J-12. Comment: It is not appropriate to allow the Executive Officer to restrict an entity’s holding account if ARB alleges an entity is determined to be in violation of provisions of this article. This provision allows the ARB substantial opportunity to force reconciliation instead of following accepted dispute resolution processes during an enforcement matter when an entity disagrees that there is non-compliance. For example in the situation where there is a dispute that insufficient allowances were retired ARB could "restrict" the entity's allowance account potentially causing additional future noncompliance because the account cannot be accessed. Section 96011 is neither appropriate nor productive and should be removed from the regulation. (SEMPRA1)

> **Response:** We do not agree. The cap-and-trade regulation does not have a contested surrender provision because an entity's surrender obligation is based on emissions that the entity reported to ARB pursuant to the MRR. The regulation is written to provide the Executive Officer flexibility in how to respond to an issue that results in a violation of the regulatory requirements. The example provided is not explicitly stated in the regulation, so that specific concern is misplaced.

J-13. Comment: As proposed, section 96011 would allow suspension, revocation or restriction of holding accounts and Executive Orders when an entity is determined to be in violation of any provision of the cap-and-trade rule. These provisions do not specify whether the Executive Officer makes that determination, the basis for the determination (i.e., issuance of Notice of Violation (NOV), settlement, court finding), or how and when a suspension, revocation or restriction is lifted. PG&E suggests that this section be improved by adding further clarity and specific criteria with regard to determining whether a violation occurred, and for the duration and removal of any suspension, revocation or restriction. For example, "determined to be in violation" should require that an NOV has been issued. Once an alleged violation is resolved (whether through a settlement, court action, or otherwise), any suspension, revocation or restriction should be lifted except where unusual circumstances justify continuing the suspension, revocation or restriction. (PGE1)

> **Response:** Section 96011 gives the Executive Officer authority and discretion to determine whether to invoke the remedies set forth in that section. Implicit in that authority is the ability to lift a suspension, revocation, or restriction. At this time, in the absence of particular facts and circumstances, it would not be appropriate to prescribe detailed procedures or a particular duration for those remedies.

Consideration of Circumstances

J-14. Comment: The Utilities acknowledge that compliance is a critical component of any cap-and-trade program and understand that CARB, under AB 32, is directed to use existing penalty provisions. Health and Safety Code section 38580 references penalty provisions in Article 3 of Chapter 4 of Part 4, commencing with section 42400, and Chapter 1.5 of Part 5, commencing with section 43025, of Division 26. CARB is given authority to develop a method to convert a violation into the number of days in violation, where appropriate (section 38350(b)(3)). Designated maximum criminal and civil penalties are then set forth for each type of violation. In each case a list of relevant circumstances are required to be considered in setting the level and amount of penalty. (see Health and Safety Code section 42400.8.) The Utilities believe it is critical to the protection of the State's electric ratepayers that such circumstances be expressly included in the proposed regulation's penalty provisions. The Utilities want to ensure fairness in determining compliance and recognition of the numerous extenuating circumstances that can affect an entity's ability to comply. We do believe that it is necessary to ensure that any penalty to be imposed is proportionate and relative to the nature of the non-compliance. The circumstances of the non-compliance as well as existing barriers to the compliance must be taken into account. The Utilities believe that attention has to be paid to circumstances outside the control of utilities such as the availability of transmission, the availability of low emitting technologies that are feasibly implemented, the shifting of emissions from other sectors (such as through the electrification of vehicles), the responsibility of electric utilities to maintain grid reliability, the cost effectiveness of available compliance tools, and other mitigating circumstances such as unusual weather, hydro and economic conditions. Thus, a provision for dealing with extenuating and unforeseen circumstances must be included in any program design. Modify section 96013 as follows:

> Penalties may be assessed pursuant to Health and Safety Code section 38580 for any violation of this article. *In determining whether to assess a penalty and any amount assessed, the Executive Officer shall take into consideration all relevant circumstances, including but not limited to those identified in Health and Safety Code section 42400.8.* (MID1)
>
> **Response:** The suggested language incorrectly assumes that the Executive Officer can unilaterally impose penalties. That is not the case. Health and Safety Code section 38580 commands that ARB enforce AB 32 regulations. Under the Health and Safety Code, ARB can *seek* penalties, but only an administrative law judge or court can impose penalties. ARB's authority does not extend to determining final penalty amounts. In many of its enforcement actions, ARB and the entity from whom ARB is seeking penalties will reach a mutual settlement agreement, including an agreed upon penalty amount. ARB may seek penalties in a judicial action, in which the ultimate penalty amount is determined by a neutral judge, based on the statutory penalty structure. In no instance is ARB able to unilaterally assign a penalty amount on a violator. Nevertheless, we modified section 96013 to include a reference to Health and Safety Code section 42403(b); in seeking a penalty, ARB will consider all relevant circumstances. Section 42403 is the appropriate reference because it relates to penalty determinations in civil actions, the kind of enforcement action that ARB can initiate.

J-15. Comment: Dow recommends that ARB revise section 96014 of the proposed regulation to ensure that penalties for cap-and-trade violations are commensurate with the scope and severity of the violation and potential environmental harm, and are consistent with penalties for other stationary source violations. Penalties should be just high enough to induce compliance. Sections 96014(a) and (b) specify that violations for failure to surrender the required number of compliance instruments are a separate violation for each missing compliance instrument, and are a separate violation for each day after the specified compliance date that a required compliance instrument has not been surrendered. Since each "compliance instrument" is equivalent to one metric ton of GHGs (proposed section 95802(a)(36)), these subsections together result in a "per metric ton per day" penalty approach. (DOWCHEM1)

> **Response:** ARB agrees that penalties should be high enough to deter violations, but does not believe it is possible to determine what penalty will be "just high enough to induce compliance," particularly before knowing the actual circumstances of a particular violation. We modified section 96013 to include a reference to Health and Safety Code section 42403(b), to consider all relevant circumstances related to assessing a penalty. Section 42403 is appropriate because it relates to penalty determinations in civil actions, which is what an ARB enforcement action would be considered. Additionally, section 96014 has been modified to calculate penalties on late surrendered compliance instruments every 45 days instead of per day. We examined the possible penalties and found that the "per ton per day" approach could theoretically result in penalties that were too high.

Provide Flexibility Before 4:1 Untimely Surrender

J-16. (multiple comments)
Comment: The proposed regulation should provide greater flexibility in meeting the compliance obligations by providing notice and an opportunity to cure a compliance shortfall before ARB assesses the 4:1 penalty. Under the proposed regulation, a regulated entity will be penalized at a 4:1 ratio for every emissions allowance it fails to retire under its triennial or annual compliance obligations. The regulated entity would be required to retire four times the allowances within 30 days of the triennial or annual compliance deadline. This penalty could be unduly onerous in situations where a regulated entity was either unable to procure a sufficient amount of allowances (despite diligent efforts) or where a shortfall resulted from unintentional accounting errors. The 4:1 penalty should only take effect after ARB provides notice and a reasonable opportunity to cure the shortfall. This is particularly important for the electric sector, where gross emissions are a function of electric demand that is not entirely within the direct control of the utility, but rather can be an outcome under their obligation to serve customers. (PACIFICOR1)

Comment: CARB should provide flexibility in achieving compliance obligations. In accordance with section 95857(b)(2), p. A-72), a covered entity will be penalized at a 4:1 ratio if it fails to retire sufficient allowances consistent with its triennial or annual compliance obligation. The regulated entity would be required to retire four times the allowances within 30 days of the triennial or annual compliance deadline. Praxair is concerned that this penalty structure will be unduly burdensome in situations in which a regulated entity was either unable to procure a sufficient amount of allowances (despite diligent efforts) or the shortfall resulted from unintentional accounting errors. The 4:1

penalty should only take effect after CARB provides notice and a reasonable opportunity to cure the shortfall. (PRAXAIR)

> **Response:** The cap-and-trade regulation provides a reasonable opportunity to cure shortfalls; the original unsurrendered compliance obligation and the additional surrender obligation are required to be surrendered by five days after the latter of an auction or allowance price containment reserve sale. To the extent that the commenters recommend a "notice-to-comply" approach in lieu of enforcing the regulation as it is written, we note that notice-to-comply programs do not promote full compliance with the law. These programs send the wrong signal—that no one need comply with the law until caught in violation. Such programs unfairly disadvantage businesses that comply with the regulatory requirements before an enforcement action begins. Finally, notice-to-comply programs also require much greater enforcement resources than ARB has at its disposal.

Untimely Surrender: Excessive Penalties

J-17. Comment: The Board should direct staff to make appropriate revisions to the enforcement provisions to provide that covered entities would not be subject to both excess emission penalties and civil and criminal penalties under HSC. (CCC, MAZOWITA)

> **Response:** By statute, the same conduct is subject to either civil or criminal penalties, but not both. See Health and Safety Code section 42400.7. The additional surrender obligation is not a penalty. We modified the regulations to indicate that no penalties will accrue until five days after both an auction and an allowance price containment reserve sale occur.

J-18. Comment: The Board should direct the staff to make appropriate revisions to the enforcement provisions to provide that civil and criminal penalties would not apply to each compliance instrument that has not been surrendered. (CCC, MAZOWITA)

> **Response:** It is not clear what the commenter is suggesting. However, penalties will be calculated beginning on the fifth day after both an auction and an allowance price containment reserve sale, and will accrue every 45 days on each compliance instrument not surrendered, including any not surrendered as a result of the additional surrender obligation.

J-19. Comment: Pursuant to section 95857(c), the obligation to surrender allowances for untimely surrender is immediately due, and penalties can be pursued if the Covered Entity does not surrender sufficient allowances to meet this obligation within 30 days. NCPA recommends that the provisions of the proposed regulation be clarified to ensure that a Covered Entity that meets all of the obligations of section 95857 during the 30-day cure period is not also subject to additional penalties under the provisions of sections 96013 and 96014. (NCPA1)

Response: We agree. The cap-and-trade regulation requires that the original unsurrendered compliance obligation and the additional surrender obligation be surrendered by five days after the latter of an auction or allowance price containment reserve sale.

J-20.
Comment: DWR, a public agency, may face fiscal difficulties and cash flow problems in purchasing high value allowances due to the background of public budgeting and revenue collection. We request that ARB reduce the penalty for noncompliance as one way to reduce this threat. (DWR)

Response: In seeking any penalty, ARB would consider compliance efforts and compliance challenges that any alleged violator faced among the circumstances required to be considered under section 96013 of the rule and Health and Safety Code section 42403(b).

J-21. Comment: The severity of the penalty for untimely surrender of allowances should be re-evaluated. Subjecting an entity to both a monetary penalty and the requirement to surrender additional allowances is a double penalty for the same violation. In addition, the calculation methodology for monetary penalties should be limited. The current method, based on a per ton, per day violation, could generate disproportionate penalty amounts. As an example, a $10,000 fine for Paramount has a much greater impact than the same penalty assessed against a major oil company. (PMTPETRO1)

Response: The additional surrender obligation is not a penalty. Regarding the "per-ton, per-day" portion of the comment, ARB notes that in the second 15-day changes to the regulation we revised the method of calculating penalties in section 96014(b) so that there is a separate violation for every 45-day period that passes without the obligation being paid, rather than every day. This change dramatically slows the rate at which penalties may accumulate. See also the response to Comment J-15.

Regarding the commenter's concern that the "per-ton" aspect of Section 96014(a) could yield "disproportionate penalties," we note that 96014(a) identifies one compliance instrument as the unit of violation because the compliance instrument is the basic unit on which the regulation is based, and corresponds to the basic reporting unit under the MRR. In the event that an enterprise fails to surrender required compliance instruments, the number of violations and the potential penalty will always be proportional to the magnitude of the noncompliance, regardless of the enterprise's size. Defining a violation in terms of a compliance instrument is a necessary deterrent because failing to surrender an instrument as required would confer a direct economic benefit on the violator. Failing to surrender compliance instruments also threatens the integrity of the emissions cap. To discourage this type of behavior, the penalty must do more than merely take away the economic benefit gained by the violator. The deterrent effect of proportional but potentially large penalties is necessary to accomplish the goals of the cap-and-trade regulation.

Defining a violation based on a per-unit value is consistent with other ARB regulations that define penalties proportional to the conduct. The definition is consistent with the Global Warming Solutions Act's intent that regulations be enforceable, be enforced, and result in significant penalties. (See Health and Safety Code sections 38560.5 subd. (d) [enforceable rules], 38562 subd. (d)(1) [enforceable reductions], 38580, subd. (a) [ARB shall enforce], and 38580(b) [penalties].) Moreover, Health and Safety Code section 38580(b)(3) authorizes ARB to define penalties on a per-unit basis, proportional to the conduct, rather than defining violations purely in terms of days.

J-22. Comment: Requiring additional surrender of allowances above the base surrender obligation as a non-compliance penalty is inappropriate as a matter of good public policy. While the variant currently being considered is superior to a pure "assess and retire" approach, it will still have avoidable, undesirable, adverse impacts. Therefore, we recommend that the penalty for non-compliance be 1) fulfilling the underlying surrender obligation that was not initially met, and 2) an additional monetary penalty. Alternatively, although still in our view a substantially inferior approach, if there is a desire to provide a non-monetary option, in the context of the other parameters of the California program, it might be sensible to allow the "penalty" to be paid in "ex quota" offset credits—that is, using offsets over and above the 8 percent of compliance obligation restriction. (MSCG2)

Response: We do not agree. The additional surrender of allowances is not a penalty, but ensures the environmental integrity of the cap-and-trade program. The regulation has been modified to mitigate some concerns raised by stakeholders. In the second 15-day changes to the regulation we modified section 95857(d) so that three-fourths of the "excess emissions" compliance instruments are placed into the auction account to avoid "tightening" the market for all participants. We also modified section 95857(b)(4) and added new section 95857(b)(5) in the second 15-day changes to the regulation to allow the use of offsets for one-fourth of the "excess emissions," as long as the quantitative usage limit is not violated for the applicable compliance period.

J-23. Comment: The regulation's fourfold penalty for a failure to timely surrender compliance instruments is unwarranted, at least for public agencies. DWR, like most public agencies, never considers ignoring or disobeying the law to be an option. The only scenario in which such a failure is conceivable would be a complete lack of available allowances or an unexpected and extremely unaffordable allowance price. In either case, a fourfold penalty is no remedy. A public agency's failure to meet a legal obligation to surrender allowances would trigger various disclosure requirements along with concomitant adverse consequences to budget planning, water rates, cost allocation, and water contract administration. The inordinately high penalty amount would only exacerbate attempts to remedy such a situation. The regulation should be amended to delete the fourfold penalty for the Department of Water Resources. Modify section 95857 as follows:

> <u>(e) This section does not apply to the Department of Water Resources.</u> (DWR)

> **Response:** ARB does not believe that treating DWR differently from other covered entities regarding its surrender obligation is appropriate.

J-24. Comment: Subsections (a) and (b) of proposed section 96014 specify that violations for failure to surrender the required number of compliance instruments are a separate violation for each missing compliance instrument, and are a separate violation for each day after the specified compliance date that a required compliance instrument has not been surrendered. Since each compliance instrument is equivalent to one metric ton of GHGs (section 95802(a)(36)), these subsections together result in a per metric ton per day penalty approach. Under proposed section 96013, the stationary source penalty authorities of Health and Safety Code sections 42400 et seq. would apply. PG&E does not support ARB's proposal that each missing compliance instrument be considered a separate daily violation. Given the magnitude of stationary source annual GHG emissions, treating each missing compliance instrument as a separate violation for every day the shortfall continues is likely to result in extremely large numbers of violations for each occurrence of a shortfall. Large numbers of violations in turn create the possibility for extremely large penalties. In PG&E's view, the proposed cap-and-trade program should include violation provisions and penalty guidelines that ensure that penalty exposure is consistent with existing stationary source penalty assessments, and total penalty amounts are not unreasonably large because GHG emission rates are large in comparison to emission rates for traditional air pollutants. PG&E recommends the following approach to enforcement for the cap-and-trade program. First, section 95857(b) should be revised to eliminate the four time multiplier for excess emissions resulting from untimely surrender. Instead require surrender of sufficient compliance instruments to make up the shortfall on a 1:1 basis, and impose a requirement for a cash payment of three times the quantity of excess emissions, multiplied by the most recent allowance market price. Second, section 96014(a) and (b) should be revised so that no violation occurs if a compliance shortfall is cured under section 95857 within the 30-day cure period. Failure to cure a shortfall within the 30-day period should be a single violation per day from the end of the 30 days until the shortfall is made up and the cash payment is made. (PGE1)

> **Response:** We disagree with the first recommendation to eliminate the excess emissions obligation in favor of a financial penalty and did not make the recommended change. The excess surrender obligation ensures the environmental integrity of the cap-and-trade program.
>
> We modified the calculation of penalties, although the modification was not accomplished in the manner suggested by the commenter. Specifically, in the second 15-day changes to the regulation, we modified section 96014(b) so that a

> new violation occurs every 45 days that the entity has not cleared its surrender, in order to reduce the rate at which penalties increase. Each allowance not surrendered is still the basis for the penalty. See the response to Comment J-20.

J-25. (multiple comments)
Comment: Enforcement penalties are overly punitive and should be modified. Section 95857 provides for penalties in the event that an entity fails to surrender sufficient compliance instruments. The regulation would require surrender of compliance instrument equal to four times the deficient quantity of instruments and additionally subject the entity to penalties under the Health and Safety Code. Section 96013 further provides that each deficient compliance instrument will be considered a separate violation and that each day thereafter will also be considered a separate violation. WPTF has a number of concerns about these penalty provisions. First, the application of the terms of the Health and Safety Code has the potential to quickly result in excessive penalties for a single violation. The same concerns were raised by stakeholders in regard to similar provisions in the regulation for the Renewable Energy Standard, and as a result, the Board directed their modification. WPTF requests that the cap and trade regulation also be modified to address the excessive potential of these penalties. (WPTF)

Comment: The severity of the penalty for untimely surrender of allowances should be re-evaluated and a monetary penalty beyond the first allowance should replace the surrender of additional allowances. A 3:1 penalty is more appropriate. To require the submittal of the penalty in additional allowances tightens the market and penalizes all market participants. The regulation requires clarification on whether untimely submittal would result in daily health and safety code violations and penalties beyond the 3:1 (or 4:1) submittal. (BP)

Comment: Treating each individual compliance instrument not surrendered, as well as each day each instrument is not surrendered as separate violations could likely lead to penalties that go beyond incenting compliance and would create unnecessary roadblocks to the achievement of AB 32 goals. This is particularly true in light of the proposals for annual compliance obligations. The Utilities have participated in discussions regarding enforcement provisions in CARB's proposed Renewable Electricity Standard regulations, and support what the Utilities understand to be the direction staff is recommending in that arena. We believe a similar approach could be employed in the proposed Cap-and-Trade regulation. Modify section 96014 as follows:

> (a) If a covered entity fails to surrender a sufficient number of compliance instruments to meet its compliance obligation as specified in sections 95856 or 95857 there is a separate violation of this Article for ~~each required compliance instrument that has not been surrendered.~~
> ~~(b) There is a separate violation for each day or portion thereof after the compliance~~ <u>surrender</u> ~~date that~~ each required compliance instrument <u>that</u> has not been surrendered.

(b) For each six month period after the surrender date, there is an additional, separate violation of this Article for each required compliance instrument that has not been surrendered.
(c) ~~Each day or portion thereof in which any other violation of this Article occurs is a separate offense~~ In determining whether to assess a penalty and any amount assessed, all relevant circumstances shall be considered. (MID1)

Response: The additional surrender obligation is not a penalty. See also the responses to Comments J-15, J-20, and J-23.

J-26. Comment: The enforcement provisions must be developed and administered in a way that does not adversely affect a Covered Entity's ability to comply with the regulation going forward. Penalties must be assessed consistent with the principles of malfeasance and gross negligence, and mitigating factors, including programmatic difficulties and sector-related constraints, must be carefully and fully reviewed by the Executive Officer and CARB before penalties are assessed. NCPA has worked closely with CARB staff, the electric utilities, and other stakeholders as part of the Renewable Electricity Standard (RES) Working Group, specifically discussing the appropriate approach for enforcement and penalties. The RES Working Group has recommended a balance with regard to the imposition of "daily penalties," that recognizes that meeting an annual compliance obligation of the nature created in the proposed regulation is somewhat unique in several respects, and accordingly recommends that the "daily penalty" be calculated using a six month period. Consistent with this methodology, NCPA recommends the following revisions. Modify section 96013 and 96014(b) and (c) as follows:

Penalties. Penalties may be assessed pursuant to Health and Safety Code section 38580 for any violation of this article. In determining whether to assess a penalty and any amount assessed, all relevant circumstances shall be considered.

(b) There is a separate violation for each ~~day~~ six-month period or portion thereof after the compliance date that each required compliance instrument has not been surrendered.
(c) Each ~~day~~ six-month period or portion thereof in which any other violation of this Article occurs is a separate offense. (NCPA1)

Response: ARB cannot unilaterally assess penalties. In seeking any penalty, ARB considers all relevant circumstances, including those suggested by the commenter. We included a variation of the suggested language in section 96013, and modified section 96014 to allow 45 days (not the six months suggested by the commenter) for each offense to accrue.

J-27. Comment: Currently, the proposed regulation's penalty provisions are excessive, unbounded, and vague. SCE recommends that CARB clarify its penalty provisions. Section 95857(b) of the proposed regulation requires that a covered entity that has surrendered insufficient compliance instruments in a timely manner (known in the proposed regulation as “excess emissions”) is penalized with a new compliance obligation of four times the excess emissions. A penalty of four times the excess emissions is disproportionately punitive. If a compliance entity could not acquire sufficient allowances to surrender for compliance, it is unlikely that it could acquire four times that amount. Moreover, while the regulation allows for borrowing to meet this penalty provision, a penalty of four times the excess emissions implies a 300 percent interest rate to borrow.

Subsection 15 of the proposed regulation establishes additional consequences for violations of the cap-and-trade regulation, including injunctions and other penalties. Under this section, CARB may assess a separate violation for each required compliance instrument that has not been surrendered, as well as a separate violation per day. CARB staff has noted that these violations are unique to the cap-and-trade program. While these provisions represent an improvement in that they establish violations specific to compliance instruments, the penalty provisions simply provide that “penalties may be assessed pursuant to Health and Safety Code section 38580 for any violation of this article.” Section 38580 of the Health and Safety Code codify the enforcement provisions of AB 32. These provisions refer to several other sections of the Health and Safety Code that create criminal, civil, and administrative penalties for emissions violations, including emissions of air contaminants. The provisions include criminal and civil penalties that range from fines of $1,000 to $1,000,000, and up to a year in county jail or state prison per violation. This is a menu of enforcement penalties designed to punish stationary sources for their emissions, and are overly punitive and not readily applicable to the cap-and-trade regulation framework. SCE recommends that CARB revise and clarify the penalty provisions to make them more applicable to the cap-and-trade context. (SCE1)

> **Response:** Section 95857’s additional surrender obligations are not a penalty; they ensure the program’s environmental integrity. Regarding Subarticle 15, see the responses to Comments J-15, J-20, and J-23.

J-28. (multiple comments)
Comment: Clear and effective penalty provisions are essential for the program to achieve emission reductions and deter non-compliance. We commend CARB for the robust and transparent penalty structure proposed in the regulations. Requiring noncompliant entities to surrender a multiple of four compliance instruments within 30 days for every one missed (and only one may be an offset) sends a clear signal that noncompliance will neither be tolerated nor financially advantageous. Tacking on monetary fines that accumulate up to $25,000/day will further deter would-be violators. (NRDC1)

Comment: The recently proposed enforcement provisions that consider failure to report every ton of excess emissions and submittal of inaccurate information as separate violations would potentially result in unwarranted and excessive penalties, relative to other criteria pollutant penalties. CCEEB recommends that the ARB return to the original penalty provisions, which provide the ARB with a mechanism to deal with fraud and intentional actions while managing unintentional errors in fair manner. (CCEEB1)

> **Response:** See the responses to Comments J-15, J-20, J-23, and J-25.

Untimely Surrender Penalty: Market Impacts

J-29. Comment: If an entity is late in their surrender of allowances, the penalty will be that they have to purchase three additional allowances for every one that they were unable to surrender. This will shorten the supply available in the auction. (AGCOALITION)

> **Response:** Section 95857's additional surrender obligations are not a penalty; they ensure the program's environmental integrity because it is a strong deterrent to noncompliance. We added new section 95857(b)(6), which states that the additional allowances are not due until five days after the next auction and allowance price containment reserve sale, whichever is later. We also modified section 95857(d) to return allowances submitted to cover an untimely surrender back to the auction account, so as not to affect supply for other market participants.

J-30. Comment: Provide a safety valve penalty option (similar to the federal SO2 program) under which a regulated entity that is simply unable to obtain allowances may achieve compliance after the fact by paying a penalty or implementing other mitigation. Without a backup method of maintaining compliance, the cap and trade system could generate essentially infinite prices for allowances. There needs to be some absolute limit imposed or some other alternative for compliance in view of the fact that allowance shortages will come to light only after the cap is exhausted and allowances are no longer available. (HOR)

> **Response:** We disagree with providing an absolute limit on penalties. However, for each surrender obligation an entity fails to meet, the additional surrender obligation will only apply once. This will limit the number of allowances or ARB offset credits required to bring a covered entity's compliance account current.

J-29. Comment: CCAP recommends additional clarification of compliance and enforcement mechanisms including provisions for the disposition of allowances in relation to insolvency, dissolution or downscaling of covered entities. While the proposed regulation provides a useful 30-day period to cure identified untimely surrenders not otherwise satisfied by section 94857(c)(2-3), it would also be helpful to provide an explicit time frame in which the Executive Officer will assess timely surrender of obligations. (CCAP1)

> **Response:** Section 95856 provides the surrender date. Covered entities will know what their compliance obligations are because those entities will report to

emissions pursuant to MRR. There is no “time frame” to assess whether the compliance instruments have been surrendered. ARB anticipates that the disposition of allowances of an insolvent, dissolved, or downscaled covered entity will be addressed through the appropriate documentation of the covered entity and as required under the reporting elements of the MRR.

J-32. (multiple comments)
Comment: The proposed cap-and-trade rule provides an automatic emissions penalty of four times the “excess emissions” for failure to timely submit the required amount of compliance instruments. See proposed section 95857(b). The proposed rule also allows for a 30-day period to be provided allowing a covered entity time to obtain the compliance instruments needed to correct a shortfall (including the 4x multiplier). See section 95857(c)(4)(6). Dow recommends the following approach to enforcement for the cap-and-trade program. First, section 95857(b) should be revised to eliminate the 4x multiplier for excess emissions resulting from “untimely surrender,” and instead require surrender of sufficient compliance instruments to make up the shortfall on a 1:1 basis, and impose a requirement for a cash payment of twice the quantity of excess emissions, multiplied by the most recent allowance market price. This approach would be sufficient have the same economic impact on the source as the 4x surrender requirement, while avoiding potential adverse market effects resulting from artificially decreased supply of allowances. (DOWCHEM1)

Comment: The excess surrender requirements of section 95857 (Untimely Surrender of Compliance Instruments by a Covered Entity), adversely impact all Covered Entities and not just those that are out of compliance by reducing the number of compliance instruments available for surrender. Such an outcome should be avoided.
NCPA recommends that the proposed regulation be revised to permit allowances to set the value for non-compliance, by requiring the non-complying entity to surrender the required number of allowances plus a payment valued at three times the amount of allowances in the most recent auction. If CARB requires actual allowances to be surrendered in excess of the compliance obligation, then CARB is penalizing all other market participants—particularly those with a compliance obligation—because the allowances will not be available for purchase at that time. This concern is not mitigated by the fact that the allowances will be placed back into the market for two reasons. First, the allowances will come out of the market for some period of time and for Covered Entities seeking to buy allowances during that time period, the demand will be greater as the entity that is trying to meet the out-of-compliance surrender obligation will be purchasing more allowances than what was contemplated in the allowance budget. Secondly, the excess allowances will be placed back into the market, but as currently drafted, these allowances will go into the Reserve Account. That means the allowances will automatically be valued at more than the Auction Reserve Price. Again, this results in increasing the compliance cost for other Covered Entities. If the proposed regulation is not changed to monetize the value of the untimely surrender obligation for noncompliance, the provisions of section 95857(d) should be revised to ensure that the allowances from the excess surrender obligation are placed back into the auction at a non-discriminatory rate that does not adversely impact the remaining Covered Entities.

Accordingly, the three-quarters of allowances used to meet the untimely surrender obligation should either be placed back into the CARB Auction Holding Account (defined in section 95831(c)(2)), or at a minimum, the allowances should be used to repopulate the first tier of the Reserve Account, and not placed into the highest tier, where they will only be available to all other Covered Entities at the highest possible price. Section 95857(d)(2)(A) should be revised accordingly. (NCPA1)

Comment: The regulation proposes that entities that miss the deadline for retiring compliance instruments retire four allowances for every ton of emissions. Not only is this requirement unfair but it penalizes market participants by limiting the number of allowances in the market every time an entity misses its retirement obligation. (CALCHAMBER1)

Comment: CARB proposes that noncompliance should be penalized with a four times multiplier for excess emissions. We believe that the per ton penalty approach proposed by CARB staff is overly punitive. In addition, taking the additional allowances out of the market and putting them in the allowance reserve would make them available for purchase only at the higher reserve price, a bad outcome for remaining innocent market participants. We recommend that a more moderate penalty structure be adopted without taking allowances out of the market. (CMTA1)

Comment: WSPA recommends that ARB revise the enforcement provisions, so that late or insufficient amount of instruments should only be subject to one times penalty. Further, we urge ARB to strongly consider all insufficient instruments that are above one times to be surrendered in the form of a dollar payment for each instrument based on a price equal to the market price at the time the allowance should have been surrendered. While WSPA understands ARB’s need to have appropriate enforcement provisions in place to ensure compliance with meeting the requirements of the C&T Regulation, we believe imposing duplicative penalties for the same offense is unnecessarily stringent. Further, WSPA believes requiring the violator to surrender four times the insufficient amount could potentially penalize others in the market as it will force the early retirement of instruments that could otherwise be available for use by others in the market. (WSPA1)

Comment: The excess emissions obligation is excessive and should be made consistent with other trading programs. The draft regulation indicates that the covered entity's compliance obligation for untimely surrender is calculated as four times the entity's excess emissions (4:1 ratio). This compliance penalty is excessive in comparison to other existing emissions trading programs and may have the unintended consequence of limiting the market further than necessary or appropriate. The RECLAIM and Acid Rain programs require that the amount that the allocation is exceeded be deducted from the next year's allocation on a 1:1 ratio. CARS audits may reveal that some entities need to apply conservative CEMS missing data procedures, which may result in a calculated surrender obligation that is above the entities' actual emissions. Such approach ensures the environmental integrity of the program is not compromised, but does not go so far as to take out of circulation additional allowances that are needed by covered entities in general for compliance. This occurs when ARB transfers three fourths of surrendered allowances to the highest-priced tier in the Allowance Price Containment Reserve Account (the other one fourth is retired). This approach works against other cost containment provisions in the regulation and essentially penalizes all covered entities by restricting allowance supply and driving up the allowances prices. This provision is in addition to financial penalties proposed under section 96013, where penalties may be assessed for any violation, and section 96014, where a separate violation is defined for each day or portion thereof after the compliance date that each required compliance instrument has not been surrendered. If a covered entity has excess emissions of 500 MT for 10 days, it must then surrender 20,000 MT of California allowances [500 MT of GHG emissions x 4 California GHG allowances x 10 days= 20,000 MT of California GHG allowances]. LADWP strongly recommends that the untimely surrender obligation for excess emissions remain consistent with other emissions trading programs with a 1:1 surrender obligation, in which the replaced compliance instrument is permanently retired. Modify section 95857(b) as follows:

> (b)(2) *A covered entity's compliance obligation for untimely surrender is calculated as ~~four times the entities excess emissions~~* <u>equal to the entity's excess emissions</u> (LADWP1)

Comment: The severity of the penalty for untimely surrender of allowances should be re-evaluated. Subjecting an entity to both a monetary penalty and the requirement to surrender additional allowances is a double penalty for the same violation. In addition, the calculation methodology for monetary penalties should be limited. The current method, based on a per ton, per day violation, could generate disproportionate penalty amounts. (WIRA1)

Comment: California's cap-and-trade program departs from the standard practice of imposing monetary penalties, as seen in the US Acid Rain program and the EU ETS, on each ton of excess emissions not covered by allowances in any compliance period. IETA advises against using a non-compliance penalty based on the forced withdrawal of allowances, and instead recommends adopting a more traditional fixed monetary fine similar to those seen in the highly successful US SO2 and NOx emissions markets. A monetary penalty provides price stability in an uncertain market. A monetary penalty does not force the market price to increase. Under the current draft regulations, three allowances are to be placed in the APCR account, which would be available for purchase should that account be activated. It is likely to push prices up, as more allowances will only be available from the price containment reserve or at the ceiling price. A monetary penalty has no effect on permit price or availability, sufficiently punishing non-compliers without subjecting all market participants to the after-effects of others' negligence. (IETA1)

Comment: Kern is concerned about potential excessive penalty amounts (violations accrue per allowance/per day). Kern suggests that there be limitations on daily penalties, while adding any costs that were saved by not complying. Kern is opposed to the 4:1 allowance penalty. Not only is this a large expense, but it shorts the market of credits. Kern suggests that a 1:1 ratio be used. (KERNOIL1)

Comment: ARB has structured the provisions such that operators that fail to surrender their compliance obligation in a timely manner are subject to a penalty requirement of four times the insufficient amount and an additional, separate penalty for "each day" of the violation. Imposing duplicative penalties for the same offense is unnecessarily stringent. In addition, requiring the violator to surrender "4 times the number of allowances" will potentially penalize others in the market as it will force the early retirement of instruments that could otherwise be available for use by others in the market. Chevron recommends ARB revise the enforcement provisions, so that late or insufficient surrender of instruments should be subject to a surrender of one allowance plus the payment of penalty in dollars equal to the price for the additional number of allowances. Chevron recommends that all other enforcement remedies would be contingent on non-compliance with the original allowance surrender penalty. (CHEVRON1)

> **Response:** See the responses to Comments J-15, J-20, J-23, and J-25. The additional surrender of allowances is not a penalty, but is necessary to ensure the environmental integrity of the cap-and-trade program as a deterrent to noncompliance. To prevent the reduction in supply of compliance instruments to other covered entities, we modified section 95857(d) to return allowances submitted to cover an untimely surrender to the auction account.

Offsets Use for Untimely Surrender

J-33. (multiple comments)
Comment: ARB should remove the limitation on the types of allowances that may be used to satisfy the 4:1 penalty shortfall; specifically, PacifiCorp believes that regulated entities should be allowed to use both allowances and offsets in this situation. Since the certification provisions for offsets ensure that they meet ARB's additionality requirements, there is no reason why the proposed regulation should include this limitation on the use of offsets. (PACIFICOR1)

Comment: Any approved compliance instrument should be eligible for untimely surrender obligation, not just California GHG allowances. Such a provision should be deleted as it is unnecessarily restrictive. Any approved allowance or offset credit that is eligible for use in the California cap-and-trade program overall should also be eligible for use to fulfill any surrender obligation. Otherwise, divergent treatment of compliance instruments available through ARB approved offset protocols or ARB approved external trading programs sends incorrect signals to investors that such compliance instruments are inferior and less valuable than California GHG emission allowances. Modify section 95857(b)(3) as follows:

(3) *A covered entity's compliance obligation for untimely surrender may only be fulfilled with ~~CA GHG allowances or allowances issued pursuant to~~* compliance instruments issued pursuant *to subarticle ~~12~~* 4." (LADWP1)

Response: We modified the regulation to allow up to one-fourth of the untimely surrender obligation to be met through the use of offsets, so long as it does not exceed the offset limit use contained in section 95854, for the applicable compliance period. We believe that the additional surrender of allowances serves as a strong deterrent to not meeting regulatory deadlines and ensures the environmental integrity of the cap-and-trade program.

Layering of Penalties with the MRR

J-34. Comment: Under section 96014(a) (p. A-180), there will be a separate violation for each compliance instrument that is not surrendered to meet a covered entity's surrender obligation. Additionally, under section 96014(b) (p. A-181), there would be a separate violation for each day after the compliance date that each required compliance instrument has not been surrendered. These provisions for per-ton per-day violations should be considered in light of the penalties that may be applied under the revised MRR—also on a per day, per ton basis—and the requirement in section 95857 for the imposition and recovery of the untimely surrender obligation: four times the excess emissions. Without modification, these overlapping penalty provisions will constitute a grossly excessive burden. It would be more appropriate to impose per-day penalties under the revised MRR without any per-ton multiplier. Per-day penalties would meet the legitimate objective of ensuring that reports and verification statements are provided promptly. Conversely, per-ton penalties should be imposed under the Cap and Trade Regulation without any per-day multiplier. Per-ton penalties would meet the legitimate objective of ensuring that covered entities surrender the correct amount of compliance instruments to meet their surrender obligation. Additionally, there should not be a violation under section 96014 if an entity incurs an untimely surrender obligation and that obligation is met in full within the 30-day period provided in section 95857(c)(4) (p. A-73). The "compliance date" that is specified in section 96014(b) should be the end of that 30-day period. The ARB recognized the issues with imposing per-day penalties in addition to penalties for each missing instrument in relation to the Renewable Electricity Standard ("RES") regulation. Similar concerns apply here and should be addressed during the "15-day" process. (SCPPA1, SCPPA5)

Response: We worked extensively with stakeholders to ensure that penalties are not "layered" between the MRR and the cap-and-trade regulation. A covered entity reports its emissions under the MRR. Those emissions are then verified, and the covered entity receives either a positive, qualified positive, or adverse emissions verification statement. In the event of either a positive or qualified positive verification statement, ARB accepts the emissions reported. The entity's compliance obligation is equal to one allowance for each ton emitted. If a covered entity receives an adverse verification statement, ARB uses default emission factors and calculates the covered entity's compliance obligation.

To the extent that a covered entity misreports emissions under the MRR, then amends the report (or get assigned an emissions number under the MRR) in time to surrender obligations under the cap-and-trade regulation, that entity faces penalties under only one rule: the MRR. If the error is discovered after the entity has already surrendered its original compliance obligation under the cap-and-trade regulation, section 95858 (added in response to stakeholder comments) gives the entity an additional six months to make up any additional surrender obligations related to the error. In this second situation, (assuming that the instruments are surrendered during the six-month period) the entity faces potential penalties under only one rule: the MRR. Independent of MRR compliance, once a surrender obligation has been established, an entity that fails to surrender compliance obligations under the cap-and-trade regulation faces potential penalties under only one rule for that failure: the cap-and-trade regulation.

To address the concern that per-ton per day violations may result in penalties that are too burdensome, we changed the basis for determining the number of violations. We modified section 96014 so that violations would be calculated on a per-ton basis after every 45-day period in which the covered entity fails to meet its surrender obligations. While we did not adopt the suggestion that the 30-day provision in section 95857(c)(4) be the "compliance date," we did add section 95857(b)(6) to give the covered entity time to access one auction or reserve sale before the untimely surrender is due. We believe that the process now provides adequate time for covered entities to meet their obligations. See also the responses to Comments J-15, J-20, J-23, and J-25.

J-35. (multiple comments)
Comment: For the staff report section on enforcement, we do not see it so clearly and are concerned about the potential exposure to draconian enforcement actions over potential inaccuracies in complying with a half-finished, overly complex and sometimes convoluted set of requirements. Moreover, we are concerned that the violation and penalty structure as detailed in section 95107 of the MRR could lead to a layering of penalties. In fact, we agree with the Western States Petroleum Association that "one piece of missing or incorrect data (out of potentially millions of pieces of data) could lead to potentially massive penalties. In other words, failure to measure, collect, record and preserve data could lead to a violation and penalty for "each ton, for each day" that the alleged failure occurred." (PLOTKIN)

Comment: We are concerned that the violation and penalty structure as detailed in Section 95107 of the MRR could lead to a layering of penalties such that one piece of missing or incorrect data (out of potentially millions of pieces of data) could lead to potentially massive penalties. In other words, failure to measure, collect, record and preserve data could lead to a violation and penalty for "each ton, for each day" that the alleged failure occurred. Further as noted in sub-sections (a), (b), (c) and (d) the same "failure" regardless of the reason or circumstance could be subject to penalties under the different sections potentially leading to tripling or quadrupling of penalties for the same alleged violation. As the mandatory reporting rule is tied to the proposed cap and trade rule, it is critical that the cap and trade rule also be addressed accordingly. We urge that the adopting resolution acknowledge that this multiplication of penalties, whether in the Cap and Trade Rule or in the Monitoring Recordkeeping and Reporting (MRR) Rule, is not the intent and that ARB is committed to addressing this issue in order to make the penalty structure fair and rational. (WSPA1)

Comment: The proposed regulation should not create potentially overlapping penalty provisions. The proposed regulation, in conjunction with the MRR, authorizes ARB to impose four separate penalty provisions for the same activity in parallel. First, the proposed regulation would impose a separate violation for each compliance instrument that is not surrendered to meet a covered entity's compliance obligation. Second, regulated entities may be subject to a separate violation for each day after the compliance date that a compliance instrument has not been surrendered. Third, the proposed amended MRR would apply penalties on a per-day, per-ton basis. Fourth, the proposed regulation would assess an excess emissions obligation of 4:1 for every allowance that should have been surrendered, but is not surrendered.

The overlapping penalty provisions under the proposed regulation would constitute a gratuitous enforcement action if more than one penalty were to be applied. We recommend imposing penalties only on a per-ton basis under the Cap-and-Trade Program, without any per-day multiplier. Per-ton penalties would meet the legitimate objective of ensuring that covered entities surrender the correct amount of compliance instruments to meet their surrender obligation. Furthermore, there should not be a violation if a regulated entity incurs an untimely excess emissions obligation and subsequently satisfies its excess emissions obligation within the 30-day period in the proposed regulation. (PACIFICOR1)

> **Response:** See the response to Comment J-20 (4:1 and per-ton) and J-33 (layering). The scenarios posited by the commenters could not occur, considering how the cap-and-trade regulation and the MRR interact.
>
> We disagree with the comment that the provisions in the cap-and-trade regulation on violations and penalties overlap. Each provision is designed to deal with a separate issue in setting penalties.

Allow More Time to Purchase Allowances for Excess Emissions

J-36. Comment: Covered entities should be given adequate time to purchase allowances at auction for excess emissions. The draft regulation indicates that the obligation to surrender allowances for excess emissions is immediately due, and the Executive Officer may pursue enforcement activities if a covered entity does not surrender sufficient allowances equal to this untimely surrender obligation by the end of the 30-day period. The LADWP recommends that ARB provide covered entities with the opportunity to purchase allowances at the next quarterly auction. This timeframe could be less than 30 days or up to 3 months, but it offers the covered entity a more reasonable opportunity to purchase allowances without going to the secondary market or allowance reserve. Additionally, LADWP recommends that this section be revised such that it is clear that the covered entity has a set period of time until the next quarterly auction to true up its compliance obligation for untimely surrender before the Executive Officer pursues enforcement activities. In other words, the Executive Officer shall not impose penalties pursuant to Subarticle 15 unless the covered entity has failed to secure adequate allowances by the time the next quarterly auction is completed and auctioned allowances are transferred into the covered entity's compliance account. (LADWP1)

> **Response:** We agree with the need to provide covered entities with an opportunity to purchase at an auction or Reserve sale before the excess emissions obligation is due. We added section 95857(b)(6) so that the excess emissions obligation will not be due until five days after the next auction or reserve sale for the which the entity may still register.

Ensure Strong Penalties

J-37. (multiple comments)
Comment: Direct responsibility for the impact of one's business processes on resources and the environment must be strongly enforced. (WHIPPLE)

Comment: Please stay strong to stop the companies that violate the standards. Fine them to get their attention. This is a critical issue for the long term future of our civilization. (FRERIKS)

Comment: I'd like to stress that our heaviest polluters need to pay for the pollution they generate, as opposed to being able to pollute for free. Only when penalized monetarily will they even think of changing. When they're not challenged, they will always keep the status quo and only adapt when it benefits them to do so economically. (NGUYEN)

Comment: Strong limits need to be set and no waivers allowed which will help businesses make long-term investments in strategies to reduce global warming emissions. Please enforce standards by imposing and collecting fines that are commensurate with the profits of polluters. These funds can then be used to accelerate the efforts to transition the state to a cleaner economy and lowering energy costs for Californians. (AMSDEN)

Comment: We are pleased to see that the proposed regulation contains several elements that I believe will make the program effective, including strong enforcement requiring a multiple of four allowances to be surrendered within 30 days for every allowance not surrendered on time plus monetary fines for further non-compliance. (LUDLOW, UCS1, WALTERS)

> **Response:** We intend to fully enforce the regulations.

Penalty Conflict/Dispute Resolution

J-38. (multiple comments)
Comment: The complexities of the proposed program will likely result in the need for regulatory interpretation and conflict resolution for differing opinions between CARB staff and regulated entities. Instances of unanticipated long-term deviations from regulatory requirements will likely occur because of breakdowns or other circumstances beyond the control of the facility. During these events, an opportunity to obtain "variances" should be available to avoid unnecessary or misguided enforcement action. The Sanitation Districts recommend that CARB establish both an independent body for dispute resolution, as well as a hearing board, similar to the SCAQMD Hearing Board, where variances from the cap and trade regulation can be obtained. Finally, independent market monitoring and at least annual internal program evaluation by CARB should be accomplished to look for and fix program weaknesses and to ensure reasonable market behavior. (LASD1)

Comment: It would be helpful to clarify any dispute resolution procedures, including accompanying time frames, with respect to surrender obligations. These types of provisions will enhance regulatory certainty for both covered entities and implementing agencies. (CCAP1)

Comment: CCEEB recommends that the ARB establish an independent administrative dispute resolution process that will provide a fair, efficient, and predictable process available to all regulated entities. This will reduce the money and time spent defending lawsuits and in informal negotiations. It will also increase the transparency of the appeal process as all interested stakeholders can weigh-in during the hearing. The proposed dispute resolution process could be modeled after existing air pollution hearing processes developed by the ARB for disputes that occur under local air district rules. (CCEEB1)

Comment: While NCPA does not dispute that the Executive Officer should have discretion to direct and monitor the Program, the Executive Officer’s conduct should be based on clearly defined and articulated guidelines made clear to all entities subject to the regulation, and these requirements must be clearly set forth in the final regulation. For example, in sections 95831(b) and 96011, the Executive Officer may suspend, revoke or otherwise restrict registration and accounts of various entities, which prohibits participation in the auction and could impact the ability to purchase and hold allowances. In sections 95912(e), if the Executive Officer makes a determination regarding certain bidder activities, the bidder is subject to penalties and prohibition from future auctions. Because participation in quarterly auctions are going to be key to meeting annual compliance commitments, it is imperative that any such actions be taken only with full notice and an opportunity to be heard. The proposed regulation should include specific provisions that address due process issues that arise in these provisions. (NCPA1)

Comment: We strongly recommend that the Board direct staff to develop regulations for the operation of an independent administrative dispute resolution board. The sole purpose of this entity would be to adjudicate those factual, legal and jurisdictional disputes that will inevitably arise in the implementation of the AB 32 program. (CCC, MAZOWITA)

Comment: There are innumerable situations under such a comprehensive regulatory program in which such factual, legal and jurisdiction disputes will arise. The absence of an expert administrative dispute resolution body will not avoid controversy. Controversies will arise. If there is no administrative mechanism for dispute resolution, then parties will simply direct such disputes to courts of law, likely resulting in significant unnecessary litigation, increased cost of compliance, excessive uncertainty and delay. (CCC, MAZOWITA)

Comment: The regulation should ensure that due process is applied in all enforcement cases under the cap and trade program. ARB should provide a mechanism by which respondent entities can review and respond to allegations before penalties are assessed. (WPTF)

Response: We disagree and do not believe a dispute resolution board is necessary. Any such process would add cost and complexity for both ARB and regulated parties. We believe that delays and uncertainty incumbent in a new, untried proceeding could disrupt the market features of the cap-and-trade regulation. Covered entities have sufficient time to obtain the allowances required for their compliance obligations. The process of obtaining and surrendering compliance instruments is not an industrial process subject to unexpected equipment breakdowns of the kind that form the basis for variance requests submitted to air districts. A variance process would be inappropriate in this regulation. The emissions at issue have already occurred and been reported to ARB; therefore, no “variance” is required. Instead of a formal variance process, the MRR includes a process by which a facility may petition for an interim data collection method under certain circumstances that would result in loss of data due to unforeseen reasons. The MRR also contains a dispute-resolution process for when a reporting entity and its verifier do not agree on the quality of the emissions data report. We believe that these two design features will ensure an efficient market process where timely data are critical to the functioning of a well-developed market program and that they will address the commenter’s concerns. Finally, we will be contracting for the services of an independent market monitor to help identify any issues in the implementation of the market program and to ensure market integrity.

ARB disagrees with the commenters’ premise that there is no fair, independent method of resolving disputes that may arise. As one commenter acknowledges, the existing recourse is to challenge a decision in court. That process is well established, transparent, and understood by regulated entities, the public, and ARB. Inventing a new, additional dispute resolution process, whether that would be through the creation of a hearing board or an administrative hearing, will not necessarily reduce the time or expense of resolving such disputes. In fact, and contrary to the claimed rationale of the commenter, ARB believes such additional process may actually increase the time and expense of resolving these matters, because after a hearing board process, either party could still ultimately take the dispute to court. Given the timelines in the cap-and-trade regulation, including an additional dispute resolution process would give rise to delay that could have broader market impacts.

Miscellaneous

J-39. Comment: To ensure fairness, the market rules and parameters must be known sufficiently in advance to provide all market participants information upon which to base their important business decisions. Missing elements such as reporting requirements and monitoring tools will make compliance with the program both difficult and confusing to participants. CalChamber urges CARB to develop a time schedule for the development of the compliance tools, policies and infrastructure necessary for entities to comply with this regulation. (CALCHAMBER1)

Response: This comment addresses implementation of the program rather than particular provisions of the regulation. However, we are developing a time schedule for the compliance tools and hope to have various tools available for covered entities by early 2012.

J-40. Comment: WSPA urges ARB to work with the regulated community to develop an enforcement guidance policy. That policy should address both the Cap and Trade and MRR enforcement provisions to avoid application of duplicative penalties within and among both of the regulations. It should also recognize an operator's earnest efforts to comply, yet allow enforcement and assessment of penalties on those operators that fail to comply. (WSPA1)

Response: We worked with stakeholders to refine the enforcement provisions in both the cap-and-trade regulation and the MRR so that there is no penalty "layering" between the regulations. See the response to Comment J-34.

J-41. Comment: The penalty provisions adopted from AB 32 remain confusing and inapplicable to the cap-and-trade context and should be further clarified. (SCE1)

Response: We clarified the penalty provisions in sections 96013 and 96014. See the responses to Comments J-14, J-15 and J-19.

K. LEGAL

This section includes comments and responses about legal issues surrounding the regulation, and refer but are not limited to sections 96020–96022. Major topics include offset protocols, the extent to which the regulation addresses AB 32 requirements, and the Commerce Clause.

Protocols

K-1. Comment: ARB's proposed cut-off in 2014 would make sense only if ARB provided a procedure to transition existing projects verified under early-action protocols (such as the CAR protocol as well as ACR and VCS) to an ARB protocol without significant additional cost and without changing the eligibility rules under which the forest project was started, since the financial values (and economic viability) of early action projects depends on the crediting period and eligibility rules under which the project was commenced.

ARB has not yet provided a procedure for such a transition, and without such a procedure, the value given to early action forest projects would be severely diminished since most forest projects do not generate significant carbon reductions until up to ten years into the project and would have relatively little carbon credit accumulated by 2014 despite significant financial investment. Moreover, such a policy would perversely disincentivize projects using hardwood species, which deliver comparatively more co-benefits due to the longer maturation of those carbon stocks. In short, any cut-off deadlines for early action must be linked to the availability of a procedure for transitioning existing early action projects to the ARB Forest Protocol. And, as discussed below, such transition rules cannot impose significant new costs or change eligibility criteria in a manner that would undermine the early action nature of the project as a practical matter. Any contrary rule would be inconsistent with AB 32 and has not been justified either under APA or CEQA. (FCC, BLUESOURCE)

> **Response:** We do not agree that limiting the start date or providing a 2014 date for an end to early action are inconsistent with AB 32. New section 95990(k) was added to clarify how early action offset projects transition to Compliance Offset Protocols. New section 95990(k)(2) clarifies that once an early action offset project transitions to a Compliance Offset Protocol it will begin an initial crediting period. The crediting period under the early action offset program does not count under the compliance offset program, so the early action offset project may transition to a Compliance Offset Protocol any time before February 28, 2015, but must list or register with an Early Action Offset Program by January 1, 2014 (section 95990(c)(3)). We removed any requirements that restrict the earliest date that early action offset projects must transition to Compliance Offset Protocols. It is necessary for offset projects beginning February 28, 2015, to transition to Compliance Offset Protocols to ensure consistency in the program and that all offset projects are following the rules of the regulation, including the rules in the Compliance Offset Protocols.

K-2. Comment: ARB needs to provide greater clarity on how project owners and offset project developers should obtain timely clarification on certain aspects of the protocol. (It is not clear whether qualified positive verification statements will allow verifiers to accept deviation from or slight changes to protocols as dictated under certain project specific circumstances). Currently, updates to quantification methodologies have to be made public through a public review and Board adoption process. There are likely to be numerous instances where project owners and developers require clarity on the interpretation of the guidance provided or wish to deviate from the protocol due to some unforeseen event. Waiting for public review and board approval may result in the project missing deadlines prescribed in the regulations. ARB needs to enable verifiers and/or registries to make decisions on deviations and variances within a short-time frame and to specify what constitutes a deviation or variance. (CIG)

> **Response:** Updating numerical or equation-related aspects of the protocols is considered part of the protocol's quantification methods. Changes to quantification methods can be updated through stakeholder input and Board action without having to go through the full APA (Administrative Procedure Act) process. ARB will develop guidance documents to aid in the use of the compliance offset protocols. As these methods are part of a regulation, any deviation from a documented ARB quantification method is not allowed. As ARB and approved registries get questions from offset project developers, these will become part of Q and A's posted on ARB's website.

K-3. Comment: The forestry protocol states in section 3.5 that conservation easements must "expressly acknowledge that ARB is a third party beneficiary of the conservation easement with the right to enforce all obligations under the easement." Again, this is a barrier for projects with a 2007-2010 commencement date, for which the relevant easement would already be in place. It seems to us that a Federal conservation easement that, for example, protects project lands in perpetuity and subordinates all timber harvest rights under the easement, which is itself legally enforceable under state and Federal law, ought to provide a sufficient basis for enforcement. (CIG)

> **Response:** Under the Forest Offset Protocol, only avoided conversion projects require a Qualified Conservation Easement to be eligible; other project types may reduce their risk rating and required forest buffer account contributions with a Qualified Conservation Easement but would still be eligible if the easement was not "Qualified". Offset Project Developers or Authorized Project Designees may be able to modify an existing easement to include ARB as a third-party beneficiary so that it will meet the definition of a Qualified Conservation Easement. Requiring ARB to be a third-party beneficiary to a conservation easement ensures that the provisions of the easement are enforceable and that ARB would be a party to any potential future modifications to the easement. The definition of a qualified conservation easement under v3.2 of the CAR protocol is similar to that of ARB, but instead requires identifying the terms and conditions of

the Project Implementation Agreement in the easement. Thus the commenter would need to modify the easement to qualify as an early action project under CAR v3.2 or under ARB's Forest Offset Protocol.

K-4. Comment: The regulation is silent on what happens after 2020. There must be a mechanism to address violations for facilities that do not surrender enough compliance instruments to cover their emissions in the third compliance period. (CAPCOA1, CAPCOA2)

Response: The enforcement provisions of the regulation will remain in full force and effect after 2020. If a covered entity does not surrender sufficient compliance instruments in the third compliance period, the additional surrender obligation would also remain. Additional reductions will likely be necessary after 2020 to meet long term climate change goals. At this time it would be premature to speculate how those additional reductions would be achieved.

K-5. Comment: ARB's decision to limit the start date for early action forestry projects, as well as its decision to cut off crediting in 2014, is inconsistent with AB 32, is unsupported by the record or environmental review, and therefore would be illegal if adopted as written. (FCC, BLUESOURCE)

Response: We do not agree that limiting the start date or providing a 2014 date for an end to early action are inconsistent with AB 32. The start date is needed to ensure that projects are additional and were not implemented as part of business as usual prior to the drafting of AB 32. The cut-off date is to ensure that all offset projects transition to the Board-approved compliance protocols in a timely manner. This eligibility period allows us to provide some offset credit for additional projects that were implemented early under less stringent protocols and time for those early action projects to transition to the compliance program.

K-6. Comment: The limitation in section 95990(b)(4) restricting forest projects to those developed under the Climate Action Reserve Forest Protocol is likewise improperly restrictive and anti-competitive. Although significant investment has been directed at CAR projects, the CAR forestry protocol was only made available relatively recently, and many worthy projects were initiated under other protocols, such as administered by ACR and VCS. The ISOR appropriately recognizes the "rigor" of the CAR program and notes that the CAR program began in 2005, ISOR at III-21, but gives no justification for failing to consider other rigorous programs under which forest offset projects have already been approved and issued credits.

Moreover, discriminating in favor of CAR, a private California non-profit organization, and disadvantaging other registries and forest offset programs raises a host of equal protection and constitutional commerce clause concerns, such that the restriction to CAR- only projects is arguably illegal. In a scant reference, ARB states that it is "aware" that other voluntary offset programs have protocols, but fails to provide any discussion of its rejection of these programs or other existing protocols. Although section 95990(c) appears to authorize other "third-party offset programs" to administer early action credits, it does not appear that credits issued under protocols other than the CAR Forest Protocol will be recognized, thus presumably disqualifying forest projects that would be otherwise legitimate but for the fact that the project developer sought registration under a competing protocol. Nor can ARB impose eligibility criteria that would have the effect of disqualifying early action projects started under other programs unless ARB can demonstrate that such criteria are mandated by AB 32. Because ARB has not shown that forest projects registered under ACR, VCS, or other programs are not legitimate early action projects, it must provide a mechanism for crediting those projects. (FCC, BLUESOURCE)

> **Response:** ARB will continue to consider and evaluate additional protocols for compliance and early action. Three of the four protocols included for early action had already been reviewed and endorsed by the Board for voluntary use after an ARB public process. ARB staff participated on the work group for the fourth protocol. By not including other protocols for early action at this time, we are not precluding them from future consideration. Staff anticipates returning to the Board with additional protocols and will continue to evaluate those protocols currently included in the regulation.

General and Miscellaneous Legal

K-7. Comment: The California Administrative Procedure Act requires each rulemaking agency to "consider all relevant matter presented to it during a comment period before adopting any regulation." The undersigned companies have substantial doubt whether ARB has left itself adequate time to consider each of these comments and to revise the rule accordingly. It is our understanding that a Board vote is scheduled for December 16, with the close of public comment on December 15. That timing leaves little room for the agency's duty under the Administrative Procedure Act to consider each relevant, timely public comment. However, it is our understanding that ARB will undertake appropriate revisions to the proposed rules, and we look forward to working with ARB to work through these important issues and implement appropriate revisions to the market rules and Forest Protocol where necessitated by law and good policy. (FCC, BLUESOURCE)

> **Response:** The California Administrative Procedure Act (APA) requires that all relevant matter be considered, however, it does not require that all relevant matter be considered before a Board hearing. Staff may consider the comments in formulating any 15-day changes to the regulation, which is what staff has done in this instance. The responses to comments are contained in this document, as required by the APA, and are available for public review.

K-8. Comment: BPA appreciates that ARB has afforded BPA Asset Controlling Supplier status through the greenhouse gas reporting regulations (section 95102 (a)(15), 95111(b)(3), 95111(f), and in ARB's Cap and Trade regulations section 95802(a)(8)). However, BPA disagrees with ARB's suggestions in its greenhouse gas reporting rules and cap and trade rules that it has "authority" to regulate BPA and that BPA is "required" to comply (see section 95101(d)(5), 95102(a)(102), 95802(a)(59)). BPA wishes to make clear that BPA is participating in California's GHG reporting program and Cap and Trade program purely on a voluntary basis and BPA is not conceding that California has any jurisdiction over BPA. Sovereign immunity may prevent BPA (and similarly WAPA) from being subject to these regulations. Despite ARB's position that the Clean Air Act waives sovereign immunity, it is questionable whether that waiver would cover BPA because it is purely a marketer that is not engaged in an activity that discharges pollutants. Further, although BPA intends to voluntarily comply with these regulations, BPA is concerned that mandatory regulations could interfere with its existing contracts and conflict with the marketing scheme established by Congress in BPA's governing statutes. Because BPA is willing to voluntarily comply, it is not necessary for ARB to include these jurisdictional assertions in its rules. Doing so could unnecessarily raise complicated legal issues that are unnecessary to full and timely implementation of the greenhouse gases reporting rules and/or the cap & trade program. Accordingly, BPA urges ARB to modify sections 95101(d)(4) and (5), 95102(a)(102), and section 95802(a)(59) (same definition of "Electricity importers" as the definition used in section 95102(a)(102)) in one of two ways, either by simply deleting the unnecessary language entirely, or by modifying it. The following illustrate both options for each of the three sections:

Delete option for section 95802:

(a) Definitions. For the purposes of this article, the following definitions shall apply:

(59) "Electricity importers" are marketers and retail providers that hold title to imported electricity. For electricity delivered between balancing authority areas, the entity that holds title to delivered electricity is identified on the NERC E-tag as the purchasing-selling entity (PSE) on the tag's physical path, with the point of receipt located outside the state of California, and the point of delivery located inside the state of California. ~~Federal and s~~State agencies are subject to the regulatory authority of ARB under this article and include~~ Western Area Power Administration (WAPA), Bonneville Power Administration (BPA), and~~ California Department of Water and Power (DWR). When PSEs are not subject to the regulatory authority of ARB, including tribal nations, the electricity importer is the immediate downstream purchaser or recipient that is subject to the regulatory authority of ARB.

Modification option for section 95802:

(a) Definitions. For the purposes of this article, the following definitions shall apply:

(59) "Electricity importers" are marketers and retail providers that hold title to imported electricity. For electricity delivered between balancing authority areas, the entity that holds title to delivered electricity is identified on the NERC E-tag as the purchasing- selling entity (PSE) on the tag's physical path, with the point of receipt

located outside the state of California, and the point of delivery located inside the state of California. ~~Federal and s~~State agencies are subject to the regulatory authority of ARB under this article and include ~~Western Area Power Administration (WAPA), Bonneville Power Administration (BPA), and~~ California Department of Water and Power (DWR). Federal agencies, including Western Area Power Administration (WAPA) and Bonneville Power Administration (BPA), are not subject to these regulations so long as they voluntarily participate under these regulations. When PSEs are not subject to the regulatory authority of ARB, including tribal nations, the electricity importer is the immediate downstream purchaser or recipient that is subject to the regulatory authority of ARB. (BONNEVILLEPWR)

Response: Section 118 of the Clean Air Act constitutes a waiver of sovereign immunity for federal agencies such as BPA. Additionally, this document only responds to comments regarding the cap-and-trade regulation (which includes section 95802) but does not include the other specific sections with which BPA takes issue which are included in the MRR . Although the definition of "electricity importer" has changed through the course of two 15-day notices, BPA, DWR and WAPA remain specifically named as electricity importers to California and subject to the cap-and-trade regulation. Title 42 U.S.C. section 7418 (Section 118) specifically states:

(a) General Compliance

Each department, agency, and instrumentality of the executive, legislative and judicial branches of the Federal Government

(1) Having jurisdiction over any property or facility, or

(2) engaged in any activity resulting, or which may result, in the discharge of air pollutants, and each officer, agent, or employee thereof, shall be subject to, and comply with, all Federal, State, interstate, and local requirements, administrative authority, and process and sanctions respecting the control and abatement of air pollution in the same manner, and to the same extent as any nongovernmental entity. The preceding sentence shall apply

(A) to any requirement whether substantive or procedural (including any recordkeeping or reporting requirement, any requirement respecting permits and any other requirement whatsoever),

(B) to any requirement to pay a fee or charge imposed by any State or local agency to defray the costs of its air pollution regulatory program,

(C) to the exercise of any Federal, State, or local administrative authority, and

(D) to any process and sanction, whether enforced in Federal, State, or local courts, or in any other manner. This subsection shall apply notwithstanding any immunity of such agencies, officers, agents, or

> employees under any law or rule of law. No officer, agent, or employee of the United States shall be personally liable for any civil penalty for which he is not otherwise liable.

Section 118 is clear. Environmental laws of California apply to BPA "notwithstanding any immunity of such agencies, officers, agents, or employees under any law or rule of law." While ARB appreciates BPA's voluntary participation in the ARB programs, the language suggested by BPA is not necessary and appropriate because (1) sovereign immunity has been waived by section 118 of the CAA, and (2) the language is unclear because "voluntary participation" is a vague term that leaves unresolved whether the enforcement provisions of the regulation would apply to BPA.

K-9. Comment: ARB's method of including "imported electricity" as a greenhouse gas emissions source was not introduced in legislation, but was developed by ARB in order to implement AB 32. DWR's only activity triggering a surrender obligation under the regulations is based on the "first deliverer" method of identifying deliveries of imported electricity. DWR does not object to this methodology, but points out that as applied to DWR it appears to exceed ARB's authority. (DWR)

Response: ARB does not believe that including DWR in the cap-and-trade regulation exceeds ARB's authority to regulate greenhouse gas emissions. DWR is being treated in the same manner and principle as every other regulated entity subject to the cap-and-trade program. Simply because DWR is another state agency does not automatically make it exempt from the regulation. See the response to Comment K-8.

Comment Period

K-10. Comment: CSCME objects to the prejudicial manner in which CARB both established the comment period for the proposed regulation and scheduled the concomitant CARB meeting for its adoption. CARB stated that comments will be accepted through December 15 at noon, and that the public hearing to consider adoption of the proposed regulation will begin less than 24 hours later, at 9:00 a.m. on December 16. It is well-settled that "one purpose of the Administrative Procedure Act is to ensure that those persons or entities whom a regulation will affect have a voice in its creation." The schedule CARB set forth virtually ensures that neither CARB members nor staff will have the opportunity to review all submitted comments prior to the hearing. Based upon the volume and complexity of the proposed regulation and supporting documentation, CARB's approach violates fundamental due process principles and is inconsistent with the California Administrative Procedure Act (APA). In State Water Resources Control Board v. Office of Administrative Law, a California Court of Appeal found that 15 days, although a short period of time to consider comments from interested parties, was not so short as to render the task impossible. In contrast, it is impossible for CARB to give adequate consideration in one afternoon to comments on a proposed regulation that will affect virtually every sector of the California economy. (CSCME2)

> **Response:** The initial public comment period for the proposed regulation was determined based on Government Code section 11346.4(a), which requires that, at least 45 days prior to the hearing "on the adoption, amendment, or repeal of a regulation" notice be posted in accordance with the requirements of that section. At the December 16, 2010, hearing the Board did not take final action to adopt the proposed regulation, but instead approved Resolution 10-42, which directed the Board's Executive Officer to take a number of actions. Among other things, Resolution 10-42 directed the Executive Officer to hold one or more workshops on proposed modifications to the regulation to provide an additional opportunity for public input, to make the modified regulatory language available for one or more formal public comment periods, to consider written comments that may be submitted, and to make such modifications as may be appropriate in light of the comments received. At the end of this process, the Executive Officer was further directed to either take final action to adopt the proposed regulation with the additional modifications, or return the proposed amendments to the Board for further consideration before taking final action, if he determines that this is warranted.
>
> In response to the Board's direction, the Executive Officer took the actions specified in Resolution 10-42 and then determined that it was appropriate to return the proposed regulation to the Board for further consideration. This occurred at a public hearing held on October 20, 2011, at which the Board took final action to adopt the proposed regulation, with the modifications made since the regulation was first considered by the Board at its December 16, 2010, public hearing.
>
> From the above description it can be seen that the December 16, 2010 public hearing was simply an interim step in a long administrative process culminating in final adoption of the regulation by the Board on October 20, 2011. During this long process there was adequate time for all comments to be thoroughly considered by both ARB staff and the Board. We believe that this process is a fair one that complies with all applicable laws, including the Administrative Procedure Act and constitutional due process principles.

K-11. Comment: Constellation Energy suggests that additional time be allocated to consider and address public comment. Given the far-reaching impact of the rule, it is important that the contributions of all stakeholders be fully considered. The comment period ends at noon on December 15, and CARB will vote on the proposed regulations during the December 16–17 meeting. Given the potential for thousands of comments, CARB will be hard put to review, let alone seriously consider comments in such a timeframe. On a similar note, Constellation Energy is skeptical that issues related to IPPs can be resolved within a 1-2 day period. (CONSTELLATIONENERGY)

Response: This comment is addressed in the response to Comment K-10.

K-12. Comment: We are concerned that CARB has begun a pattern of passing regulations before they are completed and using the 15 day update process to attempt to fill in holes. We believe this is illegal and wrong and the practice flies in the face of requirements that the record be complete prior to voting on a measure if for no other reason than it precludes regulated parties from doing a complete analysis and filing fully informed comments to say nothing of the practice making it impossible to do a complete cost effectiveness analysis required by both the Administrative Procedure Act as well as AB 32. The full range of details required to understand and implement the Cap and Trade program have not yet been fully sorted and accounted for. Many of the tools, provisions, and methods still being developed by CARB will provide crucial information for business operations in California. There is no confidence that the information will be available or even determined prior to the last quarter of 2011 or even before the start of the market in 2012.

CIPA also agrees with the AB 32 Implementation Group that CARB has no current authority, under AB 32 or otherwise, to raise revenue for purposes unrelated to administration of the AB 32 program. The statement of reasons does not demonstrate that an auction to raise revenue is necessary for, or limited to, administration of the program, which is the only authority bestowed by AB 32. We also agree with the AB 32 Implementation Group that an auction and its proceeds are not only unauthorized by AB 32, but equate to a tax that will require 2/3 vote of the legislature. (PLOTKIN)

Response: ARB has complied with all statutes and regulations in adopting the cap and trade regulations, including the requirements of the Administrative Procedure Act (Government Code sections 11340 et seq.) See also the response to Comment K-10, which explains that the Board did not take final action to adopt the regulation at the December 2010 public hearing. In addition, after reviewing the comments received, ARB has changed the first year of the compliance obligation to 2013. This change should help address the commenter's concern that insufficient information will be available to businesses before the start of the program. .

ARB respectfully disagrees with the assertion that the cap-and-trade program is a tax and is unauthorized. The cap-and-trade program itself is a market based program specifically authorized in Health and Safety Code section 38562(c).

The way a market-based program incentivizes GHG reductions is by placing a cost on carbon. By providing allowances for free at the beginning of the program, we are allowing for a measured start to get covered entities used to the program and to carefully start to include carbon price in their operations and products. The auction mechanism is used to put a price on carbon for the allowances that are not directly provided for industry assistance. As the program matures, there will be less industry assistance through direct allocation and entities will have to purchase the right to emit GHG's. The auction revenues are a product of the program design to incent GHG reductions. All revenue collected through auction will be appropriated at the discretion of the Legislature, not ARB. This revenue is not collected by ARB to appropriate as it desires.

K-13. (multiple comments)
Comment: The board should not vote on this proposal tomorrow as communities have not had sufficient notification. (MASCARENHAS)

Comment: Valero strongly urges ARB to complete the regulatory development process prior to adoption, so that the totality of the impacts can be meaningfully reviewed by the impacted parties. (VALERO)

Response: ARB has complied with all of the required notification processes and procedures of the Administrative Procedure Act. See also the responses to Comments K-10, and K-12, which explain that the Board did not take final action to adopt the regulation at the December 2010 public hearing.

Leakage

K-14. Comment: CARB unlawfully delegates its duty to minimize the leakage associated with indirect emissions to another state agency. CARB's delegation of the responsibility for regulating indirect emissions costs in leakage-exposed sectors to the California Public Utilities Commission (PUC) is unlawful because CARB has essentially abdicated its responsibility under AB 32 to minimize leakage in adopting regulations to reduce GHG emissions. AB 32 directs CARB, not PUC, to "adopt greenhouse gas emission limits and emission reduction measures by regulation to achieve the maximum technologically feasible and cost-effective reductions in greenhouse gas emissions." AB 32 further provides that in adopting those regulations, CARB must "to the extent feasible minimize leakage" and consider many other factors. In contravention of that command, CARB has delegated its responsibility under AB 32 to minimize leakage to PUC, and it has done so without providing PUC with any direction as to how to achieve AB 32's command. (CSCME2)

Response: ARB disagrees with the commenter. ARB's authority to implement the cap-and-trade program derives from AB 32, and, to the extent possible, ARB has examined leakage possibilities. However, ARB does not regulate several industries that are subject to the cap-and-trade regulation and does not have authority to impose additional obligations on those industries.

K-15. Comment: AB 32 directs CARB to design all GHG emissions-reduction measures, including market-based compliance mechanisms, in a manner that "minimizes leakage" to the extent feasible. CARB found that to minimize leakage, in-state and imported products need to be subject to the same standards. Finally, the California Supreme Court has held that a statute mandating an agency to take action "to the extent feasible" confers no discretion on that agency to ignore feasible actions that will aid the statute's stated purpose. (CSCME2)

Response: ARB has not ignored any feasible alternatives to the cap-and-trade regulation. ARB has examined all feasible alternatives to the cap-and-trade program, both from a regulatory and environmental perspective and has found that the cap-and-trade program is the best option to meet the AB 32 goals and is the least burdensome alternative. To further explain, as part of the development of the cap-and-trade program, we performed a careful leakage analysis and identified all industries that may be susceptible to emissions leakage. All industries that were identified as at risk for leakage will receive free allowances in the first compliance period. The mechanism for allocating allowances was designed to minimize the incentive to relocate production out of state. In this way cap and trade will achieve cost effective emissions reductions while fully minimizing leakage to the extent feasible. A complete description of this allocation approach is included Appendix K of the Staff Report.

Confidentiality

K-16. Comment: The Utilities are concerned there could be a conflict between section 95912 and various existing laws affecting POUs, such as the Public Records Act. Modify section 95912 as follows:

(d) Protection of Confidential Information.

(1) An entity approved for auction participation shall not publicly release confidential information related to its auction participation<u>, except as otherwise required by law</u>, including: (MID1)

Response: ARB significantly rewrote section 95912 including the subsection referenced. The section referenced has been changed to reflect the spirit of this comment, if not precisely the proposed change.

K-17. Comment: ARB should clarify the confidentiality provisions to ensure that information concerning allowance holding accounts and Cap-and-Trade transactions remain confidential. The proposed regulation provides that emissions information is public information and is not confidential. However, it is unclear whether information submitted under the MRR and information concerning the amount of allowances contained in a regulated entity's Holding Account could be made publicly available by ARB. ARB should specify that information related to allowances that have not been retired or retired ahead of the compliance deadline are not emissions information, and therefore will indeed be protected from public disclosure. (PRAXAIR, PACIFCOR1)

Response: ARB is continuing to evaluate what information submitted under the MRR would be made public along with whether individual holding account information would be public. The California Public Records Act specifies that all air pollution emission data are public records (see Government Code section 6254.9), and the regulation is consistent with this statutory provision. For information that is not emissions data, ARB anticipates additional consultation with the public to determine what information is entitled to confidentiality protection under California law. This is a complex and unresolved issue, and at this time it is not appropriate to further specify in the regulation the categories of non-emissions information that should either kept confidential or made public. Instead, ARB will follow its existing confidentiality regulations in making decisions on the disclosure of information (see title 17, California Code of Regulations, sections 91000 to 91022).

K-18. Comment: Fully disclose firm-level information used to administratively allocate allowances to regulated entities. Toward these transparency goals, EDF recommends that reports of emissions and trading activities be made publicly available. (EDF1)

Response: Disclosing too much information could result in a variety of market ills, including collusion, price fixing, bid fixing and other possible market manipulations. ARB intends to evaluate the information it collects and publicly release as much as possible, without creating a situation that could lead to market manipulation and collusion. As stated in the response to Comment K-17, ARB anticipates additional consultation with the public to determine what information is entitled to confidentiality protection under California law, and at this time it is not appropriate to further specify in the regulation the categories of non-emissions information that should either kept confidential or made public. Instead, ARB will follow its existing confidentiality regulations in making decisions on the disclosure of information (see title 17, California Code of Regulations, sections 91000 to 91022).

Compliance Instruments and Property Rights

K-19. Comment: Compliance instruments must be surrendered for the annual and triennial compliance obligations. There is apparent no enforcement by CARB until the final year of the three year compliance period. This could give rise to statute of limitations problems if timely verification of emissions and issuance of final determinations is not conducted in a timely fashion. (CAPCOA1, CAPCOA2)

Response: The regulation requires one-third of the estimated number of compliance instruments be surrendered in each of the first two years of the compliance period. Failure to surrender compliance obligations at any of these interim dates would subject a covered entity to an additional surrender obligation and potential penalties well before the end of the compliance period and the final surrender obligation.

K-20. Comment: The Utilities believe that the statement regarding a compliance instrument not being a property right should be limited for the purposes of this regulation only. Modify section 95820 as follows:
(b) Each compliance instrument issued by the Executive Officer represents a limited authorization to emit up to one metric ton in CO_2e of any greenhouse gas specified in section 95810, subject to all applicable limitations specified in this article. No provision of this article may be construed to limit the authority of the Executive Officer to terminate

or limit such authorization to emit. *<u>For the purposes of this regulation only, a</u> compliance instrument issued by the Executive Officer does not constitute property or a property right*. (MID1)

> **Response:** The proposed modification is not appropriate because it is unclear why it is necessary, and the legal effect of such a statement is also unclear. The statement seems to imply that compliance instruments can be both property and not be property, depending on the whether the instrument is either "for the purposes of the regulation" or for some other "purpose" which is not identified. It is very unclear how one would make such a distinction or what the legal or practical impact of such a distinction would be. ARB is not prepared to create such confusion and lack of clarity by including this language in the regulation.

K-21. Comment: There should be criteria on cause to terminate or limit authorization to emit or the sentence should be deleted. Modify section 95820 (c) as follows:

(c) Each compliance instrument issued by the Executive Officer represents a limited authorization to emit up to one metric ton in CO_2e of any greenhouse gas specified in section 95810, subject to all applicable limitations specified in this article. ~~No provision of this article may be construed to limit the authority of the Executive Officer to terminate or limit such authorization to emit~~. A compliance instrument issued by the Executive Officer does not constitute property or a property right. (CCEEB1)

> **Response:** ARB did not implement this suggestion. The Executive Officer needs broad authority to limit or terminate the allowances to ensure that, in the event of any violations, fraud, or other malfeasance in the conduct of the allowance market, it can be immediately addressed.

K-22. Comment: In creating a new program, CARB must also create surrender instruments to be used in the Program. Sections 95820 sets forth the general description of the "California Greenhouse Gas Emissions Allowances" and "offset credits." Section 95820(c) goes on to describe the compliance instrument, and notes that "[a] compliance instrument issued by the Executive Officer does not constitute property or a property right." The rationale for this limitation is based on the premise that "property rights cannot attach to the compliance instruments because, in the event of federal preemption in the cap and trade market or other conditions, California must have the ability to revoke the compliance instruments without creating a loss to the people of California." (ISOR, p. IX-18) NCPA recommends that the proposed regulation clarify that an allowance – whether it is a California Greenhouse Gas Emission Allowance or offset credit – does not constitute a compliance instrument until such time as it has been surrendered to CARB pursuant to the provisions of section 95856. (NCPA1)

> **Response:** All allowances or offset credits issued by ARB are compliance instruments upon their issuance. It is not clear what the purpose of issuing an

allowance would be if it were not also a compliance instrument for purposes of the regulation.

Exemption

K-23. Comment: The Railroads understand that, for purposes of diesel fuel, the MRR and Cap-and-Trade Rule are modeled on the reporting requirements of the Board of Equalization ("BOE"). While this approach may have been logical from the standpoint of streamlining existing reporting practices, ARB's decision to rely on the existing BOE reporting forms for defining the first point of supply unwisely places differing compliance burdens on the major transportation companies depending on the method through which they receive fuel from their suppliers, and thus would inhibit the competitiveness of some companies as compared to others within the same market. The fuel producers and fuel importers are the first supplier of fuel for both bulk and non-bulk transfers. Therefore, the fuel producers and fuel importers are the best source of information for purposes of reporting and compliance with AB 32, and it is illogical and overly-complicated to have different points of compliance based strictly on whether the fuels are transferred via the bulk or non-bulk system. Whereas non-bulk transfers will generally be reported by, and the compliance obligation will rest with, upstream fuel producers and fuel importers, the reporting and compliance obligation for bulk transfers is pushed downstream to multiple and various fueling facilities that might qualify as "terminals" under the Rule. As currently drafted, the Railroads could be determined to be "suppliers" of diesel fuel, and therefore "covered entities," under the proposed Cap-and-Trade Rule. This would mean that the Railroads would be required to acquire compliance instruments in order to supply diesel fuel to locomotives in California. By limiting the number of compliance instruments available to all covered entities in a given year, the Cap-and-Trade Rule would impose a *de facto* regulation on the Railroad's ability to supply diesel fuel to locomotives in California, notwithstanding the preemptive effect of the federal Interstate Commerce Commission Termination Act of 1995 ("ICCTA"). [The ICCTA's preemption of state and local regulations that impose an unreasonable burden on the railroad industry has been upheld in multiple court decisions. *See City of Auburn v United States Government* (154 F.3d I 025, 1029-31 (9th Cir. 1998) ("Congress intended to preempt a wide range of state and local regulation of rail activity"); *Association of American Railroads v South Coast Air Quality Management District* (9th Cir. 2010) 622 F.3d 1094 ("[the] ICCTA preempts those [local and state] rules unless they are rules of general applicability that do not unreasonably burden railroad activity").] The Railroads and Air Resources Board have long recognized this federal preemption of state and local authority to regulate railroads, and should continue to do so when implementing the MRR and Cap-and-Trade Rule.
(CRI)

Response: The coverage of the program is intended to provide a level playing field for all energy sources starting in the second compliance period. Fuel used for transportation is covered at the terminal rack as the regulated party with sufficient information about the amounts of fuel consumed in

California, is administratively manageable in terms of the amount of regulated parties, and is consistent with existing reports already submitted to a State agency as indicated by the commenter. Fuel producers do not always know whether the fuel they produce is consumed in California or out of state. We expect that the a carbon price will be reflected in fuel purchased by all end users and therefore we do not agree there is a competitiveness concern for end users whether they have a direct compliance obligation in the program or if they purchase fuels from entities that pass the costs through. We disagree that the program imposes a de facto regulation on the supply of diesel for railroads. The program has no limitation on the energy use or emissions of any single entity. Entities report the emissions for which they are responsible and are required to submit compliance instruments, allowances and offsets, at the end of a specified period of time. Entities are afforded the flexibility of a partial compliance annually and a full compliance every 3 years. Given this flexibility and the consistency with current reporting requirements to a State agency as noted by the commenter, the regulation is not unreasonably burdensome to railroads.

Nevertheless, ARB is committed to continuing to work with the railroads on addressing reporting concerns.

K-24. Comment: The regulation should expressly exclude DWR. DWR suggests the following addition and deletion:

Section 95811(h): <u>This article does not apply to the California Department of Water Resources.</u>

Section 95802(a)(59), "Electricity importers" are marketers and retail providers that hold title to imported electricity. For electricity delivered between balancing authority areas, the entity that holds title to delivered electricity is identified on the NERC E-tag as the purchasing-selling entity (PSE) on the tag's physical path, with the point of receipt located outside the state of California, and the point of delivery located inside the state of California. Federal ~~and state~~ agencies are subject to the regulatory authority of ARB under this article, and include Western Area Power Administration (WAPA) <u>and</u> Bonneville Power Administration (BPA) ~~and California Department of Water Resources (DWR)~~. When PSEs are not subject to the regulation authority of ARB, including tribal nations <u>and state agencies</u>, the electricity importer is the immediate downstream purchaser or recipient<u>, if any</u>, which is subject to the regulatory authority of ARB. (DWR)

Response: It is not appropriate to exclude DWR from regulation, because it is ARB's intent to include all emissions that are a result of electricity imported and delivered to the California grid. This includes the electricity DWR imports to run their operations.

Does Not Meet AB 32 Requirements

K-25. Comment: ARB should not adopt the cap and trade rule until a pending legal challenge to the scoping plan is concluded. On June 10, 2009, Petitioners Association of Irritated Residents, et al, represented by CRPE and Communities for a Better Environment (CBE), filed a Complaint for Declaratory and Injunctive Relief and Petition for a Writ of Mandate directing ARB to revise its Climate Change Scoping Plan to comply with Assembly Bill 32 (AB 32) and CEQA. Petitioners filed their First Amended Complaint and Petition (FAC).On February 19, 2010, Petitioners challenged the Scoping Plan because it inadequately sets up the overarching regulatory framework for AB 32's implementation. Further, the range of measures that the Scoping Plan has established dictates the parameters of the future options available to meet AB 32's goals. Petitioners raised a number of deficiencies in the Plan, and specifically raised four claims regarding ARB's inclusion of a cap and trade program: (1) ARB's failure to assess maximum technological feasibility and to develop a cost-effectiveness criteria with which to compare reduction measures to market mechanisms (FAC, First Cause of Action), (2) ARB's failure to analyze whether a cap and trade program could effectively facilitate the achievement of maximum feasible and cost-effective reductions of greenhouse gas emissions by 2020 (FAC, Second Cause of Action), (3) ARB's failure to consider the performance of cap and trade programs in other states, localities, and nations, including the northeastern states of the United States, Canada, and the European Union (FAC, Fourth Cause of Action), and (4) ARB's failure to adequately analyze alternatives to regional cap and trade (FAC, Eighth Cause of Action). Because the Scoping Plan lacks the fundamental analysis required, not only will AB 32 fail, but each subsequent regulatory program that flows from this Plan, such as the cap and trade rule, will share these fundamental flaws. Thus, the Board should not adopt the cap and trade rule before the Court rules on Petitioners' claims, for which the hearing is scheduled for December 20, 2010. (CRPE1)

> **Response:** The commenter's request for delay has already been denied by the Superior Court in their "Scoping Plan lawsuit." The Superior Court's order denying the commenter's request expressly contemplates the Board "resolving to adopt the Proposed Cap and Trade Rule" at its December meeting. Consistent with its representations to the Superior Court, ARB did not take final action to adopt the proposed cap-and-trade regulation at the December 16, 2010 hearing. Rather, the Board authorized the finalization of the regulation and authorized ARB staff to continue to work on the regulation. ARB also disagrees that commenter's legal claims have merit. As to claims (1), (2) and (3) described in the comment, the Superior Court ruled in ARB's favor, denying those claims. As to claim (4), ARB has appealed the Superior Court's ruling against it, and ARB has obtained a stay of the Superior Court's injunction from the Court of Appeal, thereby allowing ARB to proceed with this cap-and-trade rulemaking. In addition, although not required to, ARB staff supplemented its analysis of alternatives in the AB 32 Scoping Plan Functional Equivalent Document (FED) and, on August 24, 2011, the Board approved the Supplement to the AB 32 Scoping Plan FED and re-approved the Scoping Plan (see

www.arb.ca.gov/cc/scopingplan/document/appendices_volume3.pdf and www.arb.ca.gov/cc/scopingplan/document/final_supplement_to_sp_fed.pdf).

K-26. Comment: The offsets provisions directly violate AB 32's requirement that ARB "direct public and private investment toward the most disadvantaged communities in California." Offsets from out-of-state plainly violate this mandate. Linking California's trading program to the Western Climate Initiative could also contravene AB 32's requirement that greenhouse gas emission reductions achieved are enforceable by ARB. ARB has no authority to enforce the obligations of out of state entities. (CRPE1)

Response: The requirements in AB 32 section 38565 state, "to the extent feasible, direct public and private investment toward the most disadvantaged communities in California." This provision is extended to all AB 32 rules, regulations, programs, mechanisms, and incentives. AB 32 contains many objectives for the regulation that are adopted under its authority. ARB must balance these many objectives when designing regulations. The offsets program is a very small portion of the overall strategy to reduce GHG emissions in California. ARB is currently developing recommendations on the use of auction revenue that will examine potential ways to direct investment toward the most disadvantaged communities in California. The protocols currently adopted are applicable in California and the United States. The provisions of the regulation provide that out-of-state entities, by requesting ARB offset credits for an offset program that is not located in California, submit to jurisdiction in California. Additionally, linking to other WCI jurisdictions will be addressed through linkage agreements through a full public process in the future.

K-27. (multiple comments)
Comment: CARB's proposal to raise funds via an auction for reasons outside of administrative fee purposes is beyond CARB's regulatory authority. CARB justifies an auction system as a means of lowering GHG emissions and satisfying requirements under AB 32. CARB proposes that revenues from an auction be appropriated by the legislature for purposes of funding programs such as a community benefits fund, consumer rebates program and a low carbon investment fund. These and other proposed programs are outside the scope of administrative fees, and would likely be challenged as contrary to the legislative intent of AB 32. (CALCHAMBER1)

Comment: ARB's proposed Cap-and-Trade Rule appears to impose an unauthorized "regulatory fee" on electrical generators that cannot pass through GHG allowance costs. California law requires that any "levy, charge or exaction of any kind" be passed by a two-thirds majority of the Legislature (see Cal. Const., art. XIIIA). The recently passed Proposition 26 excludes a regulatory fee from the definition of a tax, but only if the charge is imposed for the reasonable regulatory costs to a state or local government for issuing licenses and permits; performing investigations, inspections, and audits; enforcing agricultural marketing orders; and the administrative enforcement and adjudication thereof. ARB has not established that the proposed uses of the revenue raised from the Cap-and-Trade auction are reasonably related to, or limited to, the administration of the Cap-and-Trade program. ARB has suggested such broad uses for auction revenue unrelated to administration of the program such as technology and community grants and ratepayer relief. Thus, the auction provision should be enacted by the Legislature, with a two-thirds vote, rather than be imposed by regulation by ARB. (HDPP2)

> **Response:** We believe that AB 32 provides ARB with the authority to conduct an auction as part of a cap-and-trade program. AB 32 authorizes ARB to "adopt a regulation that establishes a system of market-based declining annual aggregate emission limits for sources or categories of sources that emit greenhouse gas emissions" (Health and Safety Code section 38562(c); see also section 38570, which specifies additional criteria for market-based compliance mechanisms). These statutory provisions authorize ARB to adopt a cap-and-trade regulation and, in order to initiate a cap-and-trade program, emission allowances must somehow be allocated to participating sources. Thus, AB 32 directs ARB to "Design the regulations, <u>including distribution of emissions allowances where appropriate</u>, in a manner that is equitable, seeks to minimize costs and maximize the total benefits to California and encourages early action to reduce greenhouse gas emissions." (Health and Safety Code section 38562(b)(1); emphasis added.)
>
> There are a variety of ways to allocate allowances; they can be distributed free of charge, they can be sold at a predetermined price, they can be auctioned off with competitive bidding, or by another allocation method developed. AB 32 does not direct ARB to use any particular method to distribute allowances, and does not specify that some methods are allowed and others are not. Each method of distribution has pros and cons, and different methods will vary in their ability to meet the statutory criteria set forth in AB 32. Auctioning of allowances is one widely recognized method to distribute allowances, and is in fact the method that has been recommended by the Market Advisory Committee and many other economists. We believe that in authorizing ARB to distribute allowances, and requiring that market-based compliance mechanisms must meet certain criteria, the Legislature did not intend to forbid ARB from choosing this widely recognized distribution method. In other words, as the administrating agency charged with interpreting AB 32, ARB believes that AB 32 provides ARB with the authority to include auctions as a feature of a cap-and-trade program. Also, see the response to Comments K-12 and K-34.

Environmental Justice

K-28. Comment: Cap and trade will inflict disparate impacts on low income communities of color in California. Title 6 of the Civil Rights Act in 1964 prohibits any entity receiving federal funding from discriminating on the basis of, among other things, race. We will file a Title 6 complaint once this regulation becomes final. (NEWELL)

Response: ARB disagrees that the regulation will have the discriminatory impacts claimed by the commenter. As explained in the Initial Statement of Reasons and in the responses to other comments in this Final Statement of Reasons, we do not believe the regulation will result in disparate adverse impacts on low income communities or communities of color. We are aware of no valid basis for claiming that the regulation violates Title 6 of the Civil Rights Act, and the commenter has not provided sufficient information or analysis to further evaluate his legal theory.

Consideration of Alternatives

K-29. Comment: There's a court order that's controlling these proceedings. Judge Goldsmith of the San Francisco Superior Court has ordered that this Board may not take final action on this regulation until he issues his ruling in the scoping plan lawsuit. He has further ordered that the Board must consider his opinion and his decision if his decision involves a cap and trade component of the scoping plan. In that lawsuit, which is being heard on the merits on Monday, we've argued four main points about cap and trade and the scoping plan. The Air Resources Board failed to assess the maximum technological feasibility and develop cost effectiveness comparisons between direct reductions and market mechanisms, determine whether cap and trade would facilitate the achievement of the maximum feasible and cost effective reductions, consider the performance of other greenhouse gas reduction programs in other states and nations, adequately analyze alternatives to cap and trade in the functional equivalent document. (NEWELL)

Response: The lawsuit referred to by the commenter does not affect the Board's ability to take final action to adopt the cap and trade regulation. In this lawsuit, petitioners challenged ARB's adoption of the AB 32 Scoping Plan (not the cap and trade regulation), claiming that the Plan did not comply with various statutory requirements specified in AB 32, and that the environmental analysis prepared by ARB for the Plan did not meet the requirements of the California Environmental Quality Act (CEQA). The San Francisco County Superior Court issued a final decision on May 20, 2011. In its decision the Court denied almost all of petitioners' claims, but ruled in favor of petitioners on two CEQA challenges to the environmental analysis prepared for the Plan under ARB's certified regulatory program. ARB immediately appealed the trial court's ruling, and on June 24, 2011, the Court of Appeal issued an order staying enforcement of the trial court's ruling until such time as the merits of the case are decided by the Court of Appeal. Since the trial court's ruling has been stayed, it does not impede ARB's ability to adopt the cap and trade regulation.

Separate from the Court of Appeal proceedings, ARB has been working on a parallel track to address the trial court's concerns regarding the Scoping Plan's alternatives analysis. ARB staff prepared a revised alternatives analysis and released it for a 45-day public comment period on June 13, 2011. Staff then prepared written responses to all comments received. On August 24, 2011, the

Board held a public hearing at which the Board approved the revised alternatives analysis, made various CEQA findings, and readopted the Scoping Plan.

Federal Facilities

K-30. Comment: Without an explicit waiver of sovereign immunity, Western is not subject to state laws or regulations. Western understands ARB believes the Clean Air Act provides a waiver of sovereign immunity for its program. While section 118 of the Clean Air Act, 42 U.S.C. section 7418, provides a limited waiver of sovereign immunity and requires federal facilities to comply with federal, state, interstate and local requirements for the abatement of air pollution to the same extent as any nongovernmental entity, Western understands neither the U.S. Congress nor the U.S. Environmental Protection Agency (EPA) has approved a cap and trade requirement for greenhouse gases, including California's program. While Congress or EPA, in the near future, may decide to approve such programs, until such time, Western does not have authority to bind Congress, EPA or other federal agencies with jurisdiction over such matters. To avoid any potential conflicts with federal law, Western would recommend the ARB remove references to Western and other federal agencies from the draft order until such time as Congress implements (and the President signs) a greenhouse gas law or EPA approves the states program. Including Western and other federal agencies unnecessarily raise complicated legal issues that are unnecessary for the implementation of the ARB's program. (WAPA)

Response: See the response to Comment K-8.

Authority to Raise Revenue

K-31. Comment: AB 32 does not authorize CARB to raise revenue for purposes unrelated to administration of the program, and CARB has not shown in the statement of reasons that an auction to raise revenue is necessary for, or limited to, administration of the program. In fact, CARB staff suggests that the legislature appropriate auction revenues for very broad purposes related to technology development, community benefit, workforce training, etc. Unless and until CARB can justify that revenues are required for administration of the program, the revenue is a tax that requires a 2/3 vote of the legislature.

CARB staff suggests that auctions are required to avoid windfall profits, yet free allowance up to the benchmark automatically protects against such risk by ensuring that no entity receives more allowances than needed to operate their facilities. Because there is no real risk of windfall profits under this proposed allocation scheme, it is clear that the real purpose of the auction is to raise revenues for purposes unrelated to the cap and trade program as outlined above. (CMTA1)

Response: ARB disagrees with the commenter. Please see the response to Comment K-27.

K-32. Comment: We believe CARB has no current authority, under AB 32 or otherwise, to raise revenue for purposes unrelated to administration of the AB 32 program. CARB has not shown in the statement of reasons that an auction to raise revenue is necessary for, or limited to, administration of the program. In fact, CARB staff suggests that the legislature appropriate auction revenues for very broad purposes related to other purposes including technology development, community benefit, and workforce training, for example. In our view this exaction is not only unauthorized by AB 32, but it is also a tax that will require 2/3 vote of the legislature. (AB32IG, PLOTKIN)

> **Response:** ARB disagrees with the commenter that the cap-and-trade program is a tax. Please see the response to Comment K-27.

Commerce Clause

K-33. Comment: The proposed Cap-And-Trade rule also raises substantial and novel federal questions under the Federal Power Act and Commerce Clause. In adopting the Cap-And-Trade program, ARB is clearly attempting to address a global issue, which will significantly burden interstate and international commerce in electricity from the outset in 2012. More specifically, the Federal Power Act preempts states from regulating the transmission and sale of electric energy at wholesale in interstate commerce. See 16 U.S.C. section 824. ARB's proposed Cap-And-Trade program effectively regulates the transmission and sale of electric energy at wholesale in interstate commerce by imposing the cost of purchasing GHG allowances at auction on electric energy from HDPP, which is subject to the Federal Power Act as an "exempt wholesale generator." (HDPP2)

> **Response:** ARB’s authority to implement the cap-and-trade program on imported electricity is derived from AB 32’s requirement that ARB account for imported electricity in its mandatory reporting regulation so that emission associated with imported electricity are considered part of California’s statewide GHG emissions. Additionally, the original version of the regulation on which this comment is based has changed substantially to address these concerns.

K-34. Comment: One of the problems with inter-sector competition is that it will be essentially impossible to exclude goods and services from outside of California on the basis of their implied greenhouse gas emissions costs. However small the cost may be, the cost of goods and services made or performed in California will be higher than the cost of goods or services made or performed in other states. While this cost disparity already exists in many areas, the disparities will increase, and will increase disproportionately in certain sectors. The logical method of combating the loss of jobs and businesses is to impose some sort of tariff or fee on imported goods and services to account for the energy use outside of the state. But such tariffs or fees are likely to be illegal, as a result of constitutional and federal legal prohibitions on such barriers to out-of-state commerce. Applying product-specific fees to goods and services imported into the state on the basis of their imputed energy intensity would involve administrative burdens of unimagined scope. (HOR)

Response: ARB does not intend to impose administrative fees on any imported products. As part of the development of the cap-and-trade program we performed a careful leakage analysis and identified all industries that may be susceptible to emissions leakage. All industries that were identified as at risk for leakage will receive free allowances in the first compliance period. The mechanism for allocating allowances was designed to minimize the incentive to relocate production out of state. In this way cap and trade will achieve cost effective emissions reductions while fully minimizing leakage to the extent feasible. A complete description of this allocation approach is included Appendix K of the Staff Report.

K-35. Comment: Peabody Energy Company urges ARB not to adopt provisions in the proposed Cap-and-Trade regulations that would apply the regulations to electricity produced at generating stations located outside of California. These provisions run afoul of the Commerce Clause of the United States Constitution. Peabody understands the view of ARB staff that these extra-territorial provisions were mandated by the legislature in AB 32. Nevertheless, these provisions violate the Constitution and should not be adopted. (PEABODYENERGY)

Response: ARB is not applying regulations to generating stations outside of California; it is applying regulations to energy delivered into California to account for the carbon generated to meet California demand. ARB modified the regulations to make the point of regulation more clear. Specifically, ARB has modified language to make clear that the regulation only applies to electricity that is actually designated to be imported into California by adding language to section 95852(b) to specify how the compliance obligation applies to imported electricity from when it originates from specified sources or unspecified sources outside of California. Section 95852 applies only to first deliverers of electricity, whether they are generators or electricity importers. We also modified the definitions of electricity importers and of purchasing selling entities in section 95802 to precisely identify the entity that delivers electricity to its first point of delivery in California. ARB believes these changes address the potential Commerce Clause implications of the regulation.

K-36. Comment: ARB's proposed application of its Cap-and-Trade program to out-of-state sources through the importation standard cannot withstand scrutiny under the "virtual per se" test for three reasons. The importation standard "directly regulates … interstate commerce" (see *Brown-Forman*, 476 U.S. at 579). The standard directly penalizes and therefore restricts the importation of electricity generated at out-of-state facilities. Importers must, in essence, pay a tariff to California in order to import their product into the state, and that money goes right into the state's coffers. Under the Commerce Clause, states cannot levy tariffs on imports. See *West Lynn Creamery, Inc. v. Healy*, 512 U.S. 186, 194-96 (1994), which held that a Massachusetts state law requiring mill processors, including out-of-state firms, to pay a premium to a state fund that was then disbursed only to in-state producers was “effectively a tax which makes milk produced out-of-state more expensive,” and thus discriminated against out-of-state milk . (PEABODYENERGY)

> **Response:** California’s regulations neither apply to out-of-state sources nor discriminate against interstate suppliers. The regulations are not facially discriminatory as presumed in the comment. ARB has modified the regulations to better reflect the constraints of the Commerce Clause. Specifically, ARB has modified the regulation to only apply to electricity that is actually designated to be imported into California. The regulation treats all first deliverers in essentially the same manner. Section 95852(b) is modified to clarify the treatment of first deliverers. In all cases, first deliverers must pay the compliance obligation based on the emissions associated with the electricity when it is first delivered into the California electricity grid, regardless of whether it is delivered at a point of connection where an electricity generating facility connects directly to the grid (a busbar), or to a first point of delivery for electricity that has left another jurisdiction and entered California. ARB believes these changes address the potential Commerce Clause implications of the regulation.

K-37. Comment: Application of the Cap-and-Trade program to out-of-state sources constitutes improper extra-territorial regulation. See *Healy v. Beer Institute*, 491 U.S. 324, 333 (1989), and *Edgar v. MITE Corp*., 457 U.S. 624, 642-43 (1982), in which the Commerce Clause precludes the application of a state statute to commerce that takes place wholly outside of the State’s borders, whether or not the commerce has effects within the State. ARB has chosen to regulate emissions associated with electricity generated in another jurisdiction but consumed in California. Critically, the conduct that the Importation Standard seeks to affect is the production of greenhouse gas emissions occurring in other states and thus wholly outside the State’s borders. Although the electrons produced at these out-of-state facilities are imported into California, the state is obviously not concerned with the impact these electrons have once they enter the state. (PEABODYENERGY)

> **Response:** AB 32 requires ARB to account for electricity imported into California when formulating the GHG emissions cap, and therefore, to account for the same imports when determining which entities are subject to a compliance obligation.

K-38. Comment: The imported electrons do not cause any damage in California. The concern is the generation of greenhouse gases at the out-of-state facility, and that is why staff wishes to align the threshold for out-of-state and in-state facility emissions at 25,000 metric tons. Staff’s view may be logical, but the Importation Standard is an effort to affect conduct occurring wholly outside the state, and that is something California cannot do under the Commerce Clause. (PEABODYENERGY)

Response: The regulation is intended to affect conduct occurring within California and treats all First Deliverers equally. There is no attempt to regulate conduct outside of California.

K-39. Comment: Application of the program to out-of-state generation is virtually per se invalid because such application is economically protectionist in its purpose and effect. See *Bacchus Imports*, Ltd. v. Dias, 468 U.S. 263, 270 (1984), which found that a state legislation constitutes economic protectionism' may be made on the basis of either discriminatory purpose or discriminatory effect. In order to survive a challenge based on economic protectionism, California bears the burden of showing that its justification for a discriminatory law is "unrelated to economic protectionism." See *New Energy Co. of Ind. v. Limbach*, 486 U.S. 269, 274 (1988). California cannot meet this burden. (PEABODYENERGY)

Response: The comment does not explain how the regulation discriminates or is economically protectionist. The comment contains a legal opinion based on an unexplained premise which does support the legal opinion expressed in the comment. The undisputed purpose of the regulation is to reduce emissions in California, including by affecting behavior in California that may impact imported electricity use.

K-40. Comment: California has almost no in-state coal generation and no coal industry, but it is trying to dramatically increase in-state renewable generation. This renewable generation is more expensive than the out-of-state fossil generation with which it competes. Such in-state renewable generation is therefore at risk if California does not penalize out-of-state fossil generation. (PEABODYENERGY)

Response: The regulations do not discriminate or penalize out-of-state fossil generation. This comment attempts to create a justification (protection of renewable generation) for the commenter's interpretation of case law. There is no basis provided for either of the commenter's assumptions in this comment. California welcomes and encourages renewable energy both within and outside of California. It is unclear what the commenter is intending to imply.

K-41. Comment: As stated by the Supreme Court, a regulation addressing interstate commerce that gives regulated parties "who handle domestic articles of commerce a cost advantage over their competitors handling similar items produced elsewhere constitutes such protectionism" (see *Oregon Waste*, 511 U.S. at 106). Thus, California cannot force producers or consumers in other States to surrender whatever competitive advantages they may possess to give local consumers an advantage over consumers in other states. See *Brown-Forman*, 476 U.S. at 580; *see also* Baldwin v. G.A.F. Seelig, which found that the state of New York had no power to project its legislation into Vermont by regulating the price to be paid in that state for milk acquired there, because such regulation sets] up what is equivalent to a rampart of customs duties designed to neutralize advantages belonging to the place of origin". (PEABODYENERGY)

Response: This comment assumes, without explanation or reference to the proposed regulations, that the regulations force producers or consumers in other States to surrender competitive advantages. The regulations do not contain such discriminatory language, purpose, or effect. The alleged protectionism does not exist in the proposed regulations.

K-42. Comment: Given the steep trajectory of increases in international greenhouse gas emissions, the program will have no discernible effects on the overall level of greenhouse gases in the global atmosphere nor on the global climate. Moreover, California has other alternatives for addressing the global climate change issue, such as lobbying in Congress for adoption of what could be more meaningful national or international approaches to the issue. (PEABODYENERGY)

Response: AB 32 requires California to reduce GHG emissions. California is employing a wide-range of laws and regulations, in addition to the present cap-and-trade regulations, to achieve the AB 32 emissions reduction level.

K-43. Comment: The proposed regulation interferes with the free flow of electricity in wholesale markets, a business that is interstate in nature.

The Supreme Court has often noted that state regulation having an interstate effect is given particular scrutiny where there is a need for uniform interstate regulations. *See Milk Control Bd. of Pennsylvania v. Eisenberg Farm Prods.*, 306 U.S. 346, 351 (1939) ("This court has repeatedly declared that the grant established the immunity of interstate commerce from the control of the states respecting all those subjects embraced within the grant which are of such a nature as to demand that, if regulated at all, their regulation must be prescribed by a single authority"); *Morgan v. Commonwealth of Virginia*, 328 U.S. 373, 377 (1946) ("Where uniformity is essential for the functioning of commerce, a state may not interpose its local regulation"); *Southern Pacific Co. v. Arizona,* 325 U.S. 761, 774 (1945) (noting the "confusion and difficulty" that would attend the "unsatisfied need for uniformity" in setting maximum limits on train lengths); *Cooley v. Board of Wardens*, 53 U.S. 299, 319 (1852) (Commerce Clause prohibits States from regulating subjects that "are in their nature national, or admit only of one uniform system, or plan of regulation").

Perhaps no industry in the United States is more interstate in nature and needing of uniform regulation than the electricity industry. Electrons flow according to the laws of physics at the speed of light and do not respect state borders. Every electric company in the country is part of a larger powerpool and interstate grid in order to achieve the benefits of diversity, reliability and coordination. As the Midwestern and Northeastern blackout of 2003 demonstrates, local events on the grid can have instantaneous and cascading effects across large sections of the country. Balkanized state control of interstate transactions across the grid, with individual states controlling interstate power flows based on their own conceptions of what is in their own best self-interest, could have catastrophic impacts.

Weighing the large interstate impact of California's Importation Standard against its purely symbolic purpose leads to the inescapable conclusion that such standard cannot withstand scrutiny under the Pike balancing test and therefore violates the Commerce Clause. (PEABODYENERGY)

> **Response**: The comment alleges, without explanation, that the regulation interferes with the free flow of electricity in wholesale markets. The regulations treat all wholesale energy producers equally. The comment assumes a legal conclusion that is not supported by the non-discriminatory language in the regulations.

K-44. Comment: BPA appreciates that ARB has afforded BPA Asset Controlling Supplier status through the greenhouse gas reporting regulations (section 95102 (a)(15), 95111(b)(3), 95111(f), and in ARB's Cap and Trade regulations section 95802(a)(8)). However, BPA disagrees with ARB's suggestions in its greenhouse gas reporting rules and cap and trade rules that it has "authority" to regulate BPA and that BPA is "required" to comply (see section 95101(d)(5), 95102(a)(102), 95802(a)(59)). BPA wishes to make clear that BPA is participating in California's GHG reporting program and Cap and Trade program purely on a voluntary basis and BPA is not conceding that California has any jurisdiction over BPA. Sovereign immunity may prevent BPA (and similarly WAPA) from being subject to these regulations. Despite ARB's position that the Clean Air Act waives sovereign immunity, it is questionable whether that waiver would cover BPA because it is purely a marketer that is not engaged in an activity that discharges pollutants. Further, although BPA intends to voluntarily comply with these regulations, BPA is concerned that mandatory regulations could interfere with its existing contracts and conflict with the marketing scheme established by Congress in BPA's governing statutes. Because BPA is willing to voluntarily comply, it is not necessary for ARB to include these jurisdictional assertions in its rules. Doing so could unnecessarily raise complicated legal issues that are unnecessary to full and timely implementation of the greenhouse gases reporting rules and/or the cap & trade program. Accordingly, BPA urges ARB to modify sections 95101(d)(4) and (5), 95102(a)(102), and section 95802(a)(59) (same definition of "Electricity importers" as the definition used in section 95102(a)(102)) in one of two ways, either by simply deleting the unnecessary language entirely, or by modifying it. The following illustrate both options for each of the three sections:
Delete option for section 95101:

(d) *Electric Power Entities.* The entities listed below are required to report under this article:
- (1) Electricity importers and exporters, as defined in section 95102(a);
- (2) Retail providers, including multi-jurisdictional retail providers, as defined in section 95102(a);
- (3) California Department of Water Resources (DWR);
- ~~(4) Western Area Power Administration (WAPA);~~
- ~~(5) Bonneville Power Administration (BPA).~~

Modification option for section 95101:

(d) *Electric Power Entities.* The entities listed below are required to report under this article:

(1) Electricity importers and exporters, as defined in section 95102(a);

(2) Retail providers, including multi-jurisdictional retail providers, as defined in section 95102(a);

(3) California Department of Water Resources (DWR);

(4) Western Area Power Administration (WAPA), unless it voluntarily reports under these regulations;

(5) Bonneville Power Administration (BPA), unless it voluntarily reports under these regulations.

Delete option for section 95102:

(a) For the purposes of this article, the following definitions shall apply:

(102) "Electricity importers" are marketers and retail providers that hold title to imported electricity. For electricity delivered between balancing authority areas, the entity that holds title to delivered electricity is identified on the NERC E-tag as the purchasing- selling entity (PSE) on the tag's physical path, with the point of receipt located outside the state of California and the point of delivery located inside the state of California. ~~Federal and s~~State agencies are subject to the regulatory authority of ARB under this article and include ~~Western Area Power Administration (WAPA), Bonneville Power Administration (BPA), and~~ California Department of Water and Power (DWR). When PSEs are not subject to the regulatory authority of ARB, including tribal nations, the electricity importer is the immediate downstream purchaser or recipient that is subject to the regulatory authority of ARB.

Modification option for section 95102:

(a) For the purposes of this article, the following definitions shall apply:

(102) "Electricity importers" are marketers and retail providers that hold title to imported electricity. For electricity delivered between balancing authority areas, the entity that holds title to delivered electricity is identified on the NERC E-tag as the purchasing- selling entity (PSE) on the tag's physical path, with the point of receipt located outside the state of California and the point of delivery located inside the state of California. ~~Federal and s~~State agencies are subject to the regulatory authority of ARB under this article and include ~~Western Area Power Administration (WAPA), Bonneville Power Administration (BPA), and~~ California Department of Water and Power (DWR). Federal agencies, including Western Area Power Administration (WAPA) and Bonneville Power Administration (BPA), are not subject to these regulations so long as they voluntarily report under these regulations. When PSEs are not subject to

the regulatory authority of ARB, including tribal nations, the electricity importer is the immediate downstream purchaser or recipient that is subject to the regulatory authority of ARB.

Delete option for section 95802:

(a) Definitions. For the purposes of this article, the following definitions shall apply:

(59) “Electricity importers” are marketers and retail providers that hold title to imported electricity. For electricity delivered between balancing authority areas, the entity that holds title to delivered electricity is identified on the NERC E-tag as the purchasing- selling entity (PSE) on the tag’s physical path, with the point of receipt located outside the state of California, and the point of delivery located inside the state of California. ~~Federal and s~~State agencies are subject to the regulatory authority of ARB under this article and include ~~Western Area Power Administration (WAPA), Bonneville Power Administration (BPA), and~~ California Department of Water and Power (DWR). When PSEs are not subject to the regulatory authority of ARB, including tribal nations, the electricity importer is the immediate downstream purchaser or recipient that is subject to the regulatory authority of ARB.

Modification option for section 95802:

(a) Definitions. For the purposes of this article, the following definitions shall apply:

(59) “Electricity importers” are marketers and retail providers that hold title to imported electricity. For electricity delivered between balancing authority areas, the entity that holds title to delivered electricity is identified on the NERC E-tag as the purchasing- selling entity (PSE) on the tag’s physical path, with the point of receipt located outside the state of California, and the point of delivery located inside the state of California. ~~Federal and s~~State agencies are subject to the regulatory authority of ARB under this article and include ~~Western Area Power Administration (WAPA), Bonneville Power Administration (BPA), and~~ California Department of Water and Power (DWR). Federal agencies, including Western Area Power Administration (WAPA) and Bonneville Power Administration (BPA), are not subject to these regulations so long as they voluntarily participate under these regulations. When PSEs are not subject to the regulatory authority of ARB, including tribal nations, the electricity importer is the immediate downstream purchaser or recipient that is subject to the regulatory authority of ARB. (BONNEVILLEPWR)

Response: See the previous response to Comment K-8.

K-45. Comment: Section 95812(d)(2) should be deleted. Under section 95812(b)(2)(B), revised as described in the previous comment, the threshold for coverage of emissions from out-of-state specified sources is set at the same level set for in-state generating facilities: 25,000 or more metric tons of CO_2e per year. As noted on page IX-11 of the ISOR for the Cap and Trade Regulation, this comparable treatment of in-state and out-of-state facilities is necessary to comply with the interstate commerce clause. Section 95812(d)(2) (p. A-42) would upset this comparable treatment of out-of-state and in-state generating facilities by changing the emissions threshold for coverage of out-of-state specified sources from 25,000 metric tons of CO_2e to zero tons in 2015. No reason is given for this change, and it may be challenged under the interstate commerce clause. The same threshold should be applied to in-state and out-of-state facilities for the duration of the cap and trade program. Therefore, section 95812(d)(2) should be deleted. Apart from the inappropriate change of threshold, all other provisions in section 95812(d)(2) are contained in sections 95812(b)(2)(B) and (C). Thus, if the change in threshold is eliminated from section 95812(d)(2), the section is redundant. Furthermore, section 95812(d)(2) is improperly located as a subsection of section 95812(d). Section 95812(d) relates to suppliers of natural gas, RBOB, and distillate fuels as specified in section 95851(b) (p. A-61), not first deliverers of electricity. (SCPPA1)

> **Response:** We disagree. ARB does not believe this application violates the commerce clause. In 2015, all electricity generated in California and imported into California will include the cost of compliance. Because it is infeasible to directly apply the compliance obligation to very small electricity sources in California, such as home or small business natural gas micro-generation, the compliance cost for this electricity will be passed through in the natural gas price. Effectively, California electricity generators will pay the compliance cost even for a few hundred therms of natural gas or less. It is infeasible to import electricity from micro generators. In fact, data provided to the EIA indicates in combination with data on specified source electricity imports submitted by importers pursuant to MRR shows that almost none of the electricity imported from GHG emitting sources comes from power plants that emit less than 25,000 metric tons. In essence, electricity generation is treated the same both before and after 2015, regardless of the jurisdiction of its origin. Section 95812(d)(2) does not violate the commerce clause, and is necessary in order to treat in-state and imported electricity the same once all natural gas is subject to the compliance obligation starting in 2015.

Does Not Meet AB 32 Requirements

Comment: The proposed regulation fails to maximize environmental co-benefits to the extent feasible. Prior to adopting a Cap and Trade system under AB 32, ARB must, “to the extent feasible,” maximize additional environmental benefits to California where it is appropriate to do so. Health and Safety Code section 38570(b)(3). By using the term “feasible,” the Legislature signaled its intent to require ARB to demonstrate that all appropriate measures must be taken to maximize environmental benefits, unless those measures are shown to be impracticable.

AB 32 does not define the term “feasible.” However, that term has a specific meaning under other statutes, including the California Environmental Quality Act—a meaning of which the Legislature was presumptively aware when it enacted AB 32. “Feasible” means “capable of being accomplished in a successful manner within a reasonable period of time, taking into account economic, environmental, social, and technological factors.” Pub. Res. Code section 21061.1. In the CEQA context, when a lead agency rejects an alternative as economically infeasible, it must support that determination with quantitative, comparative evidence that the alternative would be economically impracticable (not just more expensive). See, e.g., Save Round Valley Alliance v. County of Inyo, 157 Cal. App. 4th 1437, 1461-62 (2007) (holding that applicant’s inability to achieve “the same economic objectives” under a proposed alternative does not render the alternative economically infeasible); Uphold Our Heritage v. Town of Woodside, 147 Cal. App. 4th 587, 600 (2007) (requiring evidence that comparative marginal costs would be so great that a reasonably prudent property owner would not proceed with the project); Preservation Action Council v. City of San Jose, 141 Cal. App. 4th 1336, 1356-57 (2006) (holding that evidence of economic infeasibility must consist of facts, independent analysis, and meaningful detail, not just the assertions of an interested party). Nor may a lead agency conclude that mitigation measures are legally infeasible without an adequate basis. As the Supreme Court put it, “[a]n EIR that incorrectly disclaims the power and duty to mitigate identified environmental effects based on erroneous legal assumptions is not sufficient as an informative document.” City of Marina v. Bd. of Trustees, 39 Cal. 4th 341, 356 (2006).

The Legislature’s use of the term “feasible” in connection with environmental co-benefits thus imposes a specific burden on ARB—a burden that the ISOR and FED fail to meet. For many months, the Center and other organizations have identified specific, appropriate measures to ARB staff (such as, for example, measures to ensure that forest offset projects improve forest management rather than perpetuate environmentally destructive practices) that could enhance, and thus help maximize, environmental co-benefits. Many of those measures are discussed again throughout this letter. At no point, however, has ARB demonstrated the infeasibility, or even the inappropriateness, of any of these measures. The Cap and Trade regulation as proposed thus fails to comply with AB 32. (CBD1)

> **Response:** The commenter states that ARB has not demonstrated that specific measures suggested by the commenter and other groups that could help maximize environmental co-benefits (such as measures to ensure that forest offset projects improve forest management) are infeasible as required by Health and Safety Code (HSC) section 38570(b)(3). The provision cited directs ARB to: “to the extent feasible and in furtherance of achieving the statewide greenhouse gas emissions limit…maximize additional environmental benefits.” (HSC 38570(b)(3).). AB 32 does not include a specific definition of “feasible” or criteria that should be used to determine what constitutes “to the extent feasible.” AB 32 leaves the specifics of how to do so, including balancing a variety of competing concerns, up to ARB. During development of the cap-and-trade regulation, ARB considered all of its statutory mandates under AB 32, including the requirement

to consider measures to maximize additional environmental benefits based on evidence, including economic analysis, where appropriate "to the extent feasible and in furtherance of achieving the statewide greenhouse gas emissions limit." The appropriate analyses are included within the ISOR for the regulation. ARB does not interpret AB 32 to require ARB to make a formal infeasibility determination regarding specific measures suggested by the commenter and other groups.

Development of the cap-and-trade regulation included extensive economic analysis and the involvement of an Economic and Allocation Advisory Committee. The updated economic analysis supporting the development of the regulation was prepared by ARB and released on March 24, 2010 (ARB 2010). Economic reasons were not cited for potential infeasibility of avoiding impacts from implementing the proposed Forest Offset Protocol. On pages 311 to 314 of the Functional Equivalent Document (FED), ARB explains that significant adverse biological impacts are not expected from implementing the Forest Offset Protocol, because sustainable, long-term harvesting practices and natural forest management would be required and project sites would be subject to some silvicultural activities with or without a Forest Offset Protocol project. Nonetheless, the FED discloses the risk that some adverse impacts cannot be entirely eliminated and unanticipated adverse biological impacts could occur. ARB cannot speculate as to the location of such impacts, but has committed to implementing an adaptive management approach as a program design feature that affords adjustment to the regulation if any unanticipated significant biological impacts occur. These limits are well defined in authorizing legislation for ARB's responsibilities, which do not include regulation of biological or other non-air related natural resources. See the responses to comments in section F. Co-pollutants.

CEQA aspects of this comment can be found in Appendix O of the Staff Report.

L. MARKETS

This section includes comments and responses about the carbon market created by the cap-and-trade program, and refer but are not limited to sections 95920–95922. Major topics concern the confidentiality, registration and accounts, market oversight and monitoring, and holding limits.

General

L-1. (multiple comments)
Comment: Sections 95922(a), 95922(b), 95922(d)(1) refer to "section 95930," which is not part of the proposed regulation. NCPA understands CARB intends to reference section 95830 regarding registration with CARB in these three sections addressing trading and banking of compliance instruments. (NCPA1)

Comment: Under paragraph (b) of section 95922, a reference is made to section 95930, which does not exist. (CAPCOA1, CAPCOA2)

> **Response**: We corrected the typographical error by modifying section 95922 to reference section 95830.

L-2. Comment: Regulations should clarify that industrial facilities can use allowances for compliance purposes: The regulations should clarify that industrial facilities receiving an allocation of allowances will be able to use the allowances for compliance purposes. Section 95891 provides for an allocation of allowances to industrial sector facilities. Unlike section 95892, which clarifies how IOUs and POUs use allocated allowances, section 95891 fails to clarify this use for industrial facilities. While the regulations allow a POU to distribute allowances from their holding accounts to their compliance accounts, IOUs are required to monetize all allowances immediately to "ensure that the amount of value given to distribution utilities is transparent to the public and that this value is used on behalf of electric ratepayers." (See Appendix J, at J-60) CARB's regulations should clarify, in section 95891, that industrial facilities can use allowances in a manner similar to POUs, particularly in light of the fact that the identified restrictions required for IOUs are not relevant to industrial facilities. Accordingly, two sections of the regulations should be modified. The following provision should be added to section 95891:

> <u>(d) At least 90 days prior to receiving a direct allocation of allowances, industrial facilities will inform the Executive Officer of the share of their allowances that is to be placed:</u>
> <u>(1) In the industrial facility's compliance account; or</u>
> <u>(2) In the industrial facility's limited use holding account.</u>

Section 95831(a)(3) should be modified as follows:

(3) Limited Use Holding Accounts. When an entity qualifies for a direct allocation under section 95890, the accounts administrator will create a limited use holding account for the entity that shall be subject to the following restrictions:

(A) the entity may not transfer compliance instruments from other accounts into the limited use holding account; and

(B) ~~the entity~~ an investor-owned utility may not transfer compliance instruments from the limited use holding account to any account other than the Auction Holding Account. (EPUC)

Response: We disagree with the suggested changes to section 95891(d) and section 95831(a)(3)(B). We believe it is clear in the regulation that the industrial covered entities could use free allowances deposited into their compliance accounts to fulfill their compliance obligations. Furthermore, industrial covered entities do not have a "limited use holding account." Therefore, there should be no confusion that industrial covered entities are like IOUs which are subject to the consignment auction requirements.

L-3. Comment: LADWP strongly supports policies that have been incorporated into the proposed regulation intended to help contain compliance costs including banking of allowances. (LADWP1)

Response: Thank you for your support.

Participation in the Market

L-4. Comment: In the EU we provide a facility for companies and individuals to buy and cancel emissions rights. We believe this is an important feature of emissions trading and one that should be preserved. Civil society should always have the right to enter the market to buy down the cap if it considers the volume of emissions rights granted to be too high to address adequately the risk of global climate change. (SANDBAGCC)

Response: We have added a provision in our regulation to allow voluntarily associated entities to participate the market. We also provide a mechanism for any registered entity to voluntarily retire compliance instruments.

L-5. Comment: Stringent regulations are essential to California's Cap and Trade program. Speculators bent on accumulating personal wealth will cloud the proposed goal of reducing emissions and therefore should absolutely not be allowed to participate. There is little time left. The goal is to create a system of operation more in tune with a healthy environment. The focus should be to reform local operations that create the pollution. If a cap and trade system is needed to help pay for the modifications necessary then these interactions should be highly scrutinized and transparent. To think of selling responsibility for reform elsewhere is unconscionable. (SIMS)

> **Response:** As detailed in the Scoping Plan, the cap-and-trade program is designed to work in concert with a number of complementary measures, such as standards for cleaner vehicles, low-carbon fuels, renewable electricity, and energy efficiency. We evaluated four alternatives, including additional source-specific regulations, and found that none were more effective than the implementation of a cap-and-trade program in carrying out the goals of AB 32. Staff has designed the program, including the cap, to be sufficiently stringent to spur GHG reductions to achieve AB 32 goals. We will closely monitor whether, over time, the cap-and-trade program is meeting the objectives set forth in AB 32.

L-6. (multiple comments)
Comment: Allow only stakeholders to trade in the allowance market. Speculative trading in commodity markets, such as crude oil, has unnecessarily driven costs higher, placing a large economic burden on companies that need to purchase these commodities for their operations. Any speculative price increases in the allowance market will exacerbate leakage and provide additional financial difficulties for stakeholders. Speculators will only be participating in order to make a profit; they do not need to purchase allowances for any other purposes. Speculators do not have risk associated with non-compliance, while stakeholders can incur significant costs due to non-compliance. Speculators do not necessarily participate in the California economy by providing products for Californians. Stakeholders businesses are located in California. (KERNOIL1)

Comment: We are concerned that the auction allows non-regulated entities to participate. These entities will have the ability to hold allowances for a profit therefore increasing the costs of the program. Hedge funds have already begun developing strategies for the offset market and could potentially be developing the same for the allowance market. There is a profit to be made by holding entities hostage to the allowance market. Other groups will have the ability to retire allowances and prevent the regulated entities continuing to operate in California because the allowances will not be available for purchase. (AGCOALITION)

Comment: Speculation is a risk-laden distraction from the purpose of the program: One would be entitled to ask why government funds are being spent to create and police a speculative market, the operation of which enriches financial gamblers—the same risk-for-profit actors who have just brought the global banking system near to collapse—and does nothing to decrease greenhouse gas emissions. In fact, the presence of this speculative market threatens clean development by creating artificial price fluctuations that have nothing to do with anything other than the vagaries of short-selling, complex and opaque financial instruments, and the irrational fluctuations that characterize stock markets. (MAGILAVY)

Comment: Markets do not plan and are unconcerned with equity or transparency: Relying on market forces to create clean development in the developing world removes that activity from any transparent public planning process that considers sustainability, equity, or regional economic need. (MAGILAVY)

Response: We are allowing non-covered entities to hold compliance instruments to ensure that the market prices instruments to reflect the likelihood that the price of instruments will increase over time. We expect that the covered entities will undertake the cheapest direct reductions early, undertaking more expensive reductions later. This increasing cost of direct reduction should lead to higher instrument prices over time. In an efficient market, the expectation that prices will be higher in the future should cause market participants to purchase and bank additional allowances early. This causes the prices to rise early in the program, signaling to market participants that they should be more aggressive in pursuing direct reductions.

We are concerned that excluding financial participants would prevent the market from giving a price signal that reflects expected future increases in the cost of direct emission reductions. Covered entities may not have the financial ability to purchase and hold allowances for later compliance periods. If we exclude financial participants, prices may not reflect anticipated future scarcity and covered entities will not receive the correct price signal supporting the need for additional current direct reductions. The correct price signal should lead to less volatile price changes over time.

While it is true that speculative participants do not have compliance risk, they do run the risk of financial loss if they overestimate the rate of price increases.

Finally, we have a number of regulatory provisions to deter market gaming, including prohibited practices, holding limits, purchase limits, and disclosure of corporate affiliations. At the direction of the Board, we will be contracting with an independent market monitoring service to help detect market manipulations. We are also establishing a Market Surveillance Committee composed of academic experts to provide advice on market design and oversight.

L-7. Comment: Cap and Trade is just a form of buying one's way out of reducing carbon use. Allowing speculation in such markets further removes the process from the goal of reducing carbon use. At the minimum California should remove speculation from its cap and trade program so that its effectiveness can be measured, and so that incentives for maintaining a program that will not work will be removed. (MONTE)

Response: Not all carbon emissions can be eliminated. We believe that the most effective means of reduction, after taking into account reductions obtained through various direct regulatory efforts, is through placing a clear price on carbon. This allows entities to choose the lowest-cost compliance method while California as a whole meets the emissions target of AB 32. The addition of financial participants is expected to reduce price fluctuations over time and give covered entities a clearer indication of the value of emissions reductions.

L-8. Comment: Paramount is also concerned about the ability of non-obligated parties to participate in California's carbon market. Speculators in the oil and gas markets have historically affected price and reduced the efficiency of the open market. Paramount recommends CARB limit the eligibility or participation of non-obligated parties so that influence on the carbon market unassociated with manufacturing or production can be minimized. (PMTPETRO1)

Response: We do not agree that financial participants have necessarily reduced the efficiency of oil and gas markets. There are usually multiple causes of market volatility. In the case of oil and gas markets, as cited in the comment, growth in demand worldwide and the failure of producing countries to keep up with this growth contributed to the recent price increases, while the financial meltdown and resulting economic recession led to rapid price decreases. No credible analysis has shown that speculators played a greater role in determining oil and gas market prices. The addition of financial participants is expected to reduce price fluctuations and give covered entities a clearer indication of the value of emissions reductions over time.

We are recognizing the concerns of covered entities through the design of holding and purchase limits. Both of these rule provisions grant greater flexibility to covered entities to accumulate and purchase at auction than they do to financial participants.

L-9. Comment: The ISOR notes that "if market manipulation or other illicit activities are detected, ARB will work with the appropriate authorities to initiate enforcement activity and, if necessary, reevaluate regulatory requirements to avoid future incidents." (ISOR, p. II-57) However, the proposed regulation does not address the monitoring mechanisms that will be employed, nor does it identify a market oversight agency, or process by which identified shortcomings will be immediately addressed and corrected. (NCPA1)

Response: We include provisions to prevent gaming or other activities that would compromise the effective functioning of the program. These include auction registration, transaction reporting, and certification requirements, as well as provisions that establish limits on the amount of allowances entities can purchase at auction or hold.

We will be undertaking program measures as part of program implementation to address market manipulation. We will establish a Market Monitor and a Market Surveillance Committee, both of which will serve important roles in overseeing market activity and producing regular publicly available reports. We are also working with both the State Attorney General and the Commodity Futures Trading Commission to ensure all necessary provisions are in place to monitor activity in secondary markets. We will pursue enforcement and strict punishment for those who do not comply with the regulation.

L-10. Comment: There will be increased inter-sector trading of allowances. This trading will cause competition among economic sectors to purchase available allowances (or offsets). The sector most able to pay for the allowances will win the competition. It is entirely foreseeable that certain industries with thin margins will be better off shutting their doors and selling their allowances than continuing to operate. Electric utilities, as observed above, will have significant competitive advantages in this inter-sector competition. (HOR)

Response: We believe the methods used to calculate the direct allocation of allowances to industry will address this problem. The lower margin sectors that would have more difficulty competing for compliance instruments will be the most emission-intensive and trade-exposed industries, which will be receiving the highest rate of direct allocation. Utilities may have a greater ability to pass on their compliance costs than in other industries, but the electricity sector faces greater emissions reductions requirements from the full AB 32 program than do the other sectors.

Program Start-up

L-11. Comment: This regulation places many requirements on regulated entities, which must be able to plan for and comply within a timely manner. Entities will be unable to do so without the necessary enabling compliance tools, guidance, and infrastructure (e.g., compliance instrument tracking systems, a registration process, verified offsets, adequate third party verifiers, IT systems, training, and a dispute resolution process) in place from the onset of this regulation. Recent regulations, such as the AB 32 administrative fee and LCFS, have relied on regulatory enforcement advisories to minimize enforcement exposure when compliance tools and guidance have not been provided in a timely manner. Such delays and uncertainties will unnecessarily increase costs and exposure to violations. CCEEB recommends that:

1) The ARB develop a work plan with a clear lists of tools, guidances, policies, trainings, and systems that they must develop, along with completion deadlines for each activity that must be in place for the regulated entities to comply. As this regulation is being developed, requirements should be explicit and transparent.
2) The ARB include a mechanism that links an entity's compliance deadlines directly to availability of theses compliance tools, allowing for sufficient lead time for facility compliance. (CCEEB1, CCEEB2)

Comment: In order to implement the LCFS and AB 32 Administrative Fee regulations, ARB has had to issue a series of enforcement waiver regulatory advisories because the necessary enabling tools were unavailable. We are concerned that there is potential for similar problems under the proposed cap and trade program. We believe that reliance on enforcement waiver regulatory advisories for this regulation could result in exposure to unnecessary costs and business disruptions. If ARB does not have the registration process, auction process, tracking system or benchmarking free allocation process in place in a timely manner, we may begin the cap and trade program without being able to fully participate in the trading/auction process or without fully understanding our obligations. In many cases, these tools, guidance, and/or infrastructure are incomplete or yet to be developed. Therefore, ARB should prepare a detailed work plan of all compliance tools, guidance, and infrastructure that is necessary for entities to comply with the regulation and completion deadlines. At a minimum, the work plan should include a schedule for development of the mandatory reporting tool, training, allowance holding and compliance accounts, registration process, tracking system, auction and free allowance allocation timeline. In addition, the work plan should specify which compliance requirements are affected by these tools, guidelines, and market infrastructure and should provide an extension period for compliance until the work plan item is fully developed. (WSPA1)

> **Response:** We will continue working to finalize the necessary elements of the regulation. However, in light of the importance of this regulation to the success of California's climate change program and the need for all necessary elements to be in place and fully functional, including training for cover entities, we are proposing to initiate the program in 2012, but start the requirements for compliance in 2013. This will not affect the stringency of the program or change the amount of emission reductions that the program will achieve, keeping us on track to meet the 2020 target required by AB 32.

L-12. Comment: While approximately 97 percent of allowances are to be initially allocated to industry (including over 50 percent to electric utilities) during the program's first compliance period (2012 through 2014,) this number decreases to 42 percent by 2020. Dow is supportive of the high initial allocation, but believes the 55 percent decline in allocated allowances in only six years is problematic. At the rate proposed by ARB, industry will find it very difficult to adjust to the increased costs of auction, threatening competitiveness, jobs and consumer energy prices. Significant time and capital investment are needed to meet long-term emission reductions goals and transition California to a lower-carbon economy. Dow recommends exponentially phasing in more auctioning over a longer period time, where initial auctions would be small and gradually increase at a steeper rate. This will help participants acclimate to the market, keeping costs down and improving efficiency.

> **Response:** The cap-and-trade regulation is designed to gradually transition from mostly free allowance distribution to a system in which most allowances are auctioned. This transition provides regulated sources time to get used to the market and the need to procure allowances. This approach gradually introduces a carbon price on goods that consumers purchase while simultaneously ensuring that emission reductions occur. We recognize that the long-term success of the program will require significant investment in emissions reductions. However, under current economic conditions, an early emphasis on auction could hamper the ability of California sources to invest in low-carbon technologies. Further, freely allocating allowances in the early years of the program will help prevent

leakage. Allocating the allowances for free using emissions efficiency benchmarks will reward companies that have already made investments in energy efficiency and carbon reductions, and will not penalize those that produce goods in California. The overall allocation approach includes: creation of an Allowance Price Containment Reserve for cost-containment purposes, a Voluntary Renewable Electricity reserve, free allocation to the industrial sector for transition assistance and leakage prevention, free allocation to electrical distribution utilities on behalf of ratepayers, and auction of the remaining allowances.

Trading, Reporting, and Confidentiality

L-13. Comment: IETA is concerned that the reporting provisions within the proposed rules are too broad in nature, and ultimately may have the unintended consequence of restricting liquidity of trading markets. The proposed draft regulations require the reporting of all "trades" of compliance instruments under the California program, but the proposal's ambiguity may present difficulty for ARB toward using this provision to adequately oversee the market. Proposed ARB requirements to report each trade will leave the Board with a large volume of trade data that will not properly represent holdings of compliance instruments, as positions will be modified considerably before actual delivery. IETA recommends ARB gather data only on trades as they go to physical delivery. In the case of spot transactions, this would be immediate. In the instance of OTC forward, futures, and options trades, this would be at the time of delivery under the terms of the contract. (IETA1)

Response: We agree with the comment, and we believe that the changes made to section 95921 address these comments. We anticipate further discussion with market participants in the area of trade reporting and confidentiality of information as ARB begins the process of linking with the other WCI jurisdictions.

L-14. (multiple comments)
Comment: ARB should not require reporting of trade pricing. ARB proposes to require market participants to report the price of trades, among other information. This requirement may restrict liquidity in the market, and perhaps run counter to federal derivatives trading draft regulations. In general, market participants consider the price of transactions to be highly confidential. In addition, reporting price information from individual trades is not feasible for regulated marketplaces, such as exchanges. These trading venues are prohibited from reporting this information per draft regulations established by the Commodities Futures Trading Commission. IETA also questions the need for ARB to gather price information from individual trades. This information is irrelevant to the enforcement of holding limits or to monitor companies for environmental compliance. Furthermore, price transparency for market participants, which is an essential element to a properly functioning market and for the operation of proposed cost containment mechanisms, can be obtained from existing sources, such as news outlets, exchanges, and market intermediaries (i.e. brokers), without divulging the price of individual trades. (IETA1)

Comment: The collection of trade data is sensitive, and IETA is concerned with the lack of clarity in the proposed rules on how the data would be used by ARB. If the full set of data becomes available to the public, IETA has concerns this could deter trading and put regulated entities at risk for market manipulation. IETA recommends that reported trade data not be made available to the public. Rather, ARB should consider making available to the public aggregate data on trading activity. In addition, the CFTC will have the authority to collect all of the carbon market transaction data for the purpose of regulating trading in these markets. ARB may want to consider establishing a formal information sharing relationship with the CFTC for the purposes of market oversight. IETA understands this recommendation to be the intent of ARB, and we encourage ARB to clarify this intent through modification to the final rule. (IETA1)

> **Response:** We have addressed these comments through revisions to section 95921. We will treat counterparty information reported to ARB on transfers as confidential; releasing only trade quantities and prices in a manner that will protect the identity of counterparties.
>
> We recognize that many agreements to transfer compliance instruments will not result in meaningful or reportable prices. We will provide guidance on complying with these provisions. We do not agree with the assertion that existing sources can provide the necessary price information. These sources are themselves subject to manipulation.
>
> As the commenter recommends, we do intend to work with the CFTC in combining information on markets regulated by the CFTC or by ARB. However, CFTC has advised us that it does not routinely collect information on markets outside of its direct jurisdiction. We will work with CFTC to prevent seams in market oversight, but it is clear that to do this ARB must collect extensive data on the primary and secondary markets. These coordination issues are program considerations that are not typically placed in regulation and resolved as part of program implementation.

L-15. (multiple comments)
Comment: More Clearly Define the Type of Transaction that is Reported: The proposed regulations require the reporting of all trades of compliance instruments under the California program. The use of the term "trade" may present difficulty to ARB in the acquisition of useful transaction data. Evolution Markets anticipates trading in California compliance instruments to be highly liquid and take place in a variety of venues, using a variety of products. Many of these transactions, such as forward and futures trades and derivatives (i.e. swaps and options) involve physical delivery of compliance instruments at some point in the future—if at all. (EVMKTS)

Comment: ARB should clarify what constitutes a “trade” in compliance instruments, and what it intends to do with the trade information it collects. Under the proposed regulations, ARB will collect detailed information about all “trades” involving compliance instruments. It is not clear what constitutes a “trade.” A straightforward approach would be for ARB to collect information on transactions in which compliance instruments are actually transferred from the account of one registered entity to the account of another. ARB should clarify whether it intends to make this information public and, if so, whether it will be disclosed in an aggregated form or in a form that provides information about specific transactions. Market participants generally see certain transactional information, such as price terms, as highly sensitive. Keeping such information confidential can be important for ensuring an efficient and competitive marketplace. (CERP1)

Comment: Proposed ARB requirements to report each trade will leave the Board with a large volume of trade data that will not properly represent holdings of compliance instruments, as positions will be modified considerably before actual delivery. Evolution Markets recommends ARB gather data only on trades as they go to physical delivery and transfer within the ARB-established registry system. (EVMKTS)

Comment: Section 95921 requires disclosure of transaction information. We understand that certain information disclosure is needed by ARB because the system of accounts maintained by the accounts administrator is the final record of who owns each compliance instrument and additionally, ARB needs to be able to determine if a transaction would result in an account holder exceeding the holding limit.

However, it is not necessary for a market participant to report every transaction for ARB to enforce allowance holding limits. When the trade settles, and allowances are transferred, the registry would be able to ascertain if the buyer has exceeded any holding limit at that time. Therefore, it is not necessary to report a transaction when the trade is executed.

In addition, it does not make sense to require reporting of all transactions for the simple reason that many transactions will be made on a financial basis (i.e. settled with cash and with no ultimate physical delivery of allowances) and in jurisdictions outside of California. ARB would have no ability to enforce reporting of such transactions, resulting in an unfair reporting burden on compliance entities subject to ARB penalties. In addition, ARB would have an incomplete data set on transactions that may not reflect market conditions.

We recommend that Section 95921 be amended to apply only to transfers of allowances, and not the actual transaction itself. (SHELLENERGY)

Comment: Restrict Dissemination of Trade Date to the Public: The data requested by ARB, either the broad trade data interpreted above or a more restrictive interpretation as transfer data only, would include elements considered proprietary by market participants. Specifically, counterparties rarely allow information on the timing, size or price of their trades to be made public based on competitive concerns, and the availability of such information can make market manipulation in some cases easier to achieve. Requirements to submit such data to the regulator, and the potential for this data to be made available to the public, may also inhibit market liquidity.

The proposed rule does not indicate what data, if any, will be made available to the public. Evolution Markets recommends that reported trade data not be made available to the public. As necessary, ARB can market available to the public aggregate trade data. (EVMKTS)

> **Response:** We agree and have made revisions to section 95921 to remove the references to "trades" in the reporting requirements. Instead, we are using the term "transfer request" when referring to a document submitted to the accounts administrator indicating that counterparties have agreed to transfer allowances between their accounts and requesting that the transfer be recorded into the market tracking system. The confidentiality of the transfer is preserved through the provisions treating holding account balances and trade counterparties as confidential. In addition, only transactions that result in a request for transfer between tracking system accounts would be reported. For example, financially settled contracts would not be reported.

L-16. (multiple comments)
Comment: Sections 95920 and 95921 of the proposed rules stipulate that trading counterparties must be disclosed to ARB, and all trades must be reported within three days of the transaction. Evolution Markets fully supports ARB's goal of market transparency, and its ability to monitor the trading market in order to enforce holding limits and ensure environmental compliance. However, Evolution Markets recommends ARB provide further detail in the regulatory language on what types of information will be reported and how the Board may use this information. Without such clarifications, the trade reporting rules may have the unintended consequence of restricting liquidity in trading markets. (EVMKTS)

Comment: Section 95921(b)(6) requires reporting of prices and Section 95921(b)(4) requires reporting of the date and time of a particular transaction. This presents some logistical challenges, as allowances are fungible, and will be held in inventory on an aggregate basis. In addition, there are commercial and competitiveness concerns with reporting prices.

Shell Energy considers the price of individual transactions to be strictly confidential. Knowing a competitor's previous pricing strategies can put that company at significant disadvantage in future commercial negotiations. In addition, the price for any particular transaction is just one component of a deal, and a somewhat misleading figure without an understanding of the risks and obligations of the two transacting parties. Accordingly, Shell Energy does not agree that this data should be required by ARB.

Many IT systems do not capture the time of a transaction, as it is often not pertinent commercial information. Requiring this information to be captured and reported would result in excessive costs on businesses having to comply with these reporting regulations.

We believe that ARB can achieve their objectives to monitor prices by allowing private companies to establish exchanges on which allowances and offsets can be traded. Liquid trading of standard exchange-based products is the best means of achieving price transparency in a traded market.

We recommend that Sections 95921(b)(6) and 95921(b)(4) be deleted. (SHELLENERGY)

> **Response:** ARB addressed these comments through revisions to section 95921. ARB will treat counterparty information reported to ARB on transfers as confidential; releasing only trade quantities and prices in a manner that will protect the identity of counterparties.
>
> ARB recognizes that many agreements to transfer compliance instruments will not result in meaningful or reportable prices. ARB will provide guidance on complying with these provisions. In addition, ARB has removed the requirement to disclose a time for the underlying transaction and settlement, as ARB agreed with the comments below from MSCG2 that this requirement is unnecessary.

L-17. Comment: The date and time of the transaction agreement may be problematic. This information is not necessarily captured and retained by existing reporting systems designed for reporting to the CFTC, and the utility of that datum in preventing market manipulation or fraud seems minimal at best. We recommend that date and time reporting for transactions not be required. (MSCG2)

> **Response:** ARB agrees with part of the comment and has removed the requirement to report the time of a transaction or settlement. ARB has retained the requirement to disclose a date as useful for monitoring the market and evaluating holding limits.

L-18. Comment: CARB should require that all trades (with the possible exception of offset initiation contracts or the first sale of an offset contract) be cleared by federally regulated clearing organizations. (EDF1)

> **Response:** ARB considered this approach, but there are too many uncertainties concerning ARB's authority to regulate all trading venues in this manner.

Registration, Accounts, Market Monitoring and Holding Limits

L-19. Comment: Deadlines should be established for ARB decision-making processes to provide entities with a degree of certainty. Modify section 95830(e) as follows:

> (e) Completion of Registration. Registration is completed when the Executive Officer approves the registration and informs the entity and the accounts

administrator of the approval. <u>The executive officer shall approve or deny a registration application within 30 days of submittal.</u> (CCEEB1)

Response: We did not make this change, as there is already a general requirement that state agencies respond within 30 days when there is an expectation of response, unless specified otherwise in a specific regulation.

L-20. Comment: Clarification is needed in regards to what type of relationship constitutes "beneficial ownership." We recommend that "beneficial ownership" regulations only apply to circumstances where the nominal owner has an arrangement with a third party whereby that third party can direct the owner as to how to act with the allowances acquired on its behalf. (MSCG2)

Response: We agree that "beneficial ownership" needed clarification. We modified the regulation by deleting section 95915 and adding new section 95834 (Disclosure of Beneficial Holding). New section 95834 provides detailed provisions that any entity holding compliance instruments on behalf of another entity disclose the relationship to ARB. New section 95921(e)(1) defines when a beneficial holding relationship exists and when the requirements of 95834 will apply.

Section 95834(a) describes the participants in a beneficial holdings relationship, defining an agent as an entity holding allowances owned by a second entity, which is defined as the principal. Section 95834(b) contains requirements for the disclosure of beneficial holding relationships. This section requires that both agent and principal confirm the existence of a relationship, as well as any transfers made as a result of that relationship. Section 95834(c) contains requirements applying to an entity which may serve as an agent for more than one principal. The requirements are intended to prevent the disclosure of market information between market participants, to prevent opportunities for collusion.

L-21. (multiple comments)
Comment: We do not oppose transaction price reporting to the Regulator. However, it is likely that many types of transactions will not have a specific price. For example, allowances may be transferred to a compliance entity by a service provider as part of a broader-based services arrangement, where there is no price explicitly stated for the allowances. Another example is where a transaction is part of a non-like exchange—say, 1000 California emissions allowances swapped for 100 crude oil futures. The Regulation Order needs to either exempt these types of transactions from price reporting, or develop explicit rules for how a price is to be calculated and reported. (MSCG2)

Comment: We do wish to emphasize that carbon credit transactions are often structured in complex and customized formats by entities that are comparatively thinly capitalized and without traditional access to exchanges and clearinghouses. We thus urge caution when designing market oversight rules regulating over-the-counter transactions between market entities and offset project developers, as in many cases these transactions cannot be replicated or placed on an exchange. Project developers and market entities need the flexibility to be able to enter into highly customized, private transactions that are conducted bilaterally, and these types of transactions do not pose a systemic risk to the functioning of the broader market. (CLIMATEWEDGE)

> **Response:** ARB acknowledges that for some underlying transactions, such as derivatives contracts, the reported price may not convey complete information about the value of the transaction. However, that is not true for all transactions, with standardized contracts trading on exchanges being one example. In addition, ARB sees no evidence that that reporting this information will prevent market participants from entering into more complex transactions as suggested in comment.

L-22. Comment: In section 95832(a)(3) (p. A-53) as well as other sections of the Cap and Trade Regulation, there are references to entities having an “ownership interest” in compliance instruments held in the account of other entities. It is unclear what form of “ownership interest” an entity can have in instruments that exist only as serial numbers in an account belonging to another entity without property rights attaching to the instruments. The references to “ownership interests” should be reconsidered. Although third party “ownership interests” are recognized in section 95832(a)(3), they are not recognized, for example, in section 95857(c)(3) (p. A-72), which allows the Executive Officer to remove instruments from the account of an entity with excess emissions without regard to whether those instruments may in some sense belong to a third party. (SCPPA1)

> **Response:** The references to "ownership interests" refers to any participating entity’s right relative to other private parties to direct the use of allowances or offset compliance instruments held in accounts in the California cap-and-trade program. As clearly stated in Section 95820(c), "[a] compliance instrument issued by the Executive Officer does not constitute property or a property right." The mention of "ownership interests" in Section 95832(a)(3) and elsewhere is not intended to and does not alter this fundamental characteristic of compliance instruments. Further, the terms "Allowance," "ARB Offset Credit," and "Compliance Instrument" are defined in Section 95802. Lastly, the commenter's concern regarding section 95857(c)(3) of the October 2010 Proposed Regulation is moot, as that section has been modified in the regulation approved by the Board.

L-23. Comment: As designed, the Allowance Reserve does not provide true long-term cost containment. At the beginning of the program, the Allowance Reserve will be fully populated with allowances drawn from future compliance periods. Thus, in the early years of the cap-and-trade program, covered entities should be able to meet allowance shortfalls with purchases from the first tier of the Allowance Reserve. However, because the allowances filling the Allowance Reserve are pulled from under the cap, compliance entities will eventually have to use them. Thus, over time, the availability of sufficient reserves in any of the tiers to meet market demand becomes less and less certain. In the long term, the Allowance Reserve will only increase the prices of allowances. At best, the Allowance Reserve can only delay cost increases. CARB should develop a mechanism to populate the Allowance Reserve without reducing the number of allowances available for distribution or auction.

For example, SCE believes CARB should populate the Allowance Reserve by using the proceeds from reserve procurement to purchase emissions offsets. In the alternative, CARB could develop detailed rules stipulating that the Allowance Reserve be replenished with additional compliance instruments once a predetermined number of reserve instruments have been purchased. This would create stronger assurances to regulated entities that the Allowance Reserve will always be available as a source of compliance instruments and can operate as a true long-term cost containment mechanism. (SCE1)

> **Response:** The Reserve does not lead to higher prices over time because the allocation of allowances to the reserve is "backfilled" through an increase in the offset quantitative use limit from four to eight percent. Had the backfill not been added, then the comment that creation of the reserve provides no price relief may have been correct.
>
> ARB considered the purchase of offsets to fund the reserve, but there were too many concerns with ARB intervening in the market by choosing which offsets to purchase, as well as questions over whether ARB could use auction proceeds in this manner. Finally, as explained in the Staff Report, ARB made the policy decision to avoid the institution of a hard price cap. Replenishing the reserve with an unlimited number of compliance instruments would result in a hard price cap.

L-24. Comment: Establish a contingency plan to address potential market failure. Dow is concerned about the rapid decline in allocated allowances. To address potential depletion of the allowance price containment reserve, Dow supports proposals that revenues from the reserve allowance auction be used to refill the reserve with Reducing Emissions from Deforestation and Forest Degradation ("REDD") offset credits.

> **Response:** ARB considered the purchase of offsets to fund the reserve but there were too many concerns with ARB intervening in the market by choosing which offsets to purchase, as well as questions over whether ARB could use auction proceeds in this manner. Finally, as explained in the Staff Report, ARB made the policy decision to avoid the institution of a hard price cap. Replenishing the reserve with an unlimited number of compliance instruments would result in a hard price cap.

L-25. Comment: Strategic reserve created to moderate supply of permits is a very welcome design feature that helps to maintain control over the supply of permits in the event of unforeseen circumstances. A market with variable demand but fixed supply is at risk of price crashes and spikes and the proposed reserve is a sensible suggestion for mitigating these risks. We consider the overall balance of supply and demand in the proposed system is such that it is far more at risk of price crashes than spikes and that it is unlikely that the reserved allowances will be bought. (SANDBAGCC)

Response: No response needed.

L-26. (multiple comments)
Comment: In the event additional and adequate supply of compliance instruments is not immediately available, Dow supports the development and inclusion of a mechanism in the regulation that allows ARB to temporarily suspend the cap-and-trade program and the entities' associated compliance responsibility until cost containment mechanisms are fully developed and functioning in a manner that fulfills their intended purpose. (DOWCHEM1)

Comment: Under higher economic growth, reduced offset supply, and lower than expected efficacy of complementary measures, the allowance reserve could become entirely depleted. Dow agrees that ARB should "establish a formal review process that would include monitoring the allowance market for potential market failures or unsustainably high allowance prices, and develop a contingency plan that could be implemented should the allowance reserve approach low levels." Any additional allowances that may be necessary to fortify or replenish the allowance reserve ought not to come from EITE entities. According to PG&E's written comments, PG&E commissioned Charles River and Associates ("CRA") to analyze a range of scenarios in an effort to understand the circumstances under which the allowances in the reserve might become depleted. CRA analyzed the sufficiency of allowances in the containment reserve under different assumptions about economic activity (including economic growth, demand for electricity, and emissions growth in the non-electric sectors), offset supply, efficacy of complementary measures, and unforeseen events. Under ARB's business as usual forecast for economic activity, (including ARB's assumptions for offsets), CRA concluded that under certain plausible circumstances the allowance reserve reached a critically low level or was depleted entirely. Specifically, under higher economic growth, reduced offset supply, and lower than expected efficacy of complementary measures the allowance reserve was depleted entirely. Dow shares PG&E's concern regarding the potential depletion of the price containment reserve. (DOWCHEM1)

Comment: In a letter to the ARB on May 17, 2007, regarding Proposed Early Actions to Mitigate Climate Change in California, CCEEB stated, "that it is important to view the market mechanisms as a continuum that continually examines the economic impact of the program and allows for realistic turnover of capital investments." CCEEB suggested that, "[ARB] consider recommending additional details surrounding the implementation of the cap-and-trade program in its report so that any market system failure can be properly mitigated with as minimal impact to the California economy as possible. This detail should include identification of the criteria and data that will be needed to determine that there is a working market and the information that needs to be tracked to identify market system failures before they cause significant harm." (CCEEB1)

> **Response:** Board Resolution 10-42 instructed staff to monitor depletion of the reserve, determine the cause, and make recommendations for corrective actions. The Board resolution did not specifically include temporary suspension of the cap-and-trade program. We will be investigating a number of options in responding to this direction from the Board. We will continue to evaluate if such a mechanism is needed, triggers for action, and types of potential responses. In the event of some catastrophic problem, the Executive Officer does have authority to issue emergency regulations to address the issue. Additionally, we will establish a Market Surveillance Committee to monitor the market and provide timely recommendations to the Board on market performance or any potential issues.

