the time of this memo, DPR has released pesticide use data for 2005 and 2006, and is awaiting publication of the 2007 pesticide use report. For the purposes of this memorandum, preliminary projected emissions for 2009 are based on a draft edition of 2007 data, and should be regarded merely as a guideline (Table 8). Projections for 2009 will be revised once the final version of the 2007 data has been released.

**TABLE 8**: Preliminary projection for 2009 VOC emissions for NAAs 2, 3, and 4. The 2009 projected furnigant limits are determined by subtracting the 2007 nonfurnigant emissions from the SIP goals and VOC regulation benchmarks.

| NonAttainment<br>Area | SIP<br>Goal<br>(tons/day) | VOC<br>Regulation<br>Benchmark<br>(tons/day) | 2007<br>Nonfumigant<br>Emissions<br>(tons/day) | 2009<br>Projected<br>Fumigant<br>Limit, Based<br>on SIP Goal<br>(tons/day) | 2009 Projected<br>Fumigant<br>Limit, Based on<br>Regulation<br>Benchmark<br>(tons/day) | 2007<br>Adjusted<br>Fumigant<br>Emissions<br>(tons/day) |
|-----------------------|---------------------------|--|--|--|--|---|
| 2–San Joaquin         |                           |  |  |  |  |   |
| Valley                | 18.139                    | 16.0   | 11.134   | 7.005  | 4.866  | 6.146   |
| 3-Southeast           |                           |  |  |  |  |   |
| Desert                | 0.923                     | 0.62   | 0.189  | 0.734  | 0.431  | 0.575   |
| 4–Ventura             | 4.030 a                   | 3.63 a                                       | 0.428  | 3.602  | 3.202  | 2.933   |

<sup>&</sup>lt;sup>a</sup> The Ventura SIP Goal and VOC Regulation Benchmark for 2009 are shown.

Based on the available data, the San Joaquin Valley, Southeast Desert, and Ventura NAAs are likely to exceed their fumigant limit triggers based on VOC regulation benchmarks for 2009 (Table 8 and Figure 1).

In 2007, fumigant emissions in the San Joaquin Valley nonattainment area were calculated to be 6.146 tpd (Table 8), more than the projected fumigant limit based on the VOC regulation benchmark of 4.866 tpd. In the Southeast Desert NAA, a reduction in fumigant emissions of 0.144 tpd or more from 2007 levels would meet the projected fumigant limit for 2009 based on the VOC regulation benchmark. Overall emissions have declined for NAA 4 (Ventura) between 2004 and 2007. The total adjusted fumigant emissions for 2007 were 2.933 tpd, which is below the projected fumigant limit for 2009.

# IV. CONCLUSIONS

In 2005, 2006 and 2007 NAA 1 (Sacramento Metropolitan) and NAA 5 (South Coast) were the only regions with emission rates below their respective VOC regulation benchmarks. The South Coast NAA continues a downward trend, whereas Sacramento NAA emissions increased in both 2005 and 2006, but decreased in 2007. Emission rates for NAA 3 (Southeast Desert) were significantly lower in 2007 than those in 2004, but are up compared to emissions in 2006. NAA 2 (San Joaquin Valley) produced successively higher emissions from 2004 to 2006, with most of the increase due to nonfumigants (Figure 2). Total adjusted emissions in 2007 were largely due to nonfumigants that declined by over three tpd. It may be necessary to address the issue of nonfumigant emissions if VOC regulation benchmark emission goals are to be met in this NAA. Emissions declined for NAA 4 (Ventura) between 2004 and 2007. NAA 4 emissions meet the 2009 regulation benchmark for 2009. Fumigants were a major source of emissions in NAA 3 and NAA 4, whereas nonfumigants contributed significantly to the Sacramento Metro, San Joaquin Valley, and South Coast nonattainment areas. Unless these emissions are

significantly reduced, especially the increased use of emulsifiable concentrate formulations in the San Joaquin Valley, NAA 2 may continue to fail to meet its attainment goal.

<sup>&</sup>lt;sup>2</sup> DPR assumes 100 percent conversion of metam and dazomet to MITC and percentages are relative to the amount of MITC applied.

<sup>&</sup>lt;sup>3</sup> DPR assumes 100 percent conversion of sodium (Na) tetrathiocarbonate to carbon disulfide and percentages are relative to the amount of carbon disulfide applied.

#### APPENDIX 2-SUMMARY OF UNADJUSTED PESTICIDE VOC EMISSIONS

# 1. Sacramento Metropolitan Area-NAA 1

**TABLE A2-1a**: Top ten primary AIs contributing to **2005** May–October ozone season *unadjusted* VOC emissions in NAA 1, the Sacramento Metropolitan Area.

| Primary AI    | Total Product<br>Emissions (tons/day) | Percent of all NAA 1 May-Oct<br>2005 emissions |
|---------------|---------------------------------------|--|
| CHLORPYRIFOS  | 0.186                                 | 14.17  |
| MOLINATE      | 0.093                                 | 7.11   |
| THIOBENCARB   | 0.070                                 | 5.36   |
| TRIFLURALIN   | 0.064                                 | 4.85   |
| 1,3-D         | 0.062                                 | 4.74   |
| PERMETHRIN    | 0.057                                 | 4.34   |
| METAM-SODIUM  | 0.051                                 | 3.91   |
| ETHALFLURALIN | 0.048                                 | 3.63   |
| CYPERMETHRIN  | 0.044                                 | 3.32   |
| SETHOXYDIM    | 0.039                                 | 2.96   |

**TABLE A2–1b**: Top ten primary AIs contributing to **2006** May–October ozone season *unadjusted* VOC emissions in NAA 1, the Sacramento Metropolitan Area.

| Primary AI     | Total Product<br>Emissions (tons/day) | Percent of all NAA 1 May-Oct<br>2006 emissions |
|----------------|---------------------------------------|--|
| 1,3-D          | 0.143                                 | 9.45   |
| TRIFLURALIN    | 0.123                                 | 8.14   |
| METAM-SODIUM   | 0.116                                 | 7.64   |
| CHLORPYRIFOS   | 0.115                                 | 7.58   |
| ETHALFLURALIN  | 0.082                                 | 5.42   |
| HYDROPRENE     | 0.047                                 | 3.13   |
| MOLINATE       | 0.046                                 | 3.04   |
| THIOBENCARB    | 0.040                                 | 2.67   |
| OXYFLUORFEN    | 0.040                                 | 2.64   |
| METHYL BROMIDE | 0.040                                 | 2.62   |

**TABLE A2–1c**: Top ten primary AIs contributing to **2007** May–October ozone season *unadjusted* VOC emissions in NAA 1, the Sacramento Metropolitan Area.

| Primary AI     | Total Product<br>Emissions (tons/day) | Percent of all NAA 1 May-Oct<br>2007 emissions |
|----------------|---------------------------------------|--|
| 1,3-D          | 0.274                                 | 21.77  |
| CHLORPYRIFOS   | 0.116                                 | 9.25   |