L-27. (multiple comments)
Comment: It is imperative that the State monitor leading indicators that reflect the economic health of California. CCEEB recommends that the ARB include provisions in the cap-and-trade regulation to: (1) monitor specific economic indicators, including cap-and-trade market elements, such as, the price in the quarterly auctions, the functioning of secondary markets, adequacy of the Allowance Price Containment Reserve, detection of market manipulation, offset supply, evidence of contract shuffling, progress towards achieving the 2020 target, total cost of the program, jobs in manufacturing, vacancy rates, home sales, volume of trade through ports, GSP, energy prices, and other indicators used by the Department of Finance to monitor the health of California's economy; (2) establish formal reviews of the regulation at least once each compliance period; and (3) develop and implement a more structured process and approach for evaluating the comparative cost-effectiveness of program measures, as well as the relative cost-effectiveness of those measures vis-a-vis the cap-and-trade program and identify any potential problems. (CCEEB1, CCEEB2)

Comment: ARB recognizes in the ISOR that effective market oversight is a necessary component of GHG cap-and-trade compliance programs. The proposed regulation notes that unanticipated effects and results could occur over the life of the program. While ARB proposes periodic reviews, the ARB should also establish a market oversight committee that meets regularly to assess whether the market is functioning as expected. This committee, similar to the one that reviews CAISO markets, should make recommended changes to the program to ARB on a periodic basis and be able to recommend that the Governor suspend the program if the market fails, creating unforeseen and harmful impacts to consumers. (SEMPRA1)

> **Response:** We agree and are establishing a Market Surveillance Committee (MSC) patterned in large part after the MSC created to advise the CAISO. The MSC will consist of a group of academic economists with experience in market monitoring and detection of market manipulation to assess market design and operation.

The MSC will have several important functions. First, it will periodically review the market's structure and operation and provide recommendations for improvement. Second, it will review market events and trends based on analysis and data provided by us. Third, it will convene scheduled public meetings to give market participants the opportunity to raise market issues to the MSC. Finally, the MSC will report any findings or recommendations to the Board as needed.

The Board Resolution 10-42 instructed us to perform monitoring and evaluation functions very similar to those suggested in comments. We will be contracting with an independent market monitoring service. This contractor will also provide a periodic review of how the system is functioning. The Board has also directed staff to continually monitor several program features of concern, such as leakage and depletion of the reserve. The cost-effectiveness assessment requested in the comments is beyond the scope of the current rulemaking effort.

L-28. Comment: CCEEB recommends that an Independent Market Monitor be established with authority to: (1) review bids prior to the running of any auction; (2) provide analysis of the competitiveness of any auction, preferably on an ex-ante basis (e.g. prior to running the auction); and (3) report findings and concerns to the ARB and the California Senate Energy, Utilities and Communications Committee. (CCEEB1)

Response: ARB intends to contract with an independent market monitoring service provider. On September 8, 2011, ARB released a Request for Proposals (RFP) for contract proposals from market monitoring service providers. The RFP proposes market monitoring functions that should address the concerns raised by CCEEB and perform the functions recommended by CCEEB.

L-29. Comment: While utilities have certain actions that they can take to help protect their customers and ratepayers from market fluctuations, they also need the certainty that the market in which they are operating also has such protections in place. As currently drafted, the proposed regulation does not contain sufficient information regarding the administration, operations, or oversight of the proposed auction. While subarticle 10 of the proposed regulation includes information regarding the auction design and the sale of California allowances, including information regarding auction administration and registration, aside from general references to the oversight of the Executive Officer in section 95912(a), there is insufficient information regarding the specific market oversight body or market monitoring entity that will oversee the day-to-day administration of the program. It is imperative that the regulation include specific provisions regarding market design and program oversight within the regulatory language, including potential impacts and interactions with the secondary market. The program should include provisions for testing the efficacy of all auction functions, including bid monitoring and tracking platforms, and registration and tracking of auction participants prior to implementation. The Board should also direct staff to conduct pre-implementation training and workshops, which would include a run-through of all market and auction operations. It is important that California not repeat the mistakes of the past and that this market-based mechanism not be implemented until it has been fully tested and deemed ready. (NCPA1)

> **Response:** ARB has taken steps to address these issues in response to the Resolution 10-42 adopted by the Board on December 16, 2010. ARB has taken steps to contract with an independent market monitoring service to maintain the integrity of the market. ARB is developing a Market Surveillance Committee to provide an ongoing source of expert analysis in market operations.
>
> ARB is also developing a market simulation capability. This activity will provide input to the program testing prior to the first auction. In addition, contract RFPs for auction, reserve sale, registry, and financial services will all have provisions for testing prior to operation.

L-30. Comment: The ISOR notes that "if market manipulation or other illicit activities are detected, ARB will work with the appropriate authorities to initiate enforcement activity and, if necessary, reevaluate regulatory requirements to avoid future incidents." (ISOR, p. II-57) However, the proposed regulation does not address the monitoring mechanisms that will be employed, nor does it identify a market oversight agency, or process by which identified shortcomings will be immediately addressed and corrected. (NCPA1)

> **Response:** We include provisions to prevent gaming or other activities that would compromise the effective functioning of the program. These include auction registration, transaction reporting, and certification requirements, as well as provisions that establish limits on the amount of allowances entities can purchase at auction or hold.
>
> We will be undertaking program measures as part of program implementation to address market manipulation. We will establish a Market Monitor and a Market Surveillance Committee, both of which will serve important roles in overseeing market activity and producing regular publicly available reports. We are also working with both the State Attorney General and the Commodity Futures Trading Commission to ensure all necessary provisions are in place to monitor activity in secondary markets. We will pursue enforcement and strict punishment for those who do not comply with the regulation.

L-31. (multiple comments)
Comment: Effective market oversight is a necessary component of GHG cap-and-trade compliance programs. Further, "ARB will regularly (at a minimum, once every three-year compliance period) evaluate whether the objectives identified by the stature are being achieved." DRA supports this program monitoring, however also believes that ARB should establish a market oversight committee that meets regularly to assess whether the market is functioning as expected. The committee should be comprised of market experts with experience in market monitoring activities and could include members from ARB, the CPUC, the CEC, and CAISO. DRA recommends that this

committee be given the authority to suspend the program or recommend that the Governor suspend the program if allowance prices remain unacceptably high, if the program is not achieving the objectives as defined by AB 32, or if the program results in unforeseen and harmful impacts to consumers. (DRA)

Comment: Program evaluation market monitoring and surveillance provisions should be added. The staff report states that CARB will evaluate the program every three years and make adjustments as necessary. Evaluation of the program periodically is appropriate but there are no specifics as to what portions of the program will be evaluated and what situations would trigger adjustments to the regulation. This creates much regulatory uncertainty and makes it difficult for entities to plan for compliance. LADWP recommends that the ARB include a provision in the regulation related to market monitoring and surveillance and program evaluation. This provision should provide a full assessment of the cap-and-trade program's performance and market operations. It should also clearly define what would trigger possible amendments to the regulation (e.g. price of allowances reach a certain level during a specified time period number of offset credits available drops below a specified level). LADWP recommends that such provisions for program evaluation market monitoring and surveillance be included directly in the regulation and not just in the staff report. (LADWP1)

> **Response:** The monitoring within compliance periods referred to in the Comments refers to achievement of AB 32 environmental goals. ARB is planning extensive market monitoring. In addition, the Executive Officer has the authority to issue temporary emergency regulations to make changes to the existing cap-and-trade regulations that would address any serious issues arising in the market. These could deal with unforeseen operational issues. However, a decision on when to revise a regulation is strictly up to the Board, and cannot be left to an independent committee, staff discretion, or a regulatory provision.

L-32. (multiple comments)
Comment: To ensure GHG reductions are achieved while maintaining the competitiveness of California businesses and the health of the economy, it is critical for CARB to monitor key indicators of not only the GHG reductions that are occurring but also indicators of the health of California's economy. We urge CARB to identify and monitor these key indicators, so that any inadvertent problems that may occur can be corrected before significant damage is done to California economy or environment. (CALCHAMBER1)

Comment: The Board's resolution should provide for a prompt independent market evaluation to test areas of potential market vulnerability, including the role of linkages, offsets, anticipated demand response and the functioning of the auction and price containment reserve and for the staff to return to the Board with proposed program revisions, as warranted. (CCC, MAZOWITA)

Comment: The Air Resources Board should create an independent market monitoring board responsible for monitoring the market and auction on a quarterly basis and recommending corrective action if needed. (BCFSE)

> **Response:** As directed in Board Resolution 10-42, we will contract with an independent entity with appropriate expertise that will monitor and provide public reports on a quarterly basis on the operation of the market, including auctions and reserve sales, and recommend appropriate action. ARB is establishing a Market Surveillance Committee to provide expert advice on monitoring trends and program revisions. We will evaluate the reports from both these groups, along with staff analysis of underlying market supply and demand conditions, in developing recommendations to the Board. These recommendations may include corrective action if all allowances are sold from any tier of the reserve.
>
> Board Resolution 10-42 also directed staff to work with the California Energy Commission, the California Independent System Operator, and others to monitor the cap-and-trade market, including the effect of the cap-and-trade program on the State's energy markets.

L-33. (multiple comments)
Comment: As currently written, adequate allowances could not be held by a compliance entity, such as Shell, to cover their obligations or to mitigate unacceptable price exposure. This problem is exacerbated during the 2nd compliance period when transportation fuels are included under the cap. Because of the large quantity of allowances that entities like Shell must surrender, we must have the flexibility to hold and trade sufficient allowances to meet our compliance obligations and minimize unacceptable risks. Entities that have compliance obligations should be permitted to hold a number of allowances in their registry account equal to at least 3 times their rolling future annual average emissions obligations, to correspond with the 3-year compliance periods. Otherwise, an entity would be prevented from managing its price exposure for the full compliance period. The "rolling" aspect of the proposal is necessary to manage the step change in compliance obligation that occurs between the 1st and 2nd compliance period when transportation and commercial/residential fuels are added to the cap. An estimate of this future obligation could be calculated using data from previously reported years. For the purposes of calculating an entity's holding limit, that entity should be able to include any emissions obligations of its affiliates, and any contractual emission obligations of those entities. An entity should also be able to transfer allowances and offsets freely between its general account and its compliance account. Otherwise, allowances bought by a compliance entity and moved to its compliance account (in order to take advantage of the compliance entity holding limit exemption) would suffer extreme financial loss if prices suddenly fluctuated. (SHELLENERGY)

Comment: The proposed holding limit, which translates to roughly 6 MMT, is far too low for a three-year compliance period for large compliance entities such as SoCal Gas, even with the limited exemption that does not count the allowances in the compliance holding account. It would essentially eliminate banking by those entities. While such holding limits are appropriate for entities without a compliance obligation, the holding limits should be increased for compliance entities. One approach would be to make the holding limit a function of the cumulative Annual Allowance Budgets within the three-year compliance period (e.g., year 2 holding limit based on the sum of year 1 and year 2 allowance budgets) for compliance entities.

Modify section 95920(b)(3) as follows:

Calculation for compliance entities: The holding limit will be calculated and applied within each compliance period using the following formula:

$$\text{Holding Limit} = \underline{\sum_{i=1}^{t}}[0.1*\text{Base} + 0.025*(\text{Annual Allowance Budget}_{\underline{i}} - \text{Base})\underline{]}$$

In which:
"Base" equals 25 million metric tons of CO_2e.
"Annual Allowance Budget$_{\underline{i}}$" is the number of allowances associated with the budget year **i** pursuant to subarticle 6.
"t" equals the current year in the compliance period (1,2, or 3) (SEMPRA1)

Comment: In order to avoid undue restrictions on covered entities ability to meet their compliance obligation, the proposed regulation includes an exemption for covered entities from the holding limit for allowances they place in their compliance accounts up to the amount of their most recent year's verified emissions, or that covered entity's direct obligation. SCE agrees that a Holding Limit is necessary to address concerns about market participants hoarding allowances with the intent to manipulate market prices. However, covered entities also need flexibility to meet their legitimate compliance obligations. The Holding Limit for each covered entity should be proportional in size to its compliance obligation. Moreover, the Proposed Regulation's Holding Limit and exemption fail to address the needs of covered entities such as IOUs that, as a result of electricity deregulation, purchase a large portion of their customer's energy requirements through contracts with non-IOU-owned power plants. Many of these contracts require the IOU to directly provide allowances to counterparties for their compliance needs. This creates significant indirect GHG compliance obligations, where the IOU is responsible for the delivery of allowances but not directly responsible for surrendering these allowances to CARB through its own Compliance Account. SCE supports CARB's intent in creating the Holding Limit exemption, as it allows entities to accumulate compliance instruments to meet their direct obligation without violating the Holding Limit. In the case of IOUs, however, the Holding Limit exemption is based upon verified emissions of only utility-owned generation—its direct obligation—and not the emissions of the counterparties that will be passed allowances from the IOUs original allocation—its indirect obligation. Thus, the Holding Limit exemption alone does not provide a sufficient mechanism to address an IOU's full obligation associated with existing electric utility contracts, and consequently will not adequately provide some covered entities a path to compliance without exceeding their Holding Limits. Under the current Holding Limit, an electric utility may be unable to procure sufficient allowances from a quarterly auction to meet its total (direct and indirect) obligations under existing agreements.

Modify section 95920(b)(3) as follows:

Holding Limit = <u>the higher of</u>

<u>(a) the Proposed Regulation's formula of</u>
<u>0.1 * Base + 0.025 * (Annual Allowance Budget – Base) or</u>
<u>(b) 50 percent of a covered entity's allowance allocation</u>.

SCE believes its suggested holding limit formula balances two objectives. First, it maintains the proposed regulation's holding limit to address potential market manipulation concerns. Second, it allows entities that have obligations under existing contractual agreements (signed prior to the issuance of the proposed regulation) the ability to satisfy those obligations without exceeding the holding limit. In addition, CARB should clarify the limited exemption from the holding limit in section 95920(a)(4)(A) to reflect the proposed regulation's intent that the exemption apply as long as the allowances are transferred to a compliance account by the end of a calendar year.

Modify section 95920(b)(4)(A) as follows:

(4) Limited Exemption from the Holding Limit.

<u>(A) Allowances up to an amount equal to the emissions reported in a positive or qualified positive verification statement covering the previous calendar year shall not count towards a covered entity's or an opt-in covered entity's holding limit provided the covered entity or opt-in covered entity transfers those allowances to its compliance account during a single calendar year.</u> (SCE1)

Comment: SCE requests clarification on the extent to which compliance entities can bank compliance instruments for future use. CARB describes its desire to allow unlimited banking numerous times in the ISOR, and SCE strongly supports this position. However, the holding limit restricts the amount of allowances compliance entities may have in each holding account (initially, around 6 million allowances and 11 million beginning in 2015). If CARB proposes to allow for unlimited banking of allowances, SCE requests that CARB clarify that compliance entities may effectively "bank" allowances in their compliance accounts. Under this interpretation, any excess compliance instruments in a compliance account on any compliance dates (either annually or triennially) would then remain in the account for use in future periods, effectively "rolling over" to these future periods. SCE requests that CARB confirm this analysis of the proposed regulation. Otherwise, as proposed, the "unlimited" banking of allowances would be extremely limited and do little to control costs. (SCE1)

Comment: ARB draft regulations establish a limit on the amount of compliance instruments that may be held by any single or affiliated group of entities. In our experience such holding limits are difficult to effectively enforce and can actually impede the proper functioning of a cap-and-trade program, particularly in the early years of the program. In order to deliver the full benefits of the market for consumers, these draft regulations need to encourage participation not just from covered entities but also from other liquidity providers so as not to discourage legitimate participation by non-emitting investors and entrepreneurs, which would create a risk of reduced liquidity. By identifying carbon offsets as a primary tool for cost containment and placing limits on offsets usage, it is unlikely that a firm could gain such a commanding presence in the offsets market that it could manipulate prices. Should ARB be concerned with market power, it may find existing regulatory programs for trading markets have already addressed this issue. For instance, Derivatives Clearing Organizations (DCOs), as designated by the U.S. Commodity Futures Trading Commission (CFTC), establish "position limits" on traders in specific commodity markets. Under the recently passed Dodd-Frank Act, which reforms derivatives market regulation, the CFTC will likely exercise the authority to set these limits. IETA recommends California rely on the relevant DCOs or the CFTC to set appropriate holdings limits, as both have the expertise and flexibility to adjust position limits as the liquidity of the market fluctuates. (IETA1)

Comment: Portions of the proposed regulation will unnecessarily constrain the market. The advantage of a cap-and-trade program is to allow market pressures to create solutions that best fit business models and consumer behaviors. Due to the small market currently proposed, some limitations are necessary. However, care must be taken to ensure market liquidity. Of particular concern are:

- The holding limit is too low. As currently written, about 70 percent of allowances, for large compliance entities will be locked in compliance accounts. This creates an uneven playing field that favors traders over regulated entities. Compliance entities must be able to hold and trade a larger portion of their allowances to adequately manage their risk throughout the cap-and-trade program.
- CCEEB recommends that the program allow compliance entities to hold sufficient allowances to cover their obligation for the entire compliance period based on a rolling 3-year emissions obligation. This change would free up allowances for the major compliance entities and enable a much more liquid market where an entity could adequately hedge its forward risk without major complications. While there are still allowances locked in compliance accounts in some years, the increase in holding limits makes these limitations much more manageable.
- CCEEB supports the recommendation of the International Emissions Trading Association that suggest that the ARB should be guided by the SEC and existing federal entities (e.g., Derivatives Clearing Organizations as designated by the U.S. Commodity Futures) to set appropriate holdings limits, as both have the expertise and flexibility to adjust holding limits as the liquidity of the market fluctuates on markets to deal with gaming and other concerns.

- CCEEB has concerns with an annual surrender requirement as it doesn't allow facilities to freely adjust their holdings over the compliance period. The annual surrender removes the benefit of a 3-year compliance period. Recognizing that there may be concerns about default risk, the ARB should not penalize entities that are not true default risks. To address this, there should be a financial assurance test that would exempt non-risk compliance entities from a yearly surrender. This change recognizes that all compliance entities have an interest in preventing each other from defaulting.
- Business fluctuations at the end of a compliance period are anticipated. These fluctuations could adversely impact the smooth operation of the market. CCEEB recommends that vintage allowances (i.e. borrowing from current year) be allowed to be used during the true-up period. This will provide a mechanism for the end of compliance truing-up will increase market confidence. (CCEEB1, CCEEB2)

Comment: The Board should remove or significantly increase the proposed holding limit. As currently proposed, the holding limit will severely restrict the ability of companies to trade economically, which will both materially increase costs and reduce liquidity. (CCC, MAZOWITA)

Comment: It is a major concern that the current provisions of the rule on holding limits preclude major compliance entities from trading and optimizing their economic position. Under this provision, the vast majority of allowances for major compliance entities will be locked up in their compliance accounts, unable to be traded. Chevron, as a large supplier of transportation fuels with two refineries and, several oil and gas fields in the state is a major compliance entity. Using basic calculations assuming that we comply with the minimum annual surrender of 30 percent as required in the cap and trade rule, over 70 percent of our allowances are frozen and cannot be traded. This provision inhibits liquidity in the market; limits the ability of entities to trade economically; and disadvantages compliance entities vs. traders which may be an unintended outcome since the trading community may represent a more serious concern for market manipulation. We must be able to trade a larger portion of our allowances to adequately hedge our risk particularly after the first two years of the cap and trade program. Additionally, there are other scenarios such as refinery shut downs, economic slowdowns, etc. that could necessitate the trading of allowances which could be stuck in our compliance account. We propose to increase the holding account limit for compliance entities to two times the average of the previous two year’s reported emissions for compliance entities. This change would free up allowances for the major compliance entities and enable a much more liquid market where we can adequately hedge our forward risk without major complications. While there are still allowances locked in our compliance account in some years, we feel that the increase in holding limits makes these limitations much more manageable. We are proposing an increase in holding limits for compliance entities only, so traders and speculators would not be affected by this change. By increasing the compliance entity holding limits you are creating a much more liquid market where major companies with the most at stake in the cap and trade program can achieve a lower total cost of compliance, and you are reducing overall financial impact on California economy. (CHEVRON1)

Comment: WSPA understands the theoretical concept of imposing holding limits as a way to reduce or eliminate the potential for hoarding of market allowances. However, it should be clear that such limits may reduce liquidity and even inhibit efforts to achieve mandated emission reductions. As written, the proposed regulations appear to limit holdings to a fraction of the amount needed for facilities to ensure compliance. Conversations with ARB staff indicate that the intent was to allow facilities to hold allowances in amounts at least equal to past emissions plus some ability for growth or increased production. However, the language in the proposed rule is inconsistent with the stated objective. We recommend that ARB convene a working group to develop appropriate language governing proposed holding limits. (WSPA1) (WSPA2)

> **Response:** We agree that the language was unclear, and we rewrote the section on calculation of the limited exemption. We discussed the language with a number of stakeholders, and staff believes the revisions to be clear.
>
> In addition to the allowances an entity may have in its Holding account under the holding limit, covered entities may accumulate allowances in their compliance accounts up to an amount given by the limited exemption contained in section 95920(b)(4). The limited exemption increases each year to allow covered entities to accumulate for compliance.
>
> However, we agree that the language governing calculation of the limited exemption was unclear. We replaced the language on the limited exemption with new section 95920(d)(2). This text explains the date and manner in which the amount of the limited exemption increases each year. It also explains how the limited exemption is reduced following the triennial surrender. At that point, the entity is in the first year of a compliance period, yet the limited exemption will equal two years' worth of emissions. It then increases through the compliance period. Thus, at times, the limited exemption is less than the three-year average recommended in the comment, but during the year when a triennial obligation is due, the exemption will be higher than the three-year average.
>
> We do not agree with the assessment that covered entities will lose money due to the restriction preventing allowances from being removed from the compliance account. First, entities may actively trade allowances held in their holding accounts. In 2013 the holding limit is about 6 million MT, while in 2015 it increases to over 11 million MT. We are skeptical that covered entities would need the ability to sell greater numbers of allowances in response to temporary price changes.
>
> Holding limits are needed for covered entities because, absent a holding limit, any market participant would have the ability to accumulate sufficient instruments to exercise market power. We constructed the holding limit to balance the

covered entity's need to accumulate with the potential for market power. Once the covered entity has accumulated instruments to cover its compliance needs, the holding limit treats it the same as any other market participant.

L-34. Comment: Pursuant to the discussion on section 95857(d)(2)(A) which requires the Executive Officer to transfer penalty allowances to the highest-priced tier of the Allowance Price Containment Reserve Account, transferring allowances into the Price Containment Reserve Account will remove those allowances from the first market the auction and may inadvertently tighten the cap. Sections 95831 and 95857(d)(2)(A) need to be modified to correct this error.

Modify section 95831 as follows:

Section 95831(c) Accounts under the Control of the Executive Officer. The accounts administrator will create and maintain the following accounts under the control of the Executive Officer:

(1) A holding account to be known as the Allocation Holding Account into which the serial numbers of compliance instruments will be registered when the compliance instruments are created;

(2) A holding account known as the Auction Holding Account into which allowances are transferred to be sold at auction from:

(A) the Allocation Holding Account;

(B) the holding accounts of those entities for which allowances are being auctioned on consignment pursuant to 95831(b)(1)(B); and

(C) the limited use holding accounts of those entities consigning allowances to auction pursuant to subarticle 8.

<u>(D) Into which the serial numbers of allowances submitted to fulfill an entity's excess emissions obligation pursuant to section 95857(c) will be transferred.</u>

Modify section 95831(c)(4) as follows:

A holding account to be known as the Allowance Price Containment Reserve Account:

(A) Into which the serial numbers of allowances allocated by ARB for auction that remain unsold at auction will be transferred.

(B) Into which the serial numbers of allowances directly allocated to the Allowance Price Containment Reserve under subarticle 8 will be transferred.

(C) Into which the serial numbers of allowances submitted to fulfill an entity's excess emissions obligation pursuant to section 95857(c) will be transferred.

(D) From which the Executive Officer will withdraw allowances to sell to covered entities pursuant to section 95913. (SEMPRA1)

Response: Due to stakeholder concerns related to the potential "tightening" of the market due to the transfer of allowances used to fulfill an entity's "excess emissions," we modified the regulation to return three-fourths of the allowances into the auction account and not the price containment reserve.

L-35. Comment: Holding limits are best held in reserve as a tool to be deployed if actual market functioning identifies a problem for which a holding limits is the clear solution, rather than being made part of the "Day 1" market rules. (MSCG2)

Response: No response necessary.

L-36. Comment: Some of the mechanisms in the proposed regulation will serve to constrain the market liquidity of allowances. For example, CARB should relax the holding limit for allowances. Entities with large compliance obligations will seek to mitigate the uncertainty of market fluctuations by accruing a more significant fraction of their anticipated compliance obligation during the course of the compliance period. Current holding limits will overly restrict this cost control tool for large emitters. (APC)

Response: Except for the largest covered entities, the holding limit will have very little effect on the ability to accumulate allowances in advance of actual emissions. To give larger entities more flexibility, staff has revised the calculation procedure for the limited exemption from the holding limit (section 95920(d)) to allow covered entities to accumulate allowances ahead of their anticipated emissions.

L-37. Comment: BP strongly recommends the removal of holding limits on compliance entities and instead recommends the imposition of plans/rules to monitor for potential market power. Many of the regulation's market and trading rules combine to create serious issues around allowance availability, liquidity and market confidence. Holding limits should not apply to compliance entities, there should be no annual surrender obligation for most market participants, and the use of allowance vintages from the year in which allowance surrender is made should be permitted. Non-compliance entities should not be allowed to carry allowances across a compliance period. (BP)

Response: The regulation does have rules to prevent the exercise of market power in section 95921. We have also developed plans to monitor for the exercise of market power, through the creation of a Market Surveillance Committee of academic experts and contracting with an independent market monitoring service. However, we do not agree that these are sufficient to prevent the exercise of market power.

We revised the regulation to ensure that covered entities may accumulate allowances as needed, even in advance of their actual emissions. At the same time, holding limits are needed for covered entities because absent a holding limit any market participant would have the ability to accumulate sufficient instruments to exercise market power. We constructed the holding limit to balance the covered entity's need to accumulate instruments with the potential for market power. Once the covered entity has accumulated instruments to cover its compliance needs, the holding limit treats it the same as any other market participant.

The annual surrender provision was added out of concern that the three-year compliance period may result in large defaults on compliance obligations, hindering California's ability to meet the requirements of AB 32. The requirement for two partial payments of an emissions obligation would allow staff to identify potential defaults. We do not believe the requirement to be burdensome or to reduce the flexibility created by the three-year compliance period. If an entity's emissions are constant for a three-year period, then the total payment should be less than 25 percent of the entity's triennial obligation. Any prudent firm would accumulate that amount. The requirement would certainly not prevent the entity from undertaking speculative sales or timing its purchases to take advantage of market prices to minimize costs.

The restriction on the use of vintages of instruments for compliance follows a policy decision to prevent the borrowing of future vintages for current compliance. Borrowing would reduce the carbon price signal, leading to a reduction in direct emissions. Borrowing increases the risk of future noncompliance, due to both the greater current period emissions and reduced future supply. These factors could actually increase the amount of borrowing over time.

Non-covered entities are allowed to participate in the market and to bank compliance instruments across compliance periods. Preventing either of these could reduce the liquidity of the market. Financial participants in markets are generally considered to provide an essential service by ensuring that current market prices reflect available information on future price trends. We have rules in place to prevent these entities from exercising market power, including a holding limit without the limited exemption and an auction purchase limit that is much lower than the limit for covered entities (4 percent versus 15 percent.)

L-38. Comment: The draft proposes holding limits to all participants based on the overall market cap (section 95920(b)). The holding limit is roughly 5.5 MT CO_2e in the first compliance period and 11.5 MT CO_2e in the second compliance period for most obligated parties. Any regulations that dictate when a qualifying market participant must buy, sell or hold allowances (e.g. holding limits) will reduce the efficiency of the allowance market resulting in higher compliance costs and decreased ability of firms to manage risk. CARB should remove all holding limits for all qualifying market participants. (CONOCO)

> **Response:** We believe the holding limits are necessary to deal with the specific features of a cap-and-trade market. Price-responsive supply is a characteristic of most competitive markets. However, between the fixed cap and the quantitative use limit on offsets, the supply of compliance instruments is fixed. The price responsiveness of the demand for allowances, which depends on the ability to make direct emissions reductions, is not known but not expected to be very high. We have established the cap using procedures to avoid over-allocation, so there should not be a large supply of allowances above compliance needs. These factors combined create a market which cannot rapidly adjust to meet changes in demand conditions. Consequently, staff believes that any concentration of holdings in this market could be a source of market power and must be avoided.

L-39. (multiple comments)
Comment: The proposed regulation includes a holding limit that would dramatically limit the ability of large affiliated generators, such as Calpine, to utilize the important flexibility mechanisms otherwise provided, including unlimited banking of allowances and three-year compliance periods. While the Proposed Regulation would provide a limited exemption from this holding limit for allowances deposited in a covered entity's compliance account up to its most recent year's reported emissions, this would effectively nullify the flexibility afforded by limiting the annual compliance obligation to only 30 percent of the previous year's emissions. See 17 C.C.R. section 95855(b). In other words, covered entities would need to transfer 100 percent of their annual compliance obligation to their compliance accounts each year to avoid exceeding the holding limit. This would unfairly deny the largest generators within the State with the same flexibility afforded to other generators and would therefore place the largest generators at a competitive disadvantage. Further, the holding limit would severely restrict the ability of the largest generators within the State to bank allowances for use at a later time. This could forego the important early reductions to be gained by allowing unlimited banking of allowances. Although Calpine understands the importance of assuring that no one entity controls the allowance market or hoards allowances, Calpine is strongly opposed to the Proposed Regulation's holding limit, which it understands will equate to only approximately 6.02 million metric tons CO_2e for the first year of the program.

At the very least, Calpine believes that the holding limit must at least be equal to the sum of the amount derived through application of the formula appearing at subsection 95920(b)(3) (e.g., 6.02 million metric tons CO_2e during 2012), plus 70 percent of a covered entity's emissions reported during the preceding calendar year, plus all banked allowances from prior vintages. Modify section 95920 as follows:

> (A) General Prohibitions on Trading.
> (B) Holding Limit.

(1) The holding limit is the maximum number of California GHG allowances that may be held by an entity or group of associated entities registered pursuant to section 95830.

(2) The holding limit will apply to each entity with a holding account.

(3) Calculation The holding limit will be calculated and applied within each calendar year using the following formula:
Holding Limit= 0.1*Base+ 0.025*(Annual Allowance Budget - Base) + 0.7(GHG Emissions) + Banked Allowances

In which:

"Base" equals 25 million metric tons of CO_2e.

"Annual Allowance Budget" is the number of allowances associated with the current budget year pursuant to subarticle 6.

"GHG Emissions” is equivalent to the positive or qualified positive GHG emissions reported by a covered entity or group of associated entities form the previous data year.

"Banked Allowances” is all allowances from a prior vintage year held by a covered entity or group of associated entities. (CALPINE1, CALPINE2)

Comment: Section 95920(b)(3) (p. A-105) sets out the method for calculating the holding limit in each year. There does not seem to be sufficient justification in the ISOR for the manner in which the holding limit is calculated. The ISOR refers to the holding limit proposed by J. Harris in a paper prepared for the Western Climate Initiative. However, the analysis in that paper was unsatisfactory. The analysis relied heavily on controls for markets for agricultural products without explaining why agricultural products markets provide a good model for carbon markets. Additionally, there does not seem to be sufficient justification in the ISOR for the level of the holding limit that would apply to covered entities that will need to accumulate allowances to meet their compliance obligation. The holding limit under section 95920(b)(3) would be six million metric tons in 2012, declining over time as annual allowance budgets decline. Although that holding limit might be appropriate for opt-in entities under section 95813 (p. A-43) or voluntarily associated entities under section 95814 (p. A-44), it is too low for very large covered entities. Some covered entities, including one of the SCPPA members, have annual emissions that are more than twice six million metric tons per year. The holding limit would preclude such large covered entities from banking a significant portion of allowances they would need, while smaller covered entities would be allowed to bank a multiple of their annual emissions. Restricting banking by large covered entities by an overly tight holding limit would conflict with the policy establishing banking without restriction as a key cost-containment mechanism. Unlimited banking allows covered entities to manage their acquisition and accumulation of allowances to control compliance costs. Additionally, unlimited banking provides an incentive for covered entities to make early reductions by permitting the early accumulation of allowances in excess of a current compliance obligation to avoid higher future allowance prices. The tight section 95920(b)(3) limit on banking by large covered entities would reduce the efficacy of that incentive. Section 95920(b)(4) (p. A-105) provides for a "limited exemption" from the holding limit for allowances that are held in a covered entity's compliance account that would be approximately equal to the compliance obligation that the entity had accumulated during a compliance period, but for a large entity the "limited exemption" would not provide meaningful relief. A large entity that had annual emissions that were twice the holding limit would be permitted to bank less than 20 percent of its total compliance obligation for a triennial period. Prudent banking of allowances in early years of the program by covered entities should not be discouraged. The resolution that the Board will consider on December 16 should permit the staff to consider alternatives to the holding limit specified in section 95920(b)(3) as a change to the Cap and Trade Regulation that will be considered during the "15-day" revision process. The change should permit large covered entities to bank more allowances than under the currently drafted provisions. (SCPPA1)

Comment: SCPPA recommends that the holding limit for an entity should be the higher of the currently proposed limit or twice the entity's most recent annual emissions burden. The limited exemption from the holding limit should be clarified and calculation of the exemption should take into account the fact that the verification statement for each year's emissions will not be available until late the following year. Holding limit should be adjusted to accommodate large covered entities: The holding limit and the exemption would not allow a large covered entity to bank many allowances beyond its compliance obligation. This is too restrictive, given that banking is an important market stabilization and cost containment measure. To give large covered entities more flexibility and to retain the flexibility already afforded to smaller entities, the holding limit for each entity should be set at the higher of: the amount calculated using the formula in section 95920(b)(3); or twice the sum of the emissions reported in the entity's most recent set of verified emissions reports. (Note that a utility may have more than one emissions report and verification statement, as each generating facility and imported electricity must be reported and verified separately.). Market participants that are not covered entities, such as voluntarily associated entities, will not have an emissions burden, so the applicable holding limit will be the amount calculated using the existing formula in section 95920(b)(3) (the "Base Limit" in the wording proposed below). Modify section 95920(b)(3) as follows:

> (b)(3) *Holding limit =* <u>The Base Limit or the Emissions Burden Limit, whichever is higher</u> ~~0.1*Base + 0.025*(Annual Allowance Budget– Base)~~

In which:

"<u>Base Limit" = 0.1*Base + 0.025*(Annual Allowance Budget – Base)</u>

“Base” equals 25 million metric tons of CO_2e.

“Annual Allowance Budget” is the number of allowances associated with the current budget year pursuant to subarticle 6.

“Emissions Burden Limit” means twice the sum of the entity’s verified emissions in the most recent year for which verification statements have been submitted. (SCPPA3)\

Comment: The limits on holding of compliance instruments should be removed. If holding limits are established they should be set at a level that is greater than an entity’s annual emission obligation. Section 95920(b) limits the number of allowances a regulated entity can hold in any given year. There are already existing laws to prohibit unfair competition. Further, other provisions of the regulation, including participation by non-covered entities, disclosure of auction and transaction information, periodic distribution of allowances, including through an auction mechanism, and annual surrender of allowances will together prevent hoarding of compliance instruments. For this reason, WPTF opposes establishment of holding limits. Neither the EU ETS nor RGGI have established holding limits on market participants and to our knowledge market manipulation problems have not arisen in those programs. We therefore recommend that holding limits be eliminated. If holding limits are applied, they must be set at a level that enables larger participants to manage their compliance during a compliance interval and for future compliance intervals. As currently formulated, the holding limit would severely restrict the compliance flexibility for large entities, because it could prevent holding of an amount of allowances in active holding accounts greater than 70 percent of the previous year’s emissions (since 30 percent of allowances must be retired annually). Instead, the PRO should tie each entity’s holding limit to the level of the previous year emissions and at a percentage greater than 100 percent. (WPTF)

Response: We agree with the concern that the existing language on the holding limit and limited exemption does not clearly indicate that the covered entities will have the capacity to accumulate allowances to meet their obligation, including some ability to accumulate in advance of their actual emissions. Staff revised the text and added completely new language covering the limited exemption from the holding limit that is available to covered entities (section 95920(d).) Staff believes the new text clearly explains how the limited exemption is calculated and provides covered entities with sufficient flexibility to minimize their costs of meeting their obligations.

We believe that changes made to the regulation render incorrect the calculations offered in the comments. For example, in the first compliance period, entities may hold around 6 million MT of allowances in their holding account. Since the first compliance period now consists of only 2013 and 2014, an entity emitting 12 million MT per year could keep 25 percent of its first-period compliance obligation in its holding account. It does not have to transfer 100 percent to its compliance account, as the comments assert. In the second period, the holding limit is about 11.5 million MT, so an entity emitting 12 million MT per year could keep about one-third of its triennial obligation in its holding account. Staff believes this is sufficient for the entity to take advantage of the flexibility of three-year compliance periods while balancing flexibility against the need to limit the exercise of market power. The entity would retain sufficient flexibility to time purchases or sales of allowances based on changes in market prices, and thus would not be at a competitive disadvantage compared with smaller emitters. Therefore, staff sees no reason to implement the change to the holding limit proposed in the comments.

We disagree with two assertions made by WPTF. First, provisions of the regulation other than the holding limit do not prevent entities from accumulating sufficient allowances to create market power. Those rules do promote greater knowledge among market participants of who is accumulating allowances, and staff does expect that this will help market participants respond to the threat of market power. Second, both RGGI and the EU ETS have a more price-responsive supply of instruments than does the California program, stemming from greater use of offsets and the creation of supply of allowances under their respective caps that creates a large cushion at the beginning of their programs.

L-40. Comment: Section 95914(f)(1) (p. A-101) states that the total number of compliance instruments held by a group of entities with a corporate association must be less than the holding limit. However, section 95920(b)(1) (p. A-105) provides that the holding limit applies to California GHG allowances rather than to compliance instruments, which includes offsets. Section 95914(f)(1) should be revised to be consistent with section 95920(b)(1) so that it applies to the total number of allowances rather than compliance instruments that are held by a group of entities with a corporate association, thereby precluding the limit from applying to offsets. Section 95914(f)(1) should also be clarified to provide that the holding limit does not apply to allowances in limited use holding accounts and to provide that the section 95920(b)(4) (p.A-105) “limited exemption” for allowances that are in an entity’s compliance account applies to each entity in the group. If the holding limit stays the same regardless of the number of entities in the group or the size of their compliance obligations, this should be made clear by deleting the reference to the holding limit “of the group of associated entities.” Having a single holding limit for all SCPPA members together, if they are not exempted from corporate associations as requested in section IX.I, would be very restrictive. A higher limit (for example based on the sum of the group members’ compliance obligations) should be considered. Modify section 95914(f)(1) as follows:

> The total number of ~~compliance instruments~~<u>California GHG Allowances</u> held <u>in holding accounts and compliance accounts (subject to each entity’s holding limit exemption)</u> by a group of entities with a disclosable corporate association must sum to less than the holding limit ~~of the group of associated entities~~ pursuant to section 59520(b). (SCPPA1)

Response: We agree with the need to correct the reference to compliance instruments as part of the calculation of the holding limit, which was originally part of section 95914(f). We made the correction, which is now part of section 95920(a). We agree with the need to exempt allowances in limited-use holding accounts from the holding limit. This correction is now section 95920(b)(2).

We disagree with the comment that clarification is needed that the limited exemption applies to the facility not a corporate association. Entities qualify for the exemption when they transfer allowances into their compliance account. Then the allowances can only be used for that entity's compliance, so there is no way they can be construed as belonging to the corporate association. The holding limit, which applies to allowances in holding accounts, is shared across members of the association.

We revised the criteria in section 95834 governing when entities have a direct or indirect corporate association, which would trigger a joint application of the holding limit to members of the association. We understand that the entities referred to in the comment would not be part of an association under the new criteria. Therefore, we do not see a need for the revision to the holding limit calculation recommended in the comment.

L-41. Comment: Section 95920(b)(2) (p. A-105) states that the holding limit will apply to each entity with a holding account. It is unclear from this provision whether the holding limit will be applied across all types of accounts (holding, compliance, and limited use holding accounts), or just holding accounts. Mr. R. Olsson, in a teleconference with SCPPA members on November 19, 2010, stated that the holding limit is intended to apply to allowances held in holding accounts and compliance accounts (subject to the "limited exemption" under section 95920(b)(4) (p. A-105) for allowances held in compliance account), but that the holding limit is not intended to apply to limited use holding accounts. For clarity, modify section 95920(b)(2) as follows:

The holding limit will apply to <u>the California GHG allowances in</u> each entity<u>'s</u> ~~with a~~ holding account <u>and compliance account (subject to the Limited Exemption in section 95920(b)(4))</u>. (SCPPA1)

Response: We agree with the need to exempt limited use holding accounts from the holding limit calculation, and the corrected text is new section 95920(b)(2).

L-42. Comment: The holding limit should only apply to California GHG allowances, or MJRPs should be exempted from the holding limit requirements. The proposed regulation provides that the holding limit applies to "compliance instruments," which includes offsets. If the holding limit were to apply to both California allowances as well as allowances from other jurisdictions, this restriction could be especially problematic for an MJRP operating in multiple linked jurisdictions. PacifiCorp therefore urges ARB to amend the proposed regulation to apply the holding limit to only California allowances, such that a regulated entity could exceed the holding limit as long as its California allowances did not exceed the holding limit. Alternatively, PacifiCorp requests a limited exemption from the holding limit for MJRPs to ensure they can acquire sufficient allowances to meet their compliance obligations in all of the jurisdictions within which the MJRP operates. (PACIFICOR1)

Response: We agree with the need to correct the reference to compliance instruments as part of the calculation of the holding limit, which was originally part of section 95914(f). Staff made the correction, which is now part of section 95920(a).

If California links to other jurisdictions or other cap-and-trade programs, there will be another regulation that creates the link. That linking regulation will address the calculation of the holding limits for the linked programs.

L-43. Comment: Limited exemption from holding limit needs clarification. Section 95920(b)(4) sets out the limited exemption from the holding limit for allowances held in a covered entity's compliance account. This exemption should be retained, as it is crucial to allow for the accumulation of allowances for surrender at the end of the compliance period. However, the drafting of the exemption provision should be clarified. According to section 95920(b)(4)(B) as written, in 2014 the holding limit exemption for an entity would be that entity's 2011 emissions plus its 2012 emissions plus its 2013 emissions. Emissions from 2011are included in each year, given the language in sections 95920(b)(4)(A) and (C). The first compliance period's emissions are deducted from the exemption at the end of 2015 and the second compliance period's emissions are deducted at the end of 2018, as apparently required by section 95920(b)(4)(C). SCPPA seeks staff confirmation that the limited exemption is intended to operate this way. The calculation of the exemption should take into account the fact that the verification statement for each year's emissions will not be available until late the following year. Under section 95920(b)(4)(A), the exemption is based on emissions reported in a verification statement covering the previous calendar year. This is problematic because an electric power entity's verification statement for a year is not due until October 1 of the following year. How will the exemption be calculated prior to that date? Furthermore, section 95920(b)(4) as currently drafted assumes that there will be only one verification statement per entity, but an entity may have more than one verification statement each year, if it operates more than one facility. The clearest and simplest way to draft the limited exemption provision may be to state how the exemption is calculated for each year 2012 through 2020, year by year, rather than using general provisions. (SCPPA3)

Response: We agree with the concern that the existing language on the holding limit and limited exemption does not clearly indicate that the covered entities will have the capacity to accumulate allowances to meet their obligation, including some ability to accumulate in advance of their actual emissions. We revised the text and added completely new language covering the limited exemption from the holding limit that is available to covered entities (section 95920(d).) We believe the new text clearly explains how the limited exemption is calculated and provides covered entities with sufficient flexibility to minimize their costs of meeting their obligations.

L-44. Comment: PG&E supports a holding limit for unregulated entities. However, PG&E believes a holding limit is not necessary for regulated utilities. Utilities do not have any incentives to boost allowance prices because they have cost-based rates for service. In addition, utilities face various requirements to hedge against volatile commodity prices, which are likely to conflict with the holding limit. PG&E, by virtue of its electricity and natural gas services, has a greater need for allowances than perhaps any other single entity. A one-size-fits-all holding limit, if designed to accommodate PG&E's need, could be quite high. With that in mind, PG&E believes an exemption for regulated utilities is an appropriate policy choice. Although PG&E has offered specific language, PG&E is open to alternatives for setting the holding limit and counting toward it in a way that enables a regulated utility to implement an orderly and gradual purchase of allowances over time and to effectively manage the volatility in allowance prices. Modify section 95920(b)(2) as follows:

(b)(2) <u>No holding limit shall be applied to the holdings of a publicly owned utility operating under a plan approved by the governing board of the utility. No holding limit shall be applied to the holdings of an investor-owned utility operating under a plan approved by the California Public Utilities Commission.</u> (PGE1)

Response: We disagree with the comment, since the holding limit and limited exemption are large enough for the utilities to meet their direct emissions obligations. In addition, we modified the regulation to exempt the allowances utilities hold in limited-use holding accounts from inclusion in the holding limit calculation. Utilities have also asked for latitude under the holding limit to accumulate emission allowances for eventual transfer to generators with whom they have long-term contracts. However, we believe that the rules governing beneficial holdings added to new section 95834 are sufficient to handle these instances without revising the holding limit.

L-45. Comment: The holding limit conflicts with the cost containment unlimited banking provision and should better accommodate the needs of electric distribution utilities. The draft regulation currently proposes a holding limit formula that equals a fixed six MMT limitation on the holding of emission allowances by any entity or group of associated entities. It also includes a limited exemption for allowances that are transferred into an entity's compliance account equivalent to its annual emissions accumulating annually over the compliance period. The holding limit provision runs contrary to the overall cost containment strategy of "unlimited" banking of emission allowances. The currently proposed holding limit may work well for small covered entities but is unnecessarily restrictive for larger entities. If a holding limit is applied to electric distribution utilities the LADWP recommends that the limited exemption be retained for allowances placed in the compliance account. Additionally the electric distribution utility should be given the option of either the six million metric ton holding limit or a holding limit equivalent to no less than an entity's previous two years reported emissions associated with serving retail electric load. This would provide electric distribution utilities with much needed flexibility to purchase and bank allowances as needed at auction while also providing closer alignment to a large electric distribution utility's actual compliance obligation. Additionally the "group of associated entities" should exclude electric distribution utilities in so far as many electric distribution companies jointly own or have entitlement shares in the same electric generation facilities. (LADWP1)

> **Response:** We have used the term “unlimited” to refer to the length of time compliance instruments may be held before they are used, not to any ability to hold an unlimited number. Regarding the application of corporate association requirements to utilities, we believe that revisions to the criteria in section 95833 should prevent the utilities referred to in the comment from being subject to joint holding limits. We believe the holding limit is adequate to allow utilities to meet their direct emissions obligations. Utilities have also asked for latitude under the holding limit to accumulate for eventual transfer to generators with whom they have long-term contracts. However, we believe that the rules governing beneficial holdings added to new section 95834 are sufficient to handle these instances without revising the holding limit.

L-46. (multiple comments)
Comment: The Executive Officer's authority to limit or prohibit transfers from holding accounts should be modified. Section 95831 sets up account types for the cap and trade structure, and includes language in (b)(2)(B) that indicates that the holding account of any entity may be restricted by the Executive Officer to limit or prohibit transfers in and out of the holding account. SMUD would appreciate some clarification here of how or when the Executive Officer may act to limit an entity’s holding account. Presumably, such action should only be taken for cause, but there are no causes or problems cited in the regulation that would act to trigger the Executive Officer’s authority in this regard. Failure to indicate when the Executive Office may so act adds to risk for market participants. (SMUD1)

Comment: Section 95831(b)(2) (p. A-50) provides that the Executive Officer may impose various restrictions on an entity’s holding account. Such restrictions may have negative effects on the ability of the entity to meet its compliance obligation and may cause the entity to default under contracts for allowance transactions with third parties. While it may be appropriate for the Executive Officer to have the power to impose such restrictions, the Executive Officer should only be able to exercise that power in specific circumstances, for example, when the entity has committed an offense or the Executive Officer believes on reasonable grounds that the entity is about to commit an offense. Section 95831(b)(2) should specify these circumstances. Furthermore, in the interest of procedural fairness, the Executive Officer should be required to notify the entity of the intended restrictions, their expected duration, and the reasons for imposing them, before any restrictions are placed on the entity’s account. Lastly, sections 95920(c) (p. A-106-107) and 96011 (p. A-179-180) as well as section 95831(b)(2) allow the Executive Officer to impose restrictions on an entity’s holding account. Sections

95831(b), 95920(c), and 96011 should be coordinated with cross-references and perhaps even combined. (SCPPA1)

> **Response:** We agree with the need to consolidate multiple references to account restrictions, and modified section 95831. In addition, the original sections 95831(b) and 95920(c) were moved to new section 95921(f), to consolidate the text which deals with account restrictions that may be imposed for rule violations.
>
> Section 95921(f) makes clear that the restrictions would be imposed for rule violations. We see no need to add the notification procedure suggested by the comment because ARB's existing enforcement process already involves notification prior to resolution of violations.
>
> Section 96011 was kept separate to make clear the authority of the Executive Officer.

L-47. Comment: Regarding Specific Account Designation for Disposition of Allocated Allowances, modify section 95870 (c)(1) as follows:

> The Executive Officer will place an annual individual allocation in the <u>limited use</u> holding account or <u>compliance account, as appropriate</u>, of each eligible distribution utility on or before January 15 of each calendar year from 2012-2020 pursuant to section 95892. (NCPA1)

> **Response:** We agree with the approach behind the suggested language. However, the language was added to section 95892(b), which contains the details of the transfers to utility accounts. This section also explains how transfers to a Joint Power Agency account would be handled.
>
> Original section 95870(c) was modified and moved to section 95870(d). New section 95870(c) was added to include new language as directed in Resolution 10-42 to specify how many allowances will be set aside for Voluntary Renewable Electricity reductions.

L-48. (multiple comments)
Comment: ARB needs to clarify the provisions governing holdings for associated companies. It is unclear how the regulations on individual companies may affect joint ventures or other corporate entities. In addition some facilities must be able to hold allowances for up to three years due to the nature of their manufacturing or industrial processes. We recommend that ARB convene a working group to develop appropriate language governing holdings. (WSPA1, WSPA2)

Comment: The proposed regulation would place a holding limit on the number of allowances that can be held by any one entity (section 95920). These limits have implications for entities with complex ownership interests, such as joint powers agencies (JPAs) under section 95914, which requires the disclosure of direct and indirect

"Corporate Associations." For purposes of holding allowances for program compliance, the proposed regulation should clarify that the holdings of a JPA are not counted when calculating the holding limit of any of its individual members, and likewise, allowances held by any of the individual members of a JPA shall not be included in calculating the holding limit of the JPA. As with all aspects of auction design, the implementation of the holding limit must be narrowly tailored as not to limit the ability of Covered Entities to cost-effectively manage their compliance burden. (NCPA1)

Comment: SCPPA is a joint powers agency, constituted in accordance with sections 6500-6536 of the California Government Code. The consequences of having a corporate association with other entities are significant. Under sections 95914(e) and (f) (pp. A-100-102), the purchase and holding limits would be applied to all entities with corporate associations with each other as if that group were one entity with no increase in the limits to reflect the size of the group. This may be problematic for SCPPA members, as some members will have high compliance obligations. For example, if the SCPPA members do not take advantage of the section 95892(b)(2) (p. A-83) option to have the Executive Director place their allocated allowances in their compliance accounts and, as a result, have to buy allowances through the auction, they could need to buy more than ten percent of the allowances offered in a given auction, exceeding the section 95911(c)(2) (p. A-88) purchase limit (assuming that section 95911(c)(2) is not revised to exempt POUs as well as IOUs from the purchase limit as SCPPA recommended in the previous comment. The section 95920(b)(3) (p. A-105) holding limit of six million metric tons in 2012 and declining thereafter could also be a problem for SCPPA members, given that one member alone has annual emissions that are more than twice that level. Given the particular circumstances of POUs, with their high compliance burdens and close regulation by their governing boards, groupings of POUs in Joint Powers Agencies should be excluded from being "corporate associations" under section 95914(a). This can be achieved by adding a new section 95914(a)(1)(3) as follows:

(1) <u>Membership of a joint powers agency established in accordance with sections 6500-6536 of the California Government Code will not constitute a direct or indirect corporate association between members of the same joint powers agency.</u> (SCPPA1)

Response: We agree with the need for clarification and made significant changes to section 95833. First, the level of control that would result in a group of entities being declared a corporate association is raised from 20 percent to 50 percent. This ensures that we only capture instances where one entity controls another. For an entity with a level of control over another entity of between 20 and 50 percent, staff created a requirement to disclose the relationship as an aid to market monitoring. Second, we added an exemption from the corporate association rules for entities that are affiliated but are subject to state or federal affiliate compliance rules. This text was added as new section 95833(a)(4), to cover entities where there is a level of control but government regulations prevent joint market activities. These changes should ensure that the issue raised in the comment does not occur.

L-49. (multiple comments)
Comment: In order to incentivize innovation, CLFP urges CARB to ensure that credits be transferrable between facilities owned by the same entity. Transferable credits will succeed in giving producers the incentive to increase innovation across facility portfolios, especially where such upgrades make the most sense for the business. For instance, it may fit into a company's overall procurement strategy to upgrade a system at a plant that emits less than 25,000 tons CO_2e per year rather than at one which must buy allocations. The reward for those reductions should be reflected in the company's overall participation in the cap and trade program. (CALFP1)

Comment: CLFP recommends allowing the transfer of compliance instruments/credits between facilities owned by the same entity thereby providing incentives to food processors to increase innovation across facility portfolios. (CALFP1)

> **Response:** Under existing rules, compliance instruments held in holding accounts may be transferred between holding accounts of facilities owned by the same entity. If one facility could reduce its emissions, it could transfer the instruments from its holding account to any other facility.

L-50. Comment: Section 95831(a)(4)(B) (p. A-49) provides that a covered entity may not remove compliance instruments from its compliance account. This may be problematic for SCPPA members. SCPPA members are publicly-owned utilities ("POUs") that will receive an administrative allocation of allowances that will be deposited at their election into their compliance accounts under section 95892 (p. A-83). Several SCPPA members (Anaheim, Burbank, Cerritos, Colton, Glendale, Pasadena) participate in a generating station, the Magnolia Power Project ("Magnolia"), which is operated by a SCPPA member, Burbank, and owned by SCPPA. The operator may have the compliance obligation, but the allocation of allowances will be to the SCPPA members. There needs to be an exemption from section 95831(a)(4)(B) to allow the SCPPA participants in Magnolia to transfer allowances from their compliance accounts to the compliance account of the plant operator. In addition, there needs to be a provision in the regulation that would allow the operator of Magnolia, Burbank, to establish a separate compliance account for these allowances to avoid commingling of Magnolia allowances with the allowances that Burbank will hold to cover its own compliance obligation. (SCPPA1)

> **Response:** We agree with the comment and revised section 95892 to address the problem. Section 95892(b)(2) allows utilities receiving an allocation to inform the Executive Officer whether to transfer the allowances to the utility's compliance account, or that of a JPA, a generator operated by a POU, or an electrical cooperative. The approach recommended in the comment is therefore not needed.

Staff also added a new definition "Joint Powers Agency(ies)" to section 95802(138), and modified section 95892(b)(2)(A) to include POUs in Joint Powers Agency(ies). We also deleted section 95914 as previously written, and added a new section 95814(e)(2).

L-51. Comment: Option for publicly-owned utilities to direct allowances to either auction by consignment or simple compliance provides flexibility but carries risk. Section 95982 (b)(2) states that publicly-owned electric distribution utilities must inform the Executive Officer at least 90 days prior to receiving annual allowances what portion of the allowances should be placed in the utility's compliance account to be used only for compliance, and the utility's limited use holding account to be consigned for auction. While SMUD appreciates the flexibility provided to publicly-owned utilities to choose to apply their allowance allocation to compliance without the price risk inherent in allowance auctions, we see other risks in this approach that we believe ARB should carefully weigh prior to adoption. These risks include the possibility that reduced auction participation by some public entities will increase allowance prices and price volatility because of reduced participation.

In addition, since the provisions of 95982(d) would no longer apply to allowance value that is reflected in the allowances placed in an entity's compliance account, there is the potential for reduced revenues dedicated to AB 32 purposes. This may serve to increase allowance prices in the long run if such reduction in specifically dedicated revenues leads to fewer investments in energy efficiency and renewables. (SMUD1)

Response: Section 95892 was strengthened to require electrical distribution utilities to use allowance value (not simply auction revenue) for the benefit of ratepayers, consistent with the goals of AB 32. ARB explains why all utilities should not be required to consign their allowances for auction based on the discussion starting on page II-30 and the rationale starting on page IX-61 of the Staff Report.

We do not agree with the implication that a direct allocation will lead to higher and more volatile auction prices. Several POU representatives have indicated that they would pursue a buy-as-you-go approach to the auction, in which they purchase allowances at auction as close in time as possible to when they incur an obligation. To implement this strategy, POUs would bid high for the number of allowances they need. For this reason staff does not believe that the POUs will be setting the auction settlement price. That will instead be done by entities following more speculative purchase strategies. These would be entities that are willing to run the risk of not acquiring allowances at an auction in order to maximize profits.

If utilities must consign the allowances, the utilities would have to use ratepayer funds to purchase them back at auction for compliance or for transfer to a JPA. The net effect of this, together with the small share of the sector in overall compliance, suggests that the magnitude of the effect suggested by the comment would be small.

L-52. Comment: SCE believes the Holding Limit placed on all parties in the cap and trade market is too low for IOUs. While CARB provides an exemption for direct compliance burdens, SCE will likely need to acquire allowances to fulfill its indirect compliance burdens on behalf of independent power producers in accordance with its contractual obligations.

Response: ARB has provided a mechanism through new section 95834 to allow utilities to hold allowances in excess of the holding limit for eventual transfer to generators with whom they have contracts. In addition, the utilities have the ability to acquire allowances and hold them in their holding accounts for eventual transfer to their contract counterparties. ARB believes the two provisions give utilities sufficient flexibility.

L-53. Comment: Section 95857(c), Recovery of the Untimely Surrender Obligation, states the obligation to surrender allowances for excess emissions is immediately due and upon determining that a covered entity has excess emissions, the Executive Officer is allowed to prevent any transfers of compliance instruments from an entity's holding account to transfer any and all allowances from the holding account to its compliance account until the retirement obligations of this section are met. It is not appropriate to allow the Executive Officer to restrict an entity's holding account if ARB alleges an entity is determined to be in violation of provisions of this article. This provision circumvents dispute resolution procedures and allows the ARB substantial opportunity to force reconciliation of an enforcement matter when an entity disagrees that there is non-compliance. For example in the situation where there is a dispute that insufficient allowances were retired ARB could "restrict" the entity's allowance account, potentially causing additional future noncompliance because the account cannot be accessed. This section would prevent the company alleged to be out of compliance from transferring any allowances from their account until the excess emissions "penalty" is reconciled. If a dispute is under consideration among the entities at the time of the next compliance deadline, the entity would basically be forced into noncompliance again because it would not be able to transfer allowances from its account to meet the new compliance obligation. Modify Section 95857(c) as follows:

(c) Recovery of the Untimely Surrender Obligation.

(1) The obligation to surrender allowances for excess emissions is immediately due;

~~(2) Immediately upon determining that a covered entity has excess emissions, the Executive Officer shall prevent any transfers of compliance instruments from the holding account controlled by the covered entity;~~

~~(3) The Executive Officer shall transfer any remaining allowances from the Holding Account controlled by the covered entity with excess emissions to its compliance account until the retirement obligations of this section are met;~~

(2)~~(4) If the Executive Officer is unable to retrieve sufficient allowances using the above process,~~ the Executive Officer shall provide the deficient covered entity 30 days to secure the allowances needed to cover its untimely surrender obligation;
~~(5) If the covered entity fails to transfer allowances equal to the untimely surrender obligation pursuant to this section to its compliance account within the period specified in 95857(c)(4), the Executive Officer will:~~

~~(A) Identify holding accounts controlled by affiliates of the deficient covered entity to which the covered entity has transferred compliance instruments during the compliance period for which a compliance obligation remains unfilled; and~~

~~(B) The Executive Officer will prevent transfers from the holding accounts identified in (A) above, and retrieve allowances from those accounts to meet the untimely surrender obligation pursuant to this section.~~

(3)~~(6)~~ Additionally, if the covered entity or opt-in covered entity does not surrender sufficient allowances equal to its untimely surrender obligation pursuant to this section by the end of the 30-day period, the Executive Officer may pursue enforcement activities pursuant to subarticle 15. (SEMPRA1)

Response: The comment is now moot as we have replaced the section of interest. The section became unnecessary with the addition of a new section 95857(c), which created a new method of dealing with failure to meet the untimely surrender obligation with a new untimely surrender obligation. We believe the new procedure will be more effective and less cumbersome in securing compliance than the original system.

M. OFFSETS

This section includes responses for comments concerning the offsets provisions of the regulation, including sections 95970–95988 and sections 95990–95997. Major topics include limits on the geographic location of offset projects; limits on the use of offset credits; quality of offset credits; linkage with other offset and carbon trading programs; offset project registries; monitoring, reporting, and record retention requirements; verification; recognition of early action; and sector-based crediting.

Limits on Offsets

Restrict Offsets to Local and/or In-State Offset Projects

M-1. (multiple comments)
Comment: Polluting facilities should reduce their carbon emissions in the communities where they pollute, rather than be allowed to pay for offsets far from home. (FORMLETTER07)

Comment: Agricultural offset credits should come from California. Agricultural practices that reduce GHG emissions can provide multiple environmental and health benefits, including improved air and water quality and enhanced wildlife habitat. Offset credits should be limited to California to realize the co-benefits of these activities. (CACAN1)

Comment: We believe that the use of offsets should be geographically confined to within the state and possibly within the air basin where they originate. (FRESNOMINISTRY)

Comment: Although offsets may be good from a global perspective, they don't always make sense from a local community's perspective. Offsets should remain local. For instance, we can look at a place like Modesto, one of the ten most air polluted cities in America according to the American Lung Association. What if a Modesto power plant which violated air quality rules more than any other plant in the northern San Joaquin Valley for ten years and kept refusing to pay its fines had been given offsets to plant trees in Ohio. Then, the people living around that plant, 50 percent Latino, and 35 percent living beneath the poverty line would still be sick. (CATHCHAR2)

Comment: The number of offsets allowed should be geographically confined to within the State to ensure maximum reductions in California as required by AB 32 and limited to ensure the cap is not meaningless. (CVAQC)

> **Response:** The program imposes a limit on the amount of offsets that an individual covered entity can use for compliance. All offsets used for compliance are real reductions, albeit outside the cap. Allowing a limited number of offsets into the program provides cost-containment benefits and ensures that some GHG emissions reductions occur within the sectors covered by the cap-and-trade

program. The program includes provisions that would allow a maximum of 201 $MMTCO_2e$ of offsets through the year 2020. This limit will be enforced through a limit on the use of offsets by an individual entity equal to eight percent of its compliance obligation. Combined with the Allowance Price Containment Reserve, this limit ensures that a majority of reductions from the program come from sources covered by the program at expected allowance prices, while use of the reserve will relax that constraint if prices rise.

In addition, achieving the goal of climate stabilization will require a commitment to work at the international level to reduce GHG emissions globally. Although we encourage offset projects to be developed in California, we recognize out-of-state projects will expand the scope of the program to allow for more low-cost GHG reduction possibilities to be incorporated and reduce the overall costs of the program. Therefore, at this time, ARB will issue offset credits for projects located in the U.S., U.S. territories, Canada, and Mexico.

M-2. Comment: With regard to the proposed regulation's framework for accepting sector-based offset credits from developing countries, the undersigned companies respectfully urge the California Air Resources Board to give preference to offset credits that can be produced through qualified activities within the borders of the State of California. (BODEGRAVEL)

Response: While the regulation provides a framework for the potential acceptance of REDD credits, we do not currently have provisions in the regulation to approve those credits or allow them to be used in the compliance program. When it is appropriate for us to begin to consider a REDD regulatory program, we will be analyzing each of these issues very carefully. This would occur after the Board adopts the cap-and-trade regulation, and it would require a separate regulation that includes its own public stakeholder review and a separate regulatory and environmental review process.

In addition, achieving the goal of climate stabilization will require a commitment to work at the international level to reduce GHG emissions globally. Although we encourage offset projects to be developed in California, we recognize out-of-state projects will expand the scope of the program to allow for more low-cost GHG reduction possibilities to be incorporated and reduce the overall costs of the program. Therefore, at this time, ARB will issue offset credits for projects located in the U.S., U.S. territories, Canada, and Mexico if we have developed protocols that apply in each region.

No Offsets/Reduce Number of Offsets

M-3. (multiple comments)
Comment: Reduce the percentage of emission reductions allowed to come from offsets. (LISH)

Comment: I strongly object to the proposal to adopt market-based compliance mechanisms to meet a cap on GHG emissions. I oppose the use of offsets to comply. (MASCARENHAS)

Comment: We, along with dozens of environmental, public health, faith-based, environmental justice, and other organizations, continue to believe that the cap and trade program should require the vast majority of the emission reductions to occur in the state's heavily-polluting sectors that are regulated by the program. An over-reliance on offsets delays investment in transforming these sectors and denies California residents valuable co-benefits that come along with local emission reductions. (UCS1, LUDLOW, WALTERS)

Comment: ARB should severely limit the use of offsets in the Cap and Trade program. As the proposal now stands, polluting industries would be allowed to offset up to eight percent of their compliance obligations, which is almost 100 percent of their required emissions reductions. An oil refinery, utility, or other polluting company could find it more convenient and cost-effective to buy offsets far from the communities in which they pollute. Offsets do nothing to reduce the co-pollutants already harming the communities in which these large polluters operate. (CATHCHAR1, CIPAL)

Comment: "The proposed program includes provisions that would allow a maximum of 232 $MMTCO_2e$ of offsets through the year 2020. This limit will be enforced through a limit on the use of offsets by an individual entity equal to eight percent of its compliance obligation." This is double the initially proposed limit of four percent. The problems with offsets identified above, combined with the low ambition in the overall target, leads us to expect that there will be very little obligation on participants to take action at source. (CTW)

Comment: Offsets should be limited to assure the integrity of the emission reductions and fulfill the letter and spirit of the law. Excessive reliance on offsets could open up loopholes that undermine the very purposes of California's AB 32 cap on emissions. Curbing global warming will require a fundamental transformation of our energy economy, a task that cannot be outsourced to other countries. Requiring California's largest polluters to reduce their own emissions will spur technological advances that can be exported to the rest of the world, bringing green jobs to the Golden State. If polluters are allowed to outsource their emission reductions to other sectors and jurisdictions, the clean-energy revolution will be delayed. The staff proposal would allow polluters to offset almost half of the emission reductions required under this rule. That amount should be significantly reduced. (We supported the 10 percent limit in AB 1404, which was passed by the Legislature but vetoed by the Governor in 2009). (SIERRACLUBCA4)

Comment: The Board is being asked to adopt a program that forgoes the economic and public health benefits from in-state reductions, favors out-of-state reductions from virtually unlimited offsets, and creates a vastly complicated and unproven mechanism that will more likely than not fail to deliver AB 32's ultimate goal of reducing GHG emissions in a thoughtful and equitable manner by 2020. Unfortunately, this challenge to ARB's implementation of AB 32 is not new to environmental justice communities. Offsets do not maximize environmental or economic benefits for California. The regulation proposes to allow entities to use offsets for up to eight percent of its compliance obligation, which is nearly 100 percent of the entities' required emissions reductions. In addition, the regulation allows offsets outside of the regulated sectors and outside of California, and possibly the United States. In no way does this structure maximize environmental or economic benefits for California as required by AB 32. This regulation is structured in such a way that an entity can comply without actually making any emissions reductions. A review of Figure E-3 in Appendix E of the Staff Report reveals that through 2016 the combined allowances and offsets would allow greater GHG emissions than the projected business as usual emissions of the covered entities without this regulation. Clearly, this does not comply with the requirements of AB 32 to achieve the maximum reductions feasible and maximize the benefits for California. Further, by allowing allowance trading and offsets out of state, ARB is allowing the new jobs that will be created by investment in green technology to be created in other states or countries, rather than in California. In this economy, squandering opportunities to create investments and jobs within California is unthinkable, irresponsible, and contrary to the mandates of AB 32. AB 32 offers the promise of a new green economy in California and requires any market-based mechanism to maximize economic benefits for California. For the Board to consider adopting this regulation with these offset provisions is irresponsible to the millions of Californians who could benefit from the investments and jobs lost to other states. (CRPE1, CRPE3)

Comment: The current maximum offsets level, eight percent, is too high. By some calculations, this amount would allow emitters to continue with business as usual emissions levels until 2017. It may be better to run a separate program for uncapped sectors which is not linked to the permits market. More information on the "supplementary reductions concept" may be found in the Cantwell-Collins CLEAR Act, available at U.S. Senator Maria Cantwell's website. (CPC1)

Comment: Lower the offset limit. (VARON)

Comment: Eliminate the eight percent cap on offsets, which will encourage the development of GHG-reducing measures and provide additional flexibility for sources to address their GHG emissions. (SMITHS)

Comment: There is too much offsetting allowed (eight percent of emissions). Offsetting is not a robust a policy for tackling climate change as cap and trade mechanisms. The use of baseline and credit programs to generate offsets has many potential weaknesses, including the difficulty in establishing additionality and accurately projecting a baseline. Offsets should only be used in cap and trade programs as a guard against high prices, such as in the event of carbon abatement projects in capped sectors proving to be more expensive or more difficult to uncover than initially projected. Access to offsets should be limited and always supplemental to action in the capped sectors. The price of offsets is generally lower than the price of the allowances created under the cap, and often the first option for firms buying their way to compliance. It is our expectation that the generous offset provisions proposed will mean that cap and trade in California will operate as a mandatory offset program for capped participants, stimulating little or no investment in abatement within capped sectors. The decision to increase the offset provision has been justified in relation to the creation of the strategic reserve of allowances. However, the creation of a reserve is not the same as tightening the cap since it does not permanently remove the permits from the program, merely places a higher price on them. The increase in the offsets provision is therefore equivalent to a significant decrease in overall effort in the traded sector. Also, the current proposals state that the placing of the permits into the reserves will be done gradually over time, whereas, the increased offset provision is in place from the start. This is clearly imbalanced. If the proposals are not to result in significantly weakened price signals, then the additional offset provisions, if introduced, should similarly be phased in over time. (SANDBAGCC)

Comment: Drastically reduce the percentage of emission reductions allowed to come from offsets and require that 100 percent of offsets be located in California (thus providing California jobs). Californians support our global warming law because we want to green our state's economy, not outsource the job of reducing emissions to other states and countries. (STEWARTJ)

Comment: Please protect the public by reducing the percentage of emission reductions allowed to come from offsets. Californians support our global warming law because we want to green our state's economy, not outsource the job of reducing emissions to other states and countries. (FORMLETTER10)

Comment: Offsets do not and will not provide real emissions reductions. They will offset the responsibility of the State and polluting industries. This will allow pollution in California to continue both in the form of CO_2 emissions and in the form of the more immediate toxic threats from refineries, incinerators, power plants and so on. This will lead to the kinds of immediate health impacts we see around the Richmond refineries, Kettleman City, West Oakland, Fresno, and other industrial impacted areas. I would recommend that offset allowances within AB 32 be kept to a minimum in order to truly encourage clean and green economic alternatives for California. (GJEP2)

Comment: A limited role for offsets may necessary in the beginning, but the ability to offset carbon pollution must be very limited or greenhouse gases will not be cut significantly. Offsets must be allowed sparingly and less allowed every year. (BEAZLIE)

Comment: We are concerned with the doubling of offsets. (EBCHR)

Comment: Any offsets allowed should be limited and narrowly targeted to benefit the impacted communities that are suffering from power plant and refinery pollution. (COHEN2)

Comment: California must lead this nation. But I urge you also not to provide loopholes for polluting industries like offset protocols. No more half measures. Let's get the caps on the books and let industry adapt. (ARNDT)

Comment: Selling the carbon credits in no way changes the excessive amount of pollution that is expended into our environment. Let's come up with a plan that will be appreciated and praised by the future generations. (ATCHER)

Comment: I do not agree with "offsets" which allow companies to continue to pollute out atmosphere. (CUNNINGHAM)

> **Response:** We did not change the limit on the use of offsets in the program. We believe that a limited use of offsets is necessary in the program to contain costs and incentivize reductions in uncapped sectors. The program imposes what we believe is an appropriate limit on the amount of offsets that an individual covered entity can use for compliance. All offsets used for compliance are real reductions, albeit outside the cap. Allowing a limited number of offsets into the program provides cost-containment benefits and ensures that some GHG emission reductions occur within the sectors covered by the cap-and-trade program. The program includes provisions that would allow a maximum of 201 $MMTCO_2e$ of offsets through the year 2020. This limit will be enforced through a limit on the use of offsets by an individual entity equal to eight percent of its compliance obligation. Combined with the Allowance Price Containment Reserve, this limit ensures that a majority of reductions from the program come from sources covered by the program at expected allowance prices, while use of the reserve will relax that constraint if prices rise.

M-4. Comment: Please consider the following suggestions made by Union of Concerned Scientists for making the CARB program even stronger as you go forward:

1. More clearly define CARB's role in offset decisions.
2. Ensure that offsets cannot be sold more than once through different registries.
3. Lower the offset limit. (CADMANS, UCS2)

> **Response:** We agree with the comment to more clearly define ARB's role in offset decisions. We deleted Offset Project Registries from the appeals process for adverse verification statements. This clarification was made to be consistent with the MRR, and reflects stakeholder comments that the appeals process should only be limited to determinations made by the Executive Officer of ARB, and that ARB should be the only one to make these determinations. In addition, we clarified that ARB makes the final determination on whether or not a registry offset credit meets all requirements of the regulation, and we added this text to the regulation.
>
> New section 95975(c)(5) of the regulation now requires that an Offset Project Operator or Authorized Project Designee disclose any offset credits issued for the same project for any other purposes in any other program. In addition, we

added new attestations to section 95981(c). Offset Project Operators and Authorized Project Designees must make these attestation(s) in order for ARB to issue offset credits. Also, if ARB finds that ARB offset credits were issued to the offset project for the same GHG reductions or GHG removal enhancements, ARB may invalidate the ARB offset credits pursuant to section 95985. This provision addresses double-counting of the GHG reductions or GHG removal enhancements in multiple programs.

We did not change the limit on the use of offsets in the program. The program imposes what we believe is an appropriate limit on the amount of offsets that an individual covered entity can use for compliance. All offsets used for compliance are real reductions, albeit outside the cap. Allowing a limited number of offsets into the program provides cost-containment benefits and ensures that some GHG emissions reductions occur within the sectors covered by the cap-and-trade program. The program includes provisions that would allow a maximum of 201 MMTCO_2e of offsets through the year 2020. This limit will be enforced through a limit on the use of offsets by an individual entity equal to eight percent of its compliance obligation. Combined with the Allowance Price Containment Reserve, this limit ensures that a majority of reductions from the program come from sources covered by the program at expected allowance prices, while use of the reserve will relax that constraint if prices rise.

M-5. Comment: We are very much opposed to the cap-and-trade program that would allow industrial polluters to purchase carbon "offset credits" instead of reducing their own greenhouse gas emissions. (REED)

Response: We disagree that the inclusion of offsets does not require capped sources to reduce emissions. The program imposes a limit on what we believe is an appropriate amount of offsets that an individual covered entity can use for compliance. All offsets used for compliance are real reductions, albeit outside the cap. Allowing a limited number of offsets into the program provides cost-containment benefits and ensures that some GHG emissions reductions occur within the sectors covered by the cap-and-trade program. The program includes provisions that would allow a maximum of 201 MMTCO_2e of offsets through the year 2020. This limit will be enforced through a limit on the use of offsets by an individual entity equal to eight percent of its compliance obligation, or total emissions. Combined with the Allowance Price Containment Reserve, this limit ensures that a majority of reductions from the program come from sources covered by the program at expected allowance prices, while use of the reserve will relax that constraint if prices rise.

Unlimited Offsets/Increase Number of Offsets

M-6. (multiple comments)
Comment: CERP strongly supports the increase in the offsets usage limit to eight percent of an entity's compliance obligation. The offsets usage limit remains, however,

a severe and unnecessary limit on the ability of offsets to provide cost containment to the California program while delivering environmentally rigorous emission reductions. CERP recommends that in the event that half of the allowances from the Allowance Price Containment Reserve have been purchased, the offset usage limit should increase to provide additional cost containment. At that point, ARB should also use revenue from the sale of allowances from the Reserve to purchase offsets to "refill" the Reserve. Such safeguards are not only reasonable, but essential to ensure that cost containment will be available when it is needed. By limiting offsets usage to approximately eight percent of entities' compliance obligations—as ARB has proposed in the draft regulations—ARB is unduly limiting the emissions reduction potential and cost containment that offsets can provide, and increasing the costs of the Cap and Trade program for California households and businesses. CERP urges ARB to increase the offsets usage limit. At the very least, the proposed regulations should provide for the reevaluation of the offsets usage limit in the future if allowance costs become high, and provide an automatic recalibration of the limit in the event that half the allowance reserve is depleted. (CERP1, CERP3)

Comment: Dow supports the addition of new provisions in the proposed rule that would increase the offset supply via an increased offset limit if a risk of depletion in the allowance reserve is detected. Inclusion and approval of mechanisms in the final rule would allow ARB an additional and potentially robust means of containing potential runaway costs while avoiding a curtailment and/or dismantling of the cap and trade program. (DOWCHEM1)

Comment: Eliminate the quantitative usage limitation for California-based offset projects, most specifically the projects using forestry, urban forestry, and urban life cycle methane capture protocols. This would promote the AB 32 goals of achieving the GHG emission reduction cost effectiveness and providing environmental benefits to California. (OFFSETSWG2)

Comment: While IETA is encouraged that ARB has significantly increased this limit from the original four percent, IETA continues to support the removal of a quantitative usage limit. IETA believes that as long as only real, permanent, and verifiable offset credits are allowed into the market, arbitrary usage limits will only prevent further reductions of greenhouse gas emissions in a cost-effective manner. (IETA1)

Comment: IETA's membership would like to stress the importance of continuing to think about higher quality of offset limits and allowing more methodologies and standards into the state of play. (IETA2)

Comment: We appreciate that CARB staff has increased the ability to use offsets from four percent up to eight percent of the compliance obligation. However, this parameter is likely too small to accommodate the needs of a growing California economy. We recommend that CARB impose no quantitative limit on qualified offsets and that CARB not impose geographic limitations. (CMTA1)

Comment: We are very disappointed that the cap and trade program will proceed with so few approved protocols for offsets. We are glad that CARB has recognized the value of offsets as both a cost-control mechanism and a way to advance the goals of emission reductions. In addition, we appreciate that CARB staff has increased the ability to use offsets from four percent up to eight percent of the compliance obligation. However, this expansion is likely still too small to accommodate the needs of a growing California economy. We recommend that ARB set no limit on the use of qualified offsets. We offer this recommendation because the stringent offset qualification rules and the need for CARB approval of any offset protocol will ensure only the best projects are approved, and the process could constrain the availability of offsets in any event. Further, since CARB has assured quality offsets through stringent offset qualification rules and third party verification, it is redundant, and unreasonably onerous for the entity holding the offset credit to be responsible for it being real, permanent, etc. It seems clear that we shouldn't impose artificial constraints on the offset market that could provide such great benefits to the state and the environment. (AB32IG)

Comment: We also recommend you consider raising the cap on offsets for those subject to leakage. (PMTPETRO2, PMTPETRO3)

Comment: CLFP supports the notion that the eight percent level be established as a floor, and that additional offsets be allowed as necessary to maintain costs of the program within acceptable limits. (CALFP1)

Comment: We believe that the most cost-effective approach to achieving the emission reduction goal of AB 32 is via a well-designed market program that includes a robust offsets program. We believe eight percent is still too restrictive and will prevent interest and investment in innovative emissions reductions projects in uncapped sectors, which is a significant missed opportunity for climate change mitigation. This limitation will result in the loss of cost-containment from the use of offsets especially in the early stages of the Cap and Trade program, when new technologies and best practices are still being developed and implemented by capped sectors. The result will be increased costs of the entire Cap and Trade system and a loss of flexibility during the transitional years post-enactment. We request that the Board review the eight percent cap in the future as potential new offset protocols come on line. Without a promise to review the eight percent cap, this may provide a strong disincentive for capital to be invested by state or private organizations to development of new offsets. (ACC1)

Comment: Inclusion of a robust offsets program is essential to cost-containment of AB 32. The eight percent limitation is too restrictive and will prevent interest and investment in innovative emissions reductions projects in uncapped sectors. Agricultural cooperatives, in particular, have a unique opportunity to participate in carbon sequestration activities of their grower-owners and utilizing those offsets as part of the compliance rules in cap and trade. Limiting the total allowance market to only 8 percent for offset projects discourages potential participation in the program from production agriculture and could prevent this unique opportunity for agricultural cooperatives. Ag Council urges the Board to review this cap in the future as potential new offset protocols come on line. Without a promise to review the 8 percent cap, this may provide a strong disincentive for capital to be invested by state or private organizations to development of new offsets. (ACC3)

Comment: We would recommend that CARB monitor the development of the offset market and prices in the allowance market, and consider increasing this cap beyond 8 percent should prices begin to rise to higher levels than may be tolerable given the prevailing state of the economy. Unlikely other cost containment strategies such as safety valves and off-ramps, offsets do have the benefit of maintaining the net environmental integrity of the cap, so long as they come from real, verified, additional and permanent reductions. Regulatory scrutiny of the offset market is welcomed and encouraged to ensure that these requirements for offset quality are met. (CLIMATEWEDGE)

Comment: The Board should amend the offset provisions by removing the limit on offset use for compliance purposes. Limiting offset use will simply increase the cost of the program unnecessarily. The regulation should use appropriate integrity criteria to assure that offsets are verified, surplus and otherwise worthy of use in the program; but should not otherwise limit offset access or use. ARB's complementary measures directly ensure appropriate California investment in strategic low carbon fuels and technologies. (CCC, MAZOWITA)

Comment: Because climate change is a global problem that requires a global solution and because California will continue to be negatively impacted if regions outside the State do not act, CARB should re-evaluate the restrictive quantitative limits on the use of offsets while hastening and widening the approval of offset protocols to ensure adequate supply. The regulation should be designed to ensure introduction to the market of the full allowed quantity of offsets. (BP)

Comment: We recommend CARB eliminate the eight percent cap on offset use for facility compliance. Section 95854 and the Initial Statement of Reasons (pg. II-5) state that only eight percent of source's compliance obligation can be satisfied with offsets. This restriction, combined with the expected use of auctions as a means to distribute the allowances, can serve to:

- Increase leakage by sources moving to less stringent regulatory regimes;
- Restrict California's ability to lead other states into participating in the cap and trade program;
- Increase compliance costs;
- Marginalize (render inconsequential) the use of offsets; and
- Reduce offset usability. (CANTORCO2E)

Comment: While it is an improvement that CARB has increased the allowable level of offsets that can be used in a compliance period, we believe that this level should be even higher, if not unlimited, at least at the beginning of the program, to spur the development of offsets and ensure allowance availability. (LASD1)

Comment: The offset limit should be increased. Allowing only eight percent of compliance requirements to be met by offsets seems too low to provide flexibility for compliance. Constellation Energy requests that the opportunity for compliance using qualified offsets be increased substantially. (CONSTELLATIONENERGY)

Comment: The amount of offsets that are allowed in the program should be higher than eight percent. (SDCHAMBER)

Comment: We appreciate that CARB has recognized the two-fold value of offsets as a cost-control mechanism and a way to further the goals of emission reductions. We further appreciate that CARB staff has increased the ability to use offsets from four percent up to eight percent of the compliance obligation. Nevertheless, this expansion is too small to realize the full value to regulated parties and to the success of the regulation itself insofar as offsets are compliance cost mitigation instruments. We agree with the AB 32 Implementation Group in their recommendation that CARB set no limit on the use of qualified offsets. (PLOTKIN)

Comment: Expand offset use from eight percent to 25 percent so that warehousing can engage in distributed energy solutions for dealing with climate change instead of expensive fuel mandates. (IWLA1, IWLA2)

Comment: Essentially all of the studies on the economics of cap and trade show that offsets are critical to minimize costs. Although ARB adjusted its limits on the use of offsets, from four percent to eight percent, this limitation is still unnecessary. (CCEEB1)

Comment: The eight percent cap on the use of offsets should be lifted. COPC welcomes CARB's lifting of the quantitative offset usage cap to eight percent from the four percent level that appeared in the prior Preliminary Draft Regulation (see section 95854). If CARB determines that some type of quantitative usage limit is necessary, then it should be set it higher than eight percent. Such a low limit will severely hinder the ability of offsets to provide the cost containment mechanism that will be necessary to manage the costs of AB 32's implementation. It also will severely discourage the investment in and development of new offset projects, thereby failing to harness a powerful tool for combating climate change. (COPC1)

Comment: Offset credits allowed for mitigating CO_2 emissions in the PDR were limited to four percent. The proposed Cap and Trade Regulation raises the allowable percentage to eight percent. Additionally, there are only four offset protocols that CARB is currently considering for approval. As the number of available allowances declines, there will be increased need to additional and creative offset projects both inside and outside California. Therefore, more flexibility needs to be built into this aspect of the Cap and Trade Regulation, as well as an expedited approval process for new offsets. (MWDSC1)

Comment: While COPC is encouraged by the recognition that offsets should play a slightly larger role in the AB 32 cap and trade program, we remain concerned by what appear to be arbitrary limits on the use of quality offsets. COPC respectfully submits that CARB's continued embrace of a quantitative usage limit is fundamentally flawed. Establishing a quantity limitation on the use of offsets does nothing to help ensure the environmental integrity of offsets. That can be addressed far more effectively by addressing it directly (i.e. by focusing on offset quality). (COPC1)

Comment: Offsets represent an important cost containment tool for many food processors and producers. CLFP continues to strongly advocate that CARB not take a restrictive approach to the use of emission offsets by Cap and Trade program participants such as limiting the number or percentage of offsets that can be used; the geographic location of offsets; or the types of offsets that would be eligible. CARB should instead focus on the quality of offsets; that they meet the requirements of being real, additional, quantifiable, verifiable, and permanent. As long as offsets meet that rigorous standard then their use by regulated entities should not be limited for compliance purposes. (CALFP1)

Comment: We recommend that CARB remove the eight percent restriction. When faced with these restrictions, potential offset buyers will choose to expand, and possibly move their operations to areas with greater offset supply (or that are not burdened with such restrictions). Rather than quantitative limits, sources should be limited to using credits that meet CARB's qualitative criteria. Any credits which meet CARB's offset protocols should be useable as offsets in any amount. (CANTORCO2E)

Comment: The quantitative usage limit should not apply to offset projects that result in direct emission reductions within California. (OFFSETSWG1)

> **Response:** We did not increase the amount of offsets allowed to be used in the program. The program imposes a limit on the amount of offsets that an individual covered entity can use for compliance. All offsets used for compliance are real reductions, albeit outside the cap. Allowing a limited number of offsets into the program provides cost-containment benefits and ensures that some GHG emissions reductions occur within the sectors covered by the cap-and-trade program. This limit will be enforced through a limit on the use of offsets by an individual entity equal to eight percent of its compliance obligation. Combined with the Allowance Price Containment Reserve, this limit ensures that a majority of reductions from the program come from sources covered by the program at expected allowance prices, while use of the reserve will relax that constraint if prices rise.
>
> The depletion of the reserve in itself may not be an indicator of a potential market issue. Therefore, we did not make a change that would require an increase in the offset usage limit if the reserve is depleted.

M-7. Comment: ConocoPhillips supports unlimited use of high-quality offsets for compliance with any cap and trade program. Emission allowances from similarly stringent cap and trade programs should qualify for compliance within the California system. CARB should increase the percentage of high-quality offset credits covered entities may use towards compliance and should include emission allowances from international trading programs (e.g. EU ETS) as a viable alternative compliance mechanism. (CONOCO)

> **Response:** We did not increase the amount of offsets allowed to be used in the program. The program imposes a limit on the amount of offsets that an individual covered entity can use for compliance. All offsets used for compliance are real reductions, albeit outside the cap. Allowing a limited number of offsets into the program provides cost-containment benefits and ensures that some GHG emissions reductions occur within the sectors covered by the cap-and-trade program. This limit will be enforced through a limit on the use of offsets by an individual entity equal to eight percent of its compliance obligation. Combined with the Allowance Price Containment Reserve, this limit ensures that a majority of reductions from the program come from sources covered by the program at expected allowance prices, while use of the reserve will relax that constraint if prices rise.
>
> The regulation includes a framework for California to link its cap-and-trade program to other emissions trading systems of similar scope and rigor. Linkage can expand the coverage of the cap-and-trade program to include emissions-reduction opportunities for sources covered in another program. The regulation does not currently include linkage to other programs, though staff anticipates bringing recommendations to the Board in 2012 for possible linkage with the programs being developed by the three other WCI Partners that are currently working to implement programs: British Columbia, Quebec, and Ontario.
>
> Each program will undergo a case-by-case analysis by staff as part of a formal rulemaking process, and the Board will need to approve regulatory amendments reflecting the linkage with a particular program before it can take effect.

M-8. Comment: ATA supports ARB's decision to increase the availability of compliance offsets under the regulation. Additional compliance offsets will provide compliance alternatives for regulated entities while ensuring real environmental benefits through offset projects. (ATAA)

> **Response:** Thank you for the support.

Carry Over of Offset Limit

M-9. (multiple comments)
Comment: The restriction on carrying over unused portions of an entity's offset limit into subsequent compliance periods should be removed. (CCEEB1)

Comment: The Council urges the Air Resources Board to propose a simple method to allow the carryover of unfilled rights to use offsets. (BCFSE)

Comment: Buyers should expect to see that they have a guarantee of that credit being able to be transacted in the future. I would suggest you carry forward offset capacity. If a facility has not used its capacity one year, then they should be able to use that in the subsequent years and bank it. (MARGOLIS)

Comment: We recommend CARB provide for the ability to carry forward/bank unused annual offset capacity. Should CARB insist on the imposition of an offset limit (whether eight percent or something greater), sources should be allowed and encouraged to bank/carry forward unused offset capacity. For example, if a source has a 100,000 ton compliance obligation it would have the ability to use 8,000 tons of offsets. If the source only uses 1,000 tons of offsets we propose that the source be allowed to carry forward 7,000 tons into the subsequent years. We also propose that the unused offset capacity be carried forward on an aggregate basis. On an annual basis, CARB should track unused, unbanked (orphaned) offset capacity from all sources. For example, in year one CARB may determine that (market wide) 100 sources used 500,000 tons fewer than would have been allowed. Under this proposal, the 500,000 ton surplus from year one would be carried forward and allocated to all sources operating in year two. The exact distribution method (and cost) can be refined at a later date. This proposal would serve to reduce compliance costs, encourage offset generation, while, at the same time, allow the State to meet its AB 32 emission reduction objectives. (CANTORCO2E)

Comment: Offsets are a crucial part of compliance entities' cost containment strategies. CARB should modify its offsets program to expand the available supply of offsets, especially in the first compliance period. SCE asks that CARB ensure that the eight percent quantitative limit on offsets is flexible over compliance periods. (SCE1)

> **Response:** The regulation requires that offsets account for eight percent of an individual entity's emissions over a three-year period. We did not allow the carryover of unused offsets within this time frame to ensure that emission reductions are being achieved by capped sources throughout the life of the program. Keeping it to the compliance period allows some flexibility by giving three years to total emissions, but still requires that emission reductions are coming from within capped sectors in all years of the program.

M-10. (multiple comments)
Comment: Dow believes that the limit on the use of offsets, set at 8 percent is too low and should be further increased. Dow is also concerned that the supply of offsets in the first compliance period will be insufficient to cover 8 percent of total retirement obligations. To address the potential shortfall in available offsets and to ensure that the program is implemented in a manner that allows this important design criteria to be achieved, Dow recommends that ARB modify the proposed regulation to allow each

covered entity to carry over any unfilled rights to use offsets. The cost implications of the rule are primarily based on the assumption that the 8 percent will be available.

To disallow access and use of an important cost containment mechanism simply because supply cannot initially match up to the demand would effectively penalize capped entities for the non-availability of a cost containment feature that under the proposed program is presumed to be fully available during the first compliance period. Allowing capped entities, in particular, EITE facilities, access to such a cost containment mechanism would help meet ARB's leakage goals, while remaining both below the eight percent offsets threshold for the program and the entity. Such a provision would also send clear signals to emission reduction project developers. (DOWCHEM1)

Comment: CERP urges ARB to allow covered entities to carry over any portion of their offsets usage quota that is unused during a compliance period. Because there may not be sufficient offset supply available in some compliance periods to meet demand, some covered entities may not be able to obtain the quantity of offsets they are allowed to use, and therefore will lose the cost containment that the offsets could have supplied. To protect the ability of offsets to provide cost containment, covered entities should be able to use additional offsets in subsequent compliance periods, up to the quantity of "unused" offsets. (CERP1)

Comments: PG&E believes that the supply of offsets in the first compliance period will be insufficient to cover eight percent of emissions, as would be permitted under the proposed regulations. To address this shortfall, PG&E recommends that each covered entity be allowed to carry over any unfilled rights to use offsets. Such carry-over could be complicated if, for example, regulators allow trading of such rights. To avoid such complexity, PG&E proposes a simple method, in which no trading of unused rights is allowed and the burden of proof is on the complying entity. For example, consider a facility X that emits 100,000 metric tons in each year. Under section 95854, facility X could cover eight percent of its emissions, or 8,000 metric tons per year, by surrendering offsets rather than allowances. If facility X uses less than its full right, it can carry over that right. For example, facility X was allowed to use 8,000 offsets, but actually covered its emissions with 97,000 metric tons of allowances and only 3,000 offsets. In the next compliance period it would be allowed to use offsets equal to eight percent of its emissions, plus 5,000 metric tons of offsets, to account for offsets that were not used in the first period. PG&E proposes that the burden of proof be placed on the complying entity. ARB can easily determine whether the burden of proof has been met because ARB will be tracking the surrender of allowances and offsets in the Retirement Account. (PGE1)

Comment: ARB proposes to enforce the eight percent limit on offset use for each three-year Compliance Period. However, depending upon conditions in offset and allowance markets, it may be uneconomic to use the full extent of offset flexibility offered in certain compliance periods. For example, if offset markets are slow to initially develop, complying entities may find it more cost-effective to rely upon emission reductions from sources under the cap, rather than offsets. However, costs might be lowered if complying entities are allowed to carry forward and even trade these "rights" to use offsets. A simple accounting mechanism that keeps track of the quantity of offsets each complying entity is allowed to use could allow them to bank and even trade these "rights" to use offsets. Such a mechanism may also lower costs by allowing firms to specialize in their use of offsets. Given the fixed administrative costs of effectively participating in offset markets, this flexibility could allow some firms to avoid these administrative costs (which could be large for smaller complying entities), while not foregoing the opportunity to achieve compliance cost savings. (ANALYSISGRP)

> **Response:** We do not agree that there will be insufficient offset supply in the first compliance period. We estimate that if every entity used their allowable eight percent offsets, approximately 26 million metric tons of offsets would be needed in the first compliance period. This reduced need is due to a start of the first compliance period in 2013 instead of 2012. At this time, based on the four offset protocols the Board has endorsed—manure digesters, forestry, urban forestry, and destruction of ozone depleting substances—ARB will be close to the supply demand for the first compliance period. We also will be looking to adopt additional Compliance Offset Protocols beginning in 2012.
>
> The regulation requires that offsets account for eight percent of an individual entity's emissions over a three-year period. We did not allow the carryover of unused offsets within this time frame to ensure that emission reductions are being achieved by capped sources throughout the life of the program. Keeping it to the compliance period allows some flexibility by giving three years to total emissions, but still requiring that emission reductions are coming from within capped sectors in all years of the program.

M-11. Comment: SCE strongly supports the use of offsets as compliance instruments for cost containment. SCE applauds CARB staff for recognizing that "a robust supply of offset credits can help to contain the costs of a Cap and Trade program" because offset credits can provide covered entities a source of low-cost emissions reductions. As SCE has noted in earlier comments, however, arbitrary quantitative limits or geographic limits on offsets will result in unnecessarily high compliance costs. The proposed regulation would only allow a maximum of 232 MMT CO_2e of offsets through the year 2020.

This limit will be enforced through a limit on the use of offsets for each covered entity equal to eight percent of its annual compliance obligation. The ISOR correctly notes that by removing 121 million allowances from underneath the cap and placing them in the Allowance Reserve, the level of stringency within the program is increased and could lead to higher allowance prices. CARB staff reasons in the ISOR, however, that this increased stringency can be addressed by allowing additional offsets in the Cap and Trade program, up to the 232 MMT CO_2e maximum. This reasoning is flawed. Although the increase in the quantitative limit on offsets from four percent to eight percent is a positive step, it does not fully counteract the pulling of allowances from under the cap to populate the allowance reserve. There is no guarantee that the four offset protocols currently proposed by CARB will provide a sufficient supply of offsets to reach the eight percent limit, particularly in the crucial first compliance period. SCE believes it is unlikely that there will be enough offsets to meet that limit.

If CARB imposes a quantitative offsets limit, SCE recommends that the limit be flexible between compliance periods to address the likelihood of a limited supply of offsets in the early years of the program. Currently, the eight percent quantitative limit is imposed on the use of offsets for each regulated entity for each compliance obligation, be it annual or triennial. In order to address concerns regarding the limited supply of offsets, especially in the early stage of the regulation, CARB should allow compliance entities to make up any shortfall of offsets in later compliance submissions. For example, in the first year of the program, if a covered entity can only purchase enough offsets in the market to fulfill five percent of its annual compliance obligation, the covered entity should be allowed to carry over the number of offsets equal to the unused additional three percent to later compliance periods. Alternatively, CARB could allow the eight percent limit to apply to a compliance entity's entire obligation over the nine-year duration of the Cap and Trade program. Otherwise, the 232 MMT CO_2e limit might never be reached and the opportunity for lower-cost emissions reductions—and the subsequent control on program costs—is lost. (SCE1)

Response: We did not increase the amount of offsets allowed to be used in the program. The program imposes a limit on the amount of offsets that an individual covered entity can use for compliance. All offsets used for compliance are real reductions, albeit outside the cap. Allowing a limited number of offsets into the program provides cost-containment benefits and ensures that some GHG emissions reductions occur within the sectors covered by the cap-and-trade program. This limit will be enforced through a limit on the use of offsets by an individual entity equal to eight percent of its compliance obligation. Combined with the Allowance Price Containment Reserve, this limit ensures that a majority of reductions from the program come from sources covered by the program at expected allowance prices, while use of the reserve will relax that constraint if prices rise.

We do not agree that there will be insufficient offset supply in the first compliance period. We recently estimated that if every entity used their allowable eight percent offsets, approximately 26 million metric tons of offsets would be needed in the first compliance period. This reduced need is due to a start of the first compliance period in 2013 instead of 2012. At this time, based on the four offset protocols the Board has endorsed—manure digesters, forestry, urban forestry, and destruction of ozone depleting substances—ARB will be close to the supply demand for the first compliance period. We also will consider additional Compliance Offset Protocols beginning in 2012.

The regulation requires that offsets account for eight percent of an individual entity's emissions over a three-year period. We did not allow the carryover of unused offsets within this time frame to ensure that emission reductions are being achieved by capped sources throughout the life of the program. Keeping it to the compliance period allows some flexibility by giving three years to total emissions, but still requiring that emission reductions are coming from within capped sectors in all years of the program.

M-12. Comment: Kern recommends that there be a robust offset market. This will assure cost competitiveness and that the goal of achieving carbon reductions will be accomplished at the lowest cost. To achieve this, it is recommended that CARB increase the offset limit and allow for unused offsets to be carried over to subsequent years. Kern also recommends increasing offset protocols and broader use of offsets in order to spur cooperation of a global nature. Strict limitations of offset quantities and offset protocols (locations) cast a shadow of doubt related to the global nature of this issue. (KERNOIL1)

Response: We did not increase the amount of offsets allowed to be used in the program. The program imposes a limit on the amount of offsets that an individual covered entity can use for compliance. All offsets used for compliance are real reductions, albeit outside the cap. Allowing a limited number of offsets into the program provides cost-containment benefits and ensures that some GHG emissions reductions occur within the sectors covered by the cap-and-trade program. This limit will be enforced through a limit on the use of offsets by an individual entity equal to eight percent of its compliance obligation. Combined with the Allowance Price Containment Reserve, this limit ensures that a majority of reductions from the program come from sources covered by the program at expected allowance prices, while use of the reserve will relax that constraint if prices rise.

The regulation requires that offsets account for eight percent of an individual entity's emissions over a three-year period. We did not allow the carryover of unused offsets within this time frame to ensure that emission reductions are being achieved by capped sources throughout the life of the program. Keeping it to the compliance period allows some flexibility by giving three years to total emissions, but still requires that emission reductions are coming from within capped sectors in all years of the program.

We recognize stakeholder concerns regarding offset supply. ARB is prohibited from adopting additional protocols as part of this cap-and-trade rulemaking. All offset protocols used in the compliance program must be adopted by the Board after undergoing a full regulatory process, including an ARB stakeholder process, in accordance with the Administrative Procedure Act, and an environmental review. We plan to look at further offset protocols for potential inclusion in the cap-and-trade program beginning in 2012. The details surrounding any new offset project types for which ARB adopts an offset protocol will be dealt with under that specific rulemaking, and modification will be made to the cap-and-trade regulation as needed.

M-13. Comment: We believe that individual facilities should not be imposed to a restriction on offsets. The restriction should be on total number of offsets overall allowed into the program. This would give regulated entities that get priced out of the allowance market to go into the offset market for the remainder of their surrender. (AGCOALITION)

> **Response:** We reviewed the options to implement the limit on offsets and, due to the accounting complexity and stakeholder comments from facilities that preferred knowing exactly what was expected with regard to surrendering offsets, we believe an individual facility limit is the optimal approach.

Geographic Limits

M-14. Comment: Section 95973(a)(3), states the offset projects can be done within the U.S., Canada or Mexico; however, it does not specifically identify U.S. Territories. This is inconsistent with the Livestock Manure (Digester) Offset Protocol, which identifies the United States and U.S. Territories. The two should be consistent. Modify section 95973(a)(3) as follows:
(3) be located in the United States and United States Territories, Canada, or Mexico. (SEMPRA1)

> **Response:** We agree and modified section 95973 (a)(3) to also include United States Territories.

M-15. (multiple comments)
Comment: Geographic restrictions and quantitative restrictions do not provide co-benefits. Unlimited and geographically unrestricted offsets will not cause environmental degradation. Offset credits should be allowed without any geographical or quantitative restrictions. (CCEEB1)

Comment: CLFP recommends that the regulation not impose geographic limitations at this time. (CALFP1)

Comment: The amount of offsets that are allowed in the program should be expanded internationally. (SDCHAMBER)

> **Response:** The regulation allows offset projects from North America to be credited under ARB-approved protocols; however, the approved Compliance Offset Protocols are only applicable in the United States and its Territories. We will continue to evaluate whether the four project types already approved for use in the program could be expanded to apply outside of the United States. Any changes to the already adopted protocols will be done as part of a separate rulemaking process to ensure that the GHG reductions and GHG removal enhancements being credited as offsets are real, additional, quantifiable, permanent, verifiable, and enforceable.

Offset credits from projects located outside of North America may also be used for compliance if they are issued by an outside program that is approved by the Board, though no such approval of another program is being evaluated at this time.

Calculation of the Quantitative Limit on Offsets

M-16. Comment: The formula calculating the offset quantitative usage limit should be drafted more clearly. OWG recommends a simpler calculation as follows:

O shall be ≤ S * 0.08, where

O = Total number of compliance instruments that are designated as subject to this quantitative usage limit pursuant to subarticle 4, section 95821(b), (c), and (d) that may be surrendered in the relevant compliance period. Sector-based credits . . .
S = Covered entity's annual or triennial compliance obligation positive or qualified GHG emissions reported in the relevant compliance period.
L = Quantitative offset credit usage limit, set at 0.08. (OFFSETSWG1)

Response: New section 95854(a) was originally expressed as part of the "O" term in the equation in this section, and it was moved into its own section to make it more clear which compliance instruments are subject to the quantitative use limit. This original text was also modified to include a reference to ARB offset credits (section 95820(b)), which was inadvertently omitted from the original regulatory text. The text in new section 95854(b) now references section 95854(a), to make it clear which compliance instruments are subject to the quantitative usage limit. This text, as well as the modified text in the O_o and S terms of the equation, establishes that the quantitative usage limit applies to the triennial compliance obligation and not the annual compliance obligation. This modification was made in response to stakeholder comments. We agree that applying the limit to each annual surrender is overly complicated, and there is no benefit to the program when applying it annually.

We added section 95854(c) to clarify that sector-based offset credits may only be used for up to 25 percent of the eight percent total limit on designated compliance instruments, increasing to one-half of the eight percent in the third and subsequent compliance period.

M-17. Comment: To add clarity, modify section 95820 as follows: (2) Surrender of offset credits shall be subject to the quantitative usage limit set forth in sections <u>95854 and </u>95995. (NCPA1)

Response: We have not made this change because section 95820 refers to ARB offset credits which are issued directly by ARB. These compliance instruments are subject to the quantitative usage limit (section 95854). In addition, ARB may approve sector-based offset credits (identified later in section 95821(d)). Sector-based offset credits are subject to different usage rules than ARB offset credits, therefore, a reference to section 95995 within section 95820 would be misplaced.

M-18. Comment: The following two provisions concerning the offset limit are difficult to interpret taken together. We recommend that they be clarified to state that the total triennial compliance obligation is subject to the quantitative usage limit but that the annual and triennial surrender obligations are not. In other words, a compliance entity may submit, in its triennial surrender (say, 2015), a quantity of offsets equal to eight percent of its total three-year compliance obligation, even if it has submitted no offsets as part of its annual compliance obligations in 2013 and 2014.

- Section 95854: The number of offset credits that each covered entity may surrender to meet its annual or triennial compliance obligation…
- Section 95856(f)(2): The total number of allowances and offset credits submitted to fulfill the combined Annual and Triennial Surrender obligations is subject to the quantitative use limit on offset credits…

Consistent with the cost-reduction purpose of offsets, we recommend that compliance entities be permitted to surrender an unlimited number of offsets in the annual compliance surrender events, understanding that when the triennial compliance obligation is calculated, the total number of offsets credited for the three-year period will be subject to the eight percent limit. In this way, a company can minimize its economic outlay in the first two years, providing capital for investment in onsite emission reductions. Should a company's offset submittals in the first two years exceed the eight percent limit over the whole period as thereafter calculated for the triennial obligation, the excess quantity of offsets would simply remain retired and the allowance surrender obligation adjusted upwards accordingly to equal 92 percent of the entire triennial obligation. (In such a case, the total number of offsets and allowances submitted would exceed the triennial obligation, which is a benefit to the environment; if a company chooses this route, there is no harm to the cap, nor to the offset limit policy). (TPI2)

Response: We modified the language in sections 95854 and 95856(f)(2) to clarify this issue. The regulation now establishes that the quantitative use limit applies to the triennial compliance obligation and not the annual compliance obligation. We made this change because applying the limit to each annual surrender is overly complicated, and there is no benefit to the program when applying it annually.

M-19. Comment: The proposed regulation appears to create annual limits on the use of allowances and offsets. This element of the proposed regulation inappropriately reduces the fungibility of allowances and offsets within the three-year compliance period. This defect should be corrected. If only 2012 allowances are valid for surrender to meet compliance obligations for 2012, as currently stated in section 95856(b)(2) and only eight percent of 2012 compliance obligation can be met with offsets as indicated in section 95854, the three-year compliance period is in actuality a series of one-year compliance obligations. However, during workshops ARB explained its intent that allowances and offsets would be fully fungible during the three-year compliance period to be able to smooth out weather and economic growth variations. Accordingly, offsets should be limited only to eight percent of the triennial compliance obligation; there should be no annual limit. Similarly, the requirement for allowances should be modified to indicate that they must be issued during the same triennial compliance period, or before, unless conditions (A) or (B) are met. Allowances issued for 2013 or 2014 should be allowed to be used in 2012.

Modify section 95854 as follows:

The number of offset credits that each covered entity may surrender to meet its ~~annual or~~ triennial compliance obligation must conform to the following limit:

O/S must be less than L
Where:
O = Total number of compliance instruments that are designated as subject to this quantitative usage limit pursuant to subarticle 4, section 95821(b), (c), and (d).
Sector-based offset credits as defined in section 95821 cannot represent more than 25 percent of O in the first and second compliance periods and 50 percent of O in all other periods.
S = Covered entity's ~~annual or~~ triennial compliance obligation
L = Quantitative offset credit usage limit, set at 0.08.

Modify section 95856(b)(2) as follows:

To fulfill any compliance obligation, a compliance instrument must be issued from an allowance budget year within or before the ~~year during which the compliance obligation is calculated~~, <u>end of the compliance period</u> unless:

(A) the allowance was purchased from the Allowance Price Containment Reserve pursuant to section 95913; or
(B) the allowance is used to satisfy an excess emissions obligation. (SEMPRA1)

> **Response:** We modified the language in section 95854 to clarify this issue. The regulation now establishes that the quantitative use limit applies to the triennial compliance obligation and not the annual compliance obligation. We made this change because applying the limit to each annual surrender is overly complicated, and there is no benefit to the program when applying it annually.
>
> We did not make the change requested to section 95856(b)(2). Allowances issued for a future year cannot be used for surrender in an earlier compliance period. The one exception is an allowance purchased from the reserve, which may be used as soon as it is bought. This approach is proposed to prevent the threat of "cascading borrowing." This situation occurs when entities are able to

use future allowances for current compliance, creating a growing shortage of instruments in later compliance periods.

Sector-Based Offset Limit

M-20. (multiple comments)
Comment: Section 95854 (p. A-68) sets out the eight percent offset limit and imposes a sub-limit on the use of sector-based offset credits. The only rationale provided in the ISOR for limiting the use of sector-based offset credits is that sector-based offset crediting programs are “new and evolving” (ISOR, p. III-25). However, the sector-based offset crediting programs will be subject to the same rigorous review as all other offset programs before ARB will approve them, and the Cap and Trade regulation includes specific criteria for such programs. Once a sectoral program has satisfied these criteria and has been subjected to the full Board approval process, there is no valid basis for restricting the use of sector-based offsets to a greater degree than other types of offsets. Sector-based offsets may provide a valuable source of real, cost-effective emission reductions that benefit the climate, the country of origin, and compliance entities in California, but this potential will be reduced by constraining the demand for such offsets even before sector-based programs have been finalized. The sub-limit on using sector-based offsets should be removed. (SCPPA1)

Comment: EDF has estimated that the number of sector-based offsets allowed for compliance will rise from 3.6 million metric tons (MMT) in 2012 to 14.5 MMT in 2020, with about 80.1 MMT cumulatively over the nine-year period, 2012-2020. Relative to the potential supply, these are low limits will unnecessarily constrain the emissions reductions that can be achieved in these sectors by discourage supplying regions from participating, so it may be prudent to consider raising the quantitative limit on sector-based offsets. (EDF1)

Comment: Dow advises ARB to expeditiously pursue the development of sector-based Reducing Emissions from Deforestation and Forest Degradation (“REDD”) offset criteria that can be adopted in time for use to contain costs in the first and subsequent compliance periods. Establishing sectoral REDD credits holds considerable promise to produce significant quantities of offsets, but the availability of those credits during the first compliance period may be very limited or non-existent due to the need to agree on protocols and other administrative tasks. Even if a large supply of REDD offsets is developed, the use of sectoral credits is capped at 25 percent which translates into 10.6 million metric tons of offsets during the first compliance period. Dow advises ARB to consider temporarily raising this cap if other strategies to establish cost containment during the first compliance period fail to mature. (DOWCHEM1)

Comment: ARB should avoid placing unnecessary limitations on the use of sector-based offset credits, as are currently stipulated under the proposed regulation. Sector-based offsets are limited to 25 percent of the total amount of offsets in the first and second compliance period and 50 percent in the third compliance period. Since sector-based offset crediting will be subject to the same detailed review as other offset programs, and proposed regulation sets forth specific criteria for sector based offsets, it is unclear why ARB would place such restrictions on sector-based offsets. Sector-based offsets are an important opportunity for ARB to develop high quality GHG reductions that are cost-effective and complimentary to the Cap and Trade Program. Accordingly, ARB should encourage the development of the offset market by deleting the limitations on sector-based offsets. (PACIFICOR1)

Comment: CERP is concerned with the phased-in sectoral credit use limit within the offsets usage limit. Under the proposed regulations, regulated entities could only use sectoral offsets for 25 percent of their compliance obligation during the first two compliance periods, and for 50 percent during the third compliance period. If there is a shortage of non-sectoral offsets, and a steady supply of sectoral offsets, this usage constraint will severely and unnecessarily hamper the cost containment value of offsets. CERP urges ARB to modify the regulations to empower the Executive Officer to increase the sectoral offsets usage quota if insufficient quantities of non-sectoral credits are available at reasonable prices. In addition, the calculation of the sectoral offsets limit as described in the proposed regulations enhances the program's vulnerability to non-sectoral offsets shortages. The sectoral offsets usage limit is calculated as a percentage of the offsets an entity turns in for compliance, rather than as a percentage of the offsets usage limit. This means that a shortage in non-sectoral offsets will also constrain the quantity of sectoral offsets that can be used, precisely when they will be most needed for cost containment. It is our understanding that ARB staff members are aware of this problem, which should be rectified. (CERP1)

Comment: It would also be helpful if CARB also ensured that programs focused on emissions stemming from deforestation and/or other forestry and land-use activities, in cases where these sectors are the bulk of total emissions, are not limited to be considered as sector-based offsets but could also potentially qualify to enter the California market as allowances from a GHG ETS specified under section 95942(b) issued by a program approved under section 95941 and not subject to the quantitative usage limit. This would further encourage the development of a robust system of emissions trading that reduces emissions comprehensively and cost-effectively. (EDF1)

Comment: EDF believes that the constraints on sector-based crediting should be according to quality rather than quantity criteria. Rigorous quality standards should ensure the integrity of the environmental goal while providing regulated entities with as much flexibility as possible in terms of how those entities can achieve that goal. The limited size of California's market makes it even more critical not to impose further quantitative constraints so as to ensure a robust demand for REDD and other sector-based credits. (EDF1)

> **Response:** We are maintaining the quantitative limit on sector-based offsets as stated in the regulation. In addition to limiting the use of sector-based offset credits because these programs are new and evolving, the limit on sector-based

offset credits will ensure that California's policy objectives to have offset projects implemented in the State of California will be met.

Ensuring Offset Quality and Criteria of AB 32

M-21. Comment: What sort of comprehensive auditing mechanism will ARB put in place to ensure that offset credits are truly "real, permanent, verifiable, enforceable, quantifiable, and additional"? What mechanism will ARB use to make the system whole? Will ARB audit offset credits? Has the cost of oversight for offset credit auditing been considered? (ASMMANDEVORE3)

Response: The regulation proposes a robust monitoring program for offset projects—both the verification that the offsets are real, additional, and enforceable, and that Offset Project Operators, verifiers, and Offset Project Registries are operating according to regulatory requirements. In addition to the ARB audits, Offset Project Registries are required to conduct oversight of their registry program and randomly audit verifications to ensure that our regulatory requirements are being met by Offset Project Operators and verification bodies.

We will provide rigorous oversight of our approved Offset Project Registries. Each year, the Offset Project Registries will provide us with a report providing basic information related to any offset project listed using a Compliance Offset Protocol and any findings related to verification audits. We will require Offset Project Registries to provide any information related to an offset project when requested by us as part of its oversight of the Offset Project Registry. During the course of an offset project, the Offset Project Registry will track and report any guidance or information provided to an Offset Project Operator related to a compliance offset project to us every month. This will ensure that we understand any issues or concerns related to its compliance offset program as Offset Project Operators are implementing the actual offset projects.

In addition, we designed our regulatory offset verification program to provide a transparent process by which we can review verification documents and fully understand any findings uncovered during the course of verification of an offset project by an ARB-accredited verification body. We will also develop an audit and oversight program for offset project verifications. All oversight functions are part of implementation and need not be specified in the regulation.

Finally, ARB's cost of oversight for offset credit auditing has been considered.

M-22. Comment: Three major criticisms of cap and trade schemes are that either the offsets themselves or the trading practices used to account for them are often not verifiable and are fraudulent, and that they can lead to oppression for indigenous communities. The scoping plan proposes to expand a California cap and trade system to other countries where others might benefit from offsets. Put differently, AB 32 would allow more pollution in California, including co-pollutants that would concentrate in low-income communities of color, with the hope that other countries will allow clean development. This vision fails to consider that these trades are not verifiable, they are often not surplus, they exacerbate the equivalency problem, and they increase the likelihood of oppression. AB 32 specifically requires that the regulations do not disproportionately impact low-income communities, that ARB consider the overall societal benefits of any regulation, and that regulations minimize leakage. These requirements have not been met. (CBE1)

> **Response:** We do not agree the requirements of AB 32 have not been met. We designed the regulation to avoid unintended consequences. However, given the complexity of the program, it is important to incorporate systems to monitor and evaluate the performance of the cap-and-trade program. We propose to monitor emissions leakage, the generation and use of offset credits, and the potential for emissions increases to ensure that the program continues to meet the diverse objectives described in Health and Safety Code sections 38562(b) and 38570(b) over time.
>
> Currently, the regulation does not include any provisions to allow offsets to come from other countries. Before ARB would accept any offsets from developing countries, there would be a separate rulemaking which would include a public process and all applicable analyses required through the APA process.
>
> AB 32 states that ARB must minimize leakage to the extent feasible. The cap-and-trade program is designed to minimize leakage to the extent feasible through the allocation strategy and the accounting for leakage using a principle of conservativeness in the offsets program. Offsets are a small component of the cap-and-trade program, which is only one of the strategies that have been adopted to reduce statewide greenhouse gas emissions. The cap-and-trade program together with the other complementary measures that have been adopted meet the requirements of AB 32 in this area.
>
> The regulation proposes a robust monitoring program for offset projects—both the verification that the offsets are real, additional, and enforceable, and that Offset Project Operators, verifiers, and Offset Project Registries are operating according to regulatory requirements. Offset Project Registries are required to conduct oversight of their registry program and randomly audit verifications to ensure that our regulatory requirements are being met by Offset Project Operators and verification bodies. We will provide rigorous oversight of our approved Offset Project Registries. In addition, we designed our regulatory offset verification program to provide a transparent process by which we can review verification documents and fully understand any findings uncovered during the course of verification of an offset project by an ARB-accredited verification body. We will also develop an audit and oversight program for offset project verifications. All oversight functions are part of implementation and need not be specified in the regulation.

The regulation provides a framework for allowances and offsets from other approved programs (such as another cap-and-trade program, an offset registry, or a sector-based crediting program) to be used to meet compliance obligations. The regulation establishes a process by which each program would be evaluated on a case-by-case basis before being considered by the Board. In approving an external program, the Board would also specify what compliance instruments from that program would be accepted for compliance use in California's program. Recognition of another program's compliance instruments or linkage would be implemented by program-specific contracts or memoranda of understandings, as applicable.

Our analysis indicates that the cap-and-trade regulation is expected to have a beneficial impact on air emissions by reducing emissions of criteria pollutants and toxics. Based on the available data, current law and policies that control industrial sources of air pollution, and expected compliance responses, we believe that emission increases due to the regulation at the statewide, regional, or local level are extremely unlikely, at best. Nevertheless, we are committed to monitoring the implementation of the cap-and-trade regulation to identify any situations where the cap-and-trade program has led to an increase in criteria pollutant or toxic emissions. We will also solicit information from local air districts regarding permit modifications and new permit applications for covered sources. This information will be used to identify compliance activities that could lead to increased emissions, and to determine whether further investigation of potential criteria pollutant and toxic emissions is warranted. If unanticipated adverse localized emissions impacts that can be attributed to the cap-and-trade regulation are identified during this periodic review, we will consider whether these impacts affect the achievement of the program objectives. If so, we will promptly develop and implement appropriate responses. Potential responses we would consider include, but are not limited to, supporting the use of allowance value from the cap-and-trade program to mitigate localized emissions increases, providing incentives for energy efficiency and other emissions-reduction activities within the community, or restricting trading or prohibiting certain compliance responses in specifically identified communities. These potential future responses are not, however, warranted based on currently available information, and their imposition today would unnecessarily conflict with AB 32's other objectives.

M-23. Comment: I strongly disagree with the use of offsets as a means to implement AB 32, and particularly to offsets outside of California. It appears it would be impossible to verify that offsets are "real, permanent, quantifiable, verifiable, enforceable, and additional," given the lack of any proposed objective method to determine if such standards are met. Further, it is easy to conceive of methods for shady businesses to profit through manipulation. The obvious concern is that businesses will create a multi-billion "cottage" industry to exploit the system by feigning that an activity is "additional," and the state will be hamstrung to prove otherwise, all while emission reduction targets are missed. California cannot afford to allow key, targeted polluting sectors to avoid reducing greenhouse gas emissions or to create perverse incentives to develop an offset industry. (REAVES)

> **Response:** We disagree that offsets cannot be verified or meet the requirements of AB 32. The regulation proposes a robust monitoring program for offset projects—both the verification that the offsets are real, additional, and enforceable, and that Offset Project Operators, verifiers, and Offset Project Registries are operating according to regulatory requirements. Offset Project Registries are required to conduct oversight of their registry program and randomly audit verifications to ensure that our regulatory requirements are being met by Offset Project Operators and verification bodies. We will provide rigorous oversight of our approved Offset Project Registries. In addition, we designed our regulatory offset verification program to provide a transparent process by which we can review verification documents and fully understand any findings uncovered during the course of verification of an offset project by an ARB accredited verification body. We will also develop an audit and oversight program for offset project verifications and offset project developers and these audits will be conducted by ARB. All oversight functions are part of implementation and need not be specified in the regulation.
>
> We disagree that the inclusion of offsets does not require capped sources to reduce emissions. The program imposes what we believe is an appropriate limit on the amount of offsets that an individual covered entity can use for compliance. All offsets used for compliance are real reductions, albeit outside the cap. Allowing a limited number of offsets into the program provides cost-containment benefits and ensures that some GHG emissions reductions occur within the sectors covered by the cap-and-trade program. The program includes provisions that would allow a maximum of 201 $MMTCO_2e$ of offsets through the year 2020. This limit will be enforced through a limit on the use of offsets by an individual entity equal to eight percent of its compliance obligation, or total emissions. Combined with the Allowance Price Containment Reserve, this limit ensures that reductions from the program come from sources covered by the program at expected allowance prices, while use of the reserve will relax that constraint if prices rise.
>
> In regard to additionality, we believe that the Compliance Offset Protocols, in conjunction with all of the strict and thorough requirements in the regulation regarding offsets, meet the requirements of AB 32. The Compliance Offset Protocols adopted under the cap-and-trade regulation have been established with multiple levels of review, use conservative methods to account for uncertainty and emissions leakage, and to establish the additionality of offset projects in setting project baselines.

M-24. Comment: Offsets allow developed countries to ignore legally binding emission reduction commitments. With offsets, developed countries can continue to produce more than their fair share of emissions, at a time in which reductions are required by all nations, but particularly by those historically responsible for the problem. This is not merely stating the fact as a matter of equity, but it is required by the Framework Convention on Climate Change, the international agreement signed by most nations in the early 1990s, committing developed countries to reduce their emissions, and to provide "new and additional" money to less-developed nations to help them with clean development and climate-change mitigation. This assistance to the developed world was very clearly meant to be in addition to, not instead of, immediate emissions reductions on the part of the developed world.

Offsets create a disincentive for technological innovation for the buyers of credits. While companies selling credits—that is, those which emit at a level below that of their carbon allocation—have an incentive to innovate, companies in highly polluting industries have no incentive as long as credits are available to them at rates lower than the anticipated cost of reduced emissions. Why should they innovate or even start on the research and development that would be required? More broadly, the existence of offsets postpones the major structural changes necessary for developed countries to switch to a low-carbon infrastructure, and allows their worst polluters to continue to emit greenhouse gases when they should be actively winding them down.

Offsets create disincentives for quicker paths to emission reductions. Offsets approved by the UN's Clean Development Mechanism executive board must be, among other things, additional to greenhouse gas reduction activity that would have occurred anyway. This rule, set for obvious reasons with respect to the purpose of the program, unfortunately creates a perverse disincentive to new programs of regulation and/or taxation in regions of sellers of certificates, usually the developing world. If more stringent regulations were set, they would limit eligibility for some projects that might have been granted approval otherwise, undercutting the inward flow of capital.

Markets do not plan and are unconcerned with equity or transparency. Relying on market forces to create clean development in the developing world removes that activity from any transparent public planning process that considers sustainability, equity, or regional economic need.

Less-developed countries are forgotten. Development projects have been disproportionately located where industrial infrastructure is already well-established—that is China, India, Mexico and Brazil (now collectively about 80 percent of all projects)—leaving less-developed nations with little inflow of money for mitigation and clean development. Offsets, along with speculation, should be eliminated from the program. (MAGILAVY)

> **Response:** We disagree that the inclusion of offsets does not require capped sources to reduce emissions. The program imposes a limit on what we believe is an appropriate amount of offsets that an individual covered entity can use for compliance. All offsets used for compliance are real reductions, albeit outside the cap. Allowing a limited number of offsets into the program provides cost-containment benefits and ensures that some GHG emissions reductions occur

within the sectors covered by the cap-and-trade program. The program includes provisions that would allow a maximum of 201 $MMTCO_2e$ of offsets through the year 2020. This limit will be enforced through a limit on the use of offsets by an individual entity equal to eight percent of its compliance obligation, or total emissions. Combined with the Allowance Price Containment Reserve, this limit ensures that reductions from the program come from sources covered by the program at expected allowance prices, while use of the reserve will relax that constraint if prices rise.

We disagree with the statements about additionality. We believe that the Compliance Offset Protocols in conjunction with all of the strict and thorough requirements in the regulation regarding offsets meet the requirements of AB 32. The Compliance Offset Protocols adopted under the cap-and-trade regulation have been established with multiple levels of review, use conservative methods to account for uncertainty and emissions leakage and to establish the additionality of offset projects in setting project baselines. Moreover, the offsets currently approved in the program under the four protocols may only result from GHG reductions or sequestration in the United States. We have not approved any offsets from other countries and have not approved any offsets developed under the Clean Development Mechanism (CDM). Our offsets program is designed very differently than the CDM by relying on standardized assessments of additionality established by ARB through a public process and not relying on project-specific assessments done by the project developers themselves.

Currently, we do not have any provisions for offsets to be developed outside of the United States. We will continue to evaluate whether the four project types already approved for use in the program could be expanded to apply outside of the United States. Any changes to the already adopted protocols will be done as part of a separate rulemaking process, to ensure that the GHG reductions and GHG removal enhancements being credited as offsets are real, additional, quantifiable, permanent, verifiable, and enforceable.

M-25. Comment: Offsets do not and will not provide real emissions reductions. They will offset the responsibility of the State and polluting industries. This will allow pollution in California to continue both in the form of CO_2 emissions and in the form of the more immediate toxic threats from refineries, incinerators, power plants and so on. This will lead to the kinds of immediate health impacts we see around the Richmond refineries, Kettleman City, West Oakland, Fresno, and other industrial impacted areas. I would recommend that offset allowances within AB 32 be kept to a minimum in order to truly encourage clean and green economic alternatives for California. (GJEP1, GJEP2)

Response: We disagree that the offsets in our program do not provide real reductions. We believe that the Compliance Offset Protocols, in conjunction with all of the strict and thorough requirements in the regulation regarding offsets, meet the requirements of AB 32. The Compliance Offset Protocols adopted under the cap-and-trade regulation have been established with multiple levels of review, use conservative methods to account for uncertainty and emissions leakage and to establish the additionality of offset projects in setting project baselines.

We disagree that the inclusion of offsets does not require capped sources to reduce emissions. The program imposes a limit on what we believe is an appropriate amount of offsets that an individual covered entity can use for compliance. All offsets used for compliance are real reductions, albeit outside the cap. Allowing a limited number of offsets into the program provides cost-containment benefits and ensures that some GHG emissions reductions occur within the sectors covered by the cap-and-trade program. The program includes provisions that would allow a maximum of 201 $MMTCO_2e$ of offsets through the year 2020. This limit will be enforced through a limit on the use of offsets by an individual entity equal to eight percent of its compliance obligation, or total emissions. Combined with the Allowance Price Containment Reserve, this limit ensures that reductions from the program come from sources covered by the program at expected allowance prices, while use of the reserve will relax that constraint if prices rise.

M-26. Comment: None of the offset types described under the Offset Protocols under discussion for AB 32 could ever be demonstrated to be real, permanent, quantifiable, verifiable, enforceable, or additional. Hence they do not meet AB 32 requirements and should be rejected. Offsets would play an even more egregious role undermining AB 32 than emissions trading proper, for additional reasons involving verifiability, reflexivity, counter productivity and environmental and social damage that have been well-rehearsed in the peer-reviewed literature. (CORNERHOUSE)

Response: We disagree with these statements. We believe offsets are real GHG reductions, albeit it from outside the cap. We believe that the Compliance Offset Protocols in conjunction with all of the strict and thorough requirements in the regulation regarding offsets meet the requirements of AB 32. The Compliance Offset Protocols adopted under the cap-and-trade regulation have been established with multiple levels of review, use conservative methods to account for uncertainty and emissions leakage and to establish the additionality of offset projects in setting project baselines. To assure offset quality, the program includes rigorous oversight and audit procedures for all ARB-accredited offset verifiers, offset project developers, and Offset Project Registries. In addition, the registry system for compliance instruments is being designed to provide strong enforcement capabilities, including mechanisms to prevent double-counting, public disclosure requirements, and methods to clearly define ownership.

M-27. (multiple comments)
Comment: Carbon offsets are a means to allow companies to buy their way out of responsibility for cutting their own emissions with theoretical reductions elsewhere. The fundamental problems with this scheme include:

- Shifting Responsibility: Offsetting does not reduce emissions at the source, but allows companies to buy credits from elsewhere.
- Selling stories: Offsetting rests on “additionality” claims about what “would otherwise have happened.” The net result for the climate is that offsetting tends to increase rather than reduce greenhouse gas emissions, displacing the necessity to act in one location by a theoretical claim to act differently in another. Moreover, countries that host offset projects have a new barrier to the implementation of environmental regulations, since to do so would remove “additionality” and thereby cut of potential revenue.
- Making things the same: The value of CDM projects is premised on constructing a whole series of dubious “equivalences” between very different economic and industrial practices, with the uncertainties of comparison overlooked to ensure that a single commodity can be constructed and exchanged. This does not alter the fact that burning more coal and oil is in no way eliminated by building more hydro- electric dams, planting monoculture tree plantations or capturing the methane in coal mines.
- Offsets burst the cap: While cap and trade in theory limits the availability of pollution permits, offset projects are a license to print new ones.
- Carbon offsets subsidize increased greenhouse gas emissions: One of the most frequent justifications put forward for carbon offsets is that they should ensure that the cheapest reductions are made first. In practice, these tend to be generated by loopholes and generous subsidies for the deployment of existing technologies, rather than stimulating shifts to a more sustainable future. (CTW)

Comment: Within the cap and trade system, offsets represent an alternative means of achieving legislated emission reductions. They enable reductions to occur outside regulated sectors, and can be more cost effective than onsite reduction at regulated emission sources. However, if emission reductions which result from “business as usual” activities are allowed as emission offsets, the emissions cap could be exceeded and the legislated quantity of emission reductions will not be achieved. (TPI1)

> **Response:** We disagree that the inclusion of offsets allows entities to buy their way out of reducing emissions on site. The program imposes a limit on what we believe is an appropriate amount of offsets that an individual covered entity can use for compliance. All offsets used for compliance are real reductions, albeit outside the cap. Allowing a limited number of offsets into the program provides cost-containment benefits and ensures that some GHG emissions reductions occur within the sectors covered by the cap-and-trade program. The program includes provisions that would allow a maximum of 201 $MMTCO_2e$ of offsets through the year 2020. This limit will be enforced through a limit on the use of offsets by an individual entity equal to eight percent of its compliance obligation, or total emissions. Combined with the Allowance Price Containment Reserve, this limit ensures that reductions from the program come from sources covered by the program at expected allowance prices, while use of the reserve will relax that constraint if prices rise. By establishing an allowance budget in the

regulation and quantitative offset usage limit, we believe there will be no "bursting of the cap."

We believe that the Compliance Offset Protocols, in conjunction with all of the strict and thorough requirements in the regulation regarding offsets, meet the requirements of AB 32. The Compliance Offset Protocols adopted under the cap-and-trade regulation have been established with multiple levels of review, use conservative methods to account for uncertainty and emissions leakage, and to establish the additionality of offset projects in setting project baselines. Moreover, the offsets currently approved in the program may only result from GHG reductions or sequestration in the United States. We have not approved any offsets from other countries and have not approved any offsets developed under the Clean Development Mechanism (CDM). Our offsets program is designed very differently than the CDM by relying on standardized assessments of additionality established by ARB through a public process and not relying on project-specific assessments done by the project developers themselves.

M-28. Comment: AB 32 requires that greenhouse gas ("GHG") offsets be "real, permanent, quantifiable, verifiable, enforceable, and additional." Adoption of the proposed Offset Protocols by the California Air Resources Board is arbitrary and capricious and should be rejected because the protocols for proposed GHG offsets cannot meet these standards. In addition, to the extent that GHG offsets are not additional, they destroy the integrity of the entire program by allowing additional GHG emissions from the capped sector above the "cap" that will not be offset by additional emission reductions elsewhere. Finally, because California's program is looked to as a model and proof of concept, adoption of this flawed mechanism would be extremely damaging to national and international efforts to effectively reduce GHG emissions. Adoption of GHG offsets as part of the California program would serve as a template for such programs, encouraging others to pursue this flawed approach to the most urgent problem facing humanity, increasing the chances of catastrophic climate change, and defeating the stated purpose of AB 32. Under the proposed action, "covered entities can use offset credits to satisfy up to eight percent of the entity's total compliance obligations." See Notice of Public Hearing at p. 5. This eight percent of the compliance obligation is very significant percentage of the total reductions sought.

To be credited as an offset, the staff report states that a project "must also be additional to what is required by law or regulation <u>or would otherwise have occurred</u>." See ARB Staff Report, page 35 of 472. (Emphasis added). Our analysis focuses primarily on the latter requirement. As demonstrated in our Whistleblower Disclosure ("Williams/Zabel Disclosure"), dated July 22, 2010) http://www.carbonfees.org/home/Whistleblower_Disclosure_to_Congress_7-21-10.pdf), GHG offsets of the type that ARB proposed to adopt are fatally flawed and cannot be fixed. There is no reliable way to distinguish offset projects which will occur because of the offset incentive from those which would have happened anyway because of the following four unfixable flaws of GHG Offsets:

Additionality: Whether reductions outside the capped sector are additional is necessarily a hypothetical inquiry and such an inquiry cannot reliably distinguish business-as-usual. Specifically, it is impossible to know what "otherwise would have occurred" and therefore it is not possible to create an offset program that reliably excludes business-as usual activities from being counted as "additional." (See U.S. Government Accountability Office discussion below, confirming this conclusion).

Leakage/Shifting Economic Activity: In some cases, such as in the context of forestry projects, the offsets will fail to appreciably mitigate demand and the polluting activity (such as logging) will simply shift elsewhere;

Perverse Incentives to Increase Emissions and Keep Them Legal: GHG offsets create perverse incentives to keep polluting activities legal and in some cases to increase them, so they can keep being sold as offsets (Note: this dynamic is recognized in the Ozone Depleting Substances ("ODS") Protocol re: HCFC-22 by-product HFC-23 destruction in the United Nations Clean Development Mechanism ("CDM"), see ODS Protocol at p. 11 of 67); and

Unenforceable: The complexity and subjectivity of offsets renders them impossible to certify, regulate or enforce.

As explained in our discussion below of each of the four proposed offset protocols suffers from one or more of these flaws and would result in approval of non-additional projects in violation of AB 32. As a result, it would be arbitrary and capricious to adopt the proposed GHG offset protocols as part of the proposed Cap and Trade program. See also, U.S. Government Accountability Office, March 2009 ―Observations on the Potential Role of Carbon Offsets in Climate Change Legislation‖ at p. 12, GAO-09-456T (http://www.gao.gov/new.items/d09456t.pdf). "Because additionality is based on projections of what would have occurred in the absence of the CDM [United Nations Clean Development Mechanism], which are necessarily hypothetical, it is impossible to know with certainty whether any given project is additional."

Keeping Our Eyes on the Wrong Ball - Offsets are described in the Staff Report as a "cost containment mechanism," which offers additional low-cost emissions-reduction opportunities. See Staff Report at page 14 of 472. However, cost containment interferes with another goal cited in the Staff Report—to "stimulate investment in clean and efficient technologies." See Staff Report at page 11 of 472. Keeping the price of fossil fuel emissions lower by allowing offsets delays investment in clean energy technologies and energy efficiency by keeping fossil fuels cost competitive. As a result, such "cost containment" defeats the goal of a rapid transition to clean energy and energy efficiency. See http://www.carbonfees.org/home/Cap-and-TradeVsCarbonFees.pdf (WILLIAMSZ)

> **Response:** We disagree that the inclusion of offsets does not require capped sources to reduce emissions. The program imposes a limit on what we believe is an appropriate amount of offsets that an individual covered entity can use for

compliance. All offsets used for compliance are real reductions, albeit outside the cap. Allowing a limited number of offsets into the program provides cost-containment benefits and ensures that some GHG emissions reductions occur within the sectors covered by the cap-and-trade program. The program includes provisions that would allow a maximum of 201 $MMTCO_2e$ of offsets through the year 2020. This limit will be enforced through a limit on the use of offsets by an individual entity equal to eight percent of its compliance obligation, or total emissions. Combined with the Allowance Price Containment Reserve, this limit ensures that reductions from the program come from sources covered by the program at expected allowance prices, while use of the reserve will relax that constraint if prices rise. In addition, California's cap-and-trade program only allows offsets to equal up to eight percent of an entity's compliance obligation, as opposed to the early phases of the EU ETS and the federal cap-and-trade bills proposed in recent years. For example, the Waxman-Markey bill would have allowed 30 percent offsets at the start of the program and 60 percent by 2050. We advocated then and still believe that offsets provide an important role in the program by providing cost-containment benefits, but that they do need to be limited to require capped entities to make meaningful emission reductions at the source. We believe the limited use of offsets in our program will serve as a good template for new proposals at the federal level.

We disagree with the statements about additionality. We believe that the Compliance Offset Protocols, in conjunction with all of the strict and thorough requirements in the regulation regarding offsets, meet the requirements of AB 32. The Compliance Offset Protocols adopted under the cap-and-trade regulation have been established with multiple levels of review, use conservative methods to account for uncertainty and emissions leakage and to establish the additionality of offset projects in setting project baselines. Moreover, the offsets currently approved in the program may only result from GHG reductions or sequestration in the United States. We have not approved any offsets from other countries and have not approved any offsets developed under the Clean Development Mechanism (CDM). Our offsets program is designed very differently than the CDM by relying on standardized assessments of additionality established by ARB through a public process and not relying on project-specific assessments done by the project developers themselves.

To ensure that reductions or removals credited as offsets are real, the regulation requires that all Compliance Offset Protocols address activity-shifting and market-shifting leakage. Each protocol incorporated by reference, including the forest protocol, accounts for leakage in the quantification of the reductions or removals achieved by the offset projects. In addition, when uncertainty exists in quantifying GHG reductions, ARB will only issue offset credits when there is a high level of confidence that reductions actually occurred. The regulation employs a principle of conservativeness in the quantification of emissions reductions. This method will ensure that the accounting will underestimate rather than overestimate any reductions when there is a high level of uncertainty.

Furthermore, ARB's Compliance Offset Protocol for Ozone Depleting Substances Projects does not credit the destruction of HFC-23, and only credits the destruction of gases that have been phased out, originate in the United States, and only exist in banks that would otherwise leak into the atmosphere. Therefore, under ARB's protocol there are no perverse incentives to produce these gases.

ARB has full enforcement and oversight authority over all offset project developers, offset verifiers and verification bodies, and Offset Project Registries. ARB can disallow offset issuance to a project developer, revoke or suspend the accreditation of ARB-accredited verifiers, and revoke or suspend the approval of Offset Project Registries. In addition, the regulation requires all users of offset credits to replace them to ARB in the event they are found to be invalid after issuance.

In addition to stimulating investment in clean energy technologies and energy efficiency in capped sectors, another goal of the cap-and-trade program is to "support the development of innovative projects and technologies from sources outside capped sectors that can play a key role in reducing emissions both inside and outside California" through the inclusion of offsets (page ES-4 and ES-5 of the Staff Report). Through a combination of the declining cap and the limited use of offsets, both goals can be met.

M-29. Comment: Offset projects involving livestock manure, ozone depleting substances, and forestry mentioned in the proposal under review have a well-documented international record of being particularly damaging not only to the climate, but to local economies and the environment. HFC-23 offsets, for instance, have caused a scandal at the level of the United Nations Framework Convention on Climate Change because of their climatically-damaging effects due to perverse incentives for production of additional greenhouse gas. Livestock manure projects in Mexico and elsewhere are subject to the same problem and are also provoking heavy public resistance, as are REDD and other carbon forestry projects worldwide. (CORNERHOUSE)

Response: All offset protocols used in the compliance program must be adopted by the Board after undergoing a full regulatory process in accordance with the Administrative Procedure Act. Before the Board adopts a new protocol there will be a separate CEQA review to assess the environmental impacts associated with that protocol. In addition, offset protocols include several elements to support existing health and environmental protection measures. Specifically, each individual offset protocol requires all offset projects to be developed in compliance with all federal, state, and local laws, regulations, ordinances, and any other legal mandate, including all CEQA and National Environmental Policy Act (NEPA) requirements where applicable. The Offset Project Operator is required to attest to ARB that their offset project meets these requirements. If, during verification, it is found that the offset project does not meet any of these requirements, the project is ineligible to be issued ARB offset credits until the project is in compliance. In addition to regulatory compliance, during project listing, Offset Project Operators must provide detailed project information, which must be posted on the Internet and available for public review.

Furthermore, ARB's Compliance Offset Protocol for Ozone Depleting Substances Projects does not credit the destruction of HFC-23 and only credits the destruction of gases that have been phased out, originate in the United States, and only exist in banks that would otherwise leak into the atmosphere. Therefore, under ARB's protocol there are no perverse incentives to produce these gases.

M-30. Comment: We are concerned with the proposed use of agricultural offsets. Our understanding was that the CO_2 reductions from agriculture were determined to be too difficult to verify or quantify to include it in the cap, yet your proposed draft allows for offsets from these same sources. How will these emission reductions be verified or quantified? (FRESNOMINISTRY)

Response: Currently, the only offset protocols that are approved for agriculture is the reduction of methane from livestock manure digesters. We believe this protocol is rigorous and accurately quantifies the emission reductions achieved by digester projects. Any new offset protocols must be approved by the Board to ensure projects meet the high standards intended under AB 32 (must be real, permanent, quantifiable, verifiable, enforceable, and additional). The Board will consider adopting additional compliance offset protocols in a separate rulemaking in the near future and will work with our WCI partners in this regard.

M-31. (multiple comments)
Comment: Safeguards against manipulation and other forms of fraudulent behavior would be beneficial, including additional provisions to guard against double counting of offsets in multiple systems. While section 95985(a) partially addresses this concern, further restrictions may be necessary to prevent the same offset credits from being sold more than once in different markets. Linkage agreements and coordination efforts between CA and other programs may help address this concern, as well as the requirement of an additional attestation from Offset Project Operators regarding this concern. (CCAP1)

Comment: CARB should devise a means of ensuring that the same offset project is not available for sale through multiple registries throughout North America and not sold more than once. (WALTERS, UCS1, LUDLOW)

Comment: Ensure that offsets cannot be sold more than once through different registries. (VARON)

Response: New section 95975(c)(5) of the regulation now requires that an Offset Project Operator or Authorized Project Designee disclose any offset credits issued for the same project for any other purposes in any other program. In addition, we added new attestations to section 95981(c). Offset Project Operators and Authorized Project Designees must make these attestation(s) in order for ARB to issue offset credits. Also, if ARB finds that ARB offset credits were issued to the offset project for the same GHG reductions or GHG removal enhancements, ARB may invalidate the ARB offset credits pursuant to section 95985. This provision addresses double-counting of the GHG reductions or GHG removal enhancements in multiple programs.

M-32. Comment: Board should close potential loopholes in the offset process by giving the Executive Officer explicit authority to deny any offset proposals that do not meet standards, and should ensure that the same offset project cannot be sold more than once through different registries. (SIERRACLUBCA4)

Response: We agree with the suggested change. The Board gave the Executive Officer the authority over offset proposals. In addition, we added language in the verification section to delete Offset Project Registries from the appeals process for Adverse Verification statements. This clarification was made to be consistent with the MRR and reflects stakeholder comments that the appeals process should only be limited to determinations made by the Executive Officer of ARB and that ARB should be the only one to make these determinations. We also clarified that ARB makes the final determination on whether or not ARB offsets credits should be issued and meet all requirements of the regulation, and we added this text to the regulation.

In addition we added new section 95975(c)(5) to the regulation that now requires Offset Project Operators or Authorized Project Designees to disclose any offset credits issued for the same project for any other purposes in any other program. In addition, we added new attestations to section 95981(c). Offset Project Operators and Authorized Project Designees must make these attestation(s) in order for ARB to issue offset credits. Also, if ARB finds that ARB offset credits were issued to the offset project for the same GHG reductions or GHG removal enhancements, ARB may invalidate the ARB offset credits pursuant to section 95985. This provision addresses double-counting of the GHG reductions or GHG removal enhancements in multiple programs.

M-33. Comment: In addition to potentially encouraging a move to anaerobic conditions so that a dairy would qualify for offsets, the Digester Protocol also creates an incentive for additional market participants to oppose regulation that would require either aerobic treatment or an anaerobic digester. As noted with respect to the other Protocols and in the Williams/Zabel Disclosure, normal regulatory evolution would move in the direction of prohibiting activities that are found to be harmful in significant ways that were not previously appreciated or known. In this case, all facilities that engage in anaerobic storage of manure for more than 150 cows could potentially be required to use a biogas control system and destroy or sell the resulting methane for energy. A law that creates an offset market for this activity creates opposition to a comprehensive regulation that would remove this activity from the offset market and deprive these market participants of the related revenue, creating instead an obligation that has associated costs. The heightened opposition to such regulation should be analyzed as part of "what otherwise would occur," in order to fully consider whether the proposed offset protocol creates truly additional reductions outside the capped sector. (WILLIAMSZ)

> **Response:** Regulatory additionality is assessed based on the regulatory environment at the time of implementation of the offset project. Additionality is not intended to look at what types of regulations could potentially be implemented in the future. The purpose of the offsets program is to incent actions to reduce GHG emissions for those activities that are not already required or being implemented as part current practices. In addition, ARB will periodically assess all offset project types to determine if they are still additional. If a new law is passed, or an activity has become common practice, no new offset projects would be able to be implemented. As such, it is not practical or technically accurate to consider an activity unadditional because there may be some unforeseen regulations that could be implemented in the future.

M-34. (multiple comments)
Comment: Imposing the most stringent regulatory additionality requirement across multiple legal jurisdictions needlessly wastes low-cost emission reduction opportunities. The staff report suggests that ARB's intent is to define additionality such that the most stringent regulatory requirement in any jurisdiction will be assumed to be in effect in all of the other jurisdictions throughout the Western Climate Initiative (WCI). Our understanding is that this "regulatory additionality" proposal is based on an assumption that the availability of income from offsets would discourage other jurisdictions from adopting regulations such as those in California—and, conversely, that denying such income would encourage promulgation of such regulations. In our view, this assumption is highly speculative, and rather reductionist. States adopt rules, or do not adopt them, for any number of reasons. The ARB's proposal seems to overstate the influence of the California offsets program on policies in other states.

This account also understates the possibility that California's offsets program could promote promulgation of new regulations, e.g., by providing financial incentives for the installation of emission capture technologies, thereby making it easier for other jurisdictions to later require their use. If California's offsets program were to help make certain abatement activities in other states effectively "business-as-usual," such activities would no longer qualify for offset credits and there would be little resistance to a regulatory requirement that they be maintained. In any event, there is no reason to make an a priori assumption about the influence of the California offsets program on other jurisdictions. A better approach would be to launch the program without this "regulatory additionality" proposal. If, after some initial period of time, there is evidence that the California offset rules are discouraging other jurisdictions from adopting regulations similar to those in the California system, the relevant offset project type(s) could be made ineligible. CERP strongly urges ARB to revisit this approach because it will deny California and the WCI system the benefit of any number of emission reduction projects that are truly additional, thereby constricting offset supply and increasing compliance costs. (CERP1)

Comment: Baselines should be established with reference to the laws and regulations that apply in the jurisdiction in which the offset project is located. The highest WCI standards should not be used to set baselines. That would be inappropriate and would substantially reduce the number of viable offset projects. Using jurisdiction-specific standards will not be a disincentive for that jurisdiction to shift towards more stringent standards. Countries, states, and provinces have many reasons for enacting (or not enacting) more stringent environmental regulations and pursuing clean-energy goals. Whether or not a jurisdiction takes these steps has little to do with whether some entities in that jurisdiction may be able to earn offsets for particular activities. Therefore there is no reason to set baselines according to the highest WCI standards rather than local regulations. The types of “early action” offsets allowed to be used for compliance should be expanded to include all CAR offsets (Climate Reserve Tons or “CRTs”). (SCPPA2)

> **Response:** The decision to only include offset projects that qualify based on a regional additionality test throughout the WCI was made by the Partners to ensure that offset projects will be developed in WCI Partner jurisdictions and to ensure that a portion of the revenues generated from offsets would be generated in-state. WCI Partners do not want to create a program that pays parties in other states and provinces to undertake activities that they are requiring their sources to undertake by capping them or applying other direct regulations to such activities.

M-35. Comment: CARB should evaluate conservative crediting of emissions reductions and consideration of uncertainty in the aggregate across a pool of individual projects to account for uncertainty, thereby allowing for expansion of scientific knowledge during the lifetime of specified emissions reduction projects without disqualifying that project from the start. (EDF1)

> **Response:** When uncertainty exists in quantifying GHG reductions, we propose to employ a principle of conservativeness in the quantification of emissions reductions. In the cap-and-trade offsets program, the quantification methods are established in a Compliance Offset Protocol. Our offsets program relies on standardized assessments of additionality established by ARB through a public process and not relying on project-specific assessments. This method will ensure that the accounting will underestimate rather than overestimate any reductions when there is a high level of uncertainty. We believe this approach is important to the environmental integrity of the program.

Offset Supply and Additional Offset Protocols

M-36. Comment: There is an apparent inconsistency. The supply of offsets is given to be "Q = (P-8)/0.75" where P is the allowance price (page N-8 of Appendix E). In a prior document, the offset supply is given to be "Q = (P-8)/0.15" (Updated Economic Analysis of Scoping Plan March 24, 2010). Based on the offset supply numbers presented in CARB's latest analysis, it is not clear which of the two offset supply formulas is the correct one. (CAPCOA1, CAPCOA2)

> **Response:** For the Scoping Plan analysis, we used an offset supply curve that looked at the cumulative supply for all years of a cap-and-trade program. The formula Q = (P-8)/0.15 represents the total quantity of offsets as a function of the 2020 allowance price.
>
> In Appendix N of the Staff Report, we used an offset supply curve for each individual year of a cap-and-trade program. The formula Q = (P-8)/0.75, represents the quantity of a given year's offsets as a function of that year's allowance price.

M-37. (multiple comments)
Comment: SCPPA's chief concern is that ARB's approach to the offsets program, both its own protocols and links to other offset programs, is so restrictive and will be finalized so late that not enough offsets will be available at the start of the cap and trade program to contain compliance costs. The ARB's own projections indicate that in some scenarios the demand for offsets will significantly exceed supply. The ARB should make every effort to avoid this outcome, given the key role of offsets in cost containment as repeatedly confirmed in the economic analyses of the cap and trade program. High-quality offset programs currently exist, including the Climate Action Reserve (CAR) and the Clean Development Mechanism under the Kyoto Protocol (CDM). These up-and-running programs should be utilized more fully. (SCPPA2)

Comment: NCPA appreciates CARB's recognition of the important role that offsets will play in the California program. However, as currently contemplated, there are an insufficient number of qualified offset project available to California compliance entities. CARB must move expeditiously towards approving additional offset protocols. (NCPA1)

Comment: ARB should enact certification protocols for a broader array of projects in the very near term to help ensure that a sufficient supply of offset credits will be available. Given the incipient nature of the offset market and its potential to achieve significant GHG emission reductions within California, nationally, and globally, we urge ARB to find ways to encourage the development of a robust offset market and not place seemingly-arbitrary restrictions on the use or certification of offsets. (PACIFICOR1)

Comment: In these difficult economic times, it is imperative that there be a robust supply of quality offsets to mitigate the cost of complying with the many requirements of AB 32, especially as under CARB's Scoping Plan only approximately 20 percent of the

State's GHG emission reductions are to come from market-based mechanisms. Offset projects achieve GHG emission reductions now. Millions of tons of GHGs have been reduced over the last 15 years in the U.S. through the voluntary offsets market. This experience can be deployed quickly to create a pool of low-cost GHG emissions reductions for covered facilities under the regulation, thereby promoting many of the goals of AB 32. (COPC1)

Comment: One of CERP's primary concerns with the proposed Cap and Trade regulations is that the offset program will not generate sufficient offsets to meet the demand anticipated and provide the cost containment needed. The draft regulations would create an offset program with an early action component, but the program is limited to only four project types. Of the four project types, only projects to destroy ozone-depleting substances (ODS) are projected to generate significant offset volume in the near term. Because of the structure of the offsets program and the limited number of offset project types, CERP is concerned that there will not be enough offsets, and that the program will be overly dependent upon a single offset project type. There are simple but important changes that would help remedy this situation. (CERP1)

Comment: The ARB Board Resolution adopting final AB 32 regulation should reflect the Staff Report's statement on the importance of linkage and offset availability. We are concerned that ARB's limited approval process and the adoption of only four protocols will impact offset supply. We have detailed recommendations to help ensure that a large supply of offsets will be available. We believe it is vital that these be proposed and approved in early 2011 so that an offset supply can develop prior to the launch of the market. (CHEVRON1)

Comment: CARB should consider how to assure an ample supply of high-quality offsets to help companies comply with carbon reduction strategies in a cost-effective manner. As the new economic study shows, offsets will play a critical role in the successful implementation of AB 32 and provide a link to a future national framework as well as to international carbon markets. (LADWP1)

Comment: PG&E believes that offsets will help California advance the goals of AB 32 while containing the overall cost to the California economy. I'm concerned about the supply of offsets based on my experience with the Climate Smart program. In the first compliance period, estimates are that we will have less than half the necessary volume that will be allowed. There are four different ways that we can work to address that supply. 1) Approve the four reserve protocols: Coal mine methane, Nitric acid production, organic waste diversion, and organic waste composting. The Board should also consider the Article 5 Ozone Depleting Substance Protocol. Take a look at the comments from Eos Climate; 2) Approve existing protocols from other bodies, such as the American Carbon Reserve's fertilizer management protocol; 3) Develop infrastructure necessary for offsets from REDD, Reducing Emissions From Deforestation and Forest Degradation. We're encouraged by the MOU that California has with Chiapas and Acre, Brazil, and encourage ARB to develop the working group recommendations outlined in the MOU. They allow ARB to allow REDD offsets within the first compliance period; and 4) Consider offsets from the capture of methane from landfills. This one-time use of offsets between the period of 2005 and 2011 will allow a necessary volume. (PGE1, PGE3)

Comment: CARB should expand the list of eligible domestic offset protocols. (CONOCO)

Comment: We encourage CARB to consider the inclusion of other offset protocols outside of the four protocols currently under consideration. (CALCHAMBER1)

Comment: ARB must be more aggressive in promoting the use of offsets by increasing the speed at which offset protocols are adopted. (WSPA1, WSPA2)

Comment: We welcome CARB's initial selection of protocols and encourage CARB to set in place measures to expand the list of protocols available to compliance entities, so long as there is harmonization with other environmental and regulatory objectives in the state. For example, we do believe there is logic in CARB's exclusion of landfill gas projects but would note that landfill projects in Mexico are among the most clear-cut cases of high quality, additional offsets in that many are little more than large uncontrolled trash dumps where there are few incentives to control, secure, and sanitize the site other than via implementing a landfill gas carbon project. (CLIMATEWEDGE)

Comment: Work with stakeholders to expand the supply of offsets. Under the proposed rule, up to 42.5 million tons of offsets would be allowed during the first compliance period. Given the thin volumes currently available, it appears very unlikely that supply would match demand in the first compliance period. The supply of offsets in the second and third compliance periods would need to more than twice as large in order for the cost containment benefit of offsets to be achieved. Dow is concerned that this mismatch between supply and potential demand will extend into the second and third compliance periods unless ARB expeditiously undertakes measures that will enable the offsets program to more fully serve its intended purpose. Dow recommends that ARB continue to coordinate with the US EPA, WCI partners, and others states and provinces throughout North America and beyond to consider how best to make real and legitimate cost containment available to those entities in California that are becoming the first in North America to become subject to added costs of a cap and trade program.

In addition to providing needed cost containment, enabling more robust offset provisions is likely to build greater acceptance and support for the concept of cap and trade in jurisdictions that are still considering its merits. The largest benefit to the climate that may be experienced by the California cap and trade program is not the significant reductions achieved but the absence of economic hardship that might otherwise result if cost containment mechanisms are not fully functional during the first compliance period (DOWCHEM1)

Comment: According to ARB’s analysis of offset supply for the California program, projects involving destruction of ozone depleting substances (ODS) are projected to supply 91 percent of the available offsets between 2012 and 2020. To be sure, ODS destruction projects can provide high quality, cost-effective offset credits and are therefore an important source of cost containment. However, in our view, it is risky to place such a heavy reliance on one offset project type to generate essentially all of the cost containment for the Cap and Trade program. CERP urges ARB to facilitate the generation of emission reductions by authorizing a diverse portfolio of offset project types, and to focus initially on offset project types that can generate cost-effective offsets in the near term. (CERP1)

Comment: Based on the criteria above, ARB should take every effort to identify protocols in addition to the four Climate Action Reserve (CAR) protocols already part of the proposed rules. By making this declaration, ARB will stimulate immediate investment in these project types, increasing the likelihood of availability of low-cost offset supply early in the program. As such, Evolution Markets recommends consideration of the following project types: Destruction of Landfill Gas Methane; Destruction of Coal Mine Methane/Ventilated Air Methane; Destruction of Ozone Depleting Substances from Countries Outside of the U.S.; Destruction of N_2O; Agricultural Practices. (EVMKTS)

Comment: In general, more strong signals are needed for the market to continue to invest in offset projects. At this stage, significant investment capital is not being deployed because of the continued uncertainty on project types in California's cap-and-trade market, most notably in the coal mine methane sector. At this stage, the voluntary market alone is not enough to incentivize investment in highly uncertain project types such as coal mine methane. The sooner the ARB provides clear signals to market, the sooner capital investment will flow to the next set of project types, and the sooner California see early offsets supply. (EVMKTS)

Comment: TFI recommends development of guidance related to the requirements and procedure for the acceptance of additional offset protocols. We believe that the protocol list must be expanded to meet the offset demand and contain costs of the program. As such, it is critical to have a transparent and efficient process for additional protocol approval. (Subarticle 13: section 95971) (TFI)

Comment: Develop offset protocols that can create credits for the use of recycled materials. (SFMAYOR1)

Comment: CARB Board should consider including landfill gas (LFG) destruction as an offset protocol. It is understood that compliant entities under California's Market-Based Compliance Mechanism were initially allowed to meet up to 4 percent of their obligation with offsets—and that has increased to eight percent (223 $MtCO_2e$) in this final draft. As we know, it will be hard enough sourcing 223 $MtCO_2e$ worth of offsets from just four protocols that CARB has initially put forward (urban forestry, forestry, livestock methane and the destruction of ozone depleting substances) even if sourced from other partner jurisdictions. When demand for offsets cannot be satisfied, their increased price will diminish their value as a least cost alternative for meeting compliance requirements; this hurts overall liquidity, increases costs of compliance, and may defeat any successful functioning of California's Market-Based Compliance Mechanism. Including LFG destruction as a fifth protocol will help mitigate the risk of California's Market-Based Compliance Mechanism from getting a "black eye" due to the above-mentioned liquidity and cost of compliance problem introduced by not getting enough offsets into the marketplace. It is understood that within California, new air quality rules requiring LFG collection preclude most California located landfills from becoming eligible offset projects. However, there are many partner jurisdictions within WCI that could contribute greatly to California's coming offset need and great demand, by providing said offsets sourced from "CAR protocol verified and registered" LFG destruction projects. (FRC)

Comment: There are two key existing protocols that can be approved today to help address the threat of lack of supply: landfill gas from North America and coal mine methane.

1) The landfill gas protocol could increase supply by 54 percent or 3.1MM credits.
   - Through 2009, there are 104 landfill gas projects receiving credits from CAR only 5 of which are from California.
   - Therefore, the protocol must not exclude non California projects, or it will not serve to improve supply.
2) Coal mine methane has the potential to supply over 50 million tons in offsets through 2020 according to sources within CAR. (CHEVRON1)

Comment: The four offset protocols identified in ARB’s proposed regulations are unlikely to produce the level of offsets needed to provide the desired level of cost containment during the first compliance period. The cost and timing of developing these offsets and making them available for AB 32 cap and trade cost containment purposes also remains very uncertain.

Allow Landfill Gas Offsets. To help ensure adequate volume during the first compliance period, Dow recommends that ARB reconsider its prohibition on the use of landfill gas credits by California entities. Landfill gas offsets from throughout North America (except in jurisdictions where capture is required) should be allowed for compliance purposes during the first compliance period. There are approximately four million metric tons of offsets verified under the CAR’s Landfill Gas protocol with significant potential untapped potential in the first compliance period. Enabling the use of landfill gas offsets is necessary to meet the forecasted demand during the first compliance period. (DOWCHEM1)

Comment: Pursue development of additional offset protocols, including a wetlands protocol. ARB staff solicited public input on which offset project types should be pursued. Dow provided comments indicating that wetlands were an important potential offset typology that provided both GHG mitigation benefits and adaptation co-benefits. While there are steps that need to take place before new offset protocols can be written, (e.g., pilot projects, research, funding, etc.), these and other offsets will be needed in future compliance periods. ARB received a variety of other recommendations on offset typologies to develop. These recommendations should be documented and included in a written plan that would put the ARB on track to provide a fully functioning cost containment mechanism in future years of the program. (DOWCHEM1)

Comment: The agricultural community has been conducting research and will continue to work on the development of offset protocols. There are many challenges due to the large diversity of crops and ecosystems. The Climate Action Reserve will soon begin work on three new agricultural protocols and there are other agricultural protocols further developed that need more on-farm testing to insure they can achieve GHG reductions in a manner that is compatible with California conditions and can be readily used by growers. We request that the board direct the CARB staff to give agricultural protocols a high priority and work closely with CAR and other providers to insure a thorough and timely review process to enable additional offsets become available. (ACC1)

Comment: All agricultural offset protocols developed by CARB should account for the carbon footprint of the whole farm or ranch production system. Current USDA research on grain cropping systems in Maryland finds that when comparing organic, no-till and conventional tillage agricultural production systems, the total carbon footprint of the organic system is lower than the no-till and conventional tillage production systems. While the organic system, in some years, had higher NO_2 emissions compared to the no-till and conventional tillage systems, those periodically higher NO_2 emissions were offset by lower overall CO_2 and CH_4 emissions. This research provides one example of the imperative to consider the entire farming system in order to accurately assess and manifest the opportunities within agriculture to provide real and significant GHG emissions reductions. (CACAN1, CACAN2)

Comment: California agriculture is beginning at a disadvantage in being able to participate in offset programs because we are already implementing modern practices and because of the regulatory environment rules already on the books and those that are scheduled to move forward will prevent California agriculture from creating an offset while a neighboring state or country can implement the same practice and get paid for it. Another impediment is our diversity of crop and crop rotations which limits us to longer term contracts that are required by the standards. Additional direction from the Board is needed to ensure that the standards will allow California agriculture to participate in offset development in a large scale. (AGCOALITION)

Comment: CARB should pay special attention to make sure agricultural sector stakeholders are involved and opportunities to reduce emissions in this sector are maximized, subject to the robust criteria established by CARB, various protocols such as wetland, nitric acid reduction, fertilizer production, and rice methane reduction. As part of this effort by CARB, current work in the field by non-regulatory entities ought to be encouraged and utilized by CARB. (EDF1)

Comment: Production of bio-based products should be included in a list of eligible offset project types. Improvements in land utilization associated with the production of renewable biomass should be eligible for carbon offset credits on a basis comparable to other activities eligible for carbon offset credits. (ERICKSON)

Comment: Considering the significant quantities of purely additional methane that are currently being vented to the atmosphere by coal mine ventilation systems, we recommend the following:

- Recognize ventilation air methane (VAM) oxidation as an eligible offset category for the first compliance period;
- Adopt a coal mine methane (CMM) VAM protocol based on Climate Action Reserve's (CAR) existing CMM Project Protocol;
- Recognize VAM carbon reduction tons (CRT) generated by projects started after October 7, 2007.

In support of these recommendations are the following

- Methane is the second most important greenhouse gas, after CO_2;
- The global warming potential of methane has recently been revised by the Intergovernmental Panel on Climate Change (IPCC) from an initial value of 21 to a current value of 25, while anthropogenic methane emissions are expected to increase by 23 percent by 2020;
- By accepting VAM as an eligible offset project category, the CARB will support crucial US and international efforts to reduce methane emissions and fight climate change;
- The protocols currently adopted by CARB could lead to a shortage of offsets;
- VAM offsets are available throughout the entire carbon credit price spectrum, including at low carbon credit prices. They are a low-cost offset and ensure a strategic diversification of offset sources, and can significantly contribute to lowering CARB's shortage in offset supply.
- VAM projects need support from a regulated carbon market.
- The CAR's CMM Protocol should provide the CARB with the necessary base to adopt a CMM protocol. We believe it is highly compatible with the Western Climate Initiative criteria, apart from a few necessary modifications. It is crucial that this adoption take place as soon as 2011 in order to send a strong signal to project developers and further encourage the destruction of methane currently being vented to the atmosphere. (BTINC)

Comment: CARB has indicated that currently it will only accept four project types as offset credits: Forestry, Livestock, Urban Forestry, and Ozone Depleting Substances (ODS). Given the small scale of Livestock and Urban Forestry, CARB is highly dependent on the supply of credits provided by Forestry and ODS. This could severely limit offset supply, as few landowners have thus far agreed to the 100-year forest management commitment and there are other competing uses for ODS. In order to provide adequate cost containment, we believe that CARB should include easily measurable and verifiable coal mine methane and landfill methane projects as eligible offset types. (CE2CP)

Comment: Two key protocols, landfill gas for North America and coal mine methane have been developed and used by the Climate Action Registry for several years. We recommend that these be considered by ARB in early 2011. The North America landfill gas protocol would add over 50 percent more offsets in the first compliance period. The coal mine methane protocol holds the potential to provide a large supply of valuable and verifiable offsets that could ensure that AB 32 emission reductions are achieved cost-effectively. (WSPA1, WSPA2)

Comment: Evolution Markets defends and advocates for well functioning, liquid markets and believes that so long as the quality and integrity of the offset is safeguarded through the application of the stringent criteria the ARB has identified for offsets, all project types meeting the ARB's regulations and the ARB's criteria should be included in the program. To ensure adequate offsets are available at the outset of the program, as well as sufficient market liquidity, Evolution Markets believes the ARB should provide in January 2010 a Policy Statement stating the ARB's intent to allow any offset project type from an uncapped sector so long as it meets the ARB's stated offset requirements. (EVMKTS)

Comment: In the event that ARB is selective of specific protocols under a given registry (e.g., CAR), we strongly suggest that ARB review and approve the CAR Nitric Acid Protocol Version 1 and subsequent versions as amended by CAR, for the same reasons ARB accepted the CAR ozone depleting substances (ODS) protocol. The Nitric Acid Protocol is very critical for the supply of high quality and high volume offsets in the early years of the program and clearly meets ARB's requirements listed in Article 5, Subarticle 13, sections 95972 and 95973. (Subarticle 13: section 95973 (a.2.C)) (TFI)

Comment: In order to ensure sufficient offset supply, it will be critically important for ARB to adopt additional protocols. CERP urges ARB to adopt additional protocols in early 2011. In addition, because it takes some time to finance and develop offset projects, CERP also encourages ARB to publicly identify, as soon as possible, the protocols being considered for adoption. CERP urges ARB to focus first on project types for which there are well-established methodologies or that have the potential to generate large quantities of emission reductions. Project types with established methodologies include methane collection at landfills, coal mines, and natural gas systems and non-landfill projects that involve collection, combustion, or avoidance of emissions from organic waste streams. Project types that have the potential to generate large quantities of emission reductions include agricultural projects involving nutrient and rangeland management. (CERP1)

Comment: CARB should expand the opportunity for agricultural and forest offsets. CARB should develop a clear confidentiality framework specific to agriculture projects and operations and with input from offset project developers. (EDF1)

Comment: Because climate change is a global problem that requires a global solution and because California will continue to be negatively impacted if regions outside the state do not act, CARB should re-evaluate the restrictive quantitative limits on the use of offsets while hastening and widening the approval of offset protocols to ensure adequate supply. The regulation should be designed to ensure introduction to the market of the full allowed quantity of offsets. (BP)

Comment: Offset credits allowed for mitigating CO_2 emissions in the PDR were limited to four percent. The proposed Cap and Trade Regulation raises the allowable percentage to eight percent. Additionally, there are only four offset protocols that CARB is currently considering for approval. As the number of available allowances declines, there will be increased need to additional and creative offset projects both inside and outside California. Therefore, more flexibility needs to be built into this aspect of the Cap and Trade Regulation, as well as an expedited approval process for new offsets. (MWDSC1)

> **Response:** We recognize stakeholder concerns regarding offset supply. ARB is prohibited from adopting additional protocols as part of this cap-and-trade rulemaking. All offset protocols used in the compliance program must be adopted by the Board after undergoing a full regulatory process, including an ARB stakeholder process, in accordance with the Administrative Procedure Act, and an environmental review. We plan to look at further offset protocols for potential inclusion in the cap-and-trade program beginning in 2012. The details surrounding any new offset project types for which ARB adopts an offset protocol will be dealt with under that specific rulemaking, and modification will be made to the cap-and-trade regulation as needed.
>
> In addition, ARB is looking at protocols developed by third parties, as well as other voluntary and regulatory offset programs, and may not rely on one program to the development of offset protocols.

M-38. Comment: A significant lack of clarity remains over the details concerning how CARB will actually certify additional offset protocols and registries. (EDF1)

> **Response:** We recognize stakeholder concerns regarding offset supply. ARB is prohibited from adopting additional protocols as part of this cap-and-trade rulemaking. All offset protocols used in the compliance program must be adopted by the Board after undergoing a full regulatory process, including an ARB stakeholder process, in accordance with the Administrative Procedure Act, and an environmental review. We plan to look at further offset protocols for potential inclusion in the cap-and-trade program beginning in 2012. The details surrounding any new offset project types for which ARB adopts an offset protocol will be dealt with under that specific rulemaking, and modification will be made to the cap-and-trade regulation as needed.
>
> We have provided a role for Offset Project Registries (OPR) to perform some of the administrative functions of the offset process in the regulation. We plan to utilize OPRs in lieu of performing these duties itself in the short-term, and may

choose to continue this throughout the program. ARB has not yet determined if and when it would itself perform these roles. Therefore, in the meantime all parties seeking to use Compliance Offset Protocols must go directly to an OPR to list their projects. ARB plans to approve OPRs sometime in 2012.

M-39. (multiple comments)
Comment: The offset protocols receiving initial consideration are those currently established by the Climate Action Reserve, which represent the protocols judged to be easiest to be established and representing significant quantities of carbon dioxide. Linkage is also expected with the Western Climate Initiative. Within the area served by the WCI, there are other appropriate standards, such as ISO-14064-2. These other standards should also be allowable, particularly, if the quantification and verification analyses were done within the WCI territories. It could have a major impact within the industry without compromising integrity. (MCLAUGHLIN)

Comment: Approve the use of the following Climate Action Reserve protocols: Coal Mine Methane; Mexico Livestock; Nitric Acid Production; Organic Waste Composting; and Organic Waste Digestion. None of these five protocols has generated any CAR CRTs (offsets) as of November 2010 and projected offsets during the first compliance period appear to be small relative to what may be needed (and allowed). Offsets from WCI partner jurisdictions appear unlikely to provide significant volume during California's first compliance period. (DOWCHEM1)

Comment: If we place constraints on finding low-cost offsets in the name of obtaining local co-benefits or creating local "green jobs," California will inhibit the adoption of similar GHG policies in other nations. Instead, ARB should move rapidly to adopt offset protocols and recognize other national and international offset programs, while establishing a process early for developing projects in California. CCEEB recommends that ARB adopt protocols rapidly to ensure that adequate supply is available in the first compliance period. Additional supply options should include:

a) Use of five additional Climate Action Reserve Protocols;
b) Use of offsets from Western Climate Initiative Partners;
c) Support the development of Pilot REDD Projects;
d) Allow use of Climate Action Reserve Landfill Credits generated before 2012;
e) Approve protocols developed by California air districts, as appropriate.

(CCEEB1, CCEEB2)

Comment: Offsets are vital to a healthy market to ensure allowance availability and price control. There is too little reliance on existing offsets protocols developed in other programs and registries. (LASD1)

Comment: Very rigorous voluntary protocols do exist and quality offsets have been generated under them. They should be recognized. (COPC2)

Comment: The Reserve also strongly encourages the Air Resources Board to consider additional standardized, performance-based protocols that are comprehensive and rigorous for inclusion in the cap and trade program. Adopting additional high-quality protocols will ensure that the cap and trade program has an adequate supply of offset credits at a reasonable cost. (CAR1, CAR2)

Comment: SCPPA's chief concern is that ARB's approach to the offsets program, both its own protocols and links to other offset programs, is so restrictive and will be finalized so late that not enough offsets will be available at the start of the cap and trade program to contain compliance costs. The ARB's own projections indicate that in some scenarios the demand for offsets will significantly exceed supply. The ARB should make every effort to avoid this outcome, given the key role of offsets in cost containment as repeatedly confirmed in the economic analyses of the cap and trade program. High-quality offset programs currently exist, including the Climate Action Reserve (CAR) and the Clean Development Mechanism under the Kyoto Protocol (CDM). These up-and-running programs should be utilized more fully. (SCPPA2)

Comment: Evolution Markets recommends ARB consider establishing clear criteria for additional project types that may qualify for early action—criteria that is predicated on the inclusion of projects that can quickly generate large volumes of offset credits. Recommended criteria may include:

High Quality: Offset protocols must be of the highest quality. Therefore, they create offsets that are real, additional, quantifiable, permanent, verifiable and enforceable.

Reputable Standards: Offset protocols must be originated by standards agencies with consistent and long-term reputations for integrity. Furthermore, ARB should consider the adoption of protocols from standards agencies that already have a broad set of accredited and experienced verifiers.

Abundant Issued Supply: ARB should also choose the next round of standards qualifying for early action based on the availability of supply. Consideration should be made to protocols that meet the above criteria and have an existing abundant supply of issued offsets that can be immediately traded in the market. (EVMKTS)

Comment: ARB's entire list of initial qualifying protocols have been developed by CAR. Evolution Markets fully supports the inclusion of offset protocols from CAR, but we also encourage ARB to consider protocols from other well established offsets standards agencies. This would increase the capacity to generate acceptable protocols, and therefore offset supply. (EVMKTS)

Comment: It is not clear whether protocols already created by other programs might be accepted, and whether each protocol will be required to undergo the CEQA process. (VCS)

Comment: We support ARB's intent to develop its own offset protocols through a public process and discourage reliance on Climate Action Reserve protocols. We support ARB's intent to develop new offset protocols through a public process involving stakeholder engagement. We have been in discussions with staff regarding opportunities for offsets in the wastewater sector and look forward to continuing these discussions. Because the Climate Action Reserve (CAR) has the ability to select members for its protocol development working groups, we do not believe that their process is equivalent to a stakeholder process that would be undertaken by ARB. In several instances, we have been excluded from these working groups and our stakeholder input has therefore not been considered. In light of these concerns, we strongly caution ARB against adopting CAR protocols without opening them up to a full new stakeholder process, and we encourage development of new ARB protocols instead. (CAWWCCG1)

Comment: The American Biogas Council believes that compliance offset protocols should include organic waste digester projects. The current compliance offset protocols for Urban Forest Projects, U.S. Ozone Depleting Substances, Livestock Manure (Digester) Projects and U.S. Forest Projects originated from project protocols developed by Climate Action Reserve (CAR) and later adopted by ARB for early action projects. The American Biogas Council urges ARB to follow a similar path in developing an organic waste digestion compliance offset protocol. CAR developed an Organic Waste Digestion Project Protocol which was adopted by its Board on October 9, 2009. Furthermore, the United Nations Framework Convention on Climate Change through the Clean Development Mechanism has adopted offset protocols for organic waste digestion. We are confident that organic waste digestion offset projects can meet the strong accounting and real GHG reduction standards and requirements of AB 32 and thus should be included. (ABC)

Comment: The risks associated with an insufficient supply of offsets should be addressed by accepting offsets from existing offset programs, such as CAR and CDM, adopting more ARB offset protocols, and broadening the application of ARB protocols. (SCPPA2)

Comment: IETA is concerned limiting eligible offsets to these four project types alone would cause an immediate supply shortage. We feel there are simply not enough offsets presently available under these four protocols to provide the market with sufficient supply in the early years of the program to effectively mitigate costs to California consumers. Additional paths for generating offset credits should be explored and incorporated into California's Cap and Trade program. Emission reductions from all qualified existing CAR projects should be brought into the compliance system and become compliance eligible. In addition, ARB should consider recognizing protocols from other high-quality carbon project standards organizations, such as the Voluntary Carbon Standard and the Gold Standard. (IETA1)

Comment: While necessary approaches, like the nesting of project-level emissions reductions within sub-national programs are being worked out, project developers are keen to know which protocols/methodologies they should invest time in understanding and applying to the design of prospective projects. We would encourage ARB to consider as streamlined a process as possible—while ensuring the highest standards of quality—in reviewing and approving appropriate protocols and methodologies from established voluntary standards and registries like the American Carbon Registry, Climate Action Reserve, and especially the Voluntary Carbon Standard as it is the most widely-used and robust voluntary standard in use around the world. The recognition by California of the Voluntary Carbon Standard for compliance-based purposes would send a clear signal to project developers and governments around the world that the voluntary market has the tools and robustness to be integrated with the regulated market, and we can thus address climate change more quickly and effectively. (SUNONESOLUT)

> **Response:** We recognize stakeholder concerns regarding offset supply. ARB is prohibited from adopting additional protocols as part of this cap-and-trade rulemaking. All offset protocols used in the compliance program must be adopted by the Board after undergoing a full regulatory process, including an ARB stakeholder process, in accordance with the Administrative Procedure Act, and an environmental review. The details surrounding any new offset project types for which ARB adopts an offset protocol will be dealt with under that specific rulemaking, and modification will be made to the cap-and-trade regulation as needed.
>
> In addition, ARB is looking at protocols developed by third parties, as well as other voluntary and regulatory offset programs, and may not rely on one program to the development of offset protocols.

M-40. Comment: To provide this cost-control feature, there must be a sufficient number of qualifying, cost-effective emission reduction opportunities outside the regulated community to supply the emitters' demand or quota for offset credits. If offsets are scarce relative to demand, prices will be dictated by the demand signal and will not be connected to the underlying emission reduction costs, thus destroying the cost-control benefit. The ISOR includes an offset supply analysis for the time period from 2012 through 2020, but does not provide enough detail to assess whether the market will be fully supplied at each of the compliance surrender dates. While there is necessarily considerable guesswork in estimating offset supply in the 2020 timeframe, there is considerably less guesswork in estimating supply in the first compliance period since it's so near at hand.

TerraPass has completed a bottom-up analysis of livestock methane offset availability, and made reasonable top-down estimates of forestry and ozone-depleting substance projects. Separately, carbon industry research organizations such as PointCarbon have published their own estimates. TerraPass estimates that approximately 20 million metric tons of offsets could be available by the end of 2014, while industry research estimates are closer to 27 million. Both of these figures are significantly less than the 39 million tons required to fully supply the market. In addition, TerraPass believes that offsets created in calendar year 2014 cannot be relied upon for the large 2015 compliance submission.

Vintage 2014 offsets will not be verified until late in the year of 2015, just before the compliance submission is due. Since offset projects carry many delivery risks, offset credit owners who make 2015 delivery commitments to emitters will likely limit those commitments to credits of vintage 2013 and earlier. This reduces the supply available for the 2015 submittal by several million tons. There are many uncertainties and assumptions buried within these large estimates, and they could be very far off in either direction.

Also, the buying behavior of emitters is difficult to predict. Even so, a well-supplied marketplace makes quite unnecessary any precise supply models or sophisticated market behavior predictions. (TPl1)

> **Response:** We recognize stakeholder concerns regarding offset supply. ARB is prohibited from adopting additional protocols as part of this cap-and-trade rulemaking. All offset protocols used in the compliance program must be adopted by the Board after undergoing a full regulatory process, including an ARB stakeholder process, in accordance with the Administrative Procedure Act, and an environmental review. We plan to look at further offset protocols for potential inclusion in the cap-and-trade program beginning in 2012. The details surrounding any new offset project types for which ARB adopts an offset protocol will be dealt with under that specific rulemaking, and modification will be made to the cap-and-trade regulation as needed.
>
> We recently estimated that if every entity used their allowable eight percent offsets, approximately 26 million metric tons of offsets would be needed in the first compliance period. This reduced need is due to a start of the first compliance period in 2013 instead of 2012. At this time, based on the four offset protocols the Board has endorsed—manure digesters, forestry, urban forestry, and destruction of ozone depleting substances—ARB will be close to the supply demand for the first compliance period. We also will consider additional Compliance Offset Protocols beginning in 2012.

M-41. (multiple comments)
Comment: We support ARB's intent to develop new offset protocols through a public process involving stakeholder engagement. Because the Climate Action Reserve (CAR) has the ability to select members for its protocol development working groups, we do not believe that their process is equivalent to a stakeholder process that would be undertaken by ARB. In several instances, we have been excluded from these working groups and our stakeholder input has therefore not been considered. In light of these concerns, we strongly caution ARB against adopting CAR protocols without opening them up to a full new stakeholder process, and we encourage development of new ARB protocols instead. (EMWD, BACWAAC)

Comment: The preliminary list of acceptable offset must be expanded. To facilitate the offset protocol review and acceptance process, we recommend that ARB simply select a registry pursuant to the requirements established in sections 95972 and 95973, rather than being selective of the specific protocol within the registry/program itself. (TFI)

Response: We recognize stakeholder concerns regarding offset supply. ARB is prohibited from adopting additional protocols as part of this cap-and-trade rulemaking. All offset protocols used in the compliance program must be adopted by the Board after undergoing a full regulatory process, including an ARB stakeholder process, in accordance with the Administrative Procedure Act, and an environmental review. We plan to look at further offset protocols for potential inclusion in the cap-and-trade program beginning in 2012. The details surrounding any new offset project types for which ARB adopts an offset protocol will be dealt with under that specific rulemaking, and modification will be made to the cap-and-trade regulation as needed.

A public process convened by a voluntary program cannot substitute for a stakeholder process conducted by ARB for rulemaking purposes.

M-42. Comment: The array of offsets recommended appears unduly limited. The Program should provide for opportunities for offsets which can be implemented in local communities as an element of economic development or satisfaction of California Environmental Quality Act (CEQA) mitigation requirements. (ASMDICKINSON)

Response: We recognize stakeholder concerns regarding offset supply. ARB is prohibited from adopting additional protocols as part of this cap-and-trade rulemaking. All offset protocols used in the compliance program must be adopted by the Board after undergoing a full regulatory process, including an ARB stakeholder process, in accordance with the Administrative Procedure Act, and an environmental review. We plan to look at further offset protocols for potential inclusion in the cap-and-trade program beginning in 2012. The details surrounding any new offset project types for which ARB adopts an offset protocol will be dealt with under that specific rulemaking, and modification will be made to the cap-and-trade regulation as needed.

Our first priority for adopting additional protocols is to look at project types that can be done in-state. Achieving the goal of climate stabilization will require a commitment to work at the international level to reduce GHG emissions globally. Although we encourage offset projects to be developed in California, we recognize out-of-state projects will expand the scope of the program to allow for more low-cost GHG reduction possibilities to be incorporated and reduce the overall costs of the program. Therefore, ARB will consider expanding the programs to provide offset credits for projects located in the United States, Canada, and Mexico.

To address stakeholder concerns about double-crediting, any offset used for CEQA mitigation is ineligible for use in the cap-and-trade program.

M-43. (multiple comments)
Comment: ARB's offset supply forecasts indicate a heavy reliance on one protocol—the destruction of ozone-depleting substances ("ODS")—to provide the needed offsets. The ARB should prioritize the development of additional protocols that are likely to result in significant numbers of offsets. The initial four ARB offset protocols should not be restricted to U.S. projects only. Projects across North America should be allowed. The ISOR notes (at III-10) that the initial ARB offset protocols being proposed are applicable to offset projects in the United States and its territories only, with potential for expansion to Canada and Mexico at a later stage. Given the urgent need for an early supply of offsets, ARB protocols should cover the US, Canada, and Mexico from the start of the cap and trade program if the necessary technical data is available for each country. The ISOR indicates (at III-5) that ARB staff will periodically propose additional offset protocols. SCPPA encourages the staff to determine which additional protocols are likely to provide the greatest supply of offsets within a relatively brief timeframe and to publish this list of priority protocols together with an indicative timeline for developing these protocols and having them approved by ARB. Additional protocols should be developed to increase offset supply as soon as possible to allow project developers to establish projects, generate emission reductions, and earn offsets for sale in time for the start of the cap and trade program. Having a greater number of offset protocols available will reduce the risk of an offset shortage. (SCPPA2)

Comment: ARB needs to expand the list of eligible offset projects and develop certification protocols for these additional project types. NextEra Energy feels the current list of project types is too limited and fails to maximize the program's potential. There are several other types of projects that could be incorporated into the cap and trade program relatively easily. Some of these project types include but are not limited to: Expanding ODS to imported substances from Mexico or Canada; N_2O abatement; Wastewater management; Coal mine methane. The expansion of this list can increase the amount of projects developed. More offset projects will decrease the cost of the offsets to purchasers of offset credits and therefore the cost of the program on consumers. It will also provide investors an opportunity to develop diverse portfolio of project types. In addition, the total amount of co-benefits associated with these offset projects will increase with more projects being developed. (NEXTERAENERGY)

Comment: Expand the Geographic Scope of CAR Protocols to North America. ARB should modify existing and new Climate Action Reserve protocols to allow for their use for projects located throughout North America. This is similar to the approach being taken to adopt the forest and livestock protocols for use in Mexico. While this approach may not allow offsets markets to mature in time to serve cost containment needs in the first compliance period, it would likely make a significant difference in the second and third compliance periods. (DOWCHEM1)

> **Response:** We recognize stakeholder concerns regarding offset supply. ARB is prohibited from adopting additional protocols as part of this cap-and-trade rulemaking. All offset protocols used in the compliance program must be adopted by the Board after undergoing a full regulatory process, including an

ARB stakeholder process, in accordance with the Administrative Procedure Act, and an environmental review. We plan to look at further offset protocols for potential inclusion in the cap-and-trade program beginning in 2012. The details surrounding any new offset project types for which ARB adopts an offset protocol will be dealt with under that specific rulemaking, and modification will be made to the cap-and-trade regulation as needed.

We will continue to evaluate whether the four project types already approved for use in the program could be expanded to apply to projects located in the United States, U.S territories, Canada, and Mexico. Any changes to the already adopted protocols will be done as part of a separate rulemaking process to ensure that the GHG reductions and GHG removal enhancements being credited as offsets are real, additional, quantifiable, permanent, verifiable, and enforceable.

M-44. Comment: SCE recognizes that CARB is attempting to ensure that offset credits represent emissions reductions that are real, permanent, quantifiable, verifiable, enforceable, and additional, as required by AB 32. Nonetheless, SCE is concerned that CARB staff have created overly complex processes for the development and approval of offsets that may unduly limit the available supply. For example, the four initial offset protocols that were recommended simultaneously with the proposed regulation must first go through a complicated, and likely lengthy, approval process by CARB and then a complex implementation design process involving CARB staff. For these four initial protocols, all of these steps must take place between January 2011 and December 2011 in order for covered entities to include tradable offsets in their compliance strategies by January 2012, when the Cap and Trade program begins. Currently, this scenario seems extremely unlikely. All other offset projects must go through the same approval process and sequence, and even the four offset protocols already in motion are unlikely to provide a robust supply of offsets until late in the first compliance period. Accordingly, those covered entities planning to use offsets as part of their compliance strategies are left with great uncertainty as to whether such offsets will be available. SCE offers the following recommendations for CARB to quickly increase the supply and use of available high-quality, low-cost offsets.

- CARB should remove the geographic limits on the first four offset protocols. Expansion to projects throughout North America would provide more incentives for offset development. SCE continues to support CARB's determination during the scoping plan process that it would not place geographic limits on the origin of offset credits.

- CARB should provide for expeditious approval of offset credits from existing and future offset projects operating under specific offset protocols beyond the four currently being proposed. For example, the Climate Action Reserve ("CAR") has already developed and is continuing to develop about 60 MMT worth of additional voluntary offset credits through its existing offsets protocols and registration program. CARB should consider these CAR offsets as part of a pre-compliance offsets pool which can be quickly approved to meet the CARB offsets project design criteria (available in December 2010).

- CARB should provide for early approval for linkage to other cap and trade programs, with a focus on Western Climate Initiative ("WCI") jurisdictions. CARB is already familiar with the offset program parameters and should be able to easily harmonize them with the California Cap and Trade program once the WCI finalizes its regulatory approach. Linkage with the WCI program should be easily and quickly brought to the Board and approved.

- CARB should create a specific framework for approving offset credits from individual projects that meet CARB's criteria. CARB should establish a framework for evaluating and accepting additional, individual projects outside of the sector-based projects. New technological approaches are being developed and new companies are being established to create offsets, which should have a direct pathway to approval. (SCE1)

Response: In developing the regulation, we attempted to strike a balance between creating a program that ensures the integrity of the greenhouse gas emission reductions required to meet AB 32 and one that is not overly complex. The regulation was modified to defer the compliance obligation requirements until 2013 to ensure all necessary elements are in place and fully functional. This will allow additional time to establish the necessary requirements for developing offsets in the cap-and-trade program.

We will continue to evaluate whether the four project types already approved for use in the program could be expanded to apply to projects located in the United States, U.S territories, Canada, and Mexico. Any changes to the already adopted protocols will be done as part of a separate rulemaking process to ensure that the GHG reductions and GHG removal enhancements being credited as offsets are real, additional, quantifiable, permanent, verifiable, and enforceable.

The regulation includes provisions to allow early action offset credits to be credited as ARB offset credits and used in the cap-and-trade program. We included these provisions to allow parties to develop offset projects and purchase offset credits that are being issued by Early Action Offset Programs. These provisions were added to provide parities the opportunity to participate in the offsets market while ARB is finalizing the regulation and taking the necessary implementation steps needed to have a fully functioning ARB offsets program and offsets tracking system. Once ARB Compliance Offset Protocols are finalized in October 2011, project developers will be able to use them to quantify, monitor, and report their GHG reductions and GHG removal enhancements. In 2012, ARB will be approving Offset Project Registries so that project developers can list and report their emissions with these registries, and will be accrediting

ARB offset verifiers to verify GHG reductions and GHG removal enhancements from offset projects developed under Compliance Offset Protocols.

M-45. Comment: To ensure investor confidence and thereby to bolster adequate investment in offset projects before the program begins, Evolution recommends ARB release a "priority list" of project types which the ARB has preliminary applied the criteria to and which the ARB intends to accept for compliance purposes. (EVMKTS)

Response: We recognize stakeholder concerns regarding offset supply. ARB is prohibited from adopting additional protocols as part of this cap-and-trade rulemaking. All offset protocols used in the compliance program must be adopted by the Board after undergoing a full regulatory process, including an ARB stakeholder process, in accordance with the Administrative Procedure Act, and an environmental review. We plan to look at further offset protocols for potential inclusion in the cap-and-trade program beginning in 2012. The details surrounding any new offset project types for which ARB adopts an offset protocol will be dealt with under that specific rulemaking, and modification will be made to the cap-and-trade regulation as needed.

We cannot presume which offset protocols the Board will adopt, or the outcome of any public stakeholder and regulatory process. However, we will provide period public statements in coordination with WCI of protocols that will be considered for evaluation and inclusion in the program.

M-46. (multiple comments)
Comment: While the requirements and expectation on emissions reductions projects with regard to additionality, project baseline calculation, leakage accounting, uncertainty accounting, permanence, crediting periods, and verification are reasonably clear, the mechanism and timing for agency consideration of submitted protocols and data transfer provisions are not sufficiently clear. (EDF1)

Comment: CERP asks that ARB establish a transparent process for protocol consideration, so that stakeholders can provide input. Offset project developers and investors have useful and important real-world experience to offer, and can help ensure that the offset protocols adopted by ARB will be effective, usable, and environmentally rigorous. CERP asks that ARB make publicly known which protocols are under consideration and the mechanics of the protocol consideration process. This transparency will help provide predictability for the marketplace and ensure a stable offset supply. (CERP1)

Comment: Provide more details about how and what additional protocols may be approved and how they might be approved. The draft regulation does not create enough certainty for offset project operators and investors to initiate protocols that fall outside of the scope of the four offset protocols indicated by the regulation as being "pre-approved." This will significantly slow momentum on any other offset protocols. (VCS)

Comment: CARB should develop additional, stand alone, guidance documents that clearly spell out the process that interested entities should use to submit completed protocols for consideration in the program. (EDF1)

> **Response:** All offset protocols used in the compliance program must be adopted by the Board after undergoing a full regulatory process, including an ARB stakeholder process, in accordance with the Administrative Procedure Act, and an environmental review. We plan to look at further offset protocols for potential inclusion in the cap-and-trade program beginning in 2012. The details surrounding any new offset project types for which ARB adopts an offset protocol will be dealt with under that specific rulemaking, and modification will be made to the cap-and-trade regulation as needed.
>
> Because reviewing every offset protocol submittal by potential developers would be too administratively burdensome, we did not include provisions in the regulation to establish an official protocol submittal and review process. However, we met with protocol developers over several years regarding protocols that are being developed for offset projects. We encourage stakeholders to engage with staff regarding the development of new protocols.

M-47. Comment: We also recommend that CARB establish a mechanism by which project developers, technology providers, and market participants can propose methodologies for new offset project types directly to CARB for adoption as eligible offsets for the California carbon market. While we commend the good work of the Climate Action Reserve in developing an initial set of protocols for a number of offset project types, we believe the market would be best served if developers and stakeholders can directly propose new methodologies and protocols to CARB for adoption, as this will spur maximum creativity and effort in the search for new abatement technologies and strategies. We note that over its short lifetime, the Kyoto Protocol's Clean Development Mechanism (CDM) has lead to the development of hundreds of proposed project methodologies across the spectrum of project types, leading to a considerable amount of intelligence on abatement projects built up in the CDM. The CDM methodology approval process is structured in such an open submission format and has thus harnessed the entrepreneurial energy of the market in developing new abatement technologies and project types. This may well be the biggest legacy of the CDM beyond the volume of tons abated by that particular mechanism, and we encourage CARB to consider improving upon this model in developing its own process for adopting new offset protocols. (CLIMATEWEDGE)

> **Response:** A protocol does not have to go through a voluntary registry to be approved by ARB. Because reviewing every offset protocol submittal by potential developers would be too administratively burdensome, we did not include provisions in the regulation to establish an official protocol submittal and review process. However, we met with protocol developers over several years regarding protocols that are being developed for offset projects. ARB

encourages stakeholders to engage with staff regarding the development of new protocols.

M-48. Comment: Add the following language to the end of the current provision on Procedures for Approval of Compliance Offset Protocols: "and protocols related to standards from other jurisdictions, such as the Voluntary Carbon Standards or the American Carbon Registry" (section 95971). (CALERACORP)

Response: We did not make this change. We cannot presume which organizations or offset protocols will be approved or the outcome of any public stakeholder and regulatory process in any future rulemakings. Therefore, we believe this language is inappropriate.

M-49. Comment: The process for proposing and approving offset protocols is not clearly specified and it is not clear whether going forward CARB will only accept standardized approaches or if it is open to project-based approaches. (VCS)

Response: Because reviewing every offset protocol submittal by potential developers would be too administratively burdensome, we did not include provisions in the regulation to establish an official protocol submittal and review process. However, we have been meeting with protocol developers for several years regarding protocols that are being developed for offset projects. We encourage stakeholders to engage with staff regarding the development of new protocols. We clarified the language referring to standardized methods in the regulation in new section 95972(a)(9). This should alleviate stakeholder confusion in this area. Furthermore, we are not planning on accepting project-based protocols because each protocol must be approved by the Board and such a process would be onerous and administratively burdensome.

M-50. Comment: CARB should consider outlining clear criteria, guidelines, and procedures for the evaluation and adoption of new protocols and project types to give the market clear guidance to continue developing protocols (and projects) that will provide the offsets necessary for effective cost-abatement. (VCS)

Response: Section 95972 in the regulation establishes clear criteria as to what must be included in Compliance Offset Protocols.

The Board must adopt all offset protocols used in the compliance program after undergoing a full regulatory process, including an ARB stakeholder process, in accordance with the Administrative Procedure Act, and an environmental review. We plan to look at further offset protocols for potential inclusion in the cap-and-trade program beginning in 2012. The details surrounding any new offset project types for which ARB adopts an offset protocol will be dealt with under that specific rulemaking, and modification will be made to the cap-and-trade regulation as needed.

Generally, we do not include implementation-related procedures in our regulations. We will develop guidance documents as necessary in 2012 regarding specific aspects of the offsets program.

M-51. Comment: ARB must be more aggressive in promoting the use of offsets by reducing the prescriptive details of the offset protocol approval process. (WSPA1, WSPA2)

Response: We disagree. The process outlined in the regulation is necessary to ensure the integrity of the program.

M-52. Comment: In the Scoping Plan, ARB determined agricultural emission reductions were not easily quantified. While we disagree with that assessment, if ARB feels agricultural emissions are not easily quantified or verified for purposes of direct regulations than they are similarly inappropriate as offsets. (CVAQC)

Response: In the proposed regulation, the only offset protocol related to agriculture that is recommended when the program is launched is livestock (originally referred to as "livestock manure digesters"). As the program evolves, ARB, along with our WCI partners, expect to consider additional offset protocols in a separate rulemaking.

M-53. Comment: For agricultural offset credits to provide real incentives for agricultural conservation practices that provide reductions in GHG emissions, farmers and ranchers must receive the greatest benefit possible. Currently, the carbon offset market is largely unregulated and farmers and ranchers may find themselves entering into offset credit contracts that do not adequately compensate them for their change in agricultural practices. Third party offset credit aggregators must be regulated to provide a fair share of the credit value to the producers providing the emissions reductions. To that end, CARB should establish contracting rules for offset credits that provide transparency and allow farmers and ranchers to compare contract terms across third-party aggregators. (CACAN1, CACAN2)

Response: ARB is prohibited from adopting additional protocols as part of this cap-and-trade rulemaking. All offset protocols used in the compliance program must be adopted by the Board after undergoing a full regulatory process, including an ARB stakeholder process, in accordance with the Administrative Procedure Act. We plan to look at further offset protocols for potential inclusion in the cap-and-trade program beginning in 2012. The details surrounding any new offset project types for which ARB adopts an offset protocol will be dealt with under that specific rulemaking, and modification will be made to the cap-and-trade regulation as needed. Furthermore, ARB will not get involved in third-party contracting mechanisms and would look to the market to develop standardized contracts as needed. With regard to ranchers and farmers receiving adequate compensation for their offset projects, ARB does not control prices. Rather, offset credits will be bought and sold in the market place. Prices for offset credits will rise and fall based on the supply and demand in the market.

M-54. Comment: We remain concerned about the level of offsets in the program. And now that things have changed a little bit from the Scoping Plan, there's actually a bigger bucket of offsets that could be allowed to be used. We are worried that there will be a lot of political pressure in the coming months and year to accept new protocols that may not be as stringent quality-wise so that we can fill that bucket. We want to make sure that you are able to put in place a very robust public process for vetting those protocols and making sure that they're strict in the future, and to make sure that CARB maintains a very strong role vis-a-vis the third-party registries in terms of approving and having the ability to deny in overseeing the offsets program. (UCS5)

Response: We agree that that all new protocols allowed to be used in the program need to be of the highest quality. To ensure this, all offset protocols used in the compliance program must be adopted by the Board after undergoing a full regulatory process, including an ARB stakeholder process, in accordance with the Administrative Procedure Act, and an environmental review. We plan to look at further offset protocols for potential inclusion in the cap-and-trade program beginning in 2012. The details surrounding any new offset project types for which ARB adopts an offset protocol will be dealt with under that specific rulemaking, and modification will be made to the cap-and-trade regulation as needed.

M-55. Comment: Appendix G to the Initial Statement of Reasons (ISOR) for the Cap and Trade Regulation notes (at G-16) that "if an allowance reserve of 100 million metric tons is created, at a 2020 allowance price of $25 the demand for offsets may exceed supply by 54 percent under the Appendix N supply assumptions." Table G-2 in ISOR Appendix G indicates that if the allowance reserve is 150 million metric tons, at a $25 allowance price the demand for offsets will exceed supply by 91 percent (under the Appendix N offset supply assumptions). Although offset supply is uncertain, Appendix G notes (at G-15) that the "restrictive" supply assumptions in Appendix N are likely to be indicative of conditions during the early years of the cap and trade program. (SCPPA2)

Response: No response necessary.

M-56. (multiple comments)
Comment: CARB should encourage the development of a methodology to verify third-party emissions reductions achieved within capped sectors. EDF also recommends that CARB include placeholder language, perhaps creating section 95998 (Reserved for Third-Party Crediting of Capped Sector Reductions) or a program to credit third party reductions once they are verified. (EDF1)

Comment: We urge you to rapidly develop additional protocols for generating greenhouse gas reduction credits associated with waste diversion, waste to energy, and waste recycling activities. One example is the low carbon fuel standard. (WM2)

Comment: WM supports efforts of CARB to ensure that CO_2 emissions from biomass energy and fuels are considered “carbon neutral”, particularly when the biomass fuel is waste derived. WM urges ARB to continue in this vein and provide recognition of the GHG lifecycle benefits of converting waste materials and resources into recovered materials and renewable energy. As mentioned above, WM and Linde are currently producing the lowest carbon fuel available in California at our Altamont Landfill Gas to LNG facility. Further development of waste derived fuels and energy will lead to even further reductions in GHG emissions. The Cap and Trade regulations must be structured to encourage the further development of waste derived energy and renewable resources. WM urges the CARB to develop protocols for generating GHG reduction credits for the production of waste-derived renewable resources, recyclables, energy and fuels. (WM1)

Comment: Constellation Energy urges staff’s recommendation for the potential of avoided emissions from energy-from-waste facilities and biomass (if determined to be a waste by EPA definition change) be assessed using criteria appropriate for offset projects in a formal process with opportunity for public consultation. These energy-from-waste and biomass facilities reduce emissions from uncapped sectors. Constellation Energy notes with approval that staff is of the opinion that energy-from- waste and biomass facilities should be given credit for avoided emissions that would otherwise result from alternative waste management practices, such as landfilling and open burning. (CONSTELLATIONENERGY)

Comment: The Central Valley Air Quality (CVAQ) Coalition offers the following recommendations: Biomass and agriculture as a source of offsets. As proposed, exempted categories include direct combustion of several sources of cellulosic biomass, including solid waste, construction and manufacturing debris, mill residues, range land maintenance residues, all agricultural crops or waste, and wood or wood waste. Covered entities must report emissions from the combustion of these fuels but are not required to obtain allowances for those emissions. Furthermore, neither users nor suppliers of biomass for energy are required to identify the sources of biomass material or report the biological greenhouse gas impacts associated with the removal of biomass for energy or fuel. Exempting these categories from compliance obligations is the equivalent to assuming an identical flux of carbon into and out of the atmosphere associated with all biomass growth, harvest, production, and combustion. In effect, by exempting bioenergy, the rule assumes "carbon neutrality" for all biomass fuels, which is not scientifically accurate. (CVAQC)

Comment: There are very limited opportunities in the current draft of Cap and Trade for a facility to earn offset credits. In considering our strategy to comply with AB 32, we are surprised at how few options there are for generating GHG offsets under the draft Cap and Trade Program. For example, if the District were to shut down our current CHP facility, we would reduce our anthropogenic GHG emissions by approximately 19,000 MT CO_2e. Under the current draft of the Cap and Trade Program, this GHG emission reduction would not be eligible for offset credits, because there is not an approved offset protocol for this situation. So, we are provided with no incentive to eliminate this combustion source, which would be one of the ways for CCCSD to comply with AB 32. (CCCSD)

Comment: CARB should take steps to increase the use of insulation in retrofitting existing buildings in order both to save energy and reduce emissions. An important part of this is to encourage the use of energy efficiency-based carbon offsets, which would not only help businesses in the Cap and Trade system reduce their compliance costs, such efficiency-based offsets would also have many sought-after co-benefits such as improvements in public health, increased health and safety of building and home occupants, increased home value, and reductions in other pollutants beyond greenhouse gas emissions. In short, NAIMA requests that CARB make NAIMA members' California plants part of the solution and not unfairly chase fiber glass insulation production to nearby out-of-state plants employing out-of-state workers. (NAIMA)

Comment: CARB recognized in the Scoping Plan that increasing the energy efficiency of existing buildings provides the "greatest potential for GHG reductions in the building sector." CARB's Scoping Plan urges "adopting mechanisms to encourage and require retrofits for existing buildings that do not meet minimum standards of performance." NAIMA urges CARB to broaden its scope of acceptable offsets. Energy efficiency offsets should be added to the list of acceptable/approved offsets. Insulation can be a key resource for combating climate change. Energy efficiency measures should be given top priority over renewable, where benefits tend to be uncertain, distant, and unpredictable. (NAIMA)

Comment: CALSEIA also encourages the Air Resources Board to allow distributed solar-thermal projects that are installed voluntarily (that is, at the facilities of business entities not covered by the Cap and Trade regulation) to become sources of offset credits. Example applications of distributed solar-thermal technology not already recognized as programmatic energy efficiency or renewable energy measures include residential space heating and cooling, residential solar water heating displacing propane, commercial swimming pool heating, and Industrial process heating, process cooling, and electricity generation. CALSEIA supports the Air Resources Board's efforts to develop "Compliance Offset Protocols" for voluntary greenhouse gas emission-reducing projects. Furthermore, CALSEIA requests that the Board direct its staff to work with CALSEIA to determine whether a "Compliance Offset Protocol" could be developed for distributed solar-thermal applications, such as those listed above. (CALSEIA)

> **Response:** In the cap-and-trade program, offset credits cannot be generated for activities that reduce emissions in capped sectors. If ARB were to also issue offset credits for those reductions, the reductions would be double-counted within the cap-and-trade program. Therefore, offset credits can only be issued for activities that are not capped.

For entities subject to the cap, any reduction in carbon emissions will require them to hold fewer allowances to cover their emissions and help them meet their compliance obligation.

M-57. Comment: It would be beneficial to have a mechanism for entities that took early action through energy efficiency or energy reduction projects to receive credit for these activities. Two possibilities are to allow third party verification of the specific project(s) or to allow the source to benchmark in a timeframe prior to the emissions reductions. Improving energy efficiency or reducing energy usage is more accessible for implementation for many facilities than those identified in the Livestock, Urban Forest, Ozone Depleting Substance, and Forest Protocols. (SVM)

Response: Offset credits cannot be generated for activities that reduce emissions in capped sectors. Because the electricity sector is under the cap, any reductions achieved by an individual facility would result in that facility having to surrender fewer GHG allowances. If ARB were to also issue offset credits for those reductions, the reductions would be double-counted within the cap-and-trade program. Therefore, offset credits can only be issued for sources that are not capped. Entities that are capped and took early actions are rewarded for being more efficient through design of the benchmarks for each sector.

M-58. Comment: We encourage ARB staff to seriously consider the unique role that the state's water and wastewater agencies can play in the immediate development and implementation of distributive generation renewable energy projects (including combined heat and power) and how this could support early successful implementation of the cap and trade program. The key issue is the types of projects to use and rejected the addition of an option for using verifiable on-site CAR was correct that there is a need for "plug number" formula as the starting point or baseline for the calculation of offset values. But it failed to recognize the long term value to California's cap and trade system of strengthening the data on which offset calculations are based. Entities which invest in on-the-ground measurements that show improved performance over the default numbers should be allowed to use this information to calculate their offsets. Being rewarded for making this additional investment is appropriate and will have ancillary benefits as other air quality issues, such as improvements in criteria pollutant emissions, are likely to be identified as well. (IEUA)

Response: Offset credits cannot be generated for activities that reduce emissions in capped activities. Because the electricity sector is under the cap, any activities that reduce electricity emissions would result in covered entities having to surrender fewer GHG allowances. If ARB were to also issue offset credits for those reductions, the reductions would be double-counted within the cap-and-trade program. Therefore, offset credits can only be issued for activities that are not capped.

One activity that may be viable and is not a capped activity in this sector is the reduction of methane emissions from treatment of wastewater. The potential of this project type is being evaluated by ARB staff.

M-59. Comment: The comments contained in this letter encourage CARB to include the use of supplementary cementitious materials in concrete production as a source of offsets recognized and encouraged by the program as it is implemented after adoption.

Several approaches could be undertaken to establish and verify offsets related to SCM use in concrete production. These include:

- Facility Approach. This approach would focus on the small universe of cement producers and incentivize them to blend SCMs into the finished cement products they deliver to the marketplace. There are a number of disadvantages to this approach, however. Blended cements account for only a small fraction of overall cement sales in the United States, meaning that the opportunity for incentivizing increased cement displacement in forms of concrete production not utilizing blended cements would be lost. A facility approach based on encouraging pre-blended cements would discourage concrete producer innovation in seeking higher rates of cement displacement than are possible at a cement production facility. Finally, cement producers are not able by themselves to document and verify the uses of their product after it is delivered to a concrete producer.
- Project Approach. This approach would focus on documenting offsets on a project by project basis. This approach overcomes the verification shortcomings of a facility approach, but still fails to incentivize the broadest possible use of SCMs. Transaction costs associated with establishing offsets on a project by project basis would ensure that only the largest projects are included, leaving behind the potential of incentivizing higher cement displacement in many thousands of small projects such as residential building foundations, sidewalks, driveways, etc.
- Point of Substitution Approach. This approach would establish offset creation at the point at which an SCM physically displaces a quantity of cement. It would be coupled with the existing delivery documentation that already verifies the addition and amount of SCMs added to concrete mixes subject to established weight and measures regulations. This approach creates regulatory accountability by linking reduction quantification to verification of actual utilization using a single consistent method. Under a point of substitution approach, numerous parties would be incentivized to reduce cement consumption by substituting SCMs. For instance:
  - Cement manufacturers producing blended cements would still qualify as the point of substitution for those products. Instead of capturing these reductions as increases in efficiency at the cement manufacturing plant, the cement manufacturers would more accurately capture the gains as offsets under the point of substitution methodology. This methodology would require them to coordinate with customers to document and verify the final use of the blended

cements to ensure regulatory accountability and avoid any opportunity for double counting.

- o Many cement manufacturers are also vertically integrated—owning their own concrete production facilities. A point of substitution approach to establishing and verifying offsets would allow them to capture offsets at this stage of their operations.
- o The full range of other concrete producers would also be incentivized to increase cement replacement with SCMs by following a single, consistent methodology.
- o Establishing and verifying emissions reduction offsets for concrete production at the point of SCM substitution best ensures regulatory accountability and best encourages achievement of the public policy goal of reducing greenhouse gas emissions. A point of substitution approach will encourage greater SCM utilization in every concrete production activity, whether it involves only a few cubic yards of concrete or hundreds of thousands of cubic yards. The undersigned companies support the proposed regulation's requirement that emissions reductions used to create offset credits are real, permanent, verifiable, enforceable, quantifiable, and additional. The companies intend to pursue development of a specific offset protocol to be accepted into the compliance offsets program as allowed under the proposed regulation. (BODEGRAVEL)

Response: The commenter states that the above-described activities will result in efficiency gains at the cement facility. In the cap-and-trade program, offset credits cannot be generated for activities that reduce emissions in capped sectors. If ARB were to also issue offset credits for those reductions, the reductions would be double-counted within the cap-and-trade program. Therefore, offset credits can only be issued for activities that are not capped.

For entities subject to the cap, any reduction in carbon emissions will require them to hold fewer allowances to cover their emissions and help them meet their compliance obligation.

In addition, the commenter states that the above-described activities will lower the carbon intensity of the cement produced. These emission reductions will be realized when the actual cement is produced, and may not reduce the actual emissions at the facility.

M-60. Comment: The Initial Statement of Reasons (Staff Report, Part I) discusses the potential need for ARB to work with developers to increase the supply of offset projects. It is not clear how ARB will do this, though we presume they would use future auction revenues. CAL FIRE suggests that the regulations include enabling language for working with and providing funding from auction revenues, as appropriate, to CAL FIRE which already has expertise, experience and program authorities for working with stakeholders and forest landowners. These resources could be used to incentivize the development of additional forest offset projects. If public funds were used, it might be appropriate to retire those credits, rather than trade them, or to consider their use completely outside the Cap and Trade program. If auction revenues are used to fund grant or cost-share programs that produce carbon offset projects on private lands, it may be appropriate to pro-rate the number of credits that the operator can sell to reflect the proportion of private funds used to develop the project. (DFFP1)

> **Response:** The commenter's interpretation of the language in the Staff Report is incorrect. We believe the reference that the commenter is referring to is on page II-46 of the Staff Report, Part I. In this paragraph, staff is referring to working with Offset Project Registries that will be approved by ARB to administer certain parts of the offset credit creation process. Offset Project Registries will be approved based on criteria in the regulation, and will assist new projects developed under ARB's Compliance Offset Protocols with the listing, monitoring, reporting, and verification processes for ultimate issuance of ARB offset credits by ARB. This particular text in the Staff Report is not intended to mean that ARB will work with offset project developers or financially assist the development of offset projects themselves.

Linkage

M-61. (multiple comments)
Comment: In addition to expanding CAR offsets and criteria, state officials must consider how to practically link with external offset and allowance programs, including the Western Climate Initiative (WCI), the Regional Greenhouse Gas Initiative (RGGI), Clean Development Mechanism (CDM), and EU ETS. In addition, IETA strongly supports ARB's consideration of Reduced Emissions from Deforestation & Degradation (REDD) credits into its state program. (IETA1)

Comment: The Council also recommends that California work together with the RGGI states to ensure consistency among offset programs where appropriate. (BCFSE)

Comment: SCPPA raises the following points to help ensure ARB's offset protocols and links to other offset programs provide ample cost-effective emission reduction options:

- Linking to the CDM and other rigorous offset programs should be considered in 2011. The CDM constitutes the largest, best developed, most liquid, and most scrutinized offset program in the world. It will be an invaluable source of supply, particularly in the early years of the cap and trade program when offsets from ARB protocols and from avoided deforestation ("Reducing Emissions from Deforestation and forest Degradation" or "REDD") are unlikely to be available in any quantity.
- The Cap and Trade Regulation restricts offsets from external programs to early-action CRTs, sector-based offsets and offsets issued under linked cap and trade programs. There is no provision to recognize offsets from other types of external

offset programs such as the CDM, the Voluntary Carbon Standard, or the Gold Standard. These are well-regarded international offset programs.

Linking to the CDM and other offset programs should be pursued. This will provide certainty and stimulate the development of additional offset projects. (SCPPA2)

Comment: California businesses will need access to a pool of verifiable offsets and allowances starting in 2012. Developing a new ARB offset review and approval process to review credits and allowances for use in California that have already been reviewed in the EU is costly and unnecessary. The EU carbon markets produce robust offsets and allowances. Linking to the EU would ensure a supply of high-quality and tradable market instruments for California's carbon market. Relying on a limited market Cap and Trade program to reduce emissions in California without linkage to a broad liquid market loses the economic efficiency of the market-based approach and undermines the policy goals. CCEEB recommends expediting linkage and making it a priority to be completed. If linkage is not possible, then CCEEB believes that other cost-containments measures must be adopted to soften the economic impact of this regulation and limit leakage of jobs and emissions. (CCEEB1, CCEEB2)

Comment: There are no valid scientific justifications for discriminating among ETS programs based on the source of emissions as long as the overall program meets the environmental integrity standards and other linkage criteria for an ETS established by CARB. (EDF1)

Response: The regulation includes a framework for California to link its cap-and-trade program to other emissions trading systems of similar scope and rigor. Linkage can expand the coverage of the cap-and-trade program to include emissions-reduction opportunities for sources covered in another program. The regulation does not currently include linkage to other programs, though staff anticipates bringing recommendations to the Board in 2012 for possible linkage with the programs being developed by the three other WCI Partners that are currently working to implement programs: British Columbia, Quebec, and Ontario.

Each program will undergo a case-by-case analysis by staff as part of a formal rulemaking process, and the Board will need to approve regulatory amendments reflecting the linkage with a particular program before it can take effect.

Offset Project Registries

General Offset Project Registry Comments

M-62. Comment: As currently drafted, the respective roles of ARB and “Offset Project Registry” (as that term is defined in the proposed regulation) are not clearly and precisely defined. For instance, as currently drafted, the proposed rule alternately refers to “ARB Offset Credits”, “ARB offset credits”, “Offset credits”, and “offset credits” as terms that are sometimes used interchangeably and sometimes used to indicate distinct and separate meanings. (CCAP1)

> **Response:** The regulation was modified to distinguish between an ARB offset credit and a registry offset credit, and to establish the requirements that each must meet (section 95970). Both terms are defined in section 95802, and the terms are now used consistently throughout the regulation. Offset Project Registries issue registry offset credits that meet the requirements of section 95980 pursuant to the process described in section 95980.1. ARB will review all of the documentation related to the issuance of the registry offset credits and make a determination as to whether ARB offset credits that meet the requirements of section 95981 should be issued for the registry offset credits pursuant to the process described in section 95981.1.

M-63. Comment: ARB must be more aggressive in promoting the use of offsets by focusing on approving independent offset approval agencies to reduce bottlenecks and increase the supply of offsets. (WSPA1, WSPA2)

> **Response:** ARB has provided a role for Offset Project Registries (OPR) to perform some of the administrative functions of the offset process in the regulation. ARB plans to utilize OPRs in lieu of performing these duties itself in the short-term, and may choose to continue this throughout the program. ARB has not yet determined if and when it would itself perform these roles. Therefore, in the meantime, all parties seeking to use Compliance Offset Protocols must go directly to an OPR to list their projects. ARB plans to approve OPRs sometime in 2012.

M-64. (multiple comments)
Comment: Establish offset registry as soon as possible. In order to ensure that Early Action Credits can be issued, tracked, monitored and transferred amongst market participants, it is imperative to have a functioning registry for offsets. Evolution Markets believes ARB should by Q2 2011 establish the legal agreements and necessary infrastructure support to enable an External Offset Registry, as defined by the Proposed Final Regulation. This will ensure that market participants can continue to buy and sell credits thereby supporting market confidence and easing contracting for delivery of credits. This will reduce potentially redundant transaction costs thereby reducing overall compliance costs, and will further support market liquidity. (EVMKTS)

Comment: CARB should expeditiously approve external offset registries to issue offsets that use CARB-approved protocols and follow regulatory requirements. An existing third-party organization with experience in offsets supply management (including establishment of protocols, development of projects, reductions verifications, and credits documentation) would provide immediate resources to help implement key elements of CARB’s overall offsets program, while operating under the agency’s authority. The CAR is one example; other entities may also be qualified to serve in this role. These external offset registries should be put in place in early 2011. In order to ensure an adequate supply of offsets at the beginning of the first compliance period, CARB should create a preparatory program that includes establishment of CARB-approved registries, certification of sufficient verifiers to check offset credits, and a schedule with a list of major procedural tasks with completion dates scheduled prior to January of 2012. (SCE1)

> **Response:** We agree that approving Offset Project Registries (OPR) should be done as soon as possible. ARB has provided a role for OPR to perform some of the administrative functions of the offset process in the regulation. We plan to utilize OPRs in lieu of performing these duties itself in the short-term, and may choose to continue this throughout the program. ARB has not yet determined if and when it would itself perform these roles. Therefore, in the meantime all parties seeking to use Compliance Offset Protocols must go directly to an OPR to list their projects. ARB plans to approve OPRs sometime in 2012.

M-65. Comment: Recognition of offset registries other than CAR should be expressly encouraged and the process for doing so streamlined. In addition to expanding the number of protocols for which early action credit will be granted, CARB should expand the number of registries from which early action offsets may be purchased, provided that they meet CARB standards. Several organizations, most notably VCS and ACR, have established offset registries. CARB should allow cap-and-trade participants to purchase offsets listed by those registries, as well as other registries such as the Chicago Climate Exchange. There is no reason to limit the authority to list and sell offsets, so long as the offsets are real, verifiable, additional, unique and permanent. If CARB is unable or unwilling to place those registries on the same footing as CAR by expressly recognizing them, then it should fast-track their approval via executive order under sections 95990(c) and 95986 of the regulation. Additional registries should be recognized, not only CAR. (COPC1, COPC2)

> **Response:** ARB has not yet recognized or approved any Offset Project Registries for the offsets program. In the regulation, we include provisions to accept early action offset credits issued under CAR protocols; however, ARB has not yet approved CAR as an Early Action Offset Program or Offset Project Registry. All offset protocols used in the compliance program must be adopted by the Board after undergoing a full regulatory process, including an ARB stakeholder process, in accordance with the Administrative Procedure Act. Before the Board adopts a new protocol there will be a separate CEQA review to assess the environmental impacts associated with that protocol. A public process convened by a voluntary program cannot substitute for a stakeholder process conducted by ARB for rulemaking purposes. ARB conducted a regulatory process and environmental review of the four project types adopted as part of the cap-and-trade regulation, which is why the CAR protocols associated with these four project types were approved for early action. In addition, we do not plan on only focusing on the approval of CAR-developed protocols. However, adopting additional protocols, even for early action purposes does not fall under the purview of this cap-and-trade rulemaking. If ARB were to adopt

any additional protocols that could be recognized for bringing in early action offset credits it would have to be done as part of this separate rulemaking and approval process. We will continue to work with all registries interested in the compliance offset program.

M-66. Comment: Offsets are critical to achieving cost-effective emission reductions under AB 32 especially until a broader market is developed when California links with other larger GHG cap and trade programs. While ARB has actively participated in offset creation at the Climate Action Registry (CAR), ARB has created additional prescriptive limits, and is not simply approving the protocols that they participated in. ARB has created a delegation process but is not yet delegating authority to the Climate Action Reserve to administer the offset mechanism although CAR has been very successful already in the offset development process and is a trusted entity. We are concerned that that the supply of offsets will not meet the needs of the CA Cap and Trade program and the program will cause economic harm because of the following policies and actions:

- adding additional layers of review and limits to the already difficult process of creating offsets;
- not providing any alternative review by existing and capable organizations that could serve as independent approvers of offsets; and
- adopting only four protocols.

There are existing organizations that can be approved today to address the threat of lack of supply due to bottlenecks and the overly prescriptive process. CAR can provide efficiency critical to ensuring offset supply. CAR currently has the capacity to administer the offset mechanism of the AB 32 program. Through 2009, 5.7MM credits have been issued by CAR.

We recommend that ARB designate CAR as an administrator of the offsets portion of the cap and trade system, designate non-California landfill gas CRTs as compliance-eligible offsets and include coal mine methane as an additional compliance-eligible protocol in 2011. Finally, in 2011 we would like to see direct recognition of existing offsets automatically from other established systems such as UN generated offsets and CAR approved offsets for compliance credits in California's cap and trade program, without additional administrative burden. Linking to other robust programs will promote the use of the highest quality offset credits known today and would do so in a cost effective manner. It would also help provide assurance to capped sectors and developers of offsets that a process to generate sufficient offsets is available to control costs and prevent undue economic impacts prior to full bilateral linkage with a larger cap and trade program, such as the European Union Emissions Trading Scheme. (CHEVRON1)

Response: We recognize stakeholder concerns regarding offset supply. ARB is prohibited from adopting additional protocols as part of this cap-and-trade rulemaking. All offset protocols used in the compliance program must be adopted by the Board after undergoing a full regulatory process, including an

ARB stakeholder process, in accordance with the Administrative Procedure Act, and an environmental review. We plan to look at further offset protocols for potential inclusion in the cap-and-trade program beginning in 2012. The details surrounding any new offset project types for which ARB adopts an offset protocol will be dealt with under that specific rulemaking, and modification will be made to the cap-and-trade regulation as needed.

ARB is the only agency that can regulate the offsets market. Offset Project Registries will be approved to conduct specific administrative functions of the offsets program. We may not designate one individual entity to be an Offset Project Registry and have included an application and approval process in the regulation to approve Offset Project Registries.

The regulation includes a framework for California to link its cap-and-trade program to other emissions trading systems of similar scope and rigor. Linkage can expand the coverage of the cap-and-trade program to include emissions-reduction opportunities for sources covered in another program. The regulation does not currently include linkage to other programs, though staff anticipates bringing recommendations to the Board in 2012 for possible linkage with the programs being developed by the three other WCI Partners that are currently working to implement programs by January, 2012: British Columbia, Quebec, and Ontario.

Each program will undergo a case-by-case analysis by staff as part of a formal rulemaking process, and the Board will need to approve regulatory amendments reflecting the linkage with a particular program before it can take effect.

M-67. Comment: Section 95986 uses the term "registration" and "registered" in a context that does not refer to offset credits (See for example (c), (c)(3)(A)). Given the specific use of this term to refer to offset credits in other parts of this Section, as well as other parts of the regulation, we suggest that a different term be adopted for the approval of offset project registries. (TPI2)

Response: We did not make the changes requested by the commenter because under section 95986(c) the provision refers to registration specifically identified in section 95830. Referencing the specific section here makes it clear what type of registration the provision is referring to. In section 95986(c)(3)(A), the use of the term registration is consistent with the way it is used for registering market participants because the term refers to registering parties and not offset credits.

Registry Approval Process and Requirements

M-68. Comment: Section 95986(d) requires the offset project registry applicant to have its "primary business" operate an offset project registry. This requirement may exclude GHG programs like the VCS which do much more than provide a limited registry function. To be clear, the VCSA is strictly dedicated to the management and improvement of the VCS Program and does not undertake other activities (e.g., consulting, validation/verification, methodology development) within the carbon market, and we applaud CARB's attempt to ensure that offset project registries not play larger roles in the market as that could lead to real or perceived conflicts of interest. The VCSA recommends that the language in this section be amended to include "operating a GHG program that includes a registry system." (VCS)

> **Response:** We clarified the language in section 95986(d) regarding the function of registries. If a registry becomes approved by ARB as an Offset Project Registry, they must perform specific functions designated in the regulation. The regulation allows a registry to perform different functions as part of their voluntary registry services, as long as the Offset Project Registry has the capability to perform the roles designated by ARB in sections 95986 and 95987.

M-69. Comment: In addition to recognizing external registries, the VCSA encourages CARB to consider the difference between registries and greenhouse gas programs. GHG programs encompass a broader range of offset functions than registries, which primarily serve to issue offset credits and allow participants to transfer them between accounts. GHG programs generally provide a comprehensive architecture and process by which protocols and projects are developed and approved, contain policies governing conflicts of interest, outline procedures for accreditation of validation and verification bodies, and set out details regarding eligibility of projects and other matters. Under CARB's proposed protocol system, many of the details that would normally be found under a broader program's architecture of rules are contained within the protocol's terms. In other words, in CARB's design, each protocol would be a standalone system and would contain many of the rules that govern all offset projects. In contrast, some GHG programs like the VCS operate on the basis that the high-level rules are applied to all protocols adopted under the program. The VCSA recommends that CARB consider this difference in approach when considering recognition of external protocols. If each protocol contains many of the same rules that are contained in all protocols, whenever a high-level policy change is made, for instance, governing how many crediting periods a project is eligible to renew, amendments will have to be made to each protocol that has been recognized, potentially creating a significant added workload that could be minimized if the generally applicable rules are contained at a higher program level that universally applies to all protocols. The VCSA offers this input as CARB seeks to potentially integrate registries and protocols from greenhouse gas programs that have adopted a slightly different approach to protocol development. (VCS)

> **Response:** We clarified the language in section 95986(d) regarding the function of registries. If a registry becomes approved by ARB as an Offset Project Registry, they must perform specific functions designated in the regulation. The regulation allows a registry to perform different functions as part of their voluntary registry services, as long as the Offset Project Registry has the capability to perform the roles designated by ARB in sections 95986 and 95987.

Any protocol incorporated into the regulation, becomes a regulatory document in itself. ARB has included general requirements that apply to all protocols in the regulation and has kept protocol-specific criteria within the protocols. Any new protocols that would be accepted would need to go through a separate rulemaking process to ensure the resulting offsets meet the AB 32 criteria and the offset project requirements conform to the regulatory requirements. This new rulemaking would be an amendment to the existing regulation. As all of this is a rulemaking action, no alternative protocol development process can be substituted in its place.

M-70. (multiple comments)
Comment: Reconsider the level of liability insurance that will be required. The requirement for an offset project registry to hold $50 million in liability insurance would be prohibitive for most non-profit organizations of the type that would likely seek to become offset project registries. Moreover, an insurance policy regarding improper issuance of offset credits may even be impossible to obtain in the insurance market. In addition, it is not clear what the term of such a policy would be required, and what the coverage or trigger for the insurance would be. (VCS)

Comment: We agree that Offset Project Registries must carry liability insurance; however, currently, it is not possible for Offset Project Registries to obtain $50 million in liability insurance, as required under section 95986(c)(1)(E). The insurance industry does not typically provide liability insurance in this amount and few entities, if any, could reasonably afford such insurance if offered. Industry standard limits for liability are between $1 million and $5 million. Changing the $50 million requirement to $5 million is a realistic requirement that is possible for Offset Project Registries to meet. Further, of equal importance to the amount of coverage is the nature of that coverage. Most general or professional liability insurance policies do not specifically cover the improper issuance of offset credits or other similar commodities, yet this is precisely the risk the Air Resources Board is seeking to manage. We would strongly suggest that the Air Resources Board impose requirements that the required liability insurance specifically cover the issuance of offset credits. (CAR1)

Response: We agree and modified the regulation to require a level of professional liability insurance of $5 million instead of $50 million. We have spoken with potential Offset Project Registries regarding this level of insurance and believe that Offset Project Registries will be able to secure an insurance policy at this level.

M-71. Comment: CERP supports the use of approved offset project registries for project listing, verification oversight, and credit issuance—in combination with an expedited, transparent process for exchanging registry-issued credits for ARB-issued credits. CERP also supports the use of ARB- approved verifiers to meet AB 32's requirement for ARB oversight of verification. There are, however, certain aspects of the offset project registry mechanism that might prove problematic. The five year approval period for offset project registries creates too much insecurity for projects registered at approved registries. ARB should provide greater certainty for registered projects. The proposed regulations provide that an offset project registry could be approved to participate in the ARB program for five years, subject to renewal. This five year approval period, which is shorter than any project's crediting period, will create considerable uncertainty for offset projects registered with those registries, and therefore limit the registries' appeal and utility. CERP recommends that ARB provide an accelerated process by which projects registered with a registry that becomes "un-approved" can re-register with ARB, and continue any on-going crediting period. CERP also recommends that ARB clarify that the validity of already-issued credits will not be compromised if the issuer-registry does not secure a subsequent approval from ARB. (CERP1)

> **Response:** We changed the approval period for Offset Project Registries from five years to 10 years to address stakeholder concerns that five years was too short. In addition, in new section 95986(l)(3) we added provisions to allow offset projects that must switch registries due to "un-approval" to qualify for an extended crediting period of one year.

M-72. Comment: Reconsider the re-application requirement. CARB should not require external offset project registries to re-apply for registration every five years (section 95986(i)(5)). This is unnecessary particularly in light of CARB's ability to sanction an offset project registry for misdeeds under section 95986(j). It also creates significant uncertainty for projects registering under an external offset project registry where those projects have crediting periods longer than five years. This uncertainty would serve as another disincentive to use an external offset project registry as opposed to CARB's offset project registry. (VCS)

> **Response:** We changed the approval period for Offset Project Registries from five years to 10 years to address stakeholder concerns that five years was too short. Original section 95986(j), now section 95986(l), was modified to clarify what happens to offset projects that reside at an Offset Project Registry, whose approval has been suspended or revoked. These offset projects may transfer to another approved registry and continue its current crediting period. In addition, in new section 95986(l)(3) we added provisions to allow offset projects that must switch registries due to "un-approval" to qualify for an extended crediting period of one year.

M-73. Comment: We are pleased with and support the accreditation of third-party Offset Project Registries to assist with program implementation. We strongly believe that it is imperative for the Regulation to impose strict competency requirements for such registries. Offset registry services are complex and require specialized knowledge and experience, especially when providing guidance to offset project operators and verifiers on protocol requirements (as contained in section 95987(d) "The Offset Project Registry may provide guidance to Offset Project Operators"). In order for this guidance to be accurate, timely, and consistent, Offset Project Registries should be required to demonstrate deep competency in each protocol they seek to administer to avoid programmatic errors and market confusion. (CAR1, CAR2)

> **Response:** The regulation requires that ARB will only approve registries that meet a high standard under the regulation. The registry staff will be required to demonstrate practical knowledge of the protocols approved by the Board. The regulation contains requirements for regular information-sharing between the registries and ARB. The regulation allows for ARB to request information or discussions with registry staff at any point. As with many of ARB's regulations, compliance training will be available, and in this case required, to ensure the highest qualified personnel are on staff at the registries.

Registry Services

M-74. Comment: Under the proposed regulations, ARB will be notified of all protocol guidance and interpretations provided to verifiers and offset project operators by approved registries. However, the proposed regulations do not clarify what will happen if ARB disagrees with that guidance. The proposed regulations should specify what will happen if ARB disagrees with protocol guidance or interpretation supplied by an approved registry. (CERP1)

> **Response:** Section 95987 specifies that an Offset Project Registry may seek clarity from ARB before providing guidance to offset verifiers and Offset Project Operators. In addition, the regulation requires that Offset Project Registries submit a monthly report to ARB regarding the guidance they have provided. ARB will then make this information available on a publicly accessible website, so that verifiers and project operators can consult this guidance before having to request it from the Offset Project Registry. We believe that ARB will be in constant contact with the registries and do not see there being a problem in this regard.

M-75. Comment: Clarify the mechanism for third party registries, such as the Climate Action Reserve, to provide timely, consistent and accurate responses to questions that arise during offset project development and implementation. Offset registries should be required to demonstrate substantial competence and technical depth on any offset protocols they are using. There should be an ARB-administered competency exam and/or demonstrated experience in implementing the relevant protocols. There needs to be a clear, transparent mechanism to ensure that ARB and the various Offset Registries are all aware of any guidance that is provided to Project Developers. The regulations require the Offset Registry to communicate any guidance to ARB. We suggest that the regulations require that all guidance be made available on a publically accessible web site available to any Offset Registry or member of the public. In this way, the guidance documents can begin to form a body of "case law" to help guide consistent implementation of the protocols. (PFT1, PFT2)

Response: Section 95987 specifies that an Offset Project Registry may seek clarity from ARB before providing guidance to offset verifiers and Offset Project Operators. In addition, the regulation requires that Offset Project Registries submit a monthly report to ARB regarding the guidance they have provided. ARB will then make this information available on a publicly accessible website, so that verifiers and project operators can consult this guidance before having to request it from the Offset Project Registry. We believe that ARB will be in constant contact with the registries and do not see there being a problem in this regard.

Also, the regulation ensures that ARB will only approve registries that meet a high standard under the regulation. The registry staff will be required to demonstrate practical knowledge of the protocols approved by the Board and the compliance offset program.

M-76. Comment: Both ARB and the approved third-party offset program are required to track an offset after the credit is approved by ARB. This should not impose multiple transaction fees on offset purchasers and sellers. This section requires both ARB and the approved third-party program to "track the transactions of offset credits until ARB retires" such credits. As all third-party registries will likely impose transfer fees for offset transactions, we would recommend that ARB clarify that a project will only be charged transfer fees by one registry for early action credits that have been transitioned into compliance credits by ARB. (section 95990(d)) (SHILLINGLAW1)

Response: Offset Project Registries must track registry offset credits. These credits may not be used for compliance. Once the registry offset credits are brought into the compliance system, ARB will issue ARB offset credits to replace the registry offset credits. ARB is the only entity that will track ARB offset credits; they will not be tracked in the registry's system. Once ARB issues an ARB offset credit, the Offset Project Registry must retire, remove, or cancel the original registry offset credit in its system. The offset system is set up so that no offset credit exists in two systems at the same time; therefore, the scenario laid out by the commenter should not occur.

M-77. Comment: Section 95986(c)(3)(C) requires that a registry possess a repository of ownership information of all offset credits it issues, including prices and counterparties. While it may be important for ARB to understand the transaction prices of compliance instruments, it is not important or relevant for ARB to understand or require a registry to track prices of credits which are being sold for voluntary retirement; which do not meet ARB's requirements for compliance credits; or which otherwise are unrelated to the ARB program but are nonetheless registered on a registry which has been approved by ARB. It is unclear whether ARB expects approved offset registries to shut down their voluntary programs; expects them to run parallel but separate registries; or expects them to treat all credits and recordkeeping as if they were compliance instruments even if they do not qualify or are not being transferred. Imposing regulatory recordkeeping and disclosure requirements on the voluntary market will significantly dampen this market's contribution to mitigating climate change and should be avoided. (TPI2)

> **Response:** ARB modified this language to clarify that Offset Project Registries must have these capabilities for offset credits issued under this article (under Compliance Offset Protocols). This clarification was made because the Offset Project Registries do not need to meet these requirements for offset credits that are developed for voluntary purposes.

M-78. Comment: Reconsider the project audit requirement. While it is critically important that oversight of project verifications is provided, the requirement that external offset project registries audit and physically visit 20 percent of their projects is onerous and likely to be prohibitively costly and thus limit the scalability of the mechanism. Depending on the number of projects listed in an offset project registry, it may be very difficult to coordinate scheduling of all these projects among three different entities at the same time of the year. Instead, we would recommend emphasizing oversight of the validation/verification bodies. Under the VCS Program, this is achieved through a strict and rigorous process of accreditation, combined with annual surveillance of validation/verification bodies by the accreditation body and contracts between the VCS Association and these entities that set out obligations and liabilities. The American National Standards Institute (ANSI) may be an appropriate accreditation body to provide accreditation services for CARB, especially given their long-standing expertise in this area. This would allow CARB to leverage an existing platform, scale up the number of approved auditors quickly, and provide consistency across the market, including one that already establishes links with international partners and may likely have more in the future. (VCS)

> **Response:** We agree and modified section 95987(e) of the regulation to change the number of in-person audits that Offset Project Registries must perform from 20 percent to 10 percent. We reduced the number of in-person audits because ARB will also have its audit program that will include in-person audits, in addition to those performed by Offset Project Registries. We will also have access to the audit results collected by Offset Project Registries.

M-79. (multiple comments)
Comment: No current voluntary registries have the capability to track price. (TPI2)

Comment: Remove the requirement for offset project registries to track prices and counterparties. The VCS does not track prices and does not see the value in having the offset project registries track such information. The purpose of a GHG program and its associated registry is to ensure the creation of offsets according to the criteria and rules set out in the program, and the requirement to track prices is not relevant to the work of a GHG program. (VCS)

Comment: While pricing plays a fundamental role in the market's operation, the requirement that Offset Project Registries track and report offset prices is likely unworkable as currently drafted and would effectively preclude recognition of any early action credits. Credible offset registries, including the Climate Action Reserve, have intentionally chosen to neither seek nor manage information related to pricing to avoid a real or perceived appearance of a financial interest in offset projects. Further, outside of exchange-based transactions, per unit pricing information is not always readily known or fully discoverable since transactions can be very complex and dependent on external factors. Most importantly, because this information has not been tracked for early action offset projects under the recognized offset quantification methodologies specified in section 95990(b)(5), its inclusion as a requirement would alone preclude all previously transacted offset credits under the adopted standards from being recognized as early action offsets, undermining the cap-and-trade program. (CAR1)

Comment: We recommend that the requirement for registries to record pricing information is removed. Registries do not currently maintain pricing data nor is it their role to do so. Beyond the fact that pricing data is extremely sensitive information, it is impossible for a registry to maintain per-offset data for highly structured over-the-counter contracts which may include revenue sharing, package pricing, or swaps. (NISSENBAUM)

Comment: Concerning transaction prices, we have concerns with the simplicity of this requirement when compared to the types of transactions common in the secondary compliance instrument marketplace. Forward sales, partial pre-pays, derivative such as options, the associated transaction credit and insurance requirements and other factors make determination of "price" less than straightforward. At the same time, these transactions create the capital to originate projects, increase liquidity and help limit market volatility. Also, many buyers keep prices confidential as sensitive business information; it is not clear how ARB would handle this sensitivity. Limiting price discovery to instruments already registered on the ARB registry may alleviate the complexity somewhat. (TPI2)

Comment: Third-party offset programs should not be required to track prices for offset transactions to be approved by ARB. Third-party offset programs that may apply to ARB under this section do not, as a general rule, track pricing information in offset transactions. They do not function as exchanges (such as NYSE) and are not regulated as such by the SEC; rather, their registry function tracks ownership of particular offset credits. In addition, there are practical problems associated with tracking prices of over the counter trades, which can take a myriad of forms. We would recommend deleting the last clause ("including prices and counter-parties") in this section (section 95990(c)(2)(C)). (SHILLINGLAW1)

> **Response:** We agree and modified the regulation to remove the requirement for price tracking for both Early Action Offset Programs and Offset Project Registries.

M-80. Comment: In the event that an offset project registry has contractual agreements with third parties for the provision of registry services involving the issuance of and custodial holding of offset credits, these third parties should face minimum financial asset and/or credit requirements. In addition, insolvency protections should be considered so that offset credits being held in the third party registries do not become tied up in bankruptcy proceedings. Strict conflict of interest provisions should also be imposed on these service providers. (VCS)

> **Response:** New section 95986(c)(2)(A)(3.) was added to require that conflict-of-interest and confidentiality requirements be in place for any contractors of Offset Project Registries. This new section provides additional integrity to the offset program. Offset Project Operators should conduct due diligence in selecting an offset project registry.

M-81. Comment: We recommend changing the record retention time for section 95988 to five years after the verification statement is issued, as noted above. (TPI2)

> **Response:** Section 95988 was modified to change record-retention requirements for Offset Project Registries to 15 years. This change was made to be consistent with the new record-retention requirements for Offset Project Operators and Authorized Project Designees in section 95976.

ARB vs. Offset Project Registry Roles

M-82. Comment: The language in sections 95980, 95981 and 95985 of the proposed regulation should be cross-referenced and clarified to explicitly indicate that ARB retains final authority over the issuance and invalidation of offset credits for use in the California Cap and Trade program. Providing this type of clarification will help further the transparency, accountability, legitimacy and success of the program. (CCAP1)

> **Response:** We agree and modified the regulation to clarify our authority over the issuance and invalidation of offset credits. In addition, we clarified that ARB makes the final determination on whether or not a registry offset credit meets all requirements of the regulation and added this text to the regulation.

M-83. Comment: Clarify CARB's authority as the final arbiter of offset credit and verification disputes. (ENVENTREP1)

> **Response:** We agree with the comment to more clearly define ARB's role in offset decisions. We deleted Offset Project Registries from the appeals process for adverse verification statements. This clarification was made to be consistent with the MRR and reflects stakeholder comments that the appeals process should only be limited to determinations made by the Executive Officer of ARB and that ARB should be the only one to make these determinations. In addition, we clarified that ARB makes the final determination on whether or not a registry offset credit meets all requirements of the regulation, and we added this text to the regulation.

M-84. (multiple comments)
Comment: Qualified third-party offset registries can play a valuable role in managing offset programs used for compliance with the cap. Independent private entities (either nonprofit or for-profit), however, cannot be granted ultimate authority over compliance determinations. As the regulatory agency designated by the legislature to implement AB 32, CARB must retain final authority to determine whether an offset credit submitted for compliance conforms with the established requirements under the program. The Executive Officer should be the ultimate arbiter of disputed verification reports and CARB should be given explicit authority to deny issuance of an offset credit when a project does not comply with regulatory requirements. (NRDC1)

Comment: We understand that there is a role for qualified third-party offset registries that are paid by offset developers to assist in managing the offset program used for compliance with the cap. However, because offset registries' profits are directly tied to the number of offsets that are verified and sold through their systems, this may create an incentive to make decisions that favor the offset developers they work with at the expense of the environmental integrity of the offset. Climate registries should not be put in the position of both promoting and selling offsets (their bread and butter) while at the same time regulating the offsets market. As the regulatory authority in charge of ensuring that offsets represent real emission reductions, CARB must have a clear role in key decisions regarding verification and offset acceptance or denial. For instance, in Section 95977(e)(2)(C)(xix)(a-c), solely the CARB Executive Officer should handle petitions from offset developers disputing Verification Statements, make decisions on whether the Offset Project Data report meets proper standards, and make final determinations on resolving disputes. Section 95980 should allow the CARB Executive Officer explicit authority to deny any offset proposals that the Executive Officer finds does not meet relevant offset criteria. (UCS1, WALTERS, LUDLOW)

> **Response:** ARB is the only agency that can regulate the offsets market. Offset Project Registries will be approved to conduct specific administrative functions of the offsets program. We have made clarifications to the regulation stipulating that ARB has the final decision in dispute resolution regarding verification and the final decision regarding the issuance of ARB offset credits which may be used for compliance. We have also included provisions regarding conflict-of-interest for Offset Project Registries to ensure the integrity of the program.
>
> We agree with the suggested change to delete Offset Project Registries from the appeals process for Adverse Verification statements. This clarification was made to be consistent with the MRR and reflects stakeholder comments that the appeals process should only be limited to determinations made by the Executive Officer of ARB and that ARB should be the only one to make these determinations.
>
> In addition, the regulation requires that Offset Project Registries submit a monthly report to ARB regarding the guidance they have provided to offset verifiers and project developers.

M-85. Comment: Provide more details about external offset project registries. The draft regulation does not create enough certainty for external offset project registries to incentivize them to prepare and apply to become an approved registry. In addition to the possibility that external offset project registries may have to compete with the CARB registry, the following issues are not clear:

- process for applying to be an approved external project registry;
- when the application window open;
- fees, if any, to participate; and
- restrictions on what the offset project registries can charge for the issuance of offsets that will later be issued by CARB? (VCS)

  Response: The regulation allows offset projects to come into the program directly under Compliance Offset Protocols instead of first registering with CAR and using CAR voluntary offset protocols and then transitioning over to ARB's protocols. ARB has provided a role for Offset Project Registries (OPR) to perform some of the administrative functions of the offset process in the regulation. ARB plans to utilize OPRs in lieu of performing these duties itself in the short-term, and may choose to continue this throughout the program. ARB has not yet determined if and when it would itself perform these roles. Therefore, in the meantime all parties seeking to use Compliance Offset Protocols must go directly to an OPR to list their projects. The cap-and-trade regulation must be approved by the Board and take effect before approval of an Offset Project Registry. Given this requirement, ARB plans to approve OPRs sometime in 2012.

  The process for applying to be an Offset Project Registry is specified in section 95986. There is no fee charged to apply as an Offset Project Registry; however, the registry must have five million dollars in professional liability insurance and pay the costs associated with any training. ARB will not specify what fees can be charged by Offset Project Registries for the issuance of registry offset credits. We expect this to be determined among the registry and the third-party operating the offset project or purchasing the registry offset credits. ARB will not charge a fee for the conversion of registry offset credits to ARB offset credits.

Monitoring, Reporting, and Record Retention Requirements

Timing for Providing Documents to ARB

M-86. Comment: Modify section 95976(e)(4) follows: (e)(4) - Upon request by ARB or an Offset Project Registry, ~~the Offset Project Operator or Authorized Project Designee must provide to ARB or an Offset Project Registry all documents~~ for a copy of documents that reasonably describes an identifiable document or documents retained pursuant to this section, the Offset Project Operator or Authorized Project Designee shall make the documents promptly available. The Offset Project Operator or

Authorized Project Designee, upon a request for a copy of documents, including data used to develop an Offset Project Data Report shall, within 10 calendar days from receipt of the request, determine whether the request, in whole or in part, seeks copies of documents retained pursuant to this section and shall promptly notify the person making the request of the determination and the reasons therefore. (OFFSETSWG1)

> **Response:** We did not make this change. Section 95976(e)(4) is very clear on the types of record retention required and to be made available to ARB upon request. Any delay in receiving that data could hamper all oversight of the program, and subsequent enforcement, as needed.

Interim Data Collection Procedures and Variances

M-87. Comment: Section 95976(f)(1)(A) allows Offset Project Operators to apply to ARB for interim data collection method approvals in the case of unexpected equipment failure. However, this approval mechanism is limited to incidents which may result in the loss of at least 20 percent of a project's annual emission reduction volume; another way to think about this, is that projects must be at risk of losing at least 73 days of data to be able to apply to ARB for a substitute/interim data collection procedure. We recommend that this loss threshold be lowered to eight percent, or about 30 days of data. It does not seem equitable that projects with major equipment problems have special procedures available to them while projects with lesser but still material data loss challenges do not have such rights. We believe this lower threshold better balances the workload implications for ARB with the capability of project operators to address equipment failures in a timely manner. (TPI2)

> **Response:** We did not make this change. We believe that routine inspections should allow for identification of problems that would lead to most cases of data loss. To be eligible to use this provision, the problem must be identified within 30 days of the initiation of data loss. This requires that the offset project operator develop and implement a routine inspection program for the offset project. We believe the twenty percent threshold provides a good balance between the number of requests made to ARB for interim data procedures and due diligence by the offset project developer to implement a routine project inspection program. All projects, regardless of size, should have a stringent offset project inspection program.

M-88. Comment: ARB needs to provide greater clarity on how project owners and offset project developers should obtain timely clarification on certain aspects of the protocol. (It is not clear whether qualified positive verification statements will allow verifiers to accept deviation from or slight changes to protocols as dictated under certain project specific circumstances). Currently, updates to quantification methodologies have to be made public through a public review and Board adoption process. There are likely to be numerous instances where project owners and developers require clarity on the interpretation of the guidance provided or wish to deviate from the protocol due to some unforeseen event. Waiting for public review and board approval may result in the project missing deadlines prescribed in the regulations. ARB needs to enable verifiers and/or registries to make decisions on deviations and variances within a short-time frame and to specify what constitutes a deviation or variance. (CIG)

> **Response:** As part of the implementation phase, we will be developing guidance documents for project owners, developers, and verifiers after the regulation has been approved and finalized by the Board. These guidance documents will include procedures for obtaining clarification and contacting ARB staff regarding questions on implementation as project developers and verifiers proceed with their offset projects. Updating numerical or equation-related aspect of the protocol is considered part of the protocol's quantification methods. Changes to quantification methods can be updated through stakeholder input and Board action without having to go through the full APA (Administrative Procedure Act) process. Where interpretation of quantitative methodologies is necessary, we anticipate developing a process whereby staff will release topical guidance documents. These are issues that will be addressed as part of the implementation process once the regulation is approved.
>
> In addition, the regulation does not allow for variances, since each offset protocol must be approved by the Board after a full public and regulatory process. In addition, any changes made to Compliance Offset Protocols must be approved by the Board. In the event that monitoring equipment associated with an offset project fails, the project operator may ask ARB to approve methods for interim data collection procedures.

M-89. Comment: CERP supports the potential use of qualified positive verification statements, and urges ARB to create a public database of approved variances. CERP strongly supports the use of qualified positive verification statements where nonconformance with a protocol does not result in an offset material misstatement. CERP urges ARB to collect and make public a list of "non-conformances" (or "variances") found to be valid by a verifier. Often different offset projects will encounter the same problem, and it will be more efficient if the operators and verifiers are not forced to reinvent the wheel each time. A public list of previously-approved variances will bring some order, consistency, and efficiency to the process. In addition, a public list of variances can identify the kind of recurring issues that should be considered in the process of developing a new or revised methodology. (CERP1)

> **Response:** The regulation does not allow for variances, since each offset protocol must be approved by the Board after a full public and regulatory process. In addition, any changes made to Compliance Offset Protocols must be approved by the Board. This would be onerous and too administratively burdensome. However, in the event that monitoring equipment associated with an offset project fails, the project operator may ask ARB to approve methods for interim data collection procedures.

Record Retention Requirements for Offset Project Operators and Offset Verifiers

M-90. (multiple comments)
Comment: Section 95976(e)(2) sets document retention limits relative to a project's crediting period. This creates a long and uneven, variable document retention policy. For example, much of a project's documentation results from verification and monitoring work. A project with a 10-year crediting period would be required to retain some documents for 15 years, and other documents of exactly the same type, sensitivity and implication, for only five. Variable retention policies are very difficult and relatively expensive to implement. Since the standard makes clear that five years is a sufficient timeframe to retain verification documents, we recommend that retention of all monitoring and verification records be limited to five years after the issuance of the relevant verification opinion. (TPI2)

Comment: It is not customary to transfer copies of records or documents from project owners to verifiers for periods longer than the verification itself. Many landowners see this information as highly confidential and outside knowledge could be detrimental to their business. We recommend that a verifier only be required to keep a record of what they have reviewed during the verification including version, page, volume, data base ID, etc. (NISSENBAUM)

Comment: PG&E feels that the record retention period for Offset Project Operators or Authorized Project Designees is inconsistent with the verification requirements and too long for sequestration projects. We recommend that ARB make the data retention requirements in section 95976 (e)(2) consistent with the requirements in section 95977(e)(2)(C)(xi). (PGE1)

Comment: SCPPA raises the following point to help ensure ARB's offset protocols and links to other offset programs provide ample cost-effective emission reduction options: Section 95976(e)(2) (p. A-122) requires documents for sequestration projects to be retained for 100 years after the end of the crediting period (which itself may be extremely long). Requiring records to be retained for 100 years is impractical, unenforceable, and verges on the ridiculous. Record retention and production periods should be changed. As SCPPA has noted in its comments on other sections of the Cap and Trade Regulation, a 10-year retention period is unreasonably long. By contrast, the US Environmental Protection Agency's Mandatory Reporting of Greenhouse Gases Rule ("EPA Rule"), 40 CFR Part 98, only requires records to be kept for three years. (SCPPA2)

Comment: Section 95976 of the regulation sets out record retention requirements. Clearly a sequestration project could be allowed to establish a final crediting period baseline plus all offsets credits registered and then enter a monitoring process that would not require maintenance of all the preceding decades of documents. Of course during the active crediting period these records are necessary, but once in the monitoring period, with no additional revenue cost is an important issue. (CAFORESTRYASSOC1)

Comment: The proposed record retention requirements are unnecessary and excessively burdensome. Under the proposed regulations, the offset project representative is required to maintain all of the information relevant to measuring and verifying emission reductions or sequestration for five years after the end of a crediting period for a non-sequestration project, and for 100 years beyond the end of crediting for a sequestration project. The duration of these retention requirements is, to say the least, commercially unrealistic—many corporations do not exist for 100 years. It is our understanding that the 100-year requirement may be based on a similar requirement imposed by the Climate Action Reserve. It is quite possible that the Reserve could cease to exist well before the crediting period ends for many of its listed projects. By contrast, ARB is an agency of the state government, and is tasked with regulatory oversight. It is reasonable to expect ARB to bear the burden of long-term record retention for the offset projects it oversees. CERP suggests that ARB require any information it may need in the future to be submitted to ARB at the time of verification. (CERP1)

> **Response:** The record retention requirements in section 95976(e)(2) were changed to 15 years following the issuance of ARB offset credits, due to stakeholder concerns about an unnecessarily long record-retention requirement for forestry projects. Verifiers are also required to retain related documents for 15 years. The record retention requirements must be extensive enough for verification of each Offset Project Data Report. This provision is necessary to ensure that ARB or an OPR will have enough data to confirm the crediting project has been operating in accordance with the appropriate ARB-approved protocol.

M-91. Comment: The record retention, conflict of interest requirements, and re-verification of early action offsets will discourage offset project development. Modest changes are needed to the recordkeeping requirements and the conflict of interest requirements will need to be more flexible at the start of the program. (BCFSE)

> **Response:** The record retention requirements in section 95976(e)(2) were changed to 15 years following the issuance of ARB offset credits, due to stakeholder concerns about an unnecessarily long record-retention requirement for forestry projects. Verifiers are also required to retain related documents for 15 years.
>
> Also, we do not agree that the conflict-of-interest requirements for offset projects are too restrictive. These provisions are necessary to ensure the integrity of the offsets system and to ensure that all reviews associated with the data from offset projects are unbiased and independent.
>
> We also made changes to section 95990(f) regarding the regulatory verification of early action offset credits to streamline the requirements in response to stakeholder comments.

Reporting and Verification Deadlines

M-92. (multiple comments)
Comment: Minimize unnecessary bureaucratic requirements. Provide flexibility in the frequency of verification, as appropriate [pg 124(b)] (CCEEB1)

Comment: The penalty for a late Project Data Report is too harsh given the potential for extenuating circumstances beyond the Project Operator's control. We recommend that the penalty be pro-rated using a sliding scale depending on the lateness of the report and to clarify that a delay resulting from ARB or an associated registry will not result in a penalty. (NISSENBAUM)

Comment: Prohibiting issuance of all offsets credits reported in an Offset Project Data Report due to the report being one day late is not reasonable. We would recommend graduated sanctions. Delivering an offset project data report will involve coordination and cooperation between the landowner and multiple consultants, and the report could be late for multiple reasons outside of an Offset Project Operator or Authorized Project Designee's control. We would recommend a graduated sanctions approach if it is necessary to impose sanctions for late reports, with a higher percentage of credits being deducted for each one month period a given report is late. (section 95976(e)) (SHILLINGLAW1)

Comment: The rigid due date for the Offset Project Data Report is impractical for sequestration projects. A report cannot be completed until after the end of the calendar year; however, it is possible that in some areas of the country where sequestration projects will be implemented, winter weather may impede the ability to collect the necessary data between the end of the calendar year and April 1 of the following year. We request that the date be extended to July 1 of the following year or allow sequestration projects to have an automatic extension to July 1 of the following year. (NISSENBAUM)

Comment: Section 95977(d) includes a very strict delivery date for offset verification reports. The penalty for being late is denial of eligibility of the offset credits reported in that Offset Project Data Report. This seems highly punitive especially given that many projects will have multiple years of data verified in the first report and if necessary to avoid this penalty just wait another year and submit this first Offset Project Data Report without any penalty. Especially in the first few years, such deadlines should be more flexible to allow verifiers to get up to speed and ARB to have a steady flow of offsets arriving to keep Cap and Trade economic impacts down. Section 95976 has a similar deadline and penalty for Offset Project Data Reports, which should be addressed. (CAFORESTRYASSOC1)

Comment: The requirement to report on a calendar year basis will increase costs for projects which don't begin on January 1st by requiring them to perform an additional verification and will also lead to verification bottlenecks (and likely an increase in prices for verifiers) at the start of each year. This impacts smaller projects and livestock projects in particular, which are unable to shoulder additional transaction costs, more than it does larger projects. (CIG)

Comment: We support the prompt submission of all data and reports required under ARB market rules; however, ARB should provide a mechanism for requesting extensions in appropriate circumstances. For instance, the penalty of disqualification for missing the April 1 deadline for project performance reports in section 95975(d)(7) is draconian and not compelled by the program needs. (FCC, BLUESOURCE)

Comment: The standardized verification schedule is likely to create a verification and issuance traffic jam, and should be revised. Under the proposed regulations, all ARB-eligible offset projects will be undergoing verification between April and September. We are unclear about the expected benefit of this requirement. Given the limited number of verifiers, the standardized schedule is likely to create problems for project operators, verifiers, ARB, and approved offset registries. The cost impacts imposed on small projects by this market restriction would be especially pronounced, assuming they can even find a qualified verifier willing to undertake a small project. A more flexible verification schedule would help avoid this problem as well as the deadline issues discussed above. CERP urges ARB to provide more flexibility in the timing of verification. One option would be for ARB to require offset project operators to submit evidence that verification has been initiated (e.g. a signed verification contract) within three months of the end of the prior data collection period. This would help to ensure that projects undergo verification promptly, while allowing offset project operators and verifiers to responsibly manage the verification process. (CERP1)

Comment: ARB proposes to disallow issuance of offsets in cases where a final Verification Statement is submitted after a certain calendar date. Further, ARB has proposed a deadline associated with the submission of Offset Project Data Reports, which also, if not met, will result in the disqualification of offsets (for that verification year). This penalty is extremely harsh. Offset projects are often subject to technical issues or questions of protocol interpretation, which can result in lengthy resolutions, occasionally leading to public consultation or expert review. Further, it is not out of the ordinary for projects to require additional measurements, modeling or instrument calibrations. In many of these cases the project is robust, fully operational, and generating high quality offsets, and is only lacking in technical evidence that can take time to develop. Also, delays can, and often are, caused by verifiers themselves, at no fault of the project operator. Equator strongly urges ARB to modify this rule. (EQUATOR)

Comment: The regulations disqualify emission reductions quantified in an offset project data report or a verification statement that is submitted after the relevant deadline. This penalty is excessively harsh and should be modified. The regulations require that an Offset Project Data Report be submitted within three months of the end of the calendar year, which is also the emission data collection period. The verification statement for those emission reductions must be submitted within nine months of the end of the calendar year data collection period. The regulations also appear to provide that if one of these deadlines is missed, the emission reductions in the report or statement become permanently ineligible for crediting. Both the deadlines and the consequence for missing them are unreasonable. When emission reduction quantification and verification are going smoothly, a project will likely be able to meet these deadlines. When problems arise, however, it may take time to resolve them. Given the many and varied reasons that quantification and verification could be delayed, the disqualification of emission reductions after a missed deadline is unwarranted. CERP recognizes the need for ARB to ensure that projects are verified in a timely manner. CERP urges ARB to modify the proposed regulations to allow offset project operators and verifiers to apply for a deadline extension should such extenuating circumstances arise, with no penalty. (CERP1)

Comment: To avoid artificially inflating the cost of verification and of offsets, we recommend that ARB allow offset project data reports to be submitted at any time within one year of the relevant vintage year, with offset verification statements due six months after the submission of an offset project data report. Requiring all offset project data reports to be submitted by April 1 and all offset verification statements to be received by ARB by October 1 of the same year will concentrate demand for scarce verification services in the six month time period between April and October, driving up the cost of verification and therefore the cost of offsets. By permitting offset project data reports to be submitted within one year of the relevant vintage year, with offset verification statements due six months after the submission of the data report, ARB will smooth demand for verification services over time and avoid artificially inflating the cost of verification and offsets. This will also smooth workflow for ARB throughout the year (section 95976(d)(6) and section 95977(d)). (SHILLINGLAW1)

Comment: Section 95977(d) sets a nine-month time limit for the submission of verification statements after the monitoring period's completion. While we agree that in general this should allow sufficient time to complete a verification, there can be incidents which significantly derail the verification process and which are beyond the control of the Offset Project Operator or even the verifier. Examples include: loss of critical Verification Body staff due to turnover, illness, or untimely death; lengthy delays in obtaining documentation or opinions required from a regulatory agency, product manufacturer, previous project owner, or anyone else without a material interest in the project's timely verification; process bottlenecks including, especially, internal review processes at verification bodies if there is a calendar-year verification cycle for all projects. To accommodate these unusual circumstances, we request that ARB allow one-time extension requests to accommodate situations where the Offset Project Operator has acted diligently and in a timely manner yet cannot meet the deadline. (TPI2)

Comment: We fully support the necessity of a clear timeline for submitting project data. Requiring submission of all offset project data on April 1 of each year, as established in section 95976(d), however, will create a severe bottleneck and disable the offset program during that period. By requiring annual reporting on a single reporting deadline, the Air Resources Board is setting the verification schedule for all projects to be coincident, which will create undue burden on the verification bodies and board or registry staff reviewing the reported data. This requirement will, in turn, reduce the total number of projects that can be verified in any given year, increase the price of verifications, cause delays in offset credit issuance, and ultimately reduce the available supply of offset credits. A more efficient and effective timeline is to have data covering an approved reporting period submitted regularly, as specified in the Compliance Offset Protocol for that project type or based on the first time a project has been submitted. (CAR1)

Comment: Forcing offset projects into calendar-year reporting cycles places extraordinary pressure on all actors in the segment due to workload cyclicality without providing any commensurate environmental or marketplace benefit. Section 95976(d) is the first reference to calendar date requirements for submittal of offset project data reports and verifications, so we will elaborate here. We agree in general that frequent reporting and verification, usually annual but with some exceptions, is appropriate.

And, there are numerous requirements throughout the regulation which ensure that offset project data is reported on a frequent, uninterrupted basis. We do not believe there is any further benefit to forcing reporting and verification tasks into an identical January-to-December cycle. For example, ARB and Covered Entities will have identical information regarding the availability of offset credits whether they are verified on a calendar year basis or on an annual basis with arbitrary start and end dates. Registries can still submit annual audit documents. Therefore, we recommend that all references to calendar dates be removed, in favor of relative dates pegged to the last day of the monitoring period. Using this framework, section 95976(d)(6) would read: “All Offset Project Data Reports are due 91 calendar days after the last day of the project’s monitoring period.” Similar changes would be required to several other sections. Here are some examples: 95977(b)—simply end the section after the word “annually” in the first sentence; 95977(c) —eliminate reference to calendar year; 95977(d) —change dates to relative timeframes; 959857(b)(2)(E) —use the phrase “monitoring period” instead of “year.” (TPI2)

> **Response:** Section 95976(d) was modified to address stakeholder concerns about a calendar year reporting period with a fixed annual “verification period.” The new requirements cover a reporting period that is not tied to the calendar year to address these stakeholder concerns. Additional modifications were made to the timing for the schedule for verification (sections 95977(b) and (c)) and the submittal of Offset Verification Statements (section 95977(d)) to be consistent with the new offset reporting schedule in section 95976(d) and clarify the verification cycle. The new cycle requires that Offset Project Data Reports be submitted to ARB within four months after the conclusion of the Reporting Period. They subsequently have to be verified within nine months after the conclusion of the Reporting Period. We believe the new requirements provide sufficient flexibility to meet the deadlines. For an example, if a project developer

completes their reporting within two months, they have seven months to get their Offset Project Data Report verified.

M-93. Comment: Section 95977(b) specifies that non-sequestration offset projects be verified annually. In general, we support imposing annual verifications. However, certain projects, indeed certain project types, result in offset projects which produce very few offset credits each year, and for these projects annual verifications are a significant cost burden. For example, TerraPass works with many agricultural methane projects which produce fewer than 7500 credits per year; annual verifications impose a project cost of $1-2 per ton, just for the verifier, for a 7500 ton project. These projects have many co-benefits for example, they tend to be run by small business concerns or be publicly owned. For these small projects TerraPass recommends that the regulation provide flexibility to allow less-frequent verifications while maintaining annual monitoring report submissions. This flexibility could be provided in a several different ways:

A sentence could be added to 95977(b) which carves out an exception if such exception is written into the Compliance Offset Protocol – <u>"The verification of GHG emission reductions… must be performed annually unless otherwise allowed by the Compliance Offset Protocol.</u>"

A blanket exception for small projects could be written into the regulation: "<u>The verification of GHG emission reductions…. must be performed annually unless the Project's submitted Monitoring Report shows that the project produced fewer than 10,000 metric tons of emission reductions during the relevant Monitoring Period. In such cases, the Project Operator may choose to forego one verification and complete a two-year verification the following year. In no case shall a Project which opted for a two-year verification be awarded more credits for its first year than its Monitoring Report estimated</u>." (TPI2)

> **Response:** We agree that some exceptions need to be made for smaller projects, and we added provisions to allow smaller projects (those that yield 25,000 metric tons, or less, of GHG reductions or GHG removal enhancements) to opt to conduct verification every two years. In this case a site visit will only be required in the second year (the year in which full offset verification services are provided).

Verification

General Verification Comments

M-94. Comment: Offset verification provisions should be split into smaller sections. For ease of reading it would be preferable to split section 95977 into several separate sections. If necessary, this could be done using a decimal place in the way the sections on biofuel emissions are split: sections 95852, 95852.1, and 95852.2. (SCPPA2)

> **Response:** We agree and modified section 95977 to split it into three sections—95977, 95977.1, and 95977.2—for ease of readability.

M-95. Comment: Some mistakes fall below a materiality threshold where the potential for disruption of contractual arrangements outweighs the incremental gains from correcting the mistake. Camco recommends a materiality threshold of 5 percent. This is an issue which present in other offset mechanisms, particularly the CDM. A materiality threshold is especially warranted for types of mistakes that, if not corrected, are just as likely to understate as they are to overstate the emission reductions at the programmatic level, resulting in little to no net environmental impact. In these instances, it may be more productive to act prospectively through protocol revisions rather than revisiting prior emissions calculations. (CIG)

> **Response:** The program includes a materiality threshold of five percent. The term "offset material misstatement" can be found in section 95802, and is defined as 'a discrepancy, omission, or misreporting, or aggregation of the three, identified in the course of offset verification services that leads an offset verification team to believe that an Offset Project Data Report contains errors resulting in an overstatement of the reported total GHG emission reductions or GHG removal enhancements greater than 5 percent.' Discrepancies, omissions, misreporting, or an aggregation of the three, that result in an understatement of total reported GHG emission reductions or GHG removal enhancements in the Offset Project Data Report is not an offset material misstatement.

General Verification Process

M-96. (multiple comments)
Comment: Section 95977(e)(2)(C)(xii)(d) requires verifiers to run parallel calculations to determine the accuracy of the project's calculations. There are many different approved software models for forest carbon projects, some of which cost more than $20,000. This alone would significantly increase the cost of verification if a verifier has to purchase three or four different models and only performs five to ten verifications a year. In addition, the hourly cost to have a verifier reproduce the calculation will result in unworkable verification costs. We recommend that verifiers be required to check the equations used within the project's model for accuracy as they are currently required to do under the Climate Action Reserve verification requirements. (NISSENBAUM)

Comment: Section 95977(e)(2)(C)(xiv) requires verifiers to re-process project data and develop their own report to compare. This is excessive and would result in unworkable verification costs. (NISSENBAUM)

> **Response:** The regulation does not require that verifiers replicate offset calculations or reprocess data to compare results with those of project owners. Offset verification does not call for a duplication of all calculations, but rather checking specific subsets of the reported data based on several criteria. Selection of data subsets for checking involves a review of the largest

contributions to overall GHG sources, sinks, and reservoirs that result in reduction or removals, as well as the sources, sinks, and reservoirs associated with the greatest uncertainties in estimation. To do this, the verifier creates a sampling plan which includes a ranking of source contributions to overall GHG sources, sinks, and reservoirs, and a ranking of sources, sinks, and reservoirs with the greatest calculation uncertainty.

The proposed regulation does not prescribe the number of data checks that the offset verification team must perform. The offset verification team must exercise professional judgment in choosing these. Ultimately, the offset verification team must have reasonable assurance that the reported GHG reductions or GHG removal enhancements do not contain an offset material misstatement that would overestimate reductions or removals by more than five percent of what was reported in the Offset Project Data Report, and that all applicable regulatory requirements in the regulation and the applicable protocol have been met in the estimation and reporting of those GHG reduction or GHG removal enhancement estimates.

M-97. Comment: The requirement for use of professional judgment in sample size is concerning for project owners. The requirement for use of professional judgment will result in a "race to the bottom" by verifiers since the sample size dramatically impacts the price of verifications. The fewer samples a verifier thinks he may get away with, the lower the sample size he may recommend. Since the landowner relies on this professional judgment, not being an expert himself, it is impossible for him to know where the line is that will result in a higher risk of errors. Since ARB suggests that landowners bear the ultimate liability for errors, we suggest that ARB require a minimum sample size of 10 percent. (NISSENBAUM)

Response: We do not agree that we should require a minimum of 10 data checks for Offset Project Data Reports. The regulation does not prescribe the number of data checks that the offset verification team must perform. The offset verification team must exercise professional judgment in choosing these. Ultimately, the offset verification team must have reasonable assurance that: (1) the reported emissions reductions or removals do not contain a material misstatement that would overestimate reductions or removals, or a material misstatement that would underestimate reductions or removals, by more than five percent of the reported emissions reductions or removals, and (2) that all applicable regulatory requirements in the proposed regulation and the applicable protocol have been met in the estimation and reporting of those reduction or removal estimates. ARB will have oversight of its verification program to ensure consistency and quality across its verifiers.

M-98. Comment: Section 95977(e)(2)(C)(xix) allows the offset project operator or authorized project designee 10 days to correct a material misstatement or nonconformance found by the offset verification team. We believe 10 days is too short and recommend it be increased to 30 days. (NISSENBAUM)

Response: We do not agree that the number of days to modify the Offset Project Data report is too short. This provision provides those developing offset projects with 10 working days to modify and correct the Offset Project Data Report, and provides enough time for those developing offset projects to make the necessary changes to the report, while balancing the need to complete the verification in a timely fashion. The verification process is an iterative data review and revision process between an offset verifier and an Offset Project Operator or Authorized Project Designee. This particular provision provides a timeline to allow a verifier to wrap up verification-related services and provide an Offset Verification Statement before the due date.

M-99. Comment: The process of appealing from ARB decisions on projects should be more clearly defined. CERP urges ARB to provide more clarity on the process by which an offset project operator can appeal a decision of ARB regarding a project listing or verification. The timing of the appeal process should be modified as it may not be workable. If an offset project data report is found to be ineligible, the proposed regulations would give the offset project operator 30 calendar days to submit a revised version. (Note that it is problematic that there is no deadline for when ARB or the approved offset project registry must inform the offset project operator that the report has been found to be ineligible, especially as the 30 days begins from the date of the determination of ineligibility). A revised verification statement must be submitted within 15 calendar days. (It is unclear when this 15 day period begins). The proposed regulations further provide that if an offset project operator disagrees with a determination made by an approved registry, they can petition ARB, provided the process is reinitiated within 60 calendar days of the applicable verification deadline. However, given that there is no deadline for when ARB or an approved offset registry must determine whether an offset project data report meets the specified requirements, or for when an approved offset project registry must determine whether a revised offset project data report and verification statement are acceptable, it may not be possible to meet the 60 day deadline. CERP urges ARB to eliminate the 60 day deadline, and instead require appeal to ARB within 30 calendar days of the final contested decision by the approved offset project registry. (CERP1)

Response: We do not agree that we should modify timing of the appeal process. However, we modified or deleted sections 95977(e)(2)(C)(xix)(a.) through (c.) and replaced with new section 95977.1(b)(3)(R)(5.). These changes reflect the deletion of Offset Project Registries from the appeals process for Adverse Verification statements. This was clarified to be consistent with the MRR so that the appeals process should reflect determinations made by the Executive Officer of ARB and that ARB should be the only one to make these determinations.

ARB's Role in Resolving Disputes

M-100. (multiple comments)
Comment: Modify section 95977(e)(2)(C)(xix)(a-c) as follows:

a. If the Offset Project Operator or Authorized Project Designee and the verification body cannot reach agreement on modifications to the Offset Project Data Report that result in a Positive Offset Verification or Qualified Positive Offset Verification Statement, due to a disagreement on the requirements of this article or Compliance Offset Protocol, the Offset Project Operator or Authorized Project Designee may petition the Executive Officer ~~or Offset Project Registry~~ to make a decision as to the verifiability of the submitted Offset Project Data Report.

b. If the Executive Officer ~~or Offset Project Registry~~ determines that the Offset Project Data Report does not meet the standards and requirements specified in this article, the Offset Project Operator or Authorized Project Designee shall have the opportunity to submit within 30 calendar days of the date of this decision any Offset Project Data Report revisions that address the Executive Officer's ~~or Offset Project Registry's~~ determination, for re-verification of the Offset Project Data Report. In re-verifying a revised Offset Project Data Report, the verification body and offset verification team shall be subject to the requirements in sections 95977(e)(2)(C)(xviii)(a) through 95977(e)(2)(C)(xviii)(d), and must submit the revised Offset Verification Statement to ARB ~~or the Offset Project Registry~~ within 15 days.

~~c. If the Offset Project Operator or Authorized Project Designee disagrees with a determination made by an Offset Project Registry, they can re-initiate the dispute resolution process in section 95977(e)(2)(C)(xix)(a) through the Executive Officer.~~

~~(i) The process must be reinitiated within 60 days of the applicable verification deadline.~~

~~(ii) The Executive Officer, verification body, Offset Project Operator or Authorized Project Designee shall be held to the requirements in section 95977(e)(2)(C)(xix)(b).~~

Modify section 95977(e)(2)(C)(xx) as follows:

(xx) Upon submission of the Offset Verification Statement to ARB ~~or the Offset Project Registry,~~ the Offset Project Data Report must be considered final and no further changes may be made. All verification requirements of this article shall be considered complete.

Modify section 95981(d)(5) as follows:

(5) If ARB determines the information submitted in sections 95981(d)(1) and (d)(4) does not meet the requirements for issuance of ARB offset credits, <u>then ARB may deny issuance of an offset credit.</u> The Offset Project Designee or

Authorized Project Operator may appeal ARB's decision by petitioning the Executive Officer, within 10 days of denial, for a review of submitted information in section 95981(d)(1) and (d)(4) and respond to any issues that prevent the issuance of ARB offset credits. (NRDC1)

Comment: CARB, as the regulatory authority in charge of ensuring that offsets represent real emission reductions, must have a clear role in key decisions regarding verification and offset acceptance or denial. For instance, in section 95977(e)(2)(C)(xix)(a-c), solely the CARB Executive Officer should handle petitions from offset developers disputing Verification Statements, make decisions on whether the Offset Project Data report meets proper standards, and make final determinations on resolving disputes. Section 95980 should allow the CARB Executive Officer explicit authority to deny any offset proposals that the Executive Officer finds does not meet relevant offset criteria. (LUDLOW)

Response: We agree with the suggested change to delete Offset Project Registries from the appeals process for Adverse Verification statements. This clarification was made to be consistent with the MRR and reflects stakeholder comments that the appeals process should only be limited to determinations made by the Executive Officer of ARB and that ARB should be the only one to make these determinations.

We agree with your suggestion to clarify that ARB makes the final determination on whether or not ARB offsets credits should be issued and meet all requirements of the regulation, and we added this text to the regulation.

Site Visits

M 101. Comment: To accommodate the possibility of two-year verification cycles as requested above for small projects, we recommend modifying the language of section 95977(e)(2)(C)(iv) to require a site visit with every verification, though not to be interpreted as a requirement for site visits more frequently than once per year. (TPI2)

Response: We changed the regulation to require that a site visit for non-sequestration projects must be conducted in the year that offset verification services occurs. For smaller projects that opt to conduct verification every two years, a site visit will only be required in the second year (the year in which full offset verification services are provided.

M-102. Comment: Verification requirements will result in unworkable costs. Section 95977 indicates that two site visits must be performed in the first year of a project's crediting period, which will double the verification costs and make most projects financially infeasible. In addition, this section requires that verifiers must replicate offset calculations for each project, as well as re-processing data to compare results with those of project owners. Equator suggests that ARB reconsider requiring costly and onerous verification requirements, and recommends deferring to the verification requirements of the Climate Action Reserve's Forest Project Protocol. (EQUATOR)

> **Response:** The commenter's interpretation of the language is incorrect. The language in original section 95977(e)(2)(C)(iv), now new section 959771.(b)(3)(D), requires that for non-sequestration offset projects a site visit be conducted every year. In addition, we added provisions for smaller projects that opt to conduct verification every two years. In this case, a site visit will only be required in the second year (the year in which full offset verification services are provided).
>
> For forest offset projects, a single site visit must be performed in the first year of operations for a forest project. In addition, a site visit is required at least once every six years in the year that offset verification services are provided. This could occur sooner than six years, since verification for forest projects must be performed at least once every six years.
>
> The regulation does not require that verifiers replicate offset calculations or reprocess data to compare results with those of project owners. Offset verification does not call for a duplication of all calculations, but rather checking specific subsets of the reported data based on several criteria. Selection of data subsets for checking involves a review of the largest contributions to overall GHG sources, sinks, and reservoirs that result in reduction or removals, as well as the sources, sinks, and reservoirs associated with the greatest estimation uncertainties. To do this, the verifier creates a sampling plan that includes a ranking of source contributions to overall GHG sources, sinks, and reservoirs and a ranking of sources, sinks, and reservoirs with the greatest calculation uncertainty.
>
> The proposed regulation does not prescribe the number of data checks that the offset verification team must perform. The offset verification team must exercise professional judgment in choosing these. Ultimately, the offset verification team must have reasonable assurance that the reported GHG reductions or GHG removal enhancements do not contain an offset material misstatement that would overestimate reductions or removals by more than five percent of what was reported in the Offset Project Data Report, and that all applicable regulatory requirements in the regulation and the applicable protocol have been met in the estimation and reporting of those GHG reduction or GHG removal enhancement estimates.

M-103. Comment: Section 95977(e)(2)(C)(iv) requires two site verifications to be performed in the first year of a project, once at initiation and another after the first year of operations. This requirement doubles the cost of verification in the first year. This further increases the minimum size requirement for a project to be financially feasible. We recommend that there only be one required site-verification every 6 years with only a single verification required in the first year. (NISSENBAUM)

Response: The commenter's interpretation of the language is incorrect. The language in original section 95977(e)(2)(C)(iv), now new section 959771.(b)(3)(D), requires that a single site visit must be performed in the first year of operations for a forest project. In addition, a site visit is required at least once every six years in the year that offset verification services are provided. This could occur sooner than six years, since verification for forest projects must be performed at least once every six years. We believe the language in the regulation already matches the recommendation.

M-104. Comment: Equator suggests that ARB modify its proposal to only require a verification site visit to forest projects every sixth year. Updated model outputs, maps and carbon calculations can be readily reviewed and verified without the need for a costly site visit. If a verifier, at any time, believes that a site visit is needed due to changes in management, reversals or other technical deviations this is at their discretion. However, Equator does not believe that an annual site visit is warranted, and will only result in increased costs without contributing to the overall rigor of the system. (EQUATOR)

Response: The regulation has been modified to address these concerns. For forest offset projects, a single site visit must be performed in the first year of operations for a forest project. In addition, a site visit is required at least once every six years in the year that offset verification services are provided. This could occur sooner than six years, since verification for forest projects must be performed at least once every six years.

M-105. Comment: Site visits by verifiers should only be required of sequestration projects once every six years, as conditions on the ground do not change significantly from year to year, and ARB has adequate remedies in the event of any reversal. Requiring annual site visits is unnecessary to ensure offset quality and will significantly increase the cost of forest carbon offsets.

Section 95977(c) makes no distinction between site visit verifications and desk review verifications in requiring the verification of sequestration projects to be performed "at least once every six years and may cover up to six years of GHG reductions or GHG removal enhancements." Section 95977(e)(2)(C)(iv) requires that "[f]or a forest or urban forest offset project, at least one accredited offset verifier in the offset verification team, including the project specialist, must make a site visit every year that offset verification services are provided. A site visit is also required after the first full calendar year of operations of an offset project."

As noted above, New Forests has found that site visit verifications can be an order of magnitude more costly than a desk verification of data. Forests grow slowly and in most circumstances there will be little change to a given site from year to year. ARB has adequate remedies in the event of a forest carbon reversal: if a forest landowner or offset project developer has engaged in fraudulent activity or made intentional material misstatements in an offset project data report, ARB will be able to impose significant economic sanctions under the proposed regulations and the State of California will be able to pursue jail time for the perpetrators due to perjury. Such penalties coupled with periodic site visits are sufficient to ensure MRV accuracy and offset quality. Requiring annual site visits is unnecessary to ensure offset quality and will significantly increase the cost of forest carbon offsets, making many projects uneconomic, particularly projects on non-industrial forest lands. We would recommend that ARB require a site visit once every six years for stand-alone forest carbon projects. A desk verification of an offset project data report should be required for issuance of compliance offset credits in the interim (section 95977(c) and section 95977(e)(2)(C)(iv)). (SHILLINGLAW1)

> **Response:** The regulation has been modified to address these concerns. For forest offset projects, a single site visit must be performed in the first year of operations for a forest project. In addition, a site visit is required at least once every six years in the year that offset verification services are provided. This could occur sooner than six years, since verification for forest projects must be performed at least once every six years.
>
> In addition, we included a requirement to allow for less-intensive verification for qualifying forest projects. This would allow desk reviews to be performed in the interim years that full offset verification services are not provided. ARB has maintained the requirement for site verification every six years and by including less-intensive verification requirements. Registry offset credits and ARB offset credits may be issued in the interim years if they meet the requirements of the regulation and the protocol.

M-106. Comment: There is no distinction made between site verification and desk verification in section 95977(c). At a minimum, a site verification costs upwards of $15,000 while desk verification can be as little as $2,500. Market swings and the time value of money both add pressure to smaller projects that cannot afford to do annual site verifications but need a steady issuance of credits. We recommend that ARB maintain the requirement for site verification every six years, but allow for offsets to be issued to projects in between site verifications based upon desk verification. (NISSENBAUM)

> **Response:** We included a requirement to allow for less-intensive verification for qualifying forest projects. This would allow desk reviews to be performed in the interim years that full offset verification services are not provided. ARB has maintained the requirement for site verification every six years, and by including less-intensive verification requirements. Registry offset credits and ARB offset credits may be issued in the interim years if they meet the requirements of the regulation and the protocol.

M-107. Comment: The requirement to perform site verification within one year after an unintentional reversal will be a significant financial obstacle for a small landowner. We recommend that ARB allow a desk verification to meet this requirement. (NISSENBAUM)

> **Response:** We do not believe that a desk review is appropriate after any type of reversal. After a reversal occurs, it is necessary to take direct samples and measurements to assess the inventory of the standing live carbon stocks within the offset project boundary. Such data cannot be collected via a desk review and can only be done through a site visit. It is necessary to secure these measurements, because according to the regulation, if a forest project's carbon stocks drop below its project baseline after a reversal, the project must be terminated. In the event of an unintentional reversal, the project may be reinitiated.

Offset Verifier Accreditation

M-108. (multiple comments)
Comment: I have concerns regarding the proposed Accreditation Requirements for Verifiers outlined in section 95132 of the proposed regulation and implore the Board not to adopt these requirements as currently written. Simply put, they are too weak. There is no reason for ARB to duplicate the work that has already been completed by ANSI to accredit third party verifiers. Thus, we recommend that ARB adopt ANSI's program. (FIRSTENVRON1, FIRSTENVRON2)

Comment: The proposed accreditation requirements for verifiers outlined in the proposed regulation are too weak and we encourage the Board to consider changes to the requirements as they are currently written. The proposed regulation does not assure the level of competency which is necessary to cultivate this market. If adopted, the requirements will undermine California's reputation as a world-wide leader in the field of climate mitigation, especially on projects involving carbon offsets. In addition, different sets of accreditation standards, one from the Air Resources Board and another from the American National Standards Institute (ANSI), will lead to confusion, error and ultimately disputed findings. The California Air Resources Board should consider adopting the ANSI program which has grown from the initial seven certified verification bodies in 2009 to over twenty today. (BCFSE)

Comment: The proposed offset regulation references section 95132 of CARB 's Mandatory Reporting Rule, which establishes accreditation requirements for verification bodies, lead verifiers and verifiers. This wide range of requirements will not provide the State of California with a consistent basis for granting accreditation and may expose it to liability not only as an accreditation body but also as a personnel certification body. As an accreditation system already exists in the U.S. not funded by tax payers in the State of California, it seems a wasteful endeavor for CARB to continue to invest the budget and resources to maintain such a system.

At the time when CARB was publishing its mandatory GHG reporting rule, ISO 14065 had not yet been published, and therefore it was not possible for CARB to incorporate

ANSI's program into its regulations. Instead, CARB developed its own process for accrediting verification bodies to provide services for its program. Now that ANSI's accreditation program is well established, this amendment to CARB's regulation is the perfect opportunity to adopt the ISO 14065 accreditation program and maintain consistency with regulations adopted by the other Western Climate Initiative (WCI) jurisdictions. Creating multiple accreditation programs with multiple verification processes will confuse rather than harmonize. If California is to link with other programs, there must be consistency in the verification process. Accreditation of verification bodies against ISO 14065 can help to achieve this much needed environmental integrity and will assure equal reliability of results.

The requirements of ANSI and other accreditation bodies do not need to be applied in isolation. As seen with other GHG programs, additional criteria can be layered into the existing requirements. ANSI recognizes the important role of regulatory bodies. The ANSI process would not prevent CARB from requiring additional requirements such as training and certification to be met by ISO 14065 accredited verification bodies operating in this jurisdiction. (ANSI1, ANSI2)

Comment: We recommend that ARB amend its language to meet the verification and validation standards developed by the International Organization for Standardization (ISO) and identified by the International Accreditation Forum (IAF) and the American National Standards Institute (ANSI) as requirements for accreditation. IAF is a global association of Conformity Assessment Accreditation Bodies in the fields of management systems, products, services, personnel, GHG validation/verification, and other similar programs of conformity assessments. Their goal is to ensure the continued competence of accredited certification bodies and the consistent application of international conformity assessment standards, such as ISO 14065, and to provide assurance of the equivalence of the operation of certification bodies across the world.

Starting with their similarities, both ARB and ANSI have provisions for:

- Modification, suspension, revocation, and an appellate process.
- Conflict of Interest (COI).
- Professional Liability Insurance.

The remaining three ARB requirements have diminished expectations:

- ARB and ANSI have different requirements for witnessing audits for the industry sectors. ARB has random oversight that is not linked to any industry sector. ANSI requires annual witness surveillance audits based on selective sampling of V/VB activities. In addition, witness assessments by sector group are required to pursue initial accreditation with ANSI.
- ARB and ANSI have different requirements to demonstrate competency, experience, and knowledge. ARB provides a grandfather provision for individual lead verifiers that is based on experience not competency. ANSI requires a documented management system for assessing verifier competency on a continual basis. The accreditation body then assesses a V/VB's criteria for

demonstrating competency against the requirements of ISO 14065 as well as IAF MD 6:2009 IAF Mandatory Document for the Application of ISO 14065, which contains additional team competency requirements.

- ARB and ANSI also have different requirements to demonstrate GHG protocol knowledge. ARB has a one-time test that can be retaken if the individual does not receive a score of 70 percent. Again, ANSI requires a more comprehensive assessment through a V/VB's internal procedures for the ongoing demonstration and assessment of competency above and beyond passing a one-time test.

Finally, ANSI has the following nine requirements that ARB does not address:

- Management system in V/VB office for validation and verification activities.
- Management system in V/VB office in conformance with ISO 14065.
- Management system in V/VB office recertified every two years with annual surveillance audits.
- Demonstration of audit skills in witnessed assessment.
- Demonstration of industry experience and knowledge.
- Justification for verification fees.
- Internal audit of V/VB's management system.
- Record retention.

The above-mentioned elements are necessary to ensure consistent, competent provision of verification services. ARB has not adopted and is silent on many of the requirements associated with best practices. ARB has no expectation of any management system, let alone one that is certified by another internationally accepted standard. There is no auditing or witnessing provision, nor any demonstration of industry experience required. Unfortunately, these weak requirements will result in weak Emissions Data Reports and Offset Data Reports. (AAVB)

Response: The ARB accreditation program was developed using international best practices as laid out in ISO 14065, which is the standard to which greenhouse gas verifiers need to be accredited. The ISO standards are meant to be guidelines that programs can use to develop and tailor for their own program needs. The standard is program neutral.

ARB's verification accreditation program is consistent with the ISO 14065 standard for accrediting verification bodies. The following list highlights the areas in ARB's verification body requirements that are inclusive of all of the major requirements in the ISO 14065 standard:

- Be a legal entity that can be held accountable;
- Possess an internal conflict-of-interest policy, mechanisms to monitor, and requirements to remove and control for conflicts if they arise;
- Maintain Liability Insurance;
- Competencies for sectors, if applicable;
- Requirements to form verification teams with appropriate skills for verification of special sectors;

- Take responsibility for any subcontractors potential for conflict of interest with the client and the quality of their work;
- Identify a verification team lead; and
- Maintain record retention requirements.

However, ARB has chosen to advance the requirements for accreditation past the ISO 14065 standard for verification bodies to the level of individual verifiers. This higher standard of verifier accreditation has only recently been considered by ISO as they sought to develop a new ISO 14066 standard that seeks to attain California's higher level of competency for verifiers. ARB chose to add such a requirement to ensure a competency standard at a level beyond that currently required by international best practices. This includes a minimum educational and work experience requirement for individual verifiers. It also includes training and accrediting verifiers as sector specialists. ARB has developed a training program that builds on international GHG auditing skills and ARB's regulatory requirements for reporting and verification. In the future, ARB's training program will be updated to include general offset verification and offset project-specific verification training for verifiers interested in providing verification services for offset projects to support the proposed cap-and-trade offsets program.

ARB is committed to continually evaluating the verification bodies' services as specified in the ARB's regulatory requirements and the verification bodies' professional care and conduct to ensure the integrity and consistency of verifications. As part of this oversight process, each reporting year, ARB staff will audit every active verification body to ensure verifiers are providing high-quality offset verification services. Audit findings and observations are sent to verification bodies at the completion of verification services in order for each verification body to take any necessary actions to improve their performance.

Rotation of Offset Verifiers

M-109. (multiple comments)
Comment: COPC urges CARB to streamline the conflict of interest requirements in the regulation. COPC believes that CARB's offset program may fail to take into account the fact that the pool of available verifiers is likely to be quite small, especially during early compliance periods. As currently drafted, the conflict rules appear to limit verifiers and project operators to single interactions once every three years. Given the small number of verifiers, this limitation is simply impracticable. The requirement that offset project operators change verifiers every six years and not utilize any verifier used by the operator on any project in the past three years will also be impracticable (see section 95979). There is a very real risk that the verification process described in the regulation will become a bottleneck in the approval of offsets. (COPC1)

Comment: Section 95979 of the proposed market rules contain detailed rules for preventing conflict of interest among verifiers of forest projects. We fully support rigorous conflict-of-interest rules, but have concerns that the rules may impose unnecessary costs and overly restrict a limited pool of available accredited verification bodies. In particular, the requirements for "rotation" of verification bodies in proposed regulation section 95977(e)(1) appears unnecessary to the extent that each of the concerns raised by ARB should be adequately addressed by the accreditation process rather than placing additional burdens on project developers that would increase verification costs and undermine efficiencies. See ISOR at IX-136 (stating that rotation is necessary to avoid bias, familiarity or complacency). We support and incorporate by reference the comments submitted by other project developers and verification bodies concerning these rules. (BLUESOURCE, FCC)

Comment: The requirement for replacement of your verifier every six years is problematic especially given cost and time involved in getting a verifier familiar with each forest offset project. (CFA)

> **Response:** We maintain that the rotation of verifiers at least once every six years is necessary to minimize any biases and avoid familiarity or complacency between those developing offset projects and the verification body. While no changes were made to the requirements for rotating verification bodies, original section 95977(e)(1), now new section 95977.1(a), dealing with rotation of verification bodies was modified to make it clear that the rotation of verification bodies must occur on an offset project basis. The intent of the language was not changed. These clarifications were made in response to stakeholder comments that it was unclear if the rotation of verification bodies every six years applied at the individual offset project level or at the Offset Project Operator level.

M-110. (multiple comments)

Comment: CERP respectfully urges ARB to revisit the conflict of interest requirements in the offset provisions. To be clear, the Coalition strongly believes that the offset program needs to be free of the contamination of conflicts of interest and supports the establishment of rigorous rules to provide such assurances. However, it is important to find a means to avoid conflicts of interest that still allows the offsets program to operate effectively. In particular, the regulations need to take into account the fact that the AB 32 program likely will have a relatively small universe of verifiers. There are not many companies with experience in offset verification, and many of these companies perform other, non-verification services for offset developers and other customers as a core part of their business model. The limited pool of available verifiers already is, and will continue to be, particularly challenging in the near-term for projects seeking early action crediting.

The conflicts-of-interest regime reflected in the current draft—which appears to limit verifiers and project operators to one-off interactions once every three years—is impracticable. Were the regulations finalized in their current form, the avoidance of conflicts of interest would come at the cost of a substantial backlog of projects awaiting verification, potential increases in verification costs, and a reduction in offset supply. For these reasons, CERP urges ARB to consider revisions to verifier replacement. The verifier replacement requirements must be adjusted because there will not be enough verifiers to allow offset project operators and authorized project designees to meet the requirements. If an offset project operator has multiple projects of a specific type, and after six years has to find a replacement verifier for each of those projects that has not worked for that operator for at least three years—there simply will not be enough verifiers with the requisite project type expertise to perform the verification.

CERP respectfully urges ARB to modify this requirement. One approach would be only to require the periodic change of verifier for a particular project, but without regard to whether the replacement verifier also has worked for the project operator on other projects. (CERP1)

Comment: ARB's proposed conflict of interest regulations require an offset project operator or project designee to change the verifier they use every six years, to a verifier that has not been used in the previous three years. Applying this rule to a project operator, who may manage or own multiple projects, is likely to result in significant delays in offset supply due to lack of qualified verifiers. Equator suggests that ARB change this requirement so that periodic changes in verifiers are required for projects, but not for project operators. (EQUATOR)

> **Response:** Original section 95977(e)(1), now new section 95977.1(a), dealing with rotation of verification bodies was modified to make it clear that the rotation of verification bodies must occur on an offset project basis. The intent of the language was not changed. These clarifications were made in response to stakeholder comments that it was unclear if the rotation of verification bodies every six years applied at the individual offset project level or at the Offset Project Operator level.

Offset Verifier Conflict of Interest

M-111. Comment: We request clarification on what constitutes an incentive. Because of the burdensome costs of verification, it makes financial sense to contract for batch verifications. Because what constitutes as an incentive is not defined, we cannot tell if receiving a discount for packaging together verifications will put projects at risk. (NISSENBAUM)

> **Response:** The term incentive is used in the context of conflict of interest where a gift or work in-kind may compromise the objective review of an Offset Project Data Report. A discount for batching verification services does not in itself jeopardize an objective review of Offset Project Data Reports.

M-112. Comment: Section 95977(e)(2)(C)(xxi) does not include any time frame or statute of limitations on when a conflict of interest must exist or be discovered in order to invalidate a verification statement. If a verification body is found to have had a high level of conflict of interest in 2009, but the verification at issue was completed in 2018 when no conflict of issue existed, this clause could potentially invalidate the verification statement issued in 2018, even if no conflict of interest existed in 2018. (VCS)

> **Response:** Original section 95977(e), now new section 95977.1, deals with the verification of GHG reductions and GHG removal enhancements, and not what constitutes a conflict of interest. The conflict-of-interest provisions can be found in section 95979. This section establishes that a conflict of interest must be high if certain criteria are met within the previous five years.

M-113. Comment: We are concerned that the conflict of interest requirements in the proposed regulation are too restrictive and may prevent high quality projects from obtaining verification and capable verifiers from providing quality service. PG&E recommends ARB develop a review and appeal process similar to that allowed for the modification of offset project data reports in section 95977(e)(2)(C)(xix)(a), which would allow companies to have potential conflicts of interest reviewed by the Executive Officer. (PGE1)

> **Response:** We do not believe that the conflict-of-interest requirements for offset projects are too restrictive. These provisions are necessary to ensure the integrity of the offsets system and to ensure that all reviews associated with the data from offset projects are unbiased and independent.

M-114. Comment: Forest carbon project development is a very small field with very few qualified individual. We recommend that ARB allow this conflict to be ameliorated by insulating potential conflicts of interest from interacting on the verification of a project. For example, a former employee of an offset project operator could not be designated as lead verifier on his former employers' project. (NISSENBAUM)

> **Response:** We did not make any changes to the regulation. The commenter's suggestion is contrary to the basic premise that an offset project be subject to an independent review. ARB will accredit new verifiers as part of implementation and do not foresee this as an issue.

Issuance of ARB Offset Credits and Registry Offset Credits

General Issuance Comments

M-115. (multiple comments)
Comment: Section 95981(d)(3) appears to conflict with section 95981(a). Please clarify. (VCS)

Comment: It is not clear how section 95981(d)(2) and (4) are different. (VCS)

> **Response:** We recognize the clarity issues with section 95981, and modified this section to apply only to the issuance of ARB offset credits. For ease of review, section 95981 is shown in complete strikeout and new section 95981 is

underlined. A new section 95981.1 was added that contains the process by which ARB would issue ARB offset credits. This new section and new section 95980.1 were added to establish the difference between the processing and issuing of a registry offset credit and an ARB offset credit.

Comment: The proposed regulatory deadlines are potentially very helpful in ensuring an efficient offsets program and predictable offset credit supply. Certain critical deadlines, however, are missing and others are unreasonably severe. The proposed regulations fail to impose deadlines at certain key junctures. In addition, the penalty for an offset project operator or a verifier missing a deadline is unreasonably severe. There are key points in the offset credit generation process where an offset project registry must act in order to facilitate the issuance of ARB offsets in exchange for approved registry offsets. In order for a project registered with an approved offset registry to obtain ARB credits, the offset registry must submit the relevant paperwork to ARB. The proposed regulations do not require the offset registry to complete this action within any specified period of time, giving ARB and the offset project operator no guarantee of timely credit issuance—even if the operator fulfills all of its responsibilities in a timely manner. The proposed regulations should be modified to require an offset registry to submit the required paperwork within five working days of receiving a transfer request from the offset project operator. If a transfer request is submitted before offset registry credit issuance, the proposed regulations should require the relevant paperwork to be submitted within five working days of credit issuance. In order for ARB to issue offset credits to a project registered through an approved offset project registry, the registry must first cancel the original credits. There is no deadline on this action, which creates excessive uncertainty for the credit owners. CERP urges ARB to require approved registries to cancel the relevant credits within one working day of receipt of a request from ARB. (CERP1)

Response: We changed the party responsible for submitting information for the issuance of ARB offset credits from the Offset Project Registry to the Offset Project Operator or Authorized Project Designee, to place the onus on the project proponent instead of the registry. This will ensure that the information is submitted as soon as the project proponent can provide it. Also, we added a requirement in section 95981.1(e) that Offset Project Registries remove, retire, or cancel registry offset credits within 10 calendar days of notification by ARB of issuance of ARB offset credits.

M-116. Comment: Adopt measures to incentivize the development of broadly applicable new protocols. Under the VCS program there is a financial incentive for developers to formulate and develop new protocols (known as “methodologies” under the VCS). Entities that successfully develop a methodology under the VCS Program receive a share of the issuance fee for credits issued using that methodology. This has motivated creativity and action to voluntarily reduce greenhouse gas emissions from a number of different sectors, and encourages protocol developers to make sure their protocols are robust, clear, broadly applicable, and scalable. Given that the development of protocols is a time and resource intensive process, we recommend that if CARB adopts protocols created by other programs with robust rules, it should recognize and compensate the program (and/or protocol developer) for the work involved in developing the protocol. It could do this by paying a licensing fee for a certain period of time, or perhaps a fee on a per credit issued basis. This would create a powerful incentive for the development of rigorous and broadly applicable protocols to be presented to CARB. (VCS)

> **Response:** There are no fees assessed for the issuance of ARB offset credits. Protocol developers have an incentive to develop new offset protocols because they are able to develop projects that are eligible to receive ARB offset credits that can be used for compliance in the cap-and-trade program. These offsets will trade at a premium because they can be used for compliance.

M-117. Comment: The regulations need to state that offsets are not automatically certified simply because CARB fails to issue approvals within its deadlines, including those in section 98951. (EDF1)

> **Response:** We agree and added new section 95981.1(d)(3) to allow ARB to deny any offset proposals that the Executive Officer finds do not meet relevant offset criteria.

Timing for Issuance

M-118. Comment: Section 95981 indicates a 15 business day delay between issuance and deposit of credits into a holding account. In most other systems, issuance and deposit are simultaneous and it is not clear why there is a need for a 3 week delay after issuance before transferring credits into a holding account. There is a total delay of 60 calendar days and 15 business days from the receipt of the verification statement until the project proponent receives the credits—nearly 3 months, which seems like an unnecessarily long period of time for what is essentially an automated function. (VCS)

> **Response:** We made changes to the timing for issuance of offset credits. We will review the Offset Verification Statement within 45 calendar days of receiving it (new section 95981(c)), issue ARB offset credits within 15 days of making the determination that the Offset Verification Statement is positive or a qualified positive (section 95981.1(a)), and transfer the ARB offset credits into the appropriate Holding Accounts (section 95981.1(f) and notify the recipients (section 95981.1(c)) within 15 days. We believe the notification and transfer of ARB offset credits into the appropriate Holding Accounts can be done simultaneously and do not have to occur consecutively.

M-119. Comment: The draft regulation suggests that offset credits may be issued only on an annual basis, and not more frequently. CARB should consider amending this to give the market flexibility to submit verification reports and request credit issuance on a more frequent basis if desired. Since the cap and trade regulation ends in 2020, CARB should consider what will happen to offset projects that may have a crediting period that extends beyond 2020. Will there be some mechanism to continue to allow such projects to be recognized or shifted to other registries and programs? This is a particular concern for forestry and sequestration-based projects with long crediting periods. (VCS)

> **Response:** We believe annual issuance of offsets is sufficient, and that there is no need for a shorter time frame. Allowing a shorter time frame could drastically increase the number of offset verifications and could cause there to be delays of ARB-accredited verifiers. We will continue to evaluate what the offsets program will look like post 2020 as part of future amendments to the rule.

M-120. Comment: The credit issuance timeline involves seemingly unnecessary delays, and should be shortened. Under the proposed regulations, ARB will have 15 calendar days after issuing credits to a project to notify the recipient(s). ARB will then have an additional 15 working days to transfer the credits to the recipients' accounts. It is difficult to understand why these two simple, mechanical actions would take so much time after ARB has already reviewed the project and determined how many credits to issue. CERP urges ARB to have notification and credit transfer follow more rapidly upon ARB's determination of the quantity of credits to be issued. (CERP1)

> **Response:** We believe the notification (section 95981.1(c)) and transfer of ARB offset credits into the appropriate Holding Accounts (section 95981.1(f)) can be done simultaneously and do not have to occur consecutively. The purpose of the notice is to notify the recipient of the ARB offset credits that the credits will be transferred to its account.

M-121. Comment: Generally, section 95981 lays out two different processes and two different timelines for issuance of offsets, depending on whether the project was submitted to ARB or submitted to an offset registry approved by ARB. We question why the process has different timelines if the approved offset registry's processes have already been approved by ARB. Second, the timelines seem unreasonably long. For example, taking more than six weeks to review a submitted verification statement; more than two weeks to notify an offset project operator that a credit has been issued (we would expect this to be instantaneous with issuance, by software); and three weeks to issue a credit once a determination has been made that an issuance is appropriate. We would expect the administrative process of issuance to take at most 5 calendar days. Note also, subsection (f) switches to "working days" when all other date references in the section are "calendar days." Finally, the language in this section and in section 95982 use the words "transfer," "issue" and "register" seemingly interchangeably so it is not clear whether there is a meaningful distinction which we are missing. (TPI2)

> **Response:** We clarified the process for issuance of registry offset credits and ARB offset credits by revising sections 95980 and 95981, and by adding new section 95980.1 and 95981.1. Sections 95980 and 95980.1 apply specifically to the issuance of registry offset credits; sections 95981 and 95981.1 apply specifically to the issuance of ARB offset credits.

We also made changes to the timing for issuance of offset credits. We will review the Offset Verification Statement within 45 calendar days of receiving it (new section 95981(c)), issue ARB offset credits within 15 days of making the determination that the Offset Verification Statement is positive or a qualified positive (section 95981.1(a)), and transfer the ARB offset credits into the appropriate Holding Accounts (section 95981.1(f) and notify the recipients (section 95981.1(c)) within 15 days. We believe the notification and transfer of ARB offset credits into the appropriate Holding Accounts can be done simultaneously and do not have to occur consecutively. The notice is just to notify the recipient of the ARB offset credits that the credits will be transferred to its account.

We are aware that section 95981.1(f) refers to working days instead of calendar days.

The term "transfer" used in sections 95981.1(f) and 95982(b) refers to the act of ARB moving the ARB offset credits into the accounts of the appropriate participants. The term "register" refers to the creation of serial numbers for the issued ARB offset credits and their transfer to the account of the appropriate participants. "Issue" refers to the determination made by ARB to create an ARB offset credit for a GHG reduction or GHG removal enhancement.

Authorized Project Designee

M-122. (multiple comments)
Comment: In section 95974, it is not clear whether one can designate an Authorized Project Designee after the project has been listed or whether this can only take place prior to listing. (VCS)

Comment: Section 95974 enables Offsets Project Operators to designate other entities to perform certain required duties. The capabilities and desires of an Offset Project Operator may change over time, especially the very long periods of time involved in crediting offset projects. Therefore, we recommend that an Offset Project Operator be able to designate an Authorized Project Designee at any time during the crediting period, not only at the time of project listing. (TPI2)

Response: Section 95974 was modified in response to stakeholder comments to clarify that an Offset Project Operator may designate an entity as an Authorized Project Designee at the time of offset project listing or any time after offset project listing, as long as that entity meets the requirements of section 95974(b).

M-123. Comment: The regulation requires that in the case a user or retiree is no longer in business that the Offset Project Operator or Authorized Project Designee must replace the offsets. Since there is significant latitude in what specific roles and responsibilities an Offset Project Operator can assign to an Authorized Project Designee and the requirement to repay offsets is a significant burden, it is important that a clearer distinction is made. We recommend that ARB amend this language so that the party required to repay offsets is clarified to be the party that signs the attestations set out in sections 95975 and 95976. (NISSENBAUM)

Response: We did not make this change to the regulation. We have clear enforcement authority over Offset Project Operators and any Authorized Project Designees. These parties can determine among themselves who will replace the invalidated ARB offset credits, and can specify these terms in any third-party contractual arrangements that they enter into with each other.

M-124. Comment: CERP strongly supports ARB's use of the "authorized project designee" role to enable a third party to be responsible for project registration and other tasks. This will significantly improve the efficiency of the offsets program. (CERP1)

Response: We appreciate the support.

Crediting Periods for Compliance Offset Projects

M-125. Comment: Clarify the project re-registration requirement. Section 95986(j)(3) of the draft regulation is not clear about whether projects that must re-register with CARB or a new external offset project registry will be able to start with a new crediting period or carry on with an existing crediting period. While it seems clear that future-generated offsets from an existing project would be issued in the new registry, it is not clear what would happen to the existing projects already issued offset credits. (VCS)

Response: Original section 95986(j), now section 95986(l), was modified to clarify what happens to offset projects that reside at an Offset Project Registry, whose approval has been suspended or revoked. These offset projects may transfer to another approved registry and continue their current crediting period. This change was necessary because stakeholders were concerned that their offset projects could be ineligible if an Offset Project Registry's approval was suspended or revoked.

In addition, new section (l)(3) allows offset projects that must transfer to another registry in the event their current registry's approval is revoked to qualify for a one-year crediting period extension. These modifications were made in response to stakeholder comments that switching Offset Project Registries could cause a delay in the reporting of GHG reductions and GHG removal enhancements and subsequently cause those reductions to be ineligible for crediting.

M-126. Comment: Section 95980(c) of the proposed regulation provides for the timing and duration of renewed crediting periods for offset projects. SCE asks that CARB staff clarify whether there is a limit on the number of times an offset project can be renewed. (SCE1)

Response: Original sections 95975(i)(1) and (2), now new sections 95975(k)(1) and (2), specify that crediting periods for non-sequestration offset projects can be renewed twice and that the crediting periods for sequestration offset projects are not subject to any renewal limits.

M-127. Comment: Renewal crediting periods should not be limited where projects remain additional. CERP supports ARB's determination to assign non-sequestration projects a crediting period of seven to ten years, although CERP believes that many project types will need a 10-year crediting period to ensure financial viability.

In addition, CERP strongly supports ARB's decision to allow non-sequestration projects to apply for two crediting period renewals rather than one, as was proposed earlier. Nevertheless, it is our view any arbitrary limit on crediting period renewals is unnecessary and inefficient. When applying for a renewed crediting period, an offset project is assessed against an up-to-date additionality standard. If a project is still generating additional emission reductions at the end of a third crediting period, there is no justification for shutting the project down and wasting cost-effective emission reductions. In addition, CERP urges ARB to make a clear statement in the proposed regulations that an offset project will be always be assessed against the compliance protocol in effect at the time the project is initially listed or, during subsequent crediting periods, against the protocol in effect at the time the project applies for a renewed crediting period. (CERP1)

Response: We believe the length of a crediting period must be finite to provide flexibility in the future to decide if certain offset project types are no longer valid for AB 32 compliance. This approach allows us to reevaluate and readjust project baseline and additionality requirements in the future if the regulatory environment changes, and if we determine that offset projects are no longer additional. The range of 7 to 10 years for non-sequestration projects and 10 to 30 years for sequestration projects will incentivize investment in these offset project types. Original sections 95975(i)(1) and (2), now new sections 95975(k)(1) and (2), specify that crediting periods for non-sequestration offset projects can be renewed twice and that the crediting periods for sequestration offset projects are not subject to any renewal limits.

M-128. Comment: Section 95975 (g), Timing for Offset Project Listing in a Renewed Crediting Period, states "The Offset Project Operator or Authorized Project Designee must submit the information in section 95975(c) for a renewed crediting period to ARB or an Offset Project Registry no earlier than 18 months and no later than 9 months from conclusion of the initial crediting period or a previous renewed crediting period." Is this meant to provide a total time window of 9 months or of 27 months? (TPI2)

Response: We modified section 95975 (g), now section 95975(i), to clarify the intent of this provision. The intent is to give a nine-month window, nine-months prior to the conclusion of the preceding crediting period, to submit the information to ARB. This gives ARB an appropriate time frame for assessing additionality and determining if the project must update to any new version of the applicable protocol.

M-129. Comment: The ARB should more proactively address the unavailability of offset credits, and should encourage long-term offset projects by preserving ARB's discretion to grant crediting periods longer than 10 years. The current state of offset market development in California and elsewhere strongly suggests that there will not be enough offsets available in the context of California's Cap-and- Trade Program. This problem will be exacerbated by the proposed regulation, because the proposed regulation would provide for certification of a limited class of offset projects and place restrictions on projects that would get credited. For example, the proposed regulation would only allow ARB to credit a non-sequestration offset project for a period not to exceed 10 years. PacifiCorp is concerned that this limitation would unnecessarily hamper long-term, high quality offset projects by creating a degree of uncertainty for potential investors. Investments in long- term offset projects would be less likely to occur given the realistic possibility that a future, discretionary decision by a regulatory agency will eliminate the investors' ability recoup the investment with a reasonable return. ARB should amend this provision to allow ARB to approve non-sequestration offset projects for a period of at least 7 years, and no more than 30 years; this would create additional incentives to invest in larger offset projects. (PACIFICOR1)

Response: We did not make this change in the regulation. The limitation on the crediting period is designed to ensure that projects are using more up-to-date factors (e.g., leakage, buffer account) and scientific standards in the future, and that they are still additional. For this reason we do not believe that a longer time frame is appropriate for non-sequestration projects.

M-130. (multiple comments)
Comment: Modify section 95972(b) as follows:

(b) Crediting Periods. . . . The crediting period for a reforestation project conforming to a protocol listed in either section 95973(a)(2)(C)(iv), 95990(b)(5)(D), or 95990(b)(5)(E) must be no less than 50 years and no greater than 100 years. The crediting period for any other sequestration project must be no less than 10 years and no greater than 30 years. (OFFSETSWG1)

Comment: A 30-year crediting period for sequestration projects is too short given the requirement for a 100-year maintenance period following the last credit which requires regular inventories, project reporting, and site verifications. The uncertainty of the length of a cap and trade program and unknown future costs are substantial deterrents from implementing a project. Adding an additional uncertainty of whether a forest owner will benefit for more than 30 years for a project which will have 130 years of associated costs is another disincentive. We recommend that ARB adopt a crediting period for forest carbon projects that is equivalent to the life of the forest carbon project. (NISSENBAUM)

> **Response:** We do not agree that the crediting period for forest carbon projects should be extended. The intent of a 25-year crediting period is not to limit sequestration of carbon and offset issuance from forest projects. In fact, renewal periods allow for forest projects to sequester carbon and obtain offset credits beyond the 25-year crediting period. A crediting period of 25 years allows for the updating of protocols, if necessary, ensuring that projects use the more up-to-date factors (e.g., leakage, buffer account) and scientific standards.

M-131. Comment: CARB's projections for offset supply rely heavily on ODS and forestry. However, there are several parameters in CARB's forestry protocol that will limit the development of forestry offset projects. First, CARB only provides a 25-year crediting period for forestry projects, yet requires a 100-year maintenance period following the last credit issuance. Although CARB indicates that it will provide crediting period renewals, it is uncertain whether eligibility requirements may change after the initial crediting period. Project developers will be wary of putting capital at risk if there is a burden and liability beyond the crediting period. We believe that the crediting period for forest projects should be commensurate with the permanence requirement. The second roadblock for developers is the 100-year permanence requirement following the issuance of the last offset credit. This restriction imposes a long tail of legal liability to project developers, one that extends well beyond AB 32's market design. This imposes obligations on forestry offset projects well beyond those of industrial and power sectors. (CE2CP)

> **Response:** The 25-year crediting period is designed to ensure that projects are using more up-to-date factors (e.g., leakage, buffer account) and scientific standards in the future. Forest projects are allowed to be renewed for subsequent 25-year periods without limitation. Forest projects are unique in that carbon sequestered and credited under these projects can be reversed. To ensure that the offsets created for the sequestered carbon are real and permanent, the carbon must be stored for a period of at least 100 years. Maintaining these obligations is essential to the environmental integrity of the program. Permanence issues do not exist for the types of reductions achieved by industrial and power sectors; therefore, the permanence obligations do not apply to these sectors.

Invalidation and forest reversals

Invalidation Provisions

M-132. (multiple comments)
Comment: Camco recommends that ARB establish a statute of limitations of one verification cycle for the correction of mistakes in the issuance of credits. One

verification cycle provides a process and a reasonable amount of time in which to uncover any mistakes that went undetected during the previous year's verification cycle and credit issuance process, while allowing for a reasonable degree of regulatory certainty and closure to existing contractual commitments. (CIG)

Comment: Regardless of where ARB assigns replacement liability, CERP also strongly urges ARB to put a statute of limitations on the "mistake" liability of one verification cycle, in order to make it commercially manageable. In addition, CERP asks that ARB provide greater specificity regarding what circumstances would justify a finding of ineligibility due to mistake. (CERP1)

Comment: Limit the time period during which erroneous documentation can lead to the requirement to acquire and cancel an equivalent amount. The draft regulations contain no statute of limitations limiting the time period during which erroneous documentation can lead to a offset invalidation. Maintaining the ability to reopen a case at any point in the future is completely out of touch with modern legal systems, where it is acknowledged that facts and evidence are obscured through the passage of time. Moreover, the omission of a time limit for invalidation means that the liable party will face unlimited and increasing levels of liability as long as they remain active in the Cap and Trade system. This makes the invalidation risk very difficult and increasingly expensive to manage, and will lead to long-term issues with market liquidity. IETA believes that the desire to maintain the integrity of the cap must be balanced with the desire to create and maintain a healthy market with manageable costs to participants. IETA suggests, ARB include in their cap-and-trade regulations a strict two year statute of limitations on the ability to find documentation erroneous. (IETA1)

> **Response:** Section 95985(b) was modified to establish a three-year statute of limitations for the invalidation of ARB offset credits if the Offset Project Data Report or a subsequent Offset Project Data Report, depending on project type, is verified by a different verifier within that time frame. If the offset project does not qualify under these requirements, the default statute of limitations is eight years. We believe that the three-year time period is sufficient to uncover any new information as long as the project has been reviewed by a second verifier. If it is not looked at by a second verifier, we believe that eight years is necessary to uncover any new information that could lead to the invalidation of ARB offset credits. We believe the eight-year statute of limitations is sufficient because it would allow two verification parties to examine the offset credits in question for continuous projects. We do not believe that one year would provide sufficient time to detect all relevant new information or uncover any mistakes that a verifier may have missed.

M-133. Comment: In Section 95985 of the proposed rule, ARB proposes a mechanism for the invalidation of offset credits. While Evolution Markets understands ARB's desire to maintain the environmental integrity of the offset program and ensure the State meets its greenhouse gas emissions reduction targets, this provision could have an adverse impact on investment in offset projects and liquidity in trading markets for California compliance instruments.

The ability for ARB to invalidate offsets that have already been issued by ARB, and perhaps submitted for compliance, under what Evolution Markets considers to be unnecessarily broad conditions would introduce an unacceptable element of uncertainty to the offset market. The result could be a reluctance of market participants to invest in offset projects and a difficulty in creating necessary liquidity in secondary offset markets. The best approach to ensuring the environmental integrity of the program is to put in place a robust system of protocols, validation, and verification, and thereby obviating the need for an invalidation process. Barring this, Evolution Markets recommends the following changes to the invalidation procedure:

Establish a Limitation on Invalidation: As currently written, the proposed rule sets no limitation on when ARB may invalidate issued credits. This makes the invalidation risk difficult to manage for all counterparties. It can also constrict capital investment and secondary market liquidity over the long term. Evolution Markets recommends establishing a time limit for the invalidation period, and we believe a two-year look back from the time of issuance is reasonable.

Establish Proper Criteria for Invalidation: Section 95985(b)(2) of the proposed rules states that credits can be invalidated in the event of errors in documentation "sufficient to warrant a reversal." Evolution Markets believes this to be too broad. Experience in other offset markets shows errors in documentation to be infrequent and most often caught during the verification process. Any errors discovered after issuance, however, are most likely so minor in nature that they do not justify the potential restriction on liquidity that is likely to occur under the current proposed rules. Evolution Markets recommends the criteria for reversal should only in the event of intentional fraud or malfeasance on the part of a project owner, verifier, or end user. (EVMKTS)

> **Response:** Section 95985(b) was modified to establish a three-year statute of limitations for the invalidation of ARB offset credits if the Offset Project Data Report or a subsequent Offset Project Data Report, depending on project type, is verified by a different verifier within that time frame. If the offset project does not qualify under these requirements, the default statute of limitations is eight years. ARB believes that the three-year time period is sufficient to uncover any new information as long as the project has been reviewed by a second verifier. If it is not looked at by a second verifier, ARB believes that eight years is necessary to uncover any new information that could lead to the invalidation of ARB offset credits. We believe the eight-year statute of limitations is sufficient because it would allow two verification parties to examine the offset credits in question for continuous projects.
>
> In addition, we included extensive modified provisions in section 95985 to make it clear what would trigger an invalidation, how ARB will invalidate offsets, and which offsets will need to be replaced.

M-134. (multiple comments)

Comment: There is no need to make a one-size-fits-all rule that buyer liability should apply to reversals of offsets. The protocol for each offset type could include analysis of the particular risks of reversal and perhaps identify methods to protect against this outcome, or incorporate insurance within the offset itself, to provide a remedy in the case of destruction. This would provide more certainty for the buyers of offsets and facilitate market trading of offsets. (CMTA1)

Comment: I would encourage you to eliminate buyer offset liability. Markets work when buyers know they buy a product that is transacted, that's stamped by the Air Resources Board and they can rely upon that without going back and undoing a transaction that occurred many times before. (MARGOLIS)

Comment: The Board should amend the offset provisions by shielding from liability any good faith purchaser of verified offsets. Imposing liability on offset purchasers would unfairly penalize covered entities who have relied on the offset verification process and otherwise fully adhered to program requirements. (CCC, MAZOWITA)

Comment: End-user liability will severely dampen the creation of offset credits as a tool for compliance. In a liquid secondary compliance market where issued offsets are usually fungible commodities, and where trades occur on a daily basis, oftentimes on electronic exchanges, it is both unreasonable and unnecessary to expect buyers to attempt to reach the original project operator to perform thorough and expensive due diligence on the project. This provision would undermine both liquidity and the goal to create fungible commodities as part of a well-functioning market. The market needs to have certainty that once an offset credit has been issued, it is as “good as gold.” Once a credit has been issued, it should be valid for compliance no matter who purchases it. In the rare circumstance where a problem is found it would be far better from a market-functioning perspective to require whichever entity holds liability for the “bad” credits to have to replace them by sourcing other offsets and retiring them, instead of mandating a cancellation of the credits at issue. If offset project operators, verifiers and others submit to the jurisdiction of CARB as required by this regulation, it is not clear why CARB would need to shift this liability onto entities that are least able to warrant or control the quality of offsets. Under the VCS, it is the project operator that guarantees the veracity of the reductions its project has generated. Additionally, section 95985(d) would shift the liability to the project operator only if the end-user no longer exists. This seems to be an arbitrary shift based on a circumstance outside of the control of the project operator. The project operator should either always be liable or it should never be. Its liability risks should not be dependent on the financial health of end-users to which it has no connection. (VCS)

Comment: Offsets should not be invalidated after issuance. Section 95985 provides that a California offset credit may be invalidated by ARB after issuance and that in the event of such an invalidation, the user of that offset credit would be required to replace it with another compliance instrument. The possible invalidation of offsets after issuance is often referred to as ‘buyer liability’, because it places responsibility for offset quality on the buyer and end-user of offsets, rather than on offset developers and suppliers. A buyer liability approach would:

- Increase transaction costs associated with offsets, and thus overall compliance costs, because it would require offset purchasers to duplicate the validation efforts already undertaken by ARB, and would require offset purchasers to enter into additional transactions to protect themselves in the event of invalidation.
- Reduce efficiency by moving responsibility for offset quality away from the entities best able to ensure it – project verifiers and suppliers – and placing it on offset buyers.
- Disadvantage California offset projects vis-à-vis offset projects in the Western Climate Initiative (WCI) and elsewhere, since these other offsets would not be subject to later invalidation.
- Create a high degree of market uncertainty for offset users and stifle investment in offset projects. (WPTF)

Comment: CARB should have the same requirements for the use of this type (forestry sequestration) of backup account and/or other insurance mechanisms for all offsets, even if it requires replacement as a first resort. CARB may also consider not requiring replacement first for offsets that it certifies without the use of a registry, to support the use of its offset program. (EDF1)

Comment: We recommend CARB eliminate buyer liability associated with offset reversals. Section 95985(d) requires that buyers suffer sanctions or replace credits that, though approved by the CARB, later turn out to be invalid (exceptions are provided in the event of credit invalidation owing to unintentional forest reversals per section 95985(f)). We recommend that CARB stand behind determinations when it decides which credits are allowed to be used as offsets, hold the initial creators of the credits responsible for maintaining the reduction. Consider setting up an insurance pool where a small part of allowances and/or offsets are shaved off and set aside and drawn upon in the event that a reversal cannot be otherwise resolved. A “buyer beware” approach will not work because it:

- is not practical, especially in situations where a credit may be created and then sold a number of times before it is used and applied;
- raises transaction costs; prior to each purchase, prudent buyers will need to re-verify the credits, audit the prior evaluations of the initial verifier, and look into their crystal ball to try to determine if the CARB or some third party will (perhaps several years after their creation) challenge the credits after they are purchased and applied to a project;
- would create two classes of separate and unequal credits – those issued by (and enjoying the full faith of) the government and those created through the offset market (which could always be undermined by some future legal challenge);
- is not consistent with historical practice in the emission allowance, emission reduction credit, or RECLAIM Trading Credit markets; and

- is reasonable to expect CARB, which approves every offset, to stand behind the offsets that it approves.

An approach that relies upon the use of high quality credit verifiers will not work because verifiers:

- are not officers of the government and do not have the ability to stand in CARB's shoes when it comes to determining if the credit creation activity meets the requirements of the rules as may be subsequently determined by CARB.;
- Cannot (and are not paid to monitor a project after the credits are claimed and/or transferred;
- Will, given the potential liabilities and likelihood of lawsuits (which may ensue after the credits are transferred/used), find it very challenging to secure professional liability insurance; and
- Will be unable to charge a fee that adequately compensates them for the cost of doing the initial and ongoing assessments, paying for liability insurance, and setting aside cash reserves in the event that any credits which have been reviewed by the verifier are subsequently determined to be bad.

Conveyance contracts cannot be written in a fashion to remove this risk because:

- Credits may change hands many times, each time with a different buyer and seller. While demanding performance from the initial project developer may be practical it becomes quite a different prospect when the credit has been purchased numerous times before it is used and discovered to be invalid. The cascading liabilities, multiple conveyance contracts, and the passage of time that are implicit in such a scenario will make it impossible for a buyer to gain resolution in the event of bad purchases; and
- The actual credits may be divided, segmented, and conglomerated into financial instruments that allow market participants to transact products that represent emission reductions from a variety of different offset creating projects. Again, it is impractical for buyers to conduct appropriate due diligence on the offset that will make up such a derivative product. So too will it be difficult for a seller of a financial product which represents an amalgam of credits from different projects to replace just that portion that are determined to be invalid.

Nor should CARB conclude that the problem of offset reversals can be managed through the use of financial derivative products. While such products may initially reduce the risk of purchasing offsets they will, if priced considering consequential damages, sell at prices that dramatically increase transaction costs. (CANTORCO2E)

Comment: SCPPA raises the following point to help ensure ARB's offset protocols and links to other offset programs provide ample cost-effective emission reduction options: The offset market will be weakened if buyers have primary liability for invalid offsets and cannot rely on the integrity of verified offsets. Placing liability on the verifier would be a straightforward and effective alternative to buyer liability. The ARB has the jurisdiction to do this. Section 95985(d) (p. A-160) requires that an entity that retires or uses an offset (other than a forestry offset) that is later found to be invalid must replace that offset. Verifiers, not buyers, should be liable for invalid offsets. Buyer liability would hamper the development of a liquid offset market. Verifiers should be required to replace invalid offsets. (SCPPA2)

Comment: There are multiple practical ways to handle offset invalidation that do not cause the financial burden to fall on a non-responsible party, and the regulation order should be changed to utilize one or more of them. The fundamental approach proposed for offset invalidation is ill-advised. Instead of focusing on recompense by the responsible party, the regulation order essentially creates a game of "musical chairs" whereby the party unlucky enough to be holding the invalidated credit "when the music stops" is left holding the financial responsibility. Instead, "make-good" for invalidation should be the responsibility of the offset credit creator. (MSCG2)

Comment: Place the liability for invalidated/erroneous offset credits on the project owner. In a fully functioning carbon market, the end users of offset credits will have a similar connection to a surrendered offset as a person has to the dollar in their pocket before they hand it to the cashier. Most likely, they were not responsible for the project that led to its issuance, and they should not be held liable for either an intentional reversal related to that project or any errors made in the documentation of that project. Discouraging the purchase and holding of offsets, such responsibility lies with the project owner, and thus any related liability for the erroneous issuance of offset credits should logically be placed on the project owner as well. (IETA1)

> **Response:** We do not agree that we should eliminate buyer liability associated with the invalidation of ARB offset credits. Requiring the user to replace the invalidated offsets ensures that purchasers and users of offset credits do their due diligence in seeking out high-quality offset credits. We have clear enforcement authority over covered entities that will be using ARB offsets for compliance. If the covered entity replaces any invalidated offset credits, they may then take appropriate action through third-party contractual arrangements they may have established prior to purchase. These arrangements currently exist in the voluntary offset market, and we expect that as the offset market becomes more established, that additional mechanisms to deal with the risk of invalidation will also be established. In the event that the offset credit has not yet been used or retired, it will be canceled in the market tracking system and removed from any Holding or Compliance Accounts. These provisions in no way diminish ARB's authority to assess penalties under section 96014 on any offset project developer or verifier that has provided false information to ARB.

M-135. Comment: We have serious concerns with the offset credit replacement provisions included in this section. As a point of background, we believe that the economic burden imposed by a replacement ton provision greatly exceeds, by more than an order of magnitude, the economic burden imposed by typical ARB enforcement proceedings. For example, if a project's verification is reversed because the verification data was found to be wrong or inaccurate (e.g., using incorrect weather data on a dairy project), the economic burden of replacing those tons will be in the hundreds of thousands of dollars. Furthermore, it is unlikely that any individual entity within the chain of responsible parties received economic benefit at a level anywhere close to the cost of replacement tons. Also, we note that the replacement provision is in addition to ARB's ordinary enforcement authority and ability to levy penalties. When addressing non-sequestration projects where credits cannot be physically reversed, we have two categories of conduct which might result in credit invalidation. First, we have human error by the ARB, the verifier, the Offset Project Operator, the Offset Project Designee, or other parties; second we have intentional misrepresentations or fraud. The replacement provision, which as noted above is far more punitive than ARB's enforcement practice from an economic standpoint, treats these behaviors as equal. We believe that human error should be treated as error, and if the ARB chooses to conduct an enforcement action against the responsible party they should do so, but without imposing a replacement ton provision. If they choose to do so, the ARB's enforcement division could establish fines based on the cost of replacement tons. Alternatively, the ARB could establish a small non-sequestration buffer pool to cover non-fraudulent actions while maintaining the integrity of the cap, and use its enforcement authority to deter such error. In cases of fraud or other intentional misconduct, we recommend that the ARB use its full enforcement authority and levy fines which are at least sufficient to replace the invalidated credits. In neither of these cases is a provision in the regulation that requires replacement of the tons necessary. We recommend deletion of all reference to this requirement. (TPI2)

Response: We do not agree that we should eliminate buyer liability associated with the invalidation of ARB offset credits. Requiring the user to replace the invalidated offsets ensures that purchasers and users of offset credits do their due diligence in seeking out high-quality offset credits. We have clear enforcement authority over covered entities that will be using ARB offsets for compliance. If the covered entity replaces any invalidated offset credits, they may then take appropriate action through third-party contractual arrangements they may have established prior to purchase. These arrangements currently exist in the voluntary offset market, and we expect that as the offset market becomes more established, that additional mechanisms to deal with the risk of invalidation will also be established. In the event that the offset credit has not yet been used or retired, it will be canceled in the market tracking system and removed from any Holding or Compliance Accounts. These provisions in no way diminish ARB's authority to assess penalties under section 96014 on any offset project developer or verifier that has provided false information to ARB.

We included extensive modified provisions in section 95985 to make it clear what would trigger an invalidation, how ARB will invalidate offsets, and which offsets will need to be replaced. We believe that these changes provide clarity on this point.

M-136. (multiple comments)
Comment: NextEra Energy feels that once an offset credit is certified, it should remain viable and not be revocable. In section 95983 of proposed rule, ARB is providing for the invalidation of already certified offset credits. The purchaser the offset credit assumes "buyer liability" and would be required to replace any invalidated offsets with either another certified offset or another compliance instrument. The viability of the offset credit should be the responsibility of the certification process, registered certifying agents, and the offset provider. In many cases the purchaser of the offset credit will be completing transactions through a third party and not be directly involved with the offset project. The purchaser should be able to trust the certification of the ARB to assure what they are buying is a real reduction in GHG emissions and that it qualifies for use as a compliance tool in the GHG cap and trade program.

Permanence of certified offsets is necessary to ensure this provision acts an effective cost containment mechanism. The current proposed regulation leaves offset purchasers and project developers in a position of uncertainty. The potential invalidation of certified offset credits will result in fewer projects moving forward and therefore fewer GHG emissions reductions as well as reducing the amount of potential the co-benefits created by these projects.

The proposed buyer liability approach…Reduces the demand for offset projects due to an additional risk to both the investors in the projects themselves and the purchasers of the offsets. The risk and uncertainty injected into the market could result in less investment in potential projects and/or the development of new project technologies. The proposed buyer liability approach…Increases the cost of offsets to the purchasers because an independent evaluation of the projects by the purchaser of the credits would be necessary.

In addition, buyers of offset credits have to purchase additional assurances or hedge financial positions to protect against this added risk. This is ironic because offsets are listed as a cost containment mechanism. The proposed buyer liability approach…Moves some level of accountability for offset credit verification from the experts in this arena (certifying agents) and shifts it to non-experts (buyers).

It places California offset projects at a disadvantage to out-of-state projects that do not institute this reversibility provision in their rules. (RGGI projects, WCI projects, non-cap and trade states/regions.)

There are options the ARB could exercise prior to the issuance of a credit that could mitigate the potential voiding of an offset credit. For instance, there may be projects at risk for the release previously sequestered carbon as the result of an action outside of the projects direct control (i.e. earthquake, fire, etc). ARB would need to identify those types of projects and assign a discount factor to the total offset production of every project certified under that protocol. This factor should be established based on the risk of sequestration or offset reversal. All the discounted offsets are then placed into a general holding account. If it is determined that a reversal has occurred, an equivalent amount of offsets are retired from this holding account. All offset projects of a particular type would share the risk of the offset reversal and there is no need to invalidate any of the offsets. The GHG cap integrity is maintained. This also gives assurances to investors up front so their risk in developing new projects is limited. If the holding account is exhausted or reversals from a specific project type are reoccurring, ARB can then either adjust the discount factor or revisit the verification protocol.

Once an offset is certified, it should remain viable and non-revocable. One example of establishing a policy of non-reversal has been proposed in British Columbia. WCI also recognizes the need for assurances of offset credits to retain their value.[Proposed Offset Regulation Consultants paper, page 17 at: http://www.env.gov.bc.ca/cas/mitigation/ggrcta/offsets- regulation/index.html#Intentions] NextEra urges ARB to establish robust offset protocols and establish the policy that offsets once certified are not reversible. (NEXTERAENERGY)

Comment: Section 95985(d) requires the user or retiree of the offset credit to replace each metric ton of CO_2e with another approved compliance instrument, in the event ARB determines that a previously issued offset credit is invalid. We understand the desire to ensure that offsets represent real reductions in emissions to safeguard the environmental integrity of the program. However, Shell Energy believes that placing revocation liability on offset users, who usually have no direct control over an offset project or intentional reversal, will dramatically discourage the trading of such offsets, and drive the market towards inefficient, illiquid bilateral transactions with no price transparency; every transaction would have to negotiate liability for revocation. An actual revocation would trigger a waterfall of contractual default provisions that would be costly to administer. Also, it would be impossible for an exchange to list a standard offset contract in this regard. Only through frequent trading of offsets will reliable price signals occur, making it imperative to structure any government recourse in a way that does not impede the liquidity of the market.

We believe that ARB can achieve their intended objective of environmental integrity without placing the liability on the users of offsets. The proposed regulation would only allow offsets credits that meet the stringent ARB approved protocol and that have been verified by ARB approved verifiers. Section 96010 clearly establishes ARB's authority over project developers as well as purchasers/users of offset credits.

We recommend that the liability for invalidated/erroneous offset credits (for example due to intentional reversals, fraud or material errors/mistakes) be placed on the project developers that have control over and responsibility for operating successful offset projects. Therefore this section should be amended as follows:

Section 95985 (d) If an offset credit found to be invalid pursuant to this section, except as provided in section 95985(e) and (f), has been retired or surrendered for compliance in any voluntary or regulatory program, the project developer of that offset credit must retire an additional metric ton of CO e of another approved compliance instrument pursuant to sub article 4, within 30 calendar days pursuant to this section. (SHELLENERGY)

Response: We do not agree that we should eliminate buyer liability associated with the invalidation of ARB offset credits. Requiring the user to replace the invalidated offsets ensures that purchasers and users of offset credits do their due diligence in seeking out high-quality offset credits. We have clear enforcement authority over covered entities that will be using ARB offsets for compliance. If the covered entity replaces any invalidated offset credits, they may then take appropriate action through third-party contractual arrangements they may have established prior to purchase. These arrangements currently exist in the voluntary offset market, and we expect that as the offset market becomes more established, that additional mechanisms to deal with the risk of invalidation will also be established. In the event that the offset credit has not yet been used or retired, it will be canceled in the market tracking system and removed from any Holding or Compliance Accounts. These provisions in no way diminish ARB's authority to assess penalties under section 96014 on any offset project developer or verifier that has provided false information to ARB.

We made clarifications to both sections 95983 and 95985 to address stakeholder concerns that the regulatory language requires that offset credits be double-compensated in the event of reversals. Section 95983(b)(2) now states that ARB will retire a quantity of ARB offset credits from the Forest Buffer Account in the event of an unintentional reversal. Sections 95983(c) and (d) specify that in the event of an intentional reversal the Forest Owner must replace ARB offset credits to ARB in the amount specified in the regulation. Also, in new section 95985(c)(4)(B) we specify that reversals do not constitute an invalidation, and if a reversal occurs, the provisions in section 95983 apply.

M-137. Comment: Invalidating an offset after it has been verified and issued significantly increases the risk profile of offsets and reduces their value. The registration of a carbon offset is an expensive and tedious process and is specifically designed to ensure the final registered offset represents a carbon reduction that is real, verifiable, additional, and permanent. We recommend that ARB eliminate the potential for invalidation and ensure integrity of the system through the threat of suspension of verifiers and Authorized Project Designees. If necessary, we also recommend that ARB protect against the potential of errors and omissions by requiring projects to submit offsets to a buffer pool similar to the forest buffer pool. The loss in value of offsets compared to allowances is likely to be ten to twenty-five percent while a buffer pool contribution of five percent (or one in twenty tons) is far more than should be necessary to address the pooled risk of errors and omissions. (NISSENBAUM)

Response: We do not agree that we should eliminate buyer liability associated with the invalidation of ARB offset credits. Requiring the user to replace the invalidated offsets ensures that purchasers and users of offset credits do their due diligence in seeking out high-quality offset credits. We have clear enforcement authority over covered entities that will be using ARB offsets for compliance. If the covered entity replaces any invalidated offset credits, they may then take appropriate action through third-party contractual arrangements they may have established prior to purchase. These arrangements currently exist in the voluntary offset market, and we expect that as the offset market becomes more established, that additional mechanisms to deal with the risk of invalidation will also be established. In the event that the offset credit has not yet been used or retired, it will be canceled in the market tracking system and removed from any Holding or Compliance Accounts. These provisions in no way diminish ARB's authority to assess penalties under section 96014 on any offset project developer or verifier that has provided false information to ARB.

In addition, an invalidation and a reversal are two separate occurrences, and they are handled differently in the regulation. We made clarifications to both sections 95983 and 95985 to address stakeholder concerns that the regulatory language requires that offset credits be double-compensated in the event of reversals. Section 95983(b)(2) now states that ARB will retire a quantity of ARB offset credits from the Forest Buffer Account in the event of an unintentional reversal. Sections 95983(c) and (d) specify that in the event of an intentional reversal the Forest Owner must replace ARB offset credits to ARB in the amount specified in the regulation. Also, in new section 95985(c)(4)(B) we specify that reversals do not constitute an invalidation, and if a reversal occurs, the provisions in section 95983 apply.

M-138. Comment: Replace ability to invalidate offset credits with requirement to acquire and cancel equivalent amount. Sec 95985 of ARB's Cap and Trade draft regulations stipulates that offset credits can be invalidated after issuance. IETA understands and shares ARB's desire to maintain the environmental integrity of the emissions cap, but believes that providing ARB the ability to invalidate issued offset credits is the wrong avenue to do so. The Alberta government audits offset projects after the offsets have been produced and submitted for compliance by regulated facilities. Depending on the results of the audit, the government may accept or revoke all or a portion of the offsets. California's proposal to invalidate issued offsets is likely to lead to the same risk, threatening compliance, increasing administrative costs and decreasing offset supply.
To resolve this, IETA proposes ARB requires the liable party acquire and submit for cancelation an equivalent amount of offset credits *or* allowances. This change will continue to ensure the integrity of the cap, while allowing a measure of flexibility to market participants. (IETA)

Response: We do not agree that an offset credit should remain viable under all conditions. To ensure the enforceability of compliance offsets, we need to have the ability to investigate and take action for violations or noncompliance with the proposed regulation. In the event of fraud or malfeasance on the part of project developers or verifiers, there may be cause to invalidate offset credits after they have been issued, to protect the environmental integrity of the program. These provisions in no way diminish ARB's authority to assess penalties under section 96014 on any offset project developer or verifier that has provided false information to ARB.

The regulation does require that an equivalent amount of offsets be submitted to replace the invalidated offsets. We included extensive modified provisions in section 95985 to make it clear what would trigger an invalidation, how ARB will invalidate offsets, and which offsets will need to be replaced. We believe that these changes provide enough flexibility for the market to handle the risk of invalidation while maintaining the environmental integrity of the program.

M-139. Comment: The retirees of offsets are saddled with too many responsibilities regarding the validity of the underlying credit project. The Sanitation Districts believe that if there is offset reversal, the offset developer should bear the burden of making the system whole. Within California, GHG offsets will become more difficult to generate because of their indirect connection with the upcoming stricter ozone standards that focus on the criteria co-pollutants. As a result, GHG offset projects will be counted against needed NOx and VOC reductions and will be incorporated into the SIP, thereby creating an impossible additionality test. (LASD1)

Response: We do not agree that the responsible party of an invalidated ARB offset credit should be the offset developer. We have clear enforcement authority over covered entities that will be using ARB offsets for compliance. If the covered entity replaces any invalidated offset credits, they may then take appropriate action through third-party contractual arrangements they may have established prior to purchase. These arrangements currently exist in the voluntary offset market, and we expect that as the offset market becomes more established, that additional mechanisms to deal with the risk of invalidation will also be established. In the event that the offset credit has not yet been used or retired, it will be canceled in the market tracking system and removed from any Holding or Compliance Accounts. Requiring the user to replace the invalidated offsets ensures that purchasers and users of offset credits do their due diligence in seeking out high-quality offset credits.

M-140. (multiple comments)
Comment: Provide greater clarity on factors that would support a determination that are "sufficient to warrant a reversal" of an issued offset credit. (OFFSETSWG1)

Comment: The draft regulations stipulate that credits can be found erroneous in the event of errors in documentation "sufficient to warrant a reversal." IETA believes that this criteria section 95985 (b)(2) should be further defined. The criteria for reversal should be in the event of intentional fraud or malfeasance on the part of a project owner, verifier, or end user. This reversal risk can then be managed in contracting between the parties involved in the project activity. Errors without intent are infrequent and so minor in nature that they do not justify the potential restriction on liquidity that is likely to occur under the current proposed rules. (IETA1)

Comment: Section 95985 (d) makes reference to the actions ARB will take if a retired or surrendered offset credit is found to be invalid, including actions ARB will take if such credit has been retired under a voluntary program. The ARB has no authority over voluntary programs (with the possible limited exception of opt-in participants to the ARB regulatory program), so the requirements and enforcement provisions listed here as pertaining to voluntary program retirements should be deleted. Instead, the ARB should commit to notifying the retiree of the voluntary program credit's invalidation so that the retiree may take appropriate private action with the voluntary program authority. Of course, the ARB's general enforcement authority, which is separate from the obligations imposed here related to replacement tons, remains in force as allowed by statute. (TPI2)

> **Response:** We included extensive modified provisions in section 95985 to make it clear what would trigger an invalidation, how ARB will invalidate offsets, and which offsets will need to be replaced. We believe that these changes provide clarity on this point.

M-141. Comment: Section 95985(b) of the proposed regulation states that an offset credit may be invalid if ARB determines that errors by "Offset Project Developers... or others involved in producing the documentation used to support the issuance of offset credits are sufficient to warrant a reversal." Section 95985(d) goes on to provide that if an offset credit is found to be invalid it must be replaced with another approved compliance instrument within 30 calendar days. Given the complexity of the project and verification protocols, there will undoubtedly be good faith errors involved in the documentation used to support the issuance of an offset credit. Consequently, the vague standard for determining whether errors are "sufficient to warrant reversal," and the harsh remedy proposed where such a determination is made, will likely discourage offset project development. We therefore recommend that ARB consider adopting a gross negligence or intent threshold for the imposition of the 95985(d) remedy. We further recommend that ARB consider allowing offsets that are invalidated as a result of a good faith error to be replaced pro rata over the remainder of the project's crediting period rather than within 30 days. (TCF)

> **Response:** We included extensive modified provisions in section 95985 to make it clear what would trigger an invalidation, how ARB will invalidate offsets, and which offsets will need to be replaced.
>
> We also changed the timing for when the responsible party must replace the invalidated ARB offsets from 30 days to six months. This should provide enough flexibility for those that must replace invalidated offsets to purchase additional compliance instruments, while still ensuring that the environmental integrity of the cap is maintained.

M-142. Comment: The regulation proposes to hold buyer's liable in the event of offset reversals. The burden to rectify an offset reversal falls on the buyer regardless of whether the reversal is intentional or unintentional, but enforcement and penalties are far more egregious in the case of an intentional reversal. According to the regulation, CARB will give a buyer 30 days to correct an intentional offset reversal. Failure to do so will constitute a violation resulting in CARB assessing penalties. CalChamber opposes buyer liability amongst regulated entities and believes that enforcement of such liability ignores the purpose of approved offsets and a certification process supported by a third party verifier. Imposition of liability upon the buyer creates uncertainty that could suppress the market. (CALCHAMBER1)

> **Response:** We do not agree that we should eliminate buyer liability associated with the invalidation of ARB offset credits. Requiring the user to replace the invalidated offsets ensures that purchasers and users of offset credits do their due diligence in seeking out high-quality offset credits. We have clear enforcement authority over covered entities that will be using ARB offsets for compliance. If the covered entity replaces any invalidated offset credits, they may then take appropriate action through third-party contractual arrangements they may have established prior to purchase. These arrangements currently exist in the voluntary offset market, and we expect that as the offset market becomes more established, that additional mechanisms to deal with the risk of invalidation will also be established. In the event that the offset credit has not yet been used or retired, it will be canceled in the market tracking system and removed from any Holding or Compliance Accounts. These provisions in no way diminish ARB's authority to assess penalties under section 96014 on any offset project developer or verifier that has provided false information to ARB.
>
> We also changed the timing for when the responsible party must replace the invalidated ARB offsets from 30 days to six months. This should provide enough flexibility for those that must replace invalidated offsets to purchase additional compliance instruments, while still ensuring that the environmental integrity of the cap is maintained.

M-143. (multiple comments)
Comment: Camco believes that the cancellation of credits due to mistake is too drastic of a response that risks unfairly stigmatizing market participants and disrupting pre-existing contracts. Camco understands why, in cases of fraud, the cancellation of credits may be warranted to preserve market integrity. For credits that have been issued by mistake, however, little will be served by cancellation of the credits that could not be equally accomplished by less disruptive means. Specifically, ARB could require that the responsible party account for and replace the missing emissions reductions through the purchase and retirement of additional credits. With respect to those mistakes that do make it through the verification and credit issuance process undetected, Camco request that ARB provide additional guidelines on which situations warrant correction retroactively. (CIG)

Comment: ARB does not need to rely on buyer-liability to ensure the quality of California offsets. ARB itself can enforce the validity of offsets, and ensure that additional compliance instruments are surrendered to cover any deficient offsets. Rather than invalidating offsets after issuance, ARB should require that, as a condition for accreditation of project verifiers and as a condition for issuance of offset credits to project developers, those entities must retire additional compliance instruments in the event that any offsets are found deficient due to that entity's negligence or misconduct. (WPTF)

> **Response:** To maintain the integrity of the program, we believe it is important to remove and disqualify the ARB offset credits that are directly related to the invalidation, as opposed to requiring that the responsible party just replace the instruments and allowing the serial numbers of the invalidated offsets to remain in the tracking system. If the ARB offset credits should not have been issued, we do not want them to be in our system, and the serial numbers that are directly affected will be made public. We cannot have a case where a complying entity has submitted a serial number for compliance that is associated with an invalidated offset.
>
> The regulation does require that an equivalent amount of offsets be submitted to replace the invalidated offsets. We included extensive modified provisions in section 95985 to make it clear what would trigger an invalidation, how ARB will invalidate offsets, and which offsets will need to be replaced. We believe that these changes provide enough flexibility for the market to handle the risk of invalidation while maintaining the environmental integrity of the program.

M-144. Comment: Buyer liability in the event of fraud or mistake will needlessly make the offsets market less liquid, and creates inefficient incentives. CERP strongly opposes the buyer liability framework in the proposed regulations. Under the proposed regulations, if already-issued offset credits are found to be ineligible due to mistake or fraud, the credits will be canceled from any holding account. Any credits that have already been submitted for compliance will also be canceled, and the entity that submitted the credit will be responsible for replacing the credit. This cancellation and replacement requirement will make offsets non-homogenous (because many offset sale contracts will incorporate a tailored credit-replacement clause) and reduce the liquidity of the offsets market. CERP urges ARB to instead allow already-issued credits to remain valid, and require the relevant offset project operators or verifiers to submit an equivalent quantity of replacement credits to be retired. This system would place the replacement liability with one of the parties that have the greatest control over the quality of emission-relevant data and reporting. It will also help ensure that offsets will be a homogenous, liquid commodity. Failing to place the liability on the party with control over the risk unfairly penalizes innocent parties, and generates considerable inefficiency in the market. The replacement liability is imposed on a party without good information about the actual risk of ineligibility, which will lead to the risk being inefficiently overvalued. As a result, the offsets market will not function efficiently and the costs of obtaining offsets will rise. ARB can avoid all of these deleterious outcomes by imposing the replacement liability where it belongs—with the party that is responsible for the mistake or fraud. (CERP1)

Response: To maintain the integrity of the program, we believe it is important to remove and disqualify the ARB offset credits that are directly related to the invalidation, as opposed to requiring that the responsible party just replace the instruments and allowing the serial numbers of the invalidated offsets to remain in the tracking system. If the ARB offset credits should not have been issued, we do not want them to be in our system and the serial numbers that are directly affected will be made public. We cannot have a case where a complying entity has submitted a serial number for compliance that is associated with an invalidated offset.

Requiring the user to replace the invalidated offsets ensures that purchasers and users of offset credits do their due diligence in seeking out high-quality offset credits. We have clear enforcement authority over covered entities that will be using ARB offsets for compliance. If the covered entity replaces any invalidated offset credits, they may then take appropriate action through third-party contractual arrangements they may have established prior to purchase. These arrangements currently exist in the voluntary offset market, and we expect that as the offset market becomes more established, that additional mechanisms to deal with the risk of invalidation will also be established. In the event that the offset credit has not yet been used or retired, it will be canceled in the market tracking system and removed from any Holding or Compliance Accounts. These provisions in no way diminish ARB's authority to assess penalties under section 96014 on any offset project developer or verifier that has provided false information to ARB.

M-145. Comment: For mistakes of a more material and systemic nature that do warrant correcting retroactively, Camco recommends that the appropriate response should be to account for and replace the missing emissions reductions through the purchase and retirement of additional credits, rather than the invalidation of already issued credits. Camco respectfully submits that the same environmental results could be achieved by issuing a corrective order requiring the responsible party to account for the shortfall through additional credit purchases. If that order is not complied with within a reasonable time, then the cancellation of existing credits and other corrective actions may be warranted. At a minimum, Camco recommends that ARB state in the regulations or accompanying guidance that it will determine on a case-by-case basis whether the invalidation of credits is warranted to preserve market integrity, or whether the proper accounting and replacement of the emission reductions could achieve the same objective with less disruption to existing contractual and institutional arrangements. (CIG)

Response: To maintain the integrity of the program, we believe it is important to remove and disqualify the ARB offset credits that are directly related to the invalidation, as opposed to requiring that the responsible party just replace the instruments and allowing the serial numbers of the invalidated offsets to remain in the tracking system. If the ARB offset credits should not have been issued, we do not want them to be in our system and the serial numbers that are directly affected will be made public. We cannot have a case where a complying entity has submitted a serial number for compliance that is associated with an invalidated offset.

Clarification of Reversals and Invalidation

M-146. Comment: One of the basic criteria for offsets along with being a real reduction and additional is the idea of permanence. The ability of ARB to invalidate certified offsets at some future date contradicts that criterion. The mechanism for the verification and certification of offset credits needs to supply the purchaser with the confidence that what they are buying will remain viable. (NEXTERAENERGY)

Response: We clarified the regulation by adding new section 95985(c)(4)(B). In this provision we specify that reversals do not constitute an invalidation, and if a reversal occurs, the provisions in section 95983 apply. By relying on the Forest Buffer Account we are ensuring permanence of sequestered carbon. An invalidation would only be found if information was omitted or there was fraudulent or new information submitted to ARB that would lead ARB to find that ARB offset credits should not have been issued.

M-147. (multiple comments)
Comment: The forestry sequestration reversal provisions should not require double compensation for a reversal. CERP strongly supports ARB's establishment of a "buffer reserve" to compensate the offset program in the event that a forest sequestration project experiences an unintentional reversal. If an intentional reversal occurs, the proposed regulations also require the offset project operator to submit to ARB an amount of credits equivalent to the reversal, which appropriately puts the replacement obligation on the entity with the greatest control over the project's success. However, the proposed regulations—in addition to providing these replacement provisions—appear to require that the offset credits issued for emission sequestrations that subsequently undergo a reversal be canceled. If the reversal is unintentional, an equivalent quantity of credits from the buffer reserve is cancelled. This makes the offset program whole. (Note: any credits in the reserve that represent a reversed sequestration must also be canceled). If the reversal is intentional, an equivalent quantity of credits must be submitted to ARB by the offset project operator, and will be cancelled. This makes the offset program whole. The credits representing the reversed sequestration are cancelled under section 95985. At this point, the offsets program has been compensated for the reversal twice. If the already-issued credits are canceled, then the buffer reserve and the replacement obligation serve no purpose, and forestry offset credits will be non-homogenous and illiquid.

CERP strongly recommends that ARB remove the section 95985 requirement for cancellation in the event of a forest sequestration reversal, and rely instead on the buffer reserve and project operator liability mechanisms to address reversals. In addition, CERP urges ARB to harmonize the requirements applying to forestry projects that undergo an intentional reversal. In the proposed regulation order, it provides that a project that undergoes an intentional reversal is automatically terminated. The ARB U.S. Forest Project Protocol, however, sensibly provides that if a forestry project experiences a reversal but its actual live standing carbon stocks are still above approved baseline levels, it may continue without termination provided the reversal has been compensated. The approach taken by the protocol is both reasonable and appropriate. So long as live standing carbon stocks remain above baseline levels, the project has generated real, additional, verifiable carbon sequestration and should continue. Minor “reversals” are also a fact of life. In the course of a 100 year forestry management project, typical silvicultural practices may require harvesting beyond the levels envisioned by a protocol in order to balance tree age classes and sustainable forest growth. (CERP1)

Comment: The Reserve is pleased that the Air Resources Board recognized the importance of addressing reversals. However, invalidation of offset credits every time a reversal occurs as proposed under section 95983 and section 95985 will create severe unintended consequences and reduce confidence in the overall program, as buyers of credits will be uncertain if their credits will be invalidated at some later date due to actions beyond their control. Reversals, intentional or otherwise, may be effectively remedied by simply retiring compliance instruments, including other offset credits, in proportion to the reversal. This is, in fact, what the Regulation stipulates in the case of unintentional reversals (section 95985(f)). The same requirement should hold for intentional reversals, i.e., the Offset Project Operator or Authorized Project Designee should simply be required to retire compliance instruments, not “replace” invalidated credits. The practical effect from an emissions integrity standpoint would be identical, and retirement would avoid the unnecessary administrative transactions and possible legal disputes associated with invalidating credits (possibly in multiple buyer or end-user accounts) and “replacing” those credits with alternative instruments provided by the Offset Project Operator or Authorized Designee. (CAR1)

Comment: The ARB should clearly define why and under what conditions it would reverse an offset credit so that there is transparency in the market and protection for the consumer. CCEEB recommends the obligation to replace offset tons due to reversals should be treated differently depending on the cause of the reversal. For intentional or fraud-related reversals, such as when a forest offset developer decides to harvest the forest, then the developer who is making the business decision should be responsible for replacing the lost carbon sequestration. For unintentional reversals due to causes such as forest loss from fire, pests, disease, or bankruptcy, the lost carbon should be replaced from a reserve held back when credits are issued for such projects. (CCEEB1)

> **Response:** We made clarifications to both sections 95983 and 95985 to address stakeholder concerns that the regulatory language requires that offset credits be double-compensated in the event of reversals. Section 95983(b)(2) now states that ARB will retire a quantity of ARB offset credits from the Forest Buffer Account in the event of an unintentional reversal. Sections 95983(c) and (d)

specify that in the event of an intentional reversal the Forest Owner must replace ARB offset credits to ARB in the amount specified in the regulation. Also, in new section 95985(c)(4)(B) we specify that reversals do not constitute an invalidation, and if a reversal occurs, the provisions in section 95983 apply.

M-148. Comment: Intentional reversals should be remedied by the Forest Owner but not cause the invalidation of transacted offset credits and the removal of such credits from any Holding or Compliance account. Buyer liability should only be imposed for fraud or significant errors in the system. (sections 95983(e)(3) and 95985)). The drafting of these sections is somewhat ambiguous and would appear to require both the replacement of reversed tonnes and the cancellation of transacted credits in the event of a reversal from a forest carbon offset project. As a general principle, a reversal of an obligated reduction should be compensated for in the system once to ensure atmospheric integrity, but the proposed system would require a reversal to be compensated for twice.

Consider the following scenario: a landowner sells an offset credit representing 1 tCO_2e to an entity with compliance obligations under AB 32. That landowner's project then suffers an intentional reversal of 1 tCO_2e. ARB exercises its discretion to determine that the offset credit sold is invalid pursuant to section 95983(e)(3) and section 95985(b)(1). The offset credit in the compliance buyer's Holding or Compliance account is therefore cancelled and removed by ARB pursuant to section 95985(c). As required by section 95985(e), the Offset Project Operator or Authorized Project Designee must replace the 1 t CO_2e, and they do so by purchasing an offset or other compliance instrument and retiring it. In this scenario, two compliance instruments have been canceled or retired to compensate for the reversal of one compliance instrument by the forest owner, the original offset canceled pursuant to section 95985(c), and the compliance instrument purchased and retired pursuant to section 95985(e). If the reversal is adequately compensated through the forest owner purchasing and retiring a compliance instrument pursuant to section 95985(e), and there is therefore a net zero emission to the atmosphere, why also cancel the transacted credit?

We would recommend that buyer liability apply only for significant errors or fraud in the system pursuant to section 95985(b)(2), and that intentional and unintentional reversals from forest carbon offset projects be addressed solely through section 95985(e) and (f), which fully maintain atmospheric integrity. Modify section 95985 as follows:

> (b) An offset credit may be determined to be invalid for the following reasons: ~~(1) a finding pursuant to section 95983 that a reversal occurred in a forest sequestration project; or (2)~~(1) ARB has determined that errors warrant a reversal.
>
> (d) If an offset credit found to be invalid pursuant to ~~this~~ section - 95985(b) above, ~~except as provided in section 95985(e) and (f),~~ has been retired.

(e) If an intentional reversal occurs from a forest offset project. within 30 calendar days of being notified by ARB. If the Offset Project Operator or Authorized Project Designee does not replace the ~~invalid~~ reversed offset credit(s)**.** will constitute a violation.

(f) If an unintentional reversal occurs from a forest offset project, ARB will retire offset credits in the amount of tons reversed from the Forest Buffer Account. ~~All other invalidated offset credits must be replaced pursuant to section 95985(d).~~" [*this last sentence is redundant and with the changes to 95985(b) above an unintentional reversal will not trigger an invalidation of credits*].

These changes would enable ARB to cancel a credit for significant errors or fraud in the system, and to require forest owners or authorized designees to replace intentionally reversed credits, while avoiding the requirement of an unnecessary double cancellation of compliance instruments solely in the instance of forest carbon offset reversal.

If ARB decides to continue to require the cancellation of transacted offset credits due to a landowner's reversal – in addition to requiring the landowner to make the system whole – compliance buyers will a) avoid forest carbon offsets; b) discount forest carbon offset prices if they must purchase forest carbon offsets; and c) impose liability for replacing any cancelled credits contractually on the forest owner or authorized designee, thereby placing a forest owner in a situation in which he or she must purchase two compliance instruments for every one tonne reversed. In such circumstances few forest owners will seek to supply the market. (SHILLINGLAW1)

Response: We made clarifications to both sections 95983 and 95985 to address stakeholder concerns that the regulatory language requires that offset credits be double-compensated in the event of reversals. Section 95983(b)(2) now states that ARB will retire a quantity of ARB offset credits from the Forest Buffer Account in the event of an unintentional reversal. Sections 95983(c) and (d) specify that in the event of an intentional reversal the Forest Owner must replace ARB offset credits to ARB in the amount specified in the regulation. Also, in new section 95985(c)(4)(B) we specify that reversals do not constitute an invalidation, and if a reversal occurs, the provisions in section 95983 apply.

In addition, we included extensive modified provisions in section 95985 to make it clear what would trigger an invalidation, how ARB will invalidate offsets, and which offsets will need to be replaced.

M-149. Comment: It is unclear what happens if offsets are subsequently discredited. The project is terminated and section 95983 provides for "offset reversals." However, if compliance depends on the purchase of the subject offsets, it is not clear if or how the affected facility will be held accountable, especially in the case of "unintentional reversals," which can happen without adequate notice. (CAPCOA1, CAPCOA2)

Response: In the case of intentional reversals in the forest sector, the Forest Owner is responsible for placing the reversed tons (sections 95983(c) and (d)). In the case of an unintentional reversal, ARB will remove ARB offset credits from the forest buffer account to cover the reversed tons (section 95983(b)(2)). The holder and/or covered entity is not responsible for replacement in the case of forest reversals. To make it more clear in new section 95985(c)(4)(B), we specify that reversals do not constitute an invalidation, and if a reversal occurs, the provisions in section 95983 apply.

Reversals in the Forest Sector

M-150. Comment: An intentional reversal should only trigger a requirement for the replacement of each metric tonne reversed. (section 95985(e)). This section contains some ambiguity as to whether it is only the reversed volume of CO_2e that must be replaced or the obligated reductions of the entire project. Modify section 95985(e) for clarity as follows:

If an intentional reversal occurs from a forest offset project, the Offset Project Operator or Authorized Project Designee must ~~replace~~ retire a volume of approved compliance instruments pursuant to subarticle 4 equivalent to the volume of metric tonne of CO_2e reversed ~~pursuant to subarticle 4~~, within 30 calendar days of being notified by ARB. (SHILLINGLAW1)

Response: Original section 95985(b)(7) was moved to new section 95985(c)(4)(A). New section 95985(c)(4)(B) was added to clarify that reversals for forest offset projects do not trigger an invalidation and reversals will be handled according to section 95983. This provision was added to alleviate stakeholder concerns that any reversal would trigger invalidation and that the forest owner would have to double compensate for those tons. New section 95983(c)(3) requires that Forest Owner replace ARB offset credits with valid compliance instruments in the case of an intentional reversal. And a new requirement was added to section 95983(c) that states ARB offset credits will be retired from the Forest Buffer Account if the reversed tons are not replaced by the Forest Owner within the 90 days. If the Forest Owner does not replace the ARB offsets within the 90 days and ARB offset credits are retired from the Forest Buffer Account, ARB will assess penalties pursuant to section 96014. This allows the program to be made whole and still requires that the responsible party is appropriately penalized for not making the program whole.

M-151. Comment: Section 95983(b)(2) provides that if CARB determines there has been an unintentional reversal of offsets, it will retire a quantity of offset credits pursuant to section 95985(e). SCE believes this reference should read “section 95985(f).” (SCE1)

Response: Original section 95985(e) has been deleted and section 95983 (b)(2) was modified to clarify that ARB will retire a quantity of ARB offset credits in the amount of metric tons of CO_2e reversed from the Forest Buffer Account in the case of an unintentional reversal.

M-152. Comment: CARB should remove the distinction between intentional and unintentional reversals in the forest buffer account provisions. Section 95983 of the draft regulation distinguishes between intentional and unintentional reversals of offset credits in the context of forestry projects. The VCSA strongly recommends that CARB consider alternative approaches that do not rely on distinguishing between intentional and unintentional reversals. The reason for this is that it can be difficult to determine whether reversals are intentional or unintentional, particularly in developing country jurisdictions where strong property law protections and legal enforcement may either not exist or be applied consistently. For instance, one could imagine a scenario in which a landowner hires someone to burn down the forest so that the project can be terminated and crops planted without having to replace offset credits, all the while making the occurrence appear to be unintentional. Since the vast majority of REDD projects will occur in developing countries, the unintentional/intentional distinction is likely to be very difficult to determine and thus may hinder the development of REDD projects and/or undermine the integrity of the buffer system. (VCS)

Response: According to the regulation, the Offset Project Operator or Authorized Project Designee must notify ARB of any reversal and provide a description of the reversal. In addition, the forest project must be verified within one year of the occurrence. This will provide sufficient data for ARB to determine whether a reversal is intentional or unintentional. Furthermore, sector-based offset credits, including REDD, would not be dealt with under these provisions. The provisions in subarticle 13 only apply to those offset projects developed under Compliance Offset Protocols. Compliance Offset Protocols are only applicable in North America. If REDD projects were to be allowed in the future, there would be a separate rulemaking to determine the rules surrounding those projects. Rules surrounding these projects would be found in subarticle 14 since they would be offsets issued by other recognized programs.

Permanence

M-153. Comment: The VCSA recommends that CARB accept alternative non-permanence management approaches than what is currently featured in the draft regulation. Although the currently proposed framework may be appropriate for the two domestic forestry-related protocols CARB has already endorsed, this framework could be highly problematic for non U.S. forest offsets that may enter the system through section 95973 (Requirements for Offset Projects Using ARB Compliance Offset Protocols). (VCS)

Response: Currently ARB's Compliance Offset Protocol, U.S. Forest Projects, only applies to forest projects in the United States. ARB would have to adopt additional protocols for forest projects outside of the United States. Any new protocols will be part of a new rulemaking, in which ARB could amend the rules in the regulation, if determined to be necessary. We believe the Forest Buffer Account in the regulation is a robust method to account for any non-permanence issues.

M-154. (multiple comments)
Comment: The VCSA recommends that CARB add language to section 95983 of the regulation about how the agency will accept other robust approaches for managing reversals if they meet certain quality standards, and the VCSA would gladly cooperate to assist in the development of the language needed to achieve this. The VCS risk tool assesses all potential reversal risks and establishes buffer withholding requirements in a manner that will maintain atmospheric integrity (and the permanence of all credits issued) without needing to distinguish between intentional and unintentional reversals. Many experts believe this approach to be more comprehensive and robust than a reversal management system that is dependent on hard-to-make determinations about intentionality. (VCS)

Comment: The Forest Carbon Developers support the use of a buffer pool to insure against unintentional reversals. Forest Protocol section 7.2. In addition, we encourage ARB to provide flexibility to approve alternative insurance mechanisms that provide equivalent certainty, such as those may be developed by the marketplace or proposed by project sponsors. (BLUESOURCE, FCC)

Response: To ensure permanence of GHG reductions and GHG removals ARB will manage the risk of reversals through the Forest Buffer Account. We believe this mechanism provides enough flexibility for developers of forest offset projects to manage the risk of potential reversals, and we do not see a need for additional mechanisms within the regulation.

M-155. Comment: The inclusion of forestry and land use offsets in a positive list of projects fails to address questions of permanence surrounding carbon sinks, or consider the impact that the use of such sinks has in delaying the transition from a fossil-fuel based economic model. (CTW)

Response: Currently the only sequestration project types included in the regulation is Compliance Offset Protocol, U.S. Forest Projects and Compliance Offset Protocol, Urban Forest Projects. To ensure permanence of GHG reductions and GHG removals, ARB will manage the risk of reversals through the Forest Buffer Account. We believe the Forest Buffer Account in the regulation is a robust method to account for any non-permanence issues. If ARB were to adopt any other protocols or apply the current protocols to other locations, ARB would conduct a new rulemaking, in which ARB could amend the rules in the regulation, if it was determined to be necessary.

M-156. Comment: CARB should consider expanding the use of the buffer pool mechanism to include all agricultural and terrestrial sequestration projects, as well as other offset types. (EDF1)

> **Response:** Currently the only sequestration project types included in the regulation is Compliance Offset Protocol, U.S. Forest Projects and Compliance Offset Protocol, Urban Forest Projects. Any additional protocols would need to be adopted as part of a separate regulatory process that meets the requirements of Administrative Procedure Act. If we were to adopt any agricultural and terrestrial sequestration protocols, we would consider the appropriate mechanisms to ensure permanence and discuss it with stakeholders through the public process.

Early Action

Early Action Operations

M-157. (multiple comments)
Comment: ARB should clarify when the ARB offsets program will be operational. Many offset project developers will want to know when the ARB offsets registry will be operational, which will affect their decision of whether to register a project with ARB versus other registries. Any information you can provide on when ARB will be ready to make decisions on early action credits and to register offsets under the ARB protocols would be very helpful. (CERP1)

Comment: Finite Carbon is actively verifying forest carbon projects to the Climate Action Reserve Protocol 3.1 and 3.2. In order to effectively plan verifications and sales, we would like ARB to publish a draft timeline of when the Compliance Protocols will be available for use. We also feel that clarity on the exact mechanics of transferring a project from the Climate Action Reserve to ARB is critical to keep continuity in the carbon market. (NISSENBAUM)

> **Response:** The regulation includes provisions to allow early action offset credits to be credited as ARB offset credits and used in the cap-and-trade program. We included these provisions to allow parties to develop offset projects and purchase offset credits that are being issued by Early Action Offset Programs. These provisions will provide parties with certainty that the regulation will allow them to participate in the offsets market while ARB finalizes the regulation and takes the necessary implementation steps to develop a fully functioning ARB offsets program and offsets tracking system. Once ARB Compliance Offset Protocols are finalized in October 2011, project developers will be able to use them to quantify, monitor, and report their GHG reductions and GHG removal enhancements. In 2012, we anticipate that the Board will consider and approve additional Offset Project Registries so that project developers can list and report their emissions with these registries. We will also accredit ARB offset verifiers to

verify GHG reductions and GHG removal enhancements from offset projects developed under Compliance Offset Protocols.

In addition we added new section 95990(k) to the regulation, to clarify how early action offset projects transition to Compliance Offset Protocols.

M-158. Comment: Under section 95990(b), it is not clear as to whether a project must simply use the CAR "offset quantification method" or whether the project must also successfully list and register credits as CRTs on the CAR Registry. Given that the CAR Registry does not currently have the capabilities listed in section 95990(c) nor the capabilities listed in section 95986(d), it is not obvious how projects using these protocols qualify under this section. Clarifying language should be added. (TPI2)

Response: Original section 95990(b), now new section 95990(c), lists the criteria that the early action offset credit, or GHG reduction or GHG removal enhancement must meet to be issued ARB offsets pursuant to section 95990(i). One of the requirements in section 95990(c)(3) is that the offset project has to be listed or registered by an Early Action Offset Program. The listing requirements for early action offset projects can be found in section 95990(e). An Early Action Offset Program is defined in section 95802, and means a program that meets the requirements of section 95990(a) and is approved by ARB. We believe there are programs that would meet the requirements and could be approved as Early Action Offset Programs.

Early Action Offset Supply and New Early Action Protocols

M-159. Comment: ACR is now submitting three offset protocols for potential approval under Subarticle 14 of the proposed regulation – either added to the list of recognized quantification methodologies for Early Action Offset Credits in section 95990(b)(5), or approved under "Third-Party Offset Programs for Purposes of Accepting Offset Credits for Early Action" in section 95990(c). These protocols are additional to those currently represented in section 95971 and Parts II through V of the regulation as Compliance Offset Protocols, and to those currently listed in section 95990(b) as Early Action protocols. The three ACR-approved protocols are listed below (NOTE: 3 protocols (attachments) also submitted with this comment- see comment 509 - MARTINN)

1. Nitrous Oxide (N_2O) Emission Reductions through Changes in Fertilizer Management. Applicable to agricultural land management project activities that involve a change in fertilizer management including changes in fertilizer rate, type, placement, timing, use of timed-release fertilizers, use of nitrification inhibitors, and other factors.

2. Conversion of High-Bleed Pneumatic Controllers in Oil and Natural Gas Systems. Details requirements for oil & gas companies to earn offsets by reducing fugitive emissions of methane through retrofitting existing high-bleed pneumatic controllers with low-bleed options.

3. Improved Forest Management (IFM) through Increased Forest Carbon Sequestration. Quantifies GHG emission reductions resulting from a long-term commitment to increase forest carbon sequestration over baseline forest management practices, on privately owned timberlands exceeding 1,000 acres in the United States.

ACR and its parent organization, Winrock International, request these protocols be listed as "under review" in section 95990(b)(5) or where appropriate in the regulation, and to provide ACR with a schedule for their review in 2011. Beyond the three protocols listed above, ACR offers for ARB's consideration the following additional protocols that we expect to be completed in 2011:

1. Livestock Manure Management. Provides requirements for the quantification, monitoring, and reporting of GHG offsets from dairy cattle and swine manure management systems. Developed in California with the support of the California Energy Commission, Inland Empire Utilities Agency, South Coast Air Quality Management District, and other stakeholders. ACR is also exploring the potential for simplified methodologies for small-scale livestock facilities, for which existing protocols are generally not cost-effective. (Expected availability: first half 2011)

2. Restoration and Preservation of Coastal Wetlands. This methodology for afforestation, reforestation and revegetation of wetlands is applicable to degraded deltaic wetlands experiencing geological subsidence where hydrology is being restored to increase wetland productivity leading to additional carbon sequestration as a result of freshwater, nutrient, and or sediment addition. (Expected availability: first half 2011)

3. Improved Grazing Land Management. This holistic grazing methodology will address changes in soil carbon sequestration, changes in emissions from enteric fermentation and manure application, and emissions from fertilizer use. (Expected availability: first half 2011)

4. Afforestation/Reforestation. This methodology adapts CDM-approved methodology AR- ACM0001 with the addition of guidance on accounting for wood products. (Expected availability: first quarter 2011)

Moreover, ACR methodologies for Reducing Emissions from Deforestation and Degradation (REDD+) internationally will provide an important added option for AB 32 compliance under section 95993. (MARTINN)

Response: We appreciate the submittal of ACR's protocols. A new section 95990(c)(5)(E) is reserved in the modifications to the regulation for new additional early action project protocols. However, approving additional protocols does not fall under the purview of this rulemaking. Any new offset protocols approved for use in the compliance program must be adopted by the Board after undergoing a full regulatory process, including an ARB stakeholder process, in accordance with the Administrative Procedure Act. If ARB were to adopt any additional protocols that could be recognized for bringing in early action offset credits, it would have to be done as part of this separate rulemaking and approval process.

M-160. Comment: The current regulation inadequately addresses early action credit. AB 32 mandates that credit be given to voluntary early action measures. As presently stated in the regulation, it is too limited. More protocols need to be recognized. (COPC2)

Response: We disagree that the regulation inadequately addresses early action. AB 32 states that ARB must ensure that entities that voluntarily reduce their emissions receive appropriate credit. We believe that early action offset program, in addition to other aspects of the cap-and-trade program, such as through the allocation of allowances, sufficiently rewards early movers. In addition to the CAR protocols that we are recognizing in section 95990, new section 95990(c)(5)(E) is reserved in the modifications to the regulation for new additional early action project protocols. All offset protocols used in the compliance program must be adopted by the Board after undergoing a full regulatory process, including an ARB stakeholder process, in accordance with the Administrative Procedure Act. ARB plans to evaluate additional protocols for approval in 2012. As we evaluate additional protocols, we will assess whether or not early action offset credits should be allowed from those project types.

M-161. Comment: COPC appreciates that CARB seeks to meet the AB 32 requirement that it give credit to early voluntary reductions in GHGs. However, COPC believes that CARB has failed to give "appropriate credit" to many early reductions in GHGs by limiting its recognition of early action offsets to those generated under four Climate Action Reserve ("CAR") protocols (see section 95990(b)(5)). While the four CAR protocols expressly recognized for Early Action credit in the Regulation have indeed guided the generation of high-quality offsets, there are other protocols developed both by CAR and by other organizations such as the Voluntary Carbon Standard Association (VCS) and the American Carbon Registry (ACR) that also have guided the development of voluntary offsets that are just as real, additional, permanent, unique and verifiable as those developed pursuant to the four chosen CAR protocols. COPC also notes that by recognizing only protocols generated by one third party and not any of the others currently operating in the voluntary market, CARB is sending the wrong signals. It risks appearing to prefer one NGO over another for little apparent substantive reason. In addition, it exposes CARB to the risks inherent in relying only on one organization. Finally, if CARB does not expand the number of eligible early action protocols, there is a strong possibility that there will be a shortage in the supply of available offsets in the initial phases of California's Cap and Trade program. To ensure that the price of AB 32 compliance does not rise unnecessarily, CARB should expand the number of protocols expressly recognized in the regulation under which early action offsets may be generated. (COPC1)

> **Response:** We disagree that the regulation inadequately addresses early action. AB 32 states that ARB must ensure that entities that voluntarily reduce their emissions receive appropriate credit. We believe that early action offset program, in addition to other aspects of the cap-and-trade program, such as through the allocation of allowances, sufficiently rewards early movers.
>
> In addition to the CAR protocols that we are recognizing in section 95990, new section 95990(c)(5)(E) is reserved in the modifications to the regulation for new additional early action project protocols. All offset protocols used in the compliance program must be adopted by the Board after undergoing a full regulatory process, including an ARB stakeholder process, in accordance with the Administrative Procedure Act. The protocol approval and public process convened by a voluntary program, such as CAR, cannot substitute for a stakeholder process conducted by ARB for rulemaking purposes.
>
> ARB plans to evaluate additional protocols for approval in 2012. As we evaluate additional protocols, we will assess whether or not early action offset credits should be allowed from those project types. In approving additional protocols ARB is looking at protocols developed by any third-party, including other voluntary and regulatory offset programs.
>
> We do not agree that there will be insufficient offset supply in the first compliance period. We estimate that if every entity used their allowable eight percent offsets, approximately 26 million metric tons of offsets would be needed in the first compliance period. This reduced need is due to a start of the first compliance period in 2013 instead of 2012. At this time, based on the four offset protocols the Board has endorsed—manure digesters, forestry, urban forestry, and destruction of ozone depleting substances— ARB will be close to the supply demand for the first compliance period. We also will consider additional Compliance Offset Protocols beginning in 2012.

M-162. (multiple comments)
Comment: Early action is recognized under section 95990 by allowing entities to use for compliance with the cap and trade program offsets issued under four CAR protocols. While this is helpful, the number of CRTs generated under those four protocols is limited. Rather than allowing only a restricted set of CRTs to be used for compliance as early action credits, ARB should allow broader use of CRTs. There is no reason not to allow a broader use of CRTs on an ongoing basis as well as to recognize early action. (SCPPA2)

Comment: Similar to eligible project types starting in 2012, CARB has limited early action credits. By only allowing Climate Action Reserve credits issued under Forestry, Livestock, Urban Forestry, and ODS protocols, CARB, is hampering its ability to contain costs in the early years since there are few CAR credits currently issued under those protocols. CARB should encourage early investment in offset projects by expanding its eligible early action credits to include landfill and coal mine projects, and to allow credits from other scientifically rigorous registries such as the Voluntary Carbon Standard and the America Carbon Registry. (CE2CP)

Comment: If offset supply falls short of demand, the fact that the few available offset projects are well-qualified and additional will be little consolation in comparison to the financial burden. As a result, the regulatory system as a whole may be endangered, putting pressure on the Board to ease the cap explicitly – exactly the situation we would all like to avoid. Therefore we believe it is critical to ensure an adequate supply of offsets throughout the first compliance period, to the extent this can be done within the established emissions cap. Therefore, we recommend that ARB expand the Early Action offset protocols accepted to include the CAR Landfill Project Protocol as soon as can possibly be achieved. In short, we see substantial benefit to including the CAR landfill methane protocols and no downside from a policy standpoint. We believe a fast-track process, such as one parallel to the final adoption of the cap and trade regulation, would do much to ensure the launch of a regulatory system in 2012 which is both environmentally and economically sound. (TPI1)

Comment: Expand the eligibility for early action offset credits to non-CAR domestic and international programs. We strongly believe that other offset programs, regulating domestic and international offsets, maintain equally high standards of environmental integrity. Restricting eligible early action offset credits to CAR seems arbitrary and may lead to the under supply of the market in crucial early years. IETA urges ARB to consider approving existing protocols/methodologies under other domestic and international offset programs like the Voluntary Carbon Standard and the Gold Standard for acceptance as early action offsets in the California cap and trade system. (IETA1)

Comment: CERP supports ARB's decision to bring early action credits into the program from the four specified project types and ARB's decision not to limit early action to California projects. These were important first steps to generate early supply. Yet, these steps will not generate a substantial quantity of offsets. More will be needed. CERP encourages ARB to expand early action eligibility to other Climate Action Reserve (Reserve) protocols, including landfill methane, and to protocols from other well-respected offset registries. In particular, landfill methane capture projects should be included. Whatever concerns ARB has about having a chilling effect on landfill regulations in other jurisdictions are not relevant to the early action program, which recognizes projects that are already ongoing or will begin in the very near-term. Making such projects eligible for the early action program can have no negative effect on regulatory decisions in the host jurisdictions. It will, however, encourage widespread adoption of methane capture technologies at unregulated landfills, a highly efficient means of reducing GHG emissions. (CERP1)

Comment: The Council encourages the Air Resources Board to facilitate offset supply by approving additional protocols, both for development of compliance offset protocols under section 95971 and for Early Action Offset Credits in section 95990(b). Considering the timeframe required for protocol approval, California Environmental Quality Act (CEQA) review, offset project development and verification, this process should begin immediately and be as streamlined as feasible in order to ensure that adequate offset supply is available at the start of the first compliance period in 2012. (BCFSE)

Response: In addition to the CAR protocols that we are recognizing in section 95990, new section 95990(c)(5)(E) is reserved in the modifications to the regulation for new additional early action project protocols. All offset protocols used in the compliance program must be adopted by the Board after undergoing a full regulatory process, including an ARB stakeholder process, in accordance with the Administrative Procedure Act. The protocol approval and public process convened by a voluntary program, such as CAR, cannot substitute for a stakeholder process conducted by ARB for rulemaking purposes.

ARB plans to evaluate additional protocols for approval in 2012. As we evaluate additional protocols, we will assess whether or not early action offset credits should be allowed from those project types. In approving additional protocols, ARB is looking at protocols developed by any third-party, including other voluntary and regulatory offset programs.

We do not agree that there will be insufficient offset supply in the first compliance period. We estimate that if every entity used their allowable eight percent offsets, approximately 26 million metric tons of offsets would be needed in the first compliance period. This reduced need is due to a start of the first compliance period in 2013 instead of 2012. At this time, based on the four offset protocols the Board has endorsed— manure digesters, forestry, urban forestry, and destruction of ozone depleting substances—ARB will be close to the supply demand for the first compliance period. We also will consideration additional Compliance Offset Protocols beginning in 2012.

M-163. Comment: Clarify the early action provisions. Section 95990(b) of the draft regulation suggests that no additional offset project types will be able to be added to the list of creditable early action offsets. This section should provide a mechanism for adding to the list of eligible early action offset project types and protocols to incentivize the development of early action offset projects now and the creation of early action offsets. VCSA recommends the recognition of project-based approaches to reducing emissions during a transitional phase that closely mirrors the early action stage of the program. This change would ensure an adequate supply of offsets for the program. (VCS)

Response: In addition to the CAR protocols that we are recognizing in section 95990, new section 95990(c)(5)(E) is reserved in the modifications to the regulation for new additional early action project protocols. All offset protocols used in the compliance program must be adopted by the Board after undergoing a full regulatory process, including an ARB stakeholder process, in accordance with the Administrative Procedure Act. ARB plans to evaluate additional protocols for approval in 2012. As we evaluate additional protocols, we will assess whether or not early action offset credits should be allowed from those project types. We will also assess whether other protocols for the four project types for which we have already approved early action protocols should be included in the early action offset program.

M-164. (multiple comments)
Comment: ARB should consider as early a start date as possible for qualifying offset projects, ideally in advance of when commitments for emissions reductions would begin. Emitters subject to compliance requirements who offset emissions voluntarily using protocols/methodologies already approved by ARB in anticipation of the start of compliance should be incentivized in a concrete fashion. (SUNONESOLUT)

Comment: For early action credits, we have a technology company that has LEED buildings and high energy efficiency equipment. They have built cogeneration. Now they are unsure whether they will get full credit under this regulation for what they've done and how it will affect their expansion plans in the future. (INDENVASSOC)

Response: The regulation includes rules to recognize early voluntary actions in section 95990. We are allowing early voluntary actions to be recognized for certain offset project types listed in section 95990(c)(5). The regulation stipulates that offset credits cannot be generated for activities that reduce emissions in capped sectors. The electricity sector is a capped sector under this program. If ARB were to also issue offset credits for those reductions, the reductions would be double-counted within the cap-and-trade program. Therefore, offset credits can only be issued for activities that are not capped.

Early Action Offset Project Eligibility

M-165. Comment: CARB should allow high quality offsets regardless of their vintage. CARB should recognize early action offsets generated prior to January 1, 2000. So long as the credits are real, additional, verifiable, unique and permanent, there is no reason to prevent the use of high-quality offsets generated prior to 2005. As drafted, the regulation would perversely penalize the earliest developers of offsets instead of rewarding them for pioneering cost-efficient and vitally important GHG reduction strategies. Exclusion of these high quality offsets also will reduce the overall volume of quality offsets available to the market, thereby hindering the overall effectiveness of the program. Rather than drawing a line at January 1, 2005, COPC recommends that CARB simply hold older offsets to the same standards of quality and verifiability as newer offsets. If, however, CARB concludes that a threshold date is necessary, it should move the date back to no later than January 1, 2001, to maintain consistency with recent federal cap and trade efforts. (COPC1)

Response: The regulation includes a process for accepting offset credits from qualified existing offset projects into the ARB compliance offsets program, to help create an initial supply of offset credits for the cap-and-trade program. We do not agree with the January 1, 2000, date proposed by the commenter because beginning in 2005, the Climate Action Reserve (CAR) and its predecessor, the California Climate Action Registry, began adopting voluntary GHG accounting protocols to encourage voluntary early action to reduce GHG emissions. To ensure the GHG reductions and GHG removal enhancements being used in the compliance program are real and additional, we chose to implement the January 1, 2005, date to correspond with the adoption of voluntary offset protocols as the eligible date for transition of early action offset credits to ARB offset credits.

M-166. Comment: The proposed regulation limits early-action compliance vintages to 2005-2014. The justification for the earliest vintage to be 2005 is that it is the first year Climate Action Reserve offset protocols were available for verification. This justification is arbitrary for the following reasons:

a. Although it was the first year the Climate Action Reserve protocols were available for verification, there is nothing in the ARB regulation which limits early-action criteria to Climate Action Reserve projects only. Another registry which may be approved by ARB may have had its first protocol available for registration in 2002 or 2004 or any of a number of dates;
b. While 2005 is the year in which the protocols were first available to be used for verifications, the Climate Action Reserve Protocols allow for projects to receive verified CRTs as far back as 2001; and
c. The early action criteria do not have a cut-off for early start dates. Therefore, a project may start in 2001 but its 2001-2004 vintages would not be considered compliance-grade while its 2005 vintages are. There is no scientific or policy reason that a 2004 vintage offset and a 2005 vintage offset from the same project do not constitute equal quality emissions reductions. Forest carbon projects in particular are adversely impacted by this provision. Forest carbon offset projects tend to have a significant number of offset credits issued in the first year of the project with annual offsets issued to a much lesser extent. If a project were to have a start date of 2001, the majority of the project offsets would come at that time. If 2001 vintages are excluded as compliance offsets, they will lose significant value in the market and make it difficult if not impossible for the project to pay for the 100+ year compliance costs let alone the opportunity cost for foregone harvest. Of the 46 forest carbon projects listed on the Climate Action Reserve, 18 have pre-2005 start dates. We recommend that ARB revise the early action vintage date to 2001 which corresponds to the signature of California Senate Bill No. 527 so that the justification is rooted in a California precedent and is not specific to an independent registry which may be one of many ultimately approved. (NISSENBAUM)

Response: In response to comment "a.": For projects developed under CAR protocols we believe that January 1, 2005, is the appropriate date to credit the early voluntary GHG reductions and GHG removal enhancements because it reflects the time frame in which the voluntary protocols were approved by CAR. If ARB decides to accept early action offset credits achieved under other protocols not developed by CAR, ARB will evaluate whether another date is appropriate for those credits and amend the regulation if necessary.

In response to comment “b.”: ARB cannot rely on the rules of a non-regulatory program or rely on such program to perform regulatory verification of offsets that will be used for compliance. AB 32 requires that all offset credits used for compliance be based on the result of regulatory verification.

In response to comment “c.”: For reasons mentioned in response to comment “a.” we believe that January 1, 2005, is the appropriate date to begin crediting voluntary reductions as compliance if they meet the requirements of section 95990. Pre-2005 vintages can still be sold in the voluntary market but may not be used for compliance.

M-167. Comment: Section 95973 states that for an offset project to be eligible under the ARB Forest Protocol it must have a project commencement date after 12/31/06. There are many projects registered with CAR, including our Garcia River Forest project, that have commencement dates prior to 12/31/06. As written, this provision suggests that while these projects will quality for early action under Subarticle 14, they will not be eligible for eventual registration (and a renewed crediting period) under the ARB Forest Protocol. It seems unlikely that this is what staff intends and it would likely discourage early action projects from participating in the compliance program. One way this can be corrected is to add the following italicized language to 95973(a)(2)(B) at page A-113: “(B) the Offset Project commencement date occurs after December31, 2006 or the Offset Project meets the requirements of section 95990(b).” (TCF)

Comment: There are numerous uses of the term "Commencement date in the protocol, all of which make sense if the Regulation is modified to recognize early action projects that meet ARB qualifications can have earlier commencement dates governed by the start date limitations as set forth in the ARB approved early action protocols. An example of this problem is: All ARB offset projects must have a "Commencement Date" of January 1, 2007 or later. This is a significant problem for early action CAR reforestation projects which were allowed to have "Start Dates" back to January 1, 2001. ARB should not be overly concerned about this Reforestation start date issue as this is the same commencement issue and these projects do not accrue significant offset credits during the four year period between 2001 and 2005 (the earliest early action offset credit that can qualify as a compliance grade offset under ARB). Also both CAR v 3.2 and the ARB protocol say that Reforestation projects can't receive credits until after the second verification which in almost all cases has not happened yet. (CAFORESTRYASSOC1, CFA)

Comment: After December 31, 2014, CAR projects must be re-verified and brought up to ARB protocol standards. There is an inconsistency with this requirement and Early Action Projects, especially around the limits on Commencement Date in the regulations which could prevent early action projects from being re-verified. (CAFORESTRYASSOC1, CFA)

> **Response:** We agree and added a new section 95973(c) that allows a commencement date prior to 2006 for early action offset projects that transition to Compliance Offset Protocols pursuant to section 95990(k).

M-168. Comment: The restriction in section 95990(b)(1) of early action credit to removals that occurred between January 1, 2005, and December 31, 2014, and the requirement in section 95973(a)(2)(B) that forest projects under the ARB compliance offset protocol begin after December 21, 2006, are arbitrary to the extent that such a policy fails to credit forest sequestration accomplished prior to 2005. The rationale provided by ARB —that 2005 is the date that "offset projects began verifying their GHG reductions... based on the protocols approved in this section" (ISOR at IX-171)—is insufficient and illogical for several reasons. First, the Climate Action Reserve ("CAR") forest protocol, upon which the ARB Forest Protocol is based, itself credits reductions from 2001. [See California Air Resource Board, Proposed Regulation to Implement the California Cap-and-Trade Program, Part V, Staff Report and Compliance Offset Protocol, U.S. Forest Projects, Preamble ("Forest Protocol") at five ("ARB used CAR's Forest Project Protocol Version 3.2 as the basis for transitioning to a compliance program").] Indeed, of the 46 forest carbon projects listed on CAR, 18 have pre-2005 start dates.

Second, numerous meritorious forest projects have been started under other protocols such as the American Carbon Registry ("ACR") and Voluntary Carbon Standard ("VCS") which credit reductions prior to 2005 (moreover, as discussed below, ARB's decision to credit only CAR protocols is itself arbitrary, unjustified and discriminatory).

Third, as ARB acknowledges, California Senate Bill 812 expressed the intent of the California legislature to promote and credit early action in forestry projects at least as early as 2003, and as early as 2001, Senate Bill 527 expanded the functions of the already-existing California Climate Action Registry to recognize emissions reductions stemming back to 1990. Similarly, ARB's statement that forest projects must switch to ARB protocols by December 31, 2014, a date which corresponds to the end of the first market compliance period, ISOR IX-171, fails to discuss the penalty imposed on early action forest projects commenced prior to that date.

Further, as a matter of environmental policy and review, ARB has failed to consider that disqualifying early-mover projects will likely result in the abandonment of those projects, thus not only increasing greenhouse gas emissions but also losing the other societal benefits provided by forest conservation projects, such as habitat and watershed protection. Although ARB recognizes its duty under AB 32 to consider "overall societal benefits, including reductions in other air pollutants...and other benefits to the economy, environment and public health," ISOR at II-51 (citing Health & Safety Code 38562(b)(6)), the Agency has failed to justify why its arbitrary date restriction is defensible in light of AB 32's mandate or why an earlier start date is not an acceptable alternative. (FCC, BLUESOURCE)

Response: We disagree that we have not met the requirements of AB 32 in regard to recognizing early actions as appropriate. The regulation includes a process for accepting offset credits from qualified existing offset projects into the ARB compliance offsets program. This not only recognizes and rewards these actions, it also helps create an initial supply of offset credits for the cap-and-trade program. We do not agree with accepting offsets from projects before 2005 because beginning in 2005, the Climate Action Reserve (CAR) and its predecessor, the California Climate Action Registry, began adopting voluntary GHG accounting protocols to encourage voluntary early action to reduce GHG emissions. To ensure the GHG reductions and GHG removal enhancements being used in the compliance program are real and additional, we chose to implement the January 1, 2005, date to correspond with the adoption of voluntary offset protocols as the eligible date for transition of early action offset credits to ARB offset credits.

That said, early action offset projects that began prior to 2005 are still allowed to come into the compliance program and receive early action offset credits for reductions that they achieve between 2005 and 2014. To clarify this point we added a new section, 95973(c), that allows a commencement date prior to 2006 for early action offset projects that transition to Compliance Offset Protocols pursuant to section 95990(k). Any reductions achieved before 2005 may still be traded and sold in the voluntary market but will not be recognized by ARB or allowed to be used for compliance.

In response to the commenter's second point, for projects developed under CAR protocols, we believe that January 1, 2005, is the appropriate date to credit the early voluntary GHG reductions and GHG removal enhancements because it reflects the time frame in which the voluntary protocols were approved by CAR. If ARB decides to accept early action offset credits achieved under other protocols not developed by CAR, ARB will evaluate whether another date is appropriate for those credits and amend the regulation if necessary.

In response to the commenter's third point, we added new section 95990(k) to clarify how early action offset projects transition to Compliance Offset Protocols. New section 95990(k)(2) clarifies that once an early action offset project transitions to a Compliance Offset Protocol it will begin an initial crediting period. The crediting period under the early action offset program does not count under the compliance offset program, so the early action offset project may transition any time before February 28, 2015, but must list or register with an Early Action Offset Program by January 1, 2014, (section 95990(c)(3)) to get early action offset credits. This provides a seamless transition process for early action offset projects and guarantees them a new crediting period. It is necessary for offset projects beginning February 28, 2015, to transition to Compliance Offset

Protocols to ensure consistency in the program. It is also necessary that all offset projects are following the rules of the regulation, including the rules in the Compliance Offset Protocols. We believe that this process will incentivize early action offset projects to transition to Compliance Offset Protocols, and that it will not penalize them.

M-169. (multiple comments)
Comment: The draft regulation proposes that ARB accept Early Action offset credits from three sets of CAR protocols that allow projects with startup dates as early as January 1, 2001, and even earlier in the case of some forestry projects. In doing so, ARB relies on CAR's assessment of additionality in the context of their protocol development work. However, CAR's definition and application of additionality has changed over time, especially with respect to forestry projects; consequently, the additionality standard applied to these early action projects is internally inconsistent and generally inconsistent with ARB's stated aims, as explained below.

According to the proposed ARB regulatory language, a project is additional if we cannot reasonably expect it to have occurred without financial incentives provided by carbon credits. By contrast, according to CAR's protocol for Conservation Based Forest Management version 2.1, a project is additional if it can demonstrate that the project's carbon sequestration activities exceed the project baseline sequestration projection (which is generally defined as management per the Forest Practices Act and could be set backwards as early as 1990), without reference to commencement date, financial requirements or incentives. Later versions of the CAR protocols establish a "no earlier than" date of January 1, 2001 in line with the creation of the California Climate Action Registry that same year. However, no other filters are applied to ascertain whether projects with historic start dates were in fact influenced by carbon revenue. In Fall 2009, CAR's Board of Directors recognized that the January 2001 start date criterion was problematic: "Although the creation of CCAR may have signaled the prospects for participating in a carbon market in 2001, the notion that a developer might have started a truly "additional" project at that time and then waited for nearly nine years to apply for formal registration with the Reserve is increasingly difficult to accept." The Board addressed this concern by adopting new rules and imposing supplementary additionality screens, but these were not applied retroactively to projects already listed. Based on TerraPass detailed factual assessments of a great many offset projects commenced in the first half of this decade, we believe a disproportionate share of these early projects were developed with no reference to or influence from the prospect of carbon revenue, even if speculative or distant. We comprehend that there are countervailing policy aims that may contribute to a decision to set aside the regulation's additionality rules for these early action projects. First, it may be appropriate to provide special consideration for project owners who acted early and purposefully to mitigate climate change impacts even if they did not anticipate a financial benefit for doing so. Second, ARB may be concerned about launching a new cap and trade system without the full complement of economic controls which a well-supplied offset market would provide. Regarding special consideration, we hasten to point out the voluntary offset marketplace has been in place and active in the US for half-a-dozen years. Early actors have had the opportunity for financial reward throughout this period thanks to early protocol development by the California Climate Action Registry, the Chicago Climate Exchange, and others. We believe it is reasonable to ask whether any further special consideration, as applied to non-additional projects in a regulatory context, is an appropriate public policy goal for the State of California. That said, we believe that appropriate recognition can be given to early actors and sufficient supply achieved without sacrificing the emissions cap. Offsets' primary purpose in the proposed cap and trade system is to enable regulated emitters to achieve the required emission reductions at a lower overall cost than would be possible if they were limited to reductions achievable within the regulated community itself.

To the extent that a well-supplied marketplace can be achieved with real, additional emission reductions, the program's goals will be well-served. TerraPass recommends that a simple additionality screen be required of all projects with commencement dates earlier than January 1, 2007, in order to better distinguish those which are additional from those which are not. Specifically, we recommend that ARB limit the maximum allowable length of time between: 1) a project's commencement date (generally, this is the online date or the start of the emission reduction/sequestration activity); and 2) the date upon which the project owner committed the project (in writing) to a carbon registry. Note, we are referring to a commitment to any carbon registry; though the Early Action credits will only come from one registry such as CAR, the project's initial commitment may have occurred many years earlier on a different registry.

In our experience, early project owners who were influenced by carbon revenue and/or by the pressing need to mitigate climate change are the very same early actors who pioneered the Chicago Climate Exchange and the California Climate Action Registry. Furthermore, these same people acted quickly and diligently to quantify and verify their activities so as to prove the promise of this new mitigation possibility. Also, simple logic and common sense dictates that if a project would not have occurred but for carbon revenue, that the project owner would seek out such revenue within a reasonably short timeframe. This simple logic has proved powerful enough that many carbon standards now impose registration time limits on both historic and new projects as an additionality test. Indeed, a "time limit screen" is precisely the technique adopted by the Climate Action Reserve Board in 2009 when it changed its eligibility rules so as to assure project additionality. Similarly, the Voluntary Carbon Standards Association imposes a maximum time limit between project startup and third-party Validation – and has done, since 2007. ARB is fortunate to be able to take best practices from the experiences of voluntary registries. In this case, these time limit screens are a widely used and agreed-upon best practice. To forego this practice would be to take a significant and unnecessary step backward. The time bounds of this screening tool (its endpoints) can be set using any number of dates in a project's lifecycle. The endpoints we recommend above are easily verifiable, and similar to endpoints used by CAR today. It's important to remember, though, that for early projects these dates will be a reflection of both the intentions of the project owners, and the practical availability of a registry to engage with. Neither the California Climate Action Registry nor the Chicago Climate Exchange, were available generally before 2004. For this reason, we recommend that the maximum time limit chosen for this screen be longer than that used by CAR and the VCS. While these two bodies use 24-month limits; we recommend a three-year limit for application to these Early Action projects. We have applied this screen to many CAR projects for which we have done substantial supplemental, project-specific research, and believe it's extremely effective and produces very few errors. Additional projects pass the screen. Non-additional projects do not. (TPI1)

Comment: Section 95973(a)(2)(B) limits ARB-issued offset credits to projects with a commencement date later than December 31, 2006. The Initial Statement of Reasons notes that this date is consistent with AB 32's passage, and projects allowed as a result are more likely to have been inspired by California's global warming legislation. However, the regulation's definitions of "additionality" and "business-as-usual" specify that the project should not have occurred but for the possibility of carbon revenue, not that such carbon revenue must have been a result of California's actions. Indeed, such a definition would limit potential offset projects to a very small pool as the revenue from California markets is still uncertain and until about a month ago was assumed to be zero due to various legal and political threats. We agree that a timing test should be applied to offset projects to assure additionality, but consistent with the stated definitions of additionality and business-as-usual, we recommend that this test take the form of a time limit instead of a cut-off date. A time limit test examines the length of time between the project's commencement and its commitment to a carbon revenue regime. Most voluntary registries use this type of test. It has the distinct advantage of always being "current," which is to say, it provides a moving time window instead of a fixed date in time that quickly become ineffective as an additionality screen as years go by. Our earlier comments on the Early Action Projects describe how this type of test works, and makes a specific recommendation for the test language. We echo those recommendations here, and suggest that this test is a superior means of assuring additionality for all projects over time than imposing an arbitrary cut-off date. (TPI2)

> **Response:** We disagree that a timing test is needed for early action offset projects. At the time of initial crediting in the voluntary program, the early action projects had to meet the additionality requirements of the voluntary offset protocol and the early action program. Once an early action offset project transitions to ARB, it must meet the additionality requirements of the Compliance Offset Protocol and regulation. We believe the early action credits that would be eligible to be issued ARB offset credit for the early action protocols are additional.
>
> In addition, we added a requirement that Offset Project Operators or Authorized Project Designees must submit their first Offset Project Data Reports within 24 months of listing their offset project (section 95976(d)), to further address these concerns.

M-170. (multiple comments)
Comment: The regulation neglects to require that projects coming from third party programs be additional. This is simply a mistake. And we hope it can be corrected in the 15-day comments. The most immediate effect of this error is that the large volume

of non-additional projects will be welcomed into the program as part of the early action provisions. This can be easily corrected. We know that there is a lot of pressure to put more offset supply into the program, especially in the early years. We agree that a fully supplied program is a good thing. However, you can do this without compromising the cap by allowing non-additional offsets into the program. This can be our accomplished with two small additions to the regulation. The first is to apply an additionally screen, which is already used by most voluntary offset programs today to early action projects. And the second is to allow additional protocols, which I know you're planning to do. In particular, we support the landfill methane protocol. That is one of the most effective offset protocols available. (TPI4)

Comment: Subarticle 14 fails to require fundamental tenets of quality for offset credits: real, additional, quantifiable, permanent, verifiable and enforceable. This oversight should be corrected. Please see our earlier comments regarding a timing test for additionality, including a test applied to all projects which commenced prior to 1/1/2007 if not all projects without exception. (TPI2)

> **Response:** We disagree that that the early action offset projects are not additional. At the time of initial crediting in the voluntary program, the early action projects had to meet the additionality requirements of the voluntary offset protocol and the early action program. Once an early action offset project transitions to ARB, it must meet the additionality requirements of the Compliance Offset Protocol and regulation. We believe the early action credits that would be eligible to be issued ARB offset credit for the early action protocols are additional.

Early Action Offset Project Transition

M-171. Comment: Early action projects should have the option to transition to compliance offset projects in the short-term and at the conclusion of the Early Action crediting period in 2014. Section 95975(g) of the cap and trade regulation implies that a project cannot seek a renewed crediting period earlier than 18 months prior to the expiration of the crediting period. We recommend that early action projects be permitted to transition into compliance projects as soon as possible. When transitioning early action CRTs to compliance credits, one consolidated verification should suffice for all previous vintage years. For future vintages, ARB and CAR verification requirements should be coordinated to only require one verification. (PFT1, PFT2)

> **Response:** We agree that early action projects should have the option to transition to compliance offset projects, and we made several modifications to the regulation to facilitate this process while still ensuring the integrity of the offsets. New section 95990(k) was added to clarify how early action offset projects transition to Compliance Offset Protocols. New section 95990(k)(2) clarifies that once an early action offset project transitions to a Compliance Offset Protocol it will begin an initial crediting period.

We modified section 95990(f) to streamline the regulatory verification process for early action offset credits. Any verifications conducted under a voluntary program, such as CAR, cannot be substituted for the regulatory verification of reductions used for compliance.

M-172. Comment: The requirement in section 95990(b)(3) that early action forest projects be commenced before 2012 and the restriction in section 95990(b)(1) denying credit for reductions achieved after December 31, 2014, artificially limit the crediting period of early action forest projects and fail to provide early action credit for legitimate reductions. Most early action forest projects were commenced on the expectation that they would receive credit for greenhouse gas removals through the end of an established crediting period (typically 30 years) under the eligibility rules applicable at that time. ARB's proposed cut-off in 2014 would make sense only if ARB provided a procedure to transition existing projects verified under early-action protocols (such as the CAR protocol as well as ACR and VCS) to an ARB protocol without significant additional cost and without changing the eligibility rules under which the forest project was started, since the financial value (and economic viability) of early action projects depends on the crediting period and eligibility rules under which the project was commenced.

ARB has not yet provided a procedure for such a transition, and without such a procedure, the value given to early action forest projects would be severely diminished since most forest projects do not generate significant carbon reductions until up to ten years into the project and would have relatively little carbon credit accumulated by 2014 despite significant financial investment. Moreover, such a policy would perversely disincentivize projects using hardwood species, which deliver comparatively more co-benefits due to the longer maturation of those carbon stocks. In short, any cut-off deadlines for early action must be linked to the availability of a procedure for transitioning existing early action projects to the ARB Forest Protocol. And, as discussed below, such transition rules cannot impose significant new costs or change eligibility criteria in a manner that would undermine the early action nature of the project as a practical matter. Any contrary rule would be inconsistent with AB 32 and has not been justified either under the APA or CEQA. (FCC, BLUESOURCE)

Response: New section 95990(k) was added to clarify how early action offset projects transition to Compliance Offset Protocols. New section 95990(k)(2) clarifies that once an early action offset project transitions to a Compliance Offset Protocol it will begin an initial crediting period. The crediting period under the early action offset program does not count under the compliance offset program, so the early action offset project may transition to a Compliance Offset Protocol any time before February 28, 2015, but must list or register with an Early Action Offset Program by January 1, 2014 (section 95990(c)(3)). We removed any requirements that restrict the earliest date that early action offset projects must transition to Compliance Offset Protocols. It is necessary for offset projects beginning February 28, 2015, to transition to Compliance Offset Protocols to ensure consistency in the program and that all offset projects are following the rules of the regulation, including the rules in the Compliance Offset Protocols.

M-173. (multiple comments)
Comment: The requirement for an ARB Compliance Offset Project to begin after December 21, 2006 is concerning because it limits early action projects to a single 10-year crediting period. As currently written, after 2014 any project which meets all the criteria to be an early action project will not be able to convert to the ARB Compliance Offset Protocol. This is especially problematic for reforestation projects which do not produce significant offsets until after the first decade of the project. Any sequestration project is unlikely to be economical if it receives only 9 or 10 years of ARB-compliant early action offsets and is then unable convert to the ARB Protocol while still having at least another 110 years of inventory, verification, and monitoring costs ahead of it and no revenue to offset these costs against. Of the 46 forest carbon projects listed on the Climate Action Reserve, 18 have pre-2005 start dates. We recommend that any project which qualifies as early action per section 95990 and also meets the ARB Compliance Offset Protocol U.S. Forest Projects can convert to the Compliance Offset Protocol on or before December 31, 2014. (NISSENBAUM)

Comment: CERP strongly encourages ARB to give projects registered through the early action pathway a full crediting period during which they will be eligible to earn credits and be approved as ARB credits. Specifically, such projects should be eligible to generate offset credits for the duration of their approved crediting period and should be "shielded" against changes of rules or methodologies during the period. Under such an approach, the regulations could provide that a qualifying early action project could have a crediting period that starts no later than January 1, 2014. Without such crediting periods, the early action pathway will not be financially viable and projects will be forced to wait for the ARB offsets program to be fully functional or for a registry to be approved (along with verifiers) before the project can be registered and begin generating emission reductions and offset credits. Apart from the relatively small quantity of emission reductions available through already ongoing projects, the early action program will generate very few additional emission reductions if there is not a full crediting period. There will be a "gap" in offset supply, as project developers and owners wait for the ARB offset program to become operational. (CERP1)

Comment: Early Action projects should be given a full crediting period: Equator supports ARB's plan to bring credits into the program for early action from projects using four CAR project protocols for vintages 2005-2014. This is an important step towards securing adequate supply of offsets for this program. It is essential, however, to ensure that existing and new projects can count on certainty of long term eligibility under ARB. To this end, we strongly encourage ARB to allow projects to have a full crediting period under the protocol and registry that they were originally registered under. (EQUATOR)

> **Response:** New section 95990(k) was added to clarify how early action offset projects transition to Compliance Offset Protocols. New section 95990(k)(2)

clarifies that once an early action offset project transitions to a Compliance Offset Protocol it will begin an initial crediting period. This provides a seamless transition process for early action offset projects and guarantees them a new crediting period.

M-174. Comment: Section 95975(g) states that a project cannot seek a renewed crediting period earlier than 18 months prior to the expiration of its initial crediting period. (See also 95980(c)). Assuming that early action projects are eligible to re-verify under the ARB Forest Protocol, than it appears that early action offset projects will have to wait until June 2013 to do so. We would prefer to register our early action projects under the ARB Forest Protocol sooner than June 2013. More generally, it would seem to be in ARB's interest to allow projects to re-verify under a new protocol at any time rather than only upon expiration of its prior crediting period (on the theory that more projects will be using the most current, and presumably the best, quantification methodology). Section 95990(c) sets out criteria that an offset project registry must meet to issue early action offsets. One of the criteria is that the registry has the capability to track prices (section 95990(c)(2)(C)). CAR currently does not have that capability. If CAR is not eligible to issue early action offsets then there likely won't be any. We are not opposed to price disclosure and tracking per se, but we urge ARB to reconsider this requirement if it will result in disqualifying early action projects from issuing offset credits under Subarticle 14. (TCF)

Response: The rules for early action offset projects are different from offset projects that are developed initially under Compliance Offset Protocols. Early action offset projects must meet the requirements of section 95990 until they transition to Compliance Offset Protocols.

New section 95990(k) was added to clarify how early action offset projects transition to Compliance Offset Protocols. New section 95990(k)(2) clarifies that once an early action offset project transitions to a Compliance Offset Protocol it will begin an initial crediting period. The crediting period under the early action offset program does not count under the compliance offset program, so the early action offset project may transition any time before February 28, 2015, but must list or register with an Early Action Offset Program by January 1, 2014, (section 95990(c)(3)) to get early action offset credits. This provides a seamless transition process for early action offset projects and guarantees them a new crediting period. It is necessary for offset projects beginning after February 28, 2015, to transition to Compliance Offset Protocols to ensure consistency in the program and that all offset projects are following the rules of the regulation, including the rules in the Compliance Offset Protocols.

We also removed the requirement that the Early Action Offset Program must have the ability to track prices to address stakeholder concerns.

M-175. Comment: Re-registration of early action projects with ARB. As currently constructed, projects which commenced after December 31, 2006, but before January

1, 2012, have several choices: they may use CAR protocols and processes to receive credits, subject to regulatory verification on top of CAR verification; they may register with ARB instead; or they may switch from CAR to ARB at some point in the next two years.

Several questions arise for these cases:

- If a project chooses to register directly with ARB and forego any CAR processes, how will ARB handle credits which are created prior to finalized processes for listing, verification, and issuance? For example, if a project commenced in 2009 and ARB's registry is not available until the end of 2011, what are the implications for the 2009 and 2010 credits? Are they unavailable because ARB requires annual verifications?

- If a project chooses to switch its registration to ARB from CAR, does its crediting period re-set at that time, and if so does that re-set count as one of its allowable renewals?

A guidance document or other process guide which clarifies these issues is needed. (TPI2)

Response: The regulation allows offset projects to come into the program directly under Compliance Offset Protocols instead of first registering with CAR and using CAR voluntary offset protocols and then transitioning over to ARB's protocols. ARB has provided a role for Offset Project Registries (OPR) to perform some of the administrative functions of the offset process in the regulation. ARB plans to utilize OPRs in lieu of performing these duties itself in the short-term, and may choose to continue this throughout the program. ARB has not yet determined if and when it would itself perform these roles. Therefore, in the meantime all parties seeking to use Compliance Offset Protocols must go directly to an OPR to list their projects. ARB plans to approve OPRs sometime in 2012. Even if a project commences prior to the date when ARB approves OPRs it can begin collecting monitoring and reporting data from their project and submit them to an OPR. ARB will allow ARB offset credits to be issued retroactively as long as the operator can submit Offset Project Data Reports for the prior years that meet the requirements and the data are verified according to the regulation for those years.

We added language in section 95990(k)(2) to clarify that all early action offset projects which transition to a Compliance Offset Protocol will begin a new crediting period. This provision was included to provide clarity for stakeholders on the length of eligibility for transitioned offset projects. The new crediting period will count as the initial crediting period for the offset project. A non-sequestration offset project may then renew for two more crediting periods. A sequestration offset project has unlimited renewals.

M-176. Comment: CARB has indicated that it will only accept vintages from 2005-2014 as eligible early action credits. This artificially limits the crediting period of early action offset projects and hampers investment. Numerous offset projects were started with the expectation of an already established crediting period that extends beyond 2014. For example, most early action forestry projects were commenced on the expectation that they would receive credit for greenhouse gas removals through the end of an established crediting period (typically 30 years). CARB's cut off only makes sense if there is a clear procedure to transition projects from other program standards to CARB standards without significant additional cost and without changing the eligibility rules under which the project was originally registered. CARB has not yet provided any guidance on such a procedure, and needs to do so in order to encourage early investment in offset projects. Developers need certainty that their credits will seamlessly transfer from current existing protocols to the future CARB program in order to invest time and money. (CE2CP)

> **Response:** New section 95990(k) was added to clarify how early action offset projects transition to Compliance Offset Protocols. New section 95990(k)(2) clarifies that once an early action offset project transitions to a Compliance Offset Protocol it will begin an initial crediting period. The crediting period under the early action offset program does not count under the compliance offset program, so the early action offset project may transition any time before February 28, 2015, but must list or register with an Early Action Offset Program by January 1, 2014, (section 95990(c)(3)) to get early action offset credits. Once the project transitions, it is guaranteed a full initial crediting period, and, in the case of forest projects, is not subject to any renewal requirements.
>
> Further, section 95990(k) of the regulation requires projects developed under CAR's forest protocol version 2.1 to recalculate their baseline based on ARB's Compliance Offset Protocol. This provision is necessary to ensure consistency across all forest projects in the compliance program. Early action offset projects developed under the other protocols mentioned in section 95990(c)(5) must transition to the appropriate Compliance Offset Protocol but do not need to change their baselines.

M-177. Comment: Requirements for approval of third-party offset programs should include a requirement to relinquish any reversal liability requirements over third-party offsets approved by ARB for compliance use. Offset sellers that transfer early action credits into the compliance system will need a clear indication of which program they have a liability towards in the event of a reversal. If an approved third-party offset program still tracks offset transactions after the approval by ARB of credits pursuant to section 95990(d), it is unclear from the proposed regulation as drafted whether a landowner would (for example) still be subject to the requirements of the Project Implementation Agreement required by the Climate Action Reserve, and would therefore legally face a double liability in favor of both CAR and ARB in the event of a reversal. We would suggest that ARB add a requirement to section 95990(c) that offset programs relinquish any contractual right to require an action of the forest owner in the event of a forest carbon reversal that affects tonnes approved by ARB for use in the compliance system. (SHILLINGLAW1)

> **Response:** We added a requirement in section 95990(i)(1)(D)(1.) that the Early Action Offset Program transfer all offsets that reside in their buffer account for forestry to ARB, so that ARB may ensure permanence of any offset project in the ARB compliance program. Once the early action offset credits are verified pursuant to section 95990(f) and meet the requirements for early action, ARB will issue ARB offset credits to replace the early action offset credits, and the Early Action Offset Program must permanently remove them from their registry system. This clarifies that ARB has full control over the offset credits that are issued, even for early action purposes, and the Forest Buffer Account. These additional requirements should alleviate concerns that the Forest Owner must replace reversed tons in both programs.

M-178. Comment: ARB must evaluate the additionality of forest projects implemented as early actions. Forest projects registered under earlier versions of the Climate Action Reserve's Forest Project Protocol (version 2) were allowed to define the baseline as essentially the regulatory minimum for the project area. That is, under the previous versions of the protocol, the baseline was even more vulnerable than it is now to manipulation that would allow forest landowners to obtain carbon credit for forest growth that would have occurred under a business-as-usual scenario. If the credits from such projects are to be adopted for use in the Cap and Trade program, those forest projects must be evaluated for additionality. Without performing this evaluation, ARB risks adopting non-additional credits into the compliance program. (CBD1)

> **Response:** To ensure additionality and consistency within the program, ARB is requiring in section 95990(k)(1)(D) that forest projects developed under version 2.1 of the protocol recalculate their baselines based on ARB's Compliance Offset Protocol when they transfer in to the compliance program. This will ensure that any GHG removal enhancements achieved by these projects are additional and meet the AB 32 requirements.

Transitioning Early Action Offset Credits to ARB Offset Credits

M-179. Comment: Evolution Markets believes that the ARB should define in Q1 2011 an administratively simple and non-onerous process for certification of Early Action Credits for compliance. As the market evolves, project developers sell credits to manage risk and generate cash flow. These offsets in many cases have been bought and sold several times since the primary transaction. Therefore, for most projects that have produced eligible CRTs for Early Action Crediting, the CRTs are dispersed in throughout the market amongst many owners. (EVMKTS)

> **Response:** We made modifications to section 95990 to streamline the process for transitioning early action offset credits into ARB offset credits that can be used for compliance. This includes allowing holders/current owners of early

action offset credits to transition them into the compliance program if the project developers do not do so.

M-180. Comment: In the Proposed Regulation Order (Appendix A), under Registration of (Early) Offset Credits by Third Parties, (section 95990), we suggest that there be a provision added so that ARB can make adjustments as needed to the credits that have been issued by an approved third-party offset program. For example, the proposed ODS protocol uses GWPs for HFCs from IPCC's Second Assessment Report, which are slightly different from those used in the CAR protocol. To ensure internal consistency, ARB will need to re-calculate CRTs previously issued by CAR which have not yet been retired and which qualify under the AB 32 protocol. (EOSC1, EOSC2)

> **Response:** The regulatory verification and issuance of early action credits will be based on the version of the protocol that was initially used in the Early Action Offset Program. ARB will not recalculate the number of credits generated based on ARB's Compliance Offset Protocol. However, once the offset project transitions to ARB's Compliance Offset Protocol, it will be issued ARB offset credits based on the calculations in that protocol.

M-181. Comment: Evolution Markets recommends the following: Establish Streamlined Accreditation Process for Verifiers: The first step in ensuring the market's confidence in Early Action Credits is establishing an ARB accreditation program for verifiers. The sooner Early Action Credit owners can re-verify eligible CRTs to ARB-compliance grade, the sooner liquidity and trading will increase in California. Keeping in mind that credits from offset projects can be owned by several entities, the unifying element in an offset project is often the original project verifier. Therefore, Evolution Markets recommends ARB accredit existing CAR-accredited verifiers for offsets in Q12011 so that CRTs can be re-verified to be fully compliance grade. This will allow a seamless and efficient transition from Early Action to ARB certification. (EVMKTS)

> **Response:** The verifier and verification body accreditation program established in the MRR for purposes of emissions reporting has been expanded to include the accreditation of verifiers and verification bodies for offsets. Expanding the accreditation program will involve project type or protocol-specific training for verifiers. ARB anticipates that many of the verifiers currently active at CAR will apply to be accredited under ARB's regulatory verification program.

Regulatory Verification of Early Action Offset Credits

M-182. Comment: The requirement in section 95990(b)(2) that early action forest projects be verified pursuant to section 95990(f) (which requires verification by ARB-accredited verification bodies) is ambiguous, and to the extent interpreted to require re-verification of projects, is unreasonably onerous and imposes an additional expense that has not been justified in the Initial Statement of Reasons. The inherent nature of early action is that well-meaning actors are "out ahead" of regulatory agencies in terms of solving environmental challenges. Many beneficial forest projects were started well

before ARB had itself acted on its mandate in AB 32 to issue rules and regulations. These early projects were verified under programs such as CAR, ACR and VCS, that are legitimate and widely recognized sources of early reductions. Each of these programs requires strict verification and conflict-of-interest procedures.
It is unclear whether ARB is requiring early action projects to re-verify all aspects of its project in order to transition to the ARB Forest Protocol or whether ARB will allow a more sensible approach of conducting a "gap analysis" by ARB staff or accredited verifiers to ensure that the verification under the previous program was consistent with ARB's verification process. In fact, it is highly likely that most of the verifiers that are currently accredited by other programs such as CAR, VCS and ACR are already, or will quickly be, approved under the ARB accreditation program. It would be unreasonable for ARB to retroactively require forest projects to incur additional expense, which in many cases may undermine the economic viability of the projects, or to duplicate auditing functions already done and approved by third-party auditors under strict criteria recognized in the market as rigorous. The ISOR correctly identifies "rigor and validity of offset credits" as the goal of the verification requirements, ISOR at II-45, but ARB provides no justification for the apparent burden of requiring re-verification of projects that have already been approved under early action protocols. ARB acknowledges that it has a duty under AB 32 to "minimize the cost of implementation and compliance and to maximize the overall benefits" of AB 32, ISOR at II-50, but fails to discuss these requirements in the context of early action projects. (Footnote: Health & Safety Code 38562(b)(5) directs ARB to "consider the cost-effectiveness" of its market rules. Similarly Health & Safety Code 38562(b)(7) requires ARB to "minimize the administrative burden" of its market rules).

If ARB does intend to require full re-verification, the additional expense and unintended consequences will thwart the goals of AB 32 by unnecessarily increasing the cost of greenhouse gas reductions. For example, it is unclear whether transitioning to the ARB protocol for already existing projects will require re-calculating the project baseline, resulting, in some cases in different crediting results, which could raise questions about validity of past credits sold from those projects. In other cases, recalculating the baseline could make projects suddenly ineligible, or unable to generate credits; for example, if they have signed a conservation easement, HCP or SHA since their original project registration. In short, early action projects should be grandfathered into the protocol under which they were initially registered.

The ISOR does not discuss the reasons for requiring re-verification, nor is there any indication that the ARB accreditation program is any more stringent, or produces a higher level of integrity, than the verification processes already in place for existing early action projects. Accordingly, rather than re-verification, we suggest that ARB accept forest projects that have been validated and verified under early action protocols (including CAR, ACR and VCS) to transition to the ARB Forest Protocol without further verification, or at the most, undertake a gap analysis to minimize any verification that is demonstrated to be necessary based on established auditing principles. (FCC, BLUESOURCE)

Response: The requirements for regulatory verification must be met to ensure that the early action offset credits meet the requirements in AB 32 that all offsets must undergo regulatory verification. ARB cannot rely on a non-regulatory program to perform regulatory verification of offsets that will be used for compliance, and AB 32 requires that all offset credits used for compliance be based on the result of regulatory verification.

Section 95990(f) was modified to clarify the requirements for regulatory verification of early action offset projects. New section 95990(f)(1) includes new requirements that the verifier performing the regulatory verification services must be different than the one that did the initial verification for the Early Action Offset Program. This ensures that the review is completely independent and unbiased. The new requirements include a desk review of each Offset Project Data Report (new section 95990(f)(3)) by an ARB accredited verification body based on all original early action offset project documentation. This provision was added in response to stakeholder comments to streamline the requirements for regulatory verification. Instead of issuing another verification statement, the ARB verifier must make an attestation to ARB regarding their findings from the desk review. The desk review by an independent body that is accredited by ARB is sufficient to determine if the information originally submitted regarding the offset project is complete and accurate. Therefore, the regulation does not require a site visit unless the ARB accredited verifier cannot find with reasonable assurance that the Offset Project Data Report should have been issued a positive verification statement under the Early Action Offset Program.

The regulatory verification and transition of early action offset credits to the compliance program is a voluntary step. ARB has established rules in the regulation for those who would like to participate in early action offset program. Section 95990(k) of the regulation requires projects developed under CAR's forest protocol version 2.1 to recalculate their baseline based on ARB's Compliance Offset Protocol. This provision is necessary to ensure consistency across all forest projects in the compliance program. Early action offset projects developed under the other protocols mentioned in section 95990(c)(5) must transition to the appropriate Compliance Offset Protocol but do not need to change their baselines.

M-183. (multiple comments)
Comment: There are two challenges with the re-verification requirements in section 95990 (f): (1) How to reconcile any differences found during a re-verification. For example, if the Climate Action Reserve's verification generated 100,000 metric tons, but ARB's verification only yielded 90,000 metric tons, some of the offset credits created by the Reserve would not be valid. Multiple parties now own these credits and some may have been retired; reconciling this difference will be extremely challenging; and (2) Requiring the re-verification of these projects will result in higher costs to the project, which will discourage projects from entering the compliance market and further restrict offset supply. PG&E recommends that either ARB rely on the original verification for

these projects or allow existing offset credits to be used while making the necessary changes to the project for future vintages. (PGE1)

Comment: CERP urges ARB to include regulations clarifying how any recalculation of credits resulting from a re-verification—whether an increase or decrease—will be assessed against the current holders of the credits. It is the Coalition's view that the first step should be to determine what quantity of credits from the project have been voluntarily retired. If the number of voluntarily retired credits exceeds the number of "extra" credits issued, then no action need be taken. The voluntarily retired credits will "cancel out" the excess issuance, and ensure that the AB 32 offset program is whole. If the number of "extra" offset credits exceeds the number of credits voluntarily retired from a project, CERP believes the most equitable and efficient means of addressing the "balance" of extra credits is to apply a recalculation pro rata. For example, if re-verification of a CAR-approved project resulted in a 10 percent decrease in vintage year 2009 CRTs for that project, and zero credits had been voluntarily retired from that project, ARB would allow all holders of vintage year 2009 CRTs from that project to exchange their credits for compliance credits at no greater than a 100:90 ratio. (If, however, 10 percent or more of the credits from the project had been voluntarily retired, no recalculation would be needed). (CERP1)

> **Response:** The commenter's interpretation of how the regulatory verification will be conducted is incorrect. ARB will issue ARB offset credits on a one-to-one basis for each early action offset credit if the ARB accredited verifier determines with reasonable assurance that the original Offset Project Data Report should have been issued a positive verification statement. ARB will not recalculate the number of GHG reductions or GHG removal enhancements achieved by the early action offset project.
>
> In addition, we modified section 95990(f) to clarify the requirements for regulatory verification of early action offset projects. New section 95990(f) includes new requirements for regulatory verification that is intended to streamline the process and minimize costs associated with converting the voluntary offsets into compliance offsets that can be used for compliance.

M-184. Comment: CERP urges ARB to adopt a more streamlined approach to early action credit re-verification. At the outset, CERP recommends ARB re-consider whether re-verification of projects is necessary given that all CAR projects have been verified by CAR-accredited verifiers. (CERP1)

> **Response:** We modified section 95990(f) to clarify the requirements for regulatory verification of early action offset projects. New section 95990(f) includes new requirements for regulatory verification that is intended to streamline the process and minimize costs associated with converting the voluntary offsets into compliance offsets that can be used for compliance.

AB 32 requires all offset credits used for compliance purposes to be subject to regulatory verification. ARB cannot rely on a non-regulatory program to perform regulatory verification of offsets that will be used for compliance, and AB 32 requires that all offset credits used for compliance be based on the result of regulatory verification.

M-185. Comment: As currently proposed, the re-verification process is unwieldy; for example, offset credits from a single project's historic vintages are now likely to be owned by many unrelated parties who therefore separately bear the responsibility of reverification. This situation is likely to result in a great deal of duplicate and wasted effort. Similarly, operating projects have ongoing verifier site visits associated with current-vintage verifications. Can these visits, indeed the entire verifications, be combined with current CAR verifications so as to prevent site visits which are duplicative and hence add no value to the regulatory level of assurance? Can a centralized opt-in process for reverification of historic vintages be arranged? How will the timing requirements and restrictions discussed in section 95976 and 95977 be applied to reverifications, and to ongoing CAR and/or regulatory verifications of Early Action projects, if at all? (TPI2)

Response: ARB cannot rely on a non-regulatory program to perform regulatory verification of offsets that will be used for compliance. AB 32 requires that all offset credits used for compliance be based on the result of regulatory verification.

Section 95990(f) was modified to clarify the requirements for regulatory verification of early action offset projects. New section 95990(f)(1) includes new requirements that the verifier performing the regulatory verification services must be different than the one that did the initial verification for the Early Action Offset Program. This ensures that the review is completely independent and unbiased. The new requirements include a desk review of each Offset Project Data Report (new section 95990(f)(3)) by an ARB accredited verification body based on all original early action offset project documentation. This provision was added in response to stakeholder comments to streamline the requirements for regulatory verification. Instead of issuing another verification statement, the ARB verifier must make an attestation to ARB regarding their findings from the desk review. The desk review by an independent body that is accredited by ARB is sufficient to determine if the information originally submitted regarding the offset project is complete and accurate. Therefore, we will not be requiring a site visit unless the ARB accredited verifier cannot find with reasonable assurance that the Offset Project Data Report should have been issued a positive verification statement under the Early Action Offset Program.

M-186. (multiple comments)
Comment: In the event that ARB still considers re-verification necessary, CERP urges ARB to limit the scope of verifier review to confirming that the project complies with ARB requirements and the overall reasonableness of the earlier verification results. The

offset protocols eligible to generate early action credits have built in conservative assumptions and margins of error to account for any uncertainty and variation in the application of a protocol by different verifiers. Unless there is evidence of a material error or misstatement, the regulations should provide that already verified early action credits are presumed to be valid. If evidence of material misstatement is uncovered in the re-verification, then a more intensive review (including requantification and, where helpful, a site visit) would be warranted. Many offset projects, particularly small projects, cannot afford to pay for a second full-scale verification of the emission reductions they generated. In order to ensure that the early action program can appropriately recognize early emission reduction efforts and generate early offset supply, it is very important that the re-verification requirements are rigorous but achievable. (CERP1)

Comment: We recommend that ARB consider a single re-verification process through which early-action projects could be verified as projects under the Compliance Forest Protocol. Valid existing third-party credits from such projects would be exchanged for ARB compliance offset credits and the projects would thereafter be issued ARB offset credits. We strongly support ARB's interest in accurate measurement, reporting and verification (MRV) of offset projects, but in general we feel that the approach outlined in section 95990(f) could be streamlined without sacrificing MRV accuracy or confidence in offset quality. We would suggest that ARB require regulatory verification of projects for early action through a single re-verification of the project, which would transition all eligible credits from that project into ARB compliance offset credits and would enable that project to be registered as a project with ARB and thereafter issued ARB compliance offset credits. This re-verification should not require an additional site visit if a site visit has been performed by an ARB-accredited verification body to the standards of section 95977 within two years prior to said re-verification. The project would be de-listed from the third-party registry and listed with ARB or an ARB-approved registry as a compliance-grade project, approved serialized offset credits would be retired and new ARB compliance offset credits issued in their place, and the project would thereafter be issued ARB compliance offset credits pursuant to the ARB Compliance Forest Protocol. Such a system would maintain high standards for measurement, reporting and verification and a high degree of confidence in offset quality while avoiding the unnecessary multiple site verifications currently required in section 95990(f). (SHILLINGLAW1)

> **Response:** We agree and modified section 95990(f) to include new requirements for regulatory verification that are intended to streamline the process and minimize costs associated with converting the voluntary offsets into compliance offsets that can be used for compliance.
>
> The new requirements include a desk review of each Offset Project Data Report (new section 95990(f)(3)) by an ARB accredited verification body based on all original early action offset project documentation. This provision was added in response to stakeholder comments to streamline the requirements for regulatory verification. Instead of issuing another verification statement, the ARB verifier

must make an attestation to ARB regarding their findings from the desk review. The desk review by an independent body that is accredited by ARB is sufficient to determine if the information originally submitted regarding the offset project is complete and accurate. Therefore, the regulation does not require a site visit unless the ARB accredited verifier cannot find with reasonable assurance that the Offset Project Data Report should have been issued a positive verification statement under the Early Action Offset Program.

M-187. Comment: ARB requires site-based re-verification of CRTs, in addition to CAR verifications, before CRTs can be transferred into the ARB system. Equator strongly urges ARB to consider a more straightforward and less costly approach to early action credit re-verification. Specifically, we suggest limiting the scope of the re-verification review to simply confirm that projects comply with ARB requirements, and that the CAR verification results have been sufficiently robust. (EQUATOR)

Response: The commenter's interpretation of the requirements for regulatory verification is incorrect. ARB will only require a site-visit and full verification services to be performed if an ARB accredited verifier cannot determine with reasonable assurance that the original Offset Project Data Report should have been issued a positive verification statement. In addition, we modified section 95990(f) to include new requirements for regulatory verification that are intended to streamline the process and minimize costs associated with converting the voluntary offsets into compliance offsets that can be used for compliance.

M-188. Comment: Because the CRT registry allows CAR to identify every credit issued to every project, we recommend that ARB-accredited verifiers work directly with the CAR administrators and the project developer in re-verifying eligible CRTs as compliance grade. Early Action Credit owners will in many cases not have access to the requisite documentation to facilitate the re-verification event. In most cases, the project owner/developer is the most appropriate person to coordinate with to achieve re-verification. Since the verifier will already be working with the project developers on the current year verification, they can also provide any documentation for historical issued credits for the purposes of a one-time re-verification. The incremental cost associated with the re-verification of historical issued CRTs can be borne by the current CRT owners. (EVMKTS)

Response: The regulatory verification and transition of early action offset credits to the compliance program is a voluntary step. ARB has established rules in the regulation for those who would like to participate in early action offset program. The Climate Action Reserve and the offset verifiers can work with the project developers and the holders of early action offset credits to transition them to the compliance program, however, ARB will not act as a facilitator of voluntary contracts and voluntary commitments.

M-189. Comment: Establish a "Fast Track" Certification Program for Early Action Credits: Evolution Markets also believes that establishing a clear and efficient certification process for Early Action projects as ARB offsets will incentivize compliance entities to begin using the pre-compliance offsets market to hedge, which in turn helps achieve the lowest cost of compliance. Evolution Markets recommends once ARB-accredited verifiers are available to the market, ARB should allow for re-verification as part of future credit verification events for eligible CAR projects. ARB should consider a special "fast track" procedure for this re-verification, basing documentation for this process on requirements of existing standards. (EVMKTS)

> **Response:** We modified section 95990(f) to clarify the requirements for regulatory verification of early action offset projects. New section 95990(f) includes new requirements for regulatory verification that is intended to streamline the process and minimize costs associated with converting the voluntary offsets into compliance offsets that can be used for compliance. The new requirements include a desk review of each Offset Project Data Report (new section 95990(f)(3)) by an ARB accredited verification body based on all original early action offset project documentation.

M-190. Comment: The Reserve understands the need for the Air Resources Board to require a new verification of all early action credits, as required under AB 32 and described at section 95990. However, these projects have already once undergone verification by a Reserve accredited verifier and a full conflict of interest assessment. Subjecting such projects to another full re-verification is not only costly but unnecessary. To the extent that Reserve accredited verifiers become accredited by the Air Resources Board, we would request that the re-verification process be streamlined and efficient to reduce transaction costs and uncertainty. (CAR1)

> **Response:** ARB cannot rely on a non-regulatory program to perform regulatory verification of offsets that will be used for compliance. AB 32 requires that all offset credits used for compliance be based on the results of regulatory verification.
>
> We modified section 95990(f) to clarify the requirements for regulatory verification of early action offset projects. New section 95990(f) includes new requirements for regulatory verification that is intended to streamline the process and minimize costs associated with converting the voluntary offsets into compliance offsets that can be used for compliance. The new requirements include a desk review of each Offset Project Data Report (new section 95990(f)(3)) by an ARB accredited verification body based on all original early action offset project documentation.

M-191. (multiple comments)
Comment: IETA has concerns the process for accreditation of early action credits and their potential transition to ARB-certified offsets is an administrative burden. In order to bring the greatest level of efficiency to this process, IETA recommends ARB not set a pre-requisite of re-verification of early action offsets and instead define a process in the early stages of the program to enable ARB-approved verifiers the ability to re-verify

Climate Reserve Tonnes (CRT). This will facilitate the process and reduce uncertainty on the transference of CRTs. Such a program will enhance liquidity early in the offsets market, which is essential to reduce compliance costs. This also will enable firms to hedge more confidently early in the program, further reducing the costs of the program. (IETA1)

Comment: The verification process for early action offset credits should be streamlined. There is uncertainty among potential buyers concerning this process to verify existing offset credits. This process could also create a significant cost burden that unnecessarily raises the price of early action offsets. (OFFSETSWG1)

> **Response:** We modified section 95990(f) to clarify the requirements for regulatory verification of early action offset projects. New section 95990(f) includes new requirements for regulatory verification that streamlines the process and minimize costs associated with converting the voluntary offsets into compliance offsets that can be used for compliance.
>
> The new requirements include a desk review of each Offset Project Data Report (new section 95990(f)(3)) by an ARB-accredited verification body, based on all original early action offset project documentation.

M-192. Comment: Section 95990(f) (p. A-174) details the verification process that is required for early action offsets. The ISOR states (at IX-176) that the verification services are provided for the project as a whole rather than separately for each vintage year of credits. However, this is not evident from the regulation, section 95990(f)(3), which refers to verification for each year in which the offsets are issued. The ISOR (at IX-176) also refers to the ability of buyers of early action offsets from a project to group together and obtain one verification rather than separate verifications, but it is not clear how the regulation would accommodate this. In addition, it is unclear what "serialized offset credits" are. This term is used frequently in section 95990(f) but is not defined. The verification procedures in this section would be in addition to the verification that was performed under the relevant CAR protocol when the offset was originally issued. These procedures effectively constitute re-verification of the offsets and will make early action offsets more expensive with little gain. (SCPPA2)

> **Response:** We agree and modified the regulation in section 95990(f) to more clearly state the regulatory verification requirements of Early Action Offset Credits. To streamline the requirements of re-verification, we included provisions to allow all Offset Project Data Reports for an individual offset project to be included in one desk review (new section 95990(f)(3)), in response to stakeholder concerns that regulatory verification costs may be exceedingly high. The term "serialized early offset credits," used in section 95990(f), is a unique number assigned to each early offset credit for identification.

M-193. Comment: Transferring into ARB in 2014 will undoubtedly require certain administrative changes, and submitting to ARB's regulatory enforcement will also be understandably part of acceptance into the ARB system. However, this transfer into the ARB system should not include re-verification under ARB project protocols as this would, in many cases, change project baselines for no practical or beneficial reason. Updating baselines would, in some cases, make projects no longer eligible since certain actions taken (e.g., voluntarily placing a conservation easement on a forest) after the project's original registration could result in drastically different legal constraints in the baseline. As ARB's staff report correctly observes, this type of grandfathering provides a stable regulatory environment that is critical for facilitating investment into offset projects. (EQUATOR)

> **Response:** AB 32 requires all offset credits used for compliance purposes to be subject to regulatory verification. ARB cannot rely on a non-regulatory agency to perform regulatory verification of offsets that will be used for compliance, and AB 32 requires that all offset credits used for compliance be based on regulatory verification. Prior to transitioning to a Compliance Offset Protocol, an early action offset project will be re-verified according to the early action offset protocol that was used at the time the early action offset credits were originally issued by the Early Action Offset Program. Therefore, the commenter's concern about changing the project baseline prior to transition into the compliance program is misguided. That said, in section 95990(k) the regulation requires projects developed under CAR's forest protocol version 2.1 to recalculate their baseline based on ARB's Compliance Offset Protocol. This provision is necessary to ensure consistency across all forest projects in the compliance program.

M-194. Comment: It is unclear in section 95990 and in the conflict of interest provisions (e.g., section 95979(b)(4)) if offset credits registered with a third party offset program can be or cannot be verified by the same verification body that originally verified the project under the third party program. (EOSC1, EOSC2)

> **Response:** Section 95990(f) was modified to clarify the requirements for regulatory verification of early action offset projects. New section 95990(f)(1) includes new requirements that the verifier performing the regulatory verification services must be different than the one that did the initial verification for the Early Action Offset Program. This ensures that the review is completely independent and unbiased.

M-195. Comment: We would recommend not requiring an additional site visit as a part of the regulatory verification if an ARB-accredited verification body has conducted a site visit of that sequestration project to the standards of section 95977 within two years prior to the regulatory verification. Subsequent vintages issued to that project should be issued ARB offset credits following a desk verification of offset data reports. Section 95990(f)(3)(A) requires the verifier to conduct a site visit as per section 95977(e)(2)(C)(iv) in order to verify the offset project and serialized offset credits that will potentially be issued ARB offset credits. Because this section requires the verifier to perform all of the offset verification services in section 95977 "for each offset data report for each year of the offset credits issued by the third-party offset program" (section 95990(f)(3)), the requirement of a site visit would also apply to subsequent vintages as this section is currently drafted. If an early action project seeks verification for 2005-2012 vintages in 2012, and then later seeks to separately re-verify vintages 2013 and 2014 under section 95990(f), an additional two site visits would be required. Thus four site visits could be required in three years for an early action forest carbon project, once to be verified with a third-party registry like CAR in 2011, once to re-verify the project with ARB in 2011 or 2012, and twice in the following two years to verify 2013 and 2014 vintages.

This would seem to require somewhat more site visits than truly necessary for confidence in MRV. New Forests has found that the cost of site visits in forest carbon project verification can be an order of magnitude higher than a desk verification of an offset project data report. Faced with the high cost of multiple site visit verifications, many forest owners would choose to delay re-verification with ARB until they were issued all relevant early-action vintages or delay registration with a third-party registry and look to the full compliance program, in either case delaying the availability and curtailing supply of offset credits.

Because the “facts on the ground” do not ordinarily change materially from year to year, the Climate Action Reserve v3.x protocols struck a sound balance between site visit verification and desk verifications. We would urge ARB to adopt an approach to site verification similar to that taken by CAR. Modify section 95990(f) as follows:

> 95990(f)(e)(A): If the offset project is still in operation, the verification body must conduct a site visit as required in section 95977(e)(2)(C)(iv), <u>unless the offset project has received a site visit by an ARB-accredited verification body to the standards of section 95977 within two years prior to the regulatory verification of offset credits for early action pursuant to this section. Verifications of serialized offset credits issued after the first verification of the offset project under this section shall not require a site visit as required in section 95977(e)(2)(C)(iv) if the project has been verified pursuant to this section within six years prior to the verification of the serialized offset credits in question</u>. (SHILLINGLAW1)

Response: We agree that an additional site visit is not necessary, and we modified the regulation to include a desk review of each Offset Project Data Report (new section 95990(f)(3)) by an ARB-accredited verification body based on all original early action offset project documentation. A desk review by an independent body that is accredited by ARB is sufficient to determine if the information originally submitted regarding the offset project is complete and accurate. We also included provisions to allow all Offset Project Data Reports for an individual offset project to be included in one desk review (new section 95990(f)(3)), to address concerns that regulatory verification costs may be exceedingly high.

M-196. Comment: Section 95977(e) includes a limit of six consecutive years of offset project data verification. This six year limit needs to be adjusted for the first verification on early action projects and for reforestation projects. This is problematic in the first few years due to availability of verifiers and first verification may cover 2007 through 2011 vintages (five consecutive years) thus a verifier will need replacement in one additional year of verification (after only two years of actual work), this is costly and there may be limited numbers of verifiers. Initial or first verification regardless of offset credit vintage years generated should only count as one year towards this verifier year limit. Another drawback to this limit is that a verifier who is familiar with the project and conducts the first site visit (and the entity most likely to recognize issues) is prevented from doing the second required site visit at the six year interval. A more reasonable solution relative to Forest Projects is to have the ARB do random reviews of projects for the purpose of testing the verifiers and thus obviate this verifier replacement requirement. This would be more effective for ARB to assure verifier quality and be much more cost effective for projects, eventually leading to more cost effective offsets to encourage AB 32 implementation. (CAFORESTRYASSOC1)

> **Response:** The commenter's interpretation of the regulation is incorrect. Early action offset credits must be verified according to the requirements in section 95990(f). They do not need to meet the requirements of section 95977(e), now new section 95977.1, as those requirements must be met by offset projects using Compliance Offset Protocols. Once the project transitions to a Compliance Offset Protocol it must meet the requirements of section 95977 through 95977.2. The rotation of verifiers is essential to the independent review of offset project data reports.
>
> Section 95990(f) was modified to clarify the requirements for regulatory verification of early action offset projects. The new requirements include a desk review of each Offset Project Data Report (new section 95990(f)(3)) by an ARB accredited verification body based on all original early action offset project documentation. This provision was added in response to stakeholder comments to streamline the requirements for regulatory verification.

Early Action Conflict of Interest

M-197. Comment: The verifier conflict of interest requirements for early action credits are excessively burdensome, and should be streamlined. The draft regulations contemplate that owners of Climate Reserve Tonnes (CRT) of specific vintages from qualifying projects will be able to exchange those CRTs for offset credits that may be used for compliance in the AB 32 program—subject to re-verification of the project by an ARB-accredited verifier. In many cases, the CRTs from an individual project now are owned by a multitude of buyers. Yet, under the proposed regulations, ARB's verifier conflict-of-interest standards would be assessed against every owner of a credit that could qualify as an early action offset credit under the ARB program. This approach would result in a massively complex and time-consuming conflict of interest assessment process. In addition, it would likely result in the same project being re-verified by multiple verifiers. Not only would this be costly and inefficient, but the verifiers could reach different conclusions about the quantity of offsets earned, which would be difficult to reconcile. These results would defeat the aim of making early offset credits a source of readily available cost containment.

CERP urges ARB to reconsider its approach to verifiers and conflicts of interest in the early action context. One approach would be for ARB itself to appoint a verifier for each early project, which could be supported by charging a small fee for every early action offset credit submitted from that project. Alternately, ARB could apply the conflict-of-interest requirements only against entities that own a substantial portion of credits from an offset project (e.g., 40 percent). An option that would work well for ongoing projects would be for ARB to allow existing, early action-eligible credits to be re-verified during the initial verification process for a project that registers under the ARB protocol, with the conflict-of-interest assessment performed only against the current offset project operator. In any event, it is important to ensure that an early project need only have at most a single re-verification. It would be helpful if the regulations could make clear that a project's qualification for early action credits does not bar the same project from being approved under an ARB protocol, provided that it may not earn two credits for the same ton of emission reductions. (CERP1)

> **Response:** New section 95990(g) was moved from original section 95990(f)(2) and modified so that conflict of interest is now assessed only against any party that holds more than 30 percent of the early action offset credits issued in each data year. Originally the regulation required that conflict of interest be assessed against all holders of the early action offset credits. We made this modification to reflects stakeholder concerns that applying conflict of interest to all early action offset credit holders is unnecessary and overly burdensome.

Early Action Offset Programs

M-198. Comment: Section 95990 (p. A-171) refers to approved third-party offset programs. It is not clear how these programs differ from Offset Project Registries discussed in section 95986 (section 95990(c)) refers to section 95986(d), but this cross-reference does not appear to be correct). Clarify provisions on third party offset programs. (SCPPA2)

Comment: The reference to section 95986(d) in section 95990(c) appears to be a misplaced reference. (SHILLINGLAW1)

> **Response:** We agree and corrected the cross-reference issue. New section 95990(a)(3) (formerly part of section 95990(c)) now includes requirements for Early Action Offset Programs that are similar to requirements identified in section 95986(d) for Offset Project Registries. These requirements are necessary since both types of entities will be fulfilling similar functions within the offsets program, and many of these entities may be acting in both capacities.

Sector-Based Crediting

M-199. (multiple comments)
Comment: Modify section 95991 as follows: Sector-Based Offset Credits. Sector-based offset credits may be generated through reduced or avoided GHG emissions from within, or carbon removed and sequestered from the atmosphere by, a specific sector in a particular jurisdiction. The Board may consider for acceptance compliance instruments issued from sector-based offset crediting programs that meet the requirements set forth in section 95994 and originate from developing countries or from subnational jurisdictions within those developing countries, ~~except as specified in subarticle 13~~. (CCEEB1)

Comment: Section 95991 allows the Board to consider acceptance of compliance instruments issued from sector based offset crediting programs that meet the requirements and originate from developing countries or sub national jurisdictions. However its restriction to "except as specified in sub article 13" seems to imply that the sector based offset credits are geographically limited to US, Canada, and Mexico. We request that you clarify that it is not ARB's intent to geographically limit sector based offset credits to US, Canada, and Mexico. (SHELLENERGY)

> **Response:** We did not make the suggested edit. The interpretation of the language in section 95991 is incorrect. We will only allow sector-based offset credits from other countries in which we do not issue ARB offset credits directly through provisions in subarticle 13. This means that we would not allow sector-based credits to come from U.S., Canada, or Mexico, but could allow them from other developing countries or sub national jurisdictions that are approved pursuant to subarticle 14.

M-200. (multiple comments)
Comment: We would also strongly endorse CARB's consideration of adopting a REDD+ avoided deforestation protocol. California is currently in a unique position in beginning to implement a new cap and trade system which could provide a significant source of demand for pilot REDD+ projects, which are currently excluded both from the EU ETS and the entire Kyoto Protocol framework. REDD projects will not be able to be supported over the long term by the voluntary market, and near-term sources of demand for compliance offsets from REDD+ projects are scarce, recent developments from the COP16 Cancun Agreement on REDD+ notwithstanding. California and Governor Schwarzenegger are to be commended for taking a leadership role in exploring linkages with tropical forest regions in nations such as Indonesia, Brazil, and Mexico for REDD+ projects, and we hope that CARB accelerates its focus on this area for subsequent inclusion in the carbon market here from 2015 onwards. (CLIMATEWEDGE)

Comment: We support a strong role for REDD and urge you to move forward on REDD. (NC7)

Comment: We're very pleased to see the basic architecture for inclusion of sectoral crediting in the rule today, and look forward to further elaboration of those provisions as soon as practicable. A point carbon analysis that was released about a week ago indicates that there will be a shortage of offset supply in California. In the first compliance period that will be about 25 percent. Sectoral crediting and particularly REDD would go a long way to helping with that supply issue as well as being a driver for continued forward action on the global stage, particularly in preventing tropical deforestation but certainly not limited to that. (CCAP2)

Comment: IETA strongly supports ARB's consideration of Reduced Emissions from Deforestation & Degradation (REDD) credits into its state program. (IETA1)

Comment: REDD provisions should be incorporated as soon as possible. Section 95993 of the draft regulation provides placeholder language for potential future crediting of reduced emissions from deforestation and degradation (REDD) projects. It is important to the market and to developing country policymakers to indicate the general criteria and process that will be undertaken to approve REDD activities. It is currently unclear whether CARB will accept only jurisdiction-wide programs or whether it is open to project-based activities. (VCS)

Comment: The VCSA recognizes that the provisions on sectoral crediting are placeholders but we believe the parameters for how sectoral crediting might be incorporated should be outlined a bit more now if at all possible. Given the short duration of the cap and trade program, it will be important to the market and to developing country policymakers to indicate the general process for approving sectoral crediting programs, and the criteria CARB will factor in to do so. We would therefore recommend a criteria- and rules-based approach that would allow any entity meeting such requirements to participate in the program. In addition, the process should be open and transparent. In particular, CARB should indicate the following: Will CARB have an open approach to all geographic jurisdictions and sectors or will it be selective in terms of what countries or sectors can apply; When will CARB start considering sectoral approaches; What are the criteria for acceptance? (VCS)

Comment: We support ARB's decision to allow for the inclusion of a "nested approach" to REDD in section 95994(a)(6) and urge ARB to ensure that sector-specific requirements for REDD include standards and guidelines that also allow for the direct crediting of projects nested within sectoral REDD systems, where appropriate. (NEWFOREST)

Comment: TNC supports the regulatory language suggesting the future inclusion of sub-national credits from reduced emissions from deforestation and degradation (REDD) and proposes explicit language that would also permit crediting of reforestation and improved forest management (REDD+). In addition to the inclusion of deforestation and forest degradation, it is also critical to include forest restoration and improved forest management. We recommend that CARB include explicit language in this section to acknowledge that subnational REDD approaches can also include additional forest activities such as reforestation and improved forest management. However, crediting for these activities should be conditioned on maintaining or decreasing historic emissions from deforestation and degradation. (NC2)

Comment: We support CARB's explicit inclusion of a regulatory pathway to credit reduced emissions from international deforestation and degradation (REDD). Forest loss and degradation are responsible for roughly 12 percent of global anthropogenic emissions, so we are pleased that California recognizes the critical importance of addressing this problem and providing this leadership. We also commend CARB's jurisdictional approach to this issue, as it is important to engage governments to effectively and comprehensively address REDD. In addition to the inclusion of deforestation and forest degradation, it is also critical to include forest restoration and improved forest management. These activities not only remove additional carbon dioxide from the atmosphere through sequestration, they also help reduce deforestation and degradation by ultimately providing restored forested areas that can meet demand for forest products instead of continued depletion of remaining forests. With this in mind, we recommend that CARB include explicit language in this section to acknowledge that subnational REDD approaches can also include additional forest activities such as reforestation and improved forest management. Crediting for these activities, however, should be conditioned on maintaining or decreasing historic emissions from deforestation and degradation. This comprehensive approach to jurisdictional accounting and crediting, or "REDD+", would also be more consistent with CARB's overall approach to forest offset projects from North America, as it includes avoided deforestation, improved forest management and reforestation activities. (NC1)

Comment: PG&E believes that offsets will help California advance the goals of AB 32 while containing the overall cost to the California economy. I'm concerned about the supply of offsets based on my experience with the Climate Smart program. In the first compliance period, estimates are that we will have less than half the necessary volume that will be allowed. Develop infrastructure necessary for offsets from REDD, Reducing Emissions From Deforestation and Forest Degradation. We're encouraged by the MOU that California has with Chiapas and Acre, Brazil, and encourage ARB to develop the working group recommendations outlined in the MOU. They allow ARB to allow REDD offsets within the first compliance period (PGE1, PGE3).

Comment: Develop a pathway for sector-based REDD crediting in time for the first compliance period. We strongly support the inclusion of sector-based credits from Reducing Emissions from Deforestation and Forest Degradation (REDD) in California's cap and trade system. We commend the California Air Resources Board's (ARB) expressed intent in its final draft regulations to link with international REDD programs. ARB's groundbreaking efforts to create a sectoral REDD crediting mechanism will spur action to address a major source of global greenhouse gas emissions and promote significant forest conservation and sustainable development outcomes. Moreover, the rapid and comprehensive development of a REDD crediting pathway is vitally important to ensure adequate offset supply and cost containment of greenhouse gas reductions, especially during the first compliance period. (SHILLINGLAW1)

Comment: COPC believes that REDD credits should be incorporated into the CARB cap and trade system as swiftly as practicable. We are encouraged by CARB's stated goal of including credits from REDD pilot programs at some point during the first compliance period. We encourage CARB to do so, both in order to help ensure an adequate supply of quality offsets, and to send the much-needed signal to California's subnational partners in the developing world. (COPC1)

Comment: I support the REDD program and encourage its speedy development in the first compliance period. ARB is not only developing the first economy-wide cap and trade program in the U.S., but the very first cap and trade program in the world to recognize REDD credit, and we salute the Board for that and look forward to working with you more. (COPC2)

Comment: The rapid and comprehensive development of a REDD crediting pathway is vitally important to ensure adequate offset supply and cost containment of greenhouse gas reductions, especially during the first compliance period. (NEWFOREST)

Comment: DRA is also encouraged by the framework that is established for sector-based offset credits from developing countries, and believes that offset credits from reducing emissions from deforestation and forest degradation (REDD) are important to meet California's demand for offsets. DRA recommends that ARB continues its leading role in developing sector-based offset crediting mechanisms, and work towards approving REDD credits for meeting compliance obligations in the California program. (DRA)

Comment: While necessary approaches, like the nesting of project-level emissions reductions within sub-national programs are being worked out, project developers are keen to know which protocols/methodologies they should invest time in understanding and applying to the design of prospective projects. We would encourage ARB to consider as streamlined a process as possible—while ensuring the highest standards of quality—in reviewing and approving appropriate protocols and methodologies from established voluntary standards and registries like the American Carbon Registry, Climate Action Reserve, and especially the Voluntary Carbon Standard as it is the most widely-used and robust voluntary standard in use around the world. The recognition by California of the Voluntary Carbon Standard for compliance-based purposes would send a clear signal to project developers and governments around the world that the voluntary market has the tools and robustness to be integrated with the regulated market, and we can thus address climate change more quickly and effectively. (SUNONESOLUT)

> **Response:** Thank you for your support and recommendations for incorporating a REDD program into the cap-and-trade program. We believe that a well-designed, strong regulatory framework is critical before any REDD program could be considered and brought before the Board. This would occur after the

Board adopts the cap-and-trade regulation and would require a separate regulation that includes its own public stakeholder review, and a separate regulatory and environmental review process. ARB is awaiting the recommendations from the REDD Offset Working Group to better understand the legal and technical landscape for REDD credits.

M-201. (multiple comments)
Comment: One of the most significant hurdles—if not the most significant one—for the majority of private forest landowners in a country like Brazil is the upfront capital required to design and launch a rigorous project that can then be validated, monitored, and verified effectively. Many such forest-owners are land rich but relatively cash poor, and commercial credit is unavailable for developing projects in what is still considered by lenders as the embryonic and high-risk realm of carbon markets. Landowners also lack the technical expertise required for project development and approval. In a robust, well-designed project, such start-up costs should in theory be readily recouped after the initial verification(s), but that leaves a financing gap for committed, well-intentioned forest-owners to assume such costs at risk. Financial markets and investors in particular can of course help enormously in this regard, but such novel, high-risk investments will need time, a strong regulatory framework underpinning project design and approval, and consistent signals from policymakers to take hold before a forest carbon market can grow to scale. Innovative approaches to providing risk insurance and/or seed money could potentially assist California in encouraging low-cost, high-quality offset credits in significant volumes for compliance buyers that also incentivize private forestland owners who often face significant opportunity costs. (SUNONESOLUT)

Comment: Given the potentially significant role that the private sector could play-whether through financing and/or project development—we would recommend that private-sector actors based in tropical forest countries be represented as actively as possible in relevant forums and consultative processes. As individual companies or as a group, we are happy to participate in such forums and processes and/or recommend potential participants. We believe that the private sector will be the main driver for sustainable forest management- and can play a similarly pivotal role for REDD—with regard to the scale-up necessary to achieve significant results in emission reductions worldwide. In particular—and related to the question of nested REDD above—we believe the private sector should contribute actively to the debates on, and designs of, systems for coordination and REDD accounting, and we would be grateful for opportunities to do so. (SUNONESOLUT)

Comment: IETA believes that the proposed goal of having REDD offset credits from pilot programs enter the California market at some point during the first compliance period is appropriate. Regarding the establishment of reference levels for REDD programs, IETA believes that the staff's initial thinking—that this reference level should be derived from absolute deforestation based on historic emissions averaged over a 10-year period and adjusted if necessary—is a good start, but believes that critical adjustments will need to be made to this historical baseline in many cases.

Regarding the establishment of a crediting baseline, IETA is very concerned about the statement in the Staff Report that the REDD program must set a crediting baseline based on specific targets for 2020 and beyond. Given the tendency to confuse the concepts of baselines and targets/policy goals in recently proposed US legislation, IETA feels the need to emphasize that a baseline sets the incentive to reach a target; the two are not interchangeable.

IETA welcomes the Staff Report's provision for nested crediting for REDD programs under the California cap and trade system. Finding a way to fully integrate project-level activities within a state-wise system is essential to ensure the successful implementation and financing of REDD programs. IETA believes strongly that ARB should consult closely with a wide variety of public and private stakeholders as it moves forward. IETA looks forward to providing further, extensive input to this discussion over the next year. (IETA1)

Comment: I support the possibility of crediting emission reductions from verifiable reductions of tropical forest destruction and degradation. The current placeholder language on sectoral crediting helps establish some of the fundamental principles that will be needed to ensure environmental and social integrity of this program. However, careful decisions on many more details, which staff is now considering, will be necessary before this program can be implemented. (LUDLOW, UCS1, WALTERS)

Comment: I want to commend the Air Resources Board for planning to incorporate sector-based offsets from reduced emissions and deforestation and degradation cap and trade regulation. Deforestation releases as much greenhouse emissions as the global transportation sector, and significantly reducing deforestation emissions is critical to avoid dangerous destabilization. California has the opportunity to lead the world at creating an economic incentive to tropical forests and this can be done with strong social and environmental safeguards. I want to encourage the Board and staff to ensure that sector-based offsets are incorporated into this plan. (SHILLINGLAW2)

Comment: We support the inclusion of social and environmental safeguards in the sectoral REDD requirements. We encourage ARB to rely on existing standards and frameworks, such as those developed by the Climate, Community and Biodiversity Alliance, to implement such requirements. (NEWFOREST)

Comment: We note that the Climate Action Reserve, the Governors' Climate and Forests Taskforce and the Voluntary Carbon Standard have initiated processes to develop sectoral REDD protocols, frameworks and standards. We encourage ARB to participate in these efforts and draw on these processes and the resulting work products in the development of California's sectoral REDD requirements. (NEWFOREST)

Comment: The proposed cap and trade regulation establishes a program to generate offset credits from reduced deforestation and degradation, but does not include language to ensure the rights of indigenous peoples and local communities. California must ensure that the development and implementation of REDD crediting programs do not lead to negative social and environmental consequences. If the rights and participation of indigenous peoples and forest dependent communities are not guaranteed in California's regulation to establish a REDD crediting program, governments are likely to view avoiding adverse social impacts and respecting rights as merely an extra implementation cost, rather than as a contribution to and prerequisite for REDD effectiveness. It is therefore vital to include clear guidance requiring the full protection of the rights of indigenous peoples and local communities. Modify section 95994 to include the following provision:

> <u>Rights of Indigenous Peoples and Local Communities. The program has requirements to ensure that the rights of indigenous peoples and local communities, including their rights to lands, territories and resources, are fully respected</u>. (FRIENDSOFEARTH)

Comment: The inclusion of REDD sector-based offsets is an issue of particular concern. The safeguards listed (III-28) are inadequate, and gloss over a series of fundamental problems with such schemes. These will be exacerbated if the subnational Reducing Emissions from Deforestation and Forest Degradation (REDD) working group of Governors' Climate and Forests Taskforce (GCF) agrees to use REDD credits from states outside the US. (CTW)

Comment: REDD offsets diminish the responsibility to reduce GHG emissions at source, or initiate a path away from fossil fuels in power and industrial sectors. (CTW)

Comment: I object to the forest offset concept as they are generally not based in the Free Prior and Informed Consent (FPIC) of the communities who live in the affected forests. In many countries, benefits from offsets projects will flow to the government, or to the private project developer, instead of to the communities who have managed the land for generations. This leads to inherent violations of FPIC and other human rights safeguards guaranteed through the UN Declaration on the Rights of Indigenous Peoples. It is a sham to say that forest offset programs will protect forest communities and because of that, the Indigenous Environmental Network stands in opposition to these programs. (MASCARENHAS)

Comment: Using a Board approved REDD sector-based crediting programs" is laudable goal as presented in Staff Report: Initial Statement of Reasons (ISOR) but current draft of Draft decision [-/CP.16] "Outcome of the work of the Ad Hoc Working Group on long-term Cooperative Action under the Convention" will not effectively sequester carbon and could further impoverish forest communities and their forests. Nor will REDD achieve numerous criteria set in the ISOR.

Those who have title and benefit from their forests have a stake in their future and are the most likely to protect them. Governments have not protected these forests as effectively as those few forest peoples that have human and tenure rights, and can depend on and defend their forest. Rights we take for granted but now must be extended to forest people. One of the most cost and environmentally effective next steps will be to stipulate that prior to REDD+ funding human rights and resource tenure be enforced statutory rights. (LIPPMAN)

Comment: While we support the idea of a positive offset list, we are concerned that the inclusion of credits from land use and forestry does not adequately address the question of how best to maximize storage of carbon in natural sinks, and, at the same time, diverts resources away from reducing fossil emissions and investing in a low carbon economy. The capacity for carbon sinks to both remove and contribute carbon to and from the atmosphere is considerable. Their introduction into the carbon market as a form of offset risks creating an over-supply of accredited reductions whilst doing nothing to increase the overall demand to cut emissions. And yet it is precisely this that must be urgently increased to answer the risk of global climate change. An additional problem with sinks in the carbon market is the equivalence (or lack of equivalence) between different sources of greenhouse gases. There are two main anthropogenic drivers of climate change—the release of fossilized carbon through the burning of fossil fuels which contributes an additional load of carbon to the atmosphere, and changes made to land and oceans which alter the level of carbon sinks in the biosphere. These two problems inter-relate in complex ways and each needs to be urgently addressed if we are to stabilize our climate within a safe temperature range. By mixing measures to address the reduction in biospheric sinks with measures to reduce the unabated burning of fossil fuels we risk not adequately addressing either problem. A separate mechanism is required to address this and measures to reduce emissions from fossil fuels should remain focused on that issue alone. An optimized program to address changes in biospheric sinks would regulate those companies, such as logging firms, large scale plantation owners and industrialized agricultural firms, to make them responsible for protecting and restoring our land based sinks. We support the development of sectoral offsets where reductions are generated over and above business as usual projections and above basic minimum standards of performance (i.e. benchmarks). Sectoral offsets enable a move away from baseline and credit programs to sectoral cap and trade systems which help to guarantee reduced volumes of emissions and establish a carbon price. (SANDBAGCC)

Comment: I have deep concerns about California's participation in a REDD/carbon offset program. What I witnessed in Cancun was widespread criticism of REDD as a strategy for addressing climate change; indeed, many indigenous peoples' groups and forest-dwelling peoples are concerned that REDD may bring about what they are calling "perhaps the largest landgrab in history." In Cancun, many organizations, were very vocal about their opposition to carbon offset programs in general, and to REDD in particular. Such agreements implicitly promote carbon markets, offsets, unproven technologies, and land grabs—anything but a commitment to real emissions reductions. Language 'noting' rights is exclusively in the context of market mechanisms, while failing to guarantee safeguards for the rights of peoples and communities, women and youth. Using offsets to reduce emissions on paper has multiple negative effects; on the one hand, it fails to actually reduce emissions at the source, which will allow continued toxic exposure of California communities such as those living near the Richmond refineries, Kettleman City, and other hotbeds of polluting industries. On the other hand, offset programs such as REDD use dubious standards and profoundly troubling strategies, such as offering carbon credits to agrofuel/biofuel plantations, waste-to-energy facilities, and other projects that are falsely presented as "green." Indeed, in the state of Chiapas, Mexico, biofuel plantations of Jatropha curcas are extending throughout regions that previously or currently are home to indigenous subsistence farmers. Such plantations—which are erroneously called "forests" under the United Nations definition—involve massive agrochemical inputs, low-wage labor, and displacement of land-based peoples; at the same time, looked at in terms of its entire lifecycle, biofuels have been shown to be just as CO_2 intensive as fossil fuels. In order for California to truly take leadership on the environmental front, we must avoid toxic programs like REDD and carbon offsets in general, which will fail to address the problem of climate change while also leading to human rights abuses and displacement of peoples from their lands in Chiapas and throughout the global South. (GJEP1, GJEP2)

Comment: I ask CARB to incorporate the following recommendations:

1. That a Board approved REDD sector-based crediting programs should require that within the Subnational REDD Program resource rights be made statutory and binding for all indigenous people and other forest peoples whose rights do not conflict with the rights of adjoining indigenous peoples.

2. The Board review a World Bank analysis of the importance of land tenure to REDD+. The World Bank states about, "the role of community-owned forests in carbon sequestration …" That"…the larger the forest area under community ownership the higher the probability for better biodiversity maintenance, community livelihoods and carbon sequestration."

"The growing evidence that communities and households with secure tenure rights protect, maintain and conserve forests is an important consideration for the world's climate if REDD schemes go forward, and even if they do not."

The cost range of recognizing community tenure rights (average $3.31/ha) is several times lower than the yearly costs estimates for an international REDD scheme ($400/ha/year to $20,000/ha/year). A relatively insignificant investment in recognizing tenure rights has the potential to significantly improve the world's carbon sequestration and management capacity. Prioritizing policies and actions aimed at recognizing forest community tenure rights can be a cost-effective step to improve the likelihood that REDD programs meet their goals. World Bank SOCIAL DEVELOPMENT WORKING PAPERS Paper No. 120/December 2009. (LIPPMAN)

Comment: The Indigenous Environmental Network (IEN) has documented severe impacts due to carbon credit trading involving forests, including fake forest protection projects that also cause harm to indigenous people. This is a lose-lose situation for the environment—no reductions in fossil fuel are carried out because the polluter buys credits from the forestry operator. No forests are protected, and human rights are violated. California's Cap and Trade program, which is seeking to expand internationally its linkage to other trading programs, is vulnerable to such bad offsets. (CBE1)

Comment: The current program allows harms to California, for instance, by causing evictions of indigenous people through fake forest offset projects. (CBE1)

> **Response:** Thank you for your concerns and suggestions on the inclusion and design of a potential REDD program. While the regulation provides a framework for the potential acceptance of REDD credits, we do not currently have provisions in the regulation to approve those credits or allow them to be used in the compliance program. We believe that a well-designed strong regulatory framework is critical before any REDD program could be considered and brought before the Board. The REDD Working Group is in the process of developing recommendations, which is anticipated to be presented to ARB sometime in mid- 2012. At that time, we will consider options for moving forward.
>
> We appreciate the relevance each of these tools and suggestions have in developing a REDD program. When it is appropriate for us to begin to consider a REDD regulatory program, we will be analyzing each of these issues very carefully. This would occur after the Board adopts the cap-and-trade regulation and would require a separate regulation that includes its own public stakeholder review and a separate regulatory and environmental review process.

M-202 (multiple comments)
Comment: The draft regulations state that sector-based crediting is a concept that has emerged in international climate forums as an opportunity to broaden the scope and scale of emissions reductions in developing countries. Attempting to transform that concept into tangible programs has proven incredibly challenging to date. We believe that excluding project-based international offset credits from the California cap-and-trade system unnecessarily and quite severely restricts the sectors and countries that could supply offset credits into the California system. We recommend ARB expand the eligibility for international offsets beyond sector-based credits to also include project-based credits issued by external bodies using methodologies approved by ARB. (IETA1)

Comment: ARB's goal is to ensure that offset credits be real, additional, quantifiable, permanent, verifiable, and enforceable, and we will seek to contribute vigorously toward this goal. Project-level activities will be crucial for ensuring a supply of high-quality, reasonably priced REDD-based offset credits, and we would support multiple pathways to compliance standards for nested approaches. By the same token, we would urge that ARB set out a clear timetable for developing and approving the rules regarding sectoral/nested REDD. (SUNONESOLUT)

Comment: We support the early inclusion of forest offsets from Mexico. But we urge ARB to ensure that any such offsets, even if entering through the use of North American ARB Compliance Offset Protocols, fully satisfy ARB's sectoral requirements for international REDD. We believe that all international REDD offsets, regardless of country of origin, should be subject to the same rules and requirements, which will help ensure integrity and asset fungibility. (NEWFOREST)

> **Response:** Thank you for your comments regarding REDD project-based crediting. The Board's direction has been to consider the possibility of linking to programs from developing countries if those program credits are part of a larger regional or subnational program that is achieving region-wide REDD emission reductions. This is to ensure that GHG emission reductions are not isolated at the project level, rather, that the project is one piece of a larger emission-reduction effort by that subnational entity, that the program has a robust monitoring and verification process at the regional/subnational level, and that significant oversight and a regional plan is in place to achieve such reductions. Doing so reduces the potential for leakage, allows for better tracking, and carries out the principle of common but differentiated responsibilities among developed and developing subnational entities.

M-203. (multiple comments)
Comment: CARB has been considering but has not yet adopted a program for REDD-based projects. It is important that CARB proceed to promptly outline a process for developing REDD crediting rules and to commit to a timetable to complete this process in 2011. Further, we would be particularly interested in additional clarity regarding the interaction between this process and the on-going process to define specific linkages with the states of Chiapas in Mexico and Acre in Brazil announced on November 17, 2010, by the Governor's Climate and Forests Task Force. We welcome the opportunity to participate in any working group or public comment process on this matter. (CE2CP)

Comment: California has signed agreements with the States of Acre (Brazil) and Chiapas (Mexico) for the recognition of REDD credits from those regions, but has not stated clearly whether it is open to REDD offsets from other regions in the world. The VCSA strongly recommends that CARB provide additional clarity and detail regarding these provisions at the earliest possible opportunity. (VCS)

Comment: The Climate Action Reserve, the Governors' Climate and Forests Taskforce and the Voluntary Carbon Standard have initiated processes to develop sectoral REDD protocols, frameworks and standards. We encourage ARB to participate in these efforts and draw on these processes and the resulting work products in the development of California's sectoral REDD requirements. (NEWFOREST)

Comment: In executing the recent MOU with the states of Acre and Chiapas, California acknowledged that jurisdictions seeking to supply sectoral REDD offsets to the California carbon market will take varying approaches to integrating local REDD activities within a jurisdictional accounting framework. We encourage ARB to support working group recommendations, as outlined in the MOU, that can meet ARB sector-based REDD offset criteria and can be adopted in time for use in the first compliance period. (NEWFOREST)

Comment: We enthusiastically support the development of a program for REDD and other forestry projects in linked jurisdictions (such as Brazilian states and other partners under Governor Schwarzenegger's Governors' Climate and Forests Task Force), but we are concerned with ARB's apparent rejection of project-based emissions reduction for REDD in favor of a sector-only approach. ISOR at III-22. ARB's conclusions that a sector approach reduces risk of emissions leakage and alleviates competitiveness concerns among trade-exposed sectors, ISOR at III.23, is not sufficiently developed in the proposal and does not support rejection of project-based crediting. Nonetheless, we encourage ARB to act promptly to outline a process for developing REDD crediting rules, with central participation of stakeholders from the private sector, and to commit to a timetable to complete this process in 2011 such that additional forest credits can be available prior to the inception of the market program in 2012. We also ask that ARB provide clarity regarding how ARB's rulemaking process will intersect with the GCF process, including the recent memorandum of understanding signed in November 2010, which we applaud. (BLUESOURCE, FCC)

> **Response:** Thank you for your support and recommendations for incorporating a REDD program into the cap-and-trade program. We believe that a well-designed, strong regulatory framework is critical before any REDD program could be considered and brought before the Board. This would occur after the Board adopts the cap-and-trade regulation and would require a separate regulation that includes its own public stakeholder review and a separate regulatory and environmental review process. On November 17, 2010, there was an announcement related to a Memorandum of Understanding between Mexico, California, and Brazil; the purpose of the MOU was to share information between parties to understand and work through some of the issues that need to be addressed in order for any future program to be developed. A REDD Working Group separate and apart from ARB was established to address technical issues; that group will be presenting its findings to ARB in the mid-2012.

Air Districts Comments Regarding Offsets

M-204. Comment: The draft regulation specifically prohibits local air districts from performing multiple functions related to the cap on Greenhouse Gas Emissions compliance program. However, SCAQMD has staff resources and expertise that can help ensure successful implementation of the program and other stationary source programs under AB 32. The potential conflict of interest issues applicable to for-profit businesses do not exist for a local air quality agency like SCAQMD. Our organization is a sister regulatory agency with public health as the primary motivation. We are not for-profit, and would approach any function with the motivation to do what is right, not to generate income or ensure repeat business. We request the ability to perform multiple functions in the cap and trade program, including holding compliance instruments. For example, we may wish to use offsets to prefund the AQMD Registry under Regulation XVII -Climate Change, which can currently be used for CEQA mitigation. The amount of offsets or compliance instruments that would be held for these purposes would be inconsequential and could not affect market prices or availability of compliance instruments. (SCAQMD1)

Response: The cap-and-trade regulation provides for distinct roles within the compliance offset program. The roles include project developers, offset verifiers, and approved offset project registries. There is a clear separation of roles for offset project developers, verifiers, and registries to keep in place a system of independent checks and balances throughout the whole offset system. This parsing of roles is consistent with international standards and best practices, as well as program elements developed within the Western Climate Initiative, and applies to all participants (private and non-private) that choose to be part of the compliance offset program. It will be important for air districts to decide which role(s) they would like to play in the compliance offset program. Currently, air districts are allowed to develop offset projects using ARB compliance offset protocols, and then have those reductions subject to an independent review by an ARB-accredited verifier.

As with any private entity, air districts that develop offset projects or provide offset verification services cannot also act as an approved registry for the compliance offset program. This separation of roles goes back to the program design, to ensure a system of checks and balances on each step in the compliance offset program.

M-205. (multiple comments)
Comment: CAPCOA would like to have rule language amended to clarify requirements for local air districts regarding what activities could present a conflict of interest for offset verification; and adding language to enable local air districts to be able to provide multiple functions under the program. Local air districts have substantial expertise related to the operations and emissions of stationary sources and can provide technically sound emission and offset verification services. Local air districts do not have a profit motivation, can be an effective regulatory partner with CARB, and also can reduce otherwise needed CARB implementation resources. Add section 95979(g) as follows:

<u>Specific Requirements for Air Quality Management Districts and Air Pollution Control Districts.</u>

(1) <u>If an air district has provided or is providing any services listed in section 95979(b)(2) as part of its regulatory duties, those services do not constitute</u>

non-verification services or a potential for high conflict of interest for purposes of this subarticle;

(2) Before providing offset verification services, an air district must submit a self-evaluation pursuant to 95979(e) to the Offset Project Operator or Authorized Project Designee and CARB or the Offset Project Registry for each offset project for which it will perform offset verification services. The self-evaluation must contain the information specified in section 95979(e) for all entities for which it intends to provide offset verification services;

(3) As part of its conflict of interest self-evaluation submittal under section 95979(e), the air district shall certify that it will prevent conflicts of interest and resolve potential conflict of interest situations pursuant to its policies and mechanisms submitted under section 95132(b)(1)(G);

(4) If an air district hires a subcontractor to provide offset verification services, the air district shall be subject to all of the requirements of section 95979. (CAPCOA1, CAPCOA2, BAAQMD2)

Comment: Similar language to that which CARB staff will be proposing as a 15-day change for the Mandatory Reporting Regulation is requested for the Cap and Trade regulation. The language below would clarify that local air districts would not have high conflicts of interest in performing non-verification services when staff from an air district verifies greenhouse gas offset projects. The rationale for this language is that air districts are regulatory partners, do not have profit motivation, and are not interested in assuring repeat business for verification.

Add section 95979 (g) as follows:

Specific Requirements for Air Quality Management Districts and Air Pollution Control Districts.

(I) If an air district has provided or is providing any services listed in section 95979 (b)(2) as part of its regulatory duties, those services do not constitute non-verification services or a potential for high conf1ict of interest for purposes of this subarticle;

(2) Before providing offset verification services, an air district must submit a self-evaluation pursuant to 95979 (e) to the Offset Project Operator or offset project for which it will perform offset verification services. The self- evaluation must contain the information specified in section 95979 (e) for all entities for which it intends to provide offset verification services;

(3) As part of its conflict of interest self-evaluation submittal under section

95979 (e), the air district shall certify that it will prevent conflicts of interest and resolve potential cont1ict of interest situations pursuant to its policies and mechanisms submitted under section 95132 (b)(1)(G);

(4) If an air district hires a subcontractor to provide offset verification services, the air district shall be subject to all of the requirements of section 95979. (SQAQMD1, SCAQMD2)

> **Response:** We agree with suggested language and added a new section 95979(g) to the regulation that clarifies the conflict-of-interest requirements as they pertain to air districts and air quality management districts.

M-206. (multiple comments)
Comment: We are concerned that there are many restrictions written into the draft regulation that: (a) disqualify local air district participation as verifiers for offsets, and (b) place limitations on the functions that local air districts can provide for the program's benefit. This will lead to inefficiencies in resource allocations, duplication, added cost, and delays to implementation. The main obstacle apparently continues to be a perceived conflict of interest, with which CAPCOA fundamentally does not agree. We believe air districts have demonstrated the fiduciary expertise and responsibility needed to support successful implementation of this program. (CAPCOA1)

Comment: We don't understand why the air districts were lumped together with other for-profit companies that provide verification services in terms of conflict of interest provisions. Air districts and other regulatory agencies in California are subject to conflict of interest safeguards, including ethics training and financial disclosures. We are glad to see that the staff is including mandatory specific provisions for the air district in terms of conflict of interest. We ask that that be clarified also in terms of offset verification. We have some specific language in our comment letter that we think would lead to that end. (BAAQMD)

Comment: The draft regulation specifically prohibits local air districts from performing multiple functions related to the cap on Greenhouse Gas Emissions compliance program. However, SCAQMD has staff resources and expertise that can help ensure successful implementation of the program and other stationary source programs under AB 32. The potential conflict of interest issues applicable to for-profit businesses do not exist for a local air quality agency like SCAQMD. Our organization is a sister regulatory agency with public health as the primary motivation. We are not for-profit, and would approach any function with the motivation to do what is right, not to generate income or ensure repeat business. We request the ability to perform multiple functions in the Cap and Trade program, including commissioning and/or overseeing offset projects. (SCAQMD1)

> **Response:** The cap-and-trade regulation provides for distinct roles within the compliance offset program. The roles include project developers, offset verifiers, and approved offset project registries. There is a clear separation of roles for

offset project developers, verifiers, and registries to keep in place a system of independent checks and balances throughout the whole offset system. This parsing of roles is consistent with international standards and best practices, as well as program elements developed within the Western Climate Initiative, and applies to all participants (private and non-private) that choose to be part of the compliance offset program. It will be important for air districts to decide which role(s) they would like to play in the compliance offset program. Currently, air districts are allowed to develop offset projects using ARB compliance offset protocols and then have those reductions subject to an independent review by an ARB-accredited verifier.

Section 95979 of the regulation was modified to include new Board-directed text in Resolution 10-42 that clarifies the conflict-of-interest requirements as they pertain to air districts.

M-207. (multiple comments)

Comment: Local air districts have the expertise for protocol development and can help ensure high quality offset projects. CAPCOA members are willing to have any offsets developed by local air districts following CARB-approved protocols verified by a third party. This is important to local air districts because they want local co-benefits from offset projects, and to keep investments and jobs local. Local air districts do not have potential conflict of interest issues that private firms may have for implementing projects, verifying reductions or running a Registry. We are not the same as for- profit businesses—our motivation is to do what is right for our local communities and citizens. Having local air districts perform these and other functions will help keep costs down and can reduce otherwise needed CARB implementation resources.

Add section 95989 as follows:

<u>California Air Pollution Control Districts or Air Quality Management Districts.</u>

<u>California air pollution control districts or air quality management districts shall be approved for multiple roles, which include verification of offset projects or emissions data for mandatory reporting, holding compliance instruments, implementing offset projects that are verified by a third party and approved by CARB, and running a Registry; provided the appropriate training, accreditation or approvals are obtained from CARB pursuant to sections 95132, 95978, 95814 and 95986. Decisions on such approval requests shall be provided in a timely fashion.</u> (CAPCOA1, CAOCIA2, BAAQMD2)

Comment: The SCAQMD Board is very interested in potentially running a Registry (electronic bulletin board) for greenhouse gas reductions that could be used for CEQA and compliance with the state's cap and trade program. The motivation is to assist local businesses needing greenhouse gas reductions for CEQA or for the state program. The additional language, below, would enable such participation.

Add section 95989 as follows:

<u>California Air Pollution Control Districts or Air Quality Management Districts.</u>

<u>California air pollution control districts or air quality management districts shall be approved for multiple roles, which include verification of offset projects or emissions data for mandatory reporting, holding compliance instruments, implementing offset projects that are verified by a third party and approved by CARB, and running a Registry; provided the appropriate training, accreditation or approvals are obtained from CARB pursuant to sections 95132, 95978, 95814 and 95986. Decisions on such approval requests shall be provided in a timely fashion.</u> (SCAQMD1, SCAQMD2, SCAQMD3)

> **Response:** Air districts are able to participate in the cap-and-trade program, but must meet the eligibility and conflict-of-interest requirements in the regulation for whichever role(s) they decide to take. The cap-and-trade regulation provides for distinct roles within the compliance offset program. The roles include project developers, offset verifiers, and approved offset project registries. There is a careful separation of roles for offset project developers, verifiers, and registries to keep in place a system of independent checks and balances throughout the whole offset system. This parsing of roles is consistent with international standards and best practices, as well as program elements developed within the Western Climate Initiative, and applies to all participants (private and non-private) that choose to be part of the compliance offset program.
>
> As with any private entity, air districts that develop offset projects or provide offset verification services cannot also act as an approved registry for the compliance offset program. This separation of roles goes back to the program design to ensure a system of checks and balances on each step in the compliance offset program.

M-208. (multiple comments)
Comment: CAPCOA can help fill the need for technically strong offset protocols. CARB staff recently stated that they would not have time to review protocols developed by air districts. CAPCOA recommends that a process be established to bring local air districts, CARB, and other parties together to develop a list of protocols that would be worthwhile to explore developing. If local air districts step up to produce a protocol, they need assurance that timely review and quick approval will be provided once the protocols are technically sound. CAPCOA requests a tangible commitment to air districts. (CAPCOA1, CAPCOA2)

Comment: SCAQMD and other air districts have expertise and resources that can assist CARB in developing additional technically strong offset protocols. We are interested in developing offset protocols that deliver additional greenhouse gas reductions, while also providing local co-benefit pollutant reductions and helping with the economic viability of our businesses and communities. There should be a process to identify needed protocols and a commitment from CARB for substantive and timely review of draft protocols. Add to Resolution as follows:

<u>BE IT FURTHER RESOLVED that the Board directs the Executive Officer to meet with local air districts and other stakeholders in the next three months to identify protocols that will be evaluated for development by air districts. The Executive Officer will provide timely technical review of draft protocols, take the protocols through the public process, and bring multiple protocols to the Board for consideration as soon as practicable.</u> (SCAQMD1, SCAQMD2, SCAQMD3)

> **Response:** We are committed to working with districts to identify new offset protocols that could be included in the cap-and-trade program. As with all protocols and offset project ideas submitted to ARB, we will review and evaluate their potential for use in the program.

M-209. Comment: Local air districts like SCAQMD have the expertise and resources to develop protocols and commission or implement high quality offset projects. Any offsets developed by SCAQMD following CARB-approved protocols will be verified by a 3rd party. Implementing local offset projects retains the investment, jobs, and co-pollutant benefits in the local community. (SCAQMD1)

> **Response:** There is nothing in the regulation to prohibit an air district from becoming and offset project operator that develops offset projects using a Compliance Offset Protocol. Having those projects reviewed by an independent third-party verifier ensures there is an independent review of the offset project data report.
>
> We are committed to working with districts to identify new offset protocols that could be included in the cap-and-trade program. As with all protocols and offset project ideas submitted to ARB, we will review and evaluate their potential for use in the program.

Referencing

M-210. (multiple comments)
Comment: Section 95970(b) should refer to the quantitative usage limit in section 95854. (TPI2)

Comment: Modify section 95970(b) as follows: An offset credit issued by ARB must: (b) when used for compliance under this Article be subject to the quantitative usage limit pursuant to section ~~95855~~ <u>95854</u>. (NCPA1)

> **Response:** We agree and modified the reference in section 95970(b)(3) to reference section 95854.

M-211. Comment: Reconsider the drafting method of how protocols are recognized in the regulation. Listing each approved offset protocol repeatedly throughout the regulation is confusing and suggests that no additional protocols will ever be approved (see, e.g., sections 95973(a)(2)(C); 95975(c), 95976(c) and (d)). Rather than doing this, CARB should consider simply saying, “as applicable in an approved offset protocol,” or “as relevant in the approved offset protocol,” or “as contained in the appropriate protocol.” This will also minimize the regulatory amendments that need to be made each time a new protocol is adopted. (VCS)

> **Response:** In modifying the regulation, we did use the language recommended by the commenter throughout the regulation where appropriate. However, there are some provisions in the regulation where it is necessary to list the Compliance Offset Protocols.

M-212. Comment: The following sections should refer to section 95854, not the more limited section 95995. Modify section 95820(b)(2) as follows: Surrender of offset credits shall be subject to the quantitative usage limit set forth in section 95~~995~~854. Modify section 95821(e) as follows: Compliance instruments specified usage limit set forth in section 95~~995~~854. (TPI2)

> **Response:** This has been addressed in the 15-day changes to the regulation. Thank you for bringing this to our attention.

M-213. Comment: In our review, we observe a couple of occasions in which the citation in the proposed regulation seemed inconsistent with the textual content. IEP recommends review of the following citations to ensure proper referencing.

> i) Appendix A, section 95911(c)(2) p. A-88, it seems the citation in (c)(2) “the auction purchase limit in (A)…” should refer to (1).
> ii) Appendix A, section 95970, p. A-110, it seems the citation in (c)(2) “… subject to the quantitative usage limit pursuant to section 95855” is incorrect. The correct cite is to section 95854. (IEPA)

> **Response**: We corrected the references.

Forest Owner Definition

M-214. (multiple comments)
Comment: Clarify forest owner definition with respect to conservation easement holders. The revised definition of forest owner needs to be clarified with respect to easement holders. The definition asserts that easement holders are not considered a forest owner, but proceeds to define forest owner to include entities that may hold timber rights. However, easement holders may hold timber rights as part of a conservation easement, which creates an inconsistency in the definition. Therefore, the definition does not need to include an explicit exclusion of easement holders. If there are particular sections of the Protocols that should exclude easement holders from obligations of forest owners, those sections should make this explicit. (NC2)

Comment: “Forest owner” should be defined to exclude the fee owner when all timber rights are held in perpetuity by another entity. If one entity holds timber rights in perpetuity on a property and the fee holder has no control over the management of the timber, it would not seem reasonable to define both the fee holder and the timber rights holder as the “forest owner” collectively as currently drafted. Modify section 95802(a)(75) as follows:

> In some cases, one entity may be the owner in fee while another entity may have an interest in the trees or the timber on the property, in which case all entities or individuals with interest in the property are collectively considered the forest owners, unless the owner of the interest in the trees or the timber on the property owns that right in perpetuity and may manage said timber in its sole discretion. (SHILLINGLAW1)

Comment: The definition of “forest owner” in the proposed regulation (section 95802(75)) states that both the holder of timber rights and the landowner are accountable for project reversals. See also Forest Protocol at 6 (stating that “all Forest Owner(s) are ultimately responsible for all forest project commitments”). Land ownership is composed of a “bundle of sticks” and each stick can be separated from the bundle and held by a different person or entity. Accordingly, not all fee title owners of forest land or woodlots will own the timber and/or carbon rights. Since timber rights and carbon rights can be held as a separate property right from fee title to land, the landowner without timber or carbon rights has no legal ability to control forest project activities, and therefore should not be held accountable for forest project commitments associated with timber or carbon rights. This is consistent with ARB’s decision, which we support, to forgo landowner agreements such as the Project Implementation Agreement required under the CAR protocol. However, ARB does not address these issues in its rulemaking materials (see, e.g., ISOR IX-1). Any contractual relationship with ARB should be with the party that owns the carbon and/or timber rights. Similarly, liability for reversals should lie clearly with the holder of the carbon and/or timber rights and not extend to a fee owner without such rights. Accordingly we recommend that the definition of forest owner be amended so that the entity holding carbon rights can be defined as a forest owner where ownership is separated. (BLUESOURCE, FCC)

Comment: The definition of forest owner states that both the holder of timber rights and the landowner are accountable for reversals. Since timber rights are a wholly separate property right from the land, the landowner should not be held accountable for reversal associated with timber rights. A landowner does not have any management control over timber rights, nor does he share in any income associated with the harvest of timber or the sequestration of carbon. We recommend the definition be amended so that a perpetuity timber rights owner with 100 percent of managerial control and ownership of the timber assets can be defined as a “forest owner.” (NISSENBAUM)

> **Response**: We clarified the definition of “Forest Owner” to designate owners of “real” property in the forest as forest owners. In some cases, this could be the

fee holder or timber rights holder. When designating one forest owner for purposes of the offset project operator, the parties may specify in external contracts who has liability for certain parts of the project implementation. We are leaving the specific designation of roles and responsibilities up to the private parties with interests in the forest project, land, or rights. We believe that it is important for the definition of a forest owner to be as broad and inclusive as possible, to capture any entity with an interest in the property involved in the forest project. Aspects of a Forest Project such as soil carbon which is included as a required pool in the case of intensive site preparation, may extend beyond the scope of timber rights. Entities that have ownership of non-timber rights within the project area likely will have some control over activities that may affect forest management or carbon sequestration. Currently, there is no legal framework to specifically address carbon rights, although we are aware that this question is actively being researched. Given all the potential variables and entities that may share ownership or an interest in the property, we believe the most reasonable and comprehensive approach is to have a single forest owner designated as the Offset Project Operator, that will have the primary responsibility for managing the forest project in conformance with the protocol and the regulation, while all forest owner(s) will still share responsibility for all commitments associated with the forest offset project. The forest owner(s) may define in private contracts any specific roles and responsibilities for implementing a forest offset project.

Other Offset-Related Comments

M-215. Comment: These mitigating steps should not be undercut by reliance upon offsets when any other approach is available. Otherwise, the heat and drought and other climate driven stresses threaten to repeat the experience of the Amazon which in the drought of 2005 tipped for one year to not only fail to sequester its usual two to three billion tons of CO_2, but to become a source of carbon nearly as large, with a net loss in planter sequestration as large as the European Union and Japanese emissions combined. US forests are also stressed and the California system must take that into account dynamically in its approach. (SCB)

Response: We agree that a combination of direct measures, complementary policies and offsets are necessary to achieve significant GHG reductions in California and beyond. We believe that reducing GHG emissions from uncapped sectors such as the forest sector is an important part of the state's overall emission reduction goals. We have taken steps to achieve reductions that benefit California; as offsets are limited to eight percent of the total compliance obligation of each entity under the cap and trade regulation. California has been a leader in climate change actions to reduce GHG emissions and the cap-and-trade program is a critical component of California's overall approach. Maintaining carbon in the forest sector domestically and globally is a significant component that must be preserved to address global climate change, and we believe the forest protocol provides for permanence in accordance with AB 32 requirements. The forest protocol includes a host of stringent elements to ensure permanence. These include a 100-year requirement, forest buffer (replacement for involuntary reversals such as fires), invalidation, and replacement requirement for voluntary reversals (meaning those that are caused by purposeful harvesting/ removal), and ultimately, legal enforcement and authority over entities subject to the cap.

M-216. Comment: All credited offset projects should be made available in a searchable, online database. (CACAN1, CACAN2)

Response: Section 95987(b) of the regulation requires Offset Project Registries to make specific information regarding offset projects publicly available. ARB will also make this information publicly available, and is currently in the process of developing an offset information tracking database.

M-217. (multiple comments)
Comment: ARB should develop a clearly defined procedure by which Offset Project Developers and Verification Bodies are able to seek clarification and guidance from staff regarding the implementation of this regulation. (SCS)

Comment: Once guidance documents are developed, EDF recommends CARB actively outreach to interested stakeholders with the guidance documents through open forums and public dialogue to ensure lingering questions are resolved prior to submission of project protocol applications. (EDF1)

Response: Generally, we do not include implementation-related procedures in our regulations. ARB will develop guidance documents as necessary in 2012 regarding specific aspects of the offsets program.

M-218. Comment: We recommend CARB provide additional clarity about the policy toward standardized versus project-based approaches to protocol development. The draft regulation suggests a philosophical preference for standardized protocols (Staff Report, II-45, III-4). However, this preference is not explicitly reflected in the regulation. The VCSA believes it would be helpful to the market for CARB to clearly indicate whether it intends to endorse one approach to protocol development to the exclusion of another, and insofar as CARB has a preference for standardized approaches, it should clarify exactly what this means (i.e., whether standardized approaches relate to the determination of additionality, the calculation of emissions reductions, or both). VCSA encourages CARB to specify that project-based approaches will be accepted for a limited transition period at the beginning of the cap and trade program's implementation, or as a transition to a sector-wide approach. The rationale for this would be threefold: (1) to enable an adequate supply of early offsets for the program; (2) to encourage additional innovation in a still-nascent market, and (3) to recognize pioneers for groundbreaking efforts in protocol development and project investment. Allowing project-based protocols to be approved for a limited time will encourage a diverse and creative range of protocol types over the longer term.

Standardized approaches are limited in number, take time to develop, and require significant resources. The development of project-based approaches can serve to inform the creation of standardized approaches in certain sectors and will provide the necessary incentives to motivate an industry-wide move towards lower carbon emissions. Restricting approved protocols to only standardized approaches could also result in insufficient offset supply arising from a limited set of protocols. (VCS)

> **Response:** We clarified language referring to standardized methods in the regulation; see new section 95972(a)(9) to alleviate confusion in this area. In addition, ARB cannot allow a transition from project-based protocols to standards-based protocols because each protocol must be approved by the Board. Approving additional protocols does not fall under the purview of this rulemaking. If ARB were to adopt any additional protocols that could be recognized for bringing in early action offset credits, it would have to be done as part of a separate rulemaking and approval process.

M-219. Comment: Section 95987(b)(1)(F) requires an offset project registry to publish a project's Commencement Date at the time of the project's listing. We have found that the Commencement Date identified at project Verification can differ from the Commencement Date submitted at listing, in either direction. This usually results from the unearthing of superior documentation of project commencement than was available at listing. There is no conflict or issue with including the date at listing, provided that ARB recognizes that this date may change with the first verification. (TPI2)

> **Response:** ARB is aware that these dates may differ. Additional offset project documentation will provide the actual date if it is indeed different from the original listing date. ARB may choose to update this date, if it is found to be different.

M-220. Comment: Similar to allowances, CARB should identify that offsets have no expiration. This will help keep offset prices consistent with allowance prices and encourage long-term investment in offset projects. Without such clarity, investments in offsets projects will be dramatically curtailed given the slow ramp of the program and concerns around supply of and demand for offsets. (CE2CP)

> **Response:** Section 95922(c) establishes that ARB offset credits do not expire unless retired or surrendered to meet a compliance obligation.

M-221. Comment: Apart from the quantitative limit, it is paramount to ensure that the sector-based offset credits are bankable. This would provide essential efficiency and cost containment benefits as well as potentially strengthen near-term demand for REDD and other sector-based credits in anticipation of greater demand in the future. This is likely the intent of the proposal, but the section on banking (section 95922) says only that allowances from California or other external cap and trade programs are bankable. It also says that other "California compliance instruments" do not expire until surrendered or retired. However, it is important to make sure that the sector-based credits from REDD are defined as "California compliance instruments" since Subarticle

4 on compliance instruments distinguishes between "compliance instruments issued by ARB" and "compliance instruments issued by approved programs." There is no explicit definition of "California compliance instruments." (EDF1)

> **Response:** Although we do not yet include any REDD or sector-based credits in our program, if through a separate rulemaking with an open public process, we were to accept these credits, they would be covered under section 95922(c), which defines the banking rules.

M-222. Comment: For future changes and clarity sake over a 100 year period, ARB should adopt a numbering system for the protocol versions as surely they will be updated and since they would apply for at least one crediting period there will be need to identify which specific protocol applies to a particular project. (CAFORESTRYASSOC1)

> **Response:** Thank you for the comment. We will consider it as we approve and revise Compliance Offset Protocols in the future.

Specific New Protocol Suggestion

M-223. Comment: California Ethanol + Power (CE+P) is in the process of developing a sugarcane and sweet sorghum to energy project in the Imperial Valley. CE+P intends to plant 40,000 acres of sugarcane that will support the facility. The cane will absorb massive quantities of carbon, much of it being stored in the roots of the cane. After 5 years of production, the cane that is in the ground will be turned and left in the ground. During that 5 year period a large amount of carbon would have been captured and stored. CE+P believes that some sort of carbon capture should be calculated and credited and that the benefit of that should fall into the Cap & Trade analysis. In the end, growers of the cane can apply those credits as a way to off-set the cost of planting, growing and harvesting the carbon absorbing crop. It would be the same type of plan we see today, when trees are planted and credit is given or when forests are protected from being chopped down and credit is given. (CEP)

> **Response:** Thank you for the information related to your planned activities. However, we will review any additional ideas for offset projects as part of a future rulemaking.

M-224. Comment: We request the adoption of our GHG offset protocol for Biomass Waste for Energy projects. A copy of the protocol is attached. (PCAPCD)

> **Response:** The energy sector is a capped sector under the cap-and-trade program, therefore it is ineligible to generate offsets. Any use of biomass that meets the reporting and verification requirements of the MRR as listed under section 95852.2 would be exempt from a compliance obligation. Providing offsets credits to those same emissions would result in double-counting under the cap-and-trade program.

M-225. Comment: The most effective way of maintaining stable levels of atmospheric GHG concentrations is to prevent emissions from entering the atmosphere. This can be done in one of two ways: by using less energy and energy-intensive products, or by producing energy and goods in ways that result in lower emissions. Calera's process would enable the use of domestic fossil fuel resources to create energy without the conventionally attendant GHG emissions. Unlike traditional carbon capture and storage (CCS), carbon conversion does not simply store captured CO_2 and transport it to a storage facility. It is instead a means of avoiding CO_2 emissions by converting the gas to a carbonate solid or liquid state, which is no longer a greenhouse gas and will not revert to one. Obviously, emission reductions anywhere on the earth have the same impact in terms of atmospheric concentrations of GHGs. For this reason, Calera urges ARB to revise the proposed Cap and Trade rule to encourage out-of-state sources to reduce emissions through any means, including conversion of greenhouse gases to non-GHG forms. This can be done through enabling such sources to sell offset to covered sources within the State. Calera suggests, therefore, that sources outside the State of California that capture and convert their carbon dioxide gas to non-GHG forms can sell offsets for emission reductions to California sources under the cap. This will provide an incentive for California sources to encourage out-of-state emissions that might be more cost effective but have the same benefits on atmospheric concentrations as in-state reductions. (CALERACORP)

> **Response:** Thank you for the information related to this technology. However, we will review any additional ideas for offset projects as part of a future rulemaking.

Carbon Capture and Sequestration

M-226. (multiple comments)
Comment: The proposed regulation does not allow offset development in the capped sector responsible for significant GHG emissions, and does not provide a mechanism to account properly for emission reductions attributed to CCS. We recommend that CARB develop a compliance grade CCS offset project protocol to promote the use of CCS technologies in both the capped and uncapped sectors. CARB should make available offsets for capped entities to provide additional support to recognize the significant investments required to deploy CCS. (CODEXIS)

Comment: WSPA supports the inclusion of provisions for a carbon capture and sequestration protocol. (WSPA2)

Comment: Request that the program recognize the valuable role carbon capture technologies can play as part of the state's GHG reduction strategy, as well as the way CCS is contributing globally to climate solutions. By providing proper incentives for in-state clean technology development and deployment through policy drivers and strong regulatory signals, California will also promote in-state innovation and green job growth. CARB's Cap and Trade program should encourage carbon capture retrofits to existing fossil fueled generation. As discussed, CCS can greatly reduce the emissions inherent in providing California its baseload generation, and can be applied to significantly reduce emissions from other industrial sources of GHGs. We believe that the final regulation should provide developers of CCS technologies with credit for the significant carbon reductions that may be achieved through the use of carbon capture. We encourage CARB to develop methodology for measuring, reporting, and monetizing these emission reductions to incentivize power plants serving California's electricity load and industrial base to reduce existing emissions through CCS. The development of such a methodology will rapidly promote the research and development required to commercialize this technology. CARB should develop a mechanism to recognize, account for, and verify CCS-related emission reductions. (CODEXIS)

> **Response:** While carbon capture and sequestration (CCS) is a promising technology that may someday prove useful in the effort to avert climate change, it is still a developing technology. California supports research and development of CCS through various efforts, but if a methodology is included in the cap-and-trade program it would be used to reduce the compliance obligation of covered sources, and could therefore not be used as an offset protocol.

N. PROTOCOLS

This section includes comments and responses concerning to the Forest Protocol (Part V of the Staff Report), Livestock Manure (Digester) Protocol (Part IV of the Staff Report), Ozone Depleting Substances Protocol (Part III of the Staff Report), and Urban Forests Protocol (Part II of the Staff Report). Major topics within the Forest Protocol section concern forest harvesting; forest conversion; additionality; permanence; the crediting period; and measurement, monitoring, reporting, and verification. Major topics within the Livestock Manure Protocol section include additionality; the crediting period; and measurement, monitoring, reporting, and verification. Major topics within the Ozone Depleting Substances Protocol Section include additionality; permanence; geographical location of projects; and measurement, monitoring, reporting, and verification.

U.S. Forest Projects

The Air Resources Board (ARB or Board) received extensive comments on the Offset Protocol for U.S. Forest Projects (Forest Offset Protocol or the Protocol). Many of these comments were related to offset credits and forest harvesting, including clear-cut harvesting. In order to most efficiently respond to the broad issue of forest harvesting practices and how it is addressed in the Forest Offset Protocol, we are listing those comments first, followed by a detailed response that focuses on this issue raised in the comments received. Additional comments and responses on the Protocol follow these comments and response.

N-1. (multiple comments)
Comment: Right now, CARB's draft cap and trade regulations risk tolerating an obvious scam. Big polluters like cement plants, electricity generators and oil refineries will simply duck restrictions by buying clearcut offsets. This not only will promote and subsidize the worst kind of forest cutting techniques but also will pose huge questions about CARB's program in respect to additionality, leakage and verifiability. (SIERRACLUBCA1)

Comment: The largest emitters of greenhouse gases (GHG) should always be required to reduce emissions to the fullest extent possible. The option of “buying credits” might be allowed or considered only as a last resort, only after the “emitter” has demonstrated diligent, valid, and long-term efforts to reduce emissions. Otherwise, the activity or operation must be fully curtailed. Bottom line no credits for clearcuts. (PIC)

Comment: Eliminate from the offset program clearcutting of our forests and eliminate the conversion of naturally managed forests into tree clearcut plantations. (GILBERT)

Comment: Don't make clearcutting a part of your climate program. Don't permit clearcutting in the offset regime. This is no way to sequester carbon. Allowing clearcuts as "offsets" will discredit the integrity and credibility of the state's entire climate effort. Do add stipulations that will ensure against changing natural forests into clearcut plantations. (SIERRACLUBCA1)

Comment: I am very concerned that the draft regulations might permit timber management plans that are environmentally damaging and GHG intensive, such as clear-cuts. We are very concerned about the dangers of such practices for watersheds and fish populations. This issue has been publicly discussed for many months, which suggests that the solution is either complicated or politically difficult. In such circumstances, I favor putting the burden of negotiation on the timber companies rather than on the environmentalists. For now, just leave forestry out of the regulations. In a short period of time the industry will come up with an acceptable solution and it can be amended into the rules. At present California has little experience with offsets. It is important for the program to learn to walk before it tries running into difficult areas. If the proposed draft is adopted, the owners of cement kilns, power plants and refineries will have an open season to invest in clearcut offsets which will subsidize highly damaging forest harvest techniques. (BIRDLEBOUGH)

Comment: Please remove clearcutting as an eligible protocol for improved forest management. There are really two reasons for that. One is that the accounting that we have right now for clearcutting is not accurate. It has problems with the base line. It has problems with leakage. It also has problems with the amount of carbon in the soil. A lot of people think that's up to 50 percent. (SIERRACLUB 2)

Comment: I support the concern among my fellow Sierra Club volunteers and others about the regulations allowing forest clear-cut offsets. Please eliminate this provision from the regulations. (CPC2)

Comment: If forest protocols are adopted as currently written, the Board will be endorsing deforestation. SPI and their land management practices are a clear path to a decline in watershed health and many other resource values. Endorsing their destructive practices will not be tolerated, especially coming from a representative public body. (SANDERS)

Comment: Please—this is about a whole lot more than immediate dollar signs. Coming from a logging community, we still recognize the necessity of multiple age forests. There is more to our forests than money. By allowing the clear-cutting and falsehood of the carbon credits to become law, we truly are entering the age of stupid. Our forests can be and should be managed in their total form (i.e. biodiversity) and not just in their profit form. Selling the carbon credits in no way changes the excessive amount of pollution that is expended into our environment. Let's come up with a plan that will be appreciated and praised by the future generations. Thank you for your serious, heartfelt consideration. You have an important decision to make. (ATCHER)

Comment: No clearcutting. (REHG)

Comment: I'm here to remind you that the clearcutting issue in the forest protocol has got to get fixed. (OLIVEIRAM)

Comment: I am writing to urge your board to reconsider and amend the rule to exclude clear cutting from the Carbon Offset Program. (TAYLORS)

Comment: Clear-cutting of forests should not be traded for carbon credits. (TREEFOUNDTN)

Comment: Please add my name to all those concerned with the long term effects of clear cutting. Millions and millions of acres of forest land in California, Oregon and Washington have already been changed to timber harvesting operations. The impacts of these changes will have consequences for the health of us all. Over the years the Board has taken courageous and beneficial action on behalf of the air quality of California. I hope you will be equally conscientious on behalf of our forests' ability to deal with ecosystems, water quality, wildlife habitat, and climate change. (PHELPS)

Comment: Remove clear cutting from the proposed cap and trade program. (DAVISSTEIN)

Comment: The Cap and Trade program would allow "clearcutting" which would destroy our forests and our air and create even more gas emissions than burning fossil fuels. (REED)

Comment: Deforestation is a major contributor to climate change. For the timber industry, Cal Fire, and Air Recourse Board to claim that clearcut logging is good for our climate is an excellent example of Orwelian news speak; clearcut logging equals deforestation. (WILLARD)

Comment: As someone who lives in the Sierra and has been watching the forests be decimated by 20-acre clearcuts and their plantation replacements, I strongly oppose the proposed rules which would not only allow but encourage 40-acre clearcuts and the whole clearcut-plantation system of eliminating mixed forests. Not only does this create incredible ugliness, but much science shows that clearcutting releases so much carbon that it will take up to a century for the new trees to compensate for the carbon released, let alone sequester more. Additionally, the deforestation/plantation model reduces biodiversity among both plants and animals, thus reducing resiliency, which is the key to surviving environmental and climate change. It makes no sense to try to address one environmental problem by exacerbating others. (EPFW2)

Comment: The cap part of this program is a good strategy. Industry should be willingly doing everything possible to stop source pollution, asap. Doing any type of clearcutting of our forests is a bad strategy. Californians and the biodiversity that lives in natural forests need uneven-management, and select cutting. Forests are currently being clearcut even without your cap-and-trade program. Of which itself is controversial. Are you intending to do more clearcutting than the Board of Forestry is already allowing?

See satellite images of what we have lost just in the last 10 years. Please don't let only a market economy dictate how California faces climate change. Please don't ignore the voices and the science of the people, for example; clearcutting forests will not sequester more carbon. Clearcutting more forests will definitely stress even more fragile ecosystems across the state and drive to extinction species of animals and plants that may have not even been identified. You can always take the cap off, you will never be able to put back the natural forests. Please no more clearcutting California's natural forests. (LAWRENCEP)

Comment: The forests support recreation, jobs, and the environment. Allowing clear cutting to be a key component of the cap-and-trade offset will have a detrimental impact to our area. I support timber harvests, both for its contribution to our economy and to maintaining safe communities. Utilizing clear cut harvests as a forest carbon offset, diminishes what we are doing in the realm of land-use, transportation, and housing. I ask ARB to weigh the impact of the Forest Protocol on the local area with the goal you are trying to reach for all of California. (CALLAWAY)

Comment: We urge ARB to eliminate clearcutting of any forests from any offset/sequestration programs and recognize such flimflam as the ruse it is. For "improved forest management practices" to be (mis)used to offset GHG emissions is unacceptable and will result in a shell game that can never be thoroughly monitored. The accounting issues are formidable and, unless curtailed now, will be rendered useless with complicated, multi-layered "schemes." (PIC)

Comment: The idea of cap and trade to help reduce Greenhouse Gas Emissions (GGEs) has some clear benefits if it is within scientifically accepted boundaries that promote less impact to our air quality. However, the current proposal that would allow even-aged management as an offset for GGEs is completely opposite of the intended purpose. In order to reduce our carbon footprint we must embrace forest practices that will be carbon neutral. The only forest practices that are carbon neutral are ones that promote the growth of standing forests by thinning from below and thereby reduce the threat of catastrophic fire. This type of forestry is called sustainable uneven-aged management. Even-aged management or clearcutting is not carbon neutral. It actually increases impacts to our air quality by cutting down forests that should be sequestering carbon while cleaning our air. Please consider carefully any program with market incentives to ensure that the offset is indeed an improvement to our environment. Clearcuts are not, plain and simple. The proposal as written is a mockery of the intended purpose and would increase the problem we are attempting to solve. Please include language that protects our forests in California as they are becoming one of our most valuable assets in dealing with climate change. (MRC)

Comment: I strongly urge the Air Resources Board to adamantly oppose industrial clearcutting of forests as a carbon emission offset. Sustainable harvesting and management is the most prudent means of reducing climate instability and science supports that. We need policy makers who are bold enough to stand up to industry pressure. (CRUTCHER)

Comment: The removal of forest vegetation is not justified by any need to offset carbon emissions. Our forests store carbon. Legalizing the removal of forests to provide carbon emission credits makes no sense. Polluting industries should offset polluting industries. We should not promote forest removal to further encourage polluting industries. (KANGAS)

Comment: Please do not include clearcutting as an offset for polluters. They are destroying the Sierras bio diversity. Supporters' claims of carbon sequestration from clearcutting are in serious question. Two thirds of California's water comes from these mountain watersheds. (SCHANER)

Comment: I strongly urge you to disallow these carbon offsets. Replanting following clearcutting is of questionable value in reducing carbon emissions. Clearcutting is a highly aggressive logging method which reduces biodiversity and the complexity of forest structure; it should not be encouraged in the name of reducing carbon emissions. (KLOSTERMAN)

Comment: Please eliminate from the offset program, the ability of forest companies to clearcut the forests to sequester carbon and add provisions to the offset program which assure that forest projects result in naturally managed, uneven aged forests. (BEILEY)

Comment: Please do not consider clearcutting as an improved forest management practice. Clearcutting at least temporarily destroys the part of the forest that is cut. The cut trees rot, releasing their carbon dioxide. For a while there may be no roots to hold water in the soil; this allows water to run off and erode the land. The eroded soil may reach streams with adverse effects on our drinking water and fish. Clearcut forests have no value for most wildlife or human recreation. (UNGER)

Comment: Inclusion of forest clear-cutting in the cap and trade program makes no sense because it encourages multi-fronted environmental damage with far more potential climate damage than any sequestration gains from resulting lumber products. There is no need to encourage clear cutting with its poorly understood environmental liabilities. This cap and trade program should not encourage smokestack industries to pay for raping our landscape.

- Clear-cutting is a systemically destructive process opening the landscape to erosional damage. The resulting even-aged monoculture tree plantations are more vulnerable to population collapse than forests of diverse age and species.
- Deforestation is the precursor to worsening climate change, (e.g., Easter Island, Middle East, etc.).
- Healthy (uneven aged) forests are natural buffers against desertification, modulating humidity, consuming CO_2, and stabilizing soil carbon (a huge unmeasured reservoir). It takes many decades for a tree plantation to reach the three dimensional carbon density of leaf mass in a mature uneven-aged forest.

- Though lumber companies may claim that sequestration of carbon in lumber products is most efficiently handled by clear cutting, their claims are self-serving. Lumber from judicious mature tree harvesting provides enough off-setting benefit for lumber harvesters. (KRAMER)

Comment: Please do not allow environmental polluters the option of "carbon credits" by clear cutting forests. This completely goes against attempts to green and make clean our environment. (CATTIVA)

Comment: Inclusion of clearcutting as an ARB endorsed sequestration technique completely undermines the value and credibility of the Protocol program and of California's Global Warming Solutions act of 2006. Clearcutting is a flawed and destructive forest management technique, with no potential for timely carbon sequestration. And, as such, it will be a meaningless offset option that will misuse funds that could go to true reductions of emissions through energy efficiency programs and renewable energy development. (CARLONE)

Comment: Forest clearcutting should not be included in the carbon sequestering program of cap and trade. Our forests are vital components in protecting our watersheds, preventing floods, mudslides, sedimentation of our streams, rivers and lakes, helping to replenish our groundwater, and helping to keep our water clear, clean, and healthy for all organisms. (GARCIA)

Comment: Systemic analysis of environmental impacts of greenhouse gases show that if you connect the dots, clearcutting does not have a positive impact on the health of our planet, our state, our lives. Cap and Trade schemes should not allow clearcutting to be considered a sequestration opportunity. Clearcutting with the resultant plantation replantation harms our water supply, our wildlife diversity and is an insult to the integrity of our remaining forests. The science is affected by the interests of for profit timber outfits, just as drug research sponsored by drug manufacturers will more likely be designed to find benefit from the tested drug. (EPFW1)

Comment: No carbon cap and trade credits for clear cutting. Have you even looked at the results of clearcutting? Are you aware of how much carbon is released when you cut down a tree? Are you aware of how much our air quality depends upon trees as filters? Why would the Air Resources Board even waste time considering including the destruction of our forests for cap & trade? (ST)

Comment: The protocols do not fully account for sources of carbon emissions that occur during timber harvesting, when forests are sinks for carbon storage when they are not harvested. In making these determinations, there cannot be any errors or omissions, or the entire purpose and intention of the cap and trade protocols becomes suspect and of course, ineffective at achieving its purpose. (PARKER)

Comment: I ask the Board not to adopt rules that allow timber companies to clearcut our forests and yet sell credits in the process when it takes 80-100 years to recuperate such carbon emissions. (HARD)

Comment: I'm not sure how it makes sense for timber companies to sell carbon credits while at the same time removing carbon-neutralizing/sequestering features from the landscape. Replanting a seedling to replace a mature tree does not defray the carbon sequestration lost, now does it? Not for another three or four human generations will those seedlings that survive (those that survive) be equivalent to those lost. (WALLACE)

Comment: Capping greenhouse gas emissions is a great thing to try to do, but clearcutting forests creates grave problems, like diminished biodiversity, soil erosion, and greater susceptibility to fire and disease. Forests are intrinsic to clean air. It would be unwise to allow clearcutting with the intention of capping greenhouse gasses. (STONEMAN)

Comment: This idea of clearcutting our way out of climate change makes no sense at all. It is not acceptable. I say no to allowing facilities with the greatest emissions such as power plants, refineries, and cement kilns, to avoid reductions by purchasing very highly questionable clearcut offsets, subsidizing the most aggressive and destructive forest harvest techniques. California's working timberlands are important for people, and not just for nature, habitat, and wildlife. Our forests are the lungs of the earth. They purify our air. Please only allow programs that will assure to produce a method that lowers emissions. We must avoid subsidizing clearcutting. It is a huge and unacceptable environmental risk. Please do not let this pass. (LOTUS)

Comment: It's just laughable the logging industry could push through a cap and trade scheme whereby they clear cut, plant a few trees, and get cap and trade revenues from it. (CONNERS)

Comment: Your proposal does not adequately consider all the effects of clearcutting and makes your whole program subject to valid criticism and doubts. California's forests are also important for the ecological services they provide, not only for nature, habitat and wildlife, but for people too. Our forests are the lungs of the earth that purify our air. Our forests control sedimentation and temperature of the waters we drink, and on which our salmon depend for reproduction. Even aged, clearcut forests are less resilient, more prone to fire and disease, and provide less diversity of habitat for the species on which nature and Californians depend. Clearcutting should be outlawed. Your regulations should encourage select harvesting of forests rather than clearcutting. No offsets for clearcutting. (CARLTON, GOGLIA)

Comment: As proposed, the AB 32 cap-and-trade regulation threatens California's forests and the wildlife that rely on them. I am writing to urge you to amend the proposed cap-and-trade rule to exclude offsets from forest management projects that allow forest clearcutting. I implore you not to make forest clearcuts the face of AB 32.

We cannot and should not try to clearcut and burn our way out of climate change (FORMLETTER08).

Comment: Addressing the controversy around clearcutting and the conversion of natural forests to a more simplified condition, it's important to clarify what qualifies as natural forest management. (PFT2)

Comment: Please do not use Clear Cutting as a solution to Climate Change. Improved forest management practices cannot be interpreted as clear cutting. Soil erosion, slash burning, and heavy applications of herbicides which run into nearby streams are practices that were not adequately taken into account when calculations on carbon sequestration analysis was done. Our forests are the lungs and filters for California's diminishing air and water resources. Please do not allow big polluters such as cement kilns, power plants and refineries to avoid their own emissions reductions by purchasing highly questionable clearcut credits. Please protect both our forest and our climate by eliminating clear cutting from the offset program and assuring that natural management of forest projects do not turn into clear cuts. (MINES)

Comment: Including forest clearcutting does greatly increase the possibilities for gaming and for the development of non-additional credits under the forest protocol. If you are going to approve the forest protocol as part of AB 32, do so without the forest clearcutting. (CBD3)

Comment: Including clearcutting in your program calls into question the credibility of the program (particularly for additionality, verifiability, and leakage). It will allow the facilities with greatest emissions (cement kilns, power plants and refineries) to avoid reductions by purchasing highly questionable clearcut offsets, subsidizing the most aggressive and intrusive forest harvest techniques. Even aged, clearcut forests are less resilient, more prone to fire and disease, and provide less diversity of habitat for the species on which nature and Californians depend. We should adopt only programs that will most reliably assure actual sequestration and avoid those that ignore carbon impacts of entire components of the activity seeking to be called an “offset” such as clearcuts. We should particularly avoid subsidizing clearcuts because they are extremely difficult to assure additionality, and they also pose big environmental risks. Please protect the integrity of the climate program and resiliency of California’s forests. By eliminating from the offset program clearcutting of our forests as a way of sequestering carbon, and adding provisions to assure that forest projects do not result in the conversion of naturally managed (uneven aged forests) into clearcut plantations (even aged forests). (FORMLETTER03)

Comment: The protocols for timber management – e.g., “reforestation” and “improved forest management” are nothing more than a wish list for the timber industry, and if implemented as written they will have the net effect of increasing the loss of native forest and the extirpation of the associated plants and animals that comprise California’s native forest biodiversity, while doing nothing to offset or ameliorate global warming and greenhouse gas emissions. Eliminate the credit for business-as-usual, even-aged management (clearcutting) practices in the Improved Forest Management category, and amend Reforestation Project credits to protect native biological diversity. We could go into this in more detail, but suffice it to say that we have voiced our objections to business as usual already. We have tried to explain to you that CDF's CEQA certification of the timber harvest plan process via the Z/Berg-Nejedly Forest Practice Act (the Forest Practice Rules) is not effectively protecting California's forests and conserving the plants and animals which, under the State constitution, belong to all the people of California. In California, under the current rules for timber harvests, California's fabled forest biodiversity is disappearing, acre by acre, year by year. This is entrainment towards extinction. As parties to the development and approval of these forest protocols, the ARB will become a new contributor to the extinction of thousands of plants and animals. I don't think that was your intention. It isn't too late to fix this. (PARKER)

Comment: Clearcuts have no place in the calculation of forestry carbon offsets. Natural forests sequester carbon, but a replanted clearcut site emits more carbon than it sequesters for as much as 20 years. Clearcutting also decreases the ability of forests to withstand climate change. Natural forests also stabilize the soil and reduce flooding, while providing 60 percent of Bay Area water. Clearcutting increases flooding and soil loss and disrupts the water table. Please make sure that clearcutting is excluded from the calculation of forestry carbon offsets. (SREDANOVIC)

Comment: We cannot clearcut our way out of climate change. Please take out provisions that would include clear cuts in the kind of forest projects that are eligible as offsets. (ALLENAMY)

Comment: Please do not allow clearcutting in the cap and trade program. Clearcutting offsets are suspect. We can't allow facilities with huge emissions to avoid their reductions by buying these questionable offsets. Furthermore our working timberlands matter a great deal for purifying our air, for the water we drink. Clearcut forests are more prone to fire and disease, and provide fewer different habitats that various species need, and on which our environment depends. (SEAL)

Comment: We should adopt only programs that will most reliably assure actual sequestration and avoid those that ignore carbon impacts of entire components of the activity seeking to be called an "offset" such as clearcuts. We should particularly avoid subsidizing clearcuts because they are extremely difficult to assure additionality, and they also pose big environmental risks. California's working timberlands are also important for the ecological services they provide, not only for nature, habitat and wildlife, but for people too. Our forests are the lungs of the earth that purify our air. Our forests control sedimentation and temperature of the waters we drink, and on which our salmon depend for reproduction. Even aged, clearcut forests are less resilient, more prone to fire and disease, and provide less diversity of habitat for the species on which nature and Californians depend. (NELSON, ENDICOTT, BITHELL, ENDICOTT, KENNEDYB)

Comment: Please, please, please! Protect our forests, its inhabitants and our planet. Do not pass this very questionable plan to permit market trading of carbon emissions/pollution for forest carbon offsets. This plan permits timber companies to clearcut California's forests, while allowing the companies to sell credits in the process. How long will it take for the forest to grow back to recoup? 80 to 100 years! There is nothing logical about this plan. (MOCIUN)

Comment: My name is Ciyin. I am in the 5th grade and have recently been published in The Gold Edition 2010 Poetry Collection from the American Library of Poetry. I have written you a poem today. When they clearcut they take the trees lives away. That is what I am here to remind you today. When they clearcut, the trees aren't the only thing that gets hurt. The bugs, the animals, and even the dirt, because of the pollution, herbicide pollution. That's no solution. Don't you see? When they cut down the trees, they make it bare. Do you care? Let the forests stand and the land go free, it's a part of you and a part of me. The trees breathe for you and they breathe for me. When your great great grandchildren wonder why and look back on this day. Will they curse you or bless you? It's your decision to say. I live near these sires, where the tall ones fall. /It makes me cry to look at them all. It once was so beautiful and full of life. There's still some left. Please help end this strife. (OLIVEIRA1)

Comment: I am against clearcutting. I don't see any positive things in clearcutting. First of all, all the animals run from their homes in the trees, to the suburbs and cities where they get hit by cars or shot at. Many starve to death. Next, cutting the trees and leaving one or two dead trees is still clearcutting. I go to the areas where they've clearcutted and I never see any natural biodiversity saplings, or any other trees. I don't care if they cut one or ten trees, but when they cut 20 to 30 acres at a time, with nothing left is heartbreaking. I live on 30 acres, do you know how much life is on 30 acres? I don't see why we can't make paper and building products out of hemp. It's a weed! It grows back in a few months. Unlike trees who take a hundred to hundreds of years to grow back. When all these trees are cut the ground water, and animals are poisoned with the big machines they clearcut with. They are also poisoned by the chemicals they spray to make it impossible for anything to grow except their unnatural saplings. Even humans get poisoned because the chemicals go into the air and in our drinking water. Last year, Sierra Pacific sprayed nearly 20,000 pounds of their poison into my country, for clearcuts...FOR CLEARCUTS! Amphibian population is down bird population is down The porcupine is gone! Cancer is on the rise My friends are spilling proteins You should know I used to live in a town that had mills. The loggers used to have work. Clearcutting takes one man, one machine. And it can ruin the forest, and ruin a town. Tell me, what are you leaving for your children? And your children's children. And one day they'll ask you...WHY? (OLIVEIRA2)

Comment: Some friends and I made the following very short youtube video to sing our concern about clear-cutting forests being called a carbon offset. (ROBERTSONR)

Comment: It is difficult to understand how allowing clear cutting can positively influence the carbon content of the atmosphere. What is clear is that the short term effects of harvesting timber add carbon to the atmosphere and clear cutting adds more carbon. The thrust of this proposal is to promote short-term timber harvests increasing the atmospheric carbon load while securing some unknown benefits in a long-term uncertain future. Please remove this provision and rethink the entire protocol. (CARNAHAN)

Comment: I have to say that I continue to be totally bewildered that CARB is even considering the possibility that cutting down trees, even if planting new ones can be considered a method for offset. (BROWNRE)

Comment: It is irrational to allow industries to offset (rather than actually reduce) their carbon emissions by purchasing offsets from a timber harvester who then clearcut the very trees that could help in small measure if they were left standing. The emphasis should be on reducing carbon emissions and only as a last resort offset them. If offsetting is available, the offsets must be truly environmentally beneficial, not destructive. It is imperative that you remove that from your regulations. (VWCSLV)

Comment: CARB needs to clarify that the forest protocol does not permit forest offset projects to generate credits for converting a diverse, natural forest to a simplified even-age stand. (VESSER)

Comment: A looming problem with ARB's proposal is that a large number of carbon offset credits issued throughout the state could come from forest management projects that allow clearcutting. Exclude forest clearcutting from the carbon offset program. (SCCBOS)

Comment: We strongly urge ARB to eliminate from the offset program the clearcutting of our forests as a way of sequestering carbon and to add provisions to assure that forest projects do not result in the conversion of naturally managed (uneven aged forests) into clear-cut plantations. California's working timberlands are also important for the ecological services they provide, not only for nature, habitat and wildlife, but for people too. Our forests are the lungs of the earth that purify our air. Our forests control sedimentation and temperature of the waters we drink, and on which our salmon depend for reproduction. Even-aged, clear-cut forests are less resilient, more prone to fire and disease, and provide less diversity of habitat for the species on which nature depends. Not all offsets are created equal. This is a novel program and the accounting issues are complicated. We should adopt only programs that will most reliably assure actual sequestration and avoid those that ignore carbon impacts of entire components of the activity seeking to be called an "offset" such as clear cuts. We should particularly avoid subsidizing clear cuts because they are extremely difficult to assure additionality, and they also pose big environmental risks. (FFOREVER1, FFOREVER2)

Comment: ARB's proposed Cap and Trade rule currently not only explicitly invites forest clearcutting as a carbon offset project, but also incentivizes the conversion of natural forests into tree farms. This is no solution to climate change, and further threatens forest ecosystems and wildlife already at risk from global warming. The inclusion of forest clearcutting as a carbon offset project undermines the integrity of the program as whole, especially when so many critical flaws remain in the forest offset protocol. ARB's own review of the forest protocol identified fundamental flaws that threaten to undermine the value, additionality, and verifiability of forest offset credits. The Climate Action Reserve, which developed the forest protocol, similarly acknowledged concerns regarding the environmental impacts of forest clearcutting, but has repeatedly and indefinitely postponed any action to address those concerns. When ARB board members raised questions about the inclusion of forest clearcutting when the protocol was first considered in September of 2009, they were assured that these flaws would be addressed and the forest protocol would become the "gold standard" for forest carbon offsets. Unfortunately, the proposed rule fails to address the systemic problems, and more importantly still includes forest clearcutting.

Forest clearcutting and the conversion of native forests to tree plantations pose great risk to the climate, while simultaneously degrading forest ecosystems, water quality, and wildlife habitat, and impairing the forest's resilience to the impacts of climate change. In its current form, the forest protocol lacks credibility because it would subsidize the most intensive and environmentally risky timber operations in order to provide carbon offsets that would allow power plants, oil refineries, and industrial polluters to avoid upgrading their facilities to adopt less polluting technologies. At the same time, the forest protocol fails to account for greenhouse gas emissions associated with logging slash and debris, dead trees, roots and soil, all of which are much greater for forest clearcutting than for native forest management. This is no gold standard.

Not all offsets are created equal. ARB should consider only programs that can reliably assure carbon sequestration and avoid those that introduce additional environmental risks. We cannot clearcut our way out of climate change. Rather than promoting the conversion of native forests to a patchwork of 40 acre clearcuts, California should use this opportunity to incentivize the best kinds and "green" forms of forest management, which can benefit both the climate and the forest. The forest protocol offers many other options that meet these criteria: reforestation projects; preventing the conversion of forests to development; and the conservation of forest resources.

We strongly urge the Air Resources Board to make the following changes: First and foremost, do not include forest clearcutting as part of the California's Cap and Trade offset program. A Forest Project may not include even-aged management. In addition, the forest protocol should not be part of the proposed Cap and Trade rule unless, at the minimum, the following critical amendments are adopted. Forest carbon offset projects may not include conversion of native forests to tree plantations. A Forest Project may not include conversion of native forest stands comprised of multiple ages or mixed native species to even-age or monoculture management, and may not include even-age management of any stand that had been converted to even-age or monoculture management in the harvest cycle preceding the registration of the Forest Project. Forest carbon offset projects must account for changes in down and dead wood and soil carbon pools. Forest Projects that include timber harvesting are required to account for changes in the following forest carbon pools: lying dead wood, and soil carbon.

ARB should consider only programs that can both reliably assure the value of carbon offset projects and protect forest from additional environmental risks. The failure to fully account for the carbon consequences of harvest practices poses risks to the integrity of the entire program and increases the potential for unintended impacts to our forests. We hope we can continue to work with you to address the other flaws in the forest protocol that threaten the conservation of native forests and the wildlife that depend on them. (BATTLECREEK1)

Comment: We support the adoption of the forest protocols, but with regard to concerns raised about the prospect of more diverse natural forests being converted to conditions that are less diverse and more simplified, we recommend that ARB clarify that forest offset projects not do this, and that they do not receive credit if they do this. (NC6)

Comment: By allowing clearcutting, you're allowing big trees to be replaced with this (forest picture of small trees). And this is not going to help us in the next 20 or 30 or maybe more years. (SIERRACLUB3, SIERRACLUB4, SIERRACLUBCA3)

Comment: Please watch Annie Leonard's "The Story of Cap and Trade" to learn how irrational and irresponsible it is to regulate sustainability using credit offsets. This action would let the biggest greenhouse gas polluters (oil refineries, power plants and cement plants) buy offsets in forests throughout the Sierra Nevada and elsewhere, from timber operators that clearcut California's forests. None of the international climate programs include clear cuts, so don't let the timber harvesters set this awful precedent in California's new law. Please take out provisions that would include clear cuts in the kind of forest projects that are eligible as offsets. (CHABAN)

Comment: It would be a huge mistake to include clear-cut type of timber harvest and the resulting even age tree plantation as a way to offset carbon. Once ground disturbance is introduced into the equation then the picture changes dramatically and there is no way to clear-cut without a whole lot of ground disturbance. Where is the science that backs up using plantations generated from clear cuts and includes the huge carbon release from soil disturbance? (ELIAS1, ELIAS2)

Comment: Exclude forest clearcutting from the offset program. Forest clearcutting and the conversion of native forests to tree plantations pose great risk to the climate, while simultaneously degrading forest ecosystems, water quality, and wildlife habitat, and impairing the forest's resilience to the impacts of climate change. Forest projects eligible for offset credit should not include even-aged management, and should not become an incentive for the conversion of native forests to tree plantations. Furthermore, offset projects should account for changes in down and dead wood and soil carbon pools. (SIERRACLUBCA4)

Comment: Three years ago, we urged adoption of those original protocols because in the words of the Chair, investment in this market will lead to forest management projects that will both store carbon and benefit California wildlife and watersheds.

Unfortunately, today, the forest protocols that are embodied in this proposed cap and trade regulation no longer meet that standard because they were substantially amended by the Climate Reserve in 2009. And much of that was done to accommodate the desires of timber companies like Sierra Pacific Industries and trade groups like the California Forestry Association. Those groups, as many recall, opposed the protocol in 2007 because of issues that they were concerned about, largely because they didn't allow clearcutting is one example. Specifically, clearcutting allows native forests to be converted to mono culture tree plantations. The protocols before you today allow this. urging that you not include these forest protocols as part of your regulation unless they are amended to specifically exclude even aged management. Pretty simple and straightforward policy action you can and should take today. And I would urge you not to refer this issue back to the Climate Reserve, ARB staff, or further study, but allow these flawed protocols to move forward intact. These issues were raised at a Board meeting in September 2009, and basically nothing has been done about them by CAR. Instead of fixing the problem, CAR has refused to even calendar for discussion a compromise that many of the groups that will speak next after me had put together. This was a compromise proposed back in January. I think my added concern of referring this back to CAR is it's not a State agency and not bound by the open meeting laws or other transparency requirements that the Air Board and other State and local government agencies are required to follow. In our respects, we think that CAR has bent over backwards. We urge you to not adopt these protocols unless they're amended to remove the clearcutting issue. (SHELLITO)

Comment: I am writing to urge ARB to amend the proposed Cap and Trade rule to exclude forest clearcutting from the carbon offset program, in order to protect forests and the wildlife that rely on them. The proposed Cap and Trade rule not only invites forest clearcutting as a carbon offset project, but also incentivizes the conversion of natural forests into tree farms. Do not include forest clearcutting as part of the California’s cap and trade offset program. (FORMLETTER02, BATTLECREEK2)

Comment: Let's not forget the pictures that I've passed around and shown you that shows the clearcutting damage in our area. And now they're coming back and cutting clearcuts next to clearcuts. All of this is something that California should not want to export to other countries like Mexico or Amazon. We don't need this brand of clearcutting in those countries, too. What we need is clearcutting removed from the protocols. (BATTLECREEK2, FORMLETTER02)

Comment: You need to take the snow pack into consideration. All the science that I have read points to clearcutting as having a devastating effect on the water we all need. (ELIAS1, ELIAS2)

Comment: The Forest Offset Protocol should not include forest clearcutting as an eligible forest project type. The inclusion of forest clearcutting as an eligible management type in carbon offset projects undermines the integrity of the Forest Offset Protocol and the Cap and Trade program as whole. Forest clearcutting and the conversion of native forests to tree plantations increase the risks to forest ecosystems, water quality, and wildlife habitat, and can impair the forest's resilience to the impacts of climate change. The habitat fragmentation caused by forest clearcutting can have a substantial negative impact on forest resilience and climate adaptation. In addition, forest clearcutting and the conversion of natural forests to even-aged plantations can result in tremendous GHG emissions. For example, the conversion to plantations of over 12 million acres of old-growth forests in western Oregon and Washington in the past 100 years has resulted in the release of 1.5 to 1.8 billion metric tons of carbon into the atmosphere. However, the GHG emissions associated with the conversion of natural forests to even-aged plantations would not necessarily be counted under the forest protocol if the project is registered more than 10 years after the conversion occurs. Furthermore, the forest protocol fails to require forest projects to account for changes in the soil carbon and woody debris carbon pools, which can result in substantial GHG emissions due to the impacts of forest clearcutting.

When ARB adopted the Forest Project Protocol, version 3.0, in September 2009, staff assured board members at that time that the issues associated with the inclusion of forest clearcutting would be addressed before the Forest Offset Protocol would be proposed for use in the Cap and Trade program. Since September 2009, the Climate Action Reserve has made some changes to its Forest Project Protocol, but it has failed to address these issues. The Forest Offset Protocol now proposed in the Cap and Trade regulation is nearly identical to the most recent Forest Project Protocol prepared by the Climate Action Reserve, with no substantive changes to the provisions related to forest clearcutting.

The inclusion of forest clearcutting as an eligible project type under the Forest Offset Protocol proposed in the cap and trade rule directly contradicts AB 32's requirement to maximize the environmental benefits from a carbon market program. In order to protect against some of the worst possible unintended consequences and negative environmental impacts, the Forest Offset Protocol should explicitly prohibit forest carbon offset projects that include even-aged management. (CBD1)

Comment: If we encourage clearcutting through AB 32, all the benefits of the forests will be degraded more quickly than is already occurring. Please do not make forest clearcutting count for carbon offsets. (SIERRACLUB1)

Comment: The ARB plan permits timber companies to clearcut California's forests, while allowing the companies to sell "credits" in the process. Since trees take at least 80 to 100 years to recoup their carbon emissions after clearcutting, there is no credible justification for permitting this type of trading. (RIVENES)

Comment: Please protect the public interest by protecting the integrity of the climate program and resiliency of California's forests by eliminating from the offset program clear-cutting of our forests as a way of sequestering carbon, and adding provisions to assure that forest projects do not result in the conversion of naturally managed (uneven aged forests) into clear-cut plantations (even aged forests). (FORESTWATCH,

COMPTON, CASCADEACTION, WREN, BEVINGTON, CHRISR, LEVY, LISH, FORMLETTER10, STEWARTJ, FREDIANI)

Comment: Clarify that the forest protocol does not permit forest offset projects to generate credits for converting a diverse, natural forest to a simplified even-age stand. (KUSTIN04)

> **Response**: Under the ARB Compliance Offset Protocol for U.S. Forest Projects (Forest Offset Protocol), harvesting, including clear-cut harvesting, does not generate offset credits. The protocol requires projects to maintain or increase the standing live carbon stocks in the project area. While harvesting may occur, the protocol accounts for harvesting as a decrease in standing live carbon stocks that must be compensated for by an increase in sequestration in the rest of the forest project lands. Offset credits will not be issued if, over any consecutive 10-year period, the data reports indicate a decrease in the standing live carbon stocks. If such a decrease does occur it may be considered an intentional reversal, requiring the replacement of all credits issued for the reversed carbon.
>
> In addition to the requirement to increase carbon on project lands, projects must be in compliance with all existing rules and regulations to be eligible for generating offsets. The Protocol does not allow any forest management activity that is not already allowed by state, federal, or local laws and regulations. To the extent feasible, the Protocol includes environmental safeguards to help assure the environmental integrity of Forest Offset Projects. These include requirements for projects to demonstrate sustainable long-term harvesting practices, limits on the size and location of even-aged management practices, and requirements for natural forest management, which require all projects to use management practices that promote and maintain native forests comprised of multiple ages and mixed native species at multiple landscape scales.
>
> Concerns about clear-cutting or even-aged management relate to how trees are harvested within a forest, but not directly to the carbon accounting that is at the heart of the protocol. It is possible to harvest more or less biomass than annual growth using even- or uneven-aged management. The protocol does not provide any incentive to harvest more frequently (regardless of method) or to clear-cut an area. Rather, the strongest incentive provided by the protocol is to increase the carbon in standing live trees, and increasing rotation ages (which decreases harvest frequency and intensity) is expected to be one of the most common improved forest management activities.

N-2. Comment: One of the worst parts of the cap and trade rules being considered is the inclusion of clearcutting as an improved "forest management" method under the Forest Project Protocols version 3.2. CAR essentially admits that they do not take into account critical elements of clearcutting methods (soil ripping, herbicide applications, disposal/burning of dead standing and lying wood) which would greatly affect the amount of carbon that is actually sequestered. Clearcutting turns a forest from a carbon

sink into a carbon emitter for at least the next 20 years, precisely the time period where we need to see true reductions in carbon emissions. The protocols also give 100-yr credit for carbon in wood products. Anyone who has replaced a wooden deck, fence or roof knows that these products do no last anywhere near 100 years. They begin decomposing and releasing CO_2 as soon as they are installed. Please protect the integrity of California's forests (the lungs and filters of our air and water), by:
a) eliminating from the offset program clearcutting of our forests as a way of sequestering carbon and by b) adding provisions to assure that forest projects do not result in the conversion of naturally managed (uneven aged forests) into clearcut plantations (even aged forests. (FEICHTL)

> **Response**: Please see our response above regarding forest harvesting and offsets. With regard to harvested wood products, the protocol includes in the accounting boundary the average amount of carbon expected to remain stored in wood products over 100 years. This fraction takes into account that while a large percentage of harvested wood products will have decayed over 100 years, a significant fraction is expected to remain sequestered over the period defined to be permanent. The protocol credits carbon stored in harvested wood products, and also requires that decreases in carbon stored in wood products relative to the baseline be accounted for and deducted.

N-3. (multiple comments)
Comment: Cap and trade is beset with unintended consequences, but the one I object to in this proposal is the inclusion of forest management practices that defeat the purpose of reducing carbon emissions, while increasing erosion, soil & watershed degradation, and poisoning of receiving waters by herbicides and their toxic breakdown products. If forestry is included as offsets, then it should be good forestry that avoids clearcutting or its equivalents, and disallows herbicide use which de-vegetates landscapes, simplifies biologic diversity, and poisons wildlife, including salmonids. (MILLERKEN2)

Comment: Loggers used to have jobs and work. Clearcutting takes one man, one machine, and it can ruin the forest and ruin a town. I don't see any positive things in clearcutting. All the animals run from their homes and the trees to the suburbs and cities. Next, cutting the trees and leaving one or two dead trees is still clearcutting. When all these trees are cut, the ground, water, and animals are poisoned with big machines they clearcut with. They are also poisoned by the chemicals they spray to make it impossible for anything to grow except for their only natural saplings. Even humans get poisoned because the chemicals go into the air and our drinking water. (SOL1, SOL2)

It makes a mockery of the law to allow multi-billion dollar companies to circumvent the laws intended to reduce fossil fuel emissions by paying other multi-billion dollar companies who are already getting tax benefits for TPZ designation to receive double tax benefit for their business activities. It adds insult to injury when those companies utilize clearcutting practices that REDUCE oxygen production AND use herbicides in this process to kill all competing vegetation that then finds its way into the public water supply. Any company that engages in these practices should be automatically deemed ineligible for offset benefits. I would further propose that any company engaging in practices such as these which are clearly not in the public interest be denied TPZ status and have to pay for the damage that they do. It is a sad fact that my County's water district (Calaveras County) cannot even afford the equipment to monitor the herbicides that are leaching into the water supply for not only our County, but for the large urban areas downstream. I think legislators need to adhere to the intent of the law and demand improvement in environmental practices of companies as the law intended. (CALDERWOOD)

> **Response:** Please see our response above regarding forest harvesting and offsets. In regard to herbicide use, the Protocol requires compliance with all federal, state, and local regulations. The Forest Offset Protocol is not expected to have any significant impact on whether forest owners choose to apply herbicides within legal limits as part of forest management activities. To the extent that improved forest management projects increase rotation ages and decrease harvest frequency or intensity, use of herbicides is likely to decrease.

N-4. Comment: Please do not adopt clearcutting as a carbon offset for the Cap and Trade Program. Add provisions to prevent this from happening. Clearcutting destroys the forest and converts diverse habitat into a tree plantation. Logging adds to sedimentation in streams and rivers and is a major source of degradation of fish habitat. Clearcutting is the worst kind of logging. Herbicides are usually applied after clearcuts. Does the carbon offset you are considering take that into consideration? Slash is often burned after a clearcut. Does the carbon offset you are considering take that into consideration? The fungi which knit a forest together are often destroyed during a clearcut. Does the carbon offset you are considering take that into consideration? Please include a provision that would prevent conversion of natural forests into even-aged plantations. (BULGER)

> **Response:** Please see our response above regarding forest harvesting and offsets. As it relates to carbon sequestration, the forest protocol takes into account carbon stored as a result of photosynthesis, which also produces oxygen in the process.
>
> The Forest Offset Protocol does not directly account for impacts of harvest practices on fungi, but rather relies on compliance with relevant laws and regulations, and the natural forest management provisions. Because the protocol provides incentives to harvest less frequently, it is expected that impacts on soils and fungi should be less than the baseline impacts as a result of the project activity.

N-5. Comment: The current draft proposal seems to allow clearcutting as a component of a possible procedure for offsets. This is absurd. Speaking narrowly, the rules should clearly eliminate this possibility and any similar one. More broadly, the rules should clarify require strong verifiability of offsets so that no such possibility could be entertained. (FORMAN)

> **Response:** Please see our response above to forest harvesting and offsets. Verification ensures that all provisions of the protocol and ARB's regulation are followed by an Offset Project Operator or Authorized Project Designee. ARB's regulatory verification program and oversight will ensure that all natural forest management provisions, including limits on even-aged management in section 3.8.4 are adhered to strictly.

N-6. Comment: A program for allowing the clearcutting of trees and then compensating and planting seedlings will not capture global warming gasses and should be eliminated from the Protocol. Clearcutting is destructive to biological systems and alters water resources and characteristics. It is destroying one part of nature to put in balance another part of nature a dichotomy that segments the intended goal of a sustainable world. Allowing an owner to clearcut and then to receive compensation to repair the damage will incentivize the damaging practice. A two ounce tree seedling cannot possibly be equal in sequestering the same amount of CO_2 per year as a mature multi ton giant old specimen. It is a fallacy to expect otherwise and not a real cap and trade offset. The even aged tree stands are more susceptible to forest fires than mixed aged stands of trees putting this protocol at risk of unwittingly adding to greenhouse gases. (STEPHENS)

> **Response:** Please see our response above regarding forest harvesting and offsets. We could not find any definitive evidence as to whether even-age stands are more prone to fire risk than uneven-age stands, and the Forest Offset Protocol requires all forest projects to contribute a percentage of their offset credits to a forest buffer account that will be used to compensate for any unintentional reversals of stored carbon due to fire.

N-7. Comment: The carbon emissions from clearcutting, which includes all the impacts from soil disturbance, are not offset for 80 to 100 years or more. Under this plan, polluters will be able to trade their emissions for credits from forestry "offsets" that are not offsets at all, and will only serve to hasten the demise of the planet and California's rich biological heritage. California's forests are more than chunks of carbon. California's Sierra Nevada and Klamath-Siskiyou forests are designated global biodiversity hotspots. Clearcutting, as practiced by the majority of timber companies in the state and sanctioned by our state regulators, permanently eliminates habitat for entire suites of plants and wipes out the entire home ranges for dozens of animals. Even though trees are replanted, the resulting tree farm bears nothing in common with a natural forest (except for the presence of one or two species of conifers). The net impact of permitting this to continue, and rewarding it under these proposed regulations, will be the certain entrainment of extinction for untold numbers of plants and animals. Loss of habitat will only be exacerbated by the adoption of a program that will not be effective at reducing greenhouse gas emissions. (CHUNG)

> **Response:** Please see our response above regarding forest harvesting and offsets. It is unclear that conversion to a more simplified forest structure would necessarily result in an associated decrease in soil carbon or lying dead wood. Loss of soil carbon is likely to depend on the intensity of the impact to forest soils, and the protocol already requires that soil carbon be included when intensive site preparation activities such as deep ripping, furrowing, or plowing affect greater than 25 percent of the project area during the project life. The protocol also recognizes that lying dead wood is recruited from the standing dead wood pool, and requires both visual inspections of lying dead recruitment by verifiers and minimum standards for standing dead wood recruitment that is increased if a verifier observes that lying dead wood in the project area is not commensurate with recruitment from standing dead trees. We also recognize that lying dead wood provides important environmental and ecological benefits, but that quantification methods for lying dead wood have relatively high uncertainties. For these reasons, we consider the current carbon accounting framework and protocol requirements to be sufficient to prevent or account for significant decreases in the lying dead wood and soil carbon pools.

N-8. Comment: Rewarding deforestation is not even common sense. This needs to be deleted from the legislation. (ESSERMAN)

> **Response:** Nothing in the Forest Offset Protocol or any other part of the cap-and-trade program rewards or incentivizes deforestation—just the opposite is the case, as the protocol includes Avoided Conversion as an eligible project type. An Avoided Conversion Project involves preventing the conversion of forestland to a non-forest land use by dedicating the land to continuous forest cover through a Qualified Conservation Easement or transfer to public ownership, excluding transfer to federal ownership. An Avoided Conversion Project is only eligible if it can fully satisfy the eligibility rules in the Regulation. See section 2.1.3 of the Protocol. Also, please see our response above regarding forest harvesting and offsets.

N-9. (multiple comments)
Comment: CERP requests that ARB modify the proposed regulations so that a forestry offset project may earn offset credits annually based on a remote data review by the verifier, provided that the verifier also undertakes a site visit at least once every six years or more frequently as the verifier deems advisable. (CERP1)

Comment: Calling for a site visit for every forest protocol offset verification report to receive credits is cost prohibitive and unnecessary when you consider the re-inventory of all inventory plots every 12 years. An office review should suffice for annual offset verification with site visits every six years and required new inventory every 12 years. (CFA)

Comment: The requirement calling for a site visit for every forest protocol offset verification to receive credits is cost prohibitive and really unnecessary when you consider the required re-measurement of all inventory plots every 12 years. (CAFORESTRYASSOC1)

Comment: Verification of Forest Offset Credits should occur through field visits at least every six years and annually through examination of inventory data and aerial photographs in all other years. All offsets need to be verified annually. Verification of Forest Offset Projects should allow for office examination of inventory data and aerial photographs in the years in between field visits. Project owners would be responsible for paying back credits if credits were over-estimated during office verifications. ARB would also be responsible for ensuring issuance of additional credits to project owners if credits were underestimated. The change from the CAR v.3.2 protocol made in the draft regulations, which only allow credits to be verified during a field visit, eliminates the cost efficiencies gained by allowing some verifications to occur by office review. If a project owner conducts field verification every sixth year, but can only sell credits after each field verification, five year's worth of credits will be of older than current vintage, and therefore of lower market value. Allowing "office" verifications but requiring true-ups if inaccuracies are found every sixth year reduces the transaction cost burden on the project owner but still creates a reliable system in which error rates on credit approval are likely to be very low. Digital aerial photography can be used very successfully to cross-check inventory data and ensure that forests remain in the age class stated in inventory data. Re-checks of inventory data in the field every sixth year would allow for fine-grain adjustments in the case of minor inaccuracies due to plot-level measurement, but would be no more effective at detecting large-scale deviations from stated carbon stocks than examining photos. (PFT1, PFT2)

> **Response:** In response to this and similar comments, we modified language in the Forest Offset Protocol and cap-and-trade regulation to allow less-intensive (desk review) verification to be conducted in years when a full verification with a site visit is not required. We believe that less-intensive verification as defined in the protocol will be sufficient to provide reasonable assurance, as long as a thorough on-site verification is conducted every six years.

N-10. Comment: Section 2.1.1 of the proposed Forest Project Protocol states that "Reforestation Projects on both private and public lands, excluding federal lands, are eligible" (emphasis added). The Conservation Fund and other non-profit organizations have developed reforestation projects that commence on private lands with the intent of eventual transfer to federal ownership. In the past several years, the Conservation Fund has used donations from individuals and corporations seeking to address climate change to acquire and reforest more than 20,000 acres of private land that had been cleared for agriculture prior to 1990. These properties were subsequently transferred to the U.S. Fish and Wildlife Service for long term stewardship and monitoring. Many more tens of thousands of acres could be similarly acquired, reforested and managed if they were eligible to provide offset credits under the ARB Forest Project Protocol. We therefore recommend that projects that commence on private land for the eventual transfer to federal ownership be allowed under ARB's Forest Offset Protocol. (TCF)

Comment: Clarify the status of private projects transferred to federal ownership under ARB's Forest Project Protocol. Section 2.1.1 of the proposed Forest Project Protocol states that "Reforestation Projects on both private and public lands, excluding federal lands, are eligible" (emphasis added). The Conservation Fund and other non-profit organizations have developed reforestation projects that commence on private lands with the intent of eventual transfer to federal ownership. In the past several years, the Conservation Fund has used donations from individuals and corporations seeking to address climate change to acquire and reforest more than 20,000 acres of private land that had been cleared for agriculture prior to 1990. These properties were subsequently transferred to the U.S. Fish and Wildlife Service for long term stewardship and monitoring. Many more tens of thousands of acres could be similarly acquired, reforested and managed if they were eligible to provide offset credits under the ARB Forest Project Protocol. We therefore recommend that projects that commence on private land for the eventual transfer to federal ownership be allowed under ARB's Forest. (USFWS)

Comment: CAL FIRE supports the addition of public land project eligibility, however we suggest adding language that clearly allows for future consideration of forest offset projects on federal lands. The US Forest Service owns about 12 million acres, or over half of the conifer forest and woodlands in California. Approximately 261,000 acres burned into a deforested condition between 2000 and 2009. While about 125,000 acres have been planted, funding to restore these lands to forests has not kept pace with the level of level of disturbance, generating a backlog of reforestation needs that are not currently being met. CAL FIRE appreciates the policy and legal complexities of developing carbon offset projects and binding agreements with the State on federal lands. We also understand that the US Forest Service is evaluating their policies in this regard. However, we suggest ARB include a specific placeholder, similar to the language in Version 3.0 that says, "Forest projects on federal lands may be eligible if and when their eligibility is approved through a federal legislative or regulatory/rulemaking process." (DFFP2)

Comment: We are pleased that the proposed regulations recognize the large potential for emission reductions and removals on federal lands, and we appreciate your careful consideration of the legal and regulatory implications of these standards. But we believe our agency's successful record of carrying out carbon offset projects combined with the huge potential to continue to build on these beneficial programs across the more than 150 million acre National Wildlife Refuge system are strong arguments for including these lands in this emerging offset program. We further encourage the Board to consider the unique management practices and mandates of the U.S. Fish and Wildlife Service, as it may not be necessary to enact the same protocols across all federal lands. (USFWS)

> **Response:** Projects on federal lands present an added level of complexity that requires further study before ARB may be able to accept such projects. These complexities include questions related to jurisdiction and enforcement authority, ownership of offset credits, and project approval processes. We recognize the

large potential for emission reductions and removals on federal forest lands, but believe that offset projects on federal lands necessitate further review and potential revisions to the protocol at a later point. It is not the intention of ARB to discourage carbon sequestration activities on federal lands. We are open to the possibility of reconsidering the eligibility of projects on federal lands if the policy and regulatory issues can be resolved.

N-11. Comment: The forestry protocol states in section 3.3 that “projects must be listed within six months of the offset project commencement date.” This seems to present a barrier for projects with a 2007-2010 commencement date, based on the triggers listed in section 3.2. Is this intended as such? Does the protocol assume that the project would have been listed with CAR and that the CAR listing satisfies this requirement? It seems like an unnecessary barrier to certain projects. (CIG)

> **Response:** We agree that there may be a number of legitimate reasons why a forest project would not be able to be listed with ARB within six months of the commencement date and removed this sentence from the Forest Offset Protocol.

N-12. Comment: The forestry protocol states in section 3.5 that conservation easements must “expressly acknowledge that ARB is a third party beneficiary of the conservation easement with the right to enforce all obligations under the easement.” Again, this is a barrier for projects with a 2007-2010 commencement date, for which the relevant easement would already be in place. It seems to us that a Federal conservation easement that, for example, protects project lands in perpetuity and subordinates all timber harvest rights under the easement, which is itself legally enforceable under state and Federal law, ought to provide a sufficient basis for enforcement. (CIG)

> **Response:** Under the Forest Offset Protocol, only avoided conversion projects require a Qualified Conservation Easement to be eligible; other project types may reduce their risk rating and required forest buffer account contributions with a Qualified Conservation Easement but would still be eligible if the easement was not “Qualified.” Offset Project Developers or Authorized Project Designees may be able to modify an existing easement to include ARB as a third-party beneficiary so that it will meet the definition of a Qualified Conservation Easement. Requiring ARB to be a third-party beneficiary to a conservation easement ensures that the provisions of the easement are enforceable and that ARB would be a party to any potential future modifications to the easement.

N-13. Comment: Approval for Harvest in Reforestation Projects to Reduce Disease Threat: Section 2.1.1 of the Forest Protocol requires that trees can only be harvested within the first 30 years of a reforestation project if it is needed to prevent or reduce an imminent threat of disease. Such harvesting could only occur if "the government agency in charge of forestry regulation in the state where the project is located stipulating that the harvesting is necessary to prevent or mitigate disease on reversals." It is not clear that existing CAL FIRE permitting actions will meet ARB needs and the intention of this section of the Forest Project protocol, nor that the Board of Forestry has the authority to address this issue. CAL FIRE suggests that ARB consult with CAL FIRE and the Board of Forestry to discuss the adequacy of existing permitting activities, and, if needed, alternatives such as non-regulatory CAL FIRE assistance to operators and the Cap and Trade Program or additional BOF authority for other measures. (DFFP1)

> **Response:** This approval for harvest referred to in section 2.1.1 does not need to involve a permitting action but rather a "written statement" from the government agency in charge of forest management activities in a state where forest management activities may be undertaken. If a government agency does not provide written support that the planned harvest is needed to prevent or reduce an imminent threat of disease, then such harvest either could not occur or would render the project ineligible according to the requirements of section 2. We thank CAL FIRE for their willingness to coordinate and work with us, and we welcome discussions with CAL FIRE staff about forest protocol requirements.

N-14. Comment: The summary of the Risk Analysis still refers to the Project Implementation Agreement, which will no longer be required. Under Section 9.1 the word "is" in the second paragraph needs to be struck. In Section 3.2 in the second full paragraph, there is a double period typo. (CAFORESTRYASSOC1)

> **Response:** These issues were corrected in the Forest Protocol.

N-15. Comment: Under Section 9.1.1.1 of the Forest Protocol, item #27 requires reporting of projections of baseline and actual harvests from the project area over 100 years. The Board of Forestry and CalFire recognize that such actual harvest projections need to be treated as confidential trade secret information as such estimates can impact a forest owner's competitiveness. An alternative would be to mark such data as 'confidential' according to Section 96021 of the regulation. This can be fixed by moving this item from this list since it is already required in the Annual Offset Project Report, at which time it will also be real and known from actual measured harvest. (CAFORESTRYASSOC1)

> **Response:** We understand the commenter's concern about keeping confidential business information private, and have incorporated the suggested changes by requiring this information to be submitted with the offset project data reports, but not with the project listing information.

N-16. Comment: Item 20 from that list (Project Listing Information) also needs hectare to be replaced by acre, for US based projects. (CAFORESTRYASSOC1)

> **Response:** We agree, and for consistency replaced all references to hectare units in the protocol with acre units, which are more commonly used than hectares in U.S. projects. We believe that this will minimize calculation errors

due to unit confusion and will avoid an unnecessary unit conversion calculation for many forest owners.

N-17. Comment: Section 3.8.3 of the Forest Project Protocol requires live carbon stock must be maintained and/or increased during project life. This provision needs to be revised to state that this is required for the crediting period and that after such period standing live carbon stocks may increase or decrease as long as it does not fall below that level to support all registered tonnes. This could easily be clarified by adding a fifth exception to Section 3.8.3. (CAFORESTRYASSOC1)

Response: We agree with the commenter that such an exception is permissible and does not affect the permanence of credited reductions. We added an exception to section 3.8.3 that the standing live carbon stocks may decrease as long as the decrease occurs after the final crediting period (during the required 100-year monitoring period) and the residual live carbon stocks are maintained at a level that assures all credited standing live carbon stocks are permanently maintained.

N-18. Comment: The annual reporting and six year site visits as well as the full inventory every 12 years should only be required for the crediting period, and that ARB develop monitoring period requirements that recognize the 100 year permanent and the need being of lower resolution, and an investment and detail level that demonstrate that the level of onsite carbon stocks must be maintained at or above that amount needed to assure all registered tonnes (for example, a satellite monitoring of change detection) (CAFORESTRYASSOC1)

Response: We understand the desire for less-intensive monitoring following the end of a final crediting period; however, we did not modify the monitoring and verification requirements. Verification is only required once every six years, and we are confident that this provides a sufficient level of rigor to ensure that credited reductions are being permanently maintained. We have not explored other monitoring options in sufficient detail to have confidence that they could adequately ensure that all credited reductions are being maintained with reasonable assurance.

N-19. Comment: In Section 6.1.1 Estimating Baseline Onsite Carbon Stocks there is a requirement for a pre-site prep inventory for pools that may be affected by the site prep. While very few pools would be affected by site prep, for early action projects this pre-site prep inventory cannot be measured. Suggest adding a professional estimate by an RPF based upon non-reforested areas nearby and including a specific requirement for verifiers to check this estimate for reasonableness. (CAFORESTRYASSOC1)

Response: The ARB Forest Offset Protocol requires that an inventory must be conducted prior to any site preparation activities for carbon pools affected by site-preparation activities, and is contained in versions 3.0 through 3.2 of the CAR protocol, though the requirements are more detailed in version 3.2 and the ARB protocol. We are not aware of any early action reforestation projects under version 2.1 of the CAR protocol. Consequently, we do not see any barriers to transition for early action reforestation projects that followed the requirements in versions 3.0 through 3.2 of the CAR Forest Project Protocol and conducted inventories of carbon stocks prior to site preparation activities.

N-20. Comment: Since the ARB Forest Offset Protocol Resources website is not yet available, it was impossible to check some of the required values for species composition and common practice values, which will require further comment when they become available. (CAFORESTRYASSOC1)

Response: The ARB protocol had citations or links to materials referenced within the protocol. In addition, supporting files and data that will be included on ARB's website at a later date were available for public review at ARB's offices at the Cal/EPA building in Sacramento during the 45-day comment period.

N-21. Comment: Section 6.2.6 for quantifying secondary effects of projects that reduce harvesting fails to account for differences in timing of baseline estimates and actual project real harvesting. The calculation is done annually and does not take into account timing of harvest and would require secondary effects contributions from projects that over time increase harvest above average baseline carbon harvests and thus have no reduced harvesting secondary effects. This methodology also applies a 20 percent multiplier to total onsite carbon harvested when the leakage effect is only applicable to the harvested wood products, since all other pools are required to be stable or increasing this overestimates the leakage effect. The required onsite carbon stock maintenance or increase takes care of the carbon in the non product portions of harvested trees at issue. An identical overestimate occurs in the contribution to landfills for those projects that harvest more than baseline. See Appendix C in Section C.4 - this calculation requires landfill deductions even though the project increases wood product production as compared to the baseline. In both cases, the verifier could evaluate the project and determine if it will actually harvest more than the baseline over the crediting period and correctly calculate these contributions. This decision can be re-evaluated at each six year site visit and if needed corrected in the inventory true up process. (CAFORESTRYASSOC1)

Response: We understand the commenter's concern about the quantification of secondary effects (emissions leakage) due to decreased harvest; however, the forest offset protocol adopted by ARB addresses this concern already with a change that was initially incorporated into version 3.2 of the Climate Action Reserve forest project protocol and subsequently into ARB's protocol. In section 6.2.6, when secondary effects due to harvest are evaluated, the differences between actual and baseline harvest for the current and all previous years are summed. If the result is that actual harvest has exceeded baseline harvest over the life of the project, then the discount is not applied in the current reporting year. However, if the baseline harvest has exceeded actual harvest, then the deduction is applied in the current reporting year. The equation that addresses carbon in harvested wood products entering landfills functions in the same manner, by evaluating the summed difference between actual and baseline carbon entering landfills over the project life before determining if the deduction will be applied in the current reporting year.

The application of the secondary effects deduction for reduced harvest to total onsite carbon harvested (rather than only the carbon entering wood products) is appropriate because the full effects of emissions leakage involves all the carbon in the harvested trees, and not just the wood products. The deduction for the secondary effects is only applied once, and we do not agree that the onsite carbon stock maintenance requirements account for the non-product portion of the emissions leakage.

N-22. Comment: ARB has eliminated the requirement for a deed restriction and the project implementation agreement from CAR's version 3.2. Permanence is still 100 years past your last offset sold. Some of the buffer pool risk rating values will need to be adjusted now that a "Qualified Deed Restriction" has been removed; the default financial risk is now five percent for all offset credits issued, which is way too high. There is no evidence of a five percent rate of financial failure for forest owners. The work group assumed that most projects would also include a deed restriction as well, and receive the one percent default financial risk, which is a much more realistic value. Small non-capitalized projects may have slightly elevated risk, but still less than two percent. We would recommend that ARB correct the table replacing five percent with two percent and allow verifiers to consider forest owner capitalization and allow reduction even without a Qualified Conservation Easement to one percent. (CAFORESTRYASSOC1)

Response: At this time, we do not recognize a deed restriction as achieving the same level of risk mitigation as a Qualified Conservation Easement, which must explicitly list ARB as a third party beneficiary of the conservation easement with the right to enforce all obligations under the easement and all other rights and remedies conveyed to the holder of the easement. At the outset of the cap-and-trade program, there is not sufficient data to determine if all the initial risk values used in determining the forest buffer account contribution have been calculated appropriately. However, in the absence of better risk data and based on the principle of conservative accounting, we believe that it is important to err on the side of having the risk factors too high to ensure there is a sufficient quantity of offset credits in the forest buffer account to cover any reversals in the early years. These risk ratings may be decreased or adjusted at a later time, once more data are available on the actual rate of reversals due to various risks and the functioning of the forest buffer account.

N-23. Comment: An error also found in CAR 3.2 is the setting of a default for other Episodic Catastrophic Events. This category was added for places predominately outside of California, where hurricanes, tornado or extreme high wind events occur, so setting this to default at three percent is unfair to California projects and should allow for verifiers to review and accept much lower values for lands not found in these types of high wind event areas. Similarly, in unique areas such as volcano blast zones, [the protocol] should allow for the verifier to add a risk factor. (CAFORESTRYASSOC1)

> **Response:** The risk rating for episodic catastrophic events may cover a variety of risks not accounted for in other categories. At the outset of the cap-and-trade program, there are not sufficient data to determine if all the initial risk values used in determining the forest buffer account contribution are appropriate. However, in the absence of better risk data, we believe that it is important to err on the side of having the risk factors too high, to ensure there is a sufficient quantity of offset credits in the forest buffer account to cover any reversals in the early years. These risk ratings may be decreased or adjusted at a later time once more data are available on the rate of reversals due to various risks and the functioning of the forest buffer account. It is conceivable that these average risk ratings could be made adjusted based on geography, eco-region, and other factors in the future, but it is not possible to conduct such an analysis at this time.

N-24. Comment: The Board of Forestry and Fire Protection (BOF) believes that the primary criteria for any offset project should be the demonstration of additionality, i.e. surplus carbon sequestered or CO_2 removals above what would have occurred without the project. (DFFP1, DFFP2, BFFP)

> **Response:** We agree with the importance of ensuring that all credited greenhouse gas emission reductions and removal enhancements from forest projects are additional, and this is in fact required by AB 32 and the cap-and-trade regulation. The provisions of the Forest Offset Protocol are designed to ensure that all credited reductions are additional.

N-25. Comment : We are writing to strongly urge the California Air Resources Board (CARB) to retain the proposed Cap and Trade rule to include even age management in the carbon offset program, in order to protect forests and the wildlife that rely on them from catastrophic wildfire. Even age management is a proven silviculture practice and is beneficial when implemented under the California Forest Practices rules administered by the California Department of Forestry and Fire Protection. We urge you to stand strongly to support active forest management in California while also sequestering carbon. (FSCNC)

> **Response:** After carefully considering this issue, we decided at the December 2010 Board meeting to retain a range of sustainable forest management practices, including the use of even-age management within specified limits, in the Forest Offset Protocol.

N-26. Comment: Rather than adjust baselines at renewal of crediting periods, apply additionality discount if necessary. The regulations identify renewable crediting periods for forest projects over 30 year maximum intervals. While it may be beneficial to have regular adjustment intervals to update scientific data for projects, CARB should reconsider the adjustment of forest project baselines over these intervals. Due to the permanence obligation of offsets, the project would have a continued obligation to verify reductions against the initial baseline even if new ones are established based on the 30 year updates. Readjusting a baseline at years 31, 61, etc. would have the effect of creating parallel monitoring and verification obligations against multiple baselines, which could be costly and unnecessary. We, therefore, recommend the forest project baselines to be fixed for the duration of the project life to avoid this problem. If CARB determines that additionality has changed over these 30 year increments, it should consider a discount factor to address this issue, if necessary. (NC1, NC2)

> **Response:** We believe that the current baseline requirements are robust, and agree that providing certainty that project baselines will not be recalculated as a condition of a renewed crediting period is appropriate to provide greater certainty for those developing offset projects. A sentence has been added to the protocol to indicate that the baseline for any Forest Project under this version of the Forest Offset Protocol is valid for the duration of the project life, following a successful initial verification where the project receives a positive verification statement. In transition to the latest version of the protocol during renewal of a crediting period, forest projects will need to comply with the latest quantification methods, such as updated forest buffer account risk factors and leakage risk factors. Forest projects will also need to meet any additional requirements related to maintaining and updating the forest carbon inventory, but will not be required to recalculate a baseline.

N-27. Comment: Explicitly include language to avoid any risk of conversion of natural forests. While it is unlikely that forest offset projects could convert a diverse, natural forest to more simplified conditions and still create a quantifiable climate benefit, we recommend the inclusion of explicit language that prevents this scenario. CARB should address this issue by adding language to the Forest Protocol that prohibits the award of credit for projects that would lead to or actually convert natural or diverse forest conditions to more simplified ones. (NC1, NC2)

> **Response:** The Forest Offset Protocol does not provide any incentives for the conversion of a diverse, natural forest into a more simplified structure involving even-age management. The Forest Offset Protocol includes requirements for projects to demonstrate sustainable long-term harvesting practices and places limits on the size and location of even-aged management practices. The Protocol also includes requirements for natural forest management, which requires all projects to utilize management practices that promote and maintain native forests comprised of multiple ages and mixed native species at multiple landscape scales. While it is possible that a forest owner could alter their management practices under the protocol, they must continue to comply with all laws and regulations, and the natural forest management and sustainable harvesting provisions of the protocol.

N-28. Comment: The revised definition of forest owner needs to be clarified with respect to easement holders. The definition asserts that easement holders are not considered a forest owner, but proceeds to define forest owner to include entities that may hold timber rights. However, easement holders may hold timber rights as part of a conservation easement, which creates an inconsistency in the definition. Therefore, the definition does not need to include an explicit exclusion of easement holders. If there are particular sections of the Protocols that should exclude easement holders from obligations of forest owners, those sections should make this explicit. (NC1, NC2)

> **Response:** We changed the definition of "Forest Owner" to remove the exemption of conservation easement holders and will continue to work with stakeholders to evaluate the merits of the suggested edits.

N-29. Comment: It would appear that all forest biomass can be treated as a tradable forest carbon sequestration credit if it is in the forest, but that only the biomass that ends up in finished lumber—but not in energy chips, pulp chips for paper, landscaping amendments—is counted as sequestration for finished products. This imbalance may be corrected if the emission substitution benefits of energy chips used to generate RPS energy are accounted for in a new CAR protocol. (UCB)

> **Response:** Accounting for substitution benefits of biomass power is outside the scope of the Forest Offset Protocol. Please note that combustion of biomass fuel has already been excluded from a compliance obligation in the cap-and-trade program. Providing offset credits for the combustion of biomass within California would lead to double-counting because (as a result of electricity generation being included in the cap-and-trade program) decreases in fossil-fuel emissions from electricity generation due to the combustion of biomass fuel would be already accounted for within the cap.

N-30. (multiple comments)
Comment: The more significant issue is how the project proponent is directed to calculate 'market leakage'. Market leakage occurs when a project produces less of a product and the consumer goes elsewhere to buy a substitute product. A simple example is if a homeowner wants to build a deck but there is less redwood lumber available, then they can do one of three things: 1) build the deck with western red cedar from Canada or Ipe from Brazil, 2) build a patio out of cement, or 3) don't build a deck or a patio. CAR v3 simply asserts that 80 percent of people will do 3) 'don't build" and 20 percent will do 1) 'use imported wood'. This is captured in equation 6.1 and the attached footnote in the v3 protocols. While this is an improvement over the 0 percent market leakage factor in v1 and v2, it is not justified and is far below the only published estimates that appear relevant for the United States. A number of scholarly articles (e.g. Wear and Murray 2004; Murray, McCarl, et al. 2004) estimated a continental-scale leakage factor of 84 percent for west coast conifers from the largest carbon sequestration project ever undertaken—the reduction in federal timber harvests under the Northwest Forest Plan during the 1990s. It is important to point out that none of the market leakage numbers used in CAR v1, v2 or v3 are backed up by any references to

published literature, trade statistics, or official government reports. Simple math (80/16) suggests that the latest CAR formula overestimates the global climate benefits by a factor of 5 for improved forest management projects that involve a reduction in the level of harvested products. This is larger than a rounding error and could serious diminish the credibility of offsets developed in California. Our partners in the Western Climate Initiative will notice the inflated nature of CAR v3 forest offsets since many of them (e.g. Oregon, Washington, British Columbia, Ontario, Quebec) are major wood product exporters. (UCB)

Comment: The BOF supports further consideration of the leakage issue, to avoid the problem of simply re-locating climate impacts. Version 3, which is under consideration, asserts that only 20 percent of the reduced harvest volume in California will result in 'use of imported wood'. That is, reducing harvest in California will reduce wood demand. California is importing over 80 percent of its wood currently. The BOF has identified this as a major issue, and is trying to actively encourage in-state wood utilization to reduce the state's carbon footprint. (DFFP1, DFFP2, BFFP)

> **Response:** The Protocol attempts to conservatively account for the risk of increased emissions outside the project boundary as a result of project activity. To accomplish this, the Protocol assumes 20 percent of the carbon emissions resulting from reduced harvesting will be shifted to harvest on other lands, either from within or outside of California, to meet market demands. Currently, there is little data available on actual leakage rates. The leakage factors in the Protocol can be updated as better data become available.

N-31. Comment: The proposed U.S. Forest Protocol would grant GHG offsets for three types of projects – reforestation, improved forest management, and avoided conversion. This Protocol contains a plethora of very serious flaws. The most serious of these flaws concern the determination of whether any given forest project is additional, i.e., whether the project would have occurred in the course of business-as-usual. For each type of forestry project, the U.S. Forest Protocol established a performance test. If the project meets the applicable performance standard, the project is deemed to be additional. U.S. Forest Protocol at section 3.1.2. (p. 34 of 131.) We have set forth an analysis concerning the common failures of a performance standard approach to determining additionality in the Williams/Zabel Disclosure at pp. 9-11. As detailed below, the U.S. Forest Project Protocol includes a number of these failures that result in include projects which would have occurred in the course of business-as-usual. This is because performance standards of this type are, by their very nature, almost always comparisons to projects which have actually occurred. In a market economy, the most advanced methods quite often give the business using them a competitive advantage. This is why these advanced pieces of equipment and methods are most often “significantly better than average” and “better than common practice.” In a market economy, they are the result of business-as-usual. It violates AB 32’s requirement of additionality to grant offsets to such projects. (WILLIAMSZ)

Response: The performance standard tests in the protocol are designed to provide reasonable assurance that credited GHG reductions or removal enhancements meet the regulatory definition of additionality, which requires that GHG emission reductions or removals exceed any GHG reduction or removals otherwise required by law, regulation, or legally binding mandate; and that they exceed any GHG reductions or removals that would otherwise occur in a conservative business-as-usual scenario. "Business-as-usual" is defined as the set of conditions reasonably expected to occur within the offsets project boundary in the absence of the financial incentives provided by offset credits, taking into account all current laws and regulations, as well as current economic and technological trends.

N-32. Comment: Improved Forest Management and the "Common Practice" Performance Standard: The U.S. Forest Protocol for improved forest management projects contains several different performance standard flaws. It relies on calculations that involve mind-numbing complexity and a series of subjective and unenforceable judgment calls. This protocol also relies heavily on "common practice" as its benchmark for additionality. The entire demonstration of additionality is based upon "estimating baseline onsite carbon stocks" and comparing this to "common practice" on "similar lands" in the area of the project. Since it is impossible to have an objective determination of whether forest management projects are beyond what would otherwise have occurred under this protocol, the offset performance standard clearly fails to satisfy AB 32's requirements that offsets be "real, permanent, quantifiable, verifiable, enforceable, and additional." (WILLIAMSZ)

Response: The complexity in the additionality assessment and baseline calculation reflects the need to have a multifaceted and detailed analysis to ensure that credited reductions are real and additional. The analysis is not subjective, but rather is based on objective criteria clearly defined in the protocol. Improved Forest Management Projects must take multiple factors into consideration when setting the project baseline and establishing additionality, such as current carbon stocking levels and their relation to comparable lands (common practice), historic management practices (high stocking reference), management of other entity forest lands within a logical management unit, financial feasibility of the baseline model, and all legal constraints on the management of project lands. Common practice carbon stocks are taken into consideration in the baseline determination on private lands, but are not the sole criteria for determining additionality. The use of common practice metrics helps to ensure that crediting is conservative by placing a "floor" on the baseline when carbon stocks are initially above common practice, and other factors in the baseline analysis indicate that carbon stocks would otherwise drop below that level in the absence of the project. In addition to this, all forest projects require a commitment to maintain stored carbon for a period of 100 years following the issuance of any credits, subject to ARB's regulatory enforcement authority. Any decreases in carbon stocks relative to the baseline would result in a reversal that must be compensated for. This regulatory obligation to ensure that carbon is stored “permanently” requires a commitment on the part of the forest owner that goes beyond business as usual.

N-33. Comment: Reforestation - “Less Than 10 percent Tree Canopy Cover” Performance Standards: For reforestation projects, the U.S. Forest Protocol allows two possible performance standards, either of which could lead to the approval of offsets. One of the standards is that there is currently less than ten percent tree canopy cover. In this case, the protocol merely states that projects which occur on land that has had less than ten percent tree canopy cover for the last ten years are automatically additional. No analysis, data, or rationale is presented for this determination. (WILLIAMSZ)

Response: The commenter correctly characterizes one way to meet the additionality performance standard requirement for reforestation projects. This approach uses current and past conditions to project a reasonable baseline; that is, if there is currently less than 10 percent tree canopy cover, and the land has been in this condition at least 10 years, then it is reasonable to use this current non-forested condition as the baseline condition, with the expectation that it would persist in the future absent the project activity.

N-34. Comment: Reforestation - Areas with “Significant Disturbance” - Alternative Performance Standards- “Economic Cost Scenario” or “Historical Not Engaged In or Allowed Timber Harvesting”: For reforestation projects which occur on land which has undergone a “Significant Disturbance” (e.g., fire) projects are additional if they either meet one of two performance standard. For the economic cost scenario (set forth in a two page appendix to the Protocol) or if the “Forest Owner has not historically engaged in or allowed timber harvesting.” U.S. Forest Protocol at section 3.1.2.1. The economic cost scenario approach to additionality appears to very heavily rely on data which either does not yet exist or have not been made public. Twice this part of the Protocol states that certain economic information and assumptions can be found in “the lookup table in the Forest Offset Protocol Resources section of ARB’s website.” U.S. Forest Protocol, Appendix E, p. 103. We were unable to locate this section of ARB’s website. In addition, the second test for additionality contains no explanation or number of years which constitute “historically engaged in or allowed timber harvesting.” It is suggested, by example that this qualification would apply to municipal or state parks, but this is made clear or exclusive in the Protocol. U.S. Forest Protocol at section 3.1.2.1. This completely subjective “standard” is neither rational nor enforceable. (WILLIAMSZ)

Response: If a forest owner has not historically engaged in or allowed timber harvesting, then the rationale is that the forest owner would not have either the financial incentive or means to undertake costly reforestation activities following a significant disturbance. The period of historical activities has been left broad and can apply over the course of the entity’s ownership of those lands, which is the most conservative approach. The second test is designed to determine if reforestation is likely to be financially viable, and consequently, part of business as usual. It involves a straightforward and conservative analysis to determine if the net present value for future timber is greater than $0 using standard assumptions (i.e., whether or not a forest owner would likely make or lose money by reforesting the lands). Since most financially investments would expect a significantly positive return, the current approach is conservative in making sure business-as-usual reforestation is not credited. Supporting files and data that will be included on ARB's website at a later date were available for public review at ARB's offices at the Cal/EPA building in Sacramento during the 45-day comment period.

N-35. (multiple comments)
Comment: I would like to urge the Air Resources Board not to exclude federal lands from carbon offset programs, as currently stated on page 9, 10, and 16 of the Compliance Offset Protocol for U .S. Forest Projects (Part V of the Proposed Regulation to Implement the California Cap and Trade Program).

The U.S. Fish and Wildlife Service, in conjunction with private, not-for-profit groups like The Conservation Fund, has reforested and permanently added over 40,000 acres to the National Wildlife Refuge System in recent years, funded almost entirely by carbon offset funding from private sources. These are lands that were historically forested but had been cleared during the last century. Restoring forest cover to these lands will actually increase the rate of carbon uptake and provide a very real (commensurate with scale) benefit in our collective efforts to limit carbon dioxide build-up in the atmosphere. For example, collectively these efforts have led to the sequestration of over 30 million tons of carbon, and three of our "Go Zero" projects with TCF have been validated under the standards of the Climate, Community & Biodiversity Alliance at the gold level (the highest).

We anticipate seeing many more such projects in the future, if legitimate forest carbon offset protocols do not disadvantage federal lands. However, we are concerned that Part V of the Proposed Regulation to Implement the California Cap-and-Trade Program as written does not make federal land eligible for forest offset projects. Though the Climate Action Registry's Forest Protocol made projects on federal lands eligible subject to legislative or regulatory approval, the current proposed regulation has excluded federal projects entirely, including Restoration Projects.

While we appreciate the added complexity of including federal lands in the Forest Protocol, we believe that removing the provision on federal land eligibility sends the wrong message and would discourage investment in these types of programs, not only in California but all across the country as well. Failing to grant eligibility for suitable federal lands would effectively prohibit projects on National Wildlife Refuges to qualify under this offset program, making it more difficult to attract new capital for forest-carbon projects and slowing our existing work in this area. Furthermore, this protocol is likely to serve as a benchmark for future national offset protocols, and we are concerned that they may set a standard for excluding federal lands in offset programs in the future. (USFWS)

Comment: The BOF supports the addition of public land project eligibility introduced in Version 2 of the Forest Project protocol, however we suggest adding language that clearly allows for future consideration of projects on federal lands. (DFFP1)

> **Response:** Projects on federal lands present an added level of complexity that requires further study before ARB may be able to accept such projects. These complexities include questions related to jurisdiction and enforcement authority, ownership of offset credits, and project approval processes. We recognize the large potential for emission reductions and removals on federal forest lands, but believe that offset projects on federal lands necessitate further review and potential revisions to the protocol at a later point. It is not the intention of ARB to discourage carbon sequestration activities on federal lands. We are open to the possibility of reconsidering the eligibility of projects on federal lands if the policy and regulatory issues can be resolved.

N-36. Comment: Early action projects should have the option to transition to compliance offset projects in the short-term and at the conclusion of the Early Action crediting period in 2014. Section 95975(g) of the cap and trade regulation implies that a project cannot seek a renewed crediting period earlier than 18 months prior to the expiration of the crediting period. We recommend that early action projects be permitted to transition into compliance projects as soon as possible. When transitioning early action CRTs to compliance credits, one consolidated verification should suffice for all previous vintage years. For future vintages, ARB and CAR verification requirements should be coordinated to only require one verification. (PFT1, PFT2)

> **Response:** We agree that early action projects should have the option to transition to compliance offset projects, and we made several modifications to the regulation to facilitate this process while still ensuring the integrity of the offsets. New section 95990(k) was added to clarify how early action offset projects transition to Compliance Offset Protocols. New section 95990(k)(2) clarifies that once an early action offset project transitions to a Compliance Offset Protocol it will begin an initial crediting period.
>
> We modified section 95990(f) to streamline the regulatory verification process for early action offset credits. Any verifications conducted under a voluntary program, such as CAR, cannot be substituted for the regulatory verification of reductions used for compliance.

N-37. Comment: ARB's requirement that forest owners commit to restricting land-use for 100 years following the issuance of the last offset credit has not been justified by ARB either as a matter of policy or science. Forest Protocol sections 3.4 and 7. Criteria ensuring permanence of GHG reductions are certainly appropriate, but must be consonant with scientific fact such as the United Nations IPCC analyses. As noted above, because the AB 32 market program is not anticipated to extend beyond 2050 at this time, it is unfair to forest project investors to impose continuing obligations to provide environmental benefits if there will be no corresponding obligation on industrial emitters and no market to compensate forest owners for climate benefits. Because AB-32 program essentially serves as a bridging strategy for decarbonizing industrial and power sectors, it is unnecessary to impose a long tail of legal liability on forest project owners.

In our experience, this arbitrary requirement has become in practice a major obstacle to implementing forest projects, since few landowners are willing to commit land to a certain use for such an extended period for uncertain economic returns. Thus, ARB's policy is deterring beneficial projects and reducing potential environmental and social benefits. Other forest protocols, such as those developed by ACR and VCS do not impose such an unjustified temporal restriction. ARB fails to adequately examine the scientific, policy and environmental bases for this extended requirement, and thus this requirement is contrary to the APA and CEQA. Rather than demanding that land use be restricted for 100-years, the landowner commitment should be commensurate with the length of the regulatory program, and any adjustment for early withdrawal from a commitment should be proportional to the remaining atmospheric benefit of sequestered carbon. (FCC, BLUESOURCE)

> **Response:** Ensuring permanence is essential to the environmental integrity of the entire cap-and-trade program. Because offsets allow for an equivalent quantity of GHG emissions within the capped sectors, the CO_2 stored in biological sinks resting from offset project activities must stay out of the atmosphere for a time period comparable to the emissions they are offsetting. If they do not, the net effect would be an increase in GHG emissions to the atmosphere. Scientific estimates of the atmospheric lifetime of anthropogenic CO_2 emissions are uncertain, as CO_2 is removed from the atmosphere by a number of processes that operate at different timescales. However, 100 years should really be viewed as a minimum time period for maintaining permanence because a fraction of anthropogenic CO_2 is expected to remain in the atmosphere well beyond 100 years as it is gradually removed through processes such as silicate weathering. The period of 100 years is frequently used in international climate change policy as a standard frame of reference for determining global warming potentials and setting GHG emission reduction targets, and consequently the use of 100 years to define the permanence of reductions is consistent with other programs.

N-38. (multiple comments)
Comment: Green Diamond Resource Company supports the proposed Forest Project Protocols. We encourage ARB to pass the protocols to allow forest offsets to become available to the regulated cap and trade market to allow implementation of AB 32.
We would like to request one change regarding treatment of Habitat Conservation Plans (HCP). Green Diamond was an active participant in the development of the working group that developed the Forest Project Protocol Version 3.1. Version 3.1 recognized HCPs as voluntary agreements that were not part of the baseline. Unfortunately, when the CAR Board passed Version 3.2 of the Forest Project Protocol, HCPs were assumed to be binding agreements and therefore part of part of the baseline (see Section

6.2.1.1). This same position regarding HCPs is contained in the protocols that are currently before ARB. We believe this treatment of HCPs may be a deterrent to future HCPs. It is also unfair to the two landowners in the state that voluntarily committed resources and additional protection measures for the benefit of listed species. We therefore offer the following language as an alternative: Verifiers shall review HCPs, CCAs, SHAs, and equivalents under state law (each, a "Conservation Plan") and the accompanying Implementation Agreement (IA) to determine if they contain a termination clause that could be exercised by the property owner without post-termination mitigation measures that would survive the termination and affect the baseline (such as retained habitat above the state or federal requirements without the HCP). If a Conservation Plan may be terminated without post-termination mitigation, the conservation measures in the Conservation Plan shall not be deemed to be part of the baseline for carbon credits. Verifiers shall also review Conservation Plans to determine if any of their measures are mandated by statute or rule and therefore have the full effect of regulation. Verifiers also may deem a Conservation Plan to be a new Conservation Plan that is beyond the carbon credit baseline when the property owner proposes amendments to an existing Conservation Plan that require federal approval after public review and comment on an environmental assessment or environmental impact statement prepared in compliance with the National Environmental Policy Act (NEPA). (GDRC)

Comment: The BOF supports consideration for those landowners utilizing a Habitat Conservation Program (HCP). Version 3 originally recognized HCPs as voluntary agreements that were not part of the baseline. When a later version was passed, HCPs were assumed to be binding agreements and therefore part of the baseline. The BOF would request consideration that the previous treatment of HCPs as voluntary. ARB may be placing a deterrent to future HCPs, as well as unfairly penalizing landowners engaged in enhanced habitat management. (DFFP1, DFFP2, BFFP)

> **Response:** We reviewed this comment in the context of regulatory requirements to ensure that all credited emission reductions or removal enhancements are additional to business as usual. Habitat Conservation Plans (HCPs) and similar agreements are directly related to compliance with Endangered Species Act requirements; while the specific plans may be altered at a future date or the plans terminated by either party, the forest owner's obligations to comply with the Endangered Species Act remain the same. We concluded that Habitat Conservation Plans and Safe Harbor Agreements (SHAs) that are in place prior to or at the time of project commencement should be considered part of the conservative business-as-usual scenario and modeled as a legal constraint in the baseline. The cap-and-trade regulation requires that credited GHG emission reductions or removal enhancements exceed any GHG reduction or removals otherwise required by law, regulation, or legally binding mandate, and exceed any GHG reductions or removals that would otherwise occur in a conservative business-as-usual scenario. "Business as usual" is defined as the set of conditions reasonably expected to occur within the offsets project boundary in the absence of the financial incentives provided by offset credits, taking into

account all current laws and regulations, as well as current economic and technological trends. It is not ARB's intention to discourage future HCPs; on the contrary, when a forest owner enters into a new HCP following project commencement, the baseline does not need be recalculated.

N-39. Comment: There is also a tremendous flaw in the "Reforestation Projects" category. Lands qualify in this category simply by having low tree cover, or having had a "significant disturbance" (such as fire) and which can be "reforested." The average person would ask, what is wrong with that? You take marginal lands that currently don't have "timber" and subject it to "site preparation" and then plant conifer tree crops. The problem is that this type of thinking is not informed by biology or ecology! The so-called marginal lands may be teeming with important habitat for a wide spectrum of plants and animals. It may be providing habitat for species which are currently rare or even threatened with extinction due to lack of habitat. This happens a lot in California because our state has evolved with frequent fire, and many species of plants have disappeared due to quite effective fire suppression that prevents fire from occurring in forest habitats. Also, because fire is actively suppressed, during wildfire suppression activities, forest habitats are bulldozed, subjected to implementation of fire lines, back burning, and massive drops of chemical fire retardants which all have a negative affect on the recovery of the post-fire forest environment, and reduce suitable habitat for species which require fire. But where fires have occurred, sometimes the habitats bounce back with huge flushes of native species, and are rich with native wildlife. Biologists continually locate rare species of plants that have hitherto been thought to be extinct. These sites frequently contain rare species of plants and animals, such as birds and butterflies that require a certain plant community that is increasingly in short supply. The timber industry has a different view of this phenomena. They will normally try to bulldoze the site and replant it (the even aged model) but if, for a variety of reasons, the site is not replanted after ten years, the site may be considered marginal lands if timber is not growing back at the rate and scale at which they would like to see. Sometimes these are lands with large areas of rock outcrops and poorer soils, that don't support rapid regrowth of conifers. Under natural ecological processes, hundreds of years may pass, with such areas slowly growing and building their soils and seed banks. They may never support conifers over time, or perhaps they will—not everything can be precisely predicted in evolutionary time. They may reburn, if left to natural processes. Such random events are the foundation of biological diversity. And there is no scientific credence to the supposition that non-conifer habitats cannot also serve as carbon sinks. Some types of chaparral communities on serpentine soils may contain shrubs that are hundreds of years old. You cannot tell just by looking at them. They are old because they have evolved on soils that are unique, and don't support dense and lush forests. They may grow for hundreds of years without ever supporting a conifer overstory of any significance. These types of lands are the precise suitable candidates you have designated in your protocols for reforestation. Perhaps the ARB staff thought it sounded great when first proposed by the industry. It is hard to argue against planting trees. For the industry, it's a win-win solution. They get to replant and get paid to do it. The lands may never support commercial timber – that won't matter. It will be worth it to them to bulldoze and destroy a vital ecological niche habitat landscape, and plant it to timber where they ordinarily wouldn't be bothered, in order to reap carbon trading credits. You didn't listen to the arguments against such a proposal brought forward by the public. So, here we are—once again, the great environmental leader, the state of California contributes further to the extinction pathway for hundreds of California's plants and animals. The protocols must also eliminate the provision to award carbon credits for conversion of natural areas, simply because they can be replanted. These areas may contain high levels of natural forest early successional species and intact ecological processes that provide ideal habitat for wildlife. The requirement that areas may qualify simply by virtue of lacking high tree cover for ten years, or due to a significant disturbance such as a fire, is absurd and flies in the face of all environmental law and scientific credibility. Post-fire early successional forests are among the most rare forest types left in America today. Incentives to further reduce their presence is a death sentence for countless living organisms. (PARKER)

> **Response:** We appreciate this comment, which highlights that other environmental considerations should be taken into consideration before a forest owner undertakes a reforestation project. Carbon sequestration potential should not be the only consideration in land management, and there is the potential for adverse environmental impacts if lands are managed exclusively for carbon and not for other values. ARB does not have the authority or expertise to regulate forest management, and relies in part on the expertise of other agencies to ensure that forest management activities do not result in adverse environmental outcomes. To this end, the ARB Forest Offset Protocol requires compliance with all applicable environmental and forest management laws and regulations, which would include provisions of the Endangered Species Act and environmental assessments required by the California Environmental Quality Act or National Environmental Policy Act as applicable. In addition to this requirement, the forest protocol's natural forest management provisions require that only native species would be planted in the project area. The forest protocol has robust carbon accounting methodologies that were designed to function in concert with other applicable laws and regulations.

N-40. Comment: In the case of lumber milled from fallen trees, a huge percentage of the wood will never be utilized and will simply disappear as sawdust and will rapidly cycle into the atmosphere as an emission. That percentage has not been averaged into the equations for carbon accounting. These losses occur at various stages of processing, from the forest to the mill, to the lumber yard and to the ultimate destination wherever that may be. Your only factor in accounting for biological decomposition is based on wood storage of 100 years. I assure you that sawdust does not take 100 years to degrade. Most of it will result in carbon emissions within days and weeks. Further, all of the fossil fuel emissions associated with timber harvests, from tree falling, hauling, milling, and transportation to the lumber yard and the subsequent milling and sanding that occurs when the lumber is turned into products are not accounted for at all. I don't think it is accurate to assume that the accounting for these emissions will occur in the energy production end of the equation. Rather, the amount of carbon in lumber must be a NET figure, that is arrived at after deducting the costs of the fossil fuel energy used to produce the lumber. Otherwise, you are simply externalizing the costs—which defeats the purpose of the legislation to reduce GHG emissions and curb global warming. It is also illegitimate to make assumptions about what type of energy is used to power sawmills. Perhaps some of it will come from burning wood waste. Perhaps none will come from burning wood waste. In any event, from start to finish, many forms of fossil fuel powered equipment is used before the wood product is actually turned into something that will be turned into a product that will store carbon. But you do give credit for carbon storage for lumber products, even for lumber that winds up in landfills. This is fraudulent, as there is no credible way to estimate the volume of lumber that is discarded in landfills, or to estimate its origin. It's certainly carbon stored, but not carbon stored that can accurately be credited for use in a cap and trade scheme. In short, on the one hand you are maximizing credit for tree flesh in the form of lumber, but on the debit side, you completely exclude the fossil fuels and waste emissions from the work required to turn trees into products. Because of these, and innumerable other inaccuracies, uncertainties, and opportunities for fraud, the protocols must simply remove the credit for tree carbon stored in the form of lumber. The only legitimate use of forest carbon credit is the credit for trees that are left standing in the forest. No credit should be given whatsoever for lumber, as it is just too difficult to accurate measure, or even to estimate, the true value of such carbon storage. This doesn't mean it doesn't exist. It is simply too hard to accurately measure. And we cannot get this wrong—the future of the planet is at stake. It is far better to incentivize what we know to be real—the carbon storage capacity of our biologically healthy and naturally diverse forests. Recommendation: Eliminate the inclusion of lumber for crediting carbon in the form of lumber products and in landfills. (PARKER)

Response: The methodologies for harvested wood products take into account that only a fraction of the carbon from what is initially harvested is expected to remain stored in the wood products over 100 years, including mill losses and decay from sawdust, short term wood products, and other by-products. Harvested wood product accounting was included in the forest protocol for more complete carbon accounting at the request of many stakeholders. The Protocol recognizes that not all carbon in harvested trees is immediately emitted, and that some fraction remains stored in long-term wood products over a 100-year period. We recognize that there is greater uncertainty in harvested wood product accounting than in other carbon pools within the project area, but the forest protocol makes use of the best available data and factors in accounting for it.

It is true that fossil-fuel emissions from harvest activities are not accounted for in the protocol; these were excluded on the basis that they are not expected to change significantly, or would likely decrease as a result of the project activity (due to incentives from the protocol to increase carbon in live standing trees and harvest less frequently). Fossil-fuel emissions will be accounted for at the fuel supplier or facility level for the types of sources included in the Protocol.

The commenter is mistaken that credit is given for wood products in landfills; no offsets may be issued for increased carbon in wood products entering landfills.

However, for conservative accounting, when the carbon entering landfills decreases, a deduction is applied to ensure there is no over-crediting.

N-41. (multiple comments)
Comment: Definition of Logical Management Unit: In section 6.2.1.1 of the ARB Forestry Protocol projects with initial carbon stocks below regional common practice must compare project stocks with stocks of a "Logical Management Unit" to ensure that project stocks are not significantly lower than similarly managed land under the same ownership. While this is a reasonable approach to ensure that carbon offsets will be additional to realistic estimates of initial onsite stocking levels, the definition of the Logical Management Unit is a concern. Specifically in cases where even aged management is utilized, project owners must identify a Logical Management Unit that has an excessively strict age distribution requirement by area. In many cases land owners will be unable to identify a Logical Management Unit that meets this requirement. It is not clear why a Logical Management Unit must meet strict age distribution requirements since the purpose of identifying this Unit is to ensure that project stocks are not excessively low, and nothing more. Forest projects are subject to extensive requirements related to age class distribution, species composition and harvest unit size. Equator supports these requirements for projects, but urges ARB to remove or modify requirements of this sort for areas outside of the project area. (EQUATOR)

Comment: Under Section 6.2.1.1 the requirements for a Logical Management Unit involve an impossible test as most areas have histories which prevent this uniform distribution by age class, and if there is any necessary test on age class distribution it is already included in the project requirements for Natural Forest Management under Section 3.8.2 and Table 3.2. (CAFORESTRYASSOC1)

Response: We understand the concern that the definition of a logical management unit (LMU) may not be readily applicable to all management situations. However, the forest protocol recognizes this possibility, and offers an alternative approach that is similarly conservative in evaluating whether carbon stocks within the project area are significantly different from the forest owner's broader management practices in the area. In situations where an LMU containing the project area cannot be identified, the protocol requires that an LMU instead be defined by all lands where the forest owner or its affiliate(s) either own in fee or hold timber rights within the same assessment area covered by the project boundary. This alternative definition should be readily applicable in the situation described by the commenter.

N-42. Comment: ARB should issue clear guidance such as the CAR-developed draft "Transitioning Forest Projects Registered Under Earlier Versions of the Forest Project Protocol to Version 3.x." (See Attachment A) Such guidance regarding transitioning earlier projects to the version 3.x forest protocol provides a workable path forward. Particularly for forest projects conducted under version 2.1, there is significant uncertainty about how to transition to compliance protocols. (PFT1, PFT2)

> **Response:** We included provisions for the transition of early action forest projects in the cap-and-trade regulation. This includes specific provisions regarding how projects that commenced under versions 2.1 and 3.0 through 3.2 of the Climate Action Reserve Forest Project Protocol will transition to the ARB Forest Offset Protocol. It should be noted that ARB's requirements differ in some aspects from the guidance issued by CAR referred to by the commenter. In regard to reconciling differences in baseline calculation methodologies between version 2.1 and ARB's protocol, our requirements fully recognize early action offsets through the end of 2014 as ARB offset credits, but require the baseline to be recalculated according to the ARB protocol for transition. Other language in the regulation addresses forest buffer account contributions and reconciling differences in offset project boundaries.

N-43. Comment: The proposed Regulation to Implement the California Cap-and-Trade Program, US Forest Projects: A paired t-test must be conducted to determine whether the verifier sample plot measurements are within the same population as the inventory submitted by the Offset Project Operator or Authorized Project Designee to a reasonable degree of confidence. Because plot monumentation is not required for all projects, the Offset Project Operator has the option of requesting the verification body to install re-measurement plots within the required area, but not at the same plot locations/plot centers. This would allow for the use of an unpaired t-test to determine the accuracy of the inventory. The proposed regulation should allow for either a paired or unpaired t-test to be used to determine inventory accuracy. (SCS)

> **Response:** We carefully reviewed whether to require plot monumentation, and consequently whether to allow use of an unpaired t-test in verification. After a detailed technical review, we determined that forest carbon inventories without monumented plots could be eligible, but that they would still need to pass an appropriate statistical test during verification. We agreed to modify the methodology for evaluating forest inventories where plot centers cannot be located (though it is not an unpaired t-test), and it generally will require more sample plots to be measured and included in the analysis than for inventories with monumented plots to achieve the same level of statistical confidence.

N-44. Comment: For forest projects located in California, the baseline must be modeled to reflect all silvicultural treatments associated with timber harvest plans (THPs) active within the Project Area at the time of the project's initiation. All legally enforceable silvicultural and operational provisions of a THP – including those operational provisions designed to meet California Forest Practice Rules requirements for achieving Maximum Sustained Production of High Quality Wood Products [14 CCR 913.11 (933.11, 953.11)] – are considered legal constraints and must be reflected in baseline modeling for as long as the THP will remain active. Comment: The definition of the word "active" in reference to timber harvest plans needs to be better defined. This term has significance by CalFire that may not be intended (e.g. an active versus approved THP). Clarification is needed to determine if the project would be “active” at the initiation date and for what duration in the baseline modeling. (SCS)

> **Response:** In response to this comment we carefully reviewed the protocol language in light of the requirement’s intent and the broader need to ensure that reductions are additional. We clarified the text to indicate that the baseline must be modeled to reflect all silvicultural treatments associated with “any submitted, active, or approved timber harvest plans (THPs) at the time of the project’s commencement that would affect harvesting and management within the Project Area during the Project Life.” In other words, we consider any timber harvest plan that has been submitted to a regulatory agency, at whatever stage of approval, should be included in the baseline, based on the regulatory requirement for a conservative business-as-usual scenario.

N-45. Comment: The standard error calculation should include all required and optional pools within the project. The current standard error calculation assumes that the majority of the GHG emissions reductions/removals will be generated by the standing live and standing dead carbon pools. The possibility exists for GHG reductions to be generated in higher proportions from other carbon pools (e.g. the soil carbon pool in areas with peat or muck soils) and the current calculation would not take into account this substantial contribution to the project’s GHG reductions. (SCS)

> **Response:** We agree that all carbon pools included in the forest carbon inventory should be included in the confidence deduction standard error calculations, and clarified the protocol text to indicate this. For most projects, there will not be any difference in the calculation, as we have excluded accounting of optional pools, and the standing live and dead tree carbon pools will be the only carbon pools required by these projects. Under some circumstances, such as when soil carbon accounting is required due soil disturbance, the standard error calculations would need to take these carbon pools into account. However, emissions reductions from soil carbon are not expected to be credited under ARB’s forest offset protocol because soil carbon accounting is excluded, except for when intensive site preparation activities occur above a specified threshold, as these activities may result in soil carbon losses.

N-46. Comment: The “High Stocking Reference” for the Project Area. The High Stocking Reference is defined as 80 percent of the highest value for above-ground standing live carbon stocks per acre within the Project Area during the preceding 10-year period. To determine the High Stocking Reference, the Offset Project Operator or Authorized Project Designee must document changes in the Project Area’s above-ground standing live carbon stocks over the preceding 10 years, or for as long as the Forest Owner has had control of the stocks, whichever is shorter. This definition should take into account the possibility that the Forest Owner may have previously owned the forest within the last 10 years but the ownership was discontinuous (e.g. Landowner X owned the land from years 1-7, Landowner Y owned it from 8-9, and Landowner X reacquired it in Year 10/the project start date). The language regarding ownership should clarify the timeframe for the operational control. SCS suggests that the Offset Project Operator should be responsible for operational control at any time during the preceding 10 year period. (SCS)

> **Response:** We carefully reviewed this issue, and agree with the commenter that the most reasonable and conservative approach to address it is to require that the 10-year look-back to determine the high stocking reference be independent of current ownership. This would not only avoid concerns about discontinuous ownership, but would avoid creating incentives or other potential gaming opportunities that may exist if lands could be sold following significant harvests and new owners would be eligible to initiate a forest project without accounting for the high stocking reference. This modification was made in the protocol.

N-47. Comment: ARB would be well-served to be in close communication with the Climate Action Reserve regarding any updates, clarifications, errata that they have developed since version 3.2 of the FPP was approved. A key example of an update would be their soon-to-be-released revised version of Appendix A. (SCS)

> **Response:** We have been in close communication with Climate Action Reserve (CAR) staff, and received technical input and comments from CAR on continuing work on their Forest Project Protocol. However, any proposed changes to ARB's Protocol would be subject to future rulemaking activities after a full public stakeholder process independent of any CAR update activities.

N-48. (multiple comments)
Comment: We express our full support of the proposed rulemaking package including the proposed Forest Project Protocol, with the exception of a few adjustments associated with inconsistencies in the recognition and transfer of some early action carbon credits developed pursuant to the Climate Action Reserve (CAR) protocols. Our Overview Issues are:

- There is a requirement that in the forest projects the verifier must re-measure a minimum number of plots or five percent whichever is greater, the five percent requirement of larger projects is many times over that which is necessary to check the quality of the project effort as long as the plots are randomly chosen, this cost alone could prevent many landowners from participating. As you know, the CAR Board of Directors adopted their revised Forest Project Protocol (FPP 3.2) at their meeting on August 30th after a nearly three-year multi-stakeholder public-input process of creating this protocol. This process and adoption became the basis for your current proposed FFP, which we fully support. The proposed ARB FPP also included a small but important adjustment to the methodology used to select project areas. We greatly appreciate ARB's recognition of this adjustment in your proposed regulatory action. CFA supports this simple adjustment that will help incentivize landowners to preserve mature forests via carbon projects. We would also like to address a critical issue that appears to be the central focus of challenge from several organizations to the FPP rulemaking proposal, that being the use of even-aged forest management (specifically CA's unique approach to clear-cutting) as a critical tool to maximize forest carbon sequestration while fully protecting the ecological benefits of our forests as required by compliance with all state and federal environmental laws and regulations. In this regard, the importance of foresters having the full array of silvicultural prescriptions, including planted native forests via even-aged prescriptions (including clearcuts), for which timber harvesting permits (THP) have been developed by a Registered Professional Forester (RPF), implemented by a Licensed Timber Operator (LTO), after an exhaustive multi-disciplinary environmental review and permitting process equivalent to an Environmental Impact Report (EIR) under CEQA, has led to California having the most powerful forest-related environmental protections of any state in the nation. (CFA)

Comment: There is a requirement that in forest projects the verifier must re-measure a minimum number of plots or five percent, whichever is greater. The five percent requirement of larger projects is many times over that which is necessary to check the quality of the project inventory effort as long as the plots that are re-measured are randomly chosen. This five percent re-measurement cost alone may prevent landowners from participating. A better approach is the approach (developed by a stakeholder work group) taken in CAR 3.2 where the verifier goes through a thorough review and establishes a minimum number of plots based upon project characteristics. (CAFORESTRYASSOC1)

Response: After carefully reviewing this and similar comments, we recognized the need to provide more detail in the Forest Offset Protocol's verification requirements with regard to the measurement and evaluation of sample plots used to develop the forest carbon inventory. We consulted with technical experts on this question and included modified requirements for the verification of the forest carbon inventory that are intended to provide a high degree of statistical confidence while not requiring more plots to be measured by a verifier than is necessary to assure this level of confidence.

In response to this and similar comments, we modified language in the Forest Offset Protocol and cap-and-trade regulation to allow less-intensive (desk review) verification to be conducted in years when a full verification with a site visit is not required. We believe that less-intensive verification as defined in the protocol will be sufficient to provide reasonable assurance as long as a thorough on-site verification is conducted every six years.

In the protocol, even-aged management remains within the scope of Improved Forest Management projects.

N-49. (multiple comments)
Comment: There has been a lot of public comment over the lying dead wood pool and the decision not to make it a required pool. In forests as the stakeholder workgroup correctly determined such a pool is very expensive and they recognized that the source of lying dead wood is predominantly from standing dead wood, a pool that is required to be measured and certain minimums must necessarily be maintained for the natural forest management definition, there is no need to change this decision. (CAFORESTRYASSOC1)

Comment: It is also important that the same workgroup with almost two years of effort developed the standard for when it would be necessary to actually measure soil carbon, another extremely expensive pool to estimate. That process recognized that this pool is virtually not affected by most management activities and only when a site is very drastically disturbed is there any likelihood of loss from this carbon pool, again 25 percent disturbance standard is a reasonable and conservative standard that balances cost without compromising the protocol carbon additionality. (CAFORESTRYASSOC1)

> **Response:** We thank the commenter for their input on this topic. We are not proposing to make any changes but will continue to monitor these issues for potential future updates to the Protocol.

N-50. (multiple comments)
Comment: CARB should also require additional forest carbon pools to be included in the GHG accounting, such as lying dead wood and soil carbon when activities associated with conversion to more simplified forests are undertaken. (NC1, NC2)

Comment: We also recommend that ARB include lying dead wood and soil carbon where there is significant disturbance in the accounting. We realize these were optional pools considered in the protocols in the Climate Action Reserve version and staff was looking to standardization and have required pools. And, therefore, these pools aren't part of the required pools. It is important to include lying dead wood and soil carbon where there is significant disturbance from accurate accounting perspective. And it can also help get at the issues and concerns around conversion. (NC6)

Comment: Need to capture the important carbon pools of lying dead wood and soil carbon to make sure that we are not missing important pieces of the accounting. (PFT2)

> **Response:** It is unclear that conversion to a more simplified forest structure would necessarily result in an associated decrease in soil carbon or lying dead wood. Loss of soil carbon is likely to depend on the intensity of the impact to forest soils, and the protocol already requires that soil carbon be included when intensive site preparation activities such as deep ripping, furrowing, or plowing impact greater than 25 percent of the project area during the project life. The protocol also recognizes that lying dead wood is recruited from the standing dead wood pool, and requires both visual inspections of lying dead recruitment by

verifiers and minimum standards for standing dead wood recruitment that is increased if a verifier observes that lying dead wood in the project area is not commensurate with recruitment from standing dead trees. We also recognize that lying dead wood provides important environmental and ecological benefits, but that quantification methods for lying dead wood have relatively high costs and uncertainties. For these reasons, we consider the current carbon accounting framework and protocol requirements to be sufficient to prevent or account for significant decreases in the lying dead wood and soil carbon pools. We will continue to monitor these issues for potential future updates to the Protocol.

N-51. (multiple comments)
Comment: Amend the forest protocol to include lying dead wood as a mandatory pool inside the GHG assessment boundary. Exclusion of lying dead wood from project carbon accounting facilitates its removal and the attendant loss of ecological benefits. Require the accounting of the soil carbon pool based on particular activities that could disturb the soil and cause emissions of carbon dioxide. Due to the potential for this pool to be a source of emissions under certain conditions and because the tracking of this pool could also capture conversion of natural forests to more simplified ones (i.e., by capturing increased emissions associated with the conversion practice), we urge ARB to include soil carbon as a required pool based on the activities referenced in version 3.2 of the CAR Forest Protocol. The CAR Forest Protocol only requires accounting for soil carbon when site preparation activities involve deep ripping, furrowing or plowing and soil disturbance exceeds 25 percent of the project area. That threshold is very high and could exclude most projects, even those with significant soil carbon emissions. Therefore, we suggest that ARB eliminate that “25 percent of the project area” threshold, and instead require that all projects which employ these high-impact practices, above a de minimus amount of two percent of the project area, be required to measure and report project impacts on soil carbon. (KUSTIN04)

Comment: Improved forest management projects must include the forest carbon pools associated with lying dead wood and, when there is intense site disturbance above certain thresholds, soil carbon, in order to ensure accurate accounting. We appreciate that ARB staff has proposed eliminating the category of “optional” pools in order to improve accounting consistency. As described below, we believe that lying dead wood should be a mandatory carbon pool and that soil carbon should be a mandatory pool if specific forest practices that can significantly reduce soil carbon are employed. As described below, we believe that both of these changes will reduce uncertainty, discourage any possibility of forest conversion from diverse conditions, and help to ensure accuracy at a reasonable cost. We urge ARB to amend the forest protocol to include lying dead wood as a mandatory pool inside the GHG assessment boundary. This pool was required in the prior version of the Climate Action Reserve Forest Protocol. Lying dead wood can be a significant carbon pool that can be significantly changed depending on a forest owner’s management practices. Moreover, lying dead wood can provide important wildlife habitat and other important ecological values. Exclusion of lying dead wood from project carbon accounting facilitates its removal and the attendant loss of ecological benefits. We recognize that adding this pool may increase the cost of measurement. However, while we would support efforts to achieve acceptable measurement accuracy at the lowest possible cost, a potential increase in measurement costs is not justification for inaccurate and incomplete measurement. We recommend that ARB require the accounting of the soil carbon pool based on particular activities that could disturb the soil and cause emissions of carbon dioxide. While certain forest project activities could lead to increases in soil carbon or have little impact on carbon, other practices can cause emissions. This is reflected by the CAR's inclusion of soil carbon in version 3.2 of its Forest Protocol based on activities such as deep ripping or furrowing of the soil, among others. ARB's regulation excludes this pool entirely because it was an optional pool in the CAR Protocol. However, due to the potential for this pool to be a source of emissions under certain conditions and because the tracking of this pool could also capture conversion of natural forests to more simplified ones (i.e., by capturing increased emissions associated with the conversion practice), we urge ARB to include soil carbon as a required pool based on the activities referenced in version 3.2 of the CAR Forest Protocol. The CAR Forest Protocol only requires accounting for soil carbon when site preparation activities involve deep ripping, furrowing or plowing and soil disturbance exceeds 25 percent of the project area. That threshold is very high and could exclude most projects, even those with significant soil carbon emissions. Therefore, we suggest that ARB eliminate that "25 percent of the project area" threshold, and instead require that all projects which employ these high-impact practices, above a de minimus amount of two percent of the project area, be required to measure and report project impacts on soil carbon. (KUSTIN07)

> **Response:** Projects must demonstrate a priori (section 3.8) and through verification (section 9.1) that they meet the definition for natural forest management, including stocking of lying dead wood.
>
> We clarified the language in section 5 that identifies when soil carbon is a required or excluded carbon pool. The previous language had left some ambiguity as to how to evaluate when the 25 percent threshold for intensive site preparation activities that triggers a requirement for soil carbon accounting would be exceeded. Without changing the existing requirement in any way, ARB clarified the language to identify that soil carbon accounting is required when site preparation activities involve deep ripping, furrowing, or plowing where soil disturbance exceeds or is expected to exceed from the baseline characterization and modeling 25 percent of the Project Area over the Project Life.

N-52. (multiple comments)
Comment: The proposed ARB FPP also included a small but important adjustment to the methodology used to select project areas. We greatly appreciate ARB's recognition of this adjustment in your proposed regulatory action. CFA supports this simple adjustment that will help incentivize landowners to preserve mature forests via carbon projects. We believe ARB's proposed FPP is fully consistent with your objective to achieve conservative, high quality offsets that are additional, consistent with CEQA, and

which create significant environmental co-benefits and we strongly support its adoption. (CFA)

Comment: First, I want to say the forest protocol as developed through this multi-stakeholder process is sound. It meets the test of being real, permanent, additional, verifiable enforceable.

And I want to point out one thing in particular, which is that all forest projects under the protocol regardless of the project type are absolutely required to increase and maintain permanently the total amount of carbon stored on the land over time. That is true regardless of the harvest method used. Any tree that's harvested under the protocol is the reduction in the total carbon on the forest and is not credited. I want to make that clear. I want to say that we do absolutely agree that the protocol should not be used to convert native forests to plantations. This is something that we don't believe can occur under the protocol, but we also agree that, as you pointed out, this is an iterative process and refinements can be made. (CAR3)

Comment: The simple message I have for you today is that much of the climate change debate in the world is from the fact that there is planes of different science. And I think what you challenged our work group with was to actually find the science and bring that science forward in a responsible and accurate and concise way. And we did that in the protocol. There is no incentive for even-aged management. So if you clearcut one spot, you have to hold the rest of the forest not only to replace all of those tons but more, to actually create a situation where you get a credit. There is no incentive for even-aged management. So if you clearcut one spot, you have to hold the rest of the forest not only to replace all of those tons but more, to actually create a situation where you get a credit. The protocol deals with even-age management in the most scientifically responsible way under the laws of the state of California. It does not cause any of the effects you've heard today. Otherwise, under CEQA, how could we get a permit to do that that's reviewed by the Department of Forestry, the Department of Fish and Game, and by the State Water Quality Control Board. So we're not causing erosion. We're not causing impacts to wildlife, and we're not harvesting in a non-sustainable way. Secondly, the lying dead wood issue that's been raised before you today, the work group recognized one of the most expensive inventories in the world is to count down material. We also recognize that all down material comes from standing dead material. It has to die and then fall. Our protocol designed the measurement technique to measure the standing dead so that the dying lying dead was accounted for. (PERMANENCE)

Comment: We believe the Air Resources Board's proposed FPP is fully consistent with your objective to achieve conservative, high-quality offsets that are additional, consistent with CEQA, and which create significant environmental co-benefits and we strongly support its adoption. (CAFORESTRYASSOC1)

Comment: We support the forest protocol. I was a member of the work group that met for nearly three years, a multi-stakeholder work group of forest land owners of State and federal agencies of environmental organizations that met every third Friday for almost two-and-a-half years and completely public input process as well. We brought in scientists. The protocol that was developed based upon science. It is fundamentally based on maintaining the high quality protection measures that California has. I've given you a paper there that identifies a number of the more significant protection measures that clearcutting and even age management have. I do want to point out that clearcutting in California is not clearcutting. It's not deforestation. It is, in fact, regeneration. (CAFORESTRYASSOC2)

Comment: As a practitioner of forestry in the sierras for over 30 years, I've used both even aged and uneven aged systems. And I do applaud your recognition of utilizing all of the silviculture systems in your protocol to achieve the carbon sequestration, reduce the emissions, and have sustainable forestry. A salient issue for me is retaining management as a viable silvicultural system. To take that off our book of tools would be a tragedy. We do have a lot of cut-over timber lands. We have disturbance oriented fire eco systems. And we have large fires that occur in the State of California. Whether by design, or Mother Nature, even aged management meets the goals of the state of many lands owners. And with the recognition there are forest practice rules and forest practices acts, CEQA and other guidelines, even aged management achieves distribution of landscape habitat, forest productivity, fuel reduction, and long-term sustainability. (FELLER1, FELLER2)

Comment: There really is no incentive in the rules as stated for any kind of forest deforestation. In fact, the rules only allow the kind of forest residues that would actually promote healthy forests in California. (MORRISG)

Comment: CAL FIRE supports ARB's decision to include the Urban Forest project and Forest Management project protocols for determining eligible emissions offsets under the Cap and Trade program. The protocols as proposed provide detailed methodologies for estimating carbon sequestration and avoided emission credits that are real, additional, permanent, verifiable, enforceable and quantifiable. ARB should not pick winners and losers among forest offset projects based on criteria outside the scope of AB 32, i.e. the offsets should focus on GHG reduction goals. Forest projects that include timber harvesting are already subject to regulation developed by the Board of Forestry and Fire Projection (BOF) and administered by CAL FIRE to protect soils, watersheds and water quality, wildlife and habitats, riparian and lake zones, forest health including pests and disease, and other environmental values. CAL FIRE supports the requirement that each verification team include at least one Registered Professional Forester (RPF) who takes an active role in reviewing the forest carbon inventory program and conducting site visits. (DFFP1)

Comment: We support the adoption of the Climate Action Reserve Forest Protocols as the basis for CARB issued offset credits in the United States. The Protocols have gone through numerous public processes over the past ten years with extensive input from experts, stakeholders and the general public. We appreciate that a number of edits were necessary to transition the Protocols from a voluntary framework to CARB's regulatory one. (NC1, NC2)

Comment: The BOF supports the requirements in the Forest Project Offset Protocol that each verification team include at least one Registered Professional Forester (RPF) who takes an active role in reviewing the forest carbon inventory program and conducting site visits. (DFFP1, DFFP2, BFFP)

Comment: We support the possibility of crediting emission reductions from verifiable reductions of tropical forest destruction and degradation. The current placeholder language on sectoral crediting helps establish some of the fundamental principles that will be needed to ensure environmental and social integrity of this program. However, careful decisions on many more details, which staff is now considering, will be necessary before this program can be implemented. (UCS1, LUDLOW, UCS1)

Comment: The Board of Forestry and Fire Protection supports the inclusion of forest carbon offset projects that produce GHG benefits to the atmosphere. The protocols, as proposed, provide detailed methodologies for estimating carbon sequestration and avoided emission credits that are real, additional, permanent, verifiable, enforceable and quantifiable. The Board also supports the requirement in the Forest Project Offset Protocol that each verification team include at least one Registered Professional Forester (RPF) who takes an active role in reviewing the forest carbon inventory program and conducting site visits. (BFFP)

Comment: The forest protocol meets your objective of providing offsets that are real, permanent, quantifiable, verifiable, enforceable, and efficient. At Sierra Pacific Industries, we are managing our forests for the long term. We're going to be operating under the protocol. We're going to meet the standards. And we're also going to operate and continue to operate under the State's very strict forest practice rules that are developed by the Board of Forestry and implemented by any number of agencies. In short, we urge you to adopt the package that's before you today including forestry protocol. (SPI)

Response: Thank you for your support.

N-53. (multiple comments)
Comment: The OWG encourages ARB to consider and possibly adopt amendments to the ARB Offset Protocol, no later than 2011, permitting the aggregation of small forest projects. (OFFSETSWG1) [Comment 675]

Comment: The staff report for the Compliance Offset Protocol for U.S. Forest Projects (the "Compliance Forest Protocol") highlights that ARB staff decided not to include aggregation rules for smaller forest owners in the protocol at this time, in part due to time constraints related to evaluating the aggregation rules that were very recent adopted by the Climate Action Reserve in August 2010. ARB staff noted that they recognize the significant potential benefits for the environment and offset supply of lowering barriers to participation for small forest owners. We commend ARB staff's focus on the barriers to participation facing smaller forest owners, and we would encourage ARB to incorporate aggregation rules into the compliance Forest Offset Protocol in 2011. Approximately 75 percent of all private forest acreage in the U.S. is held in ownerships of under 5,000 acres. Family forest owners often maintain forests that have higher carbon stocks and older growth stands than industrial forest owners. These older growth forests are at significant risk of harvest and conversion due to financial pressures and estate planning problems faced by the families that own and manage them. At the same time, family forest owners face high upfront costs in developing carbon offset projects and a difficulty in marketing small lots of offsets. Aggregation makes carbon projects feasible for family forest owners by helping them achieve economies of scale while maintaining high standards for carbon measurement and offset quality. Enabling aggregation will be critical to delivering offset supply from U.S. forests and to ensuring that the carbon markets are not accessible only to large industrial forest owners. In our view, the Aggregation Guidelines adopted by CAR in August 2010 do not conflict with any provision of the compliance U.S. Forest Projects Protocol, and incorporating a version of the CAR aggregation model would level the playing field for family forest owners, help protect older-growth forests managed by families, and provide a significant boost to forest carbon offset supply. We hope that developing aggregation rules will be a priority for ARB staff in 2011. (SHILLINGLAW1)

Comment: I want to urge the Air Resources Board to work to incorporate aggregation rules to the compliance forestry protocol. Seventy-five percent of private U.S. forest land is held in land holdings under 5,000 acres, really where the carbon is. Smaller family forests owners often manage forests with overgrown trees and higher carbon stocks that are significant risk to harvest and conversion to non-forest uses. These land owners face high effects of cost and lack economies of scale in developing forest carbon offset projects. Aggregation rules can enable, level the playing field for smaller family forest owners, reducing cost and achieve economies of scale, while maintaining offset qualities. Climate Action Reserve has adopted aggregational audits. And I just want to encourage the Air Resources Board to work in 2011 with that, other aggregation models, and incorporate them into the forestry protocol. (SHILLINGLAW2)

Comment: Intentional reversals that leave carbon stocks above a project's baseline should not automatically trigger project termination, and conflicting language in the proposed regulation and the U.S. Forest Project compliance protocol should be reconciled on this issue. (section 95983(e)(1))

The Compliance Forest Protocol, like the CAR Forest Project Protocol v3.2, requires intentional reversals to be replaced with offset credits at a certain rate that are then retired but does not require the termination of that project following an intentional reversal so long as the project's carbon stocks remain above baseline. Section 7.4 of the Compliance Forest Protocol states that "If a reversal lowers the Forest Project's actual standing live carbon stocks below its approved baseline standing live carbon stocks, the Forest Project will automatically be terminated" but makes no other provision for automatic termination (60). The proposed regulation, in contrast, states in section

95983(e)(1) that "If ARB determines that an intentional reversal has occurred pursuant to section 95983(c), the forest offset project will automatically be terminated by ARB or an Offset Project Registry. We recommend that this language be revised to align with the language in the Compliance Forest Protocol by modifying section 95983(e)(1) as follows:

> If ARB determines that an intentional reversal has occurred pursuant to section 95983(c) and such intentional reversal lowers the Project's actual standing live carbon stocks below its approved baseline standing live carbon stocks, the forest offset project will automatically be terminated by ARB or an Offset Project Registry.

Imposing an automatic project termination due to any intentional reversal makes little sense from an atmospheric integrity perspective and would impose unbearable financial risks on the shoulders of forest owners. Consider a forest owner with an Improved Forest Management project who accidentally removes an extra one tonne from the obligated reductions on the project area, which would constitute a minor intentional reversal. Under the current section 95983(e)(1) language, such a minor intention reversal would cause the entire project to be automatically terminated, forcing the landowner to go to the market to replace a large volume of offsets within 30 days at current market prices as required under section 95985(e), all for carbon that has not actually been emitted into the atmosphere. Because many landowners do have ready access to the large amount of liquid capital it would take to replace a large volume of offsets in 30 days, complying with the proposed regulation as written in the event of a minor intentional reversal would likely lead to the liquidation of the forest to pay the liability – an outcome contrary to the purpose of AB 32.

From the perspective of atmospheric integrity, all that is necessary in the event of an intentional reversal that does not reduce carbon stocks below the project baseline is to replace and retire the tonnes reversed. If five tonnes or 1,000 tonnes of obligated reductions have been intentionally emitted, five tonnes or 1,000 should be replaced and retired. Requiring forest projects to be terminated due to any intentional reversal is unnecessary for the climate, and the financial risk would severely reduce the number of landowners willing to enter into forest carbon offset projects. (SHILLINGLAW1) [Comment 748]

> **Response:** We recognize the significant potential benefits for the environment and offset supply of lowering barriers to participation for small Forest Owners. However, the aggregation rules for forest projects developed by CAR are a separate protocol, and we will need to conduct further review to determine their compatibility with the cap-and-trade program and specific offset provisions.

N-54. Comment: Leakage/Shifting Economic Activity: In some cases, such as in the context of forestry projects, the offsets will fail to appreciably mitigate demand and the polluting activity (such as logging) will simply shift elsewhere. (WILLIAMSZ)

Response: The Forest Offset Protocol includes standard approaches and factors for accounting for potential increases in GHG emissions outside of the project boundary as a result of the project activity. This is known as "emissions leakage." For example, to account for the potential of other forests lands to increase harvesting as a result of reduced harvesting on project lands, the protocol applies a standard factor to annual harvest figures.

We recognize the need to use the most scientifically defensible and up-to-date quantification methods, especially as it relates to accounting for leakage risks. At this time there are relatively few published articles that have explored leakage risks, and while there is broad recognition that the risks of market leakage exist, there is also high uncertainty associated with available estimates. We determined not to modify the factors adopted by the stakeholder workgroup that developed version 3.0 of the Climate Action Reserve Forest Project Protocol at this time, and expect that leakage risk will be one of the areas to be evaluated in more detail and updated based on the latest science when the protocol is updated in the future.

N-55. Comment: Avoided Conversion Projects – Shifting Economic Activity: Finally, for avoided conversion projects (e.g., conversion of forest to commercial, residential or agricultural land), the U.S. Forest Protocol relies very heavily on appraisals of land value in the various land use scenarios. U.S. Forest Protocol at section 3.1.2.3. This approach has two basic problems. First, leaving a forest uncut and unconverted to another use does not necessarily result in fewer GHGs. Forest products exist in a world market. The largest supplier to the U.S. of softwood (used, for example, in building homes), is Canada. If U.S. demand for softwood is not diminished, the forest preserved in the U.S. will almost certainly result in additional timber harvesting in Canada or some other country. This will result in no net decrease in GHGs. In fact, it would like result in a slight increase represented by the fuel it takes to import the timber products. Second, appraising land value is hardly an exact science. Anyone aware of the mortgage meltdown should be aware that appraisals can be manipulated, fabricated, and, essentially, purchased by a self-interested party. Having a "qualified" appraiser, as required by the Protocol, hardly addresses this problem. (WILLIAMSZ)

Response: Please see the response to the comment above regarding leakage. While real estate appraisal may not be an exact science, the purpose of the appraisal is to have objective criteria to use to determine if an area of forest land is at a high risk of being converted to an alternative use, and we believe that it accomplishes this purpose. A real estate appraisal, as required by the protocol, must demonstrate both that the project area is suitable for conversion and that there is a significantly higher market value in the alternative land use. The appraisal must also be conducted by a qualified appraiser in accordance with the Uniform Standards of Professional Appraisal Practice.

N-56. (multiple comments)
Comment: The proposed market rules provide only a 25-year crediting period for forestry projects, which is too short from a commercial perspective, particularly in light of the requirement for a 100-year maintenance period following the last credit issuance. See section 95972; Forest Protocol section 3.3. Although ARB indicates that it will provide an opportunity for renewing crediting periods, it is uncertain whether the eligibility or qualification requirements would change after the initial crediting period. The justification asserted by ARB for the restricted crediting, that it needs to preserve flexibility, is insufficient. ISOR at IX-120. It makes no sense to impose arbitrary restrictions that will make forest projects uneconomical simply to preserve flexibility for ARB to change its mind in the future for unspecified reasons. Indeed, ARB recognizes that "project developers need a guarantee of return on their investment," ISOR at IX-120, but fails to assess the effect of its arbitrary crediting restrictions on investment in forest projects and resulting loss of environmental benefits.

At a minimum, the crediting period for forest projects should be commensurate with the permanence requirement, such that forest projects are not forced to continue to accumulate carbon removals without any opportunity to be compensated for the additional sequestration. Under ARB's current rules, a project that is commenced in 2010 will only be credited for carbon stocks through 2035, and will have no guaranteed ability to sell carbon credits after 2050 upon expiration of California's market program, but will be forced to continue its forest management program for another 100 years possibly through the year 2140. This creates an unfair and arbitrary burden, and raises a barrier to meritorious forest projects and environmental benefits. We recommend that the crediting period for all forest projects be at least through 2050, i.e., the anticipated end of the current AB 32 market program.

In addition, we request that ARB adopt a crediting mechanism that will provide compensation for additional sequestration anticipated from forest projects after 2050 (but within the 100-year permanence period that ARB mandates) such that the forest project owner can be credited during the AB 32 compliance period for the full value of the environmental benefits guaranteed by the project. For example, because the term of the regulated market extends only to 2050 and ARB's Forest Protocol requires that forest owners guarantee permanence of the carbon at least 68 to 100 years past 2050, we propose that ARB allow some significant percentage of the projected carbon sequestration outside the term of the regulated market to be carried forward and credited during the first ten years of each offset project. (FCC, BLUESOURCE)

Comment: Recommendation on Section 95972 and ARB Forest Offset Protocol pages 14, 25 - Increase the Crediting Period for Reforestation to no less than 50 years. By its very nature, a reforestation project would sequester substantially more carbon dioxide in "project year 100" than in "project year 1." In some cases, the project may actually be a positive source of emissions in the first year due to site preparation. A reforestation project, however, will sequester a substantial amount of carbon dioxide as the forest matures. Additionally, the reforested area will provide substantial ecosystem services that would otherwise not occur. There are multiple environmental co-benefits that may be attributed to forestry projects. These include water purification, cooling shade, noise reduction, odor reduction, flood control, waste reduction, pollutant reductions, and many other positive attributes. The OWG has attached as Exhibit 1 to these comments a project summary of a CAR-registered reforestation project that is being conducted at the Cuyamaca Rancho State Park. The summary includes a discussion of the project costs and benefits. This document estimates the sequestration values over 100 years and clearly demonstrates that the environmental benefit to California and the economic incentive to the developer/operator (obtained through the sale of eligible offset credits) can hardly be obtained if a project is terminated after 25 years. The short crediting period may also destroy the incentive to develop a reforestation project because the uncertainty created by a 25-year crediting period may require the developer to recover its total project cost within the initial crediting period. This would likely increase the cost per sequestered ton well beyond the cost of any competing offset project and possibly greater than any allowance price. ARB should acknowledge the scientific, environmental, and economic evidence for increasing the reforestation crediting period to at least 50 years. (OFFSETSWG1)

Response: ARB's requirements regarding crediting periods and permanence are in place for sound technical reasons. It is anticipated that over time, the Forest Offset Protocol will be updated and improved based on science and practical experience. It is complicated both for regulators and market participants to have many different versions of the same protocol in use, so there is a desire for all projects to move to the latest protocols over time. Risk factors related to leakage and forest buffer account contributions are expected to be updated over time, and potentially other requirements related to the forest carbon inventory or verification. We believe that the current baseline requirements are robust, and agree that providing certainty that project baselines will not be recalculated, as a condition of a renewed crediting period is appropriate to provide greater certainty for those developing offset projects. We added a sentence to the protocol to indicate that the baseline for any Forest Project under this version of the Forest Offset Protocol is valid for the duration of the project life following a successful initial verification where the project receives a positive verification statement. In determining the appropriate length of a crediting period, we sought to balance the need for investor certainty in projects and the recognition that forest projects often involve reductions that accrue over a long period of time, with the need to be able to review project eligibility and additionality, and to make improvements to offset protocols at some later date. Economic considerations cannot be the only factor considered. There is no explicit limit on the number of renewals possible for forest projects, so there is the possibility that forest projects can continue to generate offset credits for 100 years or longer if the program remains in place.

Requirements for maintaining permanence are a separate issue from crediting periods. Any GHG reduction or removal that is issued an offset credit by ARB will need to be maintained for the period of time determined by ARB to ensure permanence; in this case 100 years. While the existing cap-and-trade program is initially set to continue through 2020, ARB has a designed a program that can and is expected to continue in operation well-beyond that year. However, ARB cannot consider specific mechanisms beyond the scope of AB 32 requirements at this time.

N-57. Comment: Our natural forests depend on the diversity of age, habitat, and species. We would ask that you can go ahead with three out of the four parts of the forestry protocol that you have. But the last one, clearcutting, is not ready for prime time. It has major issues with how you do the accounting. Which are critical to determining whether or not you actually have additionality, verification of that additionality, and also whether you're permitting leakage. These issues have been put off for future dates by the Climate Action Reserve and they will get to them. But you should not launch it now. So I would ask that you think back to what you're trying to accomplish with this program. That you actually want to sequester carbon, as well as promote good forestry practices. Put off including clearcuts until we've dealt with the issue of base lines of the issue of soil carbon accounting. (SIERRACLUB2, SIERRACLUBCA2)

Response: We agree with the importance of ensuring that all credited greenhouse gas emission reductions and removal enhancements from forest projects are additional. The performance standard tests in the protocol are designed to provide reasonable assurance that credited greenhouse gas reductions or removal enhancements meet the regulatory definition of additionality, which requires that greenhouse gas emission reductions or removals exceed any greenhouse gas reduction or removals otherwise required by law, regulation or legally binding mandate, and that they exceed any greenhouse gas reductions or removals that would otherwise occur in a conservative business-as-usual scenario.

The Forest Offset Protocol includes standard approaches and factors for accounting for potential increases in GHG emissions outside of the project boundary as a result of project activity (emissions leakage). We recognize the need to use the most scientifically defensible and up-to-date quantification methods, especially as they relate to accounting for leakage risks. We believe the forest protocol’s accounting methodology accounts for leakage using conservative factors based on the most recent data available. These leakage factors will be the subject to continued review and considered for updates as new information becomes available.

N-58. Comment: Retain the original baseline for the entire 100-year commitment period—but adjust buffer pool contributions or discount factors based on any new research, information, or changes in regulation that has occurred. Due to the permanence obligation of offsets, a project would have a continued obligation to verify reductions against the initial baseline even if a new baseline is established at the 25 year crediting period renewal. Recasting a baseline at years 25, 50, etc. would have the effect of creating parallel monitoring and verification obligations against multiple baselines, which could be costly, confusing, and unnecessary. Therefore, we recommend the forest project baselines to be fixed for the duration of the project life to avoid this problem. We understand and agree it makes sense to require projects to transition to the most recently approved compliance protocol as a condition of renewal. However, we think that it would more efficient, and provide more certainty, to retain the original 100-year baseline (especially given the fact that it represents an average value), and make necessary adjustments to discount factors and buffer pool contributions as new data become available. Without this baseline certainty, landowners could be deterred from participating in the offset protocol due to the increasing complexity of monitoring multiple baselines. While we expect there to be improved information over time on basic forest carbon accounting, the use of a 25-year crediting period creates uncertainties for landowners who are being asked to make 100-plus year commitments for every ton of CO_2 they sequester. (PFT1, PFT2)

> **Response:** We believe that the current baseline requirements are robust, and agree that providing certainty that project baselines will not be recalculated, as a condition of a renewed crediting period is appropriate to provide greater certainty for those developing offset projects. We added a sentence to the protocol to indicate that the baseline for any Forest Project under this version of the Forest Offset Protocol is valid for the duration of the project life following a successful initial verification where the project receives a positive verification statement. In transition to the latest version of the protocol during renewal of a crediting period, forest projects will need to comply with the latest quantification methods, such as updated forest buffer account risk factors and leakage risk factors, and meet any additional requirements related to maintaining and updating the forest carbon inventory. However, they will not be required to recalculate a baseline.

N-59. Comment: Clarify that the forest protocol does not permit forest offset projects to generate credits for converting a diverse, natural forest to a simplified even-age stand. Conversion of diverse native forests into even-aged forest plantations imposes significant ecological impacts on forest ecosystems. We believe that generating forest offsets in this way is counter to the intent of the forest protocol. In addition, the negative ecological impacts from the simplification of a complex natural system to a simplified one should be considered by ARB when evaluating the overall societal benefits and co-benefits as required by AB 32. While there is a diversity of opinions about what forest practices can reasonably constitute “natural forest management,” we believe it is clear that conversion of an existing diverse native forest to a more simplified forest or plantation will not likely meet the test of maximizing co-benefits. We recommend that ARB amend the forest protocol to explicitly clarify that forest projects that convert existing diverse natural forests to simplified, even-age stands are ineligible to generate offsets. This change does not affect the use of even-age management in forest stands where that is the pre-existing management approach. We believe that the recommended changes clarify the long-standing intent in the forest protocol regarding the conversion of natural forests. We realize this may not be a long- term solution or replace future clarifications on the types of natural forest management that would support AB 32’s requirements to maximize co-benefits. (KUSTIN07)

Response: It is unclear that conversion to a more simplified forest structure would necessarily result in an associated decrease in soil carbon or lying dead wood. Loss of soil carbon is likely to depend on the intensity of the impact to forest soils, and the protocol already requires that soil carbon be included when intensive site preparation activities such as deep ripping, furrowing, or plowing affect greater than 25 percent of the project area during the project life. The protocol also recognizes that lying dead wood is recruited from the standing dead wood pool, and requires both visual inspections of lying dead recruitment by verifiers and minimum standards for standing dead wood recruitment that is increased if a verifier observes that lying dead wood in the project area is not commensurate with recruitment from standing dead trees. We also recognize that lying dead wood provides important environmental and ecological benefits, but that quantification methods for lying dead wood have relatively high costs and uncertainties. For these reasons, we consider the current carbon accounting framework and protocol requirements to be sufficient to prevent or account for significant decreases in the lying dead wood and soil carbon pools.

Livestock Manure (Digester) Protocol

N-60. Comment: The digester performance standard contradicts AB 32 requirement of additionality: The key element of additionality is that the project is additional to what "would otherwise have occurred." The offset protocol for Livestock Manure Digester Projects fails to meet this standard of additionality by having a performance standard that allows all such digesters to be offsets on the basis that a digester "is significantly better than average." Thus, the protocol redefines "what would have occurred otherwise" to include what is already occurring at some facilities. "Data shows that California livestock operations (dairy, in particular) manage waste in a manner primarily in liquid-based systems that are very suitable for digesters. Yet even in these favorable conditions digesters are found on less than 1percent of the dairies," (however, the majority of the farms that currently have digesters are significantly larger than the average California dairy). (WILLIAMSZ)

Response: Even dairies with theoretically ideal conditions for operating a digester (such as, but not limited to, large herds and liquid manure management) are still not installing digesters in any significant numbers. Therefore, it is clear that digester adoption cannot be based on simple criteria such as whether or not the manure is managed in a liquid-based system or the size of the dairy. There are many barriers to adoption (including permitting, financial consideration, and other factors), and considering that digester adoption continues to be very rare, it is by definition "significantly better than average." Furthermore, the scenario for digester adoption does not appear to be changing in the foreseeable future (absent additional incentives), so digesters meet the condition for "what would have occurred otherwise."

N-61. Comment: A December 2009 announcement by the U.S. Department of Agriculture and the U.S. Department of Energy indicates that "Currently, only about two percent of U.S. dairies that are candidates for a profitable digester are using the technology, even though dairy operations with anaerobic digesters routinely generate enough electricity to power 200 homes." The Department of Energy has confirmed that "A biodigester usually requires manure from more than 150 large animals to cost effectively generate electricity. Anaerobic digestion and biogas production can also reduce overall operating costs where costs are high for sewage, agricultural, or animal waste disposal, and the effluent has economic value. In the United States, the availability of inexpensive fossil fuels has limited the use of digesters solely for biogas production. However, the waste treatment and odor reduction benefits of controlled anaerobic digestion are receiving increasing interest, especially for large-scale livestock operations such as dairies, feedlots, and slaughterhouses." (WILLIAMSZ)

> **Response:** The financial costs of installing and operating a digester on an average farm significantly outweigh the financial benefits, therefore digesters are typically not profitable. Contributing factors include the fact that selling biogas or electricity generated from biogas does not receive feed-in tariffs in many states, including California. The market rate or net-metering system relating to the sale of energy (or offsetting energy costs) typically falls far short of the cost of building and maintaining a digester unless grants or renewable energy value-added premiums such as feed-in tariffs are incorporated into the project. Even milk prices can affect dairy digester adoption; an otherwise willing farmer may not be able to secure a loan for building a capital-intensive project like a digester without high enough milk prices to meet bank expectations for debt-to-income ratios, which vary from bank to bank. The lack of financial precedent for digester projects is also an issue for farmers and banks. Economic incentives such as marketable emission reduction credits, favorable utility contracts, or renewable energy incentives will initially be needed to encourage investment in manure digesters and make digester offsets financially feasible. It is also important to note that additionality is multi-faceted and addressed through various methods that analyze factors such as, but not limited to, regulatory compliance, baselines, and anaerobic common practice requirements.

N-62. Comment: The proposed program appears to allow existing digester projects to count as additional to what "otherwise would have occurred." The ARB staff report states, "The proposed regulation also includes a process for offset credits from qualified existing offset projects operating under specific offset protocols to be accepted into the compliance offsets program." This feature means that existing projects—projects that are currently in progress—can be counted as additional to "would otherwise have occurred." The net result is a system that allows profitable, existing projects and approaches to methane reduction to be used to allow emissions above the cap in the allegedly "capped" sector." (WILLIAMSZ)

> **Response:** We are required to design regulations to encourage early action to reduce greenhouse gas emissions and to provide appropriate recognition or

credit for that action (HSC section 38562(b)(1) and (3)). Recognizing and rewarding greenhouse gas emissions reductions that occur prior to the full implementation of the AB 32 program can set the stage for innovation by incentivizing the development and employment of new clean technologies and by generating economic and environmental benefits for California. The offset credits from the existing digester projects are additional in that the voluntary program under which these early credits were issued required the projects at the time of implementation to be additional.

N-63. Comment: The ARB Livestock Manure Protocol Report notes that "The installation of a BCS [Biogas Control Systems] at an existing livestock operation where the primary manure management system is aerobic (produces little to no methane) may result in an increase of the amount of methane emitted to the atmosphere. Thus, the BCS must digest manure that would primarily be treated in an anaerobic system in the absence of the project in order for the project to meet the definition of an offset project." Manure could be, and sometimes is, processed in an aerobic environment, producing little to no methane. An example is that manure can provide valuable fertilizer to farming operations and be used instead of petrochemical fertilizers. However, by creating the offset program, ARB may encourage facilities to first switch from an aerobic to an anaerobic process (and hence increasing methane), so that their farm can qualify to participate in obtaining offsets. This decision could also lead to increased use of petrochemicals and other environmental harm. (WILLIAMSZ)

Response: Although any farm may pursue installing a digester, farms that switch from aerobic to anaerobic management of their waste are not eligible for this protocol's offsets, nor are new farms built in regions where aerobic waste management is common practice.

N-64. Comment: ARB has established a single, ten-year crediting period for Livestock Manure projects. TerraPass recommends that ARB allow Livestock Manure projects to extend crediting through renewals as provided by the cap and trade regulation. (TPI3)

Response: At this time, we plan to keep the ten-year crediting period. The ten-year crediting period balances the need for offset project investment certainty and periodic review for additionality. We may consider extending crediting through renewals as part of a future rule amendment.

N-65. Comment: In the introduction (Section 1), Livestock Manure projects are restricted to dairy and swine farms. In the Project Definition (Section 2.2), the protocol references "livestock" projects, which should include poultry and egg farms. We recommend ARB consider the potential for poultry and other livestock manure projects to be included in this protocol. In addition, TerraPass recommends that B_O and VS values be provided for poultry litter, and therefore explicitly included within the context of the Livestock Manure protocol. (TPI3)

Response: The current protocol is based on typical management practices that produce significant amounts of methane, namely those practiced on dairy and swine farms. Adding additional livestock types would constitute a new protocol because most other animal manure management systems do not produce significant amounts of methane. These additional project types may be explored as part of new protocol development.

N-66. Comment: ARB notes that co-digestion of wastes does not preclude a project from inclusion in the Livestock Manure protocol, a position with which we agree. We also suggest that ARB move quickly to allow co-digestion as a creditable offset stream, as this will allow more projects to be included. (TPI3)

Response: Projects that co-digest manure and other feedstock are eligible to receive offsets from the captured methane from manure only. The current protocol is based on typical management practices that produce significant amounts of methane. Non-manure feedstock is typically not managed in an anaerobic environment, and thus has significantly less associated methane emissions. In addition to few methane reduction opportunities, co-digested feedstocks would constitute a new protocol, in part due to the complexity and variability of non-manure feedstocks. Also, by providing offsets to encourage co-digestion, a new California Environmental Quality Act (CEQA) review process would be required. We believe the benefits are too small to pursue co-digestion offsets at this time.

N-67. Comment: ARB's protocol specifically excludes indirect emissions from electricity consumption by project equipment in footnote #9 of page 10. Following this exclusion, however, in Equation 5.11, are calculations for just such indirect emissions. We request that ARB clarify regulations related to accounting for indirect emissions from the use of electricity. (TPI3)

Response: We agree and have clarified the footnote language regarding indirect emissions from electricity. The protocol does not incorporate reductions in electricity consumption, but it does include increases.

N-68. Comment: The Data Substitution methodology does not refer to missed methane readings at livestock operations. Livestock digester methane readings are only required quarterly. If a quarterly reading is missed, we recommend that the project substitute for the missing data point by taking at least two more gas samples during the reporting period, and using the 95 percent upper confidence level (most conservative) of the annual average methane concentration using all samples from the reporting period. (TPI3)

Response: The protocol states that "for methane concentration substitution, flow rates during the data gap must be consistent with normal operation."

N-69. Comment: ARB needs to provide greater clarity on how project owners and offset project developers should obtain timely clarification on certain aspects of the protocol. (It is not clear whether qualified positive verification statements will allow verifiers to accept deviation from or slight changes to protocols as dictated under certain project specific circumstances). Currently, updates to quantification methodologies have to be made public through a public review and Board adoption process. There are likely to be numerous instances where project owners and developers require clarity on the interpretation of the guidance provided or wish to deviate from the protocol due to some unforeseen event. Waiting for public review and board approval may result in the project missing deadlines prescribed in the regulations. ARB needs to enable verifiers and/or registries to make decisions on deviations and variances within a short-time frame and to specify what constitutes a deviation or variance. (CIG)

> **Response:** We will work closely with our approved offset project registries to provide timely answers to questions raised by offset project developers. ARB will make such guidance routinely available so that all offset project developers have the same information and thus ensure a consistent application of the protocol across the same project types. In having a standardized methodology, we do not allow for deviations from the requirements of the offset protocol, but provide limited opportunity for alternative data collection in the event of unforeseen monitoring equipment breakdown. We do not have a variance process, as such a process could be considered an underground rulemaking when the terms are not clearly defined in the regulation. It would be unrealistic to try and provide such terms that would apply to all cases where a variance from the adopted offset protocol may be needed.

N-70. (multiple comments)
Comment: The requirement to report on a calendar year basis will increase costs for projects which don't begin on January 1st by requiring them to perform an additional verification and will also lead to verification bottlenecks (and likely an increase in prices for verifiers) at the start of each year. This impacts smaller projects and livestock projects in particular, which are unable to shoulder additional transaction costs, more than it does larger projects. (CIG)

Comment: We recommend that ARB allow Livestock Manure projects to verify on a two-year schedule. In addition to ongoing operations and maintenance costs of the digester, the metering system, and the biogas destruction devices, the annual verification has proven to be a large expense for offset projects. (TPI3)

> **Response:** We revised the verification schedule in the second 15-day changes to the regulation. Small offset projects can defer verifications to include two years of offset project data reports.

N-71. Comment: There is no mechanism for updating default values provided in the protocol other than to go through public review and board approval. Some defaults are updated on a regular basis. It is good practice to use the most recent version. This seems unnecessary and ARB should allow project developers to use more recent data if it exists. (CIG)

> **Response:** Updating default values as well as any other numerical or equation-related aspect of the protocol is considered part of the protocol's quantification methods. Changes to quantification methods can be updated through stakeholder input and Board action without having to go through the full APA (Administrative Procedure Act) process.

N-72. Comment: The methane destruction efficiency figure for lean-burn ICE's is overly conservative, out of date (taken in the 1990's) and not consistent with EPA figures. It is prohibitively expensive to use a site specific destruction efficiency figure as the protocol allows (around $5,000 per test per engine) and as any site specific test also needs to be performed on an annual basis it is likely that project developers will be forced to use the default figure of 93.6 percent. EPA guidance from some years ago (see Table 3.2-1 http://www.epa.gov/ttn/chief/ap42/ch03/final/c03s02.pdf - reciprocating natural gas engines) gives a destruction efficiency figure of 97.1 percent and the EPA Draft Manure Management Protocol provides a destruction efficiency of 99 percent. Requiring project developers to use such a low destruction efficiency figure and making it prohibitively expensive for them to use an updated figure unnecessarily penalizes small livestock projects. (CIG)

> **Response:** Destruction devices operating on biogas typically do not operate as efficiently compared to operating on pipeline-quality natural gas, so the biogas destruction efficiency value in the protocol is conservative. If a destruction device being used by a project has manufacturer efficiency specs listed for manure biogas of similar quality and attributes to the project's biogas, then those specs can be used instead of the protocol's default values.

N-73. Comment: Section 6.1.1 requires that field equipment be returned to the manufacturer if it is shown to be outside of a +/-5 percent threshold when calibrated. This is unnecessary and expensive. Some meter manufacturers accept +/- 10 percent threshold as within calibration and acknowledge that a variety of field variables can affect calibration checks. Returning a meter to the factory takes time (and means that no gas flows can be recorded) and is expensive. ARB should ask that the meter meets manufacturer's requirements with respect to calibration checks rather than impose an arbitrary threshold. (CIG)

> **Response:** When equipment such as a gas flow meter is operating outside the +/-5 percent threshold, ARB does not require that the equipment be returned to the manufacturer; ARB only specifies that the calibration must be performed by the manufacturer or a certified service provider for that piece of equipment, meaning that the calibration can be performed in the field or on-site as long as the manufacturer deems it acceptable. The threshold itself has been substantiated through many public workshops. ARB has maintained consistency with the Climate Action Reserve's Livestock Protocol and within ARB programs

such as the Mandatory Reporting Regulation Section 95103 (Greenhouse Gas Reporting Requirements). In the cap-and-trade regulation, Section 95976 specifies that equipment used to monitor emissions from offset projects must be maintained and calibrated as required by the manufacturer at the level of accuracy stated in the Compliance Offset Protocol. Other measurements must be consistent with the applicable offset protocol.

Ozone Depleting Substances Protocol

N-74. (multiple comments)
Comment: NRG is supportive of an offset program that will increase compliance flexibility and help to contain costs associated with GHG reductions. NRG also supports inclusion of an offset protocol based on the destruction of Ozone Depleting Substances ("ODS"). (NRGENERGY)

Comment: Nexant believes a robust and active compliance offset market is essential to reduce the overall cost of the California Cap-and-Trade Program on California consumers. As such, Nexant supports the Air Resources Board's (ARB) efforts to extend the application of the four Climate Action Reserve (CAR) protocols proposed for Board approval to projects in Mexico and Canada.

This will increase the overall supply of offsets, while maintaining the environmental integrity of the system. It would also be a means to support the already close collaboration the State has established with our North American neighbors on important environmental challenges such as climate change. Therefore, ARB should look for every opportunity to extend the accepted CAR protocols. (NEXANT)

Response: Thank you for your support.

N-75. Comment: Page 63 of the PDR includes "Discussion of Concept--Ozone Depleting Substances (ODSs)." ARB is considering allowing offset projects not called out by AB 32 "(such as destruction of ODSs that are no longer in production)." Overall, DOD supports this approach; however, we would note that some ODSs, though no longer produced, still serve a crucial role for critical applications, both commercial and military, as users continue to transition to non-ODSs. This is especially true for halon fire suppressants, such as Halon 1211 (bromochlorodifluoromethane, CF2CIBr) and Halon 130 l (bromotrifluoromethane, CBrF3), for which there are no viable alternatives. Military mission-critical applications on aircraft, ships, and ground tactical vehicles utilize these ODS's, as do civil aviation to protect the safety of the flying public and the oil and gas industry for production in cold climates. We would also note that federal policy requires federal agencies to offer any excess Class I ODS to the DOD ODS Reserve for continued use in military mission-critical applications before they can offer for sale or destruction, in recognition of these ongoing critical uses. Given these critical military mission and civil aviation applications, we recommend that halons not be considered for the ODS offset program until such time that it can be determined that adequate global supplies are available. (USDOD1)

Response: Eligible projects for the ODS protocol do not include ODS substances required for any defense or national security needs that are from federal government installations or stockpiles.

N-76. Comment: The proposed ODS Protocol would grant GHG offsets for projects which collect and destroy ODS from refrigeration equipment containing ODS and from foam which was manufactured using ODS as a blowing agent. Both the ODS refrigerant and the ODS blowing agent must originate from the United States. The ODS Protocol contains two major flaws. These flaws would allow potential project operators to receive GHG offsets for claimed GHG emission reductions which are not additional. In addition, the ODS Protocol's reliance on unverifiable assertions and records generated by the offset project operator would create opportunities for fraud which would be extremely difficult or impossible prove once the fraud was completed.

In explaining how the performance standard of destruction of ODS pursuant to the protocol would be additional, the staff report claims, without providing any supporting citation or materials, that "Data shows that less than 1.5 percent of recoverable US sourced ODS are destroyed upon end-of-life of the [refrigeration] equipment or [foam] material. This indicates that collecting and destroying the ODS is above and beyond common practice and therefore destruction meets the performance standard." In addition, the ODS Protocol assumes that all ODS recovered from refrigeration equipment is reclaimed for further use. The combination of these assumptions is important for claiming that all ODS destroyed pursuant to the protocol are additional for purposes of generating offsets. If ODS removed from refrigeration equipment is not always reclaimed and reused, but for technical and/or financial reasons is sometimes destroyed, the destruction of this ODS would not be additional because it would occur in the course of business-as-usual. Not all ODS recovered from refrigeration equipment is reclaimed and reused. To be used as reclaimed refrigerant, ODS must meet established specifications under Title VI of the Clean Air Act. To be economically viable as reclaimed refrigerant, ODS removed from refrigeration equipment must not be mixed with other types of ODS and must not be heavily contaminated with oils and other impurities. Either of these problems will most often make the cost of bringing the ODS up to Clean Air Act specification prohibitively expensive. These problems regularly occur and a significant amount of ODS removed from refrigeration equipment is destroyed rather than being reclaimed and reused. The ODS Protocol would allow the generation of GHG offsets from this destruction. (WILLIAMSZ)

Response: The documentation in the CAR ODS protocol provides the data and calculations supporting the <1.5 percent of recoverable U.S. sourced ODS are destroyed upon end-of-life. The original data source is ICF International (2009), *Destruction of ODS in the United States and Abroad*, prepared for the U.S. Environmental Protection Agency. Some ODS are destroyed today, but the data shows it is far from common practice. We believe the regulatory verification process and ARB's oversight of the offset program will provide for a rigorous offset issuance process. In the unlikely event that any fraud is found after issuance, ARB retains the authority to invalidate a fraudulent offset and require it to be replaced to maintain the environmental integrity of the program.

N-77. Comment: The ODS Protocol contains two glaring enforcement weaknesses. First, the ODS Protocol requires that both the ODS refrigerant and the ODS blowing agent destroyed in a project must originate from the United States. This requirement is not practically enforceable. Once the foam or refrigerant is destroyed, it will be virtually impossible for an enforcement inspector to verify or challenge the paper records kept by the project operator. Second, this hopelessly flawed reliance on paper records generated by the self-interested project operator is a hallmark of the entire verification “methodologies” in the ODS Protocol. The temptations for a project operator to exaggerate or outright fabricate records will be enormous. If GHG offset prices come close to the offset prices in the European GHG trading program, destruction of a single pound of GHG could be worth nearly $100. Again, once all the real evidence is gone, e.g., the foam and refrigeration unit are in the landfill and the ODS has allegedly been destroyed, there is little, if any, hope of proving the fraud. As with the Digester protocol, the net result of the unverifiable and non-additional offsets that can be created under this protocol is a system that would allow emissions above the cap in the capped sectors. Allowing offsets for ODS destruction from foam may also create additional barriers to passage of appropriate regulations that would require ODS destruction before foam containing these substances could be brought to a landfill. Once an offset activity is profitable, those who are profiting will provide additional resistance to the passage of legislation and/or regulations that could provide an across the board, rather than piecemeal solution. In this sense, the proposed offsets do not meet the standard of additional reductions beyond what would have occurred otherwise. (WILLIAMSZ)

Response: The ODS protocol contains chain-of-custody and point-of-origin documentation that can be used by verifiers to investigate and confirm the source of the ODS. There are no proposed ARB requirements to mandate the destruction of ODS from foam on a local, state, or national level. We believe the regulatory verification process and ARB’s oversight of the offset program will provide for a rigorous offset issuance process. In the unlikely event that any fraud is found after issuance, ARB retains the authority to invalidate a fraudulent offset and require it to be replaced to maintain the environmental integrity of the program.

N-78. Comment: On page 5 of the staff report under “Conservative Accounting”, there appears to be a typo with substantive implications. Modify text as follows:

The default credits range from a low of under 0.20 tonnes of CO_2e credit for <u>each CO_2 equivalent</u> tonne of CFC-11 from building insulation to approximately 0.87 tonnes of CO_2e credit for each <u>CO_2 equivalent</u> tonne of CFC-12 refrigerant.” (EOSC1, EOSC2)

Response: The Staff Report is not a regulatory document and is not updated. We reviewed the applicable protocol and as it is the regulatory document, we found no issues per this section of the Staff Report that required a correction in the protocol itself.

N-79. (multiple comments)
Comment: Currently, GHG offsets for ODS destruction are issued by the Climate Action Reserve ("CAR") for use within the United States. On February 3, 2010, CAR issued an ODS offset protocol for the destruction of both domestic ODS6 and ODS originating in Article 5 countries. The Article 5 offset protocol allows the creation of offsets based only on ODS "listed under Annex A, Group I of the Montreal Protocol and used in refrigerant applications." The protocol further recognizes that "these CFC have been fully phased out of production as of January 1, 2010." Like CAR, the Chicago Climate Exchange ("CCX") has issued a protocol for offset generation through the destruction of ODS, limiting eligible substances to those "whose production has been phased out under the Montreal Protocol."

By design, current offset protocols confine offset generation to the destruction of ODS that are no longer produced, assuring offset additionality. CARB should take a similar approach by allowing the use of offsets that are generated through the destruction of phased-out ODS sourced from Mexico, such as CFCs listed in Annex A - Group I of the Montreal Protocol. Mexico was required to phase out production of these CFCs by 2010, and actually achieved a complete phase-out of CFC production in 2005. Allowing offset generation from the destruction of any stockpiled ODS produced in Mexico before January 1, 2010, will provide significant additional reductions in GHG emissions while simultaneously realizing stratospheric ozone benefits. Further, such an approach would align the proposed regulations with the recently issued CAR offset protocol for the destruction of ODS. NRG requests that CARB include offsets based on ODS that have been phased out in Mexico; by adopting the methodology described in CAR's current Article 5 ODS offset protocol. (NRGENERGY)

Comment: ARB’s proposal to exclude ODS from Article 5 countries would unnecessarily constrain the scope of GHG emissions that could be realized under AB 32. We believe it would be consistent with the general policy to allow for projects that originate in Mexico at minimum. The geographic distance from much of Mexico to qualified U.S. destruction facilities is comparable to distances that would be covered in projects that originate in the U.S. By extending eligibility to Mexico for ODS projects, ARB would not only better insure sufficient offset supply to meet the AB 32 targets, but would also help bring the same co-benefits to Mexico as we will be creating in the U.S. (EOSC1, EOSC2)

Comment: In PART 1, Volume I, III.A.5, four different compliance offset protocols are discussed including destruction of ozone depleting substances (“ODS”) within the United States. PART I, Volume I, III.A.7.c further notes that “Staff plans to evaluate how the four protocols being taken to the Board can be expanded to include projects in Mexico and Canada.” This statement contains the following footnote on page III-11:

"Staff does not intend to evaluate an ODS protocol for offset projects in Mexico because the substances covered under the protocol have not yet been phased out in developing countries."

Our research indicates that this statement is not factually correct. Specifically, the Montreal Protocol requires all Article 5 countries, including Mexico, to phase-out production of all Annex A, Group 1 Substances by January 1st, 2010. These substances include Chlorofluorocarbons ("CFCs") covered under the Proposal. Mexico went above and beyond this requirement, and agreed to phase-out all production of CFCs by the end of August, 2005.

On May 5, 2010, MGM Innova received a letter from Augustin Sanchez Guevara, Coordinador de la Unidad de Proteccion of Mexico's Secretaria de Medio Ambiente y Recursos Naturales ("SEMARNAT") which confirmed the following:

1) Mexico phased out production of CFCs in August, 2005. Since that date, production of CFCs, and imports of feedstock of Carbon Tetrachloride has been banned in Mexico.
2) Since January 1, 2010, Mexico has banned imports of CFCs including for use in Metered Dose Inhalers, as Mexico did not request essential use exemptions for any purpose under the Montreal Protocol.
3) Mexico does not have regulations requiring the destruction of virgin or recovered ODS of any kind, including CFCs.

MGM Innova would be happy to provide ARB with a copy of this letter if more clarification is needed.

While Mexico can still produce HCFC-22, and HCFC-141b which are both considered as potential ODS sourced from foam under ARB's Compliance Offset Protocol for U.S. Ozone Depleting Substances Projects, it is worth noting that HCFC-22 can still be produced in the United States for use in equipment manufactured before January 1st, 2010. Finally, given the important role Climate Action Reserve ("CAR") has served in helping to develop ARB's compliance offset protocols, MGM Innova would also like to point out that CAR's Article 5 Ozone Depleting Substances Project Protocol Version 1.0 is limited to CFCs produced for the refrigerant market, and does not include HCFCs.

It is our recommendation that ARB strongly consider the development of a compliance offset protocol for ODS destruction projects for ODS sourced from Mexico. In line with this recommendation, MGM Innova suggests utilizing CAR's Ozone Depleting Substances Project Protocol Version 1.0 as a proxy for Mexico offset protocol development and a potential source of early action offsets from Mexico. The CAR Article 5 Protocol has stringent point-of-origin documentation requirements, monitoring requirements, and destruction facility requirements. Furthermore, the Article 5 Protocol negates perverse incentives related to production of ODS given the requirement that ODS be produced prior to the Montreal Protocol phase-out date. A Mexico ODS destruction protocol has the potential to deliver significant environmental benefits given the high global warming potential of CFCs. Finally, drawing upon its extensive experience working as a consultant across a wide range of emission reduction projects located in North America, MGM sees a significant risk that the compliance protocols currently listed on the Proposal will not be able to produce the quantity of offsets anticipated by ARB. The inclusion of a Mexico ODS protocol and other project types that meet ARB's environmental integrity standards will mitigate the risk of offset supply deficiencies. (MGMI)

Comment: Nexant believes ARB should extend the protocol for the destruction of Ozone Depleting Substances (ODS) to projects beyond the U.S., including projects in Canada and Mexico. However, ARB has indicated in its Staff Report that it does not intend to make this extension to projects in Mexico. The reference is made in a footnote, and is as follows:

"Staff does not intend to evaluate an ODS protocol for offset projects in Mexico because the substances covered under the protocol have not yet been completely phased out in developing countries."

This statement, in fact, is erroneous. Under the Montreal Protocol, ODS production is completely phased out in all Article 5 countries by January 01, 2010. Mexico has ratified the Montreal Protocol and is listed under the Protocol as an Article 5 country. Correspondingly, Mexico has completed phase out of ODS production. Therefore, projects that destroy ODS in Mexico after January 01, 2010 can be considered additional under the requirements set forth in the Staff Report.

In the interest of disclosure, Nexant has invested in offsets to be originated from ODS destruction projects in Mexico. Nexant's investments were made to facilitate the flow of capital to these types of projects after a protocol for the destruction of ODS in Article 5 countries was adopted by CAR.

Although not itself a regulated entity under this program, Nexant's activities in this market serve as a vital source of early capital for carbon offset projects. Our investment in these projects ensures a robust and early supply of offsets, which enhances the cost containment benefits of the offsets component of the Program.

Taking the above under consideration, Nexant encourages ARB Staff to consider the extension of the CAR U.S. ODS destruction protocol to qualifying projects in Mexico. In any case, Nexant highly recommends ARB delete from the Staff Report the footnote referenced above. Taking this action will eliminate the considerable uncertainty of the potential qualification of post-2009 Mexican ODS projects for compliance under the California Cap-and-Trade project. This uncertainty has the effect of eliminating a high-quality and low-cost source of offsets, which would ultimately contribute to controlling the cost of the Cap-and-Trade Program to the State's consumers. (NEXANT)

Comment: While this protocol initially applies only within the United States, the proposed regulations also state that CARB staff plan "to evaluate how the four protocols being taken to the Board can be expanded to include projects in Mexico and Canada."

However, this proposed expansion is then apparently limited in the context of an ODS offset protocol by the following footnote:

“Staff does not intend to evaluate an ODS protocol for offset projects in Mexico because the substances covered under the protocol have not yet been completely phased out in developing countries.”

NRG believes that this limitation is in error because ODS substances covered by current ODS offset protocols were phased out by Mexico in 2005, under the Montreal Protocol and corresponding agreements. In addition, Mexico's importation of CFCs ceased on January 1, 2010, inclusive of metered dose inhalers, because Mexico did not request an essential use exemption for any purpose. Accordingly, NRG hereby requests that CARB remove footnote 35 from the Proposed Regulations, which appears erroneous and unnecessary in light of Mexico's phase-out of CFCs in 2005. (NRGENERGY)

> **Response:** The footnote was inadvertently included in the Staff Report; however, we are not including ODS from Mexico in the protocol at this time. However, as part of ARB’s commitment to provide an increased pool of compliance-grade offsets and expand existing and explore additional protocols, we may consider including the destruction of ODS from Mexico to the ODS protocol at some point in the future.

N-80. Comment: It is our experience, and those of our partners, that in fact, CFC-113 is still in use and in circulation, not as a solvent, but as refrigerant used in cooling systems. There are opportunities to collect the R-113, but as of now, the only incentive is to recycle it back into older equipment. Based on the fact that there is continuing demand for CFC-113 refrigerant, most if not all of the CFC-113 that is being destroyed would very likely be solvent. The EPA Vintaging Model uses the same annual leak rate for R-113 as for CFC-11. Thus, to calculate the baseline emissions from recovery and resale of R-113, the same 10-year cumulative emission rate (89 percent) that is used for CFC-11 can be used in the protocol. (EOSC1, EOSC2)

> **Response:** We agreed and modified the protocol to include CFC-113.

N-81. Comment: In Section 2.3.1 of the draft Protocol (page 5), it is stated that “ODS extracted from a foam source for use in refrigeration equipment is not considered part of this source category, and must instead be considered as a foam source.” We believe this proposed decision does not reflect newly available technologies that change business as usual and would increase, not decrease, GHG emissions that could otherwise be prevented. This proposal is based on the assumption that the usual practice is that ODS blowing agent will be disposed of, still entrained in the foam. In reality, the actual baseline for CFCs that are extracted from foam will also include re-sale for use as refrigerant and eventual release to the atmosphere. Since the CAR protocol was finalized, technology has continued to be deployed, in response to market demand, that extracts ODS blowing agent from foam. The extracted ODS is in pure form and technically and legally eligible for sale and use as a refrigerant. As a result, there is a new "business as usual" where the extracted ODS will be reclaimed and used to recharge older air conditioning equipment to meet demand as this would provide the highest value for the ODS. This proposed eligibility limit makes it uneconomical to carry out destruction projects for extracted blowing agents and therefore will constrain GHG reductions and discourage implementation of innovative technologies. (EOSC1, EOSC2)

> **Response:** The eligibility limit will remain the same at this time as we believe that the technology appears to be in its infancy and not yet a common industry practice. We may consider revising the protocol in the future as part of our commitment to expand existing protocols in order to provide additional projects that would help meet compliance obligations.

N-82. Comment: In Section 2.3.1 (page 6), it is stated that "ODS sourced from federal government installations or stockpiles is not eligible under this protocol." There is no regulatory requirement, Executive Order, or other federal policy that addresses CFC refrigerant still used in operating equipment. In fact, it has been the policy of the federal government, as administered by the U.S. EPA, to encourage continued, responsible use and recycling of ODS refrigerants to maintain the installed equipment and infrastructure. The CAR protocol should have been more precisely worded to make this distinction. Without this correction, the federal government will be forced to incur expenses to destroy CFC refrigerant, or to continue using older, inefficient equipment, instead of being given the option of realizing short-term and long-term savings through early retirement of this older equipment and participation in projects that can generate GHG emission reduction offsets under this protocol. (EOSC1, EOSC2)

> **Response:** Federal government policy indicates that federal agencies should provide all recovered ODS to the Department of Defense, who will bank the substance for any defense or national security needs. Currently, we find that the Department of Defense has a policy to destroy the ODS if there is no need for it. Therefore, we will not include any federal government ODS because the destruction would occur anyway, resulting in no additional reductions.

N-83. Comment: The Laboratory Analysis (Footnote #10 on page 29) specifies where the project developer is the destruction facility itself, a 3rd party should take samples. We recommend that similarly, if the project developer is, or operates an AHRI-certified laboratory, that a different AHRI-certified lab not affiliated with the project developer must be employed to take and analyze the samples. (EOSC1, EOSC2)

> **Response:** No change is needed, as the ODS protocol already includes this requirement.

N-84. Comment: Under Section 5.2.4, facilities that do not have a RCRA permit must document that their operations are consistent with the TEAP requirements. For consistency with other provisions of this proposed protocol and the general regulatory requirements under AB 32, we suggest that this demonstration be certified by a third party. (EOSC1, EOSC2)

> **Response:** We agreed and modified the protocol to clarify that a third party must verify that the facility is in compliance with TEAP.

N-85. Comment: An assessment of the CAR US ODS protocol that deviates in a detail but in a revealing manner from that protocol as published by the CAR: What is Appendix E in the protocol published by CAR became Appendix A in the Staff Report and this Appendix A omits the first page, what is page 76 in the CAR version. Possibly it did not seem important to ARB staff but this page contains a number of significant factual errors with a profound bias. This bias consists of an oriented interpretation of the technology-specific threshold sought in CAR. What is labelled a technology-specific threshold is rather a regulation-pre-emption threshold. (GRAMMIG)

> **Response**: We did not include several Appendices and other background data in the ARB protocol because we considered the information as purely background. For those seeking background information, we provided a reference to the CAR protocol.

N-86. Comment: CAR invented Foam Recovery Efficiency and Calculations that have no technical or engineering content but that allow offset project operators to measure for their preferred result. (GRAMMIG)

> **Response:** We based the foam recovery efficiency calculations on samples and use a similar methodology for industry and international methods.

N-87. Comment: CAR US ODS protocol cites only one source of empirical data, from authors Scheutz, Kjeldsen, and Fredenslund from the Technical University of Denmark. Their research was funded by the EPA and the Association of Home Appliance Manufacturers (AHAM) and consists of measurements in four shredders in Tennessee and a landfill in North Carolina in 2004. Nowhere is it considered whether this data is representative for the other 50 states of the US (some states enforce regulations that old refrigerators should not be landfilled, others cannot because there are no shredders or only those with particular refrigerator relevant problems, and so on). AHAM's members might have reasons to be content with these limited results because AHAM wants to avoid any cost to its members from the environmental leftovers from their products and thus the lowest level of ODS emissions from all appliance disposals could be suitable for them. Why did AHAM choose a Danish research group, far away from the sampling sites, instead of laboratories in the US?

Years later, the average result 14.9 percent from eight refrigerator units becomes the threshold by using it to calculate a baseline for CAR. The Montreal Protocol has in the meantime accumulated much studies and research and the EU has several years of comprehensive data from the implementation of Directive 2002/96 known as WEEE, but these do not appear anywhere in CAR, instead only what AHAM paid for. (GRAMMIG)

> **Response:** The data are based on studies using American refrigerators. The data for ODS released from European appliances during shredding is not applicable because European appliances are subject to different regulations and markets. The Reserve's research indicates that U.S. appliances are larger, have a greater quantity of foam per appliance, and a higher concentration of CFC foam-blowing agent in the foam. Additionally, we found that using a lower emission rate in the baseline is more conservative.

N-88. Comment: On the omitted page 76 in the CAR published version, it is stated that "existing international standards benchmark best practices" and thus "do not provide a mechanism by which to calculate losses of ODS that may occur during the project activity."

It seems that "existing international standards benchmark best practices" should fit well what CAR wants to establish, a technology-specific threshold. Additionality is what is better than what happens elsewhere. If additionality is only defined intra-US, then still the approach to calculate the benchmark is possibly the best approach irrespective of where the bar is put. (GRAMMIG)

> **Response:** The protocol looks at common practice within the area for determining the baseline and what will occur in absence of the protocol. The project activity is also based on what actually occurs, not the best practice, as the best practice would not accurately reflect reductions.

N-89. Comment: CAR argued in the introduction to its Appendix E that European practice is not transferable to justify that good monitoring is not needed, since they have measurement results from eight refrigerators. This excuse was happily accepted by those who made the CAR US ODS protocol, but they did not consider the technology (recovery, recycling, demanufacturing or any treatment of old appliances), they pursued the interest of project developers.

The reasoning to discard the WEEE and RAL recycling standards was useful for CAR but would obviously render the claims from ARB that it is a technology-specific threshold sound hollow (therefore page 76 was taken out). (GRAMMIG)

> **Response:** As with all protocols included in the cap-and-trade regulation we removed background information that is unnecessary for quantification or project implementation from the protocol. The ARB protocols are regulatory documents, and background information, while informative, is not typically included in regulatory language.
>
> As mentioned in response to earlier comments, we used data for appliance measurements for the U.S. due to differences in appliances between the U.S. and other countries.

N-90. Comment: AHAM funded a small sample could have reduced the ODS emission estimation, now it is going to reduce the investments in recycling technology by excluding it from carbon trading. (GRAMMIG)

> **Response:** This protocol is specific to ODS destruction, not ODS recycling, which is business-as-usual and would not result in additional reductions.

N-91. Comment: A further problem for ARB, if WEEE and RAL standards are used in Europe, why do these standards not use the measurement approach from the Scheutz, Kjeldsen and Fredenslund ?

The avoidance of monitoring by CAR was covered by requiring a measurement of ten refrigerators once in the project lifetime. ODS content in foam varies between refrigerator manufacturers. It is false that more than ten appliances results in a higher calculated recovery efficiency (second para on page 43). The real reason for the low sample size of ten is that one can then choose those 10 appliances with the ODS content that gives the lowest baseline and thus maximises income.

Besides, the claim that ten is a minimum required and above ten results in a higher average is simply illogical. How can there be any technical reason for the sample size ten? There is no justification possible for this size. CAR did not relate it to any published study. Was ten simply chosen because it is similar to the analysis that AHAM paid for? (GRAMMIG)

> **Response:** As stated in the Appendix, the methodology uses an approach similar to that utilized by the Waste Electrical and Electronic Equipment Directive (WEEE), RAL Quality Assurance Association (RAL), and other internationally recognized standards.
>
> Regarding sample size, we cannot determine the commenter's reference of sample size, as there is no mention of sample size on page 43 of the CAR protocol, and the mentioned sample size of 10 earlier in the document is for building foams.

N-92. Comment: Another indication for this is that the whole Appendix A is superfluous, as a little bit of fractional algebra shows. It is really simple:
on page 19 in the equation for $BA_{app,i}$

- insert in place of the ratio for Recovery efficiency RE the expression "BA_{post} / BA_{init}" (as page 44)
- insert for BA_{init} the fraction above on page 44.

Since BA_{post} and $Q_{recover}$ in the equation $BA_{app,i}$ is really the same variable, it is mathematically correct to cancel out what is before the bracket and what is in the bracket in the equation $BA_{app,i}$. What is left is

$$BA_{app,i} = Q_{recover} + (Foam_{res} * BA_{conc} / (1 - BA_{conc}) - Q_{recover}$$

Thus the whole exercise of Appendix A is futile. It doesn't add anything to the emission reduction calculation.
$Q_{recover}$ = Total quantity of ODS foam blowing agent recovered during processing and sent for destruction (page 19)
BA_{post} = Quantity of recovered blowing agent in concentrated form (page 45)
Just the words are a little different, it is the same variable.

Appendix A is mathematically meaningless and it is technologically irrelevant because there is no relation between a sample of ten and the average of thousands of appliances. The sampling is meaningless for the calculation and it says nothing about the environmental integrity of the appliance treatment. (GRAMMIG)

> **Response:** The first equation provides a way to calculate the recovery efficiency. The set of equations allows one to make measurements and plug them into the equations to determine the quantity of ODS foam agent prior to treatment. The measurements in Appendix E help determine the following: (1) mass of foam recovered, and (2) the initial concentration of blowing agent in foam; both help determine the initial concentration of blowing agent in the appliance. All the preceding measurements in total help determine the recovery efficiency and then the amount of ODS in the foam prior to any treatment.

N-93. Comment: The Appendix A was invented after the public comment period for the CAR US ODS protocol ended. The November 20, 2009, public draft version 1.0 did not contain it. Nobody in the public workshop on December 7 could have known what was suddenly sprung with the January 2010 version as Appendix E. What the sampling really is, the entire reason for its inclusion in the CAR US ODS protocol, is that it creates the appearance of a technology-specific threshold.

In the clarifications from CAR "Frequency of the Recovery Efficiency Calculation" it states that the recovery calculation must be done once for each project. It doesn't matter whether it is done every day or once in a year, it makes no difference to the emission reduction calculation. Specifying once per project simply creates the impression that it is technology-specific. It actually is specific to nothing.

The sole purpose of Appendix A is to pretend that CAR US ODS is consistent with international standards, while it denies the existence of WEEE and of RAL and denies their technical and environmental properties. (GRAMMIG)

> **Response:** As shown in the response to the previous comment (GRAMMIG), the equations and measurements do provide necessary information. The protocol does not deny the existence of WEEE or RAL but notes those standards and explains why they are not useful for the purposes of a U.S. protocol (e.g., different refrigerator types and different amounts of foam and ODS agent).

N-94. Comment: Because the CAR US ODS protocol has no content that would be in any way related to recovery technology, the design principles behind the whole cap-and-trade are severely weakened in that protocol. CAR aims to "stimulate investment and reward innovation" but the CAR US ODS protocol simply credits any destruction of ODS, no matter where or how much ODS is actually around. Then CAR aims to "be consistent with established international standards." Instead, CAR US ODS rejects the analysis, the data, and the technology reflected in international standards. (GRAMMIG)

> **Response:** Recovery of ODS is common practice (as shown in Appendix B of the CAR protocol), and thus would not provide any additional reduction beyond existing baseline calculations. The protocol only provides reduction credits for reductions above and beyond those achieved through recovery of ODS. The protocol requires measurement and analysis of ODS in foams and refrigerants and the analysis must be conducted by a third party.

N-95. Comment: It is unclear in section 95990 and in the conflict of interest provisions (e.g., section 95979(b)(4)) if offset credits registered with a third party offset program can be or cannot be verified by the same verification body that originally verified the project under the third party program. (EOSC1, EOSC2)

> **Response:** Section 95990(f) was modified to clarify the requirements for regulatory verification of early action offset projects. New section 95990(f)(1) includes new requirements that the verifier performing the regulatory verification services must be different than the one that did the initial verification for the Early Action Offset Program. This ensures that the review is completely independent and unbiased.

Urban Forests Protocol

N-96. Comment: The proposed Urban Forest Protocol would grant GHG offsets for tree-planting and maintenance programs carried out by municipalities, educational institutions, and utilities. This Protocol is the most benign, and probably the most well-intentioned, of the proposed offset protocols. However, even the Urban Forest Protocol contains one serious flaw. The Urban Forest Protocol assumes that any "Net Tree Gain" represents an additional reduction in GHGs. While any Net Tree Gain is a happy thing for the environment, people, and the livability of our communities, these gains do occur in the course of business-as-usual. A case in point is the urban forest project carried out by San Francisco's Department of the Environment. In its September 2009 Annual Report to the Mayor and Board of Supervisors, San Francisco's Urban Forestry Council noted that a five-year plan, initiated in 2004, had resulted in the planting and maintenance of 26,408 trees. This occurred well before the incentives of GHG offsets. (WILLIAMSZ)

> **Response:** Performance standards are set at levels which represent beyond business-as-usual performance for the entity type. Net tree gain (NTG) is the difference between the number of trees planted minus the number of trees

removed. The analysis of tree planting and removal rates in 18 U.S. cities was used to inform setting the municipal performance standard for NTG to zero, representing a stable urban tree population. Numbers of trees planted in excess of removals qualify as offset project trees, provided all other program requirements are met. Moreover, the performance threshold is not tailored to individual cities, but rather represents a broad-based threshold for beyond business-as-usual performance.

N-97. Comment: Ultimately, for an offset protocol to have integrity, the results of all offset projects must be the result of the financial incentive. It this is not the case, the financial gain for the "would-have-happened-anyway" project is merely a gratuitous reward. While cities and other institutions would appreciate the extra revenue for planting and maintaining trees they would have planted and maintained anyway, the problem is that all non-additional GHG offset will inexcusably undercut the goal of the associated environmental program, reducing emissions. Any such non-additional offsets, will result in allowing additional unjustified emissions above the cap in the capped sectors. (WILLIAMSZ)

Response: The designation of project (additional) versus non-project (business-as-usual) trees and monitoring for resource-shifting (leakage) are unambiguous in the protocol and verifiable on the ground. There is little likelihood that offsets generated under the protocol would constitute gratuitous reward for business-as-usual municipal activity: Despite one-time initiatives such as the Trees for Tomorrow campaign, municipal resources are typically insufficient to address ordinary needs for tree planting, maintenance, and removal.

O. MISCELLANEOUS

This section includes responses for comments that either do not fall within the other comment categories, or that do not directly pertain to the regulation. Major topics concern whether California should implement a cap-and-trade program without partnering with other jurisdictions, arguments to repeal AB 32, making emitters accountable for their emissions, and the validity of climate change and/or climate science.

General

O-1. Comment: I am writing as a California citizen who remembers how hard it sometimes used to be to breathe in California when I moved to San Diego in the early 1970s. When scientists pointed out the sources of that problem, the politicians and agencies of the time took steps to correct it. I am extremely grateful for that and hope you will let scientific findings concerning pollution and global warming guide you in taking further measures to ensure health and livability in our state. I support the views on this issue presented by the Union of Concerned Scientists. (GAGE)

> **Response:** We acknowledge your comment. Please refer to responses directed to comments submitted by Union of Concerned Scientists.

O-2. Comment: Follow the guidelines put forth by environmental protection groups such as the Union of Concerned Scientists, Sierra Club, Green Peace, Friends of the River, Save the Salmon-Columbia and Snake Rivers Campaign, Surfrider Foundation, Center for Biological Diversity, National Wildlife Federation, Scripts Institute, all major universities and others. I agree with and support the recommendations put forth by these groups. (GIANNI)

> **Response:** We acknowledge your comment. Please refer to responses directed to comments submitted by Union of Concerned Scientists, Sierra Club, Greenpeace, Friends of the River, Save the Salmon-Columbia and Snake Rivers Campaign, Surfrider Foundation, Center for Biological Diversity, National Wildlife Federation, Scripps Institute, and all major universities.

O-3. Comment: ANZA fully supports and adopts by reference the comments submitted by AEPCO on this proposed regulation. (AEC)

> **Response:** We acknowledge your comment. Please refer to responses directed to comments submitted by Arizona Electric Power Cooperative.

O-4. Comment: First, if you are so sure what you are doing is right, then there is no reason not to give people more time to respond to your program. You will only need to give this plan the bums rush if you know in your hearts it is wrong. Second, don't you know Global Warming is a huge scam? Wake up and look around; you are the only western state still moving on this; are you crazy? At the very least, you should give more time for public debate. (STERWARTM2)

> **Response:** Climate change poses a serious threat to the economic well-being, public health, natural resources, and California environment. Assembly Bill 32 (AB 32) includes specific timelines for the Air Resources Board (ARB) to develop and implement strategies to achieve the greenhouse gas (GHG) reduction limit established in the law. California is working with other states, jurisdictions in the Western Climate Initiative (WCI), and the federal government to encourage the reduction of GHGs.

O-5. (multiple comments)
Comment: I was never one to believe that cap and trade would really solve the problems of climate change. There is generally not enough political will to set caps low enough and an abundance of political will for giving some polluters a get out of jail free card. If either of these happens, it will have been an interesting exercise, an example of what not to do next time. It is clear that the Republican Majority in the House of Representatives will prevent substantive action from happening at the federal level. California must not fail in showing what can be done. (ROLLEY)

Comment: Carbon trading in general would be counterproductive as a component of AB 32 because it selects for delay in addressing structural change in those industries where it is most important. (CORNERHOUSE)

Comment: Cap and trade is fundamentally flawed because it rewards the state's biggest polluters by giving them free credits. A far better approach to reducing CO_2 emissions and supporting our economy is cap and dividend. (SUSHABITAT)

> **Response:** As detailed in the Scoping Plan, the cap-and-trade program is designed to work in concert with a number of complementary measures, such as standards for cleaner vehicles, low-carbon fuels, renewable electricity, and energy efficiency. We evaluated four alternatives, including additional source-specific regulations, and found that none were as more effective than the implementation of a cap-and-trade program in carrying out the goals of AB 32. Staff has designed the program, including the cap, to be sufficiently stringent to spur GHG reductions to achieve AB 32 goals. We will closely monitor whether, over time, the cap-and-trade program is meeting the objectives set forth in AB 32. The premise that pollution trading programs do not significantly reduce air pollution is contradicted by experiences in other programs. The RECLAIM program in the South Coast Air Quality Management District has achieved reductions well beyond original expectations and continues to show increased reductions, including in areas adversely impacted by pollution and consistent with the ozone State Implementation Plan (SIP) for the South Coast Air Basin. As noted, the federal Acid Rain program has also gone well beyond original emission reduction estimates and has lowered control costs over what would otherwise have occurred under a command-and-control system. In both cases,

as in other market-based regulatory systems, adjustments have been made as problems are identified, and cost-effective emission reductions continue to occur.

O-6. (multiple comments)
Comment: The legislators in Sacramento who vote for bills like these are only greasing their own pockets in one way or another. When are they going to start voting for what is BEST FOR CALIFORNIA instead of their own self interests. This is a great example of why the Tea Parties are alive and still growing. They help the silent majority keep score on the voting records of these carpet baggers so we all can be more informed for the next election cycle. How can California implement laws that we cannot afford and expect the rest of the country to bail us out? (GIFFORD)

Comment: Stop messing with America's private enterprise system. If you choose to cap and trade your own business, be my guest, but no more treading on my children's attempts to take care of their own families. (NIELSEN)

Comment: We the people will not turn a blind eye to those in power who are making our problems worse, not better with the hearings on cap and trade. (SNOWDENT)

> **Response:** Climate change is one of the most serious environmental threats facing the world today, and California is already feeling its effects. In 2006, the Legislature passed and the Governor signed AB 32, which set the 2020 greenhouse gas emissions goal into law. AB 32 directed ARB to prepare a scoping plan outlining the State's strategy to achieve the GHG reduction limit established in the law. The Scoping Plan describes a comprehensive approach that includes direct regulations and a cap-and-trade regulation. The flexibility of the cap-and-trade program, together with specific design features included in the regulation to help contain costs, ensures that the reductions needed to meet the requirements of the regulation are cost-effective. Additionally, the cap-and-trade program is expected to drive investment in cleaner and more-efficient technologies to power California's economy. Information on the economic analysis can be found in Chapter VIII of the Staff Report and Appendix N.

O-7. (multiple comments)
Comment: The trade portion of Cap and Trade is a scam. (GOFF)

Comment: There is not a consensus in the scientific community that global warming is caused by man-made carbon. If carbon 'pollution' must be regulated, why not just regulate it? Adding the 'trade' aspect ultimately just means that money will be leaving the business's hands and ending up in government hands. It also means that industries will continue to pollute, just pay for the right to do so. This seems to suggest that the real goal might be just another government income source and /or more government control over the private sector. (PEABODY)

> **Response:** The allocation system is designed to reward those who have taken early action and have invested in energy efficiency and GHG emissions

reductions and will encourage continued investment in efficiency and clean energy in the future. Because the allowances can be traded, the program provides incentives for those with the most cost-effective reduction opportunities to reduce emissions quickly, and allows the market to find the most cost-effective overall reductions.

O-8. (multiple comments)
Comment: Keep exploring and implementing wind and solar energy. Please keep investing in these clean power technologies, and divesting from all the rest. Thank you, no biomass ever. (PHILLIPSS)

Comment: Consistent with prior CCC recommendations (see www.caclimate.org), the Board should establish an Executive Office level position with the primary responsibility of ensuring that the very clean technology and facility investments anticipated by the AB 32 program and its complementary measures (e.g., the low carbon fuel standard, the renewable electricity standard and motor vehicle technologies, among other measures) are expedited by ARB and its sister departments, commissions, agencies and air districts. (CCC)

Comment: It is important to put limits on carbon pollution that will be reduced to lower allowable limits over time, so that everyone investing in new technology will know that their investments will pay off over time. (RIEVE)

Comment: The future of energy use needs to be moving away from CO_2 producing sources. Solar energy cost is simply the cost of harvesting it. The process of building the solar industry will provide jobs that will promote spending money here instead of being shipped overseas, thereby boosting the tax base. Demanding that greenhouse gases be removed from the energy economy will provide the incentive for that industry to invest and grow, which will further reduce the cost. Legislation to require power companies to pay the prevailing rate to the small producer (such as home rooftops) will provide further incentive to commit the capital to put those solar panels into service. Additionally, local electrical generation eliminates the huge loss of energy that come with transporting electricity from central, distant power generating plants. This is a win-win situation for our state and country (except for big oil companies). This strategy will make worries about reducing greenhouse gases a moot point. (WOLF)

Comment: The fossil fuel companies need to get on board and be part of the solution and become innovative in creating clean energy technology. They have a heavy investment in fossil fuel energy so let's be empathetic and give incentives for the changes we want to see. Please support all legislation to move us rapidly in a new direction. (KRAY)

Comment: Californians want to lead the country in clean energy just like we did in the computer industry. By dedicating more of our desert lands to solar and wind development, we could be net energy exporters and create a major business and employment stimulus for our state. (YOUNGJ)

Comment: We need to develop clean energy. Give more incentives to home owners to use solar, double pane windows, and buy electric or hybrid cars. Please strengthen California's commitment to clean air. (DANIELSL)

Comment: I feel it is essential for California to take a leadership role in the development on clean energy. I believe the proposed program is a very good start even though it could hold big polluters more responsible for their emissions. I would like to see a more forceful program to get us on the right track. I should mention that as a father of a 5 year old boy with asthma I also have a personal investment in this subject matter. (MARTINR)

Comment: We need to reduce carbon based fuel, increase clean alternative energy without pandering to the polluters. (NAUSBAUM)

> **Response:** As detailed in the Scoping Plan, the cap-and-trade program is designed to work in concert with and enhance a number of direct measures that call for cleaner technology, such as standards for cleaner vehicles, low-carbon fuels, renewable electricity, and energy efficiency. For example, the bulk of electricity used in California is provided by publicly and privately owned utilities. These utilities are required by the Renewable Portfolio Standard to procure 33 percent of their electricity from renewable sources by 2020. In addition, State energy and environmental agencies are joining forces with the California Independent System Operator Corporation to expand cooperation as they advance carbon-cutting innovation and green job creation. California's Clean Energy Future points the way toward new investments in transmission, energy efficiency, smart grid applications, and increased use of renewable resources. Additional information on California's Clean Energy Future can be found at www.cacleanenergyfuture.org. In addition, Board Resolution 10-42 directs the Executive Officer to work with the California Public Utilities commission and publicly owned utilities to ensure that the proposed allowance value could include investment in energy-efficiency programs and renewable energy projects that achieve environmental and public health benefits. The regulation also includes a floor price for carbon, starting at $10 per ton, so that a consistent price signal is sent to clean technology developers.

O-9. (multiple comments)

Comment: I ask that the CARB not implement AB 32. California will be greatly harmed economically by so doing. California will push even more business and jobs out of the state. (FERNWOOD)

Comment: As a voter, taxpayer, and citizen of the State of California, I am concerned for the direction our state is headed. One hundred forty-four companies are leaving California for states that are more business friendly. Not the least of their reasons is the onerous regulations put in place in the name of protecting the environment. These regulations have been put into effect, with little science and a lot of propaganda. (RICKER)

Comment: The State of California and the California Air Resources Board has chosen to regulate the destruction of thousands of businesses. (STEVENSON)

> **Response**: We do not believe implementation of the cap-and-trade program will lead to the destruction of thousands of businesses. In developing the proposal, we conducted a comprehensive analysis of the impacts of the proposed cap-and-trade program on California businesses and business competitiveness. This analysis is described in detail in Chapter VIII of the Staff Report. The analysis showed that the proposed cap-and-trade program will not have a significant statewide adverse economic impact directly affecting businesses, and little or no impact on the ability of California businesses to compete with businesses in other states. In part, this is because the regulation includes methods to reduce competitiveness loss though the allocation process, such as through output-based updated free allocation, reducing the potential for competitive losses to California business.

O-10. (multiple comments)

Comment: To control CO_2 in our atmosphere, (I use this to mean all layers of the atmosphere in general) we would be better served to focus on reducing consumption of goods, planting trees and reducing actual production of CO_2, not pretending to do so by trading carbon credits. (KENNERLY)

Comment: The focus of CARB and businesses in the state needs to be on making our businesses more efficient and less polluting. Our manufacturing sector is one of the most efficient in the world. It makes more sense to reduce greenhouse gases by producing goods and services in the most efficient facilities here in the USA instead of having them produced in primitive inefficient plants in developing countries. The greenhouse gases are a global phenomenon. We need to focus on reducing man made greenhouse gases in other ways than cap and trade if we want to reduce global greenhouse gas emissions. (JEPSON)

> **Response:** While we recognize that these ideas are important to reduce GHG emissions, we considered other alternatives, and it was determined that a comprehensive plan with both direct regulations and a cap-and-trade program was the most cost-effective way to meet the goal of reducing GHG emissions to 1990 levels by the year 2020, and ultimately achieving an 80 percent reduction from 1990 levels by 2050. Alternatives that we considered to cap-and-trade can be found in Chapter IV of the Staff Report. The GHG reductions required under AB 32 cannot be realized without the active participation of the people of California. Therefore, individual behavior, such as reducing consumption of goods, will also play a major part in this important endeavor.

O-11. (multiple comments)
Comment: Consider implementing a carbon tax. (SUCKOW)

Comment: One aspect of the proposed regulations that goes the wrong way is the "cap and trade" provision. We don't need to turn the current pollution levels into an asset which can be traded. This would have the effect of ensuring that the pollution "cap" is exploited to the maximum extent. It's better to implement a carbon tax, even if it's minimal at first, which adds to the cost of carbon pollution, and thereby creates a consistent, across-the-board incentive to reduce greenhouse gas emissions. (ZIMMERMANM)

> **Response**: We considered alternatives to the cap-and-trade program and implementing a carbon fee was one of the alternatives considered; however, we determined that a cap-and-trade program was more favorable. Details on why we chose cap-and-trade over a carbon fee can be found in Chapter IV of the Staff Report.

O-12. Comment: I can get into what I know about CARB and I can tell you what I do know I don't like at all. But the real thing that I don't like is that this thing is over 3,000 pages and I can't even begin to understand it. This is not clever we do know why you make these things so big and confusing. It is so you can make it do anything you want it to. This is bad legislation and it was done by unelected people who have no right to set laws regulations taxes or fines. (NCTPP1)

> **Response:** AB 32, which was enacted in 2006, sets the 2020 greenhouse gas emission reduction goal into law. The AB 32 Scoping Plan identifies a cap-and-trade program as one of the strategies California will employ to reduce the GHG emissions that cause climate change. The proposed cap-and-trade regulation and the Staff Report were released concurrently for public review. The Staff Report contains detailed analyses of the requirements in the proposed regulation. The analyses include the environmental impacts, economic impacts, and technical evaluations and are presented, along with supporting documentation, in several appendices to the Staff Report. Although the report is a large document, a summary of the details of the cap-and-trade program was included in the Executive Summary and Chapter II.

O-13. Comment: Even Al Gore admits ethanol is a mistake. It increases government costs through subsidies. It increases costs to all consumers for fuel. It does nothing for the environment. It uses more energy than it provides. (FAULKNER)

> **Response:** The low carbon fuel standard considers full lifecycle impacts of fuels, including ethanol as an approved pathway to comply with the regulation. Cap-and-trade has a compliance obligation for transportation fuels and fuel suppliers that helps to drive the long-term transition to cleaner fuels well into the future. Cap-and-trade creates a price signal on fuels to drive long-term

investment in cleaner fuels, encourage energy efficiency, and to do so in the most cost-effective manner. We believe that the price signal would provide an incentive for investment in clean fuels. Additionally, including fuels in the program provides a consistent price on GHG pollution throughout the economy and ensures a level playing field across all fuels and consumers.

California Can Not Stand Alone/Insignificant Impact

O-14. (multiple comments)
Comment: Please do not take any more steps to reduce emissions in California without agreement at the national level that every state and the District of Columbia will agree to these new standards (a national policy better developed by the EPA and DOE); and new standards that are International in scope with China, India, Russia, Brazil, Indonesia, and the European Union. Without such agreement there is little to no incentive for California's taxpayers, ratepayers, and businesses to support a unilateral tax on emissions. (ENP)

Comment: We have too many people on the planet to support, and one state trying to control what does or doesn't go into the air is utterly ridiculous when other countries and continents so blatantly pollute. We have small farmers businesses in California that have tried to survive without getting enough water because of a non-native FISH! Their livelihoods are destined to crumble now if they have to comply with all the new regulations, while big corporations can buy carbon shares to offset their emissions? I want my food locally grown, not shipped from somewhere else in ships or planes that pollute way more than a local organic farm!! Get real, people. It's the rest of the world that needs educating - Regulating California alone is NOT going to make a bit of difference. (MAYNE)

Comment: Cutting 100 percent of the world's CO_2 emissions lowers CO_2 emissions by a whopping 1.5 percent of the carbon cycle. The remaining 210 billion metric tons per year (Source: J Christy, 2002) comes from natural processes. So, how much of an effect would cutting 100 percent of California's emissions have? Less than 0.15 percent. This is bad economics and bad policy. It's not about saving the world (except for the true believers) it's about money. Follow the incentives. Baptists and bootleggers, true believers and the buck-seekers, have banded together to make markets out of thin air with offsets or allowances. (BENSON)

Comment: There is no question that we are having a global climate change occur. The causitive agents have been incorrectly identified as manmade greenhouse gases. From current articles and publications, it appears that only 5.5 percent of the global greenhouse gases generated are manmade. California emits 1.2 percent of the manmade greenhouse gases. The reality is that passing a Cap and Trade program in California will not have any measurable effect on the global greenhouse gas emissions. (JEPSON)

Comment: On the national and international front, California leadership is a source of humor. It's really not taken that seriously anymore. We're very unique economically and the way we're handling ourselves. If a state can create a market for a product and a service that a private individual would never create and be successful in that and lift the overall quality of life and improvement for its citizens, I'd love to see it. It's never been done. I challenge you to work out some of these details that we've been talking about and do it. Internationally, Kyoto and Copenhagen failed. Most recently, Cancun resulted in how you redistribute capital, not in about CO_2 emissions. And I think that's where the argument has come from. The U.S. Senate would not deal with it. Our Legislature is killing the EPA committee for next year. (FORD)

> **Response:** While we recognize we cannot do it alone, California's economy is among the top 10 largest economies in the world, and is therefore is uniquely positioned to take action. Our climate change plan relies on a strong network of climate partnerships. California is working with other states, jurisdictions in the WCI, and the federal government to encourage the reduction of GHGs. Climate change will adversely affect public health, the environment, and the economy in California. California has a long history of leadership in protecting public health and the environment. For example, California's GHG standards for cars have been adopted by the federal government. Adoption of the cap-and-trade program is the next step in that leadership.

AB 32

O-15. (multiple comments)
Comment: We cannot afford more unnecessary debt especially when it would take food off the plate for many. That equals a big no and asking to suspend AB 32. (CVTP)

Comment: AB 32 must have been cooked up by a team of people with purely evil intentions. To think that this is perfectly fine to implement is hard to comprehend. (GIANNINI)

Comment: Please don't go ahead with AB 32 at this time or at any other. That is the wrong thing for California at this time and will have no effect or an unmeasurable effect on climate but huge negative effect on employment and the economy. (GOEDJEN)

Comment: American workers cannot afford this nor are most even interested. No AB 32. (SNOWDENB)

Comment: Suspend AB 32 until the unemployment in CA is 4.5 percent for four straight quarters. Those who can least afford the increase in electric rates, gas prices will be affected. (DECKER)

Comment: With the sad state of affairs in California, the last thing this state needs is more regulation. We've already driven record numbers of businesses out of the state. I am opposed to the implementation of new regulations that will come with AB 32. (BONASERA)

Comment: This is the third recession I have experienced and yes, we have always pulled through them. California? I'm not so certain, because there is something here that was never here after the last recessions, CARB and AB 32. We had 150 employees in 2007 and we now have 12. (PARIGORIS)

Comment: Suspend AB 32 until unemployment is below 5.5 percent. (MUELLERS)

Comment: I'm writing to urge repeal or, at least, suspension of AB 32. With the staggering number of people out of work and businesses fleeing California, this legislation is absolutely the worst thing that can happen to us. I live in San Joaquin county and the number of foreclosed homes and empty buildings where long standing businesses use to be is frightening. Please help us. Use some common sense and stop this. We Californians cannot afford this. (ALLENKIM)

Comment: The hard working souls of America are already struggling to survive in this economy. No on AB 32. If this continues there will be even more people on the streets, more people in debt, more people collecting un-employment, and more people not owning businesses. This means less revenue from the people, which in turn means America in debt (even more than America already is in debt) Get the idea. No on AB 32. It is no longer about "global worming" anymore! I have heard some whoppers in my time but that one tops them all. (CARRILLO)

> **Response:** Climate change is one of the most serious environmental threats facing the world today, and California is already feeling its effects. In 2006, the Legislature passed and the Governor signed AB 32, which set the 2020 GHG emissions goal into law. AB 32 directed ARB to prepare a scoping plan outlining the State's strategy to achieve the GHG reduction limit established in the law. The Scoping Plan describes a comprehensive approach that includes direct regulations and a cap-and-trade regulation. The flexibility of the cap-and-trade program, together with specific design features included in the regulation to help contain costs, ensures that the reductions needed to meet the requirements of the regulation are cost-effective. Additionally, the cap-and-trade program is expected to drive investment in cleaner and more-efficient technologies to power California's economy. Information on the economic analysis can be found in Chapter VIII of the Staff Report and Appendix N.

Make Polluters Accountable

O-16. (multiple comments)
Comment: Please do not allow large polluters to pay a small fee and continue to pollute California. If they must be given a break, then make the fees high enough to solve California's budget crisis. (MARKS)

Comment: Please clean up the cap and trade scheme so that businesses below the cap don't trade credits with other polluters who have not cut emissions. California used to be on the cutting edge of forward thinking. Set the standards for a better future and for the rest of the country to follow. You have the opportunity to write a cleaner future for the entire country. (SUMMER)

Comment: I want a plan to reduce GHGs that does not allow big polluters to further profit from their pollution. Please no credits to pollute. (LAROSE)

Comment: I am concerned that corporations or other entities that will continue to pollute are not held accountable for the destruction that they create and I want to support the board in establishing stronger standards of consequence for continued polluters. (YESSNE)

Comments: I agree with tighter restrictions on greenhouse gas emissions. We need to stop turning a blind eye to pollution just because the polluting company has political connections. In my opinion that's the biggest problem. Companies should be forced to stop polluting, not just buy politicians. (CUNNINGHAM)

Comment: For too long, big polluters have been leaving their giant footprint on our state. The deceptive Proposition 23, funded by Texas Oil Companies, to suspend AB 32 was defeated by 61 to 39 percent. Seeing such results, this must bring an important message. It says that we've had it with polluters, and we will not tolerate their filthy actions anymore. (VALDEZ)

Comment: The data is there so please act accordingly and strengthen the proposed program for decreasing global warming emissions from the state's largest polluters. (BOGIOS)

Comment: Thank you for your work on greenhouse gasses. Please correct the one portion of the bill that would allow the worst offenders to continue polluting. (PAHRE)

Comment: Please don't allow the biggest polluters to pollute more; there must be a better way to implement this plan! (STEINMANA)

Comment: The use of scientific data should inform our discussions on the environment. One would think that with continuing advancements in data collection, and research methodology that the information coming from research would be granted more and more credibility, but it seems that is not the case. Moneyed interests speak louder than scientists and a logically thinking and informed citizenry! Please stand up for your citizenry and the scientific community and remember that the voices of industries that pollute should not overwhelm the voices of us who have to live like "canaries in a coal mine." (POTTER)

Comment: The people of California have voted and defeated Proposition 23. Why are oil companies trying to circumvent the peoples' decision? Why are you even considering going against the will of the voters? Oil and gas pollute our lives, our lungs and apparently our legal system. Please don't tell us that this is about jobs, because really, it is about our health, which is a wonderful thing and often taken for granted until people lose it. You have an obligation to the people of this state, and even more, you have an obligation to the planet. To bend to the will of the oil companies is to send us all hacking, coughing and dying. (CASEY)

Comment: There is no need for a cap and trade system that, even by our best estimates will have a negligible effect on our local and global climate. This will be a waste of huge sums of money that will not curb CO_2 pollution from large "polluters" because they can purchase credits from those who create less CO_2. This is a complete wash in terms of CO_2 production and only serves to transfer money from one business, filter it through brokers who will take their share and then give it to other industries who are already conducting business with little CO_2 production. (KENNERLY)

> **Response**: We have designed the cap-and-trade program to be sufficiently stringent to reduce GHG emissions to achieve AB 32 goals. Covered entities will be subject to an enforceable and declining emissions cap, spurring the installation of more-efficient and lower-emitting technologies. They must turn in allowances or a limited number of offsets to match their GHG emissions. Allowances will be largely distributed for free in the early years of the program, transitioning to a program in which most allowances are auctioned. Because there is a decreasing cap on emissions, overall emissions will go down. Allowance trading is an important cost-containment mechanism. The price of allowances will be determined by the cost of available emission controls. Our analysis indicates that the cap-and-trade regulation is expected to have a beneficial impact on air emissions by reducing emissions of criteria pollutants and toxics, including those from larger industrial sources. Based on available data, current law, and policies that control industrial sources of air pollution, and expected compliance responses, we believe that emissions increases due to the regulation at the statewide, regional, or local level are extremely unlikely, at best. Nevertheless, the Board is committed to monitoring the implementation of the cap-and-trade regulation to identify any situations where the cap-and-trade program has led to an increase in criteria pollutant or toxic emissions.

Climate Change is Real

O-17. (multiple comments)
Comment: There is by now sufficient scientific information on greenhouse gas emissions to warrant their close study and control. Those who oppose this either have a financial stake they don't want to relinquish or they are too dumb to even recognize the emissions problem. (WHITER)

Comment: Ninety eight percent of climate scientists believe that climate change is real and that it is caused largely by human action. It's time for action to reduce greenhouse gasses. (BOREAN)

Comment: While debate is healthy, conspiracy theorizing is not. The vast majority of climate scientists do not hide out and make their findings up. They measure the large scale changes happening around the globe, including unprecedented amounts of warming gases in the atmosphere. Religion and ideology should not be a part of policy making. I urge you to regard the science and the public good as top priorities. The true costs of business and pollution must be calculated and figured in to prices and the costs of doing business. I applaud your efforts in these areas. (LERNER)

Comment: The climate science is clear, as are the increasingly devastating effects of climate change on populations all over the globe, we must act now. Statewide emissions caps are a small, small start. But we have to start now. It is almost too late. (KOIVISTO)

Comment: There are no legitimate scientists who dispute that increased levels are a result of human activity. CO_2 in the atmosphere continues to increase unabated. It has reached unprecedented levels. The earth's average temperature is rising. Cooler in some places, but overall, it is warming. Sea ice is melting at ever increasing rates and oceans levels are already rising. This information is not opinion, but scientific fact and recognized as such by NOAA and other internationally recognized institutions and governments. We must come together and place limits on CO_2 production. Create the limits as caps, dividends, rebates, or other incentives in the big picture. The means are less important than the goal. Put a stop to the naysayers, doubters, time-wasters, and politicians who don't care to understand the science. Cap greenhouse gases now please. (WOLPERT)

Comment: Can we stop having rhetoric determine public policy and use science as a basis for our decisions? Global warming is real and we need to do what we can to cap it. (MATHEWS)

Comment: I feel it is imperative that we reduce greenhouse gas emissions. What more do we need to know we already have global warming and that time is running out? We already have the seas rising, North and South Poles melting, and the life in our seas dying. Please do what is needed to stop global warming. (CRUMP)

Comment: Our economy cannot afford to allow anyone to continue spewing greenhouse gases into the air. Consider what is going to happen as climate change worsens; the central valley becomes drier, sea levels rise, storms worsen and cause more property damage. As air pollution worsens, more health costs will incur. Rates of asthma will increase, and more of us with breathing problems will be hospitalized. State costs for alleviating the problems will be much higher than the costs of preventing them. (FRONCE)

Comment: As a California college science educator I urge you to take all legal actions at your disposal to expedite the control and reduction of greenhouse gas emissions in California. Global warming caused by human activity is now beyond dispute among the honest voices in the scientific community. Responding to mediate its possible consequences is prudent public policy that will increase quality of life and create incentives for badly needed economic innovation. (RICHARDSON)

Comment: It is clear to me that climate change is real, not a hoax. In the name of all of our children, give science priority in your deliberations. (BOWLES)

Comment: Any educated individual who continues to deny global warming is an ignoramus, and, I suggest, to be considered a criminal for committing an act of violence on people and property in refusing to join the effort to contain this catastrophic planetary event. (KELLEY)

Comment: As a working scientific researcher, let me assure you that there are very few scientific conclusions that are more certain than the evidence for climate change, and that the evidence just in this year indicates that the situation is even worse than we thought when AB 32 was passed. The agricultural damage and human suffering we will see from disruption of our delicate water system in the Delta and the Central Valley is important around here, not to mention the damage to the coasts from rising sea levels in our children's lifetime. (AMENTA)

Comment: Climate change is happening. Action now is needed to slow it and ameliorate its effects. Otherwise humanity is committing suicide. (KUTCHER)

Comment: Please think of the future of our planet which is greatly endangered by global warming. We have a duty to future generations to begin now by enacting AB 32 to provide a reduction in carbon dioxide by 2020. My grandchildren are counting on you to do the right thing. (LENERT)

Comment: The conservative media, and yes it is conservative and not liberal and its conservative owners propaganda would have you believe, maintains that climate change is not a thing to be concerned about. I wonder why they would say such a thing. Is it because they always put the profits of business before the well-being of people? I will believe the word of the Union of Concerned Scientists that say climate change is a problem because I know that they put truth before profit and propaganda. The media that is for the most part owned by wealthy conservatives will always put profit first. Therefore, if you have a lick of good sense, you will also listen to the truth tellers, the members of the Union of Concerned Scientists. (YOUNGL)

Comment: Warming is just one consequence of human activity, be it from burps of cattle, cars or burning forests by the acres per minute. Warming is one of many negative consequences from melting ices which raise the ocean levels, fluorocarbons which depletes ozone which increases solar heating. Other more remarkable effects of human activities include wasting of oceans which destroys the carbon retaining qualities of sea life; overfishing which changes the eco-balance to favor ozone depleting species; economic subsidies to industries exploiting energy sources with both huge carbon footprints and enormous polluting, health and environmental costs as are the cases with coal, oil, 'nuclear' and 'natural gas'. All these confluences impact the earth in a highly negative fashion independent of their specific 'warming' effects. It is not a case of just one or two million people polluting and laying waste, but an issue of two billion people doing this and another three billion aspiring to do this. (BURCH)

Response: No response necessary.

Based on False Science

O-18. (multiple comments)
Comment: Your current designs to force cap and trade on the people of California is misguided and disastrous. This is bad policy based on flawed and fraudulent science. (WIECK)

Comment: Please reconsider your stance on cap and trade. Much of the so called science is being shown to be bogus. There is no "global warming"; it is total fakery, read your history books. (KELLOGG)

Comment: Man caused climate change is myth. The cap and trade scheme is a power grab, pure and simple. (HUTCHINGS)

Comment: NASA has updated their climate change models to show that an increase in CO_2 will induce a corresponding increase in oxygen which will reduce the predicted increase in temperatures in their prior models by half. This decrease in predicted temperature would meet the goals of the most ambitious EPA and CA regs on reducing CO_2 and its predicted impact on reducing the earth's temperature. Bottom line, whatever the regs are the earth has already made the necessary adjustments to reduce the temps making the regs unnecessary and counterproductive when it comes to California's economy. (LANDOWSKI)

Comment: Cap and trade/global warming/carbon emissions (CO_2) is a huge fraud that will make route California and the country. They're been 16 straight years of global cooling. (LARIMER)

Comment: We do NOT have global warming; we have global climate change. Climate change has existed ever since the earth was formed; AND there is no irrefutable evidence that climate change is caused by human activity. (MANGAI)

Comment: This whole human caused global warming thing has been thoroughly discredited. If you pass this bill you will be seen as hurting the economy in the name of a hoax, that you are not up to date on the research. Be bold and do the right thing and vote NO! (KEEFER)

Comment: Don't do this. It is based on bad science and will hurt companies and individuals already failing from the economy. (DENNIS)

Comment: It's well known that a lot of the "science" regarding, global warming, gas emissions, pollution is specious and if what is being discussed and carried out without Californians being able to vote on it. (TITUS)

Comment: The science is flawed. (LYNES)

Comment: This false science and bunk has no place in the real world. Do not even waste time discussing this political farce and false science. (WITT)

Comment: Global warming is a hoax. (ROLLS)

Comment: Why would you people promote regulations based on false science? I can only surmise that your political agenda overrides and demonstrates the miniscule respect you have for the people of our great country. Shame on you. You should and need to be replaced for the benefit of our prosperity. This type of policy is indicative of just how much you hate America. (BELLOVICH)

Comment: Have you not heard of Climategate, which became known a year ago this month? The scientists on climate have been cooking the books for years. There is no such thing as global warming. The climate of this planet changes constantly, it's nature. It is arrogant to believe that man can change the climate of this great planet. (YOUNGHARLAN)

Comment: I have a big quarrel with making political and business decisions for the state and country based on a scientific lie. The greenhouse theory has been shattered by scientific analyses and is simply invalid. In December 2008, 650 plus climate scientists from all corners of the globe made their concerns about global warming alarmism known on the U.S. Senate floor. In a March 30th, 2009, New York Times ad, 115 climate researchers, scientists, and others essentially called President Obama a liar for his comments about anthropogenic global warming. It is astonishing to me how organizations such as yours and willing accomplices in the news media continue to talk and proceed as if 99 percent of climatologists agree with you about anthropogenic global warming, when surely the majority worldwide sharply disagree with you. I'm sure your actions are well meant, but they are misguided. My question to the EPA and CARB is, when do you stop lying to the American people? (MOORHEAD)

Comment: In September 2006, AB 32, aimed at reducing greenhouse gas emissions was approved. This stems from a contention of the Intergovernmental Panel on Climate Change that global warming results mainly from burning fossil fuels, pumping carbon dioxide into the atmosphere. However, 31,487 scientists, including me, a Geological Engineer for half a century, petitioned the government to reject that contention, recognizing it as a hoax. (SULLIVAN)

Comment: I just question the goals of AB 32 personally. I don't believe that the goals are based upon scientific fact. They're based on consensus. Consensus historically — the quote I have is "Consensus has been the first refuge of scoundrels. It's a way to avoid debate by claiming the matter is already settled and closed." And I don't believe that's true. A whole lot of scientific evidence is out there. In fact, we see monthly, weekly, if not daily things, findings, whether it's from NASA or other organizations, former IPCT members, et cetera, that are questioning the current consensus. (HASSEBROCK1, HASSEBROCK2)

Comment: We respectfully ask that you vote to suspend AB 32, now. California does not need this legislation, especially now during this very bad fiscal time for the state. The research has been based on false information, stop it now. (TOZZINI)

Comment: Please suspend AB 32. There is no global warming and this will wreck our state. Other states have reconsidered and stopped. California should do likewise. (MUELLERD)

Comment: I see no need for this harmful legislation. I have read enough to understand that the science behind greenhouse gas and carbon emissions is faulty at best and phony at worst. The science is not there for you to consider this harmful protocol. Take this off the table. (EASTMAN)

Comment: AB 32 is very bad bill based on fraudulent science. (WELLSWILL)

Comment: Has anybody in the Air Resources Board even bothered to hear the opponents arguing against the climate change theory? I respectfully ask all of the Board to slow down and start looking both sides of the aisle before making any reserved ideas. (GUERRERO)

Comment: The earth has over the ages experienced many dramatic weather events, all of which are not the result of any man made factors. Classes in astrology have also mentioned that the planetary alignment has and will continue to change this earth as well as the seasons. Please delay any new regulations until full and accurate studies have been concluded. (RODOWICZ)

Comment: I'm really asking why we are doing this. Four years ago, I think when AB 32 came on the scene, there was a lot of emotion, a lot of interest, you know, and science kicking around that justified it. Today, about 30,000 scientists say it doesn't make sense. If you look at the carbon issue itself, carbon dioxide averages 6 percent of the greenhouse effect. If you multiply that by 3.4 percent of that emitted to the atmosphere annually that humans can claim responsibility for, then a whopping 0.2856 percent of global warming is human related. So I'm not sure I know why we're doing this. (FORD)

Comment: NASA earth science has just come out with a paper that indicates that the earth is moving into a new ice age and that man-made CO_2 is the only thing that can slow down the coming ice age. This means we need more CO_2 not less if we are to prevent the destructive forces of a new ice age which would blanket the earth in glaciers which is very bad for the future of the human race. Given this new data from NASA

PLEASE stop all your efforts to reduce CO_2 as CO_2 is the only thing that can keep the planet green and free the earth of ice. (BRYANT)

Comment: Of every one hundred scientists who have studied climate change, does the majority agree it's a real threat or just a hoax? Will people who claim global warming is a real threat have a direct financial interest in the fight or the deniers, who believe global warming is a hoax, have more at stake? (BUI)

Comment: With so much false information out there on global warming and climate change, I believe that now is not the time to impose regulations that cannot be proven to prevent any adverse climate conditions. (RODOWICZ)

Comment: Please do not over-reach the science in promoting "cap and trade." As has been shown in the past year, the proposition is founded on "shaky" science, which is by no means agreed upon by all. Until that science has "caught up" and been verified, please do not politicize or monetize or penalize it. (BROWNT)

Comment: You choose to ignore the hundreds of scientists who have come forward showing evidence that there is no such thing as “man-made global warming.” You also continue to ignore the fact that your draconian regulations are driving more and more businesses out of the State of California. (PINKSTON1)

Comment: AB 32, although well-intentioned, creates a solution for a non-existent problem. The theory of anthropogenic global warming is founded on studies and reports that, in recent years, have been confirmed to be inaccurate, misleading, and even fraudulent. I believe that there is enough reasonable doubt regarding climate change to postpone the implementation of the AB 32 mandates, at least until more conclusive science is presented. Even if global warming was supported by science, your own staff report states that California alone could not prevent it. The AB 32 policies will not produce a significant effect towards combating climate change; instead, a great majority of the world's nations would also have to create, implement, and adhere to strict cap-and-trade programs. The chances of this coalition forming are unlikely, so as California undertakes the solitary mission of cooling the earth, we merely put ourselves at a severe economic disadvantage. (LAMALFA)

Comment: Global warming is a pathetic hoax. According to the Heritage Foundation's National Center of Policy Analysis, greenhouse gases make up only two percent of the earth's atmosphere and carbon dioxide is only 3.62 percent of all greenhouse gases. In addition to that, all human activity creates are infinitesimally small .0025 percent of all the carbon dioxide in the atmosphere. So mankind's contribution to the non-existent problem is miniscule. Add to that the fact that the maximum reduction of man-caused carbon dioxide via the implementation of a global cap and trade program is estimated to be less than three percent, and simple logic tells us that even if global warming were an authentic threat, our very best efforts would have no noticeable impact. (MYERSG1)

Comment: Considering human caused global warming is based on junk science "climate gate." There is little to no reliable evidence that carbon dioxide has any warming effect on the planet. In fact carbon dioxide is an essential element in our atmosphere. (JENKINS)

Comment: The empirical data doesn't support the theoretical assertions that CO_2 is causing climate change. To live healthy and productively, carbon dioxide is an essential building block that is needed. Using the current levels of CO_2 of 380 parts per million (ppm) in the air, you realize that carbon dioxide is hardly at a level of concern. The threshold limit value (TLV) for human toxicity is 5000 ppm according to OSHA standards. This tells us that our health is not in jeopardy, yet still the proponents of global warming insist we are in an ecological crisis. None of this makes anecdotal or empirical sense and tells that we should not allow ourselves to be lied to and made to pay for changes in our behavior or regulations to reduce the levels of CO_2. (GILDERSLEEVE2)

Comment: As a student of chemistry and natural history, as well as a business-owner involved in emissions testing, I suspect that the true agenda behind such greenhouse cap and trades is not based in science but rather emotional nonsense that will benefit those staged to reap on the trade of a "new type of trade" element. Carbon dioxide is not and never will be a bad gas. It is an essential component of life on earth. I do support reduction of pollution but CO_2 is the wrong route. (BAPATRIOTS)

Comment: This is a tax imposed by a group instead of congress and thus, it is illegal. We have too many taxes as it is. The president is finding a way to get more money out of us citizens thru the EPA. It is based on lack of science and a hypothesis without being proven. It is unintelligent and unnecessary. There is not enough proof to be able to do this taxation without representation. (SCHRANK)

Comment: The environmental warming caused by humans is a hoax founded by Al Gore who has no training or expertise in this area. His expertise is to get much money from this hoax. The global warming scare is based on biased and dishonest use of weather data from around the world. (DURKEE)

Comment: It is apparent to anyone with their head above ground and their eyes open that global warming is a farce. Ask any geologist, the earth has been warming for 16,000 years. This is without the impact of humans. CARB is just another big scam being perpetrated against the people of California for the benefit of a few political lobbyists and their constituents for a pure profit motive. California's air is now better than it has been in many years. More regulation will only drive more businesses either out of business or out of State. We do not need either of these to happen if we are to survive as a State. (SMEDLY)

Comment: A recent Rasmussen poll says 59 percent of American people do not believe in man-made climate change. There is now a consensus of 1,000 scientists worldwide who now agree there is no such thing as global warming caused by man's activities on earth AND in fact, the earth is not warming. Today you start discussing the implementation of AB 32 based on bad science and a fabricated crisis created solely for the redistribution of wealth. The hockey stick graph used by global warming alarmists uses data that omits the med-evil warming period and used a limited sampling from centuries old tree rings. Any tree ring samples that conflict with the desired conclusion of global warming were omitted. The hockey stick is a hoax and the stick is broken. I now know the greenhouse gas that effects temperature is H2O not CO_2 and so does anyone who is an informed citizen. Please stop living the lie. Let AB 32 die. (PORTERJ)

Comment: Even the "global warming" folks essentially admitted that it was a lie and changed it to "climate change." Still, you guys seem not to have figured it out yet. Get rid of Cap and Trade or you will have to remember that you were the problem when California goes bankrupt. (HOLMES)

> **Response**: We have a widespread scientific consensus supported by national academies and all the major scientific institutions solidly behind the warning that the temperature is rising, *primarily as the result of human-caused greenhouse gases*, and that the warming will worsen unless we reduce emissions. The overwhelming majority of scientists are in agreement about the following fundamental conclusions: (1) the world has been warming and will continue to warm for the foreseeable future, (2) the warming is largely due to human activity (burning fossil fuel—oil, coal, and gas—and destroying forests), and (3) the consequences of rising temperature, in all projected futures, are grave enough to warrant global action. Our climate is changing in ways that are not caused by natural variability; human activities are responsible for most of this unusual change; significant harm to human well-being is already occurring as a result; and far larger—perhaps catastrophic—damages will ensue if serious remedial action is not started soon. You may view or download information detailing the facts on global warming and climate change on our website at www.arb.ca.gov/cc/facts/facts.htm.

Not Applicable

O-19. Comment: The California incentives for alternate energy has allowed Sierra Nevada Brewing in Chico to buy four fuel cells that run on the spent brew mash to generate 1 meg of power (surplus being sold), the heat from the cells "gooses" the new brew, they now have no disposal problem (which cost over $1 million a year) and a very low carbon foot print. (HAFER)

> **Response:** No response necessary.

O-20. (multiple comments)
Comment: I urged Sec. Chu to enforce the clean energy bill and to strengthen it wherever possible. Our children and grandchildren expect us to act as their responsible stewards. Many other states will emulate us. (AMES)

Comment: The electricity generated by all three plants at the Ivanpah Mojave Desert solar complex will be enough to serve more than 140,000 homes in California; more than 13.5 million tons of carbon dioxide emissions will be avoided over the 30-year life cycle of the plant. This solar complex also cuts major air pollutants by 85 percent compared to new natural gas-fired power plants. As a matter of national security regarding the survival of Americans and of the California Global Warming Solutions Act of 2006, ARB should solicit the assistance of the federal government to contract with the BrightSource Corporations and the BrightSource corporate investors to increase the number of Ivanpah projects by 150 times to eliminate carbon-based sources of electricity for the state of California, and to begin construction of these 150 solar complexes no later than 2013. (STARRY)

Response: No response necessary.

O-21. Comments: Most lifeforms survive better in an environment that does not contain substances harmful to that lifeform. Money does not change this Natural standard. Humans are such a lifeform. (ANDREWS)

Response: No response necessary.

O-22. (multiple comments)
Comment: I can't believe you would go through with this. Haven't you liberal politicians done enough to ruin this state already? There is no hope in sight when a bunch of liberals with no business experience control this state, along with the unions. (LAMPHERE)

Comment: Your messages during the elections about big oil were deceptive. I guess that’s the way of politics. (RAMSEY)

Response: No response necessary.

O-23. Comment: The board is not, unbiased, but partisan to the core. We need to see that board dissolved. We in the state of California need to come to our senses, no amount of taxation or carbon dioxide control will ever work to create a job! CARB destroys jobs, and destroys the tax base. (MARS)

Response: No response necessary.

O-24. Comment: It seems that all the things that have made California a great State have somehow become bad? How is it that so few can lay waste to so many that have worked so hard to grasp a little piece of the American Dream? Once they have destroyed our economy, they will wonder who will pick up the tab for their lavish life style, but unfortunately the old work horses that carried the load will be gone. (CORREIA)

Response: No response necessary.

O-25. Comment: You will kill 90 percent of the lawn care jobs. How will the illegals work then? They will hopefully go to Sacramento and demand Ms. Nichols for a check which she has taken from them. (NORDYKE)

Response: No response necessary.

P. OPPOSITION

This section includes responses to comments expressing opposition to the regulation. Major topics concern general opposition to the cap-and-trade regulation and AB 32, opposition to regulation in general, and the public process held during development of the cap-and-trade regulation.

Oppose Cap-and-Trade

P-1. Comment: We oppose the Board's adoption of the cap-and-trade rule and join the comments submitted by the Center on Race, Poverty & the Environment, the Center on Biological Diversity, and Communities for a Better Environment. (FORMLETTER11)

> **Response:** We acknowledge your comment. Please refer to responses directed to comments submitted by the Center on Race, Poverty & the Environment, the Center on Biological Diversity, and Communities for a Better Environment in Chapter III Summary of Comments Made During the 45-day Comment Period and Agency Responses, parts B, E, F, H, I, K, M and R.

P-2. (multiple comments)
Comment: Cap-and-trade should be called cap and tax because that is what it does. No more taxes, please. (CROOKS)

Comment: This is not what we Californians want. You do not have our better interests in mind and will continue the distain that the world holds California in. (MATTOX)

Comment: Please do not pass this bill. It would be highly difficult for our family and many others to pay more for gasoline. Plus, ethanol is a very inefficient use of fuel. It has cost farmers untold grief already. Please do not kill the monetary system in the State of California. We are holding on by a thread as it is. (DANIELSE)

Comment: It is not the time to be instituting new programs. Please do not adopt this cap-and-trade regulation. (SMITHR)

Comment: Eliminate this program and build new jobs for the Central Valley farmers and make California's agriculture business the best in the US. (GALLAGHER)

Comment: The proposed cap on Greenhouse Gas Emissions and Market-Based Compliance Mechanisms Regulation, including compliance offset protocols has been proven to be unsubstantiated. I implore you to stop with these draconian regulations for the health of California. (GILDERSLEEVE1)

Comment: The cap-and-trade documents show that CARB continues to imagine that moving forward with this proposal will show leadership in the fight against supposed global warming. However, since California began to show leadership with the passage of AB 32 in 2007, every state but New Mexico has declared that it does not want to join us in a cap-and-trade market. Please remember that you represent the people of California, not just eco-left special interests. This proposal is divisive and endangers the livelihoods of many families while failing to inspire other states to follow. Please reconsider. (COEU1)

Comment: I would urge you to vote against this bill and/or the implementation of the provisions of this bill. This is the wrong time to implement legislation that will impede the progress of businesses in California. (HARRISONW)

Comment: Who determined that anyone has the right to tax, regulate, or anything the air which circulates everywhere, to everyone anyway? This tax is just another way for people to control everyone they consider to be lesser beings than themselves. (SMITHM)

Comment: This is wrong and we the people of this State know it and want it stopped at any cost and in any way we can. This will only speed up the decline of our great State and Nation. For your own good and every Californian's good, do not do this cap-and-trade deal. (NCTPP2)

Comment: I am opposed to the implementation of regulations to enforce AB 32. (FINE)

Comment: I am opposed to the adoption of this proposal. (WESTERND)

Comment: Just say no to cap-and-trade. (SCHAEFER)

Comment: Please do not adopt the proposed California Cap on Greenhouse Gas Emissions and Market-Based Compliance Mechanisms Regulations. (SODERLING)

Comment: We do not support your cap and trade scheme. (NORRIS)

Comment: No cap-and-trade of carbon credits. Leave my energy use alone without surcharge. (CRANFIELD)

Comment: Do not institute a "cap-and-trade" policy for California. Polluters should be made to pay a tax for their excessive carbon emissions in this State, not be allowed to "trade" with a non-polluting company so that they can continue to foul our air and water. Pass a carbon tax with an allowable limit of pollution that is reduced on an annual basis. This will force polluters to actually clean up their act. (SMITHG)

Comment: It’s hard for me to believe that you are still attempting to destroy the State of California with these bogus and ridiculous regulations you are attempting to impose on us. It has to be stopped. (COYLE)

Comment: Cap-and-trade has nothing to do with the environment or global warming. It is a political charade designed to pay for a liberal agenda item. (CURTIS)

Comment: Absolutely no on California cap on greenhouse gas. (VANOOSTERHOUT)

Comment: I oppose any legislation that would impose a cap-and-trade policy for the State of California. (BILLIA)

Comment: I oppose this bill. No more government regulation. (HILLR)

Comment: The cap-and-trade idea is absolutely the wrong direction for California and the country. (MURRAY)

Comment: If the world's best scientists cannot produce overwhelming proof that a cap and trade system will ultimately have significant and demonstrable changes in our climate, then why would we even consider this system? (KENNERLY)

> **Response:** Climate change is one of the most serious environmental threats facing the world today. The California Global Warming Solutions Act of 2006, Assembly Bill 32 (AB 32), required us to adopt regulations which would implement measures to achieve the maximum technologically feasible and cost-effective reductions in greenhouse gas (GHG) emissions. California’s overall approach to meeting the goals of AB 32 is described in the Scoping Plan. We analyzed four alternatives to the cap-and-trade regulation: (1) a “no project” alternative; (2) additional source-specific regulations; (3) a carbon fee; and (4) linking California’s cap-and-trade program to a future federal cap-and-trade program. In evaluating these alternatives, we found that none were as effective or more effective than the implementation of a cap-and-trade program in carrying out the goals of AB 32. The cap-and-trade regulation provides a firm cap on 85 percent of California’s emissions. In recommending the specific design included in this proposal, we balanced the need to maintain the environmental integrity of the program, to retain a level of flexibility to help ensure cost-effectiveness, and to consider the potential for co-benefits. We have conducted a thorough evaluation of both the health and economic effects of the proposed program to ensure to the extent feasible that no disproportionate negative impact will occur. We have designed the cap-and-trade program to minimize the cost of implementation and compliance and to maximize the overall benefits. This program represents our continued role to develop innovative air pollution control strategies to help protect California's public health from damage caused by air pollution.

P-3. (multiple comments)

Comment: I am utterly amazed that government at every level seems determined to do everything possible to destroy our already weakened economy with misguided "feel good" legislation and unilateral administration actions. I request that you do your homework, look at the facts not the political imperative, and scrap this horrible plan. (REISIG)

Comment: We have bigger issues in California than to implement a Cap and Trade system. The budget is 25 billion short, we should be looking at ways to eliminate regulations but CARB is set on expanding them. (BOSWELL)

Comment: If this takes place I will not be able to afford to live in California anymore. (DAUKSCH)

Comment: Please think long and hard when you exercise a power as it has a long ripple effect on our economy. What we need is less government and more liberty to move ahead, not to put another drag on our existence. (RATLIFF)

Comment: Please perform your duties in the best interests of the citizens of California and stop the further destruction of California's economy. (VIRGA)

Comment: As I sit and pour over my budget I wonder how I will eat, buy medicine and drive to get my medicine. I will make choices to pay rent or eat or to buy gasoline or meds. California Air Resources Board members add to the problem. You dig into your conscience and pockets and send the old people the money to survive. (HORNE)

Comment: It's not about climate change. It's about Government control, more regulation, destruction of our economy, and the redistribution of wealth. (HARPER)

Comment: The implementation of the regulations associated with AB 32 in these challenging economic times will force undue hardships on Californians. I am opposed to these regulations. (EARLE)

Comment: Implementation of AB 32 will increase gas prices, cost jobs, shut down family farms and make food more expensive. Please reconsider. (THIBODEAUX)

> **Response**: AB 32 requires ARB to adopt regulations to meet the goal of reducing GHG emissions to 1990 levels by 2020. AB 32 directed ARB to prepare a scoping plan outlining the State's strategy to achieve the GHG reduction limit established in the law. The Scoping Plan describes a comprehensive approach that includes direct regulations and a cap-and-trade regulation. The flexibility of the cap-and-trade program, together with specific design features included in the regulation to help contain costs, ensures that the reductions needed to meet the requirements of the regulation are cost-effective. The projected economic growth under the cap-and-trade program would continue virtually on par with current forecasts. Investment in more energy efficient vehicles, buildings, and industrial processes will help reduce fuel use between two and four percent in 2020. These reductions will help offset potential increases in the price of electricity, natural gas, and gasoline. We do not expect the regulation to eliminate existing businesses in California. Cost impacts on consumers would result from changes in energy prices. Incentive programs available to small businesses and consumers will provide access to

funds for investing in energy-efficient technologies, which includes low interest loans, rebates, and credits.

P-4. (multiple comments)
Comment: We really cannot afford to let gross polluters use cap-and-trade to continue their destruction and also to profit from it. We spoke in November and defeated Prop. 23. It is time for you to listen, do the right thing and stop the polluters now. Do not allow the cap-and-trade component of the bill to remain. If you are a polluter then you must stop, now. (RATZLAFF)

Comment: When AB 32 is implemented, please do not financially reward polluters by permitting cap-and-trade. This would substantially weaken the impact of the climate bill. All individuals and corporations must recognize and address the impact that their actions have on the environment. It is very clear that a cap-and-trade option would not result in the necessary reductions in emissions that are essential for a healthy climate. Many experts claim that it may already be too late to reverse the impact that man has made on the quality of the earth's air, water, and overall environmental health, so let's take the first steps needed to stop the insanity. (MAYER)

Response: We have designed the cap-and-trade program to be sufficiently stringent to reduce GHG emissions to achieve AB 32 goals. Covered entities will be subject to an enforceable and declining emissions cap, spurring the installation of more-efficient and lower-emitting technologies. Our analysis indicates that the cap-and-trade regulation is expected to have a beneficial impact on air emissions by reducing emissions of criteria pollutants and toxics, including those from larger industrial sources. Based on available data, current law and policies that control industrial sources of air pollution, and expected compliance responses, we believe that emissions increases due to the regulation at the statewide, regional, or local level are extremely unlikely, at best. Nevertheless, the Board is committed to monitoring the implementation of the cap-and-trade regulation to identify any situations where the cap-and-trade program has led to an increase in criteria pollutant or toxic emissions.

Oppose All Regulations

P-5. (multiple comments)
Comment: Kindly keep this type of legislation out of the State of California. (JORDAN)

Comment: I am absolutely opposed to this nonsense. (COLE)

Comment: The California Air Resources Board (ARB) cannot continue to impose ridiculous emission requirements, etc., without unduly hurting Californians. This must stop. We oppose further controls. (MORRISM)

Comment: There is no need for any of these regulations and nobody else in the world is playing by these rules. (RAPINI)

Comment: Stop it. It will only hurt United States citizens not help in ways you want us to believe it will. (NEWMAN)

Comment: Please just walk away from this awful situation. Please do not do this to our State. You are negatively affecting lives of many people with no solid benefit. It is not necessary to do what you are doing. Just walk away from this huge regulatory tentacle you are wrapping around our State. You must know in your heart that this is wrong and unnecessary. (STEWARTM1)

Comment: What you are doing to our State is outrageous. Stop the nonsense. (VANATTA)

Comment: We do not need any more laws or regulations. Stop drowning people in red tape and paperwork. (WHEELER)

Comment: California must understand that we are not an island in both our environmental regulations and our economic situation. By enforcing overly strict environmental regulations, we make our State uncompetitive with other states and other countries, and since we share the same environment, our contribution to "clean air" is ineffective to change the air quality of the world. Please do not enforce more strict air quality standards than the rest of the USA. (MYERSG2)

> **Response:** Our mission is to promote and protect public health, welfare, and ecological resources through the effective and efficient reduction of air pollutants, while recognizing and considering the effects on the State's economy. The basis for all our programs is research into the causes of air pollution and their effects on public health and the environment. We have developed air quality standards based on our research efforts. Under AB 32 we are required to adopt regulations to implement measures to achieve the maximum technologically feasible and cost-effective reductions in greenhouse gas emissions. The cap-and-trade program is a key element of this overall strategy. The cap-and-trade regulation is designed to minimize leakage. Also, the cap-and-trade program has been designed to be part of a regional trading system. The program design allows linkage with programs established by partner jurisdictions in the Western Climate Initiative to create a regional market system. In addition, it is designed to work in concert with other measures, such as standards for cleaner vehicles, low-carbon fuels, renewable electricity, and energy efficiency. The program will also complement and support California’s existing efforts to reduce criteria and toxic air pollutants. This regulation represents our continued role to develop innovative air pollution control strategies to help protect California's public health from damage caused by air pollution.

Questioning the Public Process

P-6. Comment: I don't know how a majority of Californians support cap-and-trade when I can't find one smart person who even understands it. I have many questions and concerns about cap-and-trade not just for California but for the country and for the world. Where was the California Environmental Protection Agency (Cal/EPA)/Air Resources Board (ARB) Emissions Trading Program and the call for comments published for California residents to read and reply? What does this vote mean? How can my voice be heard? I am against the Cal/EPA/ ARB Emissions Trading Program, and think most Californians, if they really understood what is being promoted, would be against it too. (PERRIN)

> **Response:** We developed this proposed cap-and-trade regulation through an extensive public process. In 2008, we discussed the general framework for a cap-and-trade program as part of the development of the Scoping Plan. The Board included the cap-and-trade program as one of the central measures in the Scoping Plan. We held more than 30 public workshops in 2009 and 2010 devoted to developing the cap-and-trade program design in more detail. These meetings allowed the public to discuss and share concerns and ideas on the appropriate design of the cap-and-trade program. We reviewed hundreds of public comments received from the general public from these workshops. We considered these comments in crafting the design of the proposed cap-and-trade regulation. We have always invited and encouraged the public to take the opportunity to participate in our rulemaking process. Every meeting and all documents related to the cap-and-trade regulation has been and will continue to be available for public review on our website at www.arb.ca.gov/cc/capandtrade/capandtrade.htm.

Q. SUPPORT

This section includes responses to comments expressing support for the regulation. Major topics within this section include support for the cap-and-trade regulation and AB 32, and general support for combatting climate change and making California's air cleaner.

Cap-and-Trade Regulation

Q-1. (multiple comments)

Comment: To think in the short run on this problem can be disastrous. California has to lead the way. Global warming is not going away. It is going to get worse and it will have dire consequences for the human race. Cap and trade is the way to go. (HAIGHT)

Comment: Please support the Cap on Greenhouse Emissions. (ROMAIN)

Comment: We need to have a price put on carbon and a cap-and-trade system put in place. The hoped for results of our State's clean air initiatives and goals will come much sooner if CARB does this. (BUSSE)

Comment: The only way to create a disincentive or to capture the negative externality of poor environmental behavior is to use carbon dioxide taxes as a mechanism. It may not be the final answer but it is the right step and hopefully the first of many steps towards responsible behavior in how we treat our precious natural resources. Please adopt a California Cap on GHG emissions. (CHRZANOWSKI)

Comment: I strongly support passing climate change cap and trade legislation in the State of California. (BRATCHER)

Comment: Stringent steps need to be taken to reduce our impact on our environment. I think a proposed cap on GHG emissions is very important. Research into greener energy sources must be funded. More mass public transportation should be funded, including high speed rail; and decreasing intrastate plane and private car travel. (WENZEL)

Comment: I am in favor of adoption of the proposed California cap on greenhouse gas emissions and market-based compliance mechanisms regulation, including compliance offset protocols. (WELLSTED)

Comment: We are pleased to see strong design features included in the proposed regulations, including sufficiently tight, declining cap; tough penalty provisions; meaningful floor price; auctioning in the electricity and transportation sectors; and annual review. (NRDC1)

Comment: LADWP strongly supports ARB and the implementation of AB 32 to reach the goal of returning the State back to 1990 levels of GHG emissions. LADWP is your partner in AB 32, and we remain committed to making direct investments to dramatically reduce our carbon emissions. Our early actions to date have resulted in a 25 percent drop in our carbon intensity from our 1990 levels. We will continue to transform our generation portfolio by repowering our natural gas plants, investing in more renewable energy resources, expanding our energy efficiency and conservation efforts, and also upgrading our transmission to accommodate more renewables coming into the State. The cap and trade regulation, we believe the way that it is proposed by staff will support these efforts. We look forward to working with ARB staff and to implement the AB 32 program cost effectively and to make it a successful program we all want it to be. (LADWP2)

Comment: Yes to the California Cap on Greenhouse Gas Emissions and Market-based Compliance Mechanisms Regulation. (BURKS)

Comment: It has become very clear to me that there is an overwhelming preponderance of hard evidence that cap and trade does indeed work to first cap and then steadily reduce emissions of dangerous greenhouse gases—and that it leads to prosperity, and not hardship. (KRAEMER)

Comment: The program will help in making California a leader in clean energy, stimulate our economy, and creating jobs. Setting both limits on pollution that decline with time and having a minimum price area is good start. (TERSOL)

Comment: We must act quickly and carefully to bring carbon back under 350 parts per million in our atmosphere. Our coastal communities are facing the possibility of flooding and loss of life. Those with breathing difficulties are threatened. We must cap our greenhouse gas emission for the health of our children. Market-Based Compliance Mechanisms Regulation with compliance offset protocols must be adopted now. (PFEIFFER)

Comment: Please pass regulations that will strengthen California's greenhouse gas regulations. I very much support Market-Based compliance mechanisms regulation, including Compliance Offset Protocols. (KOPPEL)

Comment: Please adopt strong market-based compliance regulations to control greenhouse gas emissions in California. We must be much more aggressive in developing non-fossil fuel energy resources, and your action is an important step in the transition process. (PORTERK)

Comment: Thank you for your excellent work in developing this proposal. We have an excellent opportunity here in California to develop a model market-based system for the entire country. If we can show people that the free market can solve this problem, we have a chance of avoiding the environmental train wreck that we see accelerating around us. A big part of setting up a working market is providing certainty, and the proposed plan addresses this in many ways. (AMENTA)

Comment: Thank you for taking a stand against Global Warming Pollution. This is a big step in the right direction, the opportunity is there to strengthen and cap greenhouse emissions. Setting this wheel in motion on an issue that failed to come together in Washington D.C. will stimulate the creation of jobs revolving around the development of better technologies, manufacturing, and services here in the United States. This in turn will drive down the cost of energy and boost the economic growth of this State and our country. It's a long war against the greed and irresponsibility of the current energy industry. Prop 23 was a battle won and must be used to tighten restrictions and add accountability to companies that harm our health, our country, our world, and our way of life. (SANSONE)

Comment: Thank you for taking climate change and air pollution seriously. As a grandmother, I am terribly concerned about the world our grandchildren will inherit. The rates of pulmonary disease, cancer and other maladies have escalated but no one wants to ask why. I am convinced that pollution must be penalized and carbon and other emissions into our atmosphere must be taxed. (CRAWFORD)

Comment: Two of us here loud and clear----adopt proposed cap on greenhouse gas emissions before all the glaciers melt away. Global warming is real and verifiable and we want our grandchildren safer. (ROCA)

Comment: I think that it is a great idea that California will adopt laws that seek to reduce our carbon foot print each year. I think that this is very important for California to become a leader in strong energy laws. This is definitely a step in the right direction because job creation will increase while at the same time carbon pollution will decrease. This will make polluters think twice and perhaps even actually lead them to conduct their business in a more ethical manner. I support the direction that we are taking. (SUAREZ)

Comment: California has the opportunity to lead the country again, as it so often does. It also has the responsibility to do so because no place on earth is more blessed--not only with beauty and a desirable climate, but also with creative thinkers. If we show the rest of the country that we can lower CO_2 emissions using rational economic strategies, other states will find the courage to follow. The United States, because of California's success, may even begin to take up its responsibility and amend its deplorable behavior in the face of our global environmental crisis. Please act with maximum strength. (SDSU)

Comment: We congratulate you on the culmination of years of work to develop a regulation that puts in place the world's most comprehensive cap on global warming pollution. The cap and trade regulation currently before the Board is a major plank in a comprehensive package of policies that will enable our State to meet its global warming pollution reduction requirements while bolstering our booming clean energy economy, creating jobs, cleaning up smog-forming and cancer-causing air pollution, and maintaining strong economic growth statewide. Californians overwhelmingly support your efforts to enact policies like this to reduce global warming pollution and clean up our energy supply—as the recent election made very clear. (LUDLOW, UCS1, WALTERS)

Comment: One hundred and eighteen Ph.D. economists with expertise in climate and energy issues warned that the most expensive thing we can do is nothing. They urged the California Air Resources Board to proceed in implementing the AB 32 Scoping Plan, stating that "global warming gases will be best managed through a combination of policy approaches. Emissions caps combined with a range of regulatory and market-based implementation mechanisms offer a particularly potent strategy because they provide clear incentives for changes in business practices and the development of new technologies." (LUDLOW, UCS1, WALTERS)

Comment: California leadership in developing and implementing a cap on global warming pollution will have ripple effects throughout the nation and the world. Because the California cap and trade program may become a model for other states and the federal government, it is important that the program is designed to cost-effectively maximize emission reductions in the capped sectors. We applaud CARB for the thorough public process that has led to the proposed regulation and the opportunity for our organization and other stakeholders to work with CARB staff as the regulation evolved to find optimal solutions for many complicated issues. We are pleased to see that the proposed regulation contains several elements that we believe will make the program effective. (LUDLOW, UCS1, WALTERS)

Comment: CCEEB supports adoption of a cap-and-trade program as the best means to achieve greenhouse gas (GHG) reductions at the lowest possible cost and we appreciate the work that ARB staff has done over the last year. (CCEEB1)

Comment: The California Air Resources Board has embarked on an ambitious and worthy goal of reducing the State's greenhouse gas emissions. In this pursuit, REMA expresses its support and continued assistance in developing a climate program that encourages meaningful GHG reductions through both compliance and voluntary actions. (REMA)

Comment: AB 32 is landmark legislation which will revitalize our economy and create American jobs. This legislation is a Win-Win. Please consider the adoption of a proposed California cap on greenhouse gas emissions and market-based compliance mechanisms regulation, including Compliance Offset Protocols. (SOONG)

Comment: I am expressing my support for your implementing a cap and trade system in California. (FREY)

Comment: Please stay strong on cap and trade for carbon emissions. California has the opportunity to be a leader on this issue and to spur other states to act to protect our planet. (SCHERMERHORN)

Comment: I firmly support the adoption of comprehensive cap and trade legislation in California. California must continue to lead the way in the transition to a cleaner economy. (GERDING)

Comment: I am in favor of cap and trade to regulate greenhouse gases. (BARKOW)

Comment: We wish to commend CARB and both the outgoing and incoming Administrations for your collective leadership and determination to design and implement a well-functioning cap-and-trade system for the State of California, which we believe is what has been proposed in this rulemaking. (CLIMATEWEDGE)

Comment: We support market-based mechanisms to reduce greenhouse gas emissions for three main reasons: 1) Job Creation. Clean energy projects create durable jobs that cannot be sent offshore; 2) What is Good for the Environment is Good for Business. When companies invest in energy efficiency upgrades, they not only reduce energy use and carbon emissions, they also reduce their energy bills; and 3) Flexibility. Market mechanisms require companies to reduce carbon emissions, but allow them flexibility in deciding the most economically efficient manner. (MCKINSTRY)

Comment: Overall, we support the cap and trade regulations and believe that CARB has thoughtfully developed a program that will reduce greenhouse gas emissions to help meet the State target in conjunction with the other measures adopted by CARB. (NC1)

Comment: We support the overall Cap and Trade Program being proposed by staff. We commend ARB and staff for this tremendous accomplishment. This is an important milestone not only for the overall climate but also for the recognition that forests and nature must play a role in climate change solution. (NC6)

Comment: Codexis strongly supports the CARB's cap-and-trade regulations as a mechanism to implement AB 32's direction to reduce greenhouse gas (GHG) emissions in California. (CODEXIS)

Comment: I like the idea of making polluters pay for their damage to the environment. I really like the idea to auction the ability to pollute and then use the money generated to fund development of clean industries. (BARRICK)

Comment: I support the California cap on CO_2 emissions and applaud the work that you are doing to implement AB 32. (WAKEHAM)

Comment: Please support expansion of cap and trade efforts to address emissions of global warming pollutants. (JONES)

Comment: Although I would have preferred a carbon tax, cap and trade is a necessary step in implementing AB 32 and in controlling greenhouse gas emissions. I support the proposed cap and the market-based mechanisms. (MATZEK)

Comment: I hope this passes in California and will provide incentives to other states to do the same. We absolutely need a cap on greenhouse gas emissions driven by market considerations, not just "voluntary" compliance which doesn't get us too far. (DEDEKA)

Comment: Please adopt a California Cap on GHG emissions. (CHRZAMOWSKI)

Comment: I am writing to express my support for the California cap on greenhouse gas emissions regulation. As a certified green business owner in the Bay Area, I strongly believe that voluntary changes in the way people do business will not be enough to help curb emissions. (HOUSER)

Comment: Thank you for taking global warming seriously and developing a plan to reduce global warming pollution while at the same time creating jobs and making California a healthier and more prosperous place to live. The proposed program will decrease global warming emissions from the State's largest polluters and establish a market price on these emissions. (MSCG1, FORMLETTER06)

Comment: I am convinced by all I have read that global warming is a real phenomenon, and that it is necessary we minimize greenhouse gas emissions. My understanding of Cap and Trade policies is that they work. We need to put them in place and give the market time to establish. (CSUF)

Comment: Thank you for setting a valuable example to the rest of the country. Getting our carbon emissions down to 1990 levels is so crucial to counter runaway climate change. Persistence on policy is what our scenario needs. A steady price signal will help business adapt. Thank you, again, for your continued efforts. (SUSTAINDESIGN)

Comment: I want to thank you for your work to put a cap on greenhouse gas emissions. I am strongly in favor of the cap and trade regulation currently before the Board. I am pleased to see that the proposed regulation includes: fully auctioning allowances in the transportation sector; strong enforcement; and $10 per allowance price floor. (VARON)

Comment: Small businesses across our states stand to benefit greatly from the incentives of carbon emissions trading system establishes. For that reason, the Air Resources Board should adopt its proposed market system without delay. (SBMAJ1, SBMAJ2)

Comment: The California Energy Efficiency Industry Council supports the adoption of the proposed cap and trade regulations for the purpose of putting a price on carbon.

We believe the regulation will also support a stable energy and business environment that will result in our member companies being able to grow and employ more Californians. (CEEIC1)

Comment: I am in favor of ARB passing the Cap and Trade regulation needed to implement AB 32, California's Global Warming Solutions Act. We can move forward in this country and California has long been a leader for others to emulate. Please pass the cap and trade regulation immediately and regulate greenhouse gases. (GRISHABER)

Comment: Please support strengthening our laws concerning the proposed California Cap on Greenhouse Gas Emissions and Market-Based Compliance Mechanisms Regulation. (SPAISER)

Comment: DWR supports the ARB's concurrent efforts to reduce GHG emissions through implementation of AB 32 and the proposed Cap-and-Trade Program. (DWR)

Comment: California Interfaith Power and Light supports the timely implementation of the Cap and Trade program and commends the agency on the release of the proposed regulation. We support many of its provisions. (CIPAL)

Comment: The Council views the draft regulations for a California Cap-and-Trade Program as an important vehicle to reduce greenhouse gas emissions in the western region and the Council congratulates the State for its leadership and action. We support the intent of the regulations to reduce greenhouse gas emissions while creating jobs, providing flexibility to reach emissions reduction goals, and protecting California's economy and we look forward to continue working with you as you refine and further develop the program. (BCFSE)

Comment: I'd like to thank the Board, your staff, and the staff of the EPA for bringing forward recommendations today that Riverside Public Utilities can strongly support. (CITYRIVERSIDE)

Comment: The Bay Area Air Quality Management District is in overall support of the cap and trade rule, which, of course, will be a very important part of the State's overall climate protection program. (BAAQMD)

Comment: I'm strongly in support of the proposed emissions trading program. I think the adoption of CARB standards help to ensure that California remains a center for innovation, job growth, and wealth creation in the new clean energy economy. I'd like to encourage again the passage of the proposed regulation, because I think that it really will help to underpin the kind of growth and leadership that California has been famous for in the past. (JAMBUSE)

Comment: We encourage ARB to adopt the proposed market system that levels the playing field between dirty and clean energy, provides business owners with new opportunities to grow their businesses, and spurs the transition to a low carbon economy. Reducing carbon and increasing efficiency improves the bottom line for our State and for our businesses, giving us a competitive advantage and protecting us from volatile fossil fuel spikes and economic price shocks. (CABAGE1, CABAGE2)

Comment: Thank you for your continued efforts in leading the march toward a sustainable and healthy environment. Your plan to reduce global warming while also creating jobs is a major step in the right direction. Of particular importance is the plan for a steady transition from today's conditions to limits that will produce the desired ends while maintaining economic balance. (TRI)

Comment: This is an essential step to meet the goals. It will end up creating more jobs and new careers for Californians, and will let us become the leader of the nation again. (RAPHAEL)

Comment: I just want to say that I am in support of enforcing legislation that strongly moves in the direction of the proposed California cap on greenhouse gas emissions and that both the private and public sectors need to be made accountable. It is imperative that California continue to be a leader in promoting environmental awareness and responsibility. Sadly, the United States is still far behind many Western European countries when it comes to taking action to reduce various kinds of pollution and greenhouse gas reduction. California can still inspire the rest of the nation if clear, decisive action is taken. (LEVNO)

Comment: I applaud the California Air Resources Board for their work developing the draft regulation. As a California resident, I believe AB 32 is an extremely important means of improving the health of California's citizens, increasing the resiliency of California's natural environment, and securing California's place as an economic leader. The courageous and innovative path the ARB has taken with the draft AB 32 regulation is an example for the rest of the country (and the world) to follow. (SCHUETZ)

Comment: The City of Los Angeles and the LADWP reaffirm their strong support for AB 32 and the goal of reducing GHG emissions back to statewide 1990 levels through a set of measures outlined in the ARB's Scoping Plan, including the implementation of a cap-and-trade program that is well designed and easy to understand. (LADWP1)

Comment: LADWP strongly supports ARB and the implementation of AB 32 to reach the goal of returning the state back to 1990 levels of greenhouse emissions. We thank you, Chairman Nichols, for your continued leadership in this very important policy and regulatory development and for tackling very complex issues that have been put before you. (LADWP3)

Comment: I am so glad that Prop 23 was voted down in the polls, and I am looking forward to the adoption of a cap on greenhouse gas emissions. As a Californian deeply dedicated to working toward a more sustainable society, I urge us all to continue doing what we can to make our future cleaner and brighter. By making it more difficult for the world-polluting status quo to remain, we will see a surge in new development and technology. Please strengthen regulations and help move us even further forward. (MILLERJEN)

Comment: Thank you and please continue to take a strong position on greenhouse gas emissions control in the State of California. I fully support 'green fees' on all sorts of emissions and on waste that results in more emissions. California can be a leader in instituting green fees to curb corporate and individual citizen behaviors that pollute. I don't support a cap and trade program that uses the stock market, but I do approve of a state run gradual reduction of emissions through state fees, that captures those fees and uses them to make other efforts to ameliorate pollution. (MORSE)

Comment: The last thing we need in our State is to weaken our pollution controls. We need strong laws that set caps on gas emissions. (COOPERKEIL)

Comment: We are strong supporters of the need to establish and maintain cap and trade practices here in Calif. Our State can show leadership that other states and Washington DC can follow in this and other regards when it comes to protecting our environment and developing realistic and credible alternative fuel sources. The lives of our children and grandchildren depend on us doing these things. (SOLOMON)

Comment: The current CARB program in California is important to reach the State's goal of reducing global warming emissions to 1990 levels by 2020, along with renewable energy, energy efficiency, and cleaner transportation standards. Forcing polluters to pay for the emissions they generate by purchasing permits in an auction, the auction funds can then be re-invested into efforts that will help us transition to a cleaner economy and help lower energy costs for Californians. Thank you for your time and all the work being done in this regard. (FISH)

Comment: In general, we strongly support the State's development of a cap-and-trade program and believe that CARB has thoughtfully developed a program that will reduce greenhouse gas ("GHG") emissions and help the State to meet its mandated emission reduction targets under AB 32. (COPC1)

Comment: I strongly support the official statement of the Union of Concerned Scientists concerning the implementation of GHG emissions capping. The strong public support of Proposition 23 is a public mandate of strong GHG reduction laws. Global warming and the need to free ourselves from dependence on fossil and nuclear fuels are the most serious issues facing the human community. Please treat these issues with the serious, energetic and ethical commitment that they require. (PARLETTE)

Comment: I have some misgivings about Cap and Trade as a means to address global greenhouse gas emissions. But I think it is good idea to try it. As we know it has worked on sulfur dioxide emissions and to stop acid rain. California's nation-scale economy is a good place to test it out. As usual the devil will be in the details. But go for it. (CARMICHAEL)

Comment: I implore you please strengthen the programs that will be implemented to limit global warming emissions and establish a fee for polluters. This is long overdue. A much stronger California Cap on Greenhouse Gas Emissions program including Market-Based Compliance Mechanisms Regulation and Compliance Offset Protocols is absolutely necessary not only to help stop Global Warming, but also to protect the citizens of California from becoming sick with a myriad of upper respiratory diseases—many of which are incurable. (POWERSW)

Comment: Who are we kidding but ourselves? As usual we, humans, are hiding our ostrich like brains in the sand. Let's fix this now. Oh, there is not enough money. Cheaper now than later. (SARRIS)

Comment: Cap and trade is a great system and should be strengthened not weakened. (MCCARTER)

> **Response:** We acknowledge your support to move forward with the cap and trade regulation.

General Support for Climate Change & Clean Air

Q-2. (multiple comments)
Comment: I urge you to do ALL you can before it is too late. Our planet is getting warmer by the day and every day that passes, we will have to do more to counteract this. The scientists have spoken. It is now time to move full speed ahead and act on their advice. (NEAL)

Comment: California has been a leader in the past and needs to continue that role. Moving ahead with techniques to halt global warming will create jobs and improve health for all of us. Improving health will save money in long run. Let's take this on and become the leader and example for others. (RENTON)

Comment: I commend you for the immense responsibility you have taken on. I think debates on global warming can go on and on forever; however, increasing pollution damage and the major causes are obvious. I urge you to think long term and vote for policies that hold polluters accountable commiserate with the (short and long term) damage they cause. Without clean air food and water, nothing else matters. Thank you for reading. (REILLY)

Comment: I would like to express my appreciation to CARB for their continuing efforts to ward off the disastrous effects of climate change that daily quickens its pace. My expertise is in the treatment of wastewater and solid waste wherein by the total use of anaerobic processes makes possible the complete elimination of billions of tons per day of GHGs in wastewater treatment alone. Only the concerted action of bodies such as yours will break the lethargy and overcome the inertia of current practitioners in this field, a field wherein answers to these problems are and have been available for some time and more will arise and be put into practice with your encouragement. I thank you for what you do. (ENVDEVELOPERS)

Comment: With our long coastline and exposure to climate changes due to ocean warming and global warming, we Californian's NEED you to keep to a strong course with regard to carbon emission control. Don't let yourselves be distracted by the deniers, who appear to be happy about sacrificing their children for short term gain. Don't sacrifice ours. (CASPARINST)

Comment: Please make sure that CA gets the kind of climate rules that will save our air and our water. I am an asthmatic and would be more than grateful for a break so I can breathe. (SEAMAN)

Comment: I am writing to urge officials to vigorously enforce the California law regarding meeting the challenge of climate change. I was proud of Californians for rejecting the attempt to overturn this law in November. My feeling is this: nobody should have the right to pollute the air and water because it is essential for all life. Whatever it takes to make the large polluters invest in drastically reducing the threat to life should be pursued with everything we can muster. Please do not let delay and inaction rule the day. The "tipping point" may arrive sooner than it was thought. (THOMAS)

Comment: I urge you to adopt the strongest possible plan to mitigate greenhouse gases. This will not only be good for the environment, but also good for California's economy. One of the real growth areas of the future is green technology, and this will help that market develop. (SIMON)

Comment: Although I believe cap-and-trade policies are of little value and cannot reverse the accumulation of greenhouse gases in our atmosphere, I will support anything you can do to help address this problem. You are on the front line of U.S. response to climate change. Please do everything in your power to help alleviate this growing threat to our coastlines, our country, and the world. (USD)

Comment: As a recent volunteer on the No on Prop 23 effort in the San Diego area, I wanted to encourage you to keep California's global warming laws as strong as possible, to ensure California meets and exceeds its reduction goals. Californians have demanded it! (DISENHOUSE)

Comment: California should be a leader in this arena. I whole heartedly endorse taking the necessary steps to put California in that position nationally and globally! (SCOTT)

Comment: I support California's efforts to reduce greenhouse gas emissions. Green energy such as wind and solar creates jobs and innovation and puts California, and then the nation, further ahead in adopting new technology and fighting for our environment and our future. (JOHNSONR)

Comment: I commend the efforts of the California State EPA, its Air Resources Board, and I ask you to challenge other states and territories, and you already have. I can only hope our successors find our movements towards a more secure climate, and therefore, future, worthy of respect: hopefully, for your State and the State of New York, real pride for your leadership. I should hope that our states and territories might enter into a friendly competition towards circumspection and better valuing what we've been gifted with: such amazing resources, and a nation of great talent and energy. We have all we need, really, at hand, to prepare for, re-think our society for, a time with very different energy resources. Please continue your efforts, and know you're helping set a standard for all of us. (JOHNSONA)

Comment: I'm writing to thank California for taking aggressive action to lower your State's greenhouse gas emissions. Global warming is the greatest threat facing humanity today. Qualified scientists indicate quick action is necessary to limit the worst impacts. I appreciate California's efforts to curb greenhouse gas pollution. (CRUPI)

Comment: So impressed to hear the people of California and New York are taking measures to ensure their health as well as the health of the environment. We need to take control of these important and necessary issues concerning the climate. (TOUCHSTONE)

Comment: Thank you for taking proactive steps to counter climate change. Your leadership sets an example for the rest of us. (PLANK)

Comment: Thank you California for leading the way on climate action when our federal government has failed to act. I hope you can inspire other states to follow along (like my State of Maine). (WOLPOW)

Comment: Thank you California for showing leadership and foresight in addressing climate change. I am disappointed with the lack of action at the federal level and as a resident of Texas do not have much hope of action by my State. However, in many environmental causes, CA has taken the lead and the rest of the nation has followed. I would like to add my voice in support of legislation limiting the emission of greenhouse gases. (DILLER)

Comment: Thank you for leading the way for climate change action. We expect other states to do the same. There will be many jobs for "going green" and the sooner we make changes the less drastic the climate change negative effects will be in the future. (PRICES)

Comment: Please continue to uphold California's leading role in tackling climate change and the other destructive effects of industrialized, consumerist society. Don't let the ignoramuses get you down. (RIEBEL)

Comment: Let's strengthen California's fight against global warming. (LEVIN)

Comment: Don't pay any attention to any "climate deniers." They only want to twist things in their favor and no one else's. (HARRINGTON)

Comment: Please do everything in your power to reduce greenhouse gas emissions. My children and grandchildren are depending on it. (MAYWALD)

Comment: So far, California has been the poster child for a positive response to climate change and the way into a healthy future for the planet. Please do not drag your feet now. We need to move ahead and keep our progress going. Not just to stay #1, but for the sake of our citizens and for our State. We love this State and want it to rise to its full and green potential. People are not going to want to put up with heel draggers when it comes to the welfare of our State's green qualities. Not only is its greenness our biggest health advantage, it is also our biggest advantage for business and the economy. Be green or leave the scene will be the judgment. (KEITHLEY)

Comment: Thank you for taking a pro-active stand on controlling greenhouse gas emissions. It is important that the standards be upgraded as we begin to see the dire effects of greenhouse gas emissions. Global Warming is real. California can set the standard, other states will follow. (KAUFMAN)

Comment: I wanted to urge officials in charge of implementing California's landmark global warming law to be as aggressive as possible in taking actions to curb harmful emissions and achieving the other objectives of our law. Polluters and their representatives and their idiotic references to global warming as a "hoax" must be completely disregarded. Polluters are the problem and it is time they begin to pay all of the extra costs of pollution that citizens have already been paying for years. Thank you for your time and attention. (HORWITZ)

Comment: I am pleased that you have opened up the discussion on greenhouse gas emissions so that the public can have a say in the final wording of the rules. The public has expressed its interest in good environmental policy when it turned down the proposition that would have made it difficult if not impossible to adhere to the environmentally sound conditions which were passed recently. I hope that you will remember this when you finalize the rules for greenhouse gas emissions. Specifically, I hope that you will require the polluters to take their share of responsibility for pollution they have created. Thank you for opening this up for public comment. I am sure you will do the right thing if you follow the wishes of the citizenry. (FESSENDEN)

Comment: The rapid rate of climate change is requiring us to react quickly and creatively. Thank you for the proposals by the State of California. I hope you will move with strength and resolve to start us on the road to healing our planet so we can all live safely without droughts, floods, severe storms, loss of shore line etc. The sooner we begin the less draconian the measures will need to be. (BJELLE)

Comment: Global warming is a very serious issue. Anything you can do to cut down on greenhouse/methane and carbon gases would benefit the planet a great deal. The polar regions are melting, there are dead zones in our waters and mankind's neglect is the cause. Let's turn it around before we're past the point of no return. (ACKERMAN)

Comment: As an environmental engineer, I can tell you that the need to reduce the output of carbon dioxide and other greenhouse gases to the atmosphere is urgent. Please enact a strong climate change mitigation program and lead the way for the rest of the country and the world to do the same. The new program must include significant fees for polluters, not credits to be given away and traded like playing cards, which will not work. It must also include strong new fuel and energy efficiency standards. We must get this right. Our future depends on it. (PETLOCK)

Comment: Please up hold and strengthen California's greenhouse emissions protocol. (HARRISONE)

Comment: The science is overwhelming at this point and almost all opposition to coming regulation comes from hacks that are either directly funded by various arms of the fossil fuel industries or are reps from those industries. It is up to us to show the path to the future. The time to act is now and you have a clear message from the voters who turned down the trojan horse of proposition 23 funded by the fossil fuel industry. U.S. citizens are willing to pay more for real change and to grow the new energy economy now here in California. (PATTON)

Comment: First, thank you to the Board for creating and pushing the GHG emissions regulation making CA the first to genuinely attack global warming. As a resident Californian, I urge you to move forward on the regulations in the midst of what will be massive opposition from the powerful oil, gas and coal industries, and heavy industry. Do not let them bend you will, or the will of Californians. (HOOPERASSOC)

Comment: We have to stop energy production that creates greenhouse gases now and put our efforts into alternative energy production sources. You can be a leader in this. We all can benefit or will suffer by your decisions. (KAISERS)

Comment: Thank you for your work on climate change. (FUTRELL)

Comment: Thank you for taking global climate change seriously. A plan to reduce pollution while rebuilding jobs is not only good for California it is good for all of America and the world. (CADMANS)

Comment: I want to thank you for taking global warming seriously, believe it or not there are global warming deniers out there, even at the highest levels of government. (NGUYEN)

Comment: Thank you for your work over the years in leading the nation on the important issue of combating man-induced climate change. Please do not back down in your regulatory duties in bringing California (and perhaps by example the rest of the nation) onto a path of eventually decreasing CO_2 emissions. It is already too late, but still, better late than never. Thanks again for your work. (USGSRETIRED)

Comment: Please make sure the future of our children and our grandchildren will be a good one. Make sure California leads the fight to stop global warming. (SAUNDERS)

Comment: I urge you to resist the pressure of industry to grant a high level of free giveaways. Californians are ready for tough regulations to reduce global warming. And the world will be watching. I urge you to make care of the planet your top priority. (OSTWALD)

Comment: With the exception of a minority of right wing religious fanatics and the internationally powerful oil industry's dependence on the present course of depleting the earth's resources regardless of the consequences we have overwhelming evidence, both scientific and practical, of our urgency to do what is necessary to reverse global warming. (WILCOX)

Comment: Please know that I want a future for our children with health and safety and a planet that can sustain healthful life. Thank you, for remembering this and doing what may not be fiscally popular but morally right. Remember to make a decision to ignore the possibility of climate change will be catastrophic. Please let us not make irreparable mistake. (HANSEN)

Comment: Listen to the scientists, than act in the best interests of our State and our people. Time is running out. (BEDECARRE)

Comment: I urge you to create even stronger guidelines to promote a cleaner California environment. While I am just an "average" citizen, I am relying on my government to ensure a healthy environment for people like myself with asthma and other lung conditions. I am also relying on my government to promote green technology and to move California into an infrastructure that embraces the necessary changes to a green energy grid. Please do not be swayed by the emotional arguments of the global warming naysayers. The world scientific community has proven over and over again through meticulous research that our environment is imperiled by habitat loss and global warming. (POLANSKY)

Comment: California has a good law regarding pollution and global warming. We should do all we can to strengthen it and not punch holes in it. Polluters need to clean up their act. Do not allow them to buy their way out of their responsibilities. (COMMONS)

Comment: I'm a Los Angeles citizen and I am very much in favor of regulating greenhouse gasses. (IRELAND)

Comment: Jobs will be created if all of the goals of AB 32 are implemented. If some polluters are let off the hook, what will that do for the economy? Nothing. Please hold the line on all of AB 32. (STOLTZFUS)

Comment: I want to thank you for moving forward with the implementation of AB 32 and applaud your leadership on this important issue. The November elections make it perfectly clear that Californians care about this issue and want their leaders to see to it that our environment is protected. Already important actions have been taken. However, I would like CARB to make sure all industries are accountable for the pollution they emit. Please see to it that all industries contribute their fair share of resources and abide by the highest mandates so investments can be made to begin the change of a clean energy economy. Thank you for your time and leadership. (WESTERNS)

Comment: I'm writing to show my support for AB 32. (GROTHAUS)

Comment: Please execute AB 32 as was intended and enlarge those directives to take as aggressive a stance as possible. It's time to do the right thing by not only Californians who want to lead the way in the U.S., but ultimately, for all the earth's people. (CRAWFORD)

Comment: We support the creation of a robust clean energy economy in California and do support your implementation of AB 32. (CABAGE1, CABAGE2))

Comment: We were very glad to see that AB 32 saw overwhelming public support as witnessed by the defeat of Proposition 23 in the recent elections. (GLOVER)

Comment: California has a proud tradition of leading the nation in smart, new policies. AB 32 is a prime example. It's imperative we don't miss our chance to give small business owners the help they need during these tough economic times, because it's our creative entrepreneurs who will lead the way in restoring our State's economic vitality. (SMMAJ1)

Comment: Please fully implement AB 32. This landmark piece of legislation will go a long way to addressing a critical problem in our society (global climate change). (WHITEK)

Comment: I urge you to stake a very strong and committed stance regarding the implementation of the goals of AB 32. Global warming is a critically important problem that should be addressed and I am grateful for the existence of this key legislation. (CHRISTJANER)

Comment: We believe in the AB 32. (FORESTWATCH)

Comment: We really endorse the goals of AB 32. We poll our customers to see what they like. Do you support all of the goals of AB 32, environmental responsibility? And they do. And they also support rate increase for that. Slower smaller rate increases but sustained. (CITYRIVERSIDE)

Comment: The State Hispanic Chamber supports the goals of AB 32. (CAHISPCMBR)

Comment: I strongly endorse AB 32 and suggest increasing the tax on gasoline, and the number of tree planting projects. Have a book of global warming with clear evidence compiled so that naysayers cannot argue. (KNIGGE)

Comment: Thank you for taking global warming seriously. (COHEN1)

Comment: The people of California have spoken and they want teeth in the implementation of Proposition 23. Don't cave to corporate interests. There's nothing wrong with making the polluters pony up as long as it's a level playing field. Make that playing field stringent and then enforce the hell out of it to keep it level. (DIAMOND)

Comment: I applaud your efforts to reduce greenhouse gas emissions. Personally I'm not well informed on the "cap and trade" approach and am inclined toward improved technologies as a preferred solution but any and all efforts must be taken to deal with this critical situation. (RADCLIFFE)

Comment: California, the car-drivingest state, has taken admirable steps to slow down the human causes of global warming. Other states and whole countries will follow sooner or later. Coal-mining states will have the hardest transition to new industries and jobs. Yet without PRC China's fullest effort to change from coal energy, the jig is up for our unique Planet Earth. Avoiding climate catastrophe would have required human behavioral change on a massive scale. (HECKMAN)

Comment: I will make this short and (bitter) sweet. Do something. Lead like Californians do. Set up the goals and compliance to clear our air. The rest will follow. The argument will be we will lose jobs, it always is. It won't happen. Gone should be the days that the public pays the price for companies "rights" to profit. (POUSMAN)

Comment: The stronger your sanctions for pollution, the greater the chances are that the oil and gas industry will diversify and create jobs in the alternative energy (green) sector. You must hold the line on accountability, particularly since at the other end of our country, when the new House sits in D.C. in January, coal will become king again and California will be the sole light at the end of the global warming tunnel. Brace yourselves for the attack and stand firm. (LANE)

Comment: We must make this new law as strong as we can and to let not only the rest of the USA but the world know that there is no turning back now. California will lead the world in making our air the cleanest it can be and we need to make the polluters pay and pay big time. (WARNER)

Comment: Anything we can do to slow climate change should be at the top of our list. (CASTLEREY)

Comment: I urge you to take the opportunity to strengthen GHG and Carbon emission regulations to decrease the levels of emissions. Carbon Dioxide and many GHG gases are known to harm our health, environment, air quality, and dramatically impact climate change. Please take a bold, positive stand to regulate these gases and emissions that will make a positive impact on our health and our environment. (RICHARDS)

Comment: California must lead in clean air as clean air is better for the people who live in our State. (WANG)

Comment: Go for it. Show the rest of the nation what can be done by planning and commitment. (BRENNAN)

Comment: I want to extend my sincere thanks to you for making California a cleaner place to live. I can remember "smog alerts" as a child growing up in Los Angeles, when we were restricted from playing outdoors. Air pollution makes my asthma and my heart condition worse. Your work to keep our air pure has a measurable effect on my quality of life. Thank you. (LAUMANN)

Comment: Everything possible should be done to protect our air and our planet. (SOBO)

Comment: I thank you for realizing the importance of our clean earth but there is still a ways to go and we cannot cave to the other side’s ridiculous arguments. We must move forward with what we know is right and hold all wrongdoers accountable. (PERATA)

Comment: Continue California's trailblazing work by promoting and upholding the highest environmental standards. (TAYLORC)

Comment: Strong regulation is a win-win for the State as it will create green jobs and protect our environment. Please adopt the most robust regulation possible. (GIBBS)

Comment: Please stay on track with controlling emissions!! Don't let this opportunity slip by us. (ERILANE)

Comment: Please do your part to help the earth's air—our only air. (LITWIN)

Comment: Please support the California League of Conservation Voters and other Earth friendly groups in their attempt to save our planet and our lives. (CHITTENDEN)

Comment: Thank you for all that you are doing to try to insure a future for our children, and their world. Please consider the whole earth when you make your decisions. (CADMANL)

Comment: Thanks for what you are doing. A clean environment is best for everyone. I guess unless you just want to be as rich as possible then die before there's no fresh air left. (BROWNRO)

Comment: Please do not continue to compromise our health any further by allowing more pollution of the air, water, and food. (HARRISV)

Comment: Please keep California's air clean. Do not give in to the political pressure to weaken emission compliance. (REGINATO)

Comment: Please help us create policies that put science and sound stewardship of our environment before corporate profits. (BERALL)

Comment: We are long overdue in addressing the need of the country in being forward thinking on the environment. We must act swiftly and decisively in order to slow the degradation of our natural world. Our very lives depend on it. (ANDERSONL)

Comment: As a person who is in poor health I need good non-polluted air to breathe, please fight for me. (JACKSON)

Comment: Please help the world by having the government go green! (MYERSR)

Comment: Clean air & water will allow the planet to continue to live and assist us in having healthy bodies. 99.9 percent of all cancers are from toxins in the air, food, and water. Most corporations, including oil companies, hide the information that protects their money and destroys wildlife, plants and people. If you want to have a healthy lifestyle and body or have children, grandchildren OR anyone you love to stay healthy—please help in any way that you can. (BURDINE)

Comment: It all comes down to a very simple statement. Save it now, or lose it all latter. Your choice. (BILLER)

Comment: With the economy, the environment and our world on all levels is going through massive change. It does not look good for our future generations. I ask that you please think of our children's children's children so we can leave them a planet. Let's think far beyond our immediate future. That is all I ask, and let your consciousness decide what is correct. (MONTANA)

Comment: We live in the Sierra Foothills, especially in Nevada City. You'd think being "out in the country" would be healthy. Yet our area is ranked as one of the highest pollution areas, because much of the pollution from the Bay Area is carried by the winds and blocked in our area by the mountains. Please curb the pollution, tighten restrictions, and put incentives for going GREEN. Our State and country and world need this. (OLSON)

Comment: The problems we've had in every other area of our society come from laissez-faire "free market" or "market-based" decision-making. But there are some things that you can't put a price tag on, and don't belong in the equation in the first place. Above all, we must protect our environment and our air quality. (LYONM)

Comment: Please think of the future of our children and you immediate voters! Our issues survive and your vote keep coming be present to the future of our needs and yours. (HARRISONT)

Comment: Thank you for responding so well to the threat of global warming. California ARB has lead the nation many times, taking action when scientifically validated, instead of waiting as industry and other vested interests attempt to stall action. Your plan to reduce global warning emissions, while creating growth (jobs) through renewable energy and other technologies, is commendable. My family has taken steps to reduce our carbon footprint--reducing use of water, electricity, and gas, driving fuel efficient vehicles, recycling, composting, etc. Some businesses and trucking companies have taken steps too, but their investments will cost them a competitive edge if other companies do not make similar changes. Please do not back down from the political pressure. Californians and other Americans are counting on you. (MILLS)

Comment: Please, no more ecocide for the short-term benefit of the fossil fuel industry. We need cleaner air, cleaner jobs, cleaner energy, better health and greater security. Take stronger action now and lead the world to stop delaying the death of the fossil fuel industry. (BROCKMAN)

Comment: I believe that California can create an entirely new economy that is based on sustainable and renewable goods and services in all aspects of life. But this could never happen if we are lax with our clean environment laws. Stay strong and uncompromising, because 'big oil' isn't the only option we have. (ROBBINS)

Comment: California is in a position to lead our nation into a future of sensible controls on pollution and promoting sustainable energy use. Please do not let this opportunity pass. We need to turn around the senseless idea that jobs and growth depend on continued use of fuels that pollute. (FRIEDMAN)

Comment: We need to set a very strong example here for several reasons. If California can show the way towards alternative sources of energy and meaningful reduction of greenhouse gases, perhaps it will start a worldwide trend to follow our lead. (ENEVOLDSEN)

Comment: It is encouraging to see California leading the way scientifically by following the lead of the 97 percent of climatologist who warn us against the threats of global warming rather than listing to the 3 percent deniers. If history proofs the 97 percent to wrong, we still will be better off developing cleaner more renewable sources of energy that can help us to overcome our addiction to fossil fuels. Continuation of our fossil fuel addiction is a losing proposition no matter what. Thank you California for leading the way to the future. (LOMAX)

Comment: We need to do everything we can to convert to a green economy. The vested interests in oil, natural gas and coal have a lot of money and will do everything in their power to try and make sure they get to burn up every bit of fossil fuel in the ground. But the atmosphere is already overloaded with carbon and we just can't burn the remaining fossil fuels without horribly damaging the Earth's ecosystems. So please stand strong and protect the atmosphere and life on Earth from carbon pollution. (FRETHEIM)

Comment: We must have realistic and powerful restrictions placed on the fossil fuel industries for there is very little time left to reverse their devastating effects upon our citizens' breathing, as well as climate change. It is a dire situation which needs emergency legislation. Please do what is necessary for both humanity and every living thing on this planet. We can easily progress well beyond this petrochemical age of massive pollution. (JOHNSONS)

Comment: I want to encourage the Board to set stringent standards in order to wean us off of fossil fuels and to move us toward greater energy independence by embracing clean technologies such as wind and solar energy. Nuclear fuels are too dangerous and we have no permanent storage capacity for them. By focusing on renewable energy sources (nuclear not included here), we can create a much better future for everybody in our great State. (STEELEB)

Comment: We urge you to strengthen the proposed program for decreasing global warming emissions from the State's largest polluters. It is the right thing to do. As goes California, so goes the nation. It is not just a catch phrase, make sure you don't sell us out. (RITCHIES)

Comment: Thank you for protecting the environment for my future kids. I encourage you to continue to strengthen the global warming program further. It's worth any cost. (DELATTE)

Comment: Thank you for your efforts to reduce global warming emissions. I am writing to ask you to consider strengthening the proposal. (DUTTON)

Comment: This is not the time to weaken our air quality standards but to strengthen them and ensure that we have the regulations and enforcement mechanisms in place to keep improving our air and that we continue to support those policies that will ensure a future of clean air for all Californians. (LOZANO)

Comment: Clean air is what we need to have, in order to live a healthy life. Please strengthen and reinforce the California Clean air laws. (OFFEN)

Comments: Air quality should be strengthened to also include wood and coal burning restaurants that contribute to local pollution by emitting additional harmful smoke and carbons into the air. (AMOUR)

Comment: Thank goodness California voters and governmental officials have demonstrated overwhelming support for taking action to protect us from devastating climate change. Please keep up the good work and move regulations in the strongest possible direction. (WITTWER)

Comment: To avoid climate catastrophe, greenhouse gas emissions in the U.S. must peak in the coming decade, decline steadily, and reach a level close to zero by mid-century. I support any effort to accomplish this goal, for the health of our planet, ourselves, and generations to come. Let's lead, California. (HASKETT)

Comment: As a Dentist, I am deeply concerned about Green House Gas emissions and what pollution means for the health of our citizens. I applaud the steps being taken in California to lower emissions as a part of a greater movement in our State to ameliorate climate change and keep our air clean. (STEINBORN)

Comment: We in California deserve to have clean air to breathe. We vote for it and demand that our elected officials make and pass rules, laws and regulations to make that happen. (MILLERF)

Comment: Congratulations! You will be a positive example for the rest of the world-go for it. (KNOTH)

Comment: I support the environmental protection standards. (WILLIAMSA)

Comment: I am writing simply to send my heartfelt thanks for your state's leadership regarding reducing emissions that worsen global warming. (HURLEY)

> **Response:** We acknowledge your support on climate change and our efforts to reach the greenhouse gas (GHG) reduction goals required in the California Global Warming Solutions Act of 2006, Assembly Bill 32. These programs will also help reduce smog-forming pollution and air toxics.

Support GHG from Biomass Waste

Q-3. Comment: We support the proposed rule consideration of GHGs from biomass wastes as excluded from allowance requirements. This is consistent with other cap and trade programs, and recent U.S. EPA guidance which allows permitting authorities to take into account the environmental, energy, and economic benefits of biomass during Clean Air Act Permitting for Greenhouses Gases. (PCAPCD)

> **Response:** We acknowledge your support.

R. USE OF AUCTION PROCEEDS

This section includes comments and responses concerning how allowance auction proceeds and consignment auction proceeds are utilized. Suggestions for use of auction proceeds include creation of a Community Benefits Fund to assist communities already affected by air pollution, return of proceeds to consumers, assistance to small businesses and local governments, creation of a low-carbon technology investment fund, and investment in renewable energy and energy efficiency.

Air Pollution Control Fund

R-1. Comment: We support the deposit of allowance auction proceeds into a common fund such as the Air Pollution Control Fund, as identified in the final regulation (Subarticle 8, section 95870(f)). While the legislature may ultimately appropriate these funds, TNC urges CARB to amend this section to identify that these funds should be invested in ecosystem-based adaptation, land use, transportation and a community benefits fund for use by qualified organizations and local governments, as they were explicitly identified in the final March 2010 recommendations of the EAAC. While the EAAC report recommends the auction of emissions allowances as the most equitable and efficient way to distribute allowances to capped entities, it also recommends the distribution of allowance revenue to ecosystem-based adaptation, among other important investments. It is critical to dedicate funding to ecosystem based adaptation. Proper investment of allowance value will help minimize the negative effects that excessive greenhouse gas (GHG) emissions are having on California's natural systems, and by extension public health and safety. It will also simultaneously protect the vital GHG mitigation function these systems naturally provide. Allowance value investments and compensation should be dedicated to all natural systems in California for adaptation purposes, including forests, grasslands, working landscapes, coastal areas, watersheds, and deserts to protect and promote their vitality and diversity and the many benefits that they provide to Californians and the economy. These benefits include, clean drinking water, climate regulation and carbon sequestration, air quality protection, flood control, wildlife habitat, crop pollination, recreation, timber, and employment, among other things. The public cannot afford to lose these benefits, and the State has an opportunity to optimize its investment by dedicating a significant portion of allowance value to these resources. (NC1, NC7)

> **Response:** In Resolution 10-42, the Board directed ARB's Executive Officer to deposit a minimum of 10 percent of annual proceeds generated from the direct auction of allowances into the Air Pollution Control Fund for appropriation by the Governor and Legislature for programs and projects that reduce greenhouse gas emissions, mitigate direct health impacts of climate change, and promote green collar employment opportunities in the most impacted and disadvantaged communities in California.
>
> Also, in Chapter II of the Staff Report, we discussed the creation of a Community Benefit Fund to recognize the community protection goals of AB 32. Although

> ARB is precluded from establishing a regulatory program for a Community Benefit Fund until and unless authorized to do so by the Legislature and the Governor, the Board did direct the Executive Officer to initiate a public process to develop recommendations to the Legislature and Governor on the types of projects and programs to be funded. We encourage participation in the public process, and believe that appropriate recommendations will be developed and proposed to the Legislature and Governor.

R-2. Comment: The cap and trade regulation should explicitly include clear language on the investment of allowance auction proceeds in ecosystem-based adaptation and the preservation of our natural infrastructure for its climate benefits. Modify section 95870(f) as follows:

(f) The proceeds from the sale of these allowances will be deposited in the Air Pollution Control Fund and will be available for appropriation by the Legislature for the purposes designated in California Health and Safety Code sections 38500 et seq. <u>and may be used for purposes of ecosystem-based adaptation, the protection of public health and disadvantaged communities, land use and transportation, greenhouse gas reductions by local governments and a community benefits fund, as advised by the Economic and Allocation Advisory Committee in its March 2010 report to the California Air Resources Board.</u> (PFT1, PFT2, NC2)

> **Response:** Auction proceeds placed in the Air Pollution Control Fund will be made available for appropriation by the Governor and Legislature for purposes outlined in AB 32. Therefore, we do not believe it is appropriate to modify section 95870(f) as proposed.

Community Benefit Fund (CBF)

R-3. (multiple comments)
Comment: Set aside a minimum of eight percent of allowances to benefit disadvantaged communities. Sell eight percent of allowances to entities covered under the cap at the program's fixed floor price. A minimum of eight percent of allowances is equivalent to the offset limit percentage in the proposed regulation and ensures that the CBF program is large enough to be meaningful and attract sizeable private investment to help create jobs which are most needed in these communities. Place the revenue received from this sale in the Air Pollution Control Fund (APCF) to ensure its availability for appropriation by the Governor and the Legislature to create the Community Benefit Fund (CBF). Include a requirement that the CBF shall be used to fund programs or projects that reduce greenhouse gas emissions, mitigate direct health impacts of climate change, or promote green collar employment opportunities in the most impacted and disadvantaged communities identified by ARB. The emission reduction programs funded by the CBF will reduce burdens significantly and maximize the co-benefits as required by AB 32. Selling a portion of the allowances at the floor price ensures a predictable revenue stream to plan and implement the CBF program successfully across the State in the identified communities. The floor price eases the financial burden of entities covered by the cap and reduces the price spikes associated with

auctioning. Creating the CBF at the beginning of the program will garner wider support for the overall program (which is vital for its sustainability) from many environmental, community groups, impacted neighborhoods and potential applicants (including small businesses, local governments, etc.) as well as legislators. (CCA2)

Comment: At a minimum, CARB should definitively establish a community benefits fund (CBF) and give stakeholders greater confidence that a CBF will be funded sufficiently with revenue from the sale of allowances. EDF joins our colleagues in GWAC in encouraging the setting aside of allowance value for the CBF. (EDF1)

Comment: Greenlining recommends that CARB include provisions in the regulation that set aside funding for CBF. The funding will be used to mitigate the impact of climate change and air pollution, improve community health programs, and promote green workforce development programs. CBF should only be available to communities that are disproportionately affected by climate change, and Greenlining will work with CARB to identify the most vulnerable communities. Our multi-ethnic and multi-sector collaboration experience will help CARB reach out to communities effectively. The creation of a green technology workforce training program to help workers transition to the renewable energy sector is crucial. (GREENLINING1)

Comment: Though it did not pass, the inception and development of AB 1405, De León, California Global Warming Solutions Act of 2006: California Climate Change Community Benefit Fund, provides a framework that ARB staff could use with amendments. We recommend allocating no less than 30 percent of the total revenues generated from the annual purchase of allowances and offsets that will be allocated to CBF. The revenues should directly benefit local communities most impacted by climate change in California to mitigate the costs of reducing carbon, which disproportionately falls on low-income communities. (CBE1)

Comment: While we appreciate the inclusion of a recommendation in the Initial Statement of Reasons (page II-29) to the Legislature and Governor to establish a Community Benefit Fund (CBF), we are disappointed that such a mention is not included with further detail in the regulation to ensure the CBF is initiated by CARB at the onset of the program, beginning in 2012 when auctioning and sale of allowances will begin. We believe CARB has the authority to initiate the CBF by providing a specific amount of funding into the fund from the beginning, while still recommending the Legislature and Governor appropriate the funds through legislation. The staff proposal fails to provide reasons as to why CBF should not be created at the onset of the program. We offered a viable and specific proposal (attached), whereby funds could be provided at the initial onset of the Cap and Trade program. We urge you to reconsider our recommendation to ensure that CBF is created at the onset of the program, with a specific percentage of allowances. Or delay the use of offsets into the program for future years when additional compensatory emission reduction programs can be initiated simultaneously from the CBF funds. Should the Governing Board be unwilling to establish a CBF at the onset of the program with a minimum percentage of allowances being set aside, we suggest that the Board not make any attempts (even the most well-intentioned) to add new resolution or regulatory language which could unintentionally hinder efforts to successfully pursue legislative efforts. (CCA1, CCA3, CCA4)

Comment: The proposed regulation fails to fulfill the mandate for community investment. Nowhere in the regulations or even in the staff report did ARB describe a strategy to implement the requirement to direct monetary benefits to disadvantaged communities. AB 32 requires that ARB "ensure that the greenhouse gas emission reduction rules, regulations, programs, mechanisms, and incentives under its jurisdiction, where applicable and to the extent feasible, direct public and private investment toward the most disadvantaged communities in California and provide an opportunity for small businesses, schools, affordable housing associations, and other community institutions to participate in and benefit from statewide efforts to reduce greenhouse gas emissions." In its discussion of the incomplete Health Impact Assessment, ARB notes that it will explore potential uses of revenue generated by the program to improve public health in California. It also notes that distribution of revenues is an issue that deserves further discussion. While the draft regulation does recommend a Community Benefit Fund, none of these recommendations commits ARB to any concrete action that would actually move private and public money into disadvantaged communities. Moreover, the section lacks a clear vision on the mechanism for giving a value to the carbon credits, determining the allocation to the CBF and the best way to direct investments to the communities most impacted by air pollution. (CBE1)

Comment: CARB must include a strategy to implement the requirement to direct monetary benefits to disadvantaged communities. (CBE1)

Comment: We want to thank you for adding the Community Benefit Fund in today's staff modifications, because the San Joaquin Valley will desperately need the assistance to both cope with climate change and achieve local carbon dioxide reductions that will include co-pollutant benefits and improve public health in our region. (FRESNOMINISTRY)

Comment: We would like you to strongly consider how this economic transformation that will get us to greater emissions reductions and will create jobs at the same time, how all of that will factor on the green jobs creation picture. We can make all of these changes. But if we don't ensure that there's equity in the process for low income communities in the process of transforming our economic conditions or our economy so that we're less dependent on fossil fuels, and use more renewable energy sources, we won't have a position of equity in low income communities. We're asking you to use the Community Benefit Fund feature. (CANAACP)

Comment: Integration of the Community Benefit Fund is into the proposal is a good step forward. The adoption of a community benefits fund should not be in lieu of conducting an analysis of localized impact. We recommend no less than 30 percent of total revenues going towards a Community Benefit Fund and that resources go towards the most impacted and disadvantaged communities. (CAEJA)

Comment: ARB should ensure ongoing and consistent investment in health improvement and GHG reduction in disadvantaged communities through the Community Benefit Fund. We appreciate the resolution which calls for a set aside of revenues, initiation of a public process for determining funding priorities. (ALA)

Comment: I want to commend the inclusion of a recommendation for a Community Benefit Fund or something like that, which was vetoed by the Governor in AB 1405. (CPC5)

Comment: ARB should devote auction revenue to a Community Benefit Fund to help finance co-pollutant reductions in disadvantaged areas. (USFLAW)

> **Response:** In Resolution 10-42, the Board directed ARB's Executive Officer to deposit a minimum of 10 percent of annual proceeds generated from the direct auction of allowances into the Air Pollution Control Fund for appropriation by the Governor and Legislature for programs and projects that reduce greenhouse gas emissions, mitigate direct health impacts of climate change, and promote green collar employment opportunities in the most impacted and disadvantaged communities in California.
>
> In Chapter II and Appendix J of the Staff Report, we discuss the use of auction proceeds for a Community Benefit Fund to recognize the community protection goals of AB 32. As stated in Resolution 10-42, the Board agreed with the recommendations of the Economic and Allocation Advisory Committee including financing economic opportunities and environmental improvements in disadvantaged communities. ARB is precluded from establishing a regulatory program for a Community Benefit Fund until and unless authorized to do so by the Legislature and the Governor. However, the Board did direct the Executive Officer to initiate a public process to develop recommendations to the Legislature and Governor on the types of projects and programs to be funded. We encourage participation in the public process, and believe that appropriate recommendations will be developed and proposed to the Legislature and Governor for appropriation in adequate time.

R-4. Comment: We really urge you to increase auction allowances closer in the program rather than later out so there actually are funds in the community benefit funds that your staff is proposing, rather than us waiting around for these funds for many years to come and having them later in the game. (SFMAYOR2)

> **Response:** We recognize the benefits of an auction system. However, under current economic conditions, an early emphasis on an auction system could hamper the ability of California sources to invest in low-carbon technologies. Freely allocating allowances, initially, will also help prevent leakage of GHG

emissions and job losses in California. Therefore, we will gradually transition to a greater amount of auctioning.

R-5. Comment: CARB must develop specific criteria for how the CBF should be used in order to meet AB 32 requirements to ensure low-income communities are not disproportionately impacted and that there are other benefits beyond GHG reductions. CBE recommends including, but not limiting the CBF funding to these types of projects:

- reducing GHGs and co-pollutants in highly impacted communities, including stationary and mobile source pollution;
- non-fossil fuel electricity generating projects in and by local communities;
- green jobs training for low-income residents;
- disaster planning and preparedness, such as flooding, wildfires and other extreme weather events;
- creating community and specific plans to mitigate land use conflicts; reducing heat-island effects with strategies such as tree shade planting and "cool pavements;"
- improving access to mass transit for low-income riders;
- improving training of industry workers and reducing exposure to pollutants;
- supporting local sustainable agriculture;
- water conservation programs including water catchment projects for homes, roadways and buildings, and greywater use;
- improving water quality in low-income communities; and
- improving or creating park space in low-income communities. (CBE1)

Response: As stated in Resolution 10-42, the Board directed the Executive Officer to deposit a minimum of 10 percent of annual proceeds generated from the direct auction of allowances in the Air Pollution Control fund for appropriation by the Legislature to programs and projects that reduce GHG emissions or mitigate direct health impacts of climate change. The Board agreed with several potential uses of allowance value recommended by the Economic and Allocation Advisory Committee, including financing economic opportunities and environmental improvements in disadvantaged communities. In Chapter II and Appendix J of the Staff Report, we discussed several uses for Air Pollution Control Fund proceeds, including the creation of a Community Benefit Fund. Such a fund could be used to promote projects that simultaneously reduce GHGs and co-pollutants, finance adaptation/preparedness for climate change health impacts, create improvements to mass transit and land use planning, facilitate natural resource conservation, and support non-utility energy-efficiency programs. Additionally, we also discussed a Low Carbon Investment Fund to promote projects that support a green technology workforce training program. We will initiate a public process to develop recommendations on the uses of allocation proceeds. We anticipate that the uses for allocation revenue in the Staff Report will be further developed.

R-6. (multiple comments)
Comment: The proposed regulation requires that collected revenues from the auction of transportation sector allowances be used for public purposes. We urge CARB to strongly recommend to the governor and Legislature to use the funds as the State's Economic and Allocations Committee recommended: 75 percent dividends and 25 percent other uses including a Community Benefit Fund. Such an approach would mirror federal legislation introduced by Senators Cantwell and Collins, the CLEAR Act 2. (CPC1)

Comment: I urge CARB to strongly recommend to the governor and legislature to use auction funds as the State's Economic and Allocations Committee recommended: 75 percent dividends and 25 percent other uses including a Community Benefit Fund. (VESSER)

> **Response:** As stated in Resolution 10-42, the Board directed the Executive Officer to deposit a minimum of 10 percent of annual proceeds generated from the direct auction of allowances in the Air Pollution Control fund for appropriation by the Legislature for programs and projects that reduce greenhouse gas emissions or mitigate direct health impacts of climate change. As further stated in Resolution 10-42, the Board agrees with several uses of allowances recommended by the Economic and Allocation Advisory Committee including returning allowance value to households either through lump-sum rebates or other methods identified in the resolution. In the Staff Report, we discussed the creation of a Community Benefit Fund to recognize the community protection goals of AB 32. We will initiate a public process to develop recommendations to the Governor and Legislature on the types of projects and programs to be funded.

Dividends/Rebates/Tax Cuts to Residents/Ratepayers/Electricity Sector Use of Consignment Auction Proceeds

R-7. (multiple comments)
Comment: I support the auctioning of carbon permits to the utilities sector. The government should give 75 percent of the money, as recommended by the EAAC, as a dividend to low- and middle-income residents in the form of a lump sum of money to offset the increase in costs. This would relieve some of the financial burdens of citizens, such as veterans, who need it the most. Please make this a strong recommendation in the Regulations to the Governor and Legislature. (TASSARO)

Comment: I urge you to follow your expert economic panel's recommendation that "The largest share (roughly 75 percent) of allowance value should be returned to California households..." in the form of a dividend check. (LARES)

> **Response:** As stated in Resolution 10-42, we agree with several uses of allowances recommended by the Economic and Allocation Advisory Committee, including the value of lump-sum rebates. We will initiate a public process to

develop recommendations to the Governor and Legislature on the types of projects and programs to be funded.

R-8. Comment: In the electricity sector, the final Regulation should direct utilities to protect ratepayers by returning allowance value directly to residential customers as a rebate check. (HANSON, SONOMAFCC, FORMLETTER01)

Response: The Regulation states that electrical distribution utilities must use allowance value for the benefit of retail ratepayers, consistent with the goals of AB 32. We believe ratepayers could benefit from rebates, customer bill relief, or energy-efficiency programs.

R-9. (multiple comments)
Comment: Providing dividends to every California resident will require some extra logistical and public education work, but California is a pioneering state and California is the place where this type of democratic innovation is most likely to succeed. Please set the example for the rest of the world by introducing substantial dividends as part of the Cap and Trade regulation. I strongly encourage you to take the same approach with electricity and other sectors, and provide these revenues as dividends to consumers as well. (CANFIELD1)

Comment: Direct utilities to protect ratepayers by returning allowance value directly to residential customers as a rebate check. Allowing utilities to use allowance value for a vaguely-defined "ratepayer benefit" gives too much discretion. CARB should require the utilities to consult with local governments and stakeholders, with special attention to those with local GHG reduction goal. Any consumer rebate from utilities should not show up as a line item on electricity bills, shielding consumers from the price signal and discouraging changed behavior. My recommendations follow the EAAC recommendations that "the largest share (roughly 75 percent) of allowance value should be returned to California households" in the form of a dividend check. The remaining 25 percent should be used for a variety of purposes including preventing leakage (a very small percent), investments in renewables and energy efficiency, and a Community Benefit Fund. (CARBONSHARE)

Comment: Some of that money should go to California households to offset costs that no doubt would be passed on to consumers by utilities. This would be a big help in getting people invested in the project. (AMENTA)

Comment: I urge you ensure that auction revenues allocated to electric distribution companies directly benefit ratepayers by directing utilities to return allowance value directly to ratepayers as a rebate check. A per capita dividend to households would be a progressive policy that would benefit low-income households who spend a larger fraction of their income on fuels. (KUNKEL)

Comment: We are concerned that the utility sector will not return the allowance value to ratepayers in the most direct way, and urge CARB to compensate consumers with a dividend. (CPC1)

Comment: Provide residential ratepayers a direct rebate through lump-sum payments. Auctioning allowances and returning a large portion of the auction revenues directly to consumers are essential for ratepayer protection. Equal rebate checks for residential ratepayers (or at least equal within a LDC service area) are essential to ensure basic fairness of the program and to protect low- and middle-income ratepayers from potential increases to electricity prices. CU ardently supports a direct consumer rebate as opposed to an LDC-pass through. We strongly believe that a direct consumer rebate or "lump-sum transfer" should be the only allowable use of these funds. (CONSUMERSUNION)

Comment: Dividends (or tax cuts) should be a majority use of allowance value, not just another use of allowance value comparable to any other. Dividend checks to every California household do help with the costs that will be passed down to consumers, but they also recognize the shared ownership of the commons, and that the first priority is to return the value of this commons back to the people. (VESSER)

Comment: AB 32 requires regulations that your Board approves ensure low income communities are not disproportionately impacted. Without a dividend or rebate, low and middle income citizens will be disproportionately impacted. We encourage you to strongly recommend to the Governor and the Legislature the inclusion of dividends. (CPC4)

Comment: To the extent consumer rebates are offered, similar rebates should be available to consumers of fuels, electricity, and other consumer products. (CCC, MAZOWITA)

Comment: I am in favor of initial maximization leading to 100 percent auction of permits compensating ratepayers with a dividend. (CPC2)

Comment: We do not see dividends as just another use of allowance value, but rather as a structural foundation for a fair and effective policy. (CPC4)

Comment: I recommend a dividend check that would be paid to all residents of California to help redistribute monies that were taken in the process of the Cap and Trade program. (CPC3)

Comment: I urge you to create a structure where 100 percent of the permits are auctioned and most of the revenue is returned to California residents. This is key to ensuring that the system retains the broad support it needs to do its work over time, as well as to help individual residents deal with higher prices on items that have carbon in them. (GLICK)

Comment: AB 32 requires regulations that your board approves "ensure low-income communities are not disproportionately impacted." For this reason, tax cuts do not make sense because they do not help the people most vulnerable to higher energy prices. Without a dividend or rebate, low and middle income citizens will be disproportionately impacted by increased energy prices creating an economic and political obstacle for the smooth implementation of the law. If dividends are included in the first compliance period, they may be used as a feature to sell the program to the public up front. They will build political support for energy efficiency and climate protection over time and demonstrate to the rest of the country that this complex issue can be solved in an equitable fashion. Not including dividends will give the impression that CARB is more concerned with the impact of these Regulations on businesses than on consumers. (CPC1, VESSER)

Comment: Put money back into the hands of the people of California. (KOWALICK)

Comment: Use revenue to lower the budget deficit or return to residents or taxpayers. (DAWID)

Comment: Greenlining recommends that bill rebates be made to low-income households, as suggested by EAAC. This is intended to prevent the percentage reduction in real income for low-income households from being greater than that of other household income groups. Greenlining also recognizes the importance of not creating a disincentive for energy conservation. As a result, Greenlining favors the use of separate cash rebates, rather than simple bill discounts. These transfers should be done in a way that accounts for disproportionate impacts, rather than an equal across the board subsidy for all households. (GREENLINING1)

Comment: We support the proposed Regulation's inclusion of consumer refunds as a use of allowance value. We believe the most direct approach to this is a "lump-sum transfer" which could be implemented through a dividend check. The customer would still receive the carbon price signal on their utility bill, but would receive a rebate check to help buffer them from the regressive impact of increased electricity prices. (CPC1)

Comment: For the utility sector, CARB has proposed a combination of free allowance giveaways and (secondary) auctions. CARB wants the utilities to pass along the subsidy to consumers in a way that encourages conservation. The Economic and Allocations Advisory Committee (EAAC) report did a great job explaining the flaws in the PUC/CEC recommendation to allocate to utilities. The EAAC recognized that providing a rebate through utilities (showing up only as a line item on electricity bills) shields consumers from the price signal and discourages changed behavior. Separating the return of money from the utility bill is critical for sending any price signal at all to residential customers. There is no environmental benefit from keeping people's utility bills low. Therefore, I support the proposed Regulation's inclusion of consumer rebates as a use of allowance value. I believe the most direct approach to this is a "lump-sum transfer" which could be implemented through a dividend check. The customer would still receive the carbon price signal on their utility bill, but would receive a rebate check to help buffer them from the regressive impact of increased electricity prices. (CPC1, CPC4, VESSER)

Comment: Return a large segment of the revenue as a dividend. The forcing should come from technology competing in the market. (DSOUZA)

Comment: In the electricity sector, I am concerned about costs related to administering rebates or funds back to ratepayers and about the utilities' track record in rate reduction and equitable consumer benefit. In this time of budget deficits and economic stress a program design with the least cost to administer would be advisable. The Economic and Allocation Advisory Committee's March 25, 2010, recommendation, which suggests returning 75 percent of allowance value to California ratepayers, may provide an opportunity for lowest cost administration and overhead. It may be worth delaying adoption of this portion of the regulations until further examination of optimal means to reduce consumer economic impacts. (ASMSKINNER)

> **Response:** Per Board Resolution 10-42 we acknowledge the importance of protecting California consumers and that a portion of allocation proceeds should be returned to them. We also agree with the recommended uses of allowances made by the Economic and Allocation Advisory Committee. In Chapter II and Appendix J of the Staff Report, we consider a Per Capita Consumer Rebate Program. A per capita lump sum distribution of the proceeds raised at auction would help consumers avoid negative impacts of higher fuel expenditures while still providing the correct incentives to reduce fossil fuel use. In Board Resolution 10-42, we also refer to the potential of returning allowance value to households through lump-sum rebates. We will initiate a public process to develop recommendations to the Legislature and Governor on the types of projects and programs to be funded by allocation proceeds, during which the potential uses for allowance revenue will be further developed.

Small Business

R-10. (multiple comments)
Comment: Small Business California urges ARB to incorporate explicit recognition of the key role California small businesses will play in achieving California's climate action goals. ARB should include language that explicitly recommends that allowance auction revenue deposited into the air pollution control fund be used to support access to capital mechanisms that will allow businesses to invest in energy efficiency and alternative transportation. While we're pleased to see these programs are now in place in most California utility service areas, there is a need to bridge financing for contractors to be able to afford to wait for payment from these utilities programs, which currently can stretch out 90 to 120 days. We believe the most cost effective way to facilitate this is to provide loan loss reserve funding, lower finance bridging mechanisms, and other financing tools. (SBCA1, SBCA2)

Comment: We are concerned that we won't get sustained investments back into growing a green economy that provides pathways out of poverty and helps our oncoming small businesses. (EBCHR)

> **Response:** We recognize the importance of California's small businesses. In Board Resolution 10-42, we commit to annually evaluate the effects of the regulation on small businesses and low-income households. Additionally, the Board directed the Executive Officer to initiate a public process to develop recommendations to the Legislature and Governor on the types of projects and programs to be funded. We encourage participation during the anticipated public process.

Low-Carbon Investment Fund

R-11. Comment: Hydrogen Energy supports the Board's proposal for a Low-Carbon Investment Fund. Technology is an important element to the AB 32 Scoping Plan and to California's climate change program. A Low-Carbon Investment Fund endowed with these increasing revenues and specifically dedicated to advancing GHG reduction technology would be a shining example of how the cap and trade program could deliver secondary economic and environmental benefits. This is also a tremendous opportunity to showcase California's innovation and high-tech leadership. Hydrogen Energy recommends that the Board specify that revenue from allowance auctions be set-aside annually to fund the Low-Carbon Investment Fund in general, and specifically for Carbon Capture and Storage projects. Having the acknowledged support of the Board will provide future governors and legislative members guidance on how these new funds would best be expended in pursuit of the goals of AB 32. (HECA)

> **Response:** Thank you for your support. We will initiate a public process to develop recommendations to the Legislature and Governor on the types of projects and programs to be funded and encourage participation during the public process.

R-12. Comment: Some part of allowance value should be used to develop and promote low carbon-emitting industrial processes, as well as other societal benefits such as assistance transitioning for workers and small businesses. (WALTERS, UCS1, WALTERS)

> **Response:** As stated in Resolution 10-42, the Board directed the Executive Officer to deposit a minimum of 10 percent of annual proceeds generated from the direct auction of allowances in the Air Pollution Control fund for appropriation by the Legislature for programs and projects that reduce greenhouse gas emissions or mitigate direct health impacts of climate change. As further stated in Resolution 10-42, the Board agrees with several uses of allowances recommended by the Economic and Allocation Advisory Committee. In Chapter II and Appendix J of the Staff Report, we discussed several uses for Air Pollution Control Fund proceeds, including the creation of a Community Benefit Fund.

Such a fund could be used to promote projects that simultaneously reduce GHGs and co-pollutants, finance adaptation/preparedness for climate change health impacts, create improvements to mass transit and land use planning, facilitate natural resource conservation, and support non-utility energy-efficiency programs. Additionally, we also discussed a Low Carbon Investment Fund to promote projects that support a green technology workforce training program. We will initiate a public process to develop recommendations on the uses of allocation proceeds. We anticipate that the uses for allocation revenue in the Staff Report will be further developed.

Renewables and Energy-Efficiency Projects

R-13. Comment: Revenue generated from the sale of allowances should be allocated to natural gas local distribution companies (LDC) for the benefit of ratepayers to fund customer energy efficiency and similar programs. The revenue allocated to each LDC should be determined by using the same procedure used for allocating allowances. To the extent the LDCs further the goals of AB 32 through their energy efficiency programs, allowance value could be used to advance and support such programs. Under the proposed Regulation, natural gas LDCs are expected to procure allowances and pass on the cost of such allowances to their customers. Southwest believes that the per-capita reductions in natural gas consumption should be recognized as credits (or should at least be a factor) in the formula used to allocate initial allowances and calculate allowance reductions over time to support a more generous allocation of allowances that might otherwise be based on current consumption rates. (SWGASCORP)

Response: In Chapter II of the Staff Report, we describe an alternative under consideration in which allowances associated with emissions from dispersed natural gas combustion would be auctioned and the allowance value returned to customers through action by the Legislature. This alternative will be discussed during the public process to develop recommendations to the Governor and Legislature on the uses of allocation proceeds.

R-14. (multiple comments)
Comment: Funds could be used for programs to reduce energy use in buildings and boost public transit options. (TERSOL)

Comment: Proceeds from auctions should be reinvested into localized community energy projects and programs. "Solar Done Right" is such a group. Their focus is on building solar capacity into the existing, built environment that is already grid tied, rather than large centralized projects taking up valuable agricultural or park lands needing long transmission lines to then be laid. (EICHELBERGER)

Comment: Apply auction revenues toward funding research and development into low carbon technologies, including Carbon Capture and Storage (CCS). Auction revenues should fund investments in CCS technologies. For CCS to move rapidly toward commercial scale and contribute a measurable impact on emissions reductions, further incentives are required to encourage research and development and deployment of CCS technologies. We recommend that allowance auction revenues received by CARB and the California energy utilities be used in part to provide grants and other opportunities supporting investments in emerging clean technologies, including bio-industrial technologies that reduce GHG emissions and promote energy security. Cap-and-trade revenues should invest in California's low carbon energy future by accelerating research, development, and deployment of carbon capture and other innovative technologies required to meet the global challenge of emission reductions. Using auction revenues to fund research and development will attract significant high quality job opportunities to California. (CODEXIS)

Comment: We suggest that revenues from the cap and trade program be used directly for the support of renewable energy projects that are additional and beyond business as usual. (PCAPCD)

Comment: Re-invest money in making homes and businesses more energy efficient, increasing public transit options, and developing wind and solar projects in California. (DUTTON, FUTRELL)

Comment: I believe permits need to be offered at a cost, to help fund energy efficiency and for developing alternative energy sources. (SUSTAINDESIGN)

> **Response:** We agree that auction proceeds could be used to support energy-efficiency programs and projects that identify zero- or low-GHG technologies, reduce energy use in buildings, boost public transit options, and similar uses that align with the goals of AB 32. We recommend potential uses of auction proceeds in Chapter II and Appendix J of the Staff Report under a Community Benefit Fund. We will initiate a public process to develop recommendations to the Governor and Legislature on the types of projects and program to be funded. We encourage participation in the prospective public process, and would be a good opportunity to further discuss the specific use of funds within a Community Benefit Fund.

R-15. Comment: Auctions are unknown and depend upon many variables. The unpredictability of auctions is not a positive point for conducting business in California. If an auction is instituted, the auction proceeds should go back into advancing energy efficiency. (NAIMA)

> **Response:** We agree that auction proceeds should go toward advancing energy efficiency and similar uses that further the goals of AB 32.

R-16. Comment: The investment of auction proceeds should facilitate near-term shifts to clean energy resources, applications, and technologies in order to save consumers money, reduce emissions, enhance energy security, and create jobs in clean energy sectors. (BCFSE)

> **Response:** We agree and recommend similar uses of revenues in Chapter II and Appendix J of the Staff Report under a Community Benefit Fund and Low Carbon Investment Fund.

Transportation / Support Local Government

R-17. Comment: CARB should include in any Cap and Trade regulation it adopts language that explicitly recommends that allowance auction revenue deposited into the Air Pollution Control Fund be used to support local government programs and initiatives. The purpose is to direct the Governor's office and the Legislature to appropriate allowance auction revenue to local governments to facilitate a community benefit fund, for example. (LGSEC)

> **Response:** In Chapter II of the Staff Report, and in Appendix J, we recommend using auction proceeds for a Community Benefit Fund to recognize the community protection goals of AB 32. The Board directed the Executive Officer to initiate a public process to develop recommendations to the Legislature and Governor on the types of projects and programs to be funded, and we encourage the commenter to participate in the public process.

R-18. (multiple comments)
Comment: We urge you to recommend an investment of at least 10 percent of market-based revenues into funding transit expansion and similar transportation projects to reduce GHG emissions. This will advance GHG emissions reductions in the State as it shifts travel modes to reduce emissions, and will at the same time provide cleaner and more efficient mobility to California's citizens. (CATRANSASSOC1)

Comment: If transportation fuels are included in cap and trade, allowance value associated with the sale of gasoline and diesel should flow back to fuel customers. Under the proposed Regulations, electricity consumers will see a significant proportion of the costs of regulation offset over the life of the program via allowance allocation to local distribution companies for the purpose of consumer protection (see section 95870(c)). In contrast, commercial and light-duty vehicle transportation consumers will pay the full cost of carbon associated with transportation fuels from the time those emissions come under the emission cap starting in 2015. The inclusion of transportation fuels in the cap could increase the consumer cost of these products by nearly $0.20 per gallon (at $20 per ton CO_2E). The Regulations should direct the bulk of the allowance value attributable to transportation consumer emissions towards easing the cost burden on those consumers. Compensation of transportation consumers could take the form of direct rebates, offsets of existing taxes, incentives to promote the safe and efficient use of transportation fuel, or infrastructure improvements to increase transportation system efficiency. Transportation consumer compensation should be proportionate to compensation received by other energy consumer groups (e.g. electricity consumers). (CONOCO)

Comment: Proceeds from the sale of allowances should be available to such entities as transit districts and local governments, which can implement on-the-ground measures and operations that have significant GHG emission reduction benefits. (ASMDICKENSON)

Comment: The City of San Francisco urges the Board to incorporate the following recommendations, both in allocating allowances and in deciding how to use revenues from the sale of allowances by:

1. Recognizing the historically low emissions of the San Francisco Public Utilities Commission electric system and allocating allowances to the electric sector.
2. We're going to need funds to increase transportation infrastructure. (SFMAYOR2)

Comment: The City urges the Board to create a dedicated funding mechanism for public transportation infrastructure and planning, and to channel increased funding to cities that have demonstrated leadership on GHG reductions and could expand these efforts to mutually benefit both cities' and the State's climate action strategies. The proposed Cap and Trade system has the potential to increase the cost of fuel at the as fuel producers offset the cost of emission allowances by increasing the cost of fuel. We therefore recommend that ARB include explicit language in the Air Pollution Control Fund to decrease the impacts of rising fuel costs on public transportation providers and dedicate Cap and Trade allowances to a transportation investment program. The program would invest in transportation infrastructure, planning resources to develop and implement regional and local land use and transportation plans focused on implementing the GHG reduction goals in AB 32 and the planning mandates of SB 375, transportation demand management programs. Current State transportation funding programs that come from the sales tax on gasoline should be set up to dedicate any increases from this program to transportation infrastructure investments that limit GHGs. Also, transit service providers should be expected and allowed to increase energy consumption. ARB should also give low GHG-emitting public transit agencies credit for the services they provide, such that agencies which have already made proactive investments to reduce emissions do not find themselves unnecessarily burdened by the rising energy costs of the proposed Cap and Trade program. We further recommend that ARB create a forum for further input from and discussion with transit agencies and transportation planners around the State to mitigate expected impacts, and devote funds to job training and disadvantaged communities. ARB's consideration for utilizing a Low-Carbon Investment Fund for workforce development can be further strengthened by adopting a "green pathways out of poverty" strategy. Acknowledging the communities that have historically carried the brunt of environmental injustices in our State by supporting their growth in the burgeoning green economy would strengthen the impact of a Cap and Trade plan, and could add to the universal support of such a plan. Finally, "Job Training" and "Disadvantaged Communities" are listed as two separate opportunities for public investment of the Cap and Trade allowances, yet there is a clear opportunity and need for these types of investments to be strategically coordinated. While many higher learning institutions offer access to jobs in the green workforce, there is still a disproportionate number of young adults from undeserved or disadvantaged communities who do not have access to these resources; preventing access to quality green jobs. The Cap and Trade allowance investment could act as a social-economic equalizer in the aspect by ensuring high level training. (SFMAYOR1)

Comment: We would like to stress the opportunity that the cap and trade regulation presents to create a sustainable source of substantial funding for GHG reduction technologies, specifically in the transportation sector. We support CARB's proposal to require 100 percent auctioning of allowances in the transportation fuels sector once implemented in Phase II and III. However, we urge CARB to ensure that the substantial revenue stream created by this process is invested back into the transportation sector and is utilized for GHG reduction measures. These measures could include funding for local governments to implement SB 375 and vehicle miles traveled reduction strategies, incentive funding for emerging clean vehicle technology, subsidies for alternative fuel infrastructure, and many others. While EIN recognizes that the California Legislature is ultimately responsible for the allocation of funds, CARB should include stronger language and guidelines in the cap and trade regulation for the use of allowance auction revenue. (EIN)

> **Response:** We agree with many of the points raised in the above comments. We address these topics in the Staff Report and 15-day changes to the regulation. As stated in Resolution 10-42, the board directed the Executive Officer to deposit a minimum of 10 percent of annual proceeds generated from the direct auction of allowances in the Air Pollution Control fund for appropriation by the Legislature to programs and projects that reduce GHG emissions or mitigate direct health impacts of climate change.
>
> We agree with the potential uses of allowance value recommended by the Economic and Allocation Advisory Committee, including financing economic opportunities and environmental improvements in disadvantaged communities. In Chapter II of the Staff Report, we recommend the creation of a Community Benefit Fund as one of several uses for the proceeds in the Air Pollution Control Fund. A Community Benefit Fund could be used to promote projects that create improvements to mass transit and land use planning. As noted in the comments, we also describe a Low Carbon Investment Fund which could promote projects that support a green technology workforce training program. We will initiate a public process to develop recommendations on the uses of allocation proceeds. We anticipate that through the public process, the recommended uses for allocation proceeds in the Staff Report will be further developed.
>
> We will also annually evaluate the effects of the regulation on small businesses and low-income households; as well as the treatment of transportation fuels in the cap-and-trade program, including the effects of allowance distribution to different sectors within the transportation sector, and commitment to propose any necessary changes to the regulation before the start of the second compliance period in 2015.

Natural Community Conservation Plans (NCCP)

R-19. Comment: We ask that ARB incorporate in the regulation specific language identifying ecosystem adaptation, including Natural Community Conservation Plans (NCCP), as a recommended use for allowance value. NCCPs are prepared under State law by local jurisdictions and special districts, in partnership with stakeholders and State and federal wildlife agencies. Use of some of Cap and Trade program allowance value will be leveraged greatly by developer funds and public conservation funds. (CAHCPCOALITION)

> **Response:** We encourage the commenter to participate in the public process to develop recommendations on the use of allowance revenue.

Agriculture

R-20. (multiple comments)
Comment: We strongly oppose staff's proposal to return the value on a per capita basis because it does not adequately compensate the increased energy costs to consumers. The agriculture industry will incur substantial increases in energy costs due to the program, but the rebate will be very minimal based on the amount of use. If any rebate does occur under the program for the costs of the program, the rebate should be comparable to the costs incurred. (AGCOALITION)

Comment: Include in the final cap and trade regulation CARE's recommendations to the legislature on how allowance revenue can help meet the State's climate change goals, including allocating a portion of allowance revenue to support climate change mitigation and adaptation activities in agriculture. (CACAN1, CACAN2)

Comment: Should allowances be auctioned, Ag Council requests that some of that relief be provided to food and agriculture. These funds could help offset costs incurred by rate increases and investments at the plant, but potentially be invested in research and development in existing and future technologies. (ACC3)

Comment: CARB should include language specifying that agricultural and food processing sectors should be considered as rate-payers and some of those funds should be directed back toward the industry accordingly. (ACC3)

Comment: We cannot rely entirely on future carbon markets to achieve GHG emission reductions in agriculture. The marketplace lacks adequate funding for research to understand opportunities within farming systems to achieve GHG emission reductions. Translating research findings into real opportunities for California agriculture to provide voluntary GHG reductions requires technical assistance. In some cases, when transition costs may be high, financial incentives for farmers and ranchers are essential. Allowance revenue can turn research into opportunities for agricultural activities to help meet the State's GHG emissions targets and help farmers and ranchers adapt to climate change. (CACAN1, CACAN2)

> **Response:** In Chapter II of the Staff Report, we recommend that a portion of total allowance value be directed toward public investments in the energy innovation goals of AB 32. This use of auction proceeds could be structured as a competitive grant program administered by ARB or another entity. Project types could include research, development, and demonstration projects in zero- or low-GHG technologies for agricultural activities.

Direct Allocations of California GHG Allowances

R-21. Comment: CARB should consider whether revenues from an auction could be used to replace a fee system. (LADWP1)

> **Response:** It is not clear what fee system the commenter is referring to. However, if the commenter is referring to the AB 32 Cost of Implementation Fee Regulation (Fee Regulation), we do not agree that the Fee Regulation should be replaced by the cap-and-trade regulation. The appropriation of auction proceeds and fees collected through the Fee Regulation are approved by the Governor and Legislature.

R-22. (multiple comments)
Comment: We ask CARB to include explicit language in the regulation identifying recommended uses for allowance value. The Economic Allocation Advisory Committee (EAAC) outlines a number of critical investments that should be acknowledged, including ecosystem adaptation and land use and transportation, which would be consistent with the broader goals of AB 32. It is critical to dedicate funding to help our natural systems adapt to climate change. Investment of allowance value for this purpose will protect the vital carbon sequestration and climate regulation functions of our natural lands and the critical role they can play in buffering our communities from the worst impacts of climate change. Allowance value investments and compensation should be dedicated to all natural systems in California for mitigation and adaptation purposes, including its forests, grasslands, working landscapes, coastal areas, watersheds, and deserts to protect and promote their vitality and diversity and the many benefits that they provide to Californians and the economy. These benefits include carbon sequestration and climate regulation, clean drinking water, provision of food and jobs, air quality protection, flood control, wildlife habitat, crop pollination, recreation and timber, among other things. The public cannot afford to lose these benefits, and the State has an opportunity to ensure their long term persistence by dedicating a significant portion of allowance value to these resources. It is also critical for CARB to recommend investment of allowance value in land use and transportation strategies that reduce GHG emissions from transportation and infrastructure sources while also protecting the carbon mitigation function of California's natural systems. By integrating conservation and climate change goals into land use and infrastructure planning, the state can optimize GHG reductions across sectors and preserve our natural systems

which are the foundation of a healthy and prosperous California. Much of the authority to make these changes rests with local governments, but severe funding shortages present considerable barriers to implementing the necessary actions. The EAAC report recognizes the need to fund local governments and regional agencies for land use and transportation related reductions that promote sustainable communities and we urge CARB to acknowledge this in the regulation as well. While we recognize that CARB may not have full authority to determine the ultimate use of allowance value, we think it is critical to acknowledge in the regulation how it should be invested. The EAAC report provides a strong basis for identifying the kinds of investments that the State should make, including ecosystem based adaptation and mitigation and land use and transportation, to help fulfill its climate policy goals. We urge CARB to include these recommendations in its regulations. (NC5)

Comment: A significant portion of allowance revenue should be used to fund research, and development, and commercialization of biofuels and bio-based products that demonstrate a GHG reduction compared to the current alternative. (ERICKSON)

Comment: CLFP opposes using auction revenue to fund any of programs that do not directly relate to reducing long-term greenhouse gas emissions. Auction revenue should be dedicated first to transition assistance to reduce or prevent losses due to leakage related to higher prices and lower profits or to offset costs resulting from modification or retrofit of existing operations or the purchase of new equipment to reduce onsite GHG emissions necessary in meeting compliance goals. (CALFP1)

Comment: We recommend returning a significant portion of the allowance value to the people of California. Although we expect the State to help finance investments designed to achieve low-cost emissions reductions, help adapt to climate impacts, help disadvantaged communities, and provide job training to acquire the skill sets needed for the new technologies and industries, the State should have flexibility in using the auction revenue. (UCS3)

Comment: We understand ARB may not have the authority to direct potential cap and trade revenues in the proposed regulation. However, we strongly support the EAAC recommendation to devote a significant share of allowance value toward financing of public and private investments. The investments to consider include those oriented toward achieving low-cost emissions reductions (both directly and through investments in cleantech research and development), adaptation to climate impacts, environmental remediation, improvements to disadvantaged communities, and job training. (CARELEAF)

Comment: Allowances should be auctioned, with the money used for clean energy, green jobs, public transit, and low-income consumers. (STEWARTJ)

Comment: Money should be used for clean energy, green jobs, public transit, and low-income consumers. (FORMLETTER10)

Comment: The use of GHG allowances can play an important role in meeting California's ambitious 2020 GHG goals and set us on the path to meet ambitious long-term 2050 GHG goals. Industrial sector allowances could support further action to meet AB 32's GHG reduction goals and associated environmental and economic benefits. For instance, the Economic and Technology Advancement Advisory Committee (ETAAC) Advanced Technology Development sub-group report recommended options for using the value of GHG allowances to help end-users and producers transition California to a cleaner and more efficient economy. These options can help both small businesses as well as large GHG intensive producers. (ICCT1)

Comment: Auction revenues from all sectors should be used for comparable purposes. (CCC, MAZOWITA)

Comment: The proposed approach for using auction proceeds should be better defined. (SOLARTURBINES1)

Comment: We ask the CARB to include explicit language in the regulation identifying recommended uses for allowance value. Allowance value investments and compensation should be dedicated to all natural systems in California for both mitigation and adaptation purposes, including its forests, grasslands, working landscapes, coastal areas, watersheds, and deserts to protect and promote their vitality and diversity and the many benefits that they provide to Californians and the economy. It is also critical for CARB to recommend investment of allowance value in land use and transportation strategies that reduce GHG emissions from transportation and infrastructure sources while also protecting the carbon mitigation function of California's natural systems. (NC3)

> **Response:** As stated in Resolution 10-42, the Board directed the Executive Officer to deposit a minimum of 10 percent of annual proceeds generated from the direct auction of allowances in the Air Pollution Control fund for appropriation by the Legislature to programs and projects that reduce GHG emissions or mitigate direct health impacts of climate change. We agree with the potential uses of allowance value recommended by the Economic and Allocation Advisory Committee, including financing economic opportunities and environmental improvements in disadvantaged communities. In Chapter II and Appendix J of the Staff Report, we discuss several uses for Air Pollution Control Fund proceeds, including the creation of a Community Benefit Fund. Such a fund could be used to promote projects that simultaneously reduce GHGs and co-pollutants, finance adaptation/preparedness for climate change health impacts, create improvements to mass transit and land use planning, facilitate natural resource conservation, and support non-utility energy-efficiency programs. Additionally, we also discussed a Low Carbon Investment Fund to promote projects that support a green technology workforce training program. We will initiate a public process to develop recommendations on the uses of allocation proceeds. We anticipate that the uses for allocation revenue in the Staff Report will be further developed.

R-23. Comment: Proceeds from the Advance Auction and all remaining allowances not allocated for uses specified in sections 95870(a)-(e) will be designated for sale at auction. The Proposed Regulation designates funds from the sale of these allowance pools will be deposited into the Air Pollution Control Fund and will be available for appropriation by the Legislature for the purposes designated in California Health and Safety Code sections 38500 et seq. During the rulemaking to consider adoption of proposed AB 32 Cost of Implementation Fee Regulations, staff stated that "As the state's Cap and Trade program becomes more developed funding the administrative costs associated with AB 32 will be considered if appropriate." At the time, ARB disagreed that the regulation itself should clarify that the fee proposed therein would only be an interim funding measure as it was premature to assume that funding would come from a cap and trade program, or any another source. We recommend that ARB recognize this mode of funding administrative costs. Modify sections 95870(b)(2) and (f) as follows:

(2) The proceeds from the sale of these allowances will be deposited into the Air Pollution Control Fund and will be available for appropriation by the Legislature for ~~the~~ <u>funding the cost of implementation of AB 32 and other</u> purposes designated in California Health and Safety Code sections 38500 et seq.

(f) Auction Proceeds for AB 32 Statutory Objectives. All remaining allowances not allocated for uses specified in sections 95870(a)-(e) will be designated for sale at auction. The proceeds from the sale of these allowances will be deposited into the Air Pollution Control Fund and will be available for appropriation by the Legislature for ~~the~~ <u>funding the cost of implementation of AB 32 and other</u> purposes designated in California Health and Safety Code sections 38500 et seq. (SEMPRA1)

> **Response:** We do not agree with the commenter's recommendation. The AB 32 Cost of Implementation Fee Regulation is authorized and appropriated by the Governor and Legislature to (1) pay for the cost of the State's AB 32 program as appropriated annually by the Legislature, and (2) repay loans that were used to fund the AB 32 program during the first few years of implementation.

Use of Consignment Auction Proceeds

R-24. (multiple comments)
Comment: We support the requirement that all utility sector auction revenues be used for the benefit of ratepayers and to meet the goals of AB 32. If this benefit takes the form of rebates, the rebates should be limited to residential ratepayers and include all residential electricity customers within the utility's distribution service territory. If the benefit takes the form of clean energy investments, these investments should be made in accordance with the goals laid out in AB 32. We are concerned that the language in the draft regulations requiring that auction revenues simply be spent for the benefit of ratepayers "consistent with the goals of AB 32," affords utilities insufficient direction and puts allowance value at risk of predominately subsidizing business as usual (aka

investments that are already required under existing law). While we appreciate the oversight that the CPUC and local governing boards of the POUs can provide, we encourage CARB to provide additional guidance in the regulations to give utilities a better sense of where they should direct allowance value, and to ensure uniformity of purpose among the state's many utilities. We ask CARB to give clear guidance to the utilities, as well as the CPUC and local governing boards, that any allowance values not rebated to customers but spent on clean energy programs, should be limited to the following uses, described in more detail below. Utilities that use allowance values for clean energy investments should be required to first invest in cost-effective energy efficiency. California's loading order establishes all cost-effective energy efficiency as our first priority procurement resource. Under AB 32, cost-effectiveness is defined relative to the cost of achieving the emission reductions necessary to meet AB 32's goal of returning to 1990 emissions level by 2020. As long as energy efficiency can provide emission reductions at lower cost than other emission reduction strategies, it should be considered cost-effective. Significant energy efficiency potential remains in utility service territories that may not be cost-effective under a utility procurement framework, but is cost-effective under AB 32's framework; i.e., compared to other available emission reduction strategies that must be utilized to achieve our 2020 goal. To comply with AB 32's directive to achieve emission reductions at least cost, and to provide additional bill relief to utility customers, CARB should require utilities that receive allowance value to capture additional energy efficiency savings. (UCS1, WALTERS, LUDLOW, KUSTIN10, EBERHARD)

Comment: CARB has proposed a combination of free allowance giveaways and (secondary) auctions. The allowances are given for free to utilities that deliver electricity. Investor-owned utilities would sell the allowances to the generators when they buy electricity from them. Publicly-owned utilities that produce their own generation would need the allowances themselves. After the allowances are "monetized," the utilities are to use the billions of dollars in allowance value "to reduce the costs of AB 32 policies on their ratepayers," for "ratepayer benefit" (section 95892) and "for protection of electricity customers and for other AB 32 purposes." In the final regulation, CARB must provide a more specific definition of "ratepayer benefit" to utilities. (CPC1)

Comment: To strengthen our confidence that the consignment auction will support AB 32 goals, the uses of allowance value should be made more explicit, as should the within-sector allocation. (EDF1)

> **Response:** We modified section 95892 of the regulation to include conditions and reporting requirements that limit the use of auction revenue (utilities' monetized allowance value). CPUC currently regulates the use of ratepayer funds and utility shareholder funds for energy efficiency and renewable energy. Furthermore, although the rate structure is complex, we believe electricity consumers need to see a price signal that the cost of GHG emissions creates in the price of electricity. CPUC remains committed to ensure that allowance value is used for the purposes listed in these comments. As directed by the Board in

Resolution 10-42, we will continue to work with the CPUC and POUs to help monitor and provide input on this topic.

R-25. Comment: Section 95892(d)(3) limits the use of auction proceeds obtained by an electrical distribution utility to those purposes that benefit retail ratepayers. This is vague and unenforceable. What is an example of a use of auction proceeds that could not be characterized as ultimately "for the benefit of retail ratepayers"? Also, what are the consequences if auction proceeds are used inappropriately? (CAPCOA1, CAPCOA2)

> **Response:** Section 95892 details the requirements for the use of auction proceeds. Publicly owned utilities are subject to the oversight of their governing board and IOUs are subject to the oversight of the CPUC. Both utilities must also meet the requirements listed in sections 95892(d) and (e). The oversight of the respective governing boards and the requirements in the regulation will provide flexibility for utilities to best meet the needs of their individual ratepayers. To ensure that utilities are using auction proceeds appropriately, they will be required to submit annual reports to ARB no later than June 30, 2013, and each subsequent year.

R-26. Comment: NCPA is supportive of the key principles on which the preliminary consensus recommendation is based, covering the distribution utilities cost burden, recognition of early investments in renewable energy and cumulative energy efficiency. We support this recommendation as long as there are still 97.7 MMT minimum allocation to the utilities, that the allowances are freely allocated to the utilities, and that the value is given to the utilities to be used for the benefit of their rate payers for AB 32 related programs. (NCPA2)

> **Response:** We agree and kept the value of 97.7 million metric tons (MMT) in calculating the allowance allocation to the electrical distribution utilities.

R-27. Comment: We support the proposal to allocate allowances to utilities for the benefit of our customers. We are generally supportive of the approach using the cost burden approach found in Attachment E. We are concerned about the language in the regulation that is only applicable to IOUs and restricts the way in which we can return auction revenue to our customers. This could lead to large discrepancies in how GHG costs are returned to IOU versus POU customers. We recommend that ARB offer IOUs the ability to work with the PUC on how to best return this allowance value for our customer's benefit. (PGE1, PGE2)

> **Response:** We believe that the regulation provides an appropriate approach to allow the return of auction value to ratepayers. The regulation allows flexibility for utilities to choose the method of revenue disbursement. We believe that IOUs have the ability to work with the CPUC to determine the best way to distribute the funds to their respective ratepayers under the current regulatory language.

R-28. Comment: LADWP supports the administrative allocation of allowances to the electric sector and appreciates that ARB recognizes that electricity distribution utilities are best situated to utilize allowance value for their ratepayers, and recognizes the considerable investment required to reduce emissions within the sector. LADWP supports the policy to allocate allowances to distribution utilities to 1) support policies and programs that are reducing GHG emissions from the electricity sector, and 2) ensure that electricity ratepayers do not experience sudden increases in their electricity bills associated with the pricing of carbon emissions in the Cap and trade program. (LADWP1)

> **Response:** Thank you for your support.

Renewable Electricity

R-29. Comment: If utilities are allowed to use allowance value to invest in renewable energy resources, CARB should establish general principles for such investments in accordance with the goals laid out in AB 32. New renewable projects that provide health and job benefits to Californians should be prioritized. For instance, local distributed generation, which typically does not require new transmission capacity and may provide jobs closer to load centers, should be prioritized. All investments using allowance value to procure renewable energy should be limited to projects that service the customers covered by the cap and trade program, in order to maximize the environmental and health co-benefits for those customers. Renewable energy investments using allowance value should not count towards any cost cap that is established to limit the costs of achieving renewable energy procurement requirements that exist in law. (KUSTIN10, UCS1, LUDLOW, WALTERS, EBERHARD)

> **Response:** The CPUC and POUs will determine the best way to meet the goals of AB 32 for their ratepayers. The regulation provides flexibility to include recognition of investments in renewable energy as one of options they can pursue. The regulation requires that allowance value be used to benefit the ratepayers and requires utilities to submit annual reports to show how the auction revenue is being used. This will help to ensure that auction revenue is spent for the ratepayer benefit. We are working closely with CPUC staff in this regard and are following the CPUC proceeding (11-03-012), which will address the use of auction revenue.

Energy Efficiency

R-30. (multiple comments)
Comment: Utilities should be required to first use allowance value to invest in cost-effective energy efficiency. California's loading order establishes all cost-effective energy efficiency as utilities' first priority procurement resource. In that context, cost-effective is defined as a ratio of the total system-wide benefits from saving energy through efficiency measures relative to the total system-wide costs of achieving the savings (the Public Utilities Commission employs the Total Resource Cost (TRC) test to

make this calculation). As long as the benefits exceed the costs (TRC >1), an efficiency program is deemed cost-effective. However, under AB 32, cost-effective is defined relative to the cost of achieving the emission reductions necessary to meet AB 32's goal of returning to 1990 emissions level by 2020. As long as energy efficiency can provide emission reductions at lower cost than other emission reduction strategies, it should be considered cost-effective. Significant energy efficiency potential remains in utility service territories that may not be considered by the PUC to be cost-effective under a utility procurement framework, but is cost-effective when compared with other abatement measures available to meet the goals of AB 32. To comply with the AB 32 directive to achieve emission reductions at least cost, and to provide additional bill relief to utility customers, CARB should require utilities that receive allowance value to capture additional energy efficiency savings. (KUSTIN10, EBERHARD)

Comment: We urge you to approve California's landmark greenhouse gas cap and trade program and tighten the regulation language to ensure that auction revenue in the electricity sector is used for cost-effective energy efficiency programs that will reduce emissions while also reducing Californians' energy bills. (FORMLETTER04)

Comment: Promote investment in cost-effective energy efficiency by requiring Utilities that use allowance values for clean energy investments to first invest in cost-effective energy efficiency. (VARON)

Comment: The regulation states that money from the auction and electricity sector should be used for the benefit of customers, but it doesn't take the next step and say to help customers reduce their bills by investing in cost effective energy efficiency to help businesses reduce their electricity bills. We want to make sure that that is clear as the PUC is moving forward. Also in the allocation, we want to make sure that we're going beyond existing energy efficiency and getting even more. (NRDC2, CAEEIC)

Comment: It's very important for oversight to be established by either the PUC or ARB to make sure that funds generated are spent on appropriate GHG reducing measures, such as efficiency. Given the free allowance allocation, we think that investment in mitigation is critical, not in windfalls to any participants. (CAEEIC)

Comment: Provide clearer guidance to utilities on the use of allowance value in the electricity sector. We believe that the value of allowances should be used for cost effective energy efficiency programs that help Californians lower their energy bills. (ENVENTREP1, ENVENTREP2)

Comment: We are in favor of use of trading proceeds to fund important energy efficiency and renewable energy programs. (CPC2)

> **Response:** We modified the regulation to address concerns about the use of auction proceeds in section 95892. Utilities are required to provide annual reports to ARB for review. This will allow ARB to enforce the regulation and make sure that auction revenue is spent according to the requirements in section

95892. Oversight of the CPUC and respective governing boards and the requirements in the regulation will provide flexibility for utilities to best meet the needs of their individual ratepayers, including investments in renewable energy.

R-31. Comment: Section 95892(a)(3) states that auction proceeds by an electrical distribution utility shall only be used for the exclusive benefit of retail ratepayers. Hydrogen Energy recommends that the concept of "ratepayer benefit" include assistance in the purchase of advanced near-zero carbon electricity, such as that produced at a power plant employing CCS. Though California is a leader and the first state to adopt an economy-wide carbon reduction program, others are sure to follow its lead in putting a price on carbon. This change in the basic economic structure of electrical generation creates a financial liability to those utilities that continue to purchase higher-carbon electricity. Therefore, purchasing near-zero carbon electricity has a direct benefit to a utility's ratepayers and should be eligible under the provisions of section 95892(a)(3) and the Board should require that a portion of these revenues be dedicated to offset ratepayer costs associated with CCS power purchases. Hydrogen Energy recommends that specific language be placed in either the Regulation or adopting Resolution allowing acquiring utilities to use a portion of their consigned auction revenues to reduce the costs associated with near-zero electrical generation. This policy element will provide for revenues to promote cleaner, more advanced technology in this major emissions sector without the need to alter the distribution of allowances as outlined in the Regulation. This guidance will also provide the CPUC or POUs' Governing Boards the ability to approve such actions. (HECA)

Response: The regulation requires that auction revenues be used for the ratepayer benefit. If a technology can be shown to be cost effective at reducing GHG emissions, then it may be feasible for utilities to use it. It may have a relative value for some ratepayers, but may be more costly for others as an emerging technology. As a result, it will be important that utilities work with the CPUC and local governing boards to determine what is best for their ratepayers.

R-32. Comment: Both in allocating allowances and in deciding how to use revenues from the sale of allowances, the City urges the Board to channel increased funding to cities that have demonstrated leadership on greenhouse gas reductions and could thereby further expand their efforts to mutually benefit both local and State climate action strategies. This should be done by recognizing the historically low emissions of the San Francisco Public Utilities Commission electric system and allocating allowances to the electric sector. (SFMAYOR2)

Response: The regulation explains the consensus allocation scheme for electricity providers in section 95892. Table 9-3 shows the allowance allocation for San Francisco. Allocated allowances must be consigned to auction, and the proceeds used to benefit ratepayers.

R-33. Comment: To strengthen our confidence that the consignment auction will support AB 32 goals, the uses of allowance value should be made more explicit, as should the within-sector allocation. (EDF1)

> **Response:** This information can be found in Table 9-3 in section 95892 of the regulation.

R-34. Comment: The immediate deployment of existing clean energy technologies such as renewable energy and energy efficiency will reduce greenhouse gas emissions and help mitigate consumer impacts. In this regard, the Council supports the proposed structure in the draft regulations where utilities that are provided allowances must use them for customer benefit consistent with the goals of AB 32. BCSE supports flexibility for utilities as they make decisions about how best to balance the substantial investments needed to meet the renewables and energy efficiency goals while participating in a Cap and trade program. (BCFSE)

> **Response:** Thank you for your support.

Miscellaneous

R-35. Comment: POUs are governed by their locally electric or appointed bodies. The required reports would be appropriately prepared and submitted to these local governing bodies for approval. The Utilities suggest that, once approved, each POU covered entity would then submit a copy of the approved report to CARB. The Utilities understand that CARB did not intend for these reports to be used for enforcement actions, thus the Utilities offer the following additions to ease in this clarification. Modify section 95892(e) as follows:

> *(e)* Reporting on the Use of Auction Proceeds. Following approval pursuant to 95892(d)(1) or 95892(d)(2), and ~~N~~no later than June 30, 2013, and each calendar year thereafter, each electrical distribution utility shall submit a report to the Executive Officer describing the disposition of any auction proceeds received in the prior calendar year. The Executive Officer shall use these reports for informational purposes only. This report shall include:
>
> > (1) The monetary value of auction proceeds received by the electrical distribution utility.
> >
> > (2) How the electrical distribution utility's disposition of such auction proceeds complies with the requirements of this section and the requirements of California Health & Safety Code sections 38500 et seq. (MID1)

> **Response:** We do not believe the proposed addition to the regulation is appropriate. The term "informational purposes" is overly vague. After reviewing

reports from electrical distribution utilities, ARB may wish to modify the regulation to change the allowance allocation approach.

Carbon pricing is an important function of the cap-and-trade regulation in that it promotes energy efficiency, conservation, and the instillation of greenhouse gas efficient technologies such as combined heat and power. It is critical that the allowance value given to electrical distribution utilities not be used to prevent the development of an appropriate carbon price in electric rates.

Due to these concerns, ARB retains the right to revoke free allocation if the use of allowance value by any electrical distribution utility is inconsistent with the goals of AB 32. We will use the reports from the electrical distribution utilities to inform these decisions in future rulemakings.

R-36. (multiple comments)
Comment: Section 95892 of the proposed regulation addresses how the auction revenue from directly allocated allowances may be used by IOUs. WPTF urges ARB to provide specific regulations that specifically preclude IOUs from being able to use the auction revenues for direct capital investment in energy technologies and infrastructure, including renewable resources, or in service offerings such as energy efficiency or demand response, that are also provided by competitive merchant generators and other competitive market participants. Allowing the use of auction revenue for these purposes would erode competitive markets by subsidizing utility-owned generation, transmission, and energy management programs at the expense of independent generators, transmission developers, and competitive providers of energy management services. WPTF recommends that a provision be added to the regulation to prohibit the use by IOUs of auction revenue for direct capital investments in emission reduction technologies, and instead should be used only for direct consumer rate relief that is available to all rate-payers. (WPTF)

Comment: The proposed regulation prescribes that the proceeds obtained from the monetization of allowances directly to POUs and IOUs shall be subject to limitations imposed by their Governing Bodies or the CPUC, as appropriate, and the "additional limitations set forth in section 95892(d)(3)." Section 95892(d)(3) further prescribes that auction proceeds obtained by an electrical distribution company shall "be used exclusively for the benefit of retail ratepayers consistent with the goals of AB 32, and may not be used for the benefit of entities or persons other than such ratepayers." While recognizing CARB's interest in ensuring that the allowance allocation policy and use of revenues is not used in a discriminatory manner or to competitive advantage, IEP remains concerned that the language in section 95892(d) fails to ensure that these objectives are achieved. The allowance could be used, either directly or indirectly, on behalf of "ratepayers" to achieve the purposes of AB 32 while still providing value to the utilities in the competition to develop and operate generation assets to serve California consumers. For example, if a utility proposed to build a utility-owned CHP, renewable, or pumped storage facility, undoubtedly it would be justified as needed to achieve the purposes of AB 32 and, by definition, it would be to benefit ratepayers or it would not be approved by the appropriate Governing Board (or CPUC). IEP remains concerned that the standard of review by CARB regarding the use of allowance revenue is not sufficient to protect against anti-competitive impacts particularly given the discretion of the various Governing Boards to interpret the standards. Accordingly, IEP recommends additional language to enhance the protections against anti-competitive, discriminatory outcomes in the use of auction revenues. Modify section 95892(d)(3) as follows:

> (3) Auction proceeds obtained by an electrical distribution utility shall be used exclusively for the benefit of retail ratepayers of each electrical distribution utility, consistent with the goals of AB 32, shall avoid discriminatory impacts as between utility-owned and non-utility-owned electrical generation, and shall foster a competitive environment for the development and operation of electric generation. Auction proceeds may not be used for the benefit of entities or persons other than such ratepayers.
> (A) Investor owned utilities shall ensure equal treatment of their own customers and customers of electricity service providers, community choice aggregators, and non-utility owned electric generators. (IEPA)

> **Response:** We believe the proposed addition to the regulation is not necessary. The CPUC must approve all new contracts and will determine how auction funds are spent according to the regulation. The CPUC ensures that all contracts are competitive and fair.

R-37. Comment: Energy utilities will be given allowances with the obligation to auction them. The proceeds from utility auctions will be subject to California Public Utilities Commission direction for the investor owned utilities and local governing boards for public utilities. Less desirable from a local government perspective, there is room under section 95892(d)(3) for the Regulation to be augmented with a paragraph that says "electrical distribution utilities shall (ensure that proceeds from allowance auctions are provided to local governments for programs that reduce greenhouse gas emissions)." Local governments are a key partner in realizing climate change goals, as CARB has recognized throughout its proceedings to implement AB 32. Local governments will be best able to assist CARB if we are provided incentive and opportunity to participate in the program. (LGSEC)

> **Response:** We believe that the existing regulatory language provides flexibility to accommodate this request. Local governments can work with the CPUC and local governing utilities to determine if local government projects meet the requirements of the regulation and, if so, the utilities could fund those projects if they meet the goals of AB 32.

Consumer Rebate Check

R-38. Comment: We support the proposed language on using allowance value to provide rebates to customers as long as the rebate is not on a per kWh basis (so as not to provide perverse incentive for increased usage). We encourage CARB to go one step further and specifically require the utilities to consider providing rebates, subject to the same restrictions currently in the regulations, to low-income customers. (KUSTIN10, EBERHARD)

> **Response:** Utility providers have the option to provide rebates to ratepayers. Rebates to ratepayers could be structured to provide the greatest amount of relief to low-income customers. As stated in Resolution 10-42, the Board agreed with the recommendations of the Economic and Allocation Advisory Committee, including financing economic opportunities and environmental improvements in disadvantaged communities.

R-39. (multiple comments)
Comment: We hope that you provide a stronger recommendation to the PUC on how to provide lump sum per capita dividend checks as the primary way to return revenue back to consumers rather than just through billing. (CPC5)

Comment: I want to emphasize the point about specifically defining ratepayer benefit. Currently the benefit is not defined at all. This should be a rebate check sent to ratepayers separately from their utility bill so that they receive the price signal first and financial adjustment secondarily. (CPC2)

Comment: I am particularly concerned about the electrical power sector. Ratepayers must be protected by returning allowance value directly to residential customers as a rebate check. This follows your expert economic panel's recommendation that "The largest share (roughly 75 percent) of allowance value should be returned to California households in the form of a dividend check. This also incentivizes conservation on the broadest level. (FRIEDENBERG)

Comment: We encourage use of allowance value to incentivize efficient combined heat and power (CHP). The AB 32 Scoping Plan calls for the state to increase CHP energy generation by 30,000 GWh, yet the cap and trade regulation provides no incentives for development or expansion of CHP. In fact, the threat of creating a cap and trade compliance obligation is likely to discourage facilities including wastewater treatment plants from installing or expanding efficient CHP systems. We therefore encourage ARB to direct some portion of allowance value to development of a program that incentivizes CHP. (CAWWCCG1, EMWD, BACWAAC))

> **Response:** The CPUC will determine the most cost-effective way to return auction revenue back to IOU ratepayers. The governing boards will make these decisions for the POUs. We do not support refunds based solely on the use of electricity. We agree that this type of "volumetric" rebate would distort the carbon price signal and fail to properly promote conservation of electricity, efficient combined heat and power, and distributed generation.

R-40. Comment: We are disappointed with the proposal to launch the Cap and Trade program by offering extensive allowances for free to the electricity sector. Auction revenue is necessary to create a stream of revenue to support vulnerable communities and to allow low income Californians to fully participate in the clean energy opportunities being created. Specifically, funding is needed to help low income households avoid increased energy costs, by improving home weatherization, energy efficiency programs, and bill pay assistance as needed. In addition, revenue is needed to direct clean energy opportunities, including job training, to communities disproportionately burdened by power plant pollution. (CIPAL)

> **Response:** Allowances are allocated to utilities on behalf of ratepayers, and the allowance value must be used on behalf of ratepayers. As stated in Resolution 10-42, the Board directed the Executive Officer to deposit a minimum of 10 percent of annual proceeds generated from the direct auction of allowances in the Air Pollution Control fund for appropriation by the Legislature to programs and projects that reduce GHG emissions or mitigate direct health impacts of climate change. We agree with the potential uses of allowance value recommended by the Economic and Allocation Advisory Committee, including financing economic opportunities and environmental improvements in disadvantaged communities. In Chapter II and Appendix J of the Staff Report, we recommend several uses for Air Pollution Control Fund proceeds, including the creation of a Community Benefit Fund. Such a fund could be used to promote projects that simultaneously reduce GHGs and co-pollutants, finance adaptation/preparedness for climate change health impacts, create improvements to mass transit and land use planning, facilitate natural resource conservation, and support non-utility energy-efficiency programs. Additionally, we also discussed a Low Carbon Investment Fund to promote projects that support a green technology workforce training program. We will initiate a public process to develop recommendations on the uses of allocation proceeds. We anticipate that the uses for allocation revenue in the Staff Report will be further developed.

Reporting Use of Allowances

R-41. (multiple comments)
Comment: We encourage CARB to require that each utility report to its regulator, CARB and in the case of POUs, the CEC, in a transparent, timely, and uniform fashion. POU reporting should be coordinated with current reporting on energy efficiency achievements and targets, as required by SB 1037 and AB 2021. Reports should indicate how the value from allowances under this program have brought additional energy efficiency and renewable energy investments. As part of the adaptive management plan, CARB, CEC, and PUC should hold a joint hearing every year to analyze these reports and consider the need for further regulatory oversight of allowance value distribution. The reporting requirements should be modeled after the federal ARRA reporting requirements, which allow regulators and individuals to track all expenditures on-line at www.Recovery.gov. Using the ARRA reporting software would

save money and avoid recreating the wheel. Setting a uniform reporting requirement for all utilities would allow CARB and the public to see how the allowance value is being spent and help build public trust in the program. Modify section 95892(e) as follows: Modify section 95892(e) as follows:

> (e) Reporting on the Use of Auction Proceeds. No later than June 30, 2013, and each calendar year thereafter, each electrical distribution utility shall submit a report to the Executive Officer, <u>and the appropriate designee at the CEC and PUC,</u> describing the disposition of any auction proceeds received in the prior calendar year. <u>In July of each year, ARB, CEC, and PUC shall hold a joint hearing to consider further action regulating the use of these proceeds based on the information included in these reports.</u> This report shall include:
>
> > (1) The monetary value of <u>allowance value</u> ~~auction proceeds~~ received by the electrical distribution utility <u>and how these resources compare to other resources used for clean energy investment as required by California law.</u>
> >
> > (2) How the electrical distribution utility's disposition of such auction proceeds complies with the requirements of this section and the requirements of California Health & Safety Code sections 38500 et seq.
> > (KUSTIN10, NRDC1, EBERHARD)

Comment: Require allowance value allocated to utilities to benefit ratepayers, meet the objectives of AB 32, and facilitate emission reductions above and beyond business as usual (BAU). (UCS2, CADMANS)

Comment: We support the requirement that all utility sector auction revenues be used for the benefit of ratepayers and to meet the goals of AB 32. If this benefit takes the form of rebates, the rebates should be limited to residential ratepayers and include all residential electricity customers within the utility's distribution service territory. If the benefit takes the form of clean energy investments, these investments should be made in accordance with the goals laid out in AB 32. (AB 32 identifies many goals, including "not disproportionately impact low-income communities," complement "air quality standards and reduce toxic air contaminant emissions," and consider "overall societal benefits, including reductions in other air pollutants, diversification of energy sources, and other benefits to the economy, environment, and public health." Health & Safety Code section 38562(b)). We are concerned that the language in the draft regulations requiring that auction revenues simply be spent for the benefit of ratepayers "consistent with the goals of AB 32," affords utilities insufficient direction and puts allowance value at risk of predominately subsidizing business as usual (aka investments that are already required under existing law). (UCS1, WALTERS, LUDLOW)

Comment: One element which we believe requires greater detail is the use of allowance value directed to electric distribution utilities. While we appreciate the language proposed for 15-day modification today, we need every assurance that every utility will invest the full value of allowances it receives for free on AB 32 related purposes, including energy efficiency, renewable energy, and rebates to low-income customers. CARB should also provide specific and uniform reporting requirements and guarantee oversight for all utilities receiving these free allowances. (CEERT)

Comment: Whether a utility sells into the consignment auction or not, it should be required to account for the full value of the allowances it received, and to report on these expenditures in a timely and transparent manner to its oversight body as well as to CARB. The full value of the allowances received, and thus the full amount to be invested in AB 32-related purposes, should be assessed by multiplying the number of allowances received by the auction price in the quarter the utility received them. Thus, if a publicly-owned utility received 15 million allowances but only put 10 million allowances up for sale at auction, the utility should be required to account for the full value of allowances received (15 million) not simply the portion put up for auction (10 million). In formula form, this means:

$ Invested = # Allowances Received * $ Auction Price

Requiring utilities to account for the full value of their allowance allocation will ensure that we are investing in the maximum cost-effective emissions reductions in the electricity sector, and not continuing on a business-as-usual path. Utilities engaged in the joint CPUC/CEC proceeding starting in 2006 and the ongoing CARB proceeding have pointed out the difficulty of being required to “pay twice,” once to acquire allowances, and once to invest in emissions reductions. The rationale for initially giving utilities allowances for free is to ensure that they only have to gather the capital necessary to invest in making the reductions. Requiring utilities to spend the equivalent value of their freely received allowances on cost-effective emissions reductions ensures that they invest in additional, cost-effective reductions. Our rough calculations indicate that the minimum total allowance value in the electricity sector will be approximately $11 billion over the life of the program (2012-2020). This is calculated using an auction price of $10/MMT, escalating at 5 percent plus 2.5 percent CPI per year, multiplied by projected allowances allocated in the electricity sector results in total sectorial allowance value of $10.859 billion. (KUSTIN10, EBERHARD)

Comment: The Air Resources Board and/or the CPUC must establish strong oversight to ensure that funds generated as a result of the regulation are only spent on any appropriate consumer rate relief and GHG-reducing measures such as energy efficiency and the use of renewables. Given the free allowance allocation provisions, it is of particular concern that there is investment in mitigation versus windfalls for any participants. (CEEIC)

Comment: Require every utility to invest the full value of allowances it receives for free in AB 32-related purposes. CARB should require all utilities that receive allowances for free to invest the full value of those allowances on AB 32-related purposes. (KUSTIN10, EBERHARD)

Response: We modified section 95892 of the regulation to include conditions and reporting requirements that limit the use of auction revenue (utilities' monetized allowance value). CPUC currently regulates the use of ratepayer funds and utility shareholder funds for energy efficiency and renewable energy. Furthermore, although the rate structure is complex, we believe electricity consumers need to see a price signal that the cost of GHG emissions creates in the price of electricity. CPUC remains committed to ensure that allowance value is used for the purposes listed in these comments. As directed by the Board in Resolution 10-42, we will continue to work with the CPUC and POUs to help monitor and provide input on this topic.

R-42. (multiple comments)
Comment: We recommend ARB provide clearer guidance to utilities on use of allowance value in the electricity sector. The current regulations simply guide electric utilities to use their auction revenue for the benefit of ratepayers, consistent with the goals of AB 32. We urge CARB to be more explicit and require that utilities first use auction revenue for energy efficiency programs that are cost-effective under AB 32's framework. Modify section 95892(d)(3) as follows:

(3) Auction proceeds obtained by an electrical distribution utility shall be used exclusively for the benefit of retail ratepayers of each electrical distribution utility, consistent with the goals of AB 32, and may not be used for the benefit of entities or persons other than such ratepayers.

<u>A. All electrical distribution utilities shall use allowance value first to invest in energy efficiency programs that are not already required by California law and that achieve cost-effective GHG emissions reductions, according to the requirements of AB 32. The PUC, CEC, and POU Boards shall work together to determine the minimum amount of allowance value that should be spent on energy efficiency and develop a methodology to determine which energy efficiency programs are additional to existing programs and cost-effective under AB 32. If an electrical distribution utility does not use this minimum amount towards such programs, it risks forfeiting receipt of future allowance value.</u>

<u>B. To the extent that an electrical distribution provider uses allowance value to invest in new renewable energy, it shall prioritize projects that achieve environmental and health co-benefits for Californians.</u>

C. Investor owned utilities shall ensure equal treatment of their own customers and customers of electricity service providers and community choice aggregators.

<u>D. All electrical distribution utilities shall consider the impacts of this program on low-income customers and devote allowance value, in accordance with section 95892(d)(3)(E) below, to offset the impacts of this program, if any, on low-income customers.</u>

E. To the extent that an electrical distribution utility uses allowance value ~~auction revenue~~ to provide ratepayer rebates, it shall provide such rebates with regard to the fixed portion of ratepayers' bills or as a separate fixed credit or rebate.

F. To the extent that an electrical distribution utility uses allowance value ~~auction revenue~~ to provide ratepayer rebates, these rebates shall not be based solely on the quantity of electricity delivered to ratepayers from any period after January 1, 2012. (EBERHARD, KUSTIN10, NRDC1)

Comment: CARB should provide greater clarity and direction on the distribution utilities' use of allowance proceeds and direct the use of allowance proceeds to minimize rate impacts to the distribution utilities' customers (section 95892(d)). The proposed regulation does not specify how allowance proceeds should be used by the distribution utilities. Praxair is concerned that without additional direction from CARB, allowance revenues could be used for the utility programs that may not benefit all distribution services customers, particularly those in electricity intensive industries interconnected at transmission voltages or receiving electric commodity in the competitive market. Praxair urges CARB to clarify section 95892 to ensure that allowance revenues are used to mitigate electricity cost impacts, especially in industries that are largely exposed to higher energy costs, such as the energy-intensive industrial gases industry. The proposed regulation (section 95892(d)(3)(A)) provides that "Investor Owned Utilities shall ensure equal treatment of their own customers and customers of electricity service providers and community choice aggregators." This is an important provision, and a similar directive should also apply to the publicly owned utilities' (POU) application of allowance value. The proposed regulation provides little guidance on how CARB would ensure that IOUs will distribute allowance proceeds in a manner that ensures parity between various types of customers. The reporting requirements on the use of allowance proceeds are very simplistic and will not result in meaningful information or guidance concerning a utility's use of allowance proceeds. The reporting requirements would only require that the reporting utility provide the monetary value of the auction proceeds and how the utility's use of the proceeds complies with AB 32 (section 95892(e)). The proposed regulation should also explicitly provide that CARB will coordinate with the CPUC through an open, public workshop process to discuss how the IOUs may use allowance revenue and how the CARB and the CPUC will ensure that the distribution of allowance revenue to customers does not have a discriminatory result. Praxair also suggests that CARB provide similar guidance to the POUs with respect to the application of allowances to benefit their customers. Praxair is concerned that similar facilities located within different service areas, one IOU and one POU, could potentially face different economic impacts in their electricity costs due to different applications of value from the CARB-allocated allowances. While true parity in the compliance burden between the different types of utilities is unlikely, potential differences to customer costs should not be exacerbated from vastly different applications of the allocated allowances. The reporting requirements should be expanded to provide enough information for CARB to fully determine that customers received equal treatment. CARB should include a new subsection (h) under section

95111 of the Amendments to the Mandatory Reporting Regulation. Modify section 95911(h) as follows:

(h) Additional Requirements for Electrical Distribution Utilities Eligible for Receipt of Direct Allocation of California Greenhouse Gas Emission Allowances. Electrical Distribution Utilities, as defined in Title 17 California Code of Regulations, Subchapter 10, Article 5, shall report the amount of allowance revenue received from each quarterly auction, as well as the Electrical Distribution Utility's use or distribution of the revenues as follows:

(1) The aggregate amount of allowance revenue received from each quarterly auction;
(2) The amount of revenue received from selling allowances in a secondary allowance market (i.e., allowance revenue received from sources other than the quarterly auctions);
(3) The amount of allowance revenue the distribution utility distributed in the form of bill relief to retail customers, including the number of customers that received allowance revenue in the form of rebates or other relief, the classification of customers that received rebates or other relief, and the amount of rebates or other relief by each classification of customer received;
(4) A list of programs that the distribution utility funded with allowance revenue, including the amount of allowance revenue applied to each program; and,
(5) The amount of allowance revenue that the utility did not spend or distribute during a reporting year. (PRAXAIR)

Comment: The use of auction revenue is important not only for political and legal reasons, but NextEra believes it is also an important part of ARB reaching their long term GHG reduction goals. Section 95892 of the proposed regulation suggests IOUs use auction revenues to the benefit of ratepayers in a manner consistent with the goals of AB 32. NextEra Energy feels ARB should be more proscriptive. There is an opportunity to use these auction revenues to invest in programs that will provide the framework for a low carbon future. Examples of these potential investments include but are not limited to; building transmission to renewable energy zones; developing new or improved electric generation technologies; alternative fuel distribution facilities; appliance efficiency upgrade/replacement programs; supplementing costs of renewable energy to electricity customers (NEXTERAENERGY)

Comment: ARB should give the CPUC and CEC more direct guidance on the potential uses for auction revenue. Any unfair competitive advantages for entities administering the revenues to customers must be avoided. (NEXTERAENERGY)

Comment: DRA supports the requirement that electric distribution utilities must auction the allowances directly allocated to them, and use the proceeds from the auctions to the benefit of ratepayers. DRA recognizes that the CPUC and local governing boards (for publicly-owned utilities) will have oversight over the proceeds from the sale of allowances, and if there is no clear guidance provided by ARB, there will likely be a proceeding at the CPUC to determine the final amount of investor-owned utility (IOU) proceeds dedicated to rebate programs or to other GHG-reduction programs that will “benefit ratepayers.” DRA is concerned that the Proposed Regulation is too vague to ensure that the allowance proceeds are used to directly benefit ratepayers. Without more specific language, DRA believes that there is a risk of the allowance proceeds being spent on programs or investments that may not translate to the direct cost savings that are necessary to balance the impacts of AB 32 programs on electricity rates. DRA recommends 100 percent of allowance value freely allocated to electric distribution utilities should be directly returned to ratepayers in the form of rebates. Rebates (as opposed to rate reductions) will ensure that the carbon price will still be reflected in retail rates and incentivize increased conservation and energy-efficiency activities. If the Proposed Regulation does not adopt this recommendation, DRA requests that ARB provide clear guidance in the Proposed Regulation as to where the allowance proceeds should be directed.(DRA)

> **Response:** We do not believe that the proposed changes are necessary. We believe that the guiding principal of benefitting the ratepayer according to AB 32 goals is appropriate. The CPUC and local governments will continue to have oversight on how auction proceeds allocated to electrical distribution utilities should be used. We will continue to work with these organizations to ensure that the funds are being used appropriately. This approach provides flexibility to the utilities to meet the needs of their respective ratepayers. Finally, the regulation requires utilities to submit annual reports to show how auction revenue is being used and to make sure that it follows the guidelines specified in the regulation.

R-43. Comment: Using auction proceeds to provide customer rebates—even on the fixed portion of ratepayers' bills—will discourage customers from adopting energy saving behaviors. A 2009 report published by The Center on Budget and Policy Priorities" articulates that "Providing relief in the form of reductions in the fixed portion of utility bill charges preserves the price signal of higher rates in the variable portion of the bill to the maximum extent possible, but that effect is largely blunted if consumers look only at the bottom line of their bill, where they would not experience the 'sticker shock' that could prompt changes in behavior." We recognize the desire to protect ratepayers from increases in electric bills, but recommend an alternative solution to providing rebates. This recommendation is based on the fact that energy audits lead directly to reduced GHG emissions which is in line with the goals of AB 32; identify energy-saving solutions in line with California's preferred loading order; identify energy-saving solutions while also contributing to decreases in electric bills, unlike rebates on energy bills; typically identify previously unidentified low or no-cost energy-saving solutions; and the establishment of an energy consumption threshold customers must exceed to participate will allow electrical distribution utilities to target energy consumers typically excluded from the numerous single-family residential energy efficiency programs. Modify section 95892(d)(3)(B) as follows:

(B)To the extent that an electrical distribution utility uses auction proceeds to mitigate increases in ratepayers' bills, it shall provide customers exceeding a specified threshold of energy consumption low or no cost energy audits in addition to a list of qualified contractors to select from. (MCKINSTRY)

> **Response:** We believe it is important that ratepayers are not unduly affected by this regulation. We modified the regulation to ensure that the CPUC and the POU governing boards have adequate flexibility in designing a mechanism to return allowance value to ratepayers. We believe that a carbon price signal in electric rates is necessary to create proper incentives for conservation and investment in efficient combined heat and power and distributed generation.

R-44. Comment: IOUs will have extra allowances to auction in a secondary market. Consumers Union feels strongly that, particularly in the case of IOUs, it would be more efficient to auction these allowances in the first place and return most of the revenue directly to consumers. (CONSUMERSUNION)

> **Response:** We do not agree. IOUs are required to auction their allowances according to section 95892.

R-45. Comment: Catholic Charities is concerned that ARB's proposal will provide electric utilities almost 100 percent free allocations. These free giveaways amount to windfall profits for polluting industries and will discourage greater energy efficiency. (CATHCHAR1)

> **Response:** We do not agree. The utilities must provide annual reports to ARB to show that they meet the requirements in the regulation and are using auction proceeds for purposes outlined in AB 32.

IV. SUMMARY OF COMMENTS MADE DURING THE FIRST 15-DAY COMMENT PERIOD AND RESPONSES

A. LIST OF COMMENTERS

The table below identifies the comments received during the first 15-day comment period. Despite falling outside the scope of the first 15-Day Change Notice, a number of comments nevertheless are summarized and responded to below. Although ARB legally is not required to summarize and respond to these comments under the APA, we provided a response to these comments because it was felt the general public and interested stakeholders could benefit from the additional clarity provided by the responses.

B. AB 32 / CAP-AND-TRADE DESIGN

AB 32

General/Miscellaneous

B-1. Comment: California should go further to recommend that U.S. EPA integrate its new source review program for greenhouse gas-emitting sources into the NSPS program so that greenhouse gas-reducing facility modifications or new facility clean technology investments are not made more costly nor unduly delayed. A single, integrated program under AB 32 for California sources will be critical to assuring that California can meet its AB 32 goals expeditiously. (CCC2)

> **Response**: This comment falls outside the scope of the first 15-day changes to the regulation. Nevertheless, as stated in the responses to the 45-day comments, we recognize the importance of harmonization between State and federal GHG emissions-reduction requirements. This is reflected in Board Resolution 10-42, wherein the Board directed the Executive Officer to work with U.S. EPA on the development of a federal regulatory framework to grant delegation or equivalency to California's climate change program where appropriate.

Cap-and-Trade

General/Miscellaneous

B-2. Comment: The Regulations repeatedly indicate that an important function of offsets is to keep the costs of compliance low and thereby prevent leakage of California's industry and attendant polluting activities to other jurisdictions, as well as to address other sectors of the economy not subject to the cap. Leakage of emissions is a significant concern. However, the potential for leakage to occur is not an excuse for adopting a fatally flawed and unworkable approach, such as Cap and Trade with greenhouse gas offsets. In addition, relying solely on compliance caps and offsets to reduce emissions, rather than an increase in prices, hurts many of the incentives that would drive the rapid transition to a clean-energy economy needed to avert dangerous climate change. For instance, if CARB were to adopt carbon fees that rise predictably to insure that clean energy will become cost-competitive with fossil fuels within a known time frame, this would create huge incentives for a shift in private investment from fossil fuel energy into clean energy infrastructure and innovation as well as in energy efficiency. Similarly, individuals and businesses would experience a strong incentive to be creative in reducing their carbon footprint. In this respect, the cost containment approach of greenhouse gas offsets is not only lacking in integrity but also undermines critical incentives needed to provide the rapid reductions without which costly and potentially irremediable effects of climate change are likely to become inevitable. As noted in the Scoping Plan, one way to address leakage is "border adjustments," adding costs to goods that arrive from jurisdictions whose regulations do not have programs to address greenhouse gases and rebating costs to goods that travel from California to other jurisdictions (see Supplement at p.92). While such border adjustments can be more easily imposed on international trade, it may be possible to impose such adjustments on interstate commerce as long as the adjustments merely create a level playing field for out of state businesses and are not protectionist. Essentially, CARB fails to acknowledge that higher prices for activities that produce greenhouse gases are an extremely valuable tool for driving greenhouse gas reductions. CARB instead claims that keeping costs low is a higher value, discarding the alternative as politically and legally untenable, rather than analyzing this alternative as required by the Superior Court decision and State law. (WILLIAMSZ2)

Response: These comments fall outside the scope of the first 15-day change notice. Nevertheless, as discussed in the Staff Report, we analyzed a number of alternatives to the regulation, including the carbon tax mentioned by the commenter, and concluded that the cap-and-trade regulation was the best option. Compared to a carbon tax or fee, the cap-and-trade approach will result in a lower marginal cost of control. As stated in the responses to the 45-day comments, the cap-and-trade regulation will minimize the costs to industry and will minimize the costs passed through to consumers and lessen any impacts on individuals. We also included several cost-containment measures that are integrated into the program such as the use of offsets, three-year compliance periods, and the allowance price containment reserve.

If we find that leakage is occurring despite the safeguards in the regulation, we will examine mechanisms to address leakage, including border adjustments or changes to the allowance distribution systems, and will revise the operation and/or design of the program accordingly. Currently, we utilized a border adjustment for electricity in the form of the first deliverer compliance obligation because the requisite data are available, and because of the express direction in AB 32 to address electricity imports.

See also response to Comment K-25 in the 45-day responses.

B-3. Comment: We remain concerned that the market, as currently proposed, remains highly dependent on unpredictable future contingencies, including the degree of linkage to other jurisdictions (if any), the actual availability of verifiable offsets, the extent to which consumer demand will respond as predicted to carbon and energy prices and the degree of emissions performance of the AB 32 complementary measures. Staff has recognized that such contingencies ultimately will have a very material impact on California carbon prices. The Board should establish a periodic monitoring and reporting process by which such key elements can be carefully tracked and reported so that the Board can consider and, as appropriate, implement any necessary program adjustments. We strongly recommend that the Board require the staff, consulting with other appropriate state agencies, departments and commissions, to prepare an annual (or more frequent) report assessing the following items: (1) allowance, auction and offset supply and price (including offset project characterizations by sector, jurisdiction, verifying entities and other relevant information); (2) consumer demand response to energy prices and other signals; (3) greenhouse gas emissions performance of the AB 32 complementary measures (including at a minimum the low carbon fuel standard, the motor vehicle program, the renewable electricity standard and the sustainable communities program) relative to projected performance; (4) electricity prices; (5) transportation fuel prices; (6) employment levels and trends for all regulated sectors; (7) permitting activity for all regulated sectors; (8) leakage determinations; and (9) such other factors as the Board may designate regarding AB 32 program performance. Depending upon the findings of such annual (or other periodic) reports, the Board should be prepared to implement appropriate cost-containment mechanisms, circuit-breakers or other program protections. (CCC2)

> **Response**: This comment falls outside the scope of the first 15-day change notice. Nevertheless, as stated in the responses to the 45-day comments, we are committed to regular reviews of the implementation of the regulation, providing periodic updates to the Board, and proposing modifications to the regulation, as needed. This is also reflected in Board Resolution 10-42, wherein the Board directed the Executive Officer to update the Board annually on the status of the cap-and-trade program. We believe the language in the Resolution provides for reports to the Board on any issues of concern.

B-4. Comment: Section 95812(c)(4) references section 95151(a)(1) in the MRR. Section 95151(a)(1) no longer exists in the MRR. WSPA recommends that ARB correct this since section 95151(a)(1) no longer exists. (WSPA3)

> **Response**: We agree and modified section 95812(c)(4) as suggested by the commenter. The section now includes the applicability threshold within the section rather than referring to section 95151(a)(1).

B-5. Comment: The delay to the start date of the Cap and Trade program was an unfortunate development. Any changes to a developing market have real implications. Entities are making arrangements today in order to provide reliable electric service for future years. These entities must plan years in advance and are currently securing the resources to provide that service. A shift in policy that changes potential GHG liability associated with electricity affects the price and value of those services. NextEra would like to urge ARB to give entities as much lead time as possible when it plans to make major changes to the program. This will potentially lessen the adverse impacts on both the electricity and carbon markets. (NEXTERAENERGY2)

> **Response**: We understand the concerns of the commenter. However, we believe it was necessary to begin enforcement of the compliance obligation in 2013 of the cap-and-trade program to ensure that the central elements of the regulation (auctions, allocations, oversight, and enforcement) were developed and tested before moving into the first compliance year. We believe the adoption of this regulation will provide the market with certainty about the program's direction prior to enforcement of the compliance obligation. With regard to

providing adequate lead time prior to potential changes in the program, we agree with the commenter that we should provide as much lead time as possible.

B-6. Comment: PEB is an active member of the California Cogeneration Council (CCC) and fully supports the comments made by Beth Vaughn in a letter addressed to you on August 11, 2011. (PEBI)

Response: We acknowledge the comment. Please refer to the ARB responses directed to the relevant comments submitted by parties noted by the commenter.

B-7. Comment: NextEra supports the comments submitted by both the Independent Energy Providers (IEP) and The Western Power Trading Forum (WPTF). (NEXTERAENERGY2)

Response: We acknowledge the comment. Please refer to the ARB responses directed to the relevant comments submitted by parties noted by the commenter.

B-8. Comment: To the extent that CARB pursues a Cap and Trade program under AB 32, Valero herein adopts by reference the comments on the Cap and Trade Regulation submitted by the AB 32 Implementation Group and the California Manufacturers and Technology Association. (CMTA)(VALERO2)

Response: We acknowledge the comment. Please refer to the ARB responses directed to the relevant comments submitted by parties noted by the commenter. ARB may not respond to comments that do not address “15-day” modifications to the regulation.

B-9. Comment: We urge ARB to ensure that the infrastructure and programs necessary to support the objectives and requirements of a Cap and Trade program are fully developed before adopting a final rule. (VALERO2)

Response: We believe that the modifications to the regulation will ensure that the program is fully developed and tested before moving into the first compliance year.

B-10. (multiple comments)
Comment: The complexity of the proposed regulations for a Cap and Trade program illustrates the advantages of a fee and dividend system. Issues, such as offsets, and market manipulation problems are not present in a fee and dividend program where gradually increasing fees are set on fossil fuels. Other important advantages of fee and dividend are that since the proceeds collected are returned to the people, there is no depressing economic effect, it is politically acceptable to many who oppose cap and trade since it is revenue neutral and can be supported even by those groups that usually oppose all taxes. A system that is revenue neutral and results in a dividend check in each voter's mailbox would be attractive to many of those who typically oppose

all taxes. ARB needs to give a fair hearing to a fee and dividend program before it adopts an incredibly complex and problematic cap and trade program. (CARR)

Comment: ARB has heard from many advocacy groups voicing concerns about cap and trade and market mechanisms' potential impact on low-income and disadvantaged communities. Dividends can directly address their concerns about inequality and the regressive impact on poor people when energy and fuel prices rise. ARB can start us down the path to equal ownership of this atmospheric commons. Everyone gets the same dividend or share. People get paid as they gain understanding that we are all involved in climate protection together. CARB can provide a template for national and international climate policy by providing equal dividends or shares to all Californians. (CARBONSHARE2)

> **Response:** These comments fall outside the scope of the first 15-day change notice. However, as noted in the Staff Report, we considered all regulatory alternatives, including a carbon fee system and found that cap-and-trade was the best option. As stated in the responses to the 45-day comments, the cap-and-trade regulation has the advantage of an enforceable and declining cap, and will minimize the costs to industry and in turn that will minimize the costs passed through to consumers and lessen any impacts on individuals.

B-11. Comment: EDF supports the Cap and Trade timetables as modified in the 15-day changes, while recommending that the ultimate environmental goal—no more than 1990 levels of emissions by 2020—is not modified. (EDF4)

> **Response**: We acknowledge the comment. Regarding the 2020 emissions target, the proposed modifications do not change the emission reductions goals of the program.

B-12. Comment: ARB must strengthen carbon market oversight provisions, ultimately the best way to ensure market and environmental integrity is to re-evaluate the cap and trade system itself and design it in ways that inherently reduce the opportunities for gaming, fraud, and excessive speculation. The most important step ARB could take to ensuring the environmental effectiveness of AB 32 is to adopt a radically simpler way to price carbon (through a carbon tax, for example) or make the cap and trade program dramatically smaller and simpler. We strongly urge ARB to take the opportunity provided to examine alternatives to cap and trade to implement a robust program to reduce emissions that ensures financial market and environmental integrity and protects the lives and livelihoods of all Californians. (FRIENDSOFEARTH2)

> **Response**: This comment falls outside the scope of the first 15-day change notice. Nevertheless, as discussed in detail in Chapter IV of the Staff Report, staff analyzed a number of alternatives to the regulation, including the carbon tax mentioned by the commenter, and concluded that the cap-and-trade regulation was the best option. Compared to a carbon tax or fee, the cap-and-trade

approach has the advantage of an enforceable and declining cap, and will result in a lower marginal cost of control.

B-13. Comment: This multi-year rulemaking has involved several agencies, hundreds of stakeholders, and numerous workshops and meetings to collectively develop a program that best meets all the policy objectives of AB 32. It would be beneficial to host additional workshops to consider a number of important, complex issues including offset protocols, compliance cycle and penalties, reporting requirements for electricity-deliverers, voluntary renewable energy, long-term electricity contracts, allowance allocation, holding and purchase limits, corporate association reporting requirements, and auction design, market oversight, and penalties. At the public workshop held on July 15, 2011, ARB staff indicated that ARB is considering the release of a second 15-Day Modified Text package for public comment before submitting the Final Statement of Reasons (FSOR) to the Office of Administrative Law by the October 28, 2011 deadline. LADWP supports ARB on this effort and would appreciate an opportunity to review a second 15-Day Modified Text package. LADWP recognizes that the objective of this process is to fine-tune the regulation for clarity and is available to meet with ARB staff to discuss issues related to proposed changes to the regulation to make it workable and enforceable. (LADWP4)

Response: We agree. ARB proposed a second set of 15-day modifications as suggested by the commenter.

Transparency

B-14. Comment: ACMP understands that external forces shorted the public discussion and debate about many details, but ACMP would recommend additional and well-noticed public process as the Regulation is finalized and subsequently modified in future years. As this Regulation is just one of several market-based GHG reduction programs that California has established to achieve its AB 32 goals, ACMP believes that the key to successfully implementing any market-based GHG program, be it Cap and Trade, renewable electricity, Low Carbon Fuel Standard, and/or others, lies within the regulatory details that ensure a transparent, stable, liquid and enforceable marketplace. (ACMP)

Response: We believe that the public process used to develop the regulation provided ample opportunity for public input and discussion. As discussed in Appendix D of the Staff Report, ARB held over 30 public workshops during the development process, and participation was possible at these workshops via webcast. In addition, ARB staff maintained an ARB Public Meetings Webpage, where staff made available all workshop materials and comments posted by stakeholders on program options. As recommended by the commenter, the ARB held additional, well-noticed public workshops in conjunction with two sets of proposed 15-day modifications to finalize the regulatory details and ensure that the regulation is fully developed and tested prior to being implemented. Any future modifications to the cap-and-trade regulation would require a separate rulemaking process using a similar open and transparent public process.

B-15. Comment: ARB must vigilantly use transparency and enforcement tools to make sure that the public interest is protected from the self-dealing, fraud, and windfall profits that have plagued other markets. (SIERRACLUBCA5)

Response: This comment falls outside the scope of the first 15-day change notice. Nevertheless, ARB agrees on the need to ensure that the program contains sufficient safeguards to ensure integrity.

B-16. Comment: To garner support, the Cap and Trade program requires greater public awareness and understanding than currently exists. While CARB has been fully transparent, the use of jargon and highly technical language makes it difficult for even the somewhat knowledgeable citizen to comprehend the various proposals. I would encourage the use of Executive Summaries and other forms of communication that make the proposed changes more easily understood. (TVRP)

Response: This comment falls outside the scope of the first 15-day change notice. However, ARB agrees on the need to ensure that the program contains sufficient safeguards to ensure integrity. A number of definitions were added or modified to improve clarity and to ensure that the terms used in this regulation are consistent with those used in the mandatory reporting of GHG emissions regulation. The proposed cap-and-trade regulation package also contains an executive summary and general overview of the proposed cap-and-trade program. Additionally, fact sheets and user friendly handouts such as workshop presentations are posted on the cap-and-trade website.

District Role

B-17. (multiple comments)
Comment: In the adopting Resolution for the Hearing in December of 2010, the ARB Board directed the Executive Officer to establish a venue, facilitated by a Board Member, to resolve implementation concerns with CAPCOA (see page 13 of the Resolution). We are disheartened to report that the "Board-member facilitated dialogue" has not been convened. CAPCOA has made several attempts to schedule a meeting to initiate the dialogue. In early May, Mr. Goldstene met with the CAPCOA Board and requested a delay to allow staff the opportunity to work with CAPCOA on our concerns. Unfortunately, no meaningful discussions have been held (ARB staff requested a conference call with a small group of CAPCOA members to ensure we understood the Cap and Trade program, and Mr. Goldstene and staff have briefed the CAPCOA Board on ARB's progress on this rulemaking and several other programs). At the same time, the 15-day changes do not address a number of our concerns, nor do they leave any room for them to be addressed in the future. We believe the facilitated dialogue could have helped to resolve this before the matter came before the ARB Board a second time, and we still believe it will be critical going forward. We respectfully request that

the Board urge that this process get under way expeditiously, and that language be included in the Cap and Trade rule to allow the implementation of any future agreements. (CAPCOA3)

Comment: CAPCOA reiterates the considerable value local air districts can add to the climate program when ARB recognizes our role as co-regulators in this process, rather than considering us interested stakeholders. Local districts have decades of real-world expertise in evaluating, permitting, collecting and verifying emissions inventories from, and enforcing requirements on, the stationary sources subject to the Cap and Trade and Mandatory Reporting rules. This includes requirements related to Cap and Trade programs on the national and regional level, credit banking, and offset evaluation. This expertise has been hard-won, and with it has come a clearer understanding of the potential pitfalls and mistakes that can arise in early program development, and also how to structure programs to ensure the best compliance, and overall program performance. Our success has secured substantial reductions in ozone precursors, sulfur oxides, and particulate matter, as well as regional exposures to toxic air contaminants and smoke from open burning. CAPCOA and its members continue to offer this expertise to ARB as it develops and implements the rules for the Cap and Trade program, as well as other climate protection rules. We continue to object to program provisions that restrict district actions, and imply that air districts have a profit or other motive in participating in any program, beyond the common objective we share with ARB to achieve emission reductions and ensure the proper and successful implementation of the program. (CAPCOA3)

Comment: SCAQMD and CAPCOA have consistently raised several issues regarding how local air districts can help facilitate compliance for AB 32 requirements and the appropriate roles and responsibilities for air district participation. These items remain unresolved. The CARB adopting Resolution for the December 2010 public hearing included a provision that the Board directs the Executive Officer to establish a Board member facilitated dialogue with the California Air Pollution Control Officers Association regarding involvement of the air pollution control and air quality management districts (air districts) in the implementation of the Cap and Trade Regulation, development of compliance offset protocols, and other AB 32 programs. Unfortunately, this process has not occurred. (SCAQMD4)

> **Response**: These comments fall outside the scope of the first 15-day change notice. Nevertheless, we intend to initiate a dialogue with CAPCOA as directed by the Board in Resolution 10-42.

B-18. Comment: The proposed rules do not address the ability for air districts to perform multiple roles in the cap-and-trade program. Section 95986(d)(3) still contains restrictions that an organization cannot perform multiple roles. Add section 95989 as follows:

> California air pollution control districts or air quality management districts
> Notwithstanding any other provision of this regulation, California air pollution

control districts or air quality management districts may be approved for multiple roles, including verification for mandatory reporting or offsets, holding compliance instruments, implementing offset projects that are verified by a third party and approved by CARB, and running a Registry, provided the appropriate training, certification, or approvals are obtained from CARB. Decisions on such approval requests will be provided in a timely fashion. (SCAQMD4)

Response: We believe it is not necessary to add section 95989. The cap-and-trade regulation provides for distinct roles within the compliance offset program. The roles include project developers, offset verifiers, and approved offset project registries. There is a clear separation of roles for offset project developers, verifiers, and registries to keep in place a system of independent checks and balances throughout the whole offset system. It will be important for air districts to decide which role(s) they would like to play in the compliance offset program. Currently, air districts are allowed to develop offset projects using ARB compliance offset protocols and then have those reductions subject to an independent review by an ARB-accredited verifier.

Working Group/Advisory Group

B-19. (multiple comments)
Comment: CLFP supports and encourages a stakeholder advisory committee to provide continual and thoughtful feedback to CARB as the program rolls out during the next few years. (CALFP3, AB32IG2)

Comment: CMTA supports the development of an industry stakeholder advisory committee to provide continual and thoughtful feedback to the CARB Board for its consideration as the program rolls out during the next few years. (CMTA3)

Comment: We urge CARB to include a periodic review process of the Cap and Trade program via a stakeholder advisory group to ensure emission reductions goals are being met in a manner that is both economically efficient and environmentally sound. Periodic reviews should include impact assessments of a California only program to ensure that it meets the economic and emission reduction goals under AB 32. While ensuring GHG goals is important, it is equally important that consideration and oversight be given to any and all economic impacts, including those industries that would be both directly and indirectly impacted as a result of economic leakage. As CARB moves forward, we hope that these and other important issues are addressed with much diligence and oversight via an open forum that allows for public participation and comment in order to ensure transparency in the process and maintain integrity in the program. (CALCHAMBER3)

Comment: We support and encourage a stakeholder advisory committee to provide continual and thoughtful feedback to CARB as the program rolls out during the next few years. This committee should include representatives from capped industries as well as representatives from the agricultural sector. (CCGG2)

Comment: The District continues to support the ongoing operation of a Cap and Trade Implementation Working Group with CARB and air districts. Such a working partnership between CARB and the air district staff will help ensure the success of the Cap and Trade program. (BAAQMD3)

> **Response**: These comments fall outside the scope of the first 15-day change notice. Nevertheless, we agree that we need to carefully monitor industry progress toward compliance with the regulation, as well as the operation of the markets, although we do not necessarily see the need for the specific stakeholder committees or working groups suggested by the commenters. As specified in Board Resolution 10-42 for the original regulation, the Board directed the EO to hold public consultations to identify potential obstacles to compliance and, as necessary, incorporate or enhance compliance assistance mechanisms into the program. ARB fully expects to continue its dialogue with stakeholders and will continue to evaluate the program.

Implementation

B-20. Comment: The ARB proposal has not adequately defined many of the tools (i.e., forms, registrations, procedures, software) required for a Cap and Trade program (even one with the proposed “soft start” in 2012). Hence, a smooth and efficient start of the program is uncertain. If development of appropriate tools is further deferred, efficient functioning of the program could be put in jeopardy. WSPA recommends that where ARB has identified specific dates for program implementation, but that will require ARB tools (such as registration forms) for successful implementation, those dates should be deleted and a timeframe instead be defined. For example, instead of saying the registration is required on January 1, 2012, the Regulation should say, registration is required 30 days after ARB publishes (releases) the registration tools. Further, WSPA recommends that ARB develop a schedule for development procedures and requirements associated with the Cap and Trade program to allow interested parties to develop their approaches in line with ARB concepts. This collaborative process will facilitate involvement by stakeholders and ensure broad input into details required by the Cap and Trade program. (WSPA3)

> **Response:** Many of the 'tools' listed in the comment are part of program implementation and do not have to be included in the regulation itself. As components of the infrastructure become operational, we are committed to having stakeholders provide feedback on the design and recommend improvements. We included specific deadlines in the regulation to ensure that the regulation is enforceable. The compliance start date was moved from 2012 to 2013 to ensure that all the regulatory elements are in place and fully functional. We have initiated activities to develop the necessary rule implementation infrastructure for the regulation, including a market tracking system to trade allowances and offsets; contracts for an auction services provider; a financial services provider; and a market monitor. We are also

committed to providing continual public updates, with opportunity for stakeholder comment, on the implementation of the regulation.

Program Monitoring

B-21. (multiple comments)
Comment: Establish a work plan to ensure that the tools, guidance, training, market tests, and infrastructure that are necessary to comply with the regulation are in place before requiring entities to comply with the requirements. CCEEB recommends that:

1) The ARB develop a work plan with a clear list of tools, guidance, policies, trainings, and systems that they must develop, along with completion deadlines for each activity that must be in place for the regulated entities to comply.
2) The ARB include a mechanism that links an entity's compliance deadlines directly to availability of theses compliance tools, allowing for sufficient lead time for facility compliance.
3) The ARB should release a "formal declaration of readiness" at least 60 or 90 days prior to "going live" with their first auction. The CAISO for the Market Redesign and Technology Upgrade underwent this process including system testing by market participants and CAISO ran into some software problems. It is important for ARB to have the same type of formal action to notify market participants'. Furthermore, this declaration would be an opportunity for stakeholders to raise to ARB's attention any concerns they may have about the status of the program and readiness to go live.

Additionally, ARB should clearly announce the full schedule from now to the end of this rulemaking in October 2011. (CCEEB)

Comment: EDF supports CARB's proposal to establish market monitoring and oversight committee(s) as an essential element for public confidence in the program. In addition to detecting, responding to, and preventing activities (such as price manipulation and fraud) that can undermine the efficacy and public trust in the program, EDF recommends CARB vest the committee(s) with a broad range of important responsibilities to ensure the overall program is working as designed. While EDF recognizes that some of these responsibilities may be undertaken by CARB staff, market oversight and monitoring committee(s) will be steeped in information associated with market operations and trends, and will therefore be a valuable source of information. We urge CARB to make sure the committee(s) have adequate staff support and a clear delineation of responsibilities throughout their existence. There are responsibilities the market monitoring and oversight committee(s) should take on, including, but not limited to the following:

- Evaluating leakage risks and assumptions used to determine free allowance allocation quantities for protection of trade-exposed energy intensive industries. At a minimum, the overall evaluation of risk and the degree of protection needed to ameliorate it should be revisited prior to the start of the second program compliance period.
- Evaluating whether windfall profits are being generated due to the current allowance allocation structure and performance benchmarks used as the basis

for allocation calculations within individual industry classes. While CARB has stated that benchmarks will remain unchanged through the course of the program, it is important to be at least open to revisiting benchmarks that are causing perverse consequences. One example of a potential consequence of concern is an overly generous benchmark for heavy crude oil that may lead to increased processing of dirtier feed stocks.

- Evaluating whether existing regulatory provisions for offset liability (in the case of credit invalidation or reversals) are causing unintended consequences on the development and availability of offset project credits within the AB32 cap-and-trade market. Such impacts may arise if, for example, third party mechanisms for insurance or liability relief are not developed or are unnecessarily expensive. Additionally, the committee(s) should evaluate whether other barriers to market access exist for project developers that do not further environmental integrity or program rigor.
- Coordinating with CARB staff responsible for implementing the cap-and-trade adaptive management strategy to inform staff of emerging or existing monitoring conditions that are indicators of potential or observed impacts on environmental quality. (EDF4)

Comment: Incorporate provisions to a) establish monitoring indicators and criteria for changing the program based on the indicators by June 2012 and b) overall program review of the Cap and Trade Regulation by March 2014 and in March 2017. The Cap and Trade program touches the majority of California's economy. A well designed Cap and Trade can achieve significant GHG reductions and drive innovations but design flaws in a Cap and Trade program could cause significant economic and/or environmental damage. There are many elements in this Cap and Trade Regulation that have not been tested by other cap and trade programs. To ensure that we are able to detect any problems early and take corrective action promptly, Shell believes it is critical that key indicators of both a) market operations and b) California's energy and economic health be identified and monitored routinely. A provision should be added to the Regulation requiring that these indicators and the criteria for any changes that may be driven by the analyses of these indicators be clearly established by June 2012. Such criteria are essential to provide businesses with certainty on what conditions, how and when the Regulations may be changed. Shell additionally believes that a provision should be included requiring an overall program review of the Cap and Trade Regulation to be completed and presented to the ARB Board by March 2014 and in March 2017. (SHELLOIL)

Response: This comment falls outside the scope of the first 15-day change notice. Nevertheless, we agree that we need to carefully monitor industry progress toward compliance with the regulation, as well as the operation of the markets. Mechanisms are in place to do this, although not exactly as recommended by the commenters. As specified in Board Resolution 10-42, the Board directed the EO to hold public consultations to identify potential obstacles to compliance and, as necessary, incorporate or enhance compliance assistance mechanisms into the program. The Board also directed the Executive Officer to contract with an independent entity with appropriate expertise that will monitor and provide public reports on the operation of the market, including auctions and reserve sales, on a quarterly basis and recommend appropriate action, which could include taking corrective action prior to the next auction, adding future allowances to the allowance reserve or future auctions, or temporarily suspending trading in the market.

Adaptive Management

B-22. (multiple comments)
Comment: The adaptive management strategy should be in place no later than when facilities begin taking action to meet compliance obligations under the program. For an adaptive management strategy to be effective, it should enable an agency to respond to conditions when and if they arise, and with as much forethought and deliberation as practicable. Accordingly, in putting together the strategy, the agency should have already performed scenario assessment and identified steps of action based on likely scenario outcomes. When applied to the California Cap and Trade rule, having an adaptive management strategy in place when needed means that it should be in place when covered facilities begin taking actions to meet compliance obligations (buying and trading permits, making reductions, etc.) under the program. (EDF5)

Comment: TWS recommends the development of an adaptive management system to monitor and mitigate any adverse impacts on the forest sector. Tools that allow accurate assessment of the state of forest carbon and the health and resiliency of forest ecosystems within California are essential to assessing the effectiveness and impacts of California climate policies affecting forests. Public engagement in the development of these measurement systems will help ensure that the assumptions, inputs, and methodologies used in these systems are rigorously vetted and widely supported. The Cap and Trade Regulation should include provisions for periodic review and revision of the Regulation in light of any potential adverse or unintended impacts caused by provisions of the Cap and Trade program such as the provisions in the Cap and Trade program governing offsets or biomass. (TWS)

Comment: CARB's current approach to adaptive management of the AB 32 Cap and Trade program needs more detail and commitment. The program should be focused on a range of environmental impacts, including climate, air and ecosystem impacts, and should be designed to mitigate observed impacts as well as proactively prevent future impacts that are likely to occur. EDF has included specific ideas for the adaptive management program, and we strongly recommend that the program be in place no later than when facilities begin taking action to meet Cap and Trade compliance obligations. (EDF4)

Comment: The current proposal for adaptive management needs more detail and commitment. To date, CARB's provisions related to adaptive management have consisted of references, inferences and statements of actions yet to be taken. More clarity, definition, and concrete action planning for adaptive management is needed. For example, while the AB 32 Scoping Plan, Cap and Trade documents, and agency statements have referenced the need to evaluate and track air quality conditions in environmental justice communities, the compliance methods and permit modifications of regulated entities, and the impacts from use of biomass, no trigger levels for administrative action or evaluation have been identified. These triggers are of critical importance for determining how regulatory compliance options may be affected by the adaptive management strategy, and demonstrating that concerted planning has occurred to protect the overall environmental health from unexpected impacts. Defining triggers now will be important for determining what information must be gathered and evaluated routinely. (EDF5)

Comment: Adaptive management should include a wide range of environmental impacts, such as ecosystem health. Thus far, the approach to adaptive management outlined in CARB's rulemaking documents has been focused primarily on the potential for localized air quality impacts to be caused by the program. We urge CARB to expand their adaptive management focus to other environmental factors, such as the potential ecosystem impacts. Specifically, how to adaptively manage biomass and the potential impact of treating biomass combustion as carbon neutral. We submit this comment to memorialize the recommendation for managing biomass combustion, and to ensure the commitment to ecosystem impact response planning is retained. (EDF5)

Comment: Adaptive management should include responsive and proactive action planning. Within the discussion documents related to adaptive management released thus far, CARB has identified a need to respond to observed environmental conditions caused by the cap-and-trade program. While this reactive action planning is essential, it is not the full picture of necessary adaptive management. We also recommend that CARB's adaptive management strategy can and should incorporate indicators of potential future changes to environmental quality caused by the program, thereby allowing the program to be both responsive as well as proactive in ensuring the environmental integrity (and statutory compliance) of the program. (EDF5)

> **Response:** This comment falls outside the scope of the first 15-day change notice. Nevertheless, as stated in the responses to the 45-day comments, we are committed to develop an adaptive management approach to address any potential adverse environmental impacts associated with potential localized air quality impacts and the U.S. forest offset protocol. In addition, we will monitor the implementation of the cap-and-trade regulation and will develop appropriate responses to rectify any identified issues. The adaptive management approach will allow us to develop the appropriate tools to determine if there are impacts due to compliance with the cap-and-trade regulation as information becomes available.

B-23. (multiple comments)
Comment: We recommend the identification of indicators and impact trigger levels that are useful to determine whether forest biomass stocking changes or ecosystem health impacts are occurring due to the treatment of biomass as a carbon neutral fuel source (see NGO letter on biomass dated April 8, 2011). (EDF5)

Comment: We recommend the identification of steps that can be taken, established as a hierarchy of action, for preventative and responsive action planning to respond to observed forest biomass stocking changes or negative ecosystem health impacts. (EDF5)

> **Response:** This comment falls outside the scope of the first 15-day changes to the regulation. The commenter is correct that biomass-derived fuels are exempt from a compliance obligation since CO_2 emissions resulting from the combustion of biomass are considered biogenic. However, we will not use an adaptive management approach for forest biomass. The cap-and-trade FED did not identify potential adverse environmental impacts associated with increased use of forest biomass as a result of the cap-and-trade regulation. Separately, we include an adaptive management approach in the cap-and-trade program to address any potential adverse environmental impacts associated with potential localized air quality impacts and the U.S. forest offset protocol. We will, however, monitor the impact of the cap-and-trade regulation and other ARB and state policies on forest biomass.
>
> In addition, the updated economic evaluation of California's climate change scoping plan did not indicate that the use of biomass would increase in response to the proposed regulation. Increased use of biomass is already incentivized by existing regulations such as the renewables portfolio standards (RPS) and the low-carbon fuel standard. The RPS requires publicly owned utilities to obtain 33 percent of their energy from renewable resources, including biomass. Most utilities are challenged to achieve the renewable target despite the availability of biomass as a renewable fuel. Increased use of biomass for energy generation created by other state policies and initiatives, such as the Renewable Portfolio Standard, is discussed in the cap-and-trade FED (see pages 351-352).

Delay Action

B-24. (multiple comments)
Comment: It is critical that the Cap and Trade market features and systems be adequately structured and tested in order to avoid possible catastrophic consequences similar to the 2001 energy crisis. Thus, SCE strongly supports the one-year delay of the compliance elements of the Cap and Trade program. This delay will allow additional time for ARB to improve its market structure, test its systems, and create stronger protections against market manipulation while maintaining the environmental integrity and important leadership position of this program. (SCE3)

Comment: Ag Council appreciates ARB's decision to delay implementation of Cap and Trade for one year. There are many outstanding issues with this regulation that we continue to work on, and given these unanswered questions, the delay in implementation is appreciated by our membership. (ACC4)

> **Response**: This comment falls outside the scope of the first 15-day change notice. Nevertheless, we believe that beginning enforcement of the compliance obligation in 2013 will allow us to address outstanding issues and ensure that the market tracking system is developed and tested before moving into the first year of compliance.

Economic Harm/Burden

B-25. Comment: We ask that the costs of the program to regulated entities continue to be updated as the program moves along. Economic impacts to labor, especially in the rural communities where agricultural production is a major employer, needs to be highlighted. (CCGG2)

> **Response:** This comment falls outside the scope of the first 15-day change notice. Nevertheless, as stated in the responses to the 45-day comments, we are committed to regular reviews of the implementation of the regulation, periodic updates to the Board, and proposed modifications to the regulation, as needed. As discussed in Board Resolution 10-42, the Board directed the Executive Officer to update the Board annually on the status of the cap-and-trade program. We believe the broad language in the Resolution provides for reports to the Board on any issues of concern, including costs to rural communities.

B-26. Comment: A Cap and Trade system that distinguishes emissions from different sectors for differential treatment does not result in market consistency, does not equitably distribute economic burden and opportunity, and is a serious violation of the intent of a Cap and Trade program. This is the case when it comes to the Regulation's treatment of the electricity sector—with the most egregious example being the use of auction revenue to mitigate the price impact of carbon costs in this sector—and in this sector only. A clear example of the market distortion created by this inequity is a consumer faced with the choice of running a device, appliance or vehicle on either electricity or another fuel (i.e. diesel, gasoline, natural gas). All other factors being equal (including the carbon intensity of the chosen fuel), the choice to operate the device, appliance or vehicle on electricity will be influenced by the fact that the use of electricity comes with a monthly rebate check (or other mechanism to mitigate the cost of electricity), while the use of other fuels will not. This is a clear and unacceptable market distortion and a divergence from the intent of a cap and trade system. This picking of winners and losers distorts the effect of decisions that actually should influence energy choices and consumption. This market distortion could cause a consumer to choose to purchase an electric device, appliance or vehicle rather than a lower carbon alternative—and in doing so maintain energy demand and carbon emissions at existing levels. Emissions and consumers must be treated equally in order to provide the proper incentive for reductions and for energy consumption choices. In order for the cap and trade program to be successful and equitable, the criteria for allocation must be consistent amongst sectors—and the use of auction revenue should not result in arbitrary, differential price signals amongst energy types. (BP2)

> **Response**: This comment falls outside the scope of the first 15-day change notice. Nevertheless, as stated in the responses to the 45-day package comments, we considered cross-sector equity issues when developing the regulation. We believe that the costs of cap-and-trade are equitably distributed through the overall approach.

Cap/Allowance Budget

B-27. (multiple comments)
Comment: PG&E requests further clarification and examination of the Cap and Trade program's allowance budget for the year 2020 as established in section 95841. The Scoping Plan issued December 2008 included a preliminary estimate of 365 million metric tons (MMT). The Cap and Trade proposed Regulation proposes a substantially lower allowance budget of 334.2 MMT. This substantial downward adjustment also appears to reduce the allowance budget for many years prior to 2020. ARB has not provided support for this significant downward adjustment. (PGE4)

Comment: The 2013 first year compliance budget should be 165.8 million allowances. By reducing the year one compliance budget to 162.8 million allowances, ARB is essentially requiring reductions of 3.0 million allowances prior to the new compliance obligation start date. Under the summary of proposed modifications, ARB is requesting comment on which program elements should begin in 2012 and what advantages there are to phasing in various components during 2012. Since section 95840 proposes the extension of the first compliance period start date, the associated compliance budget should be adjusted to accurately reflect this delay. (VALERO2)

Comment: CCEEB is concerned that the cap in this regulation exceeds previously defined scoping plan levels, driving the program reductions below 1990 emissions levels. This is particularly evident given the new 2010 emissions levels that are roughly half of the projected emissions for 2012. CCEEB recommends that ARB clearly articulate the rational for this increased compliance obligation and the reasons why the emission estimates are higher when the economy, production, and business are down, and reconcile this data with the updated GHG forecast and the recent Legislative Analyst Office analysis. (CCEEB3)

> **Response**: These comments fall outside the scope of the first 15-day change notice. Nevertheless, as stated in the responses to the 45-day comments, the main difference between the estimated cap of 365 $MMTCO_2e$ in the Scoping Plan and the 334 $MMTCO_2e$ cap in the regulation is that the Scoping Plan estimate was based on entire sectors. It did not consider sources that are not addressed by the regulation or certain types of transportation fuels that are used in small quantities. In section 95841 of the regulation, we incorporated an improved approach of estimating the allowance budgets. The starting allowance budget is equal to the expected emissions for the initial year that a covered entity enters the cap-and-trade program. The adjustment to the allowance budget was made using 2008 facility-level data gathered through the mandatory reporting

program that improved emissions estimates for the covered entities. Using these improved estimates, we calculated a new broad-scope 2020 allowance budget of 334 $MMTCO_2e$.

Duplicative Regulations

B-28. Comment: CCEEB is concerned that California businesses will be subject to duplicative GHG regulations from the State and federal government. Although it is unlikely that a federal Cap and Trade regulation will be forthcoming in the near term, EPA has been working to develop GHG regulations such as GHG BACT and NSPS. Compliance with duplicative regulations will be costly and will not result in material benefit toward our GHG reduction goals. CCEEB recommends that ARB clearly state its intent to not subject California's businesses to duplicative GHG regulations. (CCEEB3)

Response: This comment falls outside the scope of the first 15-day change notice. Nevertheless, we recognize the importance of harmonization between State and federal GHG emissions reduction requirements. As stated in Board Resolution 10-42, the Board directed the EO to work with U.S. EPA on the development of a federal regulatory framework to grant delegation or equivalency to California’s climate change program where appropriate. Additionally, our mandatory GHG reporting rule is comparable to the U.S. EPA mandatory reporting rule. In the event the U.S. EPA cap-and-trade program becomes available, our cap-and-trade program design element can easily transit into the U.S. EPA program.

Periodic Review

B-29. Comment: Given the importance and complexity of the Cap and Trade Regulation, and the fact that it has never been done to this degree anywhere in the world, we strongly support inclusion, in the Regulation, of a required periodic review of the, similar to the concept included in the Low Carbon Fuel Standard Regulation. The scope of each review should include, at a minimum, consideration of the following areas:

- Trade exposure
- Progress toward linkage
- Offset supply
- Status of allowance reserve
- Leakage
- Carbon price in direct regulations
- Market liquidity and Allowance
- Status of cap and trade programs in other states
- Auction process
- Carbon price volatility
- Progress toward 2020 goal
- Benchmarking

- Market operations
- Market manipulation
- Treatment of transportation fuels in the Cap and Trade program
- Treatment of imported electricity and effect on power markets
- Evaluation pass through of carbon costs by generators who must hold allowances but are not allocated allowances
- Evaluation of cross sector inequities in sharing the burden of carbon costs, including equal carbon cost mitigation across sectors were that occurs
- Effect on energy prices—gasoline, diesel, electricity, natural gas
- Effect on employment in the State (BP2)

  Response: This comment falls outside the scope of the first 15-day change notice. Nevertheless, we agree that periodic reports should be provided to the Board on the operation of the cap-and-trade program. As discussed in Board Resolution 10-42, the Board directed the EO to update the Board annually on the status of the cap-and-trade program. While the resolution language does not specifically mention all of the specific areas suggested by the commenter, we believe the broad language in the resolution provides for reports to the Board on any issues of concern. We plan to do overall program monitoring of the cap-and-trade regulation.

Sectors/Facilities/Alternative Fuels

B-30. Comment: ARB should add text about Liquid Fluoride Thorium Reactors (LFTR), and spend time talking about them too. They must be considered. California imports electricity from Nevada, which uses coal in its production. We also use lots of Natural Gas in California. Coal and natural gas produce a huge amount of CO_2. Liquid Fluoride Thorium Reactors produce none, and are a cheaper source of electricity. Check out this web site and watch the first video: http://www.thoriumenergyalliance.com/ThoriumSite/portal.html. Also, we can use up all our spent nuclear fuel in LFTRs, also called Molten Salt Reactors. We need to get research and development going, build some, and convert our nuclear reactors to LFTRs. LFTRs are much safer, more efficient, less expensive, and far more immune to human errors than other kinds of nuclear reactors. LFTRs are scalable so small ones, can be located all over the USA, which reduces transmission lines losses. Thorium is much safer, cheaper and plentiful than uranium. Thorium can be safely transported. Let California lead the country by having the first working LFTR since the one that ran at Oak Ridge National Labs in Tennessee in the 1960's. (TEA)

> **Response**: This comment falls outside the scope of the first 15-day change notice. Nuclear power does not emit GHG emissions, and is not addressed by this regulation.

High Global Warming Potential Gases

B-31. Comment: Covered gases for the Cap and Trade Regulation currently include SF_6 and other fluorinated gases. However, high Global Warming Potential (GWP) gases are regulated separately from the Cap and Trade program under the AB 32 Scoping Plan and should not be included as covered gases in the Cap and Trade Regulation. Although they are typically included in the definition of "CO_2e" (or carbon dioxide equivalent), these fluorinated gases are not reported under the MRR, and therefore would not carry a compliance obligation under the Cap and Trade program. Modify section 95810 as follows:

> This article applies to the following greenhouse gases: carbon dioxide (CO_2), methane(CH_4), nitrous oxide (N_2O)~~, sulfur hexafluoride (SF6), hydrofluorocarbons (HFCs), perfluorocarbons (PFCs), nitrogen trifluoride (NF3), and other fluorinated greenhouse gases~~. (LADWP4)
>
> **Response**: This comment falls outside the scope of the first 15-day changes to the regulation. Nevertheless, we disagree with the comment. As stated in the Staff Report, to maximize GHG reductions, the program will include emissions of carbon dioxide (CO_2), methane (CH_4), nitrous oxide (N_2O), hydrofluorocarbons (HFCs), perfluorocarbons (PFCs), sulfur hexafluoride (SF_6), and nitrogen trifluoride (NF_3).

Energy Audits

B-32. (multiple comments)
Comment: CARB has proposed that industrial audits may form the basis of command and control regulations for emissions now covered by the Cap and Trade program. The industrial audit was not included in the scoping plan for this purpose, and such a purpose directly conflicts with the cost-minimization purpose of the cap-and-trade program. This proposal will reduce operational flexibility and increase costs and should be rejected. (CMTA3)

Comment: CARB should discontinue any consideration of mandatory energy efficiency standards and only consider options in the future after the results from the Cap and Trade program are evaluated. CARB has recently commented that it will consider rulemaking next year to mandate energy efficiency projects. This directly conflicts with the flexibility promised by the cap-and-trade program and our ability to control cost impacts on our customers. (CONOCO2)

Comments: IEP opposes mandating reductions or efficiency improvements contemplated under the audit regulation. CARB should not mandate reductions or efficiency improvements contemplated in the Audit Regulation on top of cap and trade requirements. (IEPA2)

Comment: ARB invited comment on its proposal to require identified low cost onsite reductions at large industrial sites, pursuant to the energy efficiency assessments required under the Energy Efficiency and Co-Benefits Assessment for Large Industrial Sources Regulation. The CCC is opposed to such a requirement and argues that the design of the Cap and Trade Regulations (declining cap and increasing cost per ton of carbon over time) incents large industrial sources to take cost-effective actions to reduce carbon emissions. The assessment required under this Regulation will no doubt help to identify improvement projects, but the Operators of these facilities are best qualified to determine the most cost-effective way to reduce emissions. A Cap and Trade program should set the performance standard, and then allow the market to determine how best to achieve the goals. This extra layer of "command and control" defeats the purpose of such a market mechanism as Cap and Trade. (CACC2)

Comment: Mandating GHG emission reduction projects in response to the energy audits raises problems similar to the industrial sector and electric sector allowance allocation issues. The original July 25, 2011, notice for the cap-and-trade regulation reiterates that staff continues to evaluate the manner in which the Energy Audits required by regulation for many of California's largest emitting sources will be translated into specific, mandated emission reduction actions. Subsequently CARB indicated that this issue will be addressed later through a subsequent process. ACE is very concerned with the potential for mandated programs to carry the same problem for facilities with existing contracts as does the overall cap-and-trade program: i.e., facilities with existing standard QF contracts have no way to recover the costs of the mandated programs unless and until the industrial steam hosts and the IOUs agree to contract modifications and execute revised contracts with pass through cost language. Therefore, any implementation of mandated actions as a result of the Energy Audits must also address the need for some sort of specific direct assistance if the steam hosts and/or IOU remain unwilling or unable to enter into renegotiated contracts. (ACERIO)

Comment: The costs of mandated GHG emission reduction projects in response to the energy audits will compete with capital required to comply with the cap-and-trade program. ACE fundamentally believes that any "one size fits all" approach will ultimately undermine the success of the cap-and-trade program, and should therefore be completely avoided. The Energy Audit began as a tool for CARB staff to assess the type of actions that CHP/QF and industrial facility owners might take to reduce emissions; transforming that data into mandated actions is an unwarranted interference in the market-based cap-and-trade program that will likely be counterproductive and could very likely lead to "leakage" in all industry sectors. (ACERIO)

> **Response**: The rulemaking effort to ensure that large industrial sources subject to the Energy Efficiency and Co-Benefits Assessment Regulation be required to take all cost-effective actions identified under those assessments will be a rulemaking process separate from this one. ARB plans to initiate a separate regulatory process in fall 2011 to discuss metrics and action to implement this commitment. At that time, we will also address the concerns and comments noted by the commenters. This future public process is the appropriate forum for discussion of the reductions in flexibility and cost control due to mandates.

Transportation Fuels

B-33. (multiple comments)
Comment: Transportation emissions should be considered in the Cap and Trade program only if a formal review determines that this action is necessary and implementation would be more cost-effective than other policy approaches in achieving GHG reduction from the sector. If it is determined necessary to include emissions from the consumer use of transportation fuels in the Cap and Trade system, the program should be designed to create a clear carbon price signal for consumers, reduce obligated party exposure to allowance price volatility with respect to the consumer compliance obligation, and help companies manage working capital requirements associated with the consumer emissions compliance obligation. (CONOCO2)

Comment: ConocoPhillips has considered various options for managing transportation fuel emissions in a Cap and Trade program. We believe a fixed price allowance program as outlined below could address some of the identified concerns:

- The State would set aside the volume of allowances necessary to cover transportation consumer emissions from use of gasoline and diesel fuel.
- The State would establish a price for those allowances based on some average of recent allowance market prices. That price would be adjusted periodically.
- Only obligated fuel providers could purchase the set-aside allowances at the established price noted above.

The program would also have the added benefit of reducing unnecessary administrative burden while still achieving the intended program goals. Stationary source emissions from the refining sector and other covered entities should not qualify for this set purchase price program. (CONOCO2)

Comment: CMTA is concerned about the impact of including transportation fuels under the cap beginning in 2015. The Scoping Plan proposed inclusion of transportation fuels in the cap-and-trade program beginning in 2015, largely due to the expectation that WCI states would address fuels this way in their state programs. Since California is already implementing the Low Carbon Fuel Standard, and no WCI states are prepared to link to California's Cap and Trade rule, we recommend that the leakage impacts of a California-only fuels-under-the-cap (on top of the LCFS) be studied and that a decision with regard to the treatment of transportation fuels under Cap and Trade be postponed pending that analysis. (CMTA)

Comment: WSPA continues to oppose ARB's proposal to include fuels under Cap and Trade in 2015 because there are too many unanswered questions about how this system will operate, both initially (during the first 2-year period) and in subsequent years when fuels are categorically included within the Cap and Trade program starting in 2015. We have previously asked ARB to study issues and alternatives relating to inclusion of fuels within a Cap and Trade program before finalizing a decision whether to include fuels within this program. In addition, WSPA has highlighted a number of issues related to reporting and verification of product data reporting in the Mandatory

Reporting Regulation that will require further discussion and evaluation. WSPA recommends that for this regulatory package, ARB defer inclusion of fuels within a Cap and Trade program until a thorough study of the alternatives to inclusion as well as the economic and environmental implications of possible ARB actions are clearly defined. In order for that study to be completed and reviewed, at a minimum, ARB should defer inclusion of Fuels within a Cap and Trade program until the onset of the 3rd compliance period in 2018. (WSPA3)

Comment: Fuels should not be included under the cap due to excessive costs to the consumer and business and the inequities created between industries. Placing fuels under the cap will place a high financial burden on providers and/or users of propane, gasoline and distillate fuel in California that may delay or defeat economic recovery for the state. Emissions from consumer use of these products results in about 170 million tonnes/yr of emissions. At the minimum auction price of $10/tonne, this burden would equate to approximately $0.10 per gallon or approximately $1.5 to $2.0 billion per year. California gasoline taxes are the fourth highest of any state in the US and about 40 percent higher than the national average. California diesel taxes are the highest in the nation; specifically 55 percent higher than the national average. Though California's population has grown slightly during recent years (due to foreign immigration and births), more people have left California for other states than have moved here. Cost of living is frequently cited as a primary reason for citizens and businesses leaving the state. This cost burden of including fuels under the cap is not only excessive it creates inequity in the Regulations between industry that additionally impact consumers and businesses. Power generation and imports result in approximately 90 million tonnes/yr of CO_2e emissions, yet free allowances to the utilities will offset an estimated 94 percent of the cost of carbon over the life of the program. No allowances are proposed for producers or consumers of fuel. Including fuels under the cap is redundant with the low carbon fuel standard and vehicle mileage standards. Also, as presently structured, treatment of fuels under the cap is inequitable relative to treatment of utility power. The cost to producers and/or consumers of fuels will be excessive. (TESORO2)

Comment: Transportation fuels should not be subject to the Cap and Trade program. The inclusion of transportation fuels under the Cap and Trade program will have profound financial impact on the State of California. As one of the single largest forms of energy subject to Cap and Trade, the refining industry will purchase billions of dollars of allowances to cover fuel emissions. The consumer will bear this steep financial penalty while the State will recover these funds and reap the benefits. The goal of reducing GHG emissions will only manifest itself through reduced fuel consumption brought about by price increases—a result no different than applying carbon taxes. We strongly urge CARB to abandon this approach of regulating transportation fuel GHG emissions. To the extent that CARB continues to treat transportation fuels as part of the carbon management portfolio, we request that CARB more fully consider a carbon tax on fuels as this market mechanism will eliminate much of the complexity, variability, and bureaucracy that accompany a Cap and Trade program. (VALERO2)

Comment: CARB should not extend the Cap and Trade program to consumer emissions from use of transportation fuels. This element of the program is a clear overlap of the federal Renewable Fuels Standard and the State LCFS programs. Adding the enormous burden of consumer carbon emissions due to fuel combustion to California's Cap and Trade program will overrun the program's capabilities and could compromise its success. The probable step-change in consumer product costs to cover this additive element for gasoline and diesel would only escalate leakage of jobs and businesses that rely on petroleum products. Instead, CARB should allow existing Federal programs to address GHG emissions in this sector. This is consistent with the approach adopted in the European Union. (CONOCO2)

Comment: We believe treatment of fuels-under-the-cap issue needs to be revisited. The Scoping Plan proposed inclusion of transportation fuels in the cap-and-trade program beginning in 2015, largely due to the expectation that Western Climate Initiative states would address fuels this way in their state programs. Since California is already implementing the Low Carbon Fuel Standard, and no WCI states are prepared to link to California, we recommend that the leakage impacts of a California-only fuels-under-the-cap (on top of the LCFS) be re-examined. Since CARB does not intend to implement Fuels under the Cap until the 2015-2017 compliance period, it is important for CARB to take the opportunity now to assess all available alternatives in addressing transportation fuels in a simple and comprehensive framework under AB 32. (AB32IG2)

> **Response**: This comment falls outside the scope of the first 15-day change notice. Nevertheless, we believe that including transportation fuels in the program in 2015 provides a consistent price on GHG pollution throughout the economy and ensures a level playing field across all fuels and consumers. We believe that there are important benefits of including transportation fuels and fuels for residential, commercial, and small industrial users. We also believe that it is appropriate to initially bring these fuels into the program on a reporting-only basis for the first compliance period. This will provide time for ARB and transportation fuel deliverers to work through any issues in the reporting system before they have a compliance obligation beginning in 2015. We will work with our WCI partners and linkage will require a separate rulemaking process where issues would be investigated such as concerns regarding leakage.
>
> If we determine that the cap-and-trade program is not achieving the objectives as defined by AB 32, or if substantial, unanticipated adverse economic or environmental effects are identified (e.g., substantial leakage), we will revise the operation and/or design of the program accordingly. There are also several cost-containment measures that are integrated into the program, including the use of offsets, three-year compliance periods, and the Allowance Price Containment Reserve.

Low Carbon Fuel Standard (LCFS)

B-34. Comment: Section 95820 authorizes ARB to issue GHG allowances and offset credits as compliance instruments that is an authorization to emit a ton of CO_2e GHG.

WSPA believes that compliance instruments from a cap-and-trade program should be eligible for compliance in other programs such as LCFS. WSPA recommends adding a provision allowing compliance to LCFS via transfer of compliance instruments from a Cap and Trade program. (WSPA3)

> **Response:** These comments fall outside the scope of the first 15-day change notice. Currently, to maintain the effectiveness of the program, the LCFS allows the export of LCFS credits to other programs that will accept them, but does not allow importation of credits into the LCFS program. As required by the LCFS regulation, staff is conducting a formal review of the LCFS and may consider assessing credit options in the LCFS program. We do not agree that credits should be used and transferred between the cap-and-trade program and the low carbon fuel standard. They are separate regulations and credits have different definitions in each regulation and are subject to different protocol requirements. The LCFS also looks at carbon intensity while cap-and-trade looks only at actual emissions. There is no direct correlation between the two systems. However, the cap-and-trade program considers any reductions in direct emissions as the result of compliance with LCFS to be recognized and counted as a benefit toward a capped entity's compliance obligation.

B-35. Comment: The high carbon intensity crude oil (HCICO) component of the LCFS regulation disadvantages in-state refinery operations and does nothing to help meet the goals of the AB 32 program. It will likely result in "crude oil shuffling"' and in combination with the full LCFS program lead to loss of high-paying refining and related manufacturing jobs to other states and countries. It also creates immediate competitive advantages for certain in-state producers and refiners of California heavy crudes because these crudes are grandfathered in the program, disadvantages other in-state refineries because they have no crude oil production in the State, and fails to address the fact that refineries outside of the State could process HCICO and then send the partially-refined intermediate or even finished products to California with no potential for enforcement. The HCICO component of the LCFS regulation should be eliminated.
If CARB chooses to proceed, we strongly urge CARB to carefully evaluate and consider the five alternatives (and others) that the LCFS Advisory Committee has described and to work with our industry to carefully evaluate these options and ultimately correct the inequities described. (CONOCO2)

> **Response:** This comment is outside the scope of the 15-day change notice and the proposed changes to the cap-and-trade regulation. The high carbon intensity crude oil (HCICO) component of the LCFS regulation is being addressed in a separate rulemaking related to proposed staff amendments to the LCFS.

Linkage

B-36. (multiple comments)
Comment: PG&E supports linkage to other GHG emissions trading systems as a way to enlarge the Cap and Trade market. PG&E encourages ARB to develop linkage

agreements with other WCI jurisdictions. (PGE4)

Comment: CCEEB recommends expediting linkage and making it a priority to be completed. If linkage is not possible, then CCEEB believes that other cost-containments measures must be adopted to soften the economic impact of this regulation and limit leakage of jobs and emissions. (CCEEB3)

Comment: PG&E believes a well-designed, multi-sector Cap and Trade program linked with emerging regional, national, and international programs will allow California to meet its greenhouse gas (GHG) emission reduction goals in a cost-effective manner as required by AB 32 (Cal. Health and Safety Code, section 38560). While ARB has made progress with the design of the Cap and Trade program, we believe that the program will benefit from additional review and modification based on the input of stakeholders and by engaging an independent market design expert to review the GHG market and its impacts upon energy markets to ensure both are able to function in concert with each other. In this regard, we welcome ARB's decision to defer the start of the cap-and-trade compliance obligation until 2013 to allow necessary testing of auction systems, design and protocols in the first half of 2012. It is critical to test the robustness of the auction systems, design, and protocols through market simulations in the first half of 2012. Equally important is to test the auction's potential vulnerability to manipulation through "table top" and other market simulation exercises, with oversight by market auction experts. Through such testing, ARB will be able to identify possible weaknesses in the design and undertake remedies prior to commercial and financial commitments being made in the first two auctions in 2012. (PGE4)

> **Response:** This comment falls outside the scope of the first 15-day change notice. Nevertheless, we recognize the importance of linkage with other regional, national and international programs. Subarticle 12 of this regulation provides possibilities for linkage, including procedures to evaluate external GHG emissions trading system. Furthermore, we will begin to test the market in 2012 and compliance requirements for covered entities start in 2013. This change ensures that all central elements of the program are developed and tested in 2012 before we move into the first year of compliance in 2013.

C. ALLOCATION OF ALLOWANCES

General Comments

Applicability and Methods

C-1. Comment: SCE appreciates the release of ARB's detailed allowance allocation proposal, which provides an equitable allocation method based on customer cost burden, energy efficiency accomplishment, and early action as measured by investments in renewable resources. (SCE3)

Response: Thank you for your support.

C-2. Comment: We encourage CARB to develop a straightforward LCFS process that can also be used for granting free GHG allowances to transportation hydrogen producers. (ICCT3)

Response: Your comment has been noted.

C-3. Comment: Uncapped establishments will not be subject to any form of direct GHG regulation and thus will not incur any costs in implementing reductions, buying and selling allowances, or in regulatory compliance, associated with AB 32. Regulated facilities are likely to face a competitive cost disadvantage to firms that provide a close substitute. The uncapped facilities, smaller emitters in this case, can increase their output and attendant GHG emissions, thus defeating the intent of AB 32 to reduce overall GHG emissions. Providing free allowances to large food processing emitters only partially mitigates this situation. In an industry where so much of the competitive in-state production will fall below the regulatory threshold, and so few of the capped facilities have large emissions (only a half dozen of the sector 3114 plants emit more than 50,000 tons), better public policy is to uncap the entire food processing sector and leave the emission reduction strategies to other means. For food processors, almost all emissions come through either natural gas or electricity use. The load serving entities for both natural gas and electricity will be under the Cap and Trade program by 2015. The energy utilities will have strong incentives to encourage their customers, including food processors, to reduce their emissions through utility-based programs and measures. Thus, the food processing sectors will be regulated through an alternative means, but in a less costly manner. CLFP recommends designating food processors (NAICS 3114) as an uncapped sector. (CALFP3)

Response: We do not agree the food processing sector should be uncapped in 2013. The cap-and-trade regulation is intended to regulate emissions from sources responsible for approximately 85 percent of California's GHG emissions, and in order to do this, large industrial sources and processes with annual GHG emissions at or above 25,000 $MTCO_2e$ must participate in the cap-and-trade program. The inclusion threshold balances broad coverage to provide the greatest possible reduction opportunities with minimizing administrative complexity in the beginning of the program. Including all sources at or above the threshold provides equity across all large stationary sources of emissions. In 2015, we include upstream coverage of fuel combustion at sources below 25,000 $MTCO_2e$. We will continue to monitor leakage of emissions to out-of-state or to in-state uncovered emitters that are below the threshold. The MRR will require reporting of emissions greater than 10,000 $MTCO_2e$, in order to monitor shifts in emissions from capped to uncapped producers within California.

Ten Percent Allowance Reduction

C-4. (multiple comments)
Comment: In Table 9-1, Industry Assistance Factors, WSPA believes that the 100 percent shown in the 2012-2014 columns for many sources does not "square" with ARB's proposal for a 10 percent haircut in initial allocations in Appendix B. (WSPA3)

Comment: It is important to keep in mind that for companies who have been designated as trade exposed, free allocation of allowances is a way to mitigate this trade exposure and to lessen the impact of a transition to a low carbon economy. CARB has concluded that free allocation of allowances, especially early in the program, is necessary and warranted to address trade exposure and to provide for a transition period. Therefore, when considering a method to distribute these free allowances, it is important that the method chosen and the design elements of that method do not run counter to the intentions of freely allocating allowances. Of most concern in this regard is the intention to reduce initial allocation by 10 percent (either through the benchmarking process or in other ways), which is suggested by staff to be necessary in order to fund various accounts or programs. This massive reduction in allocation would increase compliance obligations on affected regulated parties by 250 percent (from 4 percent to 14 percent) in the first compliance period—a period which was originally designed as providing a "soft start" and transition period for regulated entities. The justification for, and design of, a "soft start" to the Cap and Trade program was very carefully considered. The treatment of trade exposure and leakage avoidance was carefully and thoughtfully analyzed by staff with a primary result being full allocation in the first compliance period to sectors determined to be trade exposed. To the contrary, there seems to be little justification, rationale or analysis to support or explain consideration of a massive reduction in first compliance period allocation that would result in a 250 percent increase in the compliance obligation at the outset of the program. We strongly urge CARB to rescind any consideration of a reduced allowance allocation (or "haircut" as it has been referred to). The use of the first compliance period should continue to be viewed as a period that while it will deliver real, tangible emission reductions, allows regulated parties to transition to a low carbon economy. If any reduction in allocation is deemed necessary to fund various allowance accounts these allowances should come from sectors that have not been determined to be trade exposed, or that will benefit from the programs to which these allowances will be allocated (for instance, the electric utility sector should fund the VREC account, as voluntary renewables will reduce their compliance obligation). (BP2)

Comment: The proposed initial 10 percent "set aside" of allowances is unexpected and not recommended. A graduated start of the program, as presented in the Scoping Plan, would give California consumers and businesses time to adjust to the cost impacts of this regulation. This is particularly relevant given the now truncated first period of the program. (CONOCO2)

Comment: CARB proposes less than 100 percent allowance allocation for various industrial sectors in future compliance periods despite the fact that it has determined that these sectors, due to their energy intensity and trade exposure, qualify for 100 percent free allowance allocation. For those sectors determined to be energy intensive and/or trade exposed, CARB should be providing 100 percent free allowances, consistent with its own policy and in the interest of achieving the target reductions in the most cost-effective manner possible. (CALFP3, CMTA3)

> **Response:** We do not agree with the comments. As described in Appendix J of the Staff Report, product-based allocations are based on industrial product output and three other terms: (1) the product benchmark, (2) the assistance factor, (3) a cap adjustment factor. The 100 percent referred to by the commenters is the assistance factor term in this equation. The ten percent comment relates to the stringency of the benchmark term. We selected a benchmark stringency that reflects the emissions intensity of highly efficient, low-emitting facilities within each sector. The product-based benchmark for each activity is based on the largest of (1) 90 percent of the average emissions intensity for the sector, or (2) the emissions intensity of the best performer in California. More-efficient facilities, especially those with efficiencies better than the benchmark, will initially be receiving more allowances than they will need. Less-efficient facilities will need to purchase allowances to fulfill their compliance obligations. This is an incentive that we built in the system for industrial sectors to reward entities that took early action to reduce GHGs. This level of free allocation to each sector will be sufficient to minimize leakage and provide appropriate transition assistance.

Increase in Auctioning of Future Vintages

C-5. Comment: ARB's modified Cap and Trade draft Regulations allocate significant levels of permits to covered entities in the early years of the program, moving to an auction of greater volumes of allowances over time. We do notice on July 18, 2012, ARB now plans to transfer 10 percent of benchmark allowances for allocation from budget years 2015-2020 to the Auction Holding Account. This percentage is significantly increased from the originally proposed transfer of two percent and IETA has concerns about this "haircut" in allocated allowances starting in 2015. At this rate, industry will find it very difficult to adjust to the increased costs of auction, threatening competitiveness, jobs and consumer energy prices. Furthermore, allocating allowances helps to minimize leakage and prevent California industries from being put at a competitive disadvantage. Significant time and capital investment are needed to meet long-term emissions reductions goals and transition California to a lower-carbon economy. IETA recommends this ten percent haircut be returned to the original two percent. This will better help participants acclimate to the market and permit time for large capital investments to yield emissions reductions, keeping costs down, reducing trade exposure, and improving efficiency. (IETA3)

> **Response:** It appears that the commenter is referring to the increased amount of 2015-2020 allowances dedicated to an advanced auction. Auctioning of future vintage allowances will allow for development of a forward allowance price curve to inform long-term decision making by market participants. Selling future vintages also allows covered entities to begin to hedge against their future compliance obligations. The amount of advance auction was increased from 2 to 10 percent due to compliance entities' concerns about the ability to prepare for compliance obligations associated with upstream coverage of gasoline, diesel, propane, and natural gas.

Eligibility

C-6. Comment: Section 95890 requires that an entity obtain a positive or qualified positive verification statement to be eligible for direct allocation. WSPA believes this section needs to recognize that there are circumstances where an entity cannot get a qualified positive product data verification. This is a new procedure that could have complications. WSPA recommends that the Regulation be amended to allow an EO decision or a method for direct allocation in case a decision is pending on a qualified positive verification or in case of an adverse verification opinion. (WSPA3)

> **Response:** We do not believe there is a need to modify the regulation to allow an EO decision or a method as requested by the commenter for direct allowance allocations for entities that did not obtain a positive or qualified position product data verification. Appropriate flexibility is already included in the verification process.

Multi-Year Allocation

C-7. (multiple comments)
Comment: Under the current revision, CARB proposes to issue allowances on a one year forward basis and not multiple years. Choosing annual allocations over multi-year allowance allocations creates uncertainty for entities in terms of financial and capital planning purposes. It is not feasible for a facility to responsibly plan an expansion or retrofit for future years without knowing how it will obtain allowances to cover facility emissions in future years of the project. (CALCHAMBER3)

Comment: Per section 95910, CARB proposes to only issue allowances on a one year forward basis (not multiple years). This creates extraordinary and unnecessary uncertainty for financial and capital planning purposes. In addition, CARB is only auctioning off current year allowances and a limited amount of two year-ahead allowances, instead of multiple years of allowances. Limited allocations and auctions make it very difficult for new facilities and projects with traditional multi-year (e.g., 15-30) planning horizons. Some facilities, when faced with this uncertainty, can be expected to choose to site or expand facilities in states not subject to AB 32. As a result, CARB should follow the Acid Rain and RECLAIM program examples whereby sources are issued and allowed to trade multiple years of credits. (CANTORCO2E2, CIPA)

Comment: Without the benefit of multi-year allowance allocations, regulated entities will not be able to properly determine their growth potential and plan accordingly to select new sites or expand current facilities. A multi-year allocation approach allows regulated entities the time necessary for capital planning purposes. It is not very feasible for a facility to responsibly plan an expansion or retrofit that will take multiple years, if it must start the project without knowing how it will obtain allowances to cover facility emissions in future years of the project. Multi-year allocations will allow businesses to plan ahead. (CALFP3, CMTA3)

> **Response:** We do not believe that multi-year allocations are necessary. We believe that there is enough information in the regulation for a firm to forecast an expected allowance allocation through 2020. Because allocation is tied to production, if the firm can anticipate future levels of production they can calculate their allowance allocation for that period.

New Entrants

C-8. Comment: CARB should expand the “New Entrants” provision for the issuance of allowances to recognize significant expansions and modifications in operations. ConocoPhillips support CARB's provision to grant emissions to "New Entrants." ConocoPhillips strongly recommends that this provision be extended to facilities with "significant modifications" completed prior to 2011. The standards for a "significant modification" can be established with enough stringency to appropriately limit its use. For the refining sector, this could be defined as a project that required full CEQA review and exceeds certain production output thresholds. (CONOCO2, WSPA3)

> **Response:** We do not believe there is a need to expand the new entrants provision in Section 95891. Our preferred allocation approach is to use product-based benchmarks, which are used for the majority of facilities under the cap-and-trade program. In the case of product-based allocation, growth at an existing facility would increase the amount of product, thereby increasing the amount of free allocation. The energy-based allocation methodology, which contains the new entrant provision, is not the ideal method, and is only used for a small number of facilities whose products currently pose challenges to the use of the product-based allocation methodology. We believe that allowing for incumbent facilities in the energy-based allocation methodology to obtain more allowances for increased energy use may create perverse incentives to emit more greenhouse gas emissions. If possible, we would like to work with facilities

in the energy-based allocation methodology to develop product benchmarks and switch to the use of product-based allocation methodology for all facilities that are interested in expansion.

Facilities Dropping Below Threshold

C-9. Comment: In section 95812(e), if a facility leaves the program because its emissions drop below the threshold level it is not clear what happens to any allowances it has received free of charge. It also is not clear from the rule language whether leaving the program because of a decrease in emissions is optional or mandatory. We suggest a clarification of the consequences associated with a decrease in emissions and a provision similar to section 95813(f) for opt-out of opt-in entities, requiring surrender of allowances. (SCAQMD4)

Response: We disagree that additional clarification is needed. If a facility leaves the program, it retains all allowances it has received free of charge after accounting for the compliance obligation associated with all years for which it received free allocation. If a facility wishes to remain in the program after dropping below the threshold level of emissions, it may do so through the "opt-in" provisions of the regulation.

Effect on Industry of Increasing Electricity Allocation

C-10. Comment: WSPA is concerned that the allowance allocation system proposed by ARB would provide the electricity distribution utility sector "more than their share" of allowances, while other industries, including the petroleum industry, would be then given the "left-overs" on a pro-rata basis. Specifically, under the proposed allocation scheme outlined in Appendix A of the July 25, 2011 Proposed 15-day modifications, the electricity distribution utility sector will get 100 percent of customer cost burden plus 25 percent of their expected energy efficiency savings plus an amount related to renewable energy investments that they made in 2007 thru 2011. Approximately 1 percent of these allowances are allocated in recognition of projected energy efficiency, 0.5 percent of allowance from years 2013-2014 are allocated for recognition of renewable electricity emission reduction. Hence, the utilities' allocations would be in excess of their expected customer cost burden in 2013 range from 0.17 percent to 25.5 percent. Allowances should be allocated proportionally among all sectors. We think it critical that all sectors are treated equitably and that all industry including the petroleum industry be provided the same recognition for energy efficiency and early reduction as is given to the electricity distribution utility sector. (WSPA3)

Response: We do not agree that the allowances should be allocated proportionate to sector emissions. Our justification for allocation to electrical distribution utilities is fundamentally different than the justification for allocation to industrial sectors. The industrial allocation approach is designed to provide transition assistance and minimize emissions leakage. The electrical utility allocation is designed to protect electricity customers and provide these customers with rewards for utility investment in renewable energy and energy efficiency. Any allowance allocated to electrical distribution utilities must be used exclusively for the benefit of the retail ratepayers of each such electrical distribution utility, consistent with the goals of AB 32, and may not be used for the benefit of entities or persons other than such ratepayer. Industrial allocation is not subject to the same limitations. The differences between these two allocation categories are the reason that allocation to electrical utilities was not included in the pro ration of allowances to industrial producers.

C-11. Comment: Section 95870(d) has an increased allocation to electrical distribution utilities from 89 to 97.7 million metric tons CO_2e. This increase has the possibility of decreasing the allocations to industry assistance. It is not clear why this increase has occurred and what the potential effect it could have on industrial facilities. (CCGG2)

Response: We did not change the apportionment of allowances to the electricity sector. The Staff Report recommends that a set number of allowances be set aside each year for the electricity sector, starting with the 2012 allocation at 90 percent of 2008 electricity sector emissions, and declining linearly to 85 percent of that value by 2020. Using the mandatory reporting data, the 2008 emissions from electric generating facilities and imports were 98.9 million metric tons (MMT), so that 90 percent would be 89 MMT. Additionally, a portion of the electricity produced at facilities that identified themselves as cogeneration facilities was purchased by electricity distribution utilities. Using publicly filed data for 2008 and a heat rate based on the pending CPUC QF settlement, the estimated equivalent emissions from QF purchases is 9.67 MMT, so that 90 percent of this value is 8.7 MMT. The recommended 2012 allowance allocation to the electric sector is therefore the sum of 89 and 8.7, equal to 97.7 MMT. This approach was initially proposed in Appendix 1 to Board Resolution 10-42, entitled *Staff Proposal for 15-Day Changes to Address Electricity Sector Allowance Allocation*. This approach does not affect the amount of allowance allocation for industrial assistance.

C-12. (multiple comments)
Comment: Section 95870(e)(3) has an addition that in the event of a shortfall in available allowances, the industrial covered entities would only get a prorated amount of the available allowances after (a) through (d) are distributed. It is unclear why the industrial sector must bear the entire shortfall. A more equitable distribution of the shortfall would be to prorate the shortfall among sections (a) through (e). A spreadsheet that simulates the available allowances for sections (a) through (e) based on the latest reported emissions data would be helpful for regulated entities to better understand potential shortfalls. We ask that ARB make such a spreadsheet available to the affected sectors prior to the release of any further modifications. (CCGG2)

Comment: The proposed changes to section 95870(e)(3) now provides that if the total amount of allowances available, after all other sectors have received their allotted amounts, should be insufficient to meet the amount allotted for the industrial sector, then such remaining allowances shall be distributed on a prorated basis to the industrial sector. This is unfair, as the industrial sector is forced to absorb costs that should be spread equally across all sectors. It suggests a duplicitous intent by CARB and the utilities to conceal the true costs of the AB 32 scheme from California taxpayers and ratepayers by shifting the cost of insufficient allowances to industrial stakeholders. Fairness demands that all stakeholders should be exposed to the risk of insufficient allowances without favoritism or prejudice against any stakeholder for purposes of political expediency. Food processors, in particular, do not have the financial stamina to absorb own legitimate costs of allowances as against well-financed corporations through the auction; and the costs of CARB's attempt to shield utility ratepayers from "rate shock" associated with the implementation of AB 32. CLFP recommends that all sectors carry equal risk as to limited allowances. (CALFP3)

Comment: Section 95870(e)(3) would give the electrical distribution utilities the first share of allowances and then all other industries get a pro-rated share of what remains. WSPA opposes this electrical distribution utilities first scheme. WSPA recommends that ARB strike the word "industrial" in section 95870(e)(3). (WSPA3)

Comment: In the modified text, CARB reaffirmed its intention to prorate allowances only in the industrial sector in the event that the amount of allowances dedicated to specific uses exceeds the amount of allowances available in a given year. As a result, the industrial sector assumes the full risk that CARB mistakenly over-allocates allowances. This approach is counterproductive to the goals of the program given the concentration of leakage risk in the industrial sector. Accordingly, CSCME recommends that: (1) all entities receiving allowances be subject to the risk of proration and (2) the sequence of proration among these entities be prioritized in order to minimize the risk in sectors highly exposed to leakage. (CSCME4)

> **Response:** We do not agree with the comments. We never proposed to capture proration of electricity sector allowances under this provision. The amendments made to section 95870(e)(3) serve to clarify this initial intent. Our justification for allocation to electrical distribution utilities is fundamentally different than the justification for allocation to industrial sectors. The industrial allocation approach is designed to provide transition assistance and minimize emissions leakage. The electrical utility allocation is designed to protect electricity customers and provide these customers with rewards for utility investment in renewable energy and energy efficiency. Any allowance allocated to electrical distribution utilities must be used exclusively for the benefit of the retail ratepayers of each such electrical distribution utility, consistent with the goals of AB 32, and may not be used for the benefit of entities or persons other than such ratepayer. Industrial allocation is not subject to the same limitations. The differences between these two allocation categories are the reason that allocation to electrical utilities was not included in the proration of allowances to industrial producers.

Confidentiality

C-13. Comment: CARB noted at its July 15, 2011 workshop that it is "seeking comment on confidentiality of firm-level allocation." Firm-level allocation information for cement plants should be kept confidential. CARB recently published a graph with individual emissions intensities of the nine California cement plants. Although the individual plant names were not specified, CSCME respectfully notes that CARB should not have released this sensitive information with this level of particularity, because the data for the California cement industry include only nine plants. Confidentiality concerns are particularly relevant to the cement industry. Members of the industry treat virtually all company-specific and plant-specific data associated with energy costs and energy efficiency as confidential, because the cost of energy is a key driver of total production cost in this energy intensive industry. Under a cap-and-trade system, the cost of GHG emissions will assume similar importance. If firm-level allocation information were made public, competitors would be able to calculate several key measures via the allowance allocation formula. The public release of such information could, when coupled with other public sources, provide competitors with the data necessary to calculate output, GHG intensities, and regulatory costs for individual cement plants. This information would provide out-of-state producers with an asymmetrical competitive advantage that could exacerbate leakage in the California market. CARB should maintain the confidentiality of firm-level allocation information and should ensure that appropriate measures are in place to safeguard this sensitive information. (CSCME4)

> **Response:** Thank you for the comments. Since this is outside of the scope of the 15-day changes to the regulation, no response is necessary. We do note that in general because the production intensities we reported in graphs included adjustments for electricity sold and steam purchased, these graphs do not necessarily reveal the amount of production or energy used for production at any individual facility, as suggested by the commenter.

Allocation Not Equitable

C-14. (multiple comments)
Comment: While the 15-day language contains much more information than previous drafts regarding program allowance allocations and other critical program elements, it does not fully protect covered entities against potential equity, leakage or other material concerns. For example, that for some sources the staff have proposed a benchmarking methodology that will result in allocating at program commencement only approximately one half (l) of the allowances they will need to comply. Starting facilities significantly “in the hole” will create very significant leakage pressure and punish companies that have made material investments in California, among other reasons, to assure that their products meet highly-stringent California environmental standards. There is simply no basis for the program to provide some sources with full economic protection at the outset of the program yet to punish others. We urge the Board and staff to correct the existing disparities and inequities among sources, particularly those that would exist at

the outset of the program, so as to assure maximum fairness, to minimize the redistribution of wealth that inevitably will result from such disparities and to protect against leakage that could occur in the absence of such corrections. (CCC2)

Comment: While the Regulation proposes to freely allocate most allowances, primarily to mitigate emissions and economic leakage, we have concerns that this approach does not guarantee 100 percent allowance allocation fairly amongst industry sectors. While it's important to aid highly energy intensive trade exposed entities through the free allocation of allowances, requiring medium or low leakage prone industries to purchase allowances in the second and third compliance period will unnecessarily increase the cost of compliance for businesses, expanding these costs across to other California businesses and consumers. As long as California moves forward by itself in a Cap and Trade program, the risk of economic leakage will remain high. CARB should take every step possible to avoid this scenario. (CALCHAMBER3)

> **Response:** The allowance allocation distribution was developed through careful deliberation and analysis. We believe the approach provides the correct amount of leakage prevention and transition assistance to all Californian industries. As described in Appendix J of the Staff Report, many entities are expected to be able to raise product prices and pass on carbon costs to their customers. Providing excessive free allocation to firms with a high level of cost pass-through ability would have led to windfall profits. To address this concern, those with a lower leakage risk will receive fewer allowances due to the assistance factor term in the allocation equation, beginning in the second compliance period. In the benchmarking term of the equation, we set the benchmarks to reward efficient firms for their past action and to encourage less-efficient firms to reduce their carbon intensity.

Alternatives to Cap, Facility Shut-downs

C-15. (multiple comments)
Comment: Section 95891 of the Regulations indicate that facilities may not retain (nor gain) allowances if they cease operations. Depriving sources with the ability to gain revenue from the shutdown of emitting units will increase compliance costs (when streams of allowances from shutdown facilities are repatriated back to the state, we can presume that they will be sold through a state sponsored auction with a minimum clearing price ($10 in 2012) that will likely be above that which is offered on the secondary market) and encourage older/inefficient emitting units to stay on line. Knowing that it will forfeit its allowances and credits, a source operator will be inclined to keep the source operating as long as feasible. This will have the effect of discouraging equipment replacement (thereby keeping inefficient sources online) and keeping credits from the market (thereby reducing supply). As a means to mitigate costs and encourage companies to remove older and inefficient sources, CARB should allow for the creation of shutdown-derived offsets. Further, should CARB elect to issue multi-year allowance streams, companies should be allowed to retain, redeploy, or sell

allowances that are no longer needed by sources that are curtailed or shutdown. (CANTORCO2E2)

Comment: We recommend that ARB specify the fate of any allowances provided to a facility free of charge if the facility leaves the program because its emissions drop below the threshold for covered entities (section 95812). Our experience shows that considerable disagreement can arise about these stranded allowances if their disposition is not clearly set out in the regulations. (CAPCOA2)

> **Response:** We do not agree there is a need to add additional detail to specify the fate of any allowances after a facility exits the cap-and-trade program. Covered entities that are no longer subject to the cap-and-trade program due to reduced emissions are no longer eligible to receive free allowances. The free allocation is not a property right given by the program. Rather, free allocation is an incentive for efficient facilities to continue to operate in California. This incentive avoids emissions leakage and creates a smooth transition into the carbon pricing regime. The "true-up" terms explained in sections 95891(b) and (d) ensure allocation is matched with activities in the actual compliance years for facilities allocated to under these approaches. For facilities allocated to under section 95891(c), the regulation clearly states that entities that are no longer subject to the cap-and-trade program receive no future allocations. Any excess allowances not needed to match against emissions from the covered period are retained by the entity and may be sold.

Benchmarks

Miscellaneous

C-16. Comment: Provide that the anomaly years (short season start-ups, etc.) will be excluded in setting the benchmarks for the compliance period in which they occur. The years prior to a facility expansion should also be excluded (i.e., new boiler additions to existing facilities). New boilers should be treated as a new process and eligible for separate benchmarking and allowance allocations. (CALFP3)

> **Response:** We agree that anomalous data should be excluded when developing representative baseline allocations under the energy-based benchmarks. As to the addition of new boilers, our preferred approach for treatment of expansion at incumbent facilities is to address this issue using updating product-based allowance allocation.

C-17. Comment: There are 18 industry categories in Appendix B. However, five of those categories (not including Paper or Paperboard) are responsible for at least 91 percent of the 2008 GHG emissions from industrial facilities within the scope of the program. Thus, CARB is proposing to develop GHG efficiency benchmarks for 13 categories contributing 9 percent of the emissions. Aside from the general concerns with benchmarks and the development of benchmarks based on so few facilities, the administrative burden of developing, implementing, and enforcing benchmarks on facilities representing 9 percent of the emissions is simply a waste of both CARB's and the facilities' resources. (AFPA2)

> **Response:** We disagree. It is consistent with the leakage-minimization goal of AB 32 to include as many industrial sectors as possible under product-based benchmarks. Free allocation under the product-based approach will be updated annually to ensure that additional compensation is provided if production increases. Other methods of free allocation do not provide such a strong incentive to maintain or increase in-state production.

C-18. Comment: Air Products recommends that CARB clarify its intent regarding how new entrants subject to product-based benchmarks are treated by adding text comparable to section 95891(c)(3) under section 95891(b). (APC2)

> **Response:** We did not add additional text. New entrants covered under product-based allocation will receive allowances based on actual production levels once these data are available. The "true-up" term in the product-based allocation equation ensures that allocation for a given year is based on production for that year. The provisions in section 95853 offer flexibility in when a compliance obligation is assessed for new entrants. This section helps ensure that entities will have received free allocation prior to being required to participate in a full surrender of allowances.

Methods

C-20. Comment: AB 32 explicitly recognizes the importance of preventing negative consequences to certain industries caused by the implementation of a GHG reduction program, including both in relation to the direct emissions of carbon in their manufacturing processes and to the indirect emissions of carbon associated with the electricity they must purchase in order to manufacture their products. It places on the CARB the responsibility to "minimize leakage" (Health and Safety Code, sections 38562(a) and (b)). CARB has an obligation to ensure that all of the AB 32 goals, including the goal of minimizing leakage, are carried through in the implementation of the Cap and Trade program. CARB has generally recognized its responsibility with respect to "minimizing leakage". Resolution 10-42 and the accompanying appendices set forth in detail the considerations that the CARB included in developing its policy as well as more detail as to how CARB expects AB 32 implementation to proceed. CLECA agrees with these sentiments. Our concern with the proposed Regulations is that the CARB has not provided a mechanism to assure full protection from leakage that occurs as a result of significant increased costs to EITE industrial firms resulting from higher electric costs caused by implementation of its Cap and Trade scheme. It really is not clear how CARB intends to ensure full achievement of its obligation to minimize leakage through the electric utility allowance allocation process. Neither the Regulation nor Resolution 10-42 expressly direct the CPUC to ensure that the allowance allocation methodology fully protects EITE customers and thereby minimizes leakage. The risk we perceive is that once those free allowances are monetized and the revenues are placed under the control of the utilities and their regulator, the CPUC, the CARB's ability to specify and dictate uses for such funds may be compromised. While the CPUC's role is the regulation of electric utilities' costs and service, the CARB is the agency charged with the task of assuring that leakage is minimized. Clearly, the CARB has offered its "instructions" for disposition of such allowance auction proceeds. Unfortunately, the CARB's "instructions" regarding the disposition of allowance auction revenues are not sufficiently specific with respect to EITE customers and leakage and further, they may carry the weight of mere "suggestions" in the context of CPUC ratemaking. It is the CPUC, not the CARB, which has exclusive jurisdiction over investor-owned electric utilities with respect to ratemaking. If the CPUC determines that a substantial portion of the allowance auction proceeds should be spent on purposes other than "minimizing leakage", perhaps simply because it has not been specifically charged with that responsibility, the CARB could find that its task has been compromised. The initial proceedings at the CPUC in R.11-03-012, its rulemaking proceeding to assess how to treat both anticipated higher wholesale electric costs and allowance auction proceeds resulting from implementation of Cap and Trade, suggest that some parties will strongly urge the CPUC to direct the electric utilities to spend such allowance auction proceeds for purposes other than minimizing leakage, indeed for purposes other than benefiting ratepayers. Yes, the CARB, once informed of such actions by the CPUC and/or the utilities, might engage in the very cumbersome and time consuming process of modifying its Regulations to change the way in which it grants free allowances to utilities, but that approach would prove highly unsatisfactory given the amount of dollars at stake with respect to each year's allowances. CLECA sees two potential solutions. One is for the CARB to include such indirect electric costs in its determination of the benchmark for each EITE industry and to distribute allowances to such EITE entities sufficient to cover such costs, along with direct costs. This would, of course, require that allowances which were to be provided to the electric utilities to cover the usage of EITE customers are instead provided to the EITE pool. CLECA urges CARB to reconsider this aspect of its Regulations, specifically sections 95891 and 95892. Specifically, CARB should add a term to the Product Output-Based Allocation Calculation Methodology. Modify section 95891(b) as follows:

kWh purchased from the utility x utility emission factor/kWh.

CLECA believes that full protection of EITE customers requires that the allowances to be provided to them must include both direct and indirect costs and that the benchmarks can be set to accomplish that task. If indirect costs for EITE customers are covered in their allowances, such allowances would be deducted from those provided to the electric utilities and the utilities would be instructed not to give EITE customers any portion of the utilities allowance auction proceeds so as to avoid a double recovery. A second approach would be for the CARB to much more explicitly condition its grant of free allowances to electric utilities. CARB would make conditional its grant of free allowances to the utilities on their assuring that auction proceeds are used, in part, to fully cover the indirect costs of EITE customers. If the funds needed to cover EITE indirect costs were used for other purposes, the grant of allowances to the utilities would be adjusted downward and instead would be allocated by CARB directly to EITE customers. AB 32 places the responsibility to "minimize leakage" on the CARB and the CARB must adopt regulations which will effectively carry out that mandate. Modify section 95892(d)(3) as follows:

> <u>(D) Investor owned utilities shall use a portion of the auction proceeds to fully offset the greenhouse gas compliance costs reflected in the electricity rates charged to energy-intensive, trade-exposed customers consistent with the goal of AB 32 to limit emission leakage.</u> (CLECA)

> **Response:** We designed the regulation to minimize leakage as practicable while fulfilling the goals of GHG reduction mandated by AB 32. We believe it is premature to add provisions to the regulation to include indirect emissions associated with electricity at this time. This is because purchased power may not create an indirect carbon cost in all California utility service territories. It is our goal to see a carbon price properly embedded in all utility rates. If and when this occurs, the compensation for these indirect carbon costs could be incorporated into the product benchmarks (or reductions in these costs created in some other fashion) to help minimize leakage. We do not believe that a per kilowatt hour rebate is appropriate.

> As noted in the Staff Report, we are committed to monitoring how covered sectors, especially those that receive free allocation, address carbon costs once the program is in place. The goal of free allocation is not to “fully offset” greenhouse gas compliance costs; rather, the goal is to provide the correct incentive to maintain or increase production in California of highly greenhouse gas-efficient facilities, and thus minimize leakage and reduce greenhouse gas emissions.

> We are collecting product data from almost all sectors at risk for leakage. The data set from this collection will also serve as a key monitoring step in detecting leakage. We anticipate that the combination of using rigorous benchmark formulas and basing the free allocation on production data should ensure that free allocation appropriately minimizes leakage.

> We will revisit the issue of carbon costs embedded in purchased electricity once the CPUC proceeding addressing utility costs and revenue issues associated with greenhouse gas emissions concludes

> Per Board Resolution 10-42, we will continue to review information concerning the emissions intensity and trade exposure of different industries in California. We will recommend changes to the Board on leakage risk determinations, if needed, prior to the initial allocation of allowances for the first compliance period starting in 2013 for industrial sectors not identified in Table 8-1 of the cap-and-trade regulation. We will also do the same exercise prior to the initial allocation of allowances for the second compliance period starting in 2015, for industries

identified in Table 8-1 of the cap-and-trade regulation. Further, we will update the Board annually on the status of the cap-and-trade program, including, to the extent feasible, information on shifts in business activity that may result in emissions leakage and changes in market share for covered entities and sectors.

C-21. Comment: The CAF should be applied only to energy-related GHG emissions. CARB should exclude process emissions from the CAF for all industries. Unlike energy-related emissions, there is no practical technology for capturing or sequestering them. Purchasing allowances for process emissions will result in tremendous increases in the cost of these commodities, harming the industries' customers in essential industries. These increased costs will not encourage measures to reduce process emissions because the only way to reduce them is to curtail manufacturing. This will cost jobs, and send production overseas and to states other than California. Excluding all process emissions is a preferable approach because it is based, not on qualitative judgments as to how disproportionately large an industry's vulnerability is to leakage, but rather on what CARB staff intended to do, i.e. provide a separate rate of decline, and in effect applying the cap decline factor only to the energy use portion of the industries emissions. (NLA)

Response: We did not exclude all process emissions because we believe abatement options for these emissions could be developed in the future. We added additional flexibility in the cap adjustment factor for some sectors with process emissions that are greater than 50 percent of total emissions. Please refer to section 95891, Table 9-2.

C-22. Comment: Under section 95891(c), the Energy-based Allocation Calculation Methodology, facilities utilizing backpressure steam generation maybe be penalized. According to the formula for calculating GHG allowances, steam consumed at the industrial facility for any industrial process shall exclude any steam used to produce electricity. This promotes inefficiency since electricity produced in many industrial processing facilities is simply a byproduct of the process. A modern more efficient processing facility does not burn additional fuel to produce electricity, but captures energy that would otherwise be lost while supporting facility operations. In the backpressure turbine configuration, the turbine does not consume steam. Instead, it reduces the pressure and energy content of steam that is subsequently exhausted into the process header. With a backpressure turbine configuration, the energy produced by the turbine comes from reducing steam pressure, not from the generation of more steam. The efficiency gained from the utilization of these types of devices should be credited to the maximum free allocation, in addition to the 110 percent maximum limitation if a facility exceeds that limitation due to the inclusion of this device (as limited in section 95891(c)(2)). Staff has informed a CLFP member that a backpressure steam turbine generator has no negative impact in regards to section 95891(c). The variable "A_t," the amount directly allocated to an operator, will not be negatively adjusted and the facility will receive allocation based on the amount of fuel consumed ("$F_{consumed}$"); and that that no additional fuel or steam energy is consumed in the system as a whole from the backpressure steam. Therefore, CLFP requests that CARB modify section 95891 to reflect the above. (CALFP3)

> **Response:** We do not believe it is necessary to modify section 95891(c) significantly. We recognize that no additional energy is consumed in the system as a whole from the backpressure turbines the commenter describes. The fuel consumed by all units that produce electricity would be incorporated into the $F_{consumed}$ term. The backpressure turbine configuration generates no additional emissions and does not change the $F_{consumed}$ term. For clarification, in section 95891(c), the steam consumed term ($S_{consumed}$) was modified to explicitly exclude steam from any on-site cogeneration unit. If power produced from a backpressure turbine is sold, we expect the operator to recover some carbon cost in the price of the power sold, and would include this power in the e_{Sold} term.

C-23. Comment: We support requiring the industrial sector to base product benchmarks on best practices and allowing benchmarks to be dynamic over time, so that the rule provides additional incentives for using best practices to reduce emissions. (SIERRACLUBCA5)

> **Response:** We agree that benchmark stringency should reflect the emissions intensity of highly efficient, low-emitting facilities within each sector. We used a stringency based on the larger of 90 percent of the sector's average emissions intensity or best in California. We will review benchmark levels as part of required program reviews in the future.

C-24. Comment: CalChamber understands CARB's difficulty and challenge in establishing the industry benchmarks. The valid purpose of distribution benchmarks is to establish equitable bases for distribution of free allowances within industries, taking into account the complexity and existing energy efficiency of California facilities. Appropriate calculation of benchmarks is essential so that industry sectors know the anticipated cost of compliance, and can plan for future operations, projects, expansion, etc. We agree with a benchmarking system that rewards those facilities that are more energy efficient so long as the benchmarks are set correctly. (CALCHAMBER3)

> **Response:** No response is necessary.

C-25. Comment: In many of the cases presented in Table B of Appendix B, the proposed California emission intensity benchmarks are significantly higher than EU benchmarks, resulting in much higher emissions per ton of product. For example, the California emissions standard for Potash, Soda, and Borate Mineral Mining is 124 percent of the EU standard and for Recycled Boxboard Manufacturing is 200 percent of the EU standard. We are also concerned that the California benchmark for emissions intensity for cement plants is proposed at 0.786, while the EU standard (when adjusted) is only 0.716 (a significant 10 percent lower). We believe that ARB should be setting a world-class standard for GHG performance, and California industry should be able to meet or exceed EU standards. (EDLA)

Response: The European Union's Emissions Trading Scheme (EU ETS) benchmarks were developed based on selecting a value reflecting the average greenhouse gas performance of the top 10 percent of the installations in the EU that produced that product. This approach to stringency is slightly different from the 90 percent of average or best-in-California stringency that we used in our benchmarking. We believe our benchmark stringency rewards highly efficient facilities within California and, when combined with the other factors in the allocation equation, provides sufficient compensation to minimize leakage within each sector.

C-26. Comment: We recommend the identification of benchmark values (including identified impact levels where appropriate) for each identified metric that can act as a trigger for action by the agency. (EDF5)

Response: We do not agree that explicit triggers for action by the agency are needed in the regulation. Benchmarking is not used for setting the allowable level of emissions from any facility. The benchmark is one factor in the approach used to allocate free allowances. The goal of free allocation is to provide transition assistance to facilities in adjusting to the cost of compliance and to minimize leakage.

C-27. (multiple comments)
Comment: We recommend using these criteria to evaluate the GHG performance benchmarks: benchmarks should be transparent and based on publicly available information; the benchmark should be output (product) based, to maximize production in California; and the benchmark should be best in class to maximize carbon reductions and minimize associated criteria pollutants. (KUSTIN13)

Comment: CARB is proposing the use of a GHG performance benchmark to assess the relative carbon intensity of emitters. Polluters who meet or beat the benchmark will be given more allowances and so face lower costs relative to producers who are heavy emitters with higher carbon intensities. USC recommends the following criteria be used to evaluate alternative GHG performance benchmarks.

- The benchmarks should be transparent and based on publicly available information
- The benchmark should be output (product) based, to maximize production in California.
- The benchmark should be best in class to maximize carbon reductions and minimize associated criteria pollutants. (UCS7)

Response: Our product-based benchmarking methodology considered various elements, including the ones suggested by the commenter. To the extent feasible, we developed benchmarks based on appropriate product metrics, production-associated emissions, appropriate benchmark stringency, cost, and technical feasibility of compliance options. By necessity, we collected some facility information that was deemed confidential business information in setting the production benchmark within each sector. In a market-based program such as a cap-and-trade program, benchmarking is not used for setting the allowable level of emissions from any facility. The benchmark is just one factor in the approach used to allocate free allowances. The goal of free allocation is to provide transition assistance to facilities in adjusting to the cost of compliance and to minimize leakage.

C-28. Comment: We are very concerned over the mixed approach of developing GHG performance benchmarks based on 90 percent of average in some cases and best-in-class in other cases. We urge ARB to adopt a consistent best-in-class approach based on national and international data where possible. (KUSTIN13)

Response: To develop each benchmark, we began by analyzing the average emissions intensity of each sector and constructed benchmarks set at 90 percent of this average. "Best in class" benchmarks were developed, exceptionally, for any sector where the "90 percent of average" benchmark would be more stringent than the emissions intensity of any existing California facility in that sector.

C-29. (multiple comments)
Comment: CMTA supports direct allocation of emissions allowances without charge. The fundamental principle on which CARB has decided to conduct direct allowance distribution is the prevention of leakage by protecting industries that are energy intensive and trade exposed. The valid purpose of distribution benchmarks is to establish equitable bases for distribution of free allowances within industries, taking into account the complexity and existing energy efficiency of California industrial facilities. Benchmarks should be developed that are supported by the affected industries and serve to distribute allowances equitably among members of the industry. CARB should not use benchmarking methodology to serve unrelated goals and thus undercut the basic principle of free allocation of allowances to prevent leakage of emissions and economic activity of energy intensive and trade exposed industries. Benchmarks that penalize the superior energy efficiency of California industries relative to competitors in other states or that distort the distribution of allowances among industry members without regard to energy efficiency could result in significant allowance shortages for industry members relative to their in-state competitors. This will result in large allowance shortages for many facilities, with significant adverse impacts for California businesses and their workers. (CMTA3)

Comment: While CLFP supports the basic policy direction of free allocation of emissions allowances, the purpose of distribution benchmarks is to establish equitable bases for distribution of free allowances within industries. Benchmarks should be developed that are supported by the affected industries and serve to distribute allowances equitably among members of the targeted industry. CARB should not be using benchmarking and other distribution methods to undercut the free allocation of allowances to energy intensive and trade exposed industries. CARB should not adopt benchmarking methods which penalize the superior energy efficiency of California industries relative to competitors in other states, or methods which distort the distribution of allowances among industry members without regard to energy efficiency. Energy benchmarks should be set based upon a national standard. Setting industry-wide benchmarks, using only California facilities after nearly 30 plus years of energy efficiency efforts and expenditures by California industries, will only further exacerbate the trade exposure of California industrial facilities. Industry in California will be even more susceptible to competitors or startups in states choosing not to enact climate change regulations on their industrial base. Unfortunately, in CARB's most recent proposals on benchmarking, the basic principle of free allowance allocation is being subordinated to secondary concerns. This will likely result in large allowance shortages for many facilities and significant adverse impacts for California businesses and their workers. (CALFP3)

> **Response:** The commenters believe that setting industry-wide energy benchmarks using only California facilities will exacerbate the trade exposure of California industrial facilities. We believe that benchmark stringency should reflect the emissions intensity of highly efficient, low-emitting facilities within each sector. The allocation strategy will minimize leakage by incentivizing continued production and improved emissions efficiency from all facilities in California. We do not agree that this will result in adverse impacts for California businesses. We compared the benchmarks we developed against available national information and data from the European Union. In many cases the Californian benchmarks were more generous than what would have been established using the national or international data. We will review benchmark levels as part of required program review in the future and will consider national data as more information becomes available due to mandatory reporting of greenhouse gas emissions to the U.S. Environmental Protection Agency.

C-30. Comment: We urge the Board to give facilities, whether using an energy-based or product-based benchmark, the ability to select one of three options for the baseline period: (1) average emissions for 2008-10, (2) average emissions for any consecutive two-year period between 2008-10, or (3) any single year within that period. (MILLERCOORS)

> **Response:** We did not incorporate the proposed approach. We believe we provided sufficient flexibility to select representative data in both product and energy-based allocation methodologies.

Indirect Emissions

C-31. (multiple comments)
Comment: The GHG emissions that are incorporated into any product-based benchmarks for all sectors should include the emissions for the net power and heat used to produce the product. In order to ensure that there is even treatment of operators with cogeneration facilities compared to net purchasers of electricity and heat,

indirect emissions from imported power and heat should also be included in the benchmark calculation. (WSPA3)

Comment: WSPA strongly supports ARB's determination that because oil and natural gas production operations are global in nature, California facilities are highly trade-exposed. A natural extension of this determination is that any factor that could affect competitiveness of the in-state oil and gas production sector should receive explicit consideration and appropriate compensation under the Cap and Trade program. For California producers, electricity usage in oil production can vary widely, and for some, represents a significant portion of energy consumed. The proposed Regulation indicates that industrial customers (including oil and natural gas production) may receive energy efficiency programs or other indirect assistance, instead of the direct allocation of allowances or allowance value to address carbon cost impacts. For oil and natural gas production, energy efficiency programs, which can be useful for residential consumers or small commercial enterprises, do not provide value. Direct allowance distribution to the oil and gas production sector, more fairly addresses the impacts of higher energy costs that would otherwise disadvantage this highly trade-exposed sector. To allay concerns over the potential "double counting" of allowances already thought to be provided to the utility sector, the allowances for imported electricity can be deducted from the utility sector to prevent double counting. WSPA understood that ARB staff had agreed prior to the release of the proposed Regulation that direct allocations would be provided to make the oil and gas production sector "whole," but not until the CPUC acts on utility pass-through rules. The proposed Regulation should clearly address the matter of allowance distribution associated with electricity consumption for the oil and gas production sector; and how the proposed Regulation will mitigate the impacts of higher energy costs that would further disadvantage this highly trade-exposed sector. (WSPA3)

Comment: Refineries that purchase their energy compared to those who generate their own energy must be awarded comparable levels of free allowances or be eligible for CO_2 cost rebates. Some refineries are self-sufficient, generating all of their own power, steam and hydrogen while others rely partially or totally on third party and public utilities for their energy supply. For those refineries that are self-sufficient, the generation of these utilities is considered "inside their fence" and therefore eligible for inclusion in their free allocation calculation. This compares to a refinery that purchases their utilities that may not be eligible for free allocation since they are not considered "inside their fence." The market will require the refineries who purchase their energy to pay for the CO_2 costs at a 100 percent basis with no free allocations, thereby giving them a disadvantage by increasing their costs in an area they have no control over. This will have the effect of picking winners and losers. (TESORO2)

Comment: In order to minimize leakage, CARB should allocate allowances directly to industrial facilities with high exposure to leakage to account for indirect emissions. Failure to account for indirect emissions in the construction of the cement industry benchmark increases the risk of leakage. CARB's revised Section 95892(a) might appear to address this concern by requiring electrical distribution utilities to use allocated allowances "exclusively for the benefit of retail ratepayers." This provision for indirect emissions, however, is inadequate, because no guidance is provided as to how to allocate allowances among ratepayers. Providing general guidance to use allocated allowances "for the benefit of retail ratepayers" is insufficient action to ensure CARB is fulfilling its mandate under AB 32 to minimize leakage. For industries with high exposure to leakage, CARB should allocate allowances directly to compensate for indirect emissions. This would be consistent with the approach that was proposed at the federal level in the Waxman-Markey bill and would ensure that CARB fulfills its statutory mandate to minimize leakage. (CSCME4)

> **Response:** We recognize the importance of indirect carbon costs. We include adjustments for purchased heat and for heat and power sold in both the product-based and energy-based benchmarking. We believe it is premature to add an adjustment for power purchased at this time. This is because purchased power may not create an indirect carbon cost in all cases. It is our goal to see a carbon price properly embedded in all purchased power, including utility rates. If and when this occurs, the compensation for these indirect carbon costs could be incorporated into the product benchmarks (or reductions in these costs created in some other fashion) as necessary to help minimize leakage. We will revisit this issue once the CPUC proceeding addressing utility costs and revenue issues associated with greenhouse gas emissions concludes.

Stringency

C-32. (multiple comments)
Comment: The petroleum industry is both an energy intensive and trade exposed industry and therefore should be eligible for 100 percent allowance assistance per section 95870. This fact makes it clear that benchmarking should be per the adjusted EII methodology. However, in Appendix B, ARB proposes a 90 percent benchmark stringency, in essence a 10 percent haircut from the Cap and Trade program. ARB has justified this 10 percent haircut in a number of ways, including the need to fund reserve allowances so as to fund program needs. WSPA does not agree with the stringency concepts for the 10 percent haircut, but understands the concept of holding back some allowance to fund various accounts when the Cap and Trade program is initiated. We are concerned however, that the initial 10 percent reduction in initial allocations implicit in ARB's proposal is excessive, unsubstantiated by need, and in fact may cause irreparable harm at the start of the program when it may be most vulnerable. The 10 percent haircut is excessive when one considers the provisions within section 95870 (Disposition of Allowance). We note that the proposed section specifies that 1 percent of the first compliance period allowance budget is to be set aside for the Reserve and 0.5 percent of the allowances from those same years are to be set aside for the Voluntary Renewable Electricity Reserve Account. Hence, it seems clear that 98.5 percent of total First Compliance Period allowances should be available for initial distribution to industrial facilities including the refining sector. This amount contrasts with the 90 percent remaining at the start of the program and does not even take into consideration the two percent reduction that is inherent in the program for 2013 and

2014. In short, if the 10 percent reduction in the initial year is realized, the first compliance period (2013 and 2014) will see a total reduction of 14 percent reduction in emissions— well in excess of program requirements and comprising nearly the entirety of the original AB 32 target. WSPA opposes this 10 percent reduction in initial allocations because its use will penalize all operations, even the high performing facilities. Any significant reduction in initial allocations will undermine one of ARB's key objectives in allowance allocation, which is transition assistance and minimizing leakage. (WSPA3)

Comment: ARB staff asserts that 10 percent reduction in all allocations is needed to fund all reserves. However, 10 percent reduction across the board appears to over-fund the initial reserve requirements while making compliance more difficult in the early (transition) years. In order to determine the most appropriate reduction in the initial allocation, ARB should calculate the actual amount of reserves required to be funded in the first two years and then determine what percent reduction is needed to fund that requirement. (WSPA3)

Comment: The free allowance allocation methodology applies an arbitrary factor of 0.9 to the benchmark, resulting in a 10 percent reduction in allowances to the sector. This reduction is required from the start of the program and is in addition to the successive annual cap reductions required under AB 32. Not only is this reduction excessively difficult when compounded with the cap reduction but it also undermines the emissions leakage protection that CARB intended to provide. (EXXONMOBIL)

Comment: The Assistance Factor of 100 percent for the first compliance period was intended by CARB to avoid leakage as trade-exposed industries transitioned into the program. Refining is a highly trade-exposed industry and California refiners stand to lose competitiveness if subject to excessive regulation that refiners outside of the State are not. A reduction as significant as 10 percent has the potential to make California refining uncompetitive, leading to leakage of investment, production, jobs and emissions. (EXXONMOBIL)

Comment: CARB should adopt a cement benchmark that is based on the industry's average GHG intensity. We believe this approach is more equitable and more consistent with the objective of minimizing leakage to the extent feasible. Use of a "best in class" emissions intensity benchmark would impose immediate compliance costs on all California cement plants that would not be borne by imports. (CSCME4)

Comment: The proposed Regulation includes provisions for granting free allowances to industrial facilities. It also establishes the benchmark at a level of 90 percent of industry average for the refining sector and most other industries. Setting the benchmark at this level will create an immediate shortage of free allowances leading to a level of stringency in the program that will create immediate impacts, dilute the impact of the assistance factor, and be redundant with the cap reduction factor. The only clearly stated need for allowance withholdings during the first compliance period are 1 percent for the price containment reserve and 0.5 percent for renewable electricity emission reductions. There is no justifiable reduction in free allowances beyond 1.5 percent in the first compliance period. Because the cap reduction factor already provides for a 2 percent yearly reduction in free allowances, the 90 percent initial reduction is overreaching, beyond the needs of the program, and will cause unintended consequences like market leakage. (TESORO2)

Comment: Design the program elements to ensure a smooth transition. CCEEB recognizes that ARB has proposed several program elements designed to create a smooth transition to a market, such as the transition assistance. However, design elements, such as the benchmarking methodology and the stringency of the benchmark can place some facilities in a position that will require reductions or compliance obligations that are five to ten times more than the average cap reduction for industry, beginning in the first year. The benchmarking methodology and stringency should be carefully considered to provide a smooth transition period for entities. (CCEEB3)

Comment: The purpose of distribution benchmarks is to establish equitable bases for distribution of free allowances within industries, taking into account the higher complexity and existing energy efficiency of California industrial facilities. CARB should NOT be using benchmarking methods to arbitrarily withhold up to 10 percent of the allowances that trade exposed and energy intensive industries need in order to minimize costs and leakage. This is inequitable, does not minimize costs, and does not minimize leakage. CARB should discontinue this proposal, and should not arbitrarily withhold allowances that it has already determined these industries need. CARB should continue to work with trade exposed and energy intensive industries to develop benchmarking methods that are supported by the impacted sectors. (AB32IG2)

Comment: A stringent benchmark reduces industry assistance and leads to leakage. The proposal arbitrarily sets the benchmark for industry sectors at 90 percent of the industry average. This results in a reduction of industry assistance to 90 percent for the first compliance period from 100 percent as proposed in the December 2010 rule. ARB should provide 100 percent free allowances to industry to prevent leakage of jobs and emissions out of the state, consistent with the December 16, 2010 cap and trade rule. The proposal reduces industry assistance by setting the benchmarks at 90 percent of the industry average which results in industry having to purchase the remaining allowances at auction**.** (CHEVRON3)

Comment: Significant reductions in initial allocations will lead to leakage and adverse economic impacts to the State. The mandated haircut is excessive because the most recent emissions projection reflecting the economic downturn reveals that such reductions are unnecessary given the economic downturn. ARB's most recent emission projections show that the "Business as Usual" (BAU) target has been dramatically reduced leading, directly, to a reduction in the required AB 32 emission reductions. Finally, we note that the "haircut" should not be thought of as merely an impact on some arbitrary benchmark. Rather, more precisely, it is an impact on industry and on all market participants. ARB should fund the initial reserves without the large haircut and distribute the remaining allowances equitably in order to facilitate a smooth start to the program. We stress that excessive removal of allowances such as proposed, will make allowances artificially scarce and could dramatically impact market participants without a corresponding reduction in GHG emissions. ARB should distribute all allocations at an amount equal to 100 percent less the initial reserve funding requirements. While any reduction from 100 percent allowances will lead to leakage, if it is impossible for ARB to follow through on their commitment for full industry assistance, then the initial “haircut” should be no greater than 1 percent given all anticipated funding and program requirements. (WSPA3)

Response: We do not agree. We believe that benchmark stringency should reflect the emissions intensity of highly efficient, low-emitting facilities within each sector. The allocation strategy will minimize leakage by incentivizing continued production and improved emissions efficiency from all facilities in California. We do not agree that this will result in adverse impacts for California businesses.

We arrived at the 90 percent of average product-based emissions efficiency benchmark after careful analysis of data and approaches used in other successful cap-and-trade programs. We are balancing the need for providing adequate transition assistance and minimization of leakage while meeting the emission reduction goals of AB 32. To develop each benchmark, we began by analyzing the average emissions intensity of each sector and constructed benchmarks set at 90 percent of this average. "Best in class" benchmarks were developed, exceptionally, for any sector where the "90 percent of average" benchmark would be more stringent than the emissions intensity of any existing California facility in that sector.

Within each sector, the most efficient facilities with efficiencies better than the benchmark will be receiving more allowances than they will need, and can sell their excess allowances. Less-efficient facilities will need to purchase allowances to fulfill their compliance obligations. Beyond the initial allocation period, the level of free allowances will decline through the use of a cap declining factor and an assistance factor. Because allowances can be traded, the program provides incentives for those with the most cost-effective reduction opportunities to reduce emissions quickly. This is an incentive we built in the system for industrial sectors to choose innovation for reducing GHG.

True-Up

C-33. Comment: CSCME commends CARB staff for its proposed modifications to the output term of the allowance allocation system, including the use of output data from the most recent year available and the inclusion of a "true-up factor" in the allocation formula. (CSCME4)

Response: No response is necessary.

C-34. Comment: PPG has reviewed the proposed product output-based calculation in Section 95891(b) and the related commentary in the equation notes and the section of the July 25, 2011 Notice of Public Availability regarding section 95891. In the equation notes, the purpose of the true-up factor is explained as a factor used to "adjust for any output not properly accounted for in prior years' allocations." In the Notice of Public Availability, the true-up factor is explained as an addition to the equation "to ensure that the amount of allocation received for a given year is corrected to actual production for that year." However, the true-up factor, as proposed, does not have anything to do with correcting a previous over- or under-allocation due to improper, erroneous or corrected production numbers for a previous year. Despite the stated purpose of the true-up portion of the equation, it appears that its actual function is a modified version of the previously proposed production-averaging concept, in which the three-year averaging period is reduced to two years (i.e., t-4 and t-2). If the intent, as stated in the Notice, is "to change the timing of output data to respond to stakeholder concerns about prolonged exposure to recessionary output levels," PPG does not believe that the addition of the proposed true-up factor to the product output-based equation achieves the goal. In fact, it preserves the averaging function and the "prolonged exposure to recessionary output levels" because, for any period where production is growing year-over-year, the true-up portion of the equation (in which t-2 production is subtracted from t-4 production) results in a significant reduction in allocated allowances for the current budget year due to the lower production in the earlier year (i.e., t-4). Conversely, when production has decreased year-over-year, it appears that the number of allowances allocated will increase for the current budget year due to higher production in the earlier year. PPG understands the need to ensure that product output-based allocations are based on accurate production numbers. Thus, the application of the true-up portion of the equation to reported changes in or corrections to previously reported annual production numbers would be appropriate. But an across-the-board application of the true-up portion of the equation to all sources every year will only serve to "prolong exposure to recessionary output levels," which the factor is ostensibly intended to avoid. PPG recommends that the true-up portion of the equation be deleted and presented separately as an equation to be applied in the allocation process only in the event that a covered facility has submitted a correction to a prior year's reported production. Under that approach, any previous over-allocation or under-allocation of allowances to a facility in a prior year could be corrected, without any impact on other facilities in the cap-and-trade program. (PPG1)

> **Response:** We disagree, and believe that the commenter has misinterpreted the equation. The true-up term will allocate additional allowances if actual production in a given year was larger than estimated initially. We modified section 95891(b) to clarify our approach. $O_{a,t}$ is replaced by $O_{a,initial}$, which will be calculated by the Executive Officer as the output in year t-2 as reported to ARB. $O_{a,trueup}$ adjusts for any output in year t not properly accounted for in prior allocations.

C-35. Comment: CSCME commends CARB's proposed modifications to the allowance allocation system in order to ensure alignment between actual and intended allowance allocations. CSCME believes that these proposed modifications represent a significant step in the right direction. We recommend one additional adjustment to ensure the adoption of a "pure" true-up method. Specifically, CSCME recommends that, rather than applying the true-up factor to future allocations, CARB should apply it to existing compliance obligations. The merits of this approach are relatively straightforward. In order to accurately assess compliance obligations, CARB must have verified MRR data on both a facility's emissions and output during the compliance year in question—therefore, it has all the data it needs to perform a "pure" true-up. Furthermore, CARB only needs to remove the true-up factor from the allowance allocation formula and apply it as an offsetting term in the calculation of a facility's outstanding emissions obligations. (CSCME4)

> **Response:** We believe our second 15-day change to the regulation for section 95891(b) is sufficient. $O_{a,t}$ is replace by $O_{a,initial}$, and $O_{a,initial}$ will be calculated by the Executive Officer as the output in year t-2 as reported to ARB. Further, the inclusion of the $O_{a,trueup}$, which adjusts for any output in year t not properly accounted for in prior allocations, should adequately address the concerns raised. We prefer to keep the calculation of the allowance allocation separate from the calculation of the compliance obligation.

C-36. Comment: The true-up calculation in section 95891(b) should be clarified to ensure that entities are issued sufficient allowances to account for production increases over time. $O_{a, trueup}$ in the trueup calculation is defined as “the difference between the output reported in data year ‘t-4’ and the output reported in data year ‘t-2.’” A literal reading of this could require calculation of output in t-4 minus output in t-2. But the true-up should really be t-2 minus t-4; otherwise, if there was higher output in t-2, the entity would not have had enough allowances allocated based on t-4, so the trueup should add allowances. We respectfully request that CARB clarify the trueup calculation and provide for additional comment on clarified language. (JM)

> **Response:** We agree, and modified section 95891(b) to clarify our approach. $O_{a,t}$ is replaced by $O_{a,initial}$, which will be calculated by the Executive Officer as the output in year t-2 as reported to ARB. $O_{a,trueup}$ adjusts for any output in year t not properly accounted for in prior allocations (t-2 minus t-4). The true-up adds allowances if the actual output in a given year is higher than initially estimated. Conversely, allowances are withheld if initial output estimates were too high relative to actual values.

C-37. Comment: The current methodology as described is not adequate in providing sufficient allowances for those sources that have invested in clean technology, energy efficiency and industrial growth in the state of California. This is particularly important in light of the state’s precarious economic condition, and ARB’s stated sensitivity to the financial impact of compliance, especially in the initial years of the program. The insufficiency is related to the manner in which the compliance obligation is set and the allowances are allocated. Different production years are used to determine the compliance obligation and the allowance allocation. The Regulations base an industrial source's compliance obligation on their current year's level of emissions reported to the ARB under the Mandatory Reporting Program. Emissions are based on the source's current level of production in that same year. For example, the compliance obligation in the year 2015 is based on that source's emissions and level of production in the year 2015. However, the allowances allocated to that source for the year 2015 would be based on its production level in the year 2013. A facility that may have experienced production growth between 2013 and 2015 could find itself with insufficient allowances because different years are used as baselines in determining emissions and allowances. ARB intends to provide allowances prior to the beginning of the compliance year. Therefore, allowances for 2015 would be awarded at the end of 2014. As the 2015 production is not known until the end of the year, ARB has introduced a "true-up" calculation formula in an attempt to provide allowances to make up the difference between the estimated level of production and the actual level of production for 2015. Unfortunately, the true-up calculation also uses production levels from previous years in estimating the true-up amount. As an example, for the 2015 true-up, the difference in production between the years 2011 and 2013 is used in estimating the true-up. If there was a decline in production between 2011 and 2013, the true-up could even have a negative value, regardless of what actually occurs in 2015. A more equitable means of allocating allowances would be, as much as practicable, to use the level of production from the same year that is used in reporting emissions in the equation at section 95891(b). An additional true-up during each production year, perhaps in the late third quarter of the year, might be explored as a solution. Such an approach would certainly reduce the uncertainty for companies and would represent a more accurate and timely coverage of their exposure for allowance needs. This issue of proper true-up of allowance allocation is especially important in the weak economy which we face today. If struggling companies in the current recession are forced to buy allowances that they have counted on to be "free," it could push many of them over the edge. Under the currently proposed methodology, the need to buy allowances is likely to happen in many cases as companies' production levels gradually increase coming out of the recession. An improper true-up mechanism is especially damaging for companies that have "taken the plunge" to invest in increased production capacity in recent years. CSI is one example. CSI spent more than $70 million during the recession to invest in a new, cleaner reheat furnace, representing state-of-the-art emissions control technology for its production of hot-rolled steel sheet. The new furnace reduces greenhouse gas emissions per ton of steel produced, and also allows about 50 percent greater production capacity, which helped justify this major expenditure. Now, as CSI seeks to obtain the expected payback on this investment, it will be seeking to grow its production and sales beyond the levels that existed prior to the recession. In a scenario of annual growth for several years, a company such as CSI will be constantly coming up "short" on allowances and having to go to market to buy them—even though the new production capacity produces fewer emissions per unit of production. This result is not fair or reasonable and is both damaging to the economy and punishing to companies willing to invest in growth in California. (CSI)

Response: Our approach is fair and reasonable, and it minimizes leakage. It provides various incentives and safeguards to transition industry to a low-carbon economy. The amount of free allowances distributed under our allocation approach will vary with economic conditions. This means that, in an economic downturn, there will likely be fewer allowances distributed for free due to a decrease in production or output. When economic activity is robust and output increases, a greater number of allowances will be freely allocated. The triennial compliance obligation (except two years for period one) per compliance period will provide facilities with flexibility. Expansion at incumbent facilities is adequately addressed—as facilities produce more product, they receive additional allocation. The benchmark-based allocation system also recognizes and encourages early action. Benchmarks are chosen to reward facilities who have historically chosen to employ low-GHG fuels and enhance their emission efficiencies of their production process. Facility projects that reduce CO_2 emissions would save money in the form of either a reduced need to purchase allowances at auction or in the form of allowances given for free under our cap-and-trade program.

We modified section 95891(b) to clarify our true-up approach. $O_{a,t}$ is replaced by $O_{a,initial}$, which will be calculated by the Executive Officer as the output in year t-2 as reported to ARB. $O_{a,trueup}$ adjusts for any output in year t not properly accounted for in prior allocations.

C-38. Comment: PNA would like clarification from CARB that the first trueup factor in section 95891(b) would be applied in 2015 to reconcile the production in years 2011 and 2013. PNA also notes that the trueup factor will only account for changes in emissions that are directly linked to production and not those emissions that are needed to keep the glass furnace hot during hot holds or start-ups and shut-downs associated with cold repairs.

PNA seeks confirmation from CARB that the furnace would not be considered shut down during a cold repair or a hot hold as the term is defined in the cap and trade rules despite the fact that no glass is being produced, and that neither a cold repair nor a hot hold necessarily represent an intention to cease production, but instead are considered to be routine maintenance and repair events. As the rule is currently drafted, it seems that PNA would have a compliance obligation for the emissions during these idling periods, but would not receive any allowances for this time because the product output-based allocation methodology includes only a single year of production and there would be no production during hot hold periods and periods of cool-down or heat-up.

PNA recommends that a factor be added to the existing product output-based "trueup" factor to account for the actual emissions from the fuel combustion during the time period in which the furnace is idled but not shut down, and that such a factor be based on the fuel benchmark used for the fuel portion of the thermal energy-based allocation methodology multiplied by the actual amount of fuel burned during the hot hold period. (PNA)

Response: We modified section 95891(b) to clarify our approach. $O_{a,t}$ is replaced by $O_{a,initial}$, which will be calculated by the Executive Officer as the output in year t-2 as reported to ARB. $O_{a,trueup}$ adjusts for any output in year t not properly accounted for in prior allocations. The glass benchmarks were set after consideration of the routine maintenance and repair events the commenter outlines. We did not add a factor based on the period where the furnace is idled but not shut down.

Cement

C-39. Comment: We strongly support the cement benchmark that is based on best-in-class for clinker production with mineral additives. This will incentivize the use of supplementary cementitious materials added directly to cement (in addition to the additives that can be used in concrete) as well as process and fuel efficiency improvements to the kilns. (KUSTIN13)

Response: No response is necessary.

C-40. Comment: We fail to find a suitable explanation for the greatly diminished emission reduction obligations for the cement sector compared to all other sectors, as reflected in the Cap Adjustment Factors in Table 9-2 of the regulation (p. A-120). (KUSTIN13)

Response: This comment falls outside the scope of the first 15-day changes to the regulation. However, in the second 15-day changes to the regulation, section 95891, Table 9-2 was modified to define “sectors and activities associated with process emissions greater than 50 percent.” In the original proposed text in the 45-day notice, we identified only cement manufacturing as an activity associated with significant level of process emissions for which minimal cost-effective abatement opportunities are currently available. Stakeholders in other sectors whose activities also release process emissions raised concerns in comments. After careful consideration, we determined that some additional sectors with activities that are associated with process emissions greater than 50 percent are eligible for a lower cap adjustment factor, taking into consideration the potential impact from the emissions that currently have few cost-effective abatement opportunities. A cap adjustment factor for all industries ensures equitable incentives to all producers to minimize leakage as a result of the cap-and-trade program.

C-41. Comment: In the industrial sector, the free allocations are excessive and should be reduced. Free allocations based on industry-specific benchmarks encourage some moderate efficiency, but may disadvantage innovators (for example, Calera, Inc., a new company that produces carbon negative cement products). How many free allowances would a start-up like Calera get in relation to an incumbent cement factory? Free allocations may prevent “leakage” of the old technology by shielding business-as-usual from the carbon price. (CPC6)

Response: We do not agree that the proposed free allocations are excessive and should be reduced. We studied the strengths and weaknesses of all existing cap-and-trade programs, including the European Emissions Trading System, and learned from these systems in developing our program to avoid over- or under-allocating allowances. We determined that a soft start, under the current economic conditions, dictates greater reliance on free allocation of allowances in the early years of the program. We view this free allocation as critical to avoid adding an immediate cost to covered industries that could inhibit their ability to invest in emissions reductions. As the program progresses, we propose a transition to a greater reliance on auctions for allowance distribution while still minimizing leakage where risk exists. In addition, we are committed to monitoring the implementation of our program and making adjustments as necessary.

The commenter’s statement that free allocations based on industry-specific benchmarks encourage some moderate efficiency, but may disadvantage innovators, is not true. Any facility that produces cement may opt-in to the program regardless of emissions levels. Innovators that choose to opt-in to the program and can produce cement at an emission intensity lower than the benchmark would benefit due to the able to sell allowances. In addition, even if the innovative firm chooses not to opt-in and sell allowance, they enjoy a competitive advantage relative to the dirty firms above the benchmark that face carbon costs as a result of the program.

C-42. Comment: CARB's proposed benchmark for the cement industry does not reflect early actions taken by the industry to reduce its GHG emissions in anticipation of AB 32 implementation. CARB data suggest that the cement industry has significantly increased its use of biogenic materials from 2006 (i.e., the year in which AB 32 was adopted) to 2009 (i.e., the year used to establish the benchmark). CARB should modify the cement benchmark to account for these voluntary actions by California cement producers between 2006 and 2009. (CSCME4)

Response: We believe product benchmarks should be set with consideration of how the compliance obligation will be determined. Since biogenic materials, if they meet the provisions of the regulation, do not count toward a facility’s compliance obligation, we do not believe it is appropriate to include these emissions when setting the product benchmark. We also reviewed the amount of biogenic materials used by cement sector facilities for the year 2006, 2008, and 2009, and did not find a sector-wide increase. Therefore, we believe that the benchmark does not have to be changed to take into account the change in biogenic materials consumption by cement sector.

Food Manufacturing

C-43. (multiple comments)
Comment: Under the current proposal, emission allowances for breweries would be benchmarked using an energy-based methodology that assumes boiler efficiencies of 85 percent for the years 2008-10 and ratchets down emission levels in three-year increments through 2020. Among the inherent flaws of energy-based benchmarking approach for beer production are that it fails to reward producers that took early actions to reduce emission levels in the three baseline years, gives no recognition to how efficiently a brewer uses its fuel inputs in the production process, encourages large brewers to import more beer from their out-of-state plants, and effectively caps beer production at the major California breweries at 2008-10 levels. Because of these deficiencies, MillerCoors urges the Board to place breweries within a separate industrial classification and apply a product-based benchmark methodology to allocate allowances. A product-based benchmark would cap emissions from breweries on a per-unit of production basis, such as annual CO_2e per barrel of production. Product-based benchmarking is particularly appropriate for breweries because beer is a homogenous product with each unit of production having similar energy inputs. Differences in emissions per unit of production would be reflected almost entirely by the relative energy efficiency of each brewer's production process. More importantly, the product-based approach allows a brewer to expand beer production within the state without having to purchase additional allowance since efficiencies of scale are likely to result in lower emissions from each incremental barrel of production, even though total energy use would increase. Finally, product-based benchmarking creates the correct incentives for brewers by encouraging investment in the best available technology to get the most production from the least amount of energy inputs. (MILLERCOORS)

Comments: Because only three breweries within the state are subject to the proposed Regulation, Miller Coors' support for product-based benchmarking is conditioned on using average emission intensity data from comparable brewing facilities operating in other states. This approach recognizes the relatively higher production efficiencies already achieved by California-based breweries because of the State's high energy costs. Using out-of-state breweries in the benchmarking calculation also addresses what we believe is an understatement of the leakage risk for beer production due to the potential for large brewers to bulk ship beer in refrigerated rail tank cars for local bottling. (MILLERCOORS)

Comment: While we think that product-based benchmarking would be advantageous for all California breweries, we recognize that may not be the case. Consequently, MillerCoors would like the option of benchmarking emissions from Irwindale, where MIllerCoors made significant investments and reduced GHGs by 16 percent below 2008 levels, against the average per unit of production emissions at other comparable MillerCoors breweries in the United States. (MILLERCOORS)

> **Response:** We agree, and will continue working with all industry falling under the energy-based allocation methodology that would like to develop product-based benchmarks.

C-44. Comment: Ag Council agrees with ARB staff assessments in the December report regarding domestic competition as being problematic as it relates to the food and agricultural industry. A different approach should be taken for food processing in determining compliance costs and/or emissions intensity. The emissions intensity variable in the product-based allocation calculation should be replaced with another variable that truly represents the cost of compliance for the food industry. Staff should take more time to work with the food processing industry to determine an appropriate factor for this variable. (ACC4)

> **Response:** The food processing industry is not being allocated allowances based on the product-based allocation methodology. Instead, food processors are allocated using the energy-based allocation methodology. Pertaining to energy intensity and trade exposure, Board Resolution 11-32 directs the Executive Officer to initiate a study to analyze the ability of the agricultural industry, including food processors, to pass on regulatory costs to consumers, given domestic and international competition and continually fluctuating global markets. The Executive Officer is directed to identify and propose regulatory amendments, as appropriate, as a result of this analysis.

Gypsum

C-45. Comment: The Gypsum Association and its members request that ARB change the relevant references in Table 9-1 of section 95891 and Table B in Appendix B to correctly identify that the benchmark unit for plasterboard production is based on the mass quantity of stucco used to produce salable plasterboard and not the quantity of plasterboard produced. In Table 9-1, Product Based Emissions Efficiency Benchmarks, units should be changed for the benchmark in the "Plaster Board Manufacturing" activity from "Allowance/Short Ton of Plaster Board" to "Allowance/Short Ton of Stucco Used to Produce Saleable Plasterboard." In Table B, Comparison of California and EU ETS Product Benchmarks, units should be changed for all benchmarks (CA Imperial Units, CA SI Units, and EU ETS) in the "Plaster Board Manufacturing" activity from "…Ton of Plaster Board" to "…Ton of Stucco Used to Produce Saleable Plasterboard." (GA)

> **Response:** This change in the benchmark units was inadvertently left out of the second 15-day changes to the regulation, but will be incorporated when we make further changes to the regulation sometime next year. The units have been changed in the Mandatory Reporting Regulation, which is the basis for allocation, so the oversight will not affect plaster board manufacturing allocation.

C-46. Comment: The Gypsum Association wants to ensure that the base year that ARB selects to allocate 2013 allowances for each gypsum board manufacturing plant reflects a fair and reasonable production level. The base year should acknowledge the current economic recession, its impacts on the gypsum board industry, and the impact on allocations that will occur when idled capacity is brought back on line at a future date. The proposed regulations do not appear to address this very important issue. Data on shipments of gypsum board to locations in the State of California for the period 2005 to 2010 points out the precipitous decline in shipments and reinforces the need for ARB to be judicious when it establishes a base year for gypsum board manufacturing facilities located in the State of California. The Gypsum Association requests further information from ARB on whether or not this base year has been determined for 2013 and would value the opportunity to enter into discussions with ARB regarding the importance of setting an achievable allocation for 2013 and years beyond. (GA)

> **Response:** This comment falls outside the scope of the first 15-day changes to the regulation. For information on the methodology for calculating any year's allocation, see sections 95870(e), 95890, and 95891.

Glass

C-47. Comment: ARB has established a product output based allocation calculation that is based on a single year of production data (specifically, two years prior to the budget year for which the calculation is being performed) in section 95891(b). We understand this allocation will subsequently be subject to a "true-up" four years into the program (starting in 2017). We ask that ARB confirm that flat glass manufacturers will not be penalized because the product-output-based allocation methodology for the "true-up" is based on a single year of production. Specifically, all flat glass furnaces must periodically undergo "hot" repairs during which time the furnace remains operational at a high temperature but there is no glass production. As currently drafted, it appears that the Cap and Trade Rule would preclude flat glass plants from receiving any allowances during these periods because of the lack of any actual glass production. For this reason, Guardian urges ARB to add a factor to the product-output-based "true-up" specific to the flat glass industry in order to account for the emissions from the fuel combustion during the time period in which the furnace is idled but not shut down. Such a factor could be based on the fuel benchmark used for the fuel portion of the thermal energy-based allocation methodology multiplied by the actual amount of fuel burned during the hot hold period. (GIC)

> **Response:** In the second 15-day changes to the regulation, we modified section 95891(b) further to clarify our approach. $O_{a,t}$ is replace by $O_{a,initial}$, which will be calculated by the Executive Officer as the output in year t-2 as reported to ARB. $O_{a,trueup}$ adjusts for any output in year t not properly accounted for in prior allocations. This modification to the added "true-up" term ($O_{a,trueup}$) for adjusted outputs not properly accounted for in prior years' allocations in the equation for calculating allocations under section 95891, together with the annual updating of product outputs, adequately address fluctuations in production.
>
> Section 95891(a) was updated to indicate that the choice of allocation methodology is based on classification of "activities" rather than "industries" in

Tables 8-1 and 9-1. This change clarifies that a facility within a given industry may conduct multiple activities, and the operator of a facility may receive allocation under both the product-based and energy-based allocation methodologies (based on the assigned allocation approach for each separate activity). However, the glass production benchmarks were set after consideration of the routine maintenance and repair events that the commenter outlines. Therefore, we did not add allocation based on the period where the furnace is idled but not shut down, since the benchmark incorporates data analysis of typical operations, including maintenance shutdowns. No allocation is specifically provided for periods when emissions occur but production does not, since this would be an incentive to increase emissions.

C-48. Comment: GANA re-states its understanding of and support for using calendar years 2005-2007 as a basis for developing the industry average CO_2 emission intensity benchmark for the flat glass industry because these years preceded the current economic downturn and were less affected by the unusual operating conditions necessitated by that downturn. (GANA2)

Response: We thank you for your support of our approach and agree that we selected an appropriate and representative benchmark for flat glass production.

C-49. Comment: Leakage Risk and Product Based Benchmark. As currently proposed, the flat-glass industry benchmark is based on only the three flat glass furnaces in California which includes two air/fuel-fired regenerative furnaces and one 100 percent oxyfuel-fired furnace. The 100 percent oxyfuel furnace design is not widely employed in the flat glass industry. The inclusion of that one oxyfuel-fired furnace in an average benchmark consisting of only three plants, however, pushes the benchmark lower to a degree that disproportionately impacts the PNA air-fired regenerative furnace which is one of only two remaining in California.

PNA is positioned to make a significant investment in the Lathrop facility but cannot assume the additional risk of increased compliance costs or the technical risks of conforming to the oxyfuel furnace design which CARB has identified as a low GHG emitting technology for flat glass production. PNA's planned investment for the Lathrop site includes the installation of an on-line chemical vapor-deposition coating process. There are only nine on-line TCO coated glass production plants in the world, and PNA's parent company runs six of them, two of which are in the U.S. PNA is not aware of any on-line TCO glass production process existing on an oxyfuel-fired furnace. PNA is not prepared to assume the risk of producing on-line coated glass on an oxyfuel-fired furnace and so must assume the additional costs of the cap and trade program in order to continue to operate in California, or choose not to invest further in California and produce the coated glass product at another site outside of California or outside the US. PNA proposes an alternative benchmark which can be applied to on-line coated glass products. Specifically, PNA proposes that the current benchmark already defined for flat glass production in the 15-day changes (0.471 metric tonnes of CO_2eq/ton of glass draw) be applied to all glass product not coated with an on-line process, and that a new benchmark be developed by taking 90 percent of the average CO_2 emission intensity (in metric tonnes / ton of glass draw) of the two air-fired regenerative furnaces in California and apply it to the tons of coated glass produced with an on-line coating process. The cap adjustment factor and the industry assistance factor would remain the same for both products. The result would look something like this:

Allocations in budget year =
[(Output * Bl * c * AF) + (true up formula)] (uncoated glass Production)+ [(Output * B2* C * AF) + (true Up formula)] (0n-line coated glass production)
Where, Bl = existing benchmark for flat glass production = 0.471 metric tons of CO_2eq/ton of glass draw and B2 = benchmark for on-line TCO glass production

This approach is consistent with the CARB benchmarking approach and at the same time helps to mitigate some of the risks involved with investments in the production of on-line coated glass products in California that can be used for energy efficiency and renewable energy applications. (PNA)

> **Response:** We did not develop a separate benchmark for TCO glass production at this time since there is no current TCO production in California. We will continue to work with the industry on this issue in the future to ensure that benchmarks are developed for new products newly manufactured in California, that leakage risk is minimized, and that the correct incentive is created for investment in efficient production in California.

C-50. (multiple comments)
Comment: GANA must reiterate its concerns outlined in its comments submitted on December 15, 2010 and in a conference call with CARB staff on June 3, 2011 about the small number of flat glass sites used as a basis for the flat glass industry benchmark in the California Cap and Trade program. There are only three flat glass sites in California —two of them are regenerative furnaces, and one of them is an oxy-fuel fired furnace design. This small number of sites (3) is not representative of normal operating conditions of the industry as a whole in the US which presently includes 30 flat glass lines. Such a small sample artificially skews the California benchmark, pushing it lower than a true industry average and thereby disproportionately impacts the remaining regenerative flat glass sites in California. For these reasons, GANA once again encourages CARB to consider a more representative national carbon emission intensity benchmark which the flat glass industry estimates, based upon its experience nationwide, to be more on the order of 0.5 metric tonnes of CO_2 eq/short tons of glass draw rather than the 0.471 metric tonnes of CO_2eq /short ton of glass draw currently proposed in the 15-day modification package. (GANA2)

Comment: PPG endorses, and hereby adopts as if set forth in full, the comments of GANA regarding the product output-based emissions efficiency benchmark for the flat glass industry (see section entitled “Flat Glass Industry Benchmark” in GANA letter to CARB, dated August 11, 2011). CARB has recognized the vulnerability of the flat glass industry to emissions leakage, and the use of an artificially low benchmark for the industry will only serve to increase compliance costs, which will in turn promote rather than prevent such leakage. The proposed benchmark in Table 9-1 of the Regulation was based on a non-representative cross-section of the flat glass industry, namely three plants in California. There are many more flat glass plants operating in the United States, with which the three California plants must compete. To ensure the continued competitiveness of the California plants and to avoid emissions leakage, it is important that the data source for the benchmark be representative of the domestic flat glass industry as a whole. The use of a broad-based benchmark will be even more important if and when CARB links its GHG emissions trading system with others across the country. PPG endorses GANA's proposal for a revised benchmark of 0.5 metric tons of CO_2E per short ton of flat glass pulled. (PPG1)

> **Response:** We believe that benchmark stringency should reflect the emissions intensity of highly efficient, low-emitting facilities within each sector. The benchmarks will incentivize continued production and improved emissions efficiency from all facilities in California. We analyzed all credible data available iteratively in deriving product benchmarks. On a case-by-case basis, national data were considered in developing the benchmarks, but most frequently national data was used as a check for the benchmark developed using California facility data. We believe the allocation approach creates the correct level of compensation to minimize leakage as required by AB 32.

C-51. Comment: In the current 15-day modification of the Regulation, the product output-based allocation calculation relies upon only one year of production data (specifically production in year t-2, two years prior to the budget year for which the calculation is being performed) and then is reconciled later in the program with the true-up factor. GANA emphasizes that in order for the true-up factor to fit its intended purpose, it would need to begin in budget year 2015 to reconcile 2013 actual emissions with the 2011 emissions used to calculate allocation in 2013. However, in any case the proposed true-up factor will only account for changes in emissions that are directly linked to production and not those emissions that are needed to keep the glass furnace hot during hot-holds or start-ups and shut-downs associated with cold repairs. GANA stresses and seeks confirmation from CARB that neither a cold repair nor a hot-hold situation would constitute a site "shut down" under the Cap and Trade program. Cold repair periods, during which time standard refractory replacement and maintenance activity take place, do not represent an intention by the manufacturer to halt production, but represent a standard maintenance activity in the flat glass industry. During a hot-hold situation, up to 45 percent of the total gas burned during normal operations is needed just to keep the furnace hot with no glass being pulled. Similarly for warm-up and cool-down periods associated with cold repairs during which time fuel will be burned while no glass is being pulled. As the rule is currently drafted, flat glass sites would have a compliance obligation for the emissions during these idling and warm-up/cool-down periods, but would not receive any allowances for these periods because the product output based allocation methodology looks at a single year of production, and there would be no production during these periods. To address this inequity stemming from production disruptions inherent in flat glass manufacturing, GANA requests that a factor be added to the existing product output based "true-up" factor specific to the flat glass industry to account for the actual emissions from the fuel combustion during the time period in which the furnace is idled but not shut down. GANA further requests that this factor be based on the fuel benchmark used for the fuel portion of the thermal energy based allocation methodology multiplied by the actual amount of fuel burned during the hot-hold period. (GANA2)

> **Response:** We agree that neither a cold repair nor a hot-hold constitute a site "shut down." The glass production benchmarks were set after consideration of the routine maintenance and repair events that the commenter outlines. We did not add allocation based on the period where the furnace is idled but not shut down since the benchmark incorporates analysis of data of typical operations, including maintenance shutdowns. No allocation is specifically provided for periods when emissions occur but production does not, since this would be an incentive to increase emissions.

C-52. Comment: ARB's public record for the development of the GHG intensity baseline for the container glass manufacturing industry indicates a preference towards oxy-fuel furnace technology and their associated greater GHG emissions, in comparison to regenerative furnaces. The issue stems from ARB's limited understanding of the different glass melting furnace designs and the total energy requirements associated with each. ARB stated during discussions with O-I regarding the establishment of the intensity baseline that their analysis of the total energy requirements for the different furnace technologies had been fully considered and was based on the data that was collected from the container glass manufacturing facilities. The data that ARB collected did not contain the specificity which would allow that level of analysis. The data request asked only for total facility electrical consumption. O-I is concerned that the lack of understanding regarding the total GHG footprint of the different furnace technologies, rewards oxy-fuel designs, penalizes regenerative furnaces, results in an increase in total California GHG emissions and acts as a detriment to the environment. Although oxy-fueled furnaces will demonstrate a slightly lesser GHG emission footprint in direct emissions due to a lower fossil fuel combustion rate, once the indirect GHG emissions associated with the electricity requirements for the production of oxygen is included, the GHG emission gap is at a minimum, eliminated. To alleviate this inconsistency with the intent of AB32, ARB needs to include the indirect GHG emissions associated with electrical consumption required to generate oxygen for an oxy-fuel furnace when establishing the intensity baseline, or alternatively bifurcation of the oxy-fuel and regenerative glass furnace types. (OWENSIL2)

> **Response:** We remain concerned about differentiating product benchmarks by process type or technology. Our goal is to remain neutral to technology choice to allow for choices that reduce greenhouse gases. We believe that the focus of benchmarking under cap-and trade program is to create the correct incentive for California facilities to reduce GHG emissions and protect them from leakage. This means that, in most cases, it is appropriate to avoid benchmarks differentiated by technology, fuel mix, facility size and age, climate

circumstances, or raw material. Ensuring that all GHG emissions-abatement options remain viable is an integral part in our development of product benchmarks.

We do not believe it is necessary to add provisions to the regulation to account for indirect carbon costs associated with purchased electricity at this time. In the program framework, an adjustment factor was not made for power purchased in establishing the product-based benchmarks. This is because purchased power may not create an indirect carbon cost in all California utility service territories. It is our goal to see a carbon price properly embedded in all utility rates. If and when this occurs, the compensation for these indirect carbon costs could be incorporated into the product benchmarks (or reductions in these costs created in some other fashion) to help minimize leakage. We will revisit this issue once the CPUC proceeding addressing utility costs and revenue issues associated with greenhouse gas emissions concludes.

C-53. Comment: NAIMA had originally urged CARB to rely upon national emissions analysis for determining a benchmark for the fiber glass industry, but CARB indicated it wanted to rely upon California emissions data. CARB did agree, however, to consider 2009 California data which NAIMA provided to CARB in its February 16, 2011, letter. During the March 17, 2011 meeting, CARB indicated that it now might consider using national data to set the benchmark. CARB agreed that it would obtain direction from its Board as to whether it could rely upon national data as opposed to California data. CARB agreed to communicate to NAIMA when it has a final decision on use of national data. If national data is allowed, CARB indicated it would like national data by facility. Before NAIMA could agree to provide national data by facility, it would need to know the elements of specificity required for each facility. CARB has agreed to provide those elements of specificity to NAIMA, but NAIMA has yet to receive that information. CARB's current proposal seems to be based on California numbers. (NAIMA2)

Response: We recognize that, from a statistical point of view, averaging data from three or two facilities has limitations. In developing benchmarks for industries with a low number of facilities in California, we considered different data sets, including national data, to check the appropriateness of the benchmarks. However, we have the greatest confidence in the California data set, and from the perspective of fairly allocating free allowances to California facilities to minimize leakage risk, we believe the reliance on California facility data is appropriate.

C-54. Comment: Unlike most other manufacturing facilities, flat glass furnaces must operate continuously, even when no glass is being produced. In any given compliance period, it is possible that a flat glass furnace may have a significant, unavoidable gap in glass production due to a "hot hold" or a furnace rebuild. Moreover, in the case of a "hot hold," the lack of production will be accompanied by significant CO_2E emissions from the fuel combustion needed to maintain enough heat in the furnace to preserve its structural integrity. In a furnace rebuild scenario, the furnace cool-down period prior to the rebuild and the start-up afterward will also result in CO_2E emissions without corresponding glass production. Thus, while PPG supports the proposed product output-based formula for direct allocation of GHG allowances to the glass industry in section 95891(b), that formula must include some adjustment mechanism to avoid the substantial adverse impacts which would otherwise result from the exclusive use of a product output-based formula for years when significant gaps in production occur due to "hot holds" or furnace rebuilds. Those adverse impacts would be magnified by the fact that the year for which the allowances are allocated would not be the same as the base year used in the allocation calculation, leading to the possibility—even probability—that an allocation of allowances calculated using a base year with gaps in production would not be sufficient to cover the compliance obligation for the later, full-production year for which the allowances are allocated. To resolve this issue, an additional formula for "hot hold" and furnace rebuild periods must be used to supplement the product output-based allocation formula. PPG endorses the resolution proposed by GANA in its August 11, 2011 comments to CARB—namely the substitution of a fuel benchmark from the energy-based allocation formula in section 95891(c), multiplied by the quantity of fuel actually combusted in the furnace during any "hot hold" period or furnace rebuild, instead of the product output-based formula for that period. The allowances resulting from that fuel-based formula for non-production periods would then be added to the allowances resulting from the application of the product output-based formula to the remainder of the year when glass was being produced. PPG recognizes that this approach may complicate the equation for allocation of GHG allowances when the base year used in the equation includes a "hot hold" or furnace rebuild. However, some accommodation must be provided in section 95891(b) to avoid the artificial reduction in allowances that would otherwise result from the exclusive use of a product output-based approach when there are significant, unavoidable gaps in glass production in the base year for the calculation. To leave the provision as currently proposed would ignore the realities of flat glass production and would impose an unfair and unworkable compliance burden on the flat glass industry. (PPG1)

> **Response:** The glass production benchmarks were set after consideration of the routine maintenance and repair events that the commenter outlines. We did not add allocation based on the period where the furnace is idled but not shut down since the benchmark incorporates analysis of data of typical operations, including maintenance shutdowns. No allocation is specifically provided for periods when emissions occur but production does not, since this would be an incentive to increase emissions.

Hydrogen

C-55. (multiple comments)
Comment: The benchmark proposed for hydrogen production by "Industrial Gas Manufacturing" employs the standard product-benchmark method described conceptually in Appendix B of the 15-Day Modification Package. The gaseous hydrogen benchmark is derived from emissions and production data from only six independent hydrogen production plants (including two that produce liquid hydrogen

and are inappropriate for inclusion in the gaseous hydrogen benchmark basis) and ignores the 20 other refinery-owned hydrogen plants operating in California. Discussions with CARB staff confirmed the emissions intended to be considered in the hydrogen benchmark include combustion emissions from producing process heat and steam within the hydrogen plant; process and combustion emissions resulting from hydrogen production itself; and combustion emissions from production of electricity within the hydrogen plant. Staff indicated that the benchmark derivation is to take into account (deduct) any export of thermal energy and electricity, where appropriate. CARB staff acknowledges that it does not yet have the complete hydrogen production and emission data from even the six plants considered that are needed to define the hydrogen benchmark and thus the benchmark value of 8.51 allowances per ton of hydrogen is incorrect. In addition to excluding industrial gas manufacturing plants that produced only liquid hydrogen from the database used to develop the gaseous hydrogen benchmark, CARB must include the 20 gaseous hydrogen plants in the state owned and operated by refiners. Because the current benchmark is based on a highly biased data set excluding the majority (20 of 24) of gaseous hydrogen plants in the state, it fails to accurately reflect the true emissions associated with gaseous hydrogen production in California and cannot be considered to be an equitable benchmark. Instead, the current benchmark relies predominantly on the emission intensity performance of the four most modern and efficient plants (industrial gas manufacturing facilities) and then imposes a “performance challenge” upon that “top quartile” of facilities. This effectively penalizes these facilities and their owners for having made material investments in more efficient production technologies—a fundamental premise of the Cap and Trade allocation program as outlined in Appendix J. Again, a correct and equitable benchmark must include all hydrogen production units in California. We would further note that, while CARB staff has issued a data collection request to industrial gas producers to augment existing data, it has not yet initiated a comparable request to the refinery-owned/operated hydrogen production facilities in order to develop a representative benchmark value. This request must be issued immediately so that an accurate and equitable benchmark can be incorporated into the Cap and Trade Regulation. Air Products recommends that CARB expand the database used to calculate of the hydrogen benchmark to include all hydrogen production in the state—both refinery-owned and “independent” producers. If this requires additional data from the refinery hydrogen producers, CARB must make a timely information request to the impacted facilities. (APC2)

Comment: The product-based benchmarks in Table 9-1 are not at all transparent. WSPA has many questions on how benchmarks were calculated. For example what assumptions were made to calculate the H2 plant benchmark? Was pure H2 production assumed? WSPA recommends that ARB conduct stakeholder workshops to provide transparency to the benchmarking process. (WSPA3)

Comment: To avoid market distortions, it is important that the allocation benchmarks assigned by the California Air Resources Board (ARB) for gaseous hydrogen are equitable and apply to all gaseous hydrogen production facilities. ARB has proposed a benchmark for gaseous hydrogen production based on the performance of just six of

26 hydrogen production facilities in the state (and two of those six have significant liquid hydrogen production activities, which ARB is considering a separate product). ARB should calculate the benchmark based on the performance of all 26 gaseous hydrogen plants in the state and expand the hydrogen production survey recently sent by ARB staff to the independent hydrogen producers to include all hydrogen production facilities. A benchmark based on the full dataset of production facilities will be a more representative product benchmark. This, in turn, will result in a more accurate and equitable benchmark. Industrial gas manufacturers operate plants that supply hydrogen in gaseous and liquid form to petroleum refineries. In many cases, petroleum refiners operate their own hydrogen plants within their facilities, and thus many refiners have a choice whether to purchase hydrogen from an industrial gas manufacturer or to use their own in-house capacity to produce hydrogen. ARB's goal in designing the Cap-and-Trade provisions for hydrogen production facilities should be to avoid creating market distortions. Market distortions are undesirable for two reasons. First, by creating market distortions, the State in effect picks winners and losers in the market, thus violating AB 32's directive that ARB design the cap-and-trade regulations to be "equitable." Second, market distortions may result in increased emissions, thus undercutting AB 32's objectives. It is desirable that the allocation benchmark is equitable – the same benchmark should apply to all hydrogen production regardless of whether the hydrogen is produced within a refinery complex or produced by an independent producer and supplied across the refinery fence. We urge ARB to clarify that the hydrogen production benchmark will be based on emissions data from all hydrogen production facilities. This should be reflected in Appendix B: Sector Details for Hydrogen Production. ARB has proposed to collect data from all facilities and exclude the Aggregation of Units of different source categories, as stated in section 95114 and 95115 of the "Proposed Amendments to the Regulations for the Mandatory Reporting of Greenhouse Gas Emissions." The Panel encourages ARB to collect this information and incorporate the data reported from all facilities into the product benchmark as soon as possible. ARB should also clarify references to hydrogen production and industrial gas production facilities throughout its various draft regulations and supporting documents (Example, Table 9.1. Page A-114) so that it is clear that the allocation benchmarks apply to all gaseous hydrogen production facilities. (IGPACC)

Comment: The allocation methodology that will provide the most accurate and most equitable benchmark is the Carbon Weighted Barrel (CWB) approach outlined in Appendix J of the Staff Report for the December 2010 rulemaking. As the European Union concluded in its Emissions Trading Scheme (EU ETS) Phase 3 rulemaking, a consistent hydrogen production benchmark can be applied to hydrogen production facilities in the refining sector in combination with the overall refining benchmark, which results in a consistent performance target for all hydrogen producers. We recognize that the ARB staff needs time to conduct more comprehensive data collection and analysis to implement the CWB method, and therefore, an interim method will be required for the first compliance period of the Cap and Trade program while this data analysis is undertaken. In order to ensure a long-term, equitable benchmark, ARB should make a regulatory commitment to implement the CWB method by the beginning of the second compliance period. This will help provide certainty, promote investments in California within our industry and prevent inequity. ARB should indicate its intent to implement the CWB method by the beginning of the second compliance period in Appendix B: Sector Details for Hydrogen Production. (IGPACC)

Comment: Given the relatively small number of liquefied hydrogen production facilities in California, establishing a benchmark for an "efficient facility" is impractical. Praxair suggests that CARB use an individual facility's verified emissions associated with liquid hydrogen product output reported pursuant to the Mandatory Reporting Rule (MRR) and the GREET Model to establish a benchmark for liquefied hydrogen production. (PRAXAIR2)

> **Response:** We recognize that equity issues exist between allocation to third-party production of hydrogen gas sold to petroleum refiners and refinery-owned hydrogen production. We believe that employing the CO_2 Weighted Tonne (CWT) approach for the refining sector is the best way to address this issue. We present separate benchmarks for hydrogen gas and liquid hydrogen based on the amount produced in Table 9-1 in section 95891(b). In the second 15-day changes to the regulation, we modified the hydrogen production benchmark to match the EU ETS hydrogen benchmark for both liquid and gaseous hydrogen. As noted in Appendix B to the First 15-Day Change Notice, this benchmark was based on a value reflecting the average greenhouse gas performance of the 10 percent best performing installations in the EU. Use of this benchmark should provide equitable treatment between refinery-owned and independent hydrogen producers once the refineries are covered under the CWT approach. We recognize that production of liquid hydrogen could potentially create indirect carbon costs for the emissions associated with purchased electricity. We recognize that purchased electricity used in the production of liquid hydrogen could potentially create indirect carbon costs. We will revisit the issue of carbon costs embedded in purchased electricity once the CPUC proceeding addressing utility costs and revenue issues associated with greenhouse gas emissions concludes.

C-56. (multiple comments)
Comment: The International Council on Clean Transportation (ICCT) recommends establishing benchmarks for transportation hydrogen use. This value will not by itself pay for installing new hydrogen stations, but can play an important role in narrowing the operating stage profitability gap for hydrogen stations during the critical early ramp-up of fuel cell electric vehicles. (ICCT3)

Comment: Hydrogen fuel cell electric vehicles could suffer an unfair playing field in Phase I of Cap and Trade because the full “well-to-wheels” emissions are subject to Cap and Trade, whereas petroleum burned in internal combustion engines is not. CARB can remedy this situation and encourage development of an advanced transportation technology through free GHG allowances. We recommend awarding these allowances based on avoided vehicle petroleum combustion emissions. ICCT calculates the avoided emissions value for distributed zero carbon renewable hydrogen at 31.6 tons GHG allowances/ tons renewable H28 in Cap and Trade phase I. CARB has proposed a value of 8.62 tons GHG allowances per ton centrally produced hydrogen using steam methane reforming. For centrally generated hydrogen, a smaller adder for hydrogen used for transportation purposes should also be added based on CARBs LCFS methodology. Future updates can be made as CARB covers vehicle tailpipe emissions and eliminates free Cap and Trade allowances for petroleum production and refining subsidy. (ICCT3)

> **Response:** We did not offer incentives for individual greenhouse gas-reducing technology, such as hydrogen for transportation applications, through free allocation. The incentive for greenhouse gas reduction created by the cap-and-trade program comes through carbon pricing rather than through free allocation.

C-57. Comment: The benchmark for hydrogen production should not be reduced to account for heat or steam sold by a hydrogen production facility. ARB staff comments on previous discussion drafts have made reference to adjusting benchmarks to account for heat purchased and sold by facilities. Hydrogen plants typically produce heat in the form of steam for their refinery customers. Petroleum refiners will receive allowances either in proportion to their output or their historical emissions, and thus will receive allowances for steam production that is used in the production of petroleum. If industrial gas manufacturers do not receive allowances for the production of all inputs to the petroleum refining process, including steam, market distortions may result, and refiners may have an incentive to use less efficient sources of steam production. (IGPACC)

> **Response:** In the second 15-day changes to the regulation, we modified the hydrogen production benchmark to ensure equity between merchant hydrogen plants and refinery-owned hydrogen production allocated to using the “Carbon Dioxide Weighted Tonne” metric. However, we believe that all sales of steam should reflect a carbon price. We encourage merchant hydrogen production facilities to include a carbon adder in the price of steam sold to refineries in the future.

C-58. Comment: We recommend establishing a separate benchmark for transportation hydrogen production to recognize both the displaced GHG emissions due to fuel cell vehicles and the absence of a cap on surface transportation petroleum combustion GHG emissions initially. This benchmark should be based on the displaced CO_2 from petroleum, using LCFS values and recognizing the improved efficiency of fuel cell vehicles compared to petroleum fueled vehicles as established in the LCFS. ARB should establish a straight-forward allowance application process in conjunction with the LCFS, recognizing that a number of potential hydrogen fuel suppliers are small businesses without the resource to “opt-in” the Cap and Trade. (KUSTIN15)

> **Response:** We did not offer incentives for individual greenhouse gas-reducing technologies, such as hydrogen for transportation applications, through free allocation. The incentive for greenhouse gas reduction created by the cap-and-trade program comes through carbon pricing rather than through free allocation.

C-59. (multiple comments)
Comment: Both liquefied hydrogen and gaseous hydrogen are often produced at the same facility. Gaseous and liquefied hydrogen production have differing emissions intensities. Praxair believes that it will be important to apply two benchmarks to a facility that produces both gaseous and liquefied hydrogen. The liquefied output should receive allocations based on the facility's verified emissions that are attributable to liquefied hydrogen. The gaseous output should receive allocations based on the gaseous hydrogen efficiency benchmark. (PRAXAIR2)

Comment: Liquid hydrogen should receive an independent benchmark. ARB has recognized in the updated draft documents (Annex B and the Proposed 15 Day Modifications on Subchapter 10) that liquid hydrogen is a different product from gaseous hydrogen used in refining applications. Liquid hydrogen is produced using different equipment and processes, requires more energy to produce, and is readily transportable across California borders and it requires additional production methodology and equipment. Further, liquid hydrogen production has a material indirect GHG emission footprint due to the significant electricity consumed in the liquefaction process. For these reasons, liquid hydrogen should be treated as a distinct product with its own unique product benchmark. (IGPACC)

> **Response:** We established a separate benchmark for liquid hydrogen. We recognize that purchased electricity used in the production of liquid hydrogen could potentially create indirect carbon costs. We will revisit the issue of carbon costs embedded in purchased electricity once the CPUC proceeding addressing utility costs and revenue issues associated with greenhouse gas emissions concludes.

Oil and Gas

C-60. (multiple comments)
Comment: With respect to oil and gas (“upstream petroleum and natural gas operations”) a benchmark that differentiates between operations that produce “light” and “heavy” crude oil has serious concerns. As presented, the proposed API gravity-based approach does not consider EOR production processes. If enacted it will,
(i) significantly and adversely affect California producers relative to out-of-state oil producers, thus violating the intent to protect against “leakage,” (ii) create wide disparity in free allowance allocations among in-state producers, and (iii) potentially disadvantage future light crude oil production growth in the state. WSPA provides a detailed analysis of these issues in Attachment A and we invite follow-up discussions in the near future. WSPA recommends that ARB return to their initial approach that proposed different benchmarks for thermal and non-thermal operations. WSPA supports the thermal/non-thermal methodology submitted by WSPA to ARB staff. (WSPA3)

Comment: ICCT recommends a flat benchmark of approximately 5 grams CO_2/ MJ for both light and heavy crude production. (ICCT3)

Comment: ARB should adopt the thermal/non-thermal benchmark for oil and gas production that recognizes California's unique products which are a function of the geology and the type of resource. The proposal reversed the December 2010 rulemaking which proposed a thermal/non-thermal benchmark for oil and gas production in favor of light and heavy crude oil because it more precisely fit the definition of a product-based benchmark. Sector specific benchmarks must be based on technically sound metrics developed through a fair public process that recognize California's unique industry footprints. The ARB selected a light and heavy crude oil benchmark in its proposal because it is more precisely "product based." This shift from the thermal/non-thermal benchmark adopted in the December 2010 rule ignores key characteristics of California's energy resources and neither the approach nor the calculations supporting the benchmark were vetted with stakeholders or industry experts. The ARB should be transparent in the development of its benchmarks. The procedure establishing the benchmark should be published and vetted with stakeholders prior to adoption. It should base the benchmark on verified emissions data from 2008 and 2009, collected with all parties using the same methods under the Mandatory Reporting rule, so that it is comparable. (CHEVRON3)

> **Response:** The activities under crude petroleum and natural gas extraction were changed from "Heavy (API < 20) Crude Oil Extraction" to "Thermal EOR Crude Oil Extraction" and "Light (API >= 20) Crude Oil Extraction" to "Non Thermal Crude Oil Extraction." The product benchmarks are allowances per barrel of thermal crude oil equivalents and allowances per barrel of non-thermal crude oil equivalents, respectively. As noted in Appendix J to the Staff Report, although we prefer to apply a "one product, one benchmark" principle, an exception was made for oil extraction because non-thermal alternative techniques are not usually substitutable in the wells where thermal EOR is applied.

C-61. Comment: In establishing the benchmark for credit allocation to oil and gas production we have encountered issues that remain unresolved. For example, there exists an apparent erroneous bin assignment under CARB's proposed Heavy/|Light Crude Oil approach. This subjective assignment will serve to skew the data for both categories causing unintended consequences for both categories of crude. Moreover, split field designation using a 50 percent approach for mixed fields is technically inaccurate and would lead to inappropriate and largely inaccurate benchmarks. Despite meeting with staff, and outlining the potential fallout from these inaccuracies, we are still unsure if and how corrections might be made to the final draft. We are further concerned about how CARB will be verifying accuracy of benchmark at the onset of the program and going forward and we wonder how CARB will monitor the accuracy of the benchmark in the future (especially in consideration of difference between the MRR facility definition and what is conventionally used in California). (CIPA)

> **Response:** We addressed the "bin" data issue the commenter refers to in development of the final benchmarks. We will continue to work with stakeholders

going forward to monitor the impacts of the benchmarks selected and ensure the amount of free allocation is sufficient to minimize leakage.

C-62. Comment: We are unconvinced that heavy and light crudes are fundamentally different products and therefore oppose the more than six times higher benchmark for heavy crude extraction. This is an unnecessary subsidy of high carbon crude, which results in higher GHG and criteria pollutant emissions in the field and at the refinery. It creates a perverse incentive to increase the use of heavy crude feedstocks in California. We recommend a flat benchmark and the potential to award bonuses for implementation of efficiency measures identified by CARB and for demonstrating renewable technologies (e.g. renewable energy for steam and electricity production). This will give larger emitters the opportunity to close the gap in both directions (by cutting emissions and earning bonus allowances). (KUSTIN13)

Response: The activities under crude petroleum and natural gas extraction were changed from “Heavy (API < 20) Crude Oil Extraction” to “Thermal EOR Crude Oil Extraction” and “Light (API >= 20) Crude Oil Extraction” to “Non Thermal Crude Oil Extraction.” The product benchmarks are allowances per barrel of thermal crude oil equivalents and allowances per barrel of non-thermal crude oil equivalents, respectively. As noted in Appendix J to the Staff Report, although we prefer to apply a “one product, one benchmark” principle, an exception was made for oil extraction because non-thermal alternative techniques are not usually substitutable in the wells where thermal EOR is applied.

Paper

C-63. Comment: Resolution 10-42 directs that allowances be allocated under the product-based approach. We urge the Board to assign emissions intensity benchmarks in a way that acknowledges unique differences between facilities, and which is consistent with a facility’s current activity. PGPPC is concerned that ARB is proposing to assign our Oxnard facility annual GHG allowances based on a product benchmark established by a facility in our industrial category which produces fundamentally different products, produced using a fundamentally different technology, and with a subsequent emissions intensity that is not comparable to or demonstrably similar to our own. Our manufacturing process and equipment is specifically designed to deliver targeted consumer preferred product-based benefits and differs from others in our industrial sector. The energy utilization and subsequent emissions intensity follows as a natural consequence from the unique design of our manufacturing process which is designed to deliver preferred differences in finished product performance. Based on calculation methods identified in Appendix B - Development of Product Benchmarks for Allowance Allocation, and emissions data currently available through ARB, there is a significant difference between our Oxnard Facility and other sources in our industrial category. The difference in emissions intensity and product attributes and performance provides compelling data that our Oxnard Facility is substantially different and should be evaluated on its own merit to establish a facility specific emissions intensity product-based factor. We believe our facility located in Oxnard should be assigned an emissions intensity product benchmark unique to us, and not the same as the (one other) source in California within our same manufacturing industrial category. (PGPPC)

> **Response:** We worked with stakeholders to assess different technologies used to manufacture tissue (e.g., conventional and through air drying (TAD) processes), and found that final products that use TAD are lighter, fluffier, and more absorbent. However since the functionality of the product is still the same even though the quality is different, we believe that it makes sense to group tissue products regardless of the technology. We intend to continue working on the tissue sector to further investigate technologies and review units and numbers of final products for their benchmark.

C-64. (multiple comments)
Comment: AF&PA supports the use of actual emissions as the basis for allowance allocations. Our concerns with product-based GHG efficiency benchmarks center on the fact that product-based benchmarks are complex and unworkable for our industry; they arbitrarily create winners and losers; and there is a large variation in products and processes making it likely that dissimilar processes will be in the same category. For example, medium mills manufacture medium; linerboard mills manufacture linerboard and can also manufacture medium as well; and gypsum facing board mills can typically also manufacture linerboard and medium. In California, there are 11 industry mills manufacturing a variety of products: linerboard, medium, tissues, towelettes, tube and core stock, gypsum facing, organic roofing paper, coated board, and coated boxboard. Perhaps more importantly, the industry's internal analysis of the allowance allocation method included in federal Cap and Trade legislation showed no correlation between GHG emissions and product type for the examined sectors of our industry. Rather than product type, our analysis shows that fuel type, and degree of integration and steam production, are the overriding factors that determine a facility's GHG emissions. In most cases, these factors are intrinsic to a facility's operations and cannot be changed without changing the basic nature and/or configuration of the facility.

CARB has inappropriately ruled out using at least two of the key factors that would yield the most reliable benchmarks, stating that "staff relied upon the 'one product, one benchmark' principle. This means that, in most cases, staff believes it is appropriate to avoid benchmarks differentiated by technology, fuel mix, size and age of the facility, climatic circumstances, or raw material quality" (emphasis added). We acknowledge that in California the inability to differentiate by technology may not be as significant an issue given the current configuration of existing mills. The forest products industry is the leader among all manufacturing sectors in the use of highly-efficient cogeneration technology to generate power and steam (also called Combined Heat and Power (CHP) technology). Virtually all AF&PA member facilities that generate electricity on-site do so using this technology. This is true in California as well, as three out of four AF&PA member mills that were included in the analysis to develop pulp and paper industry facility benchmarks and generate electricity use CHP technology and are highly efficient. Instead of rewarding them for this efficiency, they are penalized by receiving very low benchmarks. Further, because mills with CHP generate electricity on-site, they have relatively higher direct emissions and significantly lower indirect emissions associated with purchased electricity, resulting in lower total emissions. This is because mills with CHP generally do not need to purchase large amounts of electricity, and indeed can sell power to the grid. In fact, in California those same three mills sell power to the grid. Unfortunately, the methodology used to develop the CARB benchmarks does not properly include adjustments to reflect this emissions profile. Specifically, the methodology counts in the benchmark development emissions associated with electricity generated on-site, but not emissions associated with purchased energy.

Because, as stated, CHP mills' direct emissions are relatively high and indirect emissions are relatively low, this penalizes mills with CHP even though their total emissions are less than comparable facilities without CHP technology. The benchmarks are based on data from too few mills to be meaningful and only address a limited number of production activities within an NAICS sector. It makes no sense to develop a "benchmark" based on one facility, or even three facilities, as these are simply insufficient numbers on which to create a valid benchmark. We recognize that CARB has adopted a policy to develop product-based benchmarks, but it is incumbent on CARB to do so in a scientifically-defensible manner. Basing benchmarks on one or a few facilities does not meet that standard, especially when, as here, the mills have already incurred the expense and taken steps to improve the efficiency of their operations and reduce their GHG emissions. The benchmarks as applied to these mills penalize them for taking those steps. (AFPA2)

Comment: The proposed product-based benchmarks are not appropriate for the pulp and paper industry. They are not workable, they are determined by product type (which does not correlate with GHG efficiency in the industry), and CARB rejected two of the key factors that determine efficiency for industry mills—technology and fuel mix. Further, they are based on too few facilities to develop credible benchmarks, especially when weighed against the complexity and resources that will be expended to develop and implement the program, and do not account for new market entrants with production activities outside of the narrowly defined categories in Table 8-1. We urge CARB to abandon the benchmarks, and instead distribute allowances in proportion to the actual absolute emissions of the mills within the scope of the program. This would be easier to develop and implement, as mills are already reporting GHG data to CARB. Further, the overall decrease in the program cap ensures CARB will achieve the needed reductions from industry facilities, not GHG efficiency benchmarks assigned to individual industry facilities. (AFPA3)

Comment: We are concerned that CARB is proposing to use product based benchmarks as the basis of allowance allocations for the Paperboard sector. An industry-wide analysis of pulp and paper manufacturing showed no correlation between greenhouse gas emissions and product type. The Paperboard sector is one of 13 sectors contributing only 9 percent of the California GHG emissions (Appendix B, p. 11). To the best of our knowledge, we are the only mill in California that produces Iinerboard, and one of two mills that produces medium. Appendix B of the proposed rulemaking indicates that CARB's approach may be compared to the product benchmark work done in the European Union's Emissions Trading Scheme (EU ETS) for the paperboard sector. The EU ETS benchmarks reflect the average GHG performance of the 10 percent best performing installations. We cannot confirm how CARB developed the product benchmarks for the Paperboard sector because there is no supporting documentation provided in the proposed rulemaking. However, CARB did establish product benchmarks for both products made at the Ontario Mill, linerboard and medium. Since the sample size for these two products (one and two mills, respectively) is so small, we do not believe it is appropriate to establish product based benchmarks. It would be inaccurate to say that the proposed benchmarks reflect the average GHG performance of the 10 percent best performers, since there are so few mills in each of the product categories. In addition, in April 2011, the European Commission determined that where several products are produced at one location, it was not feasible to assign GHG emissions to individual products and therefore, those sites were not included in setting the benchmarks. Since the Ontario Mill produces multiple products, using the EU ETS logic, it would be inappropriate to establish product benchmarks based on data from this mill. Since the Ontario Mill is the only producer of linerboard, there would be no valid data to support a product based benchmark for this activity. Therefore, we support the use of actual emissions as the basis of allowance allocations. (TI)

> **Response:** There are five paper/paperboard mills that are covered under the cap-and-trade program. We contacted all five mills and gathered information about their products, technology, and cogeneration units—including the amount they sell to the grid. Final products were classified in four categories based on their characteristics. The benchmark calculation adjusts for electricity sold in order to account for carbon cost recovery through the price of power sold. We believe that no mills are unintentionally disadvantaged only because the sample population is too small, or because the paper sector is heterogeneous and runs cogeneration units. The allocation methodology is intended to reward efficient producers within a sector and to minimize leakage. We believe that allocation based on historical emissions, as one commenter suggests, is inappropriate to achieve these goals.

C-65. Comment: It is unclear from the wording of section 95891(a) if operations within a listed sector but not defined by a listed activity would receive allocations using the energy-based benchmark allocation methodology of section 95891(c) or if they would receive no allocations because their specific activity is not listed in Table 8-1. If the latter, CARB would be severely discouraging expansion of existing operations in the state of California. The vast changes made to Table 8-1 from the December 2010 Proposed Regulation to the July 2011 Discussion Draft creates this ambiguity, and AF&PA requests that CARB specifically address this concern by eliminating the specific activities in Table 8-1 (i.e., reverting back to the December 2010 proposal) or explicitly addressing operations that fall into the NAICS sector definitions and NAICS codes in Table 8-1 but not any of the activities listed in Tables 8-1 or 9-1. For our specific sectors, it is misleading that Table 8-1 currently implies that the entire NAICS classification for “Paper (except Newsprint Mills)” (322121) is defined by the one activity of “Through Air Dried Tissue Manufacturing” or that NAICS code 322130 is defined by only the three activities currently listed in Table 8-1. (AFPA2)

> **Response:** We clarified the distinction between “activities” and “sectors.” Activities listed in Table 8-1 but not listed in Table 9-1 will receive free allocation based on an energy-based benchmark specified in section 95891(c). The change made to Table 8-1 and 9-1 was to make clear the sectors and the activities that are eligible for assistance. We intended to ensure that listed activities covered the operations conducted by each industrial facility that is subject to the regulations. We do note that “air-dried tissue manufacturing” was changed to “tissue manufacturing,” which includes any type of tissue manufacturing.

C-66. Comment: I understand and appreciate CARB needing to establish a greenhouse gas benchmark for each type of industry to determine allowances. However, when the type of industry is a population of one (such is the case for our paperboard mills), then that is not a benchmark. Statistically, a pool of twenty should be used to develop such a starting point. Since there are not twenty similar industries in the State of California, then the data source should be enlarged to incorporate such a pool. This will be accomplished soon with the mandatory reporting on a national level. Once this data is collected, then it should be used to develop a benchmark. Using a population of one to develop a standard is onerous and burdensome to the facility that must find means to reduce its carbon footprint even though it may be the best in the nation. The cost of credits may outweigh the expected margin of the facility's profit, and cause them to shut down. (GPI2)

> **Response:** We believe it is consistent with the goal of AB 32 to include as many industrial sectors as possible under product-based benchmark to minimize leakage; free allocation is based on a product level that will be updated annually to ensure that the compensation is provided as production increases. The thermal-based benchmark does not have updating mechanism, and therefore does not guarantee free allocation in proportion to production level. For the sectors for which there is only one facility, the facility’s historical performance level is considered to be “best in class.” We will consider a revision to the benchmark in future rulemakings if new and better data, including national data, become available. At this point we are not aware of any robust national emissions intensity data set available for the paper sector.

C-67. Comment: As a facility in a highly trade exposed industry (paperboard), we are concerned that market prices for allowances at $25/ton and above are going to have a severe impact on our business. Since we are trade exposed, we cannot pass these costs onto our customers as we compete with firms outside the jurisdiction of ARB. To alleviate this potentially severe impact on our manufacturing business and the jobs we provide, we suggest that ARB look at the pricing impacts on highly trade exposed industries, potentially reducing or removing the cap adjustment factor for highly trade exposed industries or waiving it when a certain price trigger (e.g. $25/ton) is hit. The cap adjustment factor exceeds the growth expected in our industry, preventing us from keeping pace from an earnings perspective. It becomes a severe penalty as the price of allowances reaches $25/ton. Controlling the costs of the cap adjustment factor for our highly trade exposed industry is vitally important to allowing our industry to sustain its manufacturing operations and keep Californians employed. (GPI4)

> **Response:** The cap adjustment factor is one factor in the calculation of allowance allocation to industrial producers. Since the amount of allowances available for all emitters declines over time, the total number of allowances allocated to entities must decline as well. Therefore, the cap adjustment factor declines in proportion to the cap for most industrial producers. In some sectors, with high emissions intensity, high leakage risk and with process emissions as the majority of their total, the cap adjustment factor is approximately half of the overall cap decline. This is indicated in the second 15-day changes to the regulation, section 95891, where Table 9-2 was modified to define "sectors and activities associated with process emissions greater than 50 percent." For this reason, the cap adjustment factor is not triggered based on allowance price. Rather, we believe that there are abatement opportunities within acceptable price ranges. As a result, covered entities are able to purchase allowances from the allowance price containment reserve at fixed prices above where we believe trading activity will occur. This helps keep allowances prices within an established range. Our analysis of leakage risk took into consideration these design features, and we believe our allocation approach for industrial producers is sufficient to minimize leakage.

C-68. Comment: The benchmark for the Recycled Boxboard industry is based on recent data which includes early action projects. ARB has said that it would not penalize facilities for conducting early action projects and inspired facilities to begin reducing GHGs. Unfortunately, the recycled boxboard group is being penalized for conducting early action projects, as the results of these early action projects are being included in the benchmark. Furthermore, the data used for this benchmark is very limited and not statistically significant. As most of the recycled boxboard mills in the country reside outside California, ARB's approach makes it impossible to tell whether the California Recycled Boxboard group is operating better or worse than its national peers. This again creates a competitive disadvantage when California mills compete against its national peers. We ask that ARB reconsider the data it uses for this group and look into a national data set for the recycled boxboard group. We request that more recent data be omitted to provide reward for early action projects. We request that data prior to 2008 be included in order to develop a fair benchmark and improve the statistical significance of this benchmark. (GPI5)

> **Response:** We believe that benchmark stringency should reflect the emissions intensity of highly efficient, low-emitting facilities within each sector. Benchmarks were selected to reward early action projects, not to penalize them. However, in some sectors, there is only one facility in a benchmarked group. In this case, we

assumed that this facility was best-in-class and used their emissions intensity as a benchmark. This is the case with recycled boxboard sector. At this point, we are not aware of any robust national emissions intensity dataset available for the recycled boxboard sector. We will be able to compare California producers with national producers when data become available.

In considering the data available for determining a benchmark for producers, we typically relied on emissions data reported under MRR and consequently used production data voluntarily supplied by facilities for the same years. The MRR data were first reported for 2008 emissions. In some cases, ARB had conducted industry surveys or facilities had voluntarily reported to the California Climate Action Registry. In those cases, we had alternate data sets on which to rely.

Refineries

Support for EII

C-69. (multiple comments)
Comment: ARB should adopt the Energy Intensity Index (EII) based benchmark that meets the goals of AB 32 to reduce CO_2, reward early action, and not punish those that invest in their California refineries. The proposed "Simple Barrels" benchmark would promote leakage and simply does not achieve AB 32 goals, which were included in the statute, of rewarding early action at existing facilities. It also is not equitable to larger facilities that manufacture cleaner California fuels and other high value products such as lubricating oils, which serve global markets. ARB proposes to use a "simple barrel" approach because it is "product based." California makes unique demands of its refineries by requiring cleaner fuels which has, in turn, required more complicated operations that utilize much more equipment than typical refining operations. The simple barrel benchmark ignores this complexity and divides the total amount of selected products into the total amount of direct carbon emissions. It does not include all products produced. Furthermore, it treats all of the products included equally despite differences in their emissions profiles. If ARB insists on a product-based approach, we would support adoption of the EU factors for the Complexity Weighted Tonne benchmark in the first compliance period. While this concept does not have industry consensus and is not ideal for California, this benchmark is technically sound, rewards early action, and is neutral on configuration so that it does not punish California's refineries. (CHEVRON3)

Comment: In the draft Regulation, free allowances are allocated to facilities according to a benchmark set at a desired standard of performance. The benchmark is set at 90 percent of the sector's average emissions (tons CO_2) per barrel of product. This approach is referred to as "Simple Barrels." Unfortunately, the effect of this approach is to penalize refineries that have invested to meet California product specifications and other "clean fuel" mandates. ExxonMobil believes that the Simple Barrels approach is inappropriate as a benchmark for refining, given the vast differences in refining complexity across the sector. ExxonMobil has spent years optimizing its operations and equipment in order to both meet product demand in California and maximize energy efficiency. The Simple Barrels approach does not recognize the differences in refinery complexity and therefore, does not appropriately measure performance across all refineries. Moreover, the benchmark favors simple refinery configurations. The result is a benchmark that rewards a facility according to the amount of equipment it contains rather than according to the efficiency with which it operates that equipment. The Simple Barrels approach may lead to unintended consequences. The Energy Efficiency Based Allowance Distribution Methodology proposed by the Western States Petroleum Association (WSPA) for the first compliance period addresses these issues. The Energy Efficiency Based Allowance Distribution Methodology, or a similar approach, would recognize differences in complexity among refineries and enable distribution of allowances according to efficiency. Complexity-based approaches have been recognized by both industry and government organizations as appropriate for measuring performance in the refining sector. We believe complexity-based metrics are suitable for use in the California Cap and Trade program and would be more effective than the Simple Barrels approach for allocation. (EXXONMOBIL)

Comment: The simple barrel method should not be chosen as the benchmark methodology as it penalizes complex refineries. For instance, simple bbls favors refineries without hydrogen plants that purchase merchant hydrogen and penalizes refineries that have their own hydrogen plant. Refineries with cogeneration units that produce excess electricity are also penalized over refineries that do not have cogeneration units. The simple barrel method does not reflect the energy efficiency of a refinery—just the amount of energy it uses, and allocating allowances in this manner can have unintended consequences. If ARB does not select the WSPA proposed EII method then it should adopt grandfathering as it will treat refiners more equitably by not picking winners and losers. We highly recommend that CARB reexamine the basis for refinery allocation. (VALERO2)

Comment: Delete the simple barrel methodology refinery benchmarking methodology and replace it, beginning in the first period, with a benchmarking methodology that recognizes complexity of refineries such as the Ell-based methodology proposed by WSPA. The proposed simple barrel benchmarking methodology for refineries is an over simplification that does not accurately reflect the carbon efficiency of a refinery and should not be used, even as an interim solution. The simple barrel methodology should not be used to allocate free allowances for refineries. First, the simple barrel methodology is not accurate. It does not accurately represent the carbon intensity of all products produced by a refinery. Refineries vary significantly in the types of teed (crude and intermediate inputs) to the refinery, the finished and intermediate products produced, the on-site consumed products produced and the process units used to produce the products. Some refineries are designed to produce more transportation fuel products from heavier crude than others, thus deriving full advantage from our oil resources. Some refineries are designed produce intermediate products that require further processing at another facility. Some refineries produce products that are used internally for the refinery operations such as electric power, steam, hydrogen and low BTU gas (Flexigas), while other refineries purchase these products from third parties.

The proposed simple barrel methodology is too simple and does not account for all these differences. It does not accurately represent the carbon intensity or energy efficiency of a refinery. Second, the simple barrel methodology incentivizes results that are contrary to the objectives for providing free allowances. It encourages leakage and does not provide a transition period. The objectives of providing free allowances to industry are 1) to minimize leakage and 2) to provide adequate transition period to prevent unnecessary economic disruptions or short term costs. The proposed simple barrel methodology is contrary to these objectives. The use of the simple barrel methodology will result in a wide range of differences in percentage of tree allowances allocated to a refinery relative to the refinery's emissions. During the first compliance period in which the average industry sector reduction is approximately 4 percent, some facilities will receive only partial free allowances and must either reduce emissions or purchase compliance instruments in amounts equivalent to 5 to 10 times greater than the average sector reduction of 4 percent. At the same time other refiners will face no emission reduction or are given excess allowances to sell. Rather than providing a smooth transition period, this methodology would create disparate conditions that spur abrupt changes for some facilities and could add pressures that encourage leakage. Additionally, because the simple barrel methodology advantages simple refiners and the use of light crude, it could incentivize leakage with importing of more tight crude into California while exporting California domestic crude. This could also have the negative side effect of increasing the overall cost to produce clean products. In some cases, it may cause California refiners to reduce rates and/or import more products. Some argue that leakage would not occur by the use of simple barrel methodology as an interim method for the first compliance period because two years is insufficient time to make changes. During this interim period or period of uncertainty, refiners may delay investment decisions in California or alternatively divert capital investment to their portfolio outside of California. While it takes refiners four to five years to permit and execute large capital projects, refiners can make crude and product import and export and throughput decisions in a relatively short period of time. Third, it is not an effective template for others interested in Cap and Trade to follow. The simple barrel approach is a technically flawed methodology that results in large disproportionate allocations that could spur abrupt changes for some facilities. It does not provide for sufficient transition period to reduce industry emissions in a cost effective manner, nor is it consistent with the European Union. It also provides windfall profits to simple refiners, and is inconsistent with ARB's stated objectives. Given these significant shortcomings, CARB has not created a Cap and Trade model that will likely to be followed by others. Fourth, it does not encourage investment in California. Refiners have made investments to meet the California's clean fuel standards while continuing to meet California's transportation fuel needs. Many of these investments increased complexity of these refineries and are necessary to keep California's refineries competitive with refineries in other states as well as across the globe. The simple barrel methodology disadvantages complex refineries and penalizes these past investments. The lack of certainty in the rulemaking effort thus far continues to jeopardize industry investment decisions that are being made today, but won't be completed for five or 10 years. It does not encourage future investments to modernize and improve California's energy infrastructure and could cause discretionary capital investment to be moved to other states or regions of the globe in which the petroleum markets are growing or where more regulatory certainty is provided. Therefore, Shell recommends that the simple barrel methodology for refineries be deleted and beginning with the first period, use a benchmarking methodology that recognizes complexity of refineries, such as the EII based methodology proposed by WSPA. (SHELLOIL)

Comment: AB 32 gave ARB the authority to issue free allowances in an equitable manner that maximizes the total benefits to California and encourages early action to reduce greenhouse emissions. ARB has chosen to use output based benchmarks as one of the factors in granting free allocation to qualified facilities. Within the various industrial sectors, ARB has estimated that entity emissions range from less than 25 percent to about 500 percent of the benchmarks. Incentives for California entities to reduce emissions by a factor of 4 or 5 are not "correct," but are simply discriminatory given that California is among the states with the lowest carbon footprint in the nation. Tesoro has expressed its views and results of its studies regarding refinery benchmarking with ARB on several occasions. Three essential points have been discussed. First, consistent with commitment from ARB management, the benchmark method must recognize the emission reductions from early actions such as the Coker modification project at Tesoro's Golden Eagle Refinery. Second, that refinery benchmarking should not be subjective. Subjective measures of refinery activity such as crude throughput, product output, clean product output, refinery activity, refinery energy intensity, refinery carbon intensity or volume and quality of feedstock's and products may appear as logical choices as a basis for a benchmark but can easily favor some and discriminate against others. Third, use of any of subjective benchmarks exaggerates the difference between refineries by a factor 3 to 5 relative to any practical opportunity to reduce emissions. For these reasons Tesoro favors a benchmark that strongly considers baseline emissions for each refinery. The WSPA proposal considers baseline emissions, energy efficiency, and reduces the disparity within the sector while meeting ARB's primary objective of setting a correct incentive for the initial period and allows the program to start with minimal interruptions. (TESORO2)

Comment: For downstream (refining and related operations), WSPA believes that the simple barrel methodology clearly works against ARB's objectives to minimize leakage and a smooth start to the program. It is clear that the simple barrel method is simply inadequate and not a suitable benchmark for use in California because it:

- does not consider all the various products produced by a refinery
- applies a one-size fits all methodology for non-comparable sources
- fails to distinguish between facilities that produce their own on-site generated and consumed products such hydrogen, power, steam, flexigas or fuel gas
- rewards a facility based on the number and type of equipment it operates rather than the efficiency with which it operates that equipment
- does not reflect nor reward early actions to reduce energy consumption or improve operational efficiency

- is neither accurate nor representative of industry operations nor reflective of either energy or carbon conservation

In summary, use of the simple barrel method could lead to an inequitable distribution of allowances and disruption in the allowance trading market. In view of the shortcomings of the Simple Barrel Method and the strengths of the EII method, ARB should adopt the Adjusted EII methodology for refineries in the first compliance period as we work toward a complex-weighted barrel methodology. WSPA recommends that ARB use an Adjusted EII benchmark for refineries within the State. (WSPA3)

Comment: Section 95802(a)(202) defines Primary Refinery Products as aviation gasoline, motor gasoline, jet fuel, distillate fuel oil, renewable liquid fuels and asphalt. For each refinery, ARB will convert blendstocks into finished fuel, by using a blending ratio. WSPA has concerns with this definition as it excludes many refinery products such as LPG, Petroleum Coke, No. 6 fuels among many others, plus it does not take into account products consumed onsite such as hydrogen, power, steam or flexigas. Further, it is not clear or transparent as to how the blending ratio is derived and how it will be used to develop the final facility product total. As used in Appendix B, the primary product is used for benchmarking purposes in the Simple Barrel methodology. It is not clear, how ARB will manage the seasonal and annual changes in product volumes in the benchmarking calculations. WSPA opposes the simple Barrels benchmarking methodology for many reasons, including the fact that the Primary Produce definition is flawed and not transparent. WSPA recommends that the Adjusted EII methodology be adopted in lieu of Simple Barrel approach that will obviate the need for this flawed "primary produce" definition. (WSPA3)

Comment: WSPA's understanding of the primary objectives for allocating free allowances to trade exposed sectors are 1) to minimize leakage and 2) to provide transition assistance. The selection of the benchmark methodology can have significant impact on whether the program successfully works to support these objectives or, instead, frustrates progress toward a workable system to implement AB 32. WSPA supports the use of a well-designed benchmarking method that results in an equitable distribution of allocations. We agree with the ARB's statement in Appendix of the proposed Regulation that "benchmarks are metrics that enable the comparison of GHG performance across similar industrial facilities" and that benchmarks can be used as a basis for allocation in a market-based system such as Cap and Trade. Characteristics of a well-designed benchmark include:

- Accurate and reliable reflection of a facility's energy (and carbon) efficiency
- Direct relationship to GHG emissions
- Appropriate application to affected comparable facilities
- Clarity and transparency in calculating methodology
- Consistent with the objective of minimizing leakage and providing assistance during a transition period
- Equitable treatment of facilities irrespective of location (i.e., on-site or off-site)

- Does not award windfalls

Using these criteria, it is clear that changes proposed in the July 25, 2011 version of the Cap and Trade Regulation for both the refining sector and the oil and gas production sectors need to be revisited. WSPA recommends that ARB incorporate the GHG emissions from net power and heat used to produce the product into any product based benchmarks for upstream and refining and for all sectors. (WSPA3)

Comment: CARB should adopt the proposed WSPA methodology. This methodology accomplishes CARB's goals of incentivizing greenhouse gas emission reductions, improvements in energy efficiency, and rewarding early action. Output-based benchmarking may be appropriate for other sectors but would be a gross mistake for the refining sector. CARB's proposal for a "Simple Barrel" output-based benchmark for our industry would create large inequities between companies unrelated to greenhouse gas emissions and could result in unintended consequences that are contrary to AB32 goals. For example, this could reward the processing of certain crude oils in other States or countries and the importing of those intermediates to California for further refining. This does nothing to meet the goals of AB32 and could actually increase global emissions of greenhouse gases. (CONOCO2)

Comment: The Regulation contemplates use of a "simple barrel" methodology for the refining sector. If such a methodology is employed by CARB, we ask that CARB incorporate three key concepts. First, indirect emissions must be accounted for in the benchmark. If the Simple Barrel benchmark is going to be employed on an equal basis, then all emissions related to the output should be included in the benchmark. Indirect emissions from purchased electricity, purchased steam, and purchased hydrogen must be included. Emissions associated with sold electricity and sold steam should be excluded. Failure to properly account for emissions from purchased electricity penalizes refineries with cogeneration units, creates an unfair playing field between refineries, and creates perverse incentives for facilities to simply shift emissions by buying electricity and hydrogen rather than producing it. Second, baseline years should extend beyond 2008-2009. Limiting the baseline years to 2008-2009 fails to account for energy efficiency activities in earlier years. Furthermore, 2008-2009 could be years that are not representative of emissions or production for reasons such as having a refinery shut-down for maintenance (typically every five years). We recommend expanding baseline years to 2006-2010. Third, other factors could influence a Simple Barrel benchmark and should be considered (i.e., step-changes) for later compliance periods. This additional review is necessary regardless of whether the later compliance periods use the Simple Barrel methodology or a methodology that is complexity or efficiency based. (BP2)

> **Response:** We allocate free allowances to the industrial sector for two purposes: (1) to provide transition assistance, and (2) to prevent leakage. Transition assistance allows industrial sectors at the outset of the program to avoid sudden or undue short-term economic impacts, flexibility to comply, and incentives to innovate to a low-carbon economy. We believe our product-based

benchmarking methodology is appropriate and will encourage energy efficiency. In a market-based program such as cap-and-trade, the goal of benchmarking is not to set an allowable level of emissions form each facility. Rather, the benchmark is used as one factor to allocate free allowances to assist facilities for the cost of compliance to prevent leakage and to incentivize them to reduce GHG emissions.

After reviewing comments received during the 45-day comment period for the regulation, numerous consultations with stakeholders, and analysis of additional data, we modified our approach for allowance allocation to the refinery sector in the second 15-day changes to the regulation. The new approach includes the "tempering" requested by stakeholders to address transition risk. In the second compliance period, we employ the CO_2 weighted tonne (CWT) approach which is a throughput-based benchmark that reflects refinery complexity. The following is a detailed summary of the changes we made.

In section 95891(d), we added a new methodology for allocating to individual operators in the petroleum refining sector in the first compliance period, in response to stakeholder comments about the impact of the prior proposal on equity in the refining sector in the first compliance period. Under the new text, complex refiners' allowances are allocated based on a methodology initially proposed by the Western States Petroleum Association. This approach allocates allowances based on the following factors: (1) historical emissions from for each refinery, (2) the Solomon Energy Intensity Index (EII) for each refinery, (3) an adjustment factor to reduce competitiveness impacts of allowance allocation between in-state refineries, and (4) future emissions for each refinery. The Solomon EII is a complexity-adjusted measurement of refinery energy efficiency developed by Solomon Associates. Solomon Associates has been developing energy-efficiency benchmarking for energy-intensive industries for the past 29 years. They maintain an extensive database for refineries' energy consumption and process data covering over 70 percent of global refining capacity. We believe that the EII is the most appropriate performance metric for complex facilities in the first compliance period. This metric is well understood by all complex facilities and has been recognized under the U.S. EPA's ENERGY STAR Program. Appendix A of the Second 15-Day Change Notice details the approach and analysis of the modified refinery allocation.

Simple refineries that do not have an EII value, or those without a representative EII value as determined by the Executive Officer, are allocated to using the "simple barrel" product benchmark proposed in the first 15-day changes to the regulation. We updated the value for this simple benchmark from 0.0465 allowances/barrel of primary refinery products to 0.0462 allowances/barrel. We made this change to reflect additional data that was provided by covered refineries and the inclusion of 2010 data in the development of the benchmark. We imposed a limit on the amount of allowances a facility can receive based on historical emission levels consistent with stakeholder comments. This approach will prevent any excessive rewards due to free allocation under the simple barrel metric.

For the second and subsequent compliance periods, we will allocate allowances to all refiners using the “Carbon Dioxide Weighted Tonne” (CWT) approach. This metric is based on the refinery benchmarking conducted for the European Union’s Emissions Trading Scheme.

We recognize the importance of indirect carbon costs. We include adjustments for purchased heat and for heat and power sold in the refining benchmarking. We believe it is premature to add an adjustment for power purchased at this time. This is because purchased power may not create an indirect carbon cost in all cases. It is ARB’s goal to see a carbon price properly embedded in all purchased power, including utility rates. If and when this occurs, the compensation for these indirect carbon costs could be incorporated into the product benchmarks (or reductions in these costs created in some other fashion) as necessary, to help minimize leakage. We will revisit this issue once the CPUC proceeding addressing utility costs and revenue issues associated with greenhouse gas emissions concludes. We recognize the issues associated with imported hydrogen. We believe the CWT allocation approach properly addresses these issues.

For the refining sector, we have the most confidence in emissions data reported to ARB under the mandatory reporting program, beginning with the 2008 data year. On a case-by-case basis we will consider high-quality data from earlier years for establishing baseline emission levels for allocation purposes. We agree that it is necessary to continue to review the allowance allocation to refineries as part of ongoing program review.

Oppose EII, Support Simple Barrel

C-70. Comment: WIRA supports the use of the Product Output-Based Allocation Calculation Methodology and the calculation modifications as described in section 95891(b). WIRA also supports the selection of the Simple Barrel Benchmarking approach contained in Table 9, 1-Product Based Emissions Efficiency Benchmarks. No other approach to allocation distribution is as transparent and predictable, nor is any other approach as consistent with the stated regulatory goal of focusing on output of products from regulated facilities. (WIRA3)

Response: Simple refineries that do not have an EII value, or those without a representative EII value as determined by the Executive Officer, are allocated to using the “simple barrel” product benchmark proposed in the first 15-day changes to the regulation. We updated the value for this simple benchmark from 0.0465 allowances/barrel of primary refinery products to 0.0462 allowances/barrel. We made this change to reflect additional data provided by covered refineries and the inclusion of 2010 data in the development of the benchmark. We imposed a limit on the amount of allowances a facility can receive based on historical emission levels consistent with stakeholder comments. This approach will prevent any excessive rewards due to free allocation under the simple barrel metric.

C-71. Comment: WIRA supports the use of the Simple Barrel approach for direct allocation of allowances described in Subarticle 9. However, the Modifications, as proposed, do not recognize an important product produced by WIRA members that should be considered a Primary Refinery Product—Residual Fuel Oil. (WIRA3)

Response: We do not currently believe that residual fuel oil represents a primary refinery product that is in need of free allocation to prevent leakage risk. However, beginning with the 2011 data year, we will collect detailed, third-party verified, refinery product data as part of the effort to monitor for emissions leakage in this sector. We will monitor the production of residual fuel oil in the state using this data set and consider changes to free allocation as needed to address leakage issues.

Oppose EII, Support Simple Barrel if Stringency Is Increased

C-72. (multiple comments)
Comment: Output-based refinery benchmarks should be set based on "best in class" emission rates, similar to the EU approach. We recommend a benchmark of 0.037 metric tons of allowances per barrel of output, approximately 20 percent lower than the proposed benchmark of 0.0465 metric tons of allowances per barrel. The ICCT recommended value is comparable to national average refinery emissions times 90 percent. This value is met or exceeded by several California refineries while the remainder would be required to purchase allowances as shown in CARB's Appendix B to the recent Cap and Trade Regulation revisions. An alternative approach, is a benchmark of approximately 0.03 metric tons of allowances per barrel based on California best in class refineries. EU refinery emissions are 0.0304-0.0306 metric tons per barrel throughput. The EU ETS reduced the GHG benchmarks by an additional 15-20 percent from average EU refinery emissions. While the EU reported per barrel throughput does not directly correspond to CARB's list of "Primary Refinery Product," a California benchmark of 0.030 allowances per barrel of "Primary Refinery Production" will provide at least as many, if not more, allowance per barrel than EU refineries receive. (ICCT3)

Comment: We oppose the WSPA proposal that mixes grandfathering, increased free allowances for refineries that increase their GHG emissions, and a very weak energy efficiency incentive. Grandfathering rewards the use of high-emitting processes and inputs. In addition, the WSPA proposal that CARB give a refinery free GHG allowances to offset most of allowances needed for emission increases would directly contravene the potential benefit of a Cap and Trade system. Facilities that choose to increase use of heavy Venezuelan crude, for instance, would receive free allowances to largely offset their increased GHG allowance obligation (while also increasing criteria pollutant emissions). Facilities that source more lower carbon crude, improve coking operations, implement renewable energy or carbon capture projects would lose most of the benefit of lower GHG compliance obligations due to cuts in their GHG allocations under the WSPA proposal. This proposal would run contrary to CARB's laudable efforts to encourage low carbon fuels and promote economic incentives for GHG emission reductions. Free GHG allowance allocations to incumbent high carbon industries are a potential barrier to advanced technology. (ICCT3)

Comment: Any free allowances given to refineries should be tied to emission reduction strategies such as advanced technology and energy efficiency. As a second choice, we believe that CARB's output-based refinery allocation proposal is superior to grandfathering. (ICCT3)

Comment: The WSPA proposal to use the Solomon EII index to rank the refineries' GHG performance is flawed since the proposed ranking is based on energy rather than carbon efficiency. This can encourage use of high carbon feedstocks which would undermine the carbon reduction objectives of AB 32. In addition this index is an industry sponsored and funded benchmarking service which is proprietary. The rankings lack public accountability since the proprietary methodology is non-transparent and based on confidential information. The WSPA allocation proposal is not based on California production and so does not maximize production in California. Finally the proposal dilutes incentives for carbon reductions by compressing the range of the distribution of allowances. In effect poor performers are not 'penalized' too much and will obtain significant subsidies to continue carbon intensive production. This payment for poor performance will dilute the incentives for improving performance. Do not use the WSPA proposed Solomon EII index as the refinery GHG performance benchmark. (KUSTIN13, UCS7)

Comment: For the refining sector, CARB has proposed an output based benchmark of 0.0465 allowances per barrel of primary product. The rationale for this proposal is that it is 90 percent of the value of the average emissions per unit of primary product among California refineries. The supposition is that this percentage reflects a 'best practice' assessment of carbon intensity performance in the refining sector. Under this proposal, nearly half (7/15) of refineries lie below the proposed benchmark, indicating that almost 50 percent of refineries will have surplus allowances to sell. This windfall occurs as a direct result of the proposed weak benchmark standards. The proposal, if adopted, would be a missed opportunity to promote refinery best practices and compares poorly with the EU ETS performance benchmarks in which only the top 10 percent of refineries are deemed 'good' performers and get all their allowances for free. (KUSTIN13)

Comment: Many of the benchmarks proposed are based on the historical GHG intensity performance of California producers. In some cases these data restrictions result in weaker performance benchmarks. California refineries have emissions intensities that are around 30 percent higher than the East Coast and the Midwest. Calculations show that if the CARB methodology was used with national rather than California data, the refinery GHG benchmarks would be around twenty percent lower (approximately 0.0385 allowances per primary product), rather than the CARB proposed value of 0.0465 allowances per primary product. We recommend that the refinery emission intensity benchmark should be based on best-in-class performers at the national rather than the California level. (KUSTIN13, UCS7)

Response: Simple refineries that do not have an EII value, or those without a representative EII value as determined by the Executive Officer, are allocated to using the "simple barrel" product benchmark proposed in the first 15-day changes to the regulation. The value for this simple benchmark was updated from 0.0465 allowances/barrel of primary refinery products to 0.0462 allowances/barrel. We made this change to reflect additional data provided by covered refineries and the inclusion of 2010 data in the development of the benchmark. We imposed a limit on the amount of allowances a facility can receive based on historical emission levels consistent with stakeholder comments. This approach will prevent any excessive rewards due to free allocation under the simple barrel metric.

Complex refiners' allowances are allocated based on a methodology initially proposed by the Western States Petroleum Association. This approach allocates allowances based on the following factors: (1) historical emissions from for each refinery, (2) the Solomon Energy Intensity Index (EII) for each refinery, (3) an adjustment factor to reduce competitiveness impacts of allowance allocation between in-state refineries, and (4) future emissions for each refinery. The Solomon EII is a complexity-adjusted measurement of refinery energy efficiency developed by Solomon Associates. Solomon Associates has been developing energy-efficiency benchmarking for energy-intensive industries for the past 29 years. They maintain an extensive database for refineries' energy consumption and process data covering over 70 percent of global refining capacity. We believe that the EII is the most appropriate performance metric for complex facilities in the first compliance period, despite the fact that it is based on energy efficiency and not greenhouse gas efficiency. This metric is well understood by all complex facilities and has been recognized under the U.S. EPA's ENERGY STAR Program. EII values reported by each facility will be independently verified by third-party verifiers and through our consultation with Solomon Associates.

For the second and subsequent compliance periods, we will allocate to all refiners using the "Carbon Dioxide Weighted Tonne" approach. This metric is based on the refinery benchmarking conducted for the European Union's Emissions Trading Scheme.

We do not agree that our approach creates an incentive to switch to lower quality sources of crude. We believe that the allocation stringency correctly provides all facilities with the correct incentives to make greenhouse gas reductions. We do not agree that our approach supports poor performance. We agree that it is necessary to continue to review the allowance allocation to refineries as part of ongoing program review. We will consider national data in the context of benchmark stringency as a robust national data set is developed by the U.S. EPA's greenhouse gas reporting program.

Appendix A of the Second 15-Day Change Notice details the approach and analysis of the modified refinery allocation.

Oppose EII and Oppose Simple Barrel

C-73. (multiple comments)
Comment: ARB's proposed performance benchmarks support poor performance. Relevant available data and evidence that ARB ignores indicate that average California refinery emissions intensity is at the extreme-high end of the range among U.S. refining regions, exceeding that of any other region by a wide margin. ARB-reported emissions from all major California refineries exceed average Midwest and East Coast emissions and seven major California refineries exceed average Gulf Coast refinery emissions. Refinery emissions performance across the rest of the U.S. demonstrates what refineries can achieve under the right conditions. ARB's analysis commits a serious error by ignoring this evidence that a large refinery emission reduction is available. ARB's proposal sets the benchmark at 90 percent of the California statewide average. Based on publicly verifiable evidence this would set the benchmark at the equivalent of 346 kg/m^3 crude refined. Average 2003–2008 performance in every other major U.S. refining region is below (better than) 346 kg/m^3. ARB's proposed benchmark would inappropriately sanction and support excess emissions and poor performance by California refineries. (CBE2)

Comment: ARB's proposed benchmark fails to measure performance accurately. Peer reviewed evidence that ARB ignores shows that refinery energy and emissions intensities are not significantly associated with refinery products yield. Other factors such as market conditions cause products yield to vary independently from refinery emissions to some extent. Therefore, products yield is an unstable and unreliable metric for benchmarking refinery emissions intensity. ARB's rationale for its benchmark ignores these facts. CBE's analysis of national and California refinery operating data shows that average observed 2004–2009 California refinery emissions differ from those expected based on ARB's "primary products" benchmark by 38 percent and differ from those expected based on ARB's benchmark even when asphalt is excluded by 22 percent. ARB's proposal to measure emissions intensity as mass emitted/volume product output is substantially less accurate and reliable than measuring emissions intensity as mass emitted/volume crude refined. ARB's proposed benchmark would fail to measure refinery emissions performance accurately. (CBE2)

Comment: ARB proposes a refinery GHG emissions performance benchmark (section 95891 Table 9-1) that is based on five assumptions, none of which is supported by publicly or scientifically verifiable data or evidence. First, ARB assumes that refiners' emissions reports pursuant to ARB's Mandatory GHG Reporting Rule (MRR) are accurate. The sum total of these polluter-reported emissions is quantitatively different from the statewide emissions based on publicly reported, openly verifiable statewide refinery fuels consumption data and emission factors developed and used by the Energy Information Administration for reporting U.S. emissions under international treaties. The reason for the discrepancy cannot be verified publicly because, despite the proffered excuse that MRR emissions are certified by "independent" contractors hired by the oil companies, both the emissions data and the certification details are kept secret from the public as a matter of ARB policy. Second, available publicly verifiable evidence indicates that ARB's "primary products" metric is not an appropriate metric for benchmarking refinery emissions intensity and ARB provides no data or analysis specifically supporting its assumption to the contrary. Third, ARB assumes that benchmarking individual refineries' emissions against products output data that are kept secret from the public will be accurate and appropriate. Available publicly verifiable data and analysis indicate that it is not accurate, and ARB's use of secret products data would make the extent of this error unverifiable by the open scientific method. Fourth, ARB assumes that the average based on its secret products data, its secret emissions data, and facility identities it keeps secret (presumably to keep facility products data secret) represents refinery climate impact performance adequately. However, ARB's own chart presenting this average (Figure 3, Appendix B) indicates an uneven distribution of facility performance data that calls the representativeness of the average into question. Further, available publicly reported data show that fuels yield roughly tracks refinery crude capacity, and three of the four highest mass-emitting refineries emit less per barrel crude capacity than the average among California fuels refineries. Finally, ARB ignores refinery performance outside California, which is the majority of U.S. refinery performance data. ARB provides no scientific support for that omission, and does not even attempt to claim that California data alone adequately represent refinery performance. (CBE2)

Comment: ARB ignores a more accurate and reliable performance benchmark. CBE's published research shows that crude feed density, sulfur content, the ratio of light liquids to other refinery products, and capacity utilization explains differences in refinery emissions intensity across the major U.S. refining regions. Applying this metric to operating data from California refineries shows that observed average 2004–2009 statewide refinery emissions are within 1 percent of those this metric would benchmark. ARB says it is considering alternative refinery benchmarks. However, ARB has ignored this evidence, discussed no option to include crude feed quality, and admits that it has not collected California refinery crude feed quality data. ARB's admission that it did not collect any data on the density or sulfur content of crude feeds refined in California demonstrates that ARB could not have analyzed impacts of crude feed quality on refinery emissions in any part of its Cap and Trade scheme or its Low Carbon Fuel Standard. As a result of this broader failure of its analysis, ARB proposes an inaccurate refinery benchmark while ignoring a more accurate one. (CBE2)

Comment: ARB's inaccurate benchmark and inappropriate assistance factor would allow emissions to increase far above current already-high emission levels by failing to address the dominant refinery GHG emissions driver when that driver is changing quickly now. Crude feed quality is the dominant driver of changes in refinery emission intensity observed nationwide and in California. Statewide refinery crude supply is changing rapidly now such that up to three-quarters of the California refinery crude feed will most likely be from different or “new” sources by 2020. ARB’s proposal to sell refineries emission allowances that would allow increasing emissions for less than the profits they would make on the marginal savings from lower quality, higher-emission new sources of crude will strongly encourage them to switch to this “dirtier” feedstock. ARB’s inaccurate benchmark and proposal to delay even the need for refiners to buy cheap pollution allowances at a profit would guarantee this result. Based on the same data and methods that predict average observed 2004–2008 California refinery emissions within 1 percent, switching to the average heavy oil as defined by the U.S. Geological Survey for 70 percent of California refinery crude feed by 2020 would increase statewide refinery emissions by approximately 49 percent or 19,600,000 tonnes/year by 2020. Again, ARB admits it did not analyze this crude quality impact. Ongoing emissions in excess of those that could be achieved by 2020 if ARB’s flawed proposals are replaced by effective environmental protections would add another 7.8 million tonnes/year to the total emissions impact of ARB’s flawed proposals. (CBE2)

Comment: ARB’s refinery benchmark and assistance factor fail to achieve available emissions reductions. The long, terminal decline of California’s existing crude production sources that has continued since the mid-1980s, government analysis and industry analysis all project with confidence that some 70–76 percent of crude processed by California refineries in 2020 will not be from existing California production. Further, the ongoing decline of Alaska’s current production and the ease of decadal switching among foreign supplies demonstrated historically show that, for all practical purposes, up to three-quarters of the 2020 California crude feed will be from “new” sources. California refineries must select and adjust to new and different crude oils. Since California refineries must change the driving factor causing their extreme-high emission intensity, they can choose blends of “new” crude oils of better quality, like every other major U.S. refining region does, and that would curb their emissions. Replacing the 70 percent of refinery crude input that will be lost from current California production by 2020 with crude the quality of the total average East Coast refinery input could curb average California refinery emission intensity to approximately 308 kg/m3, a reduction of –20 percent or –7.8 million tonnes/year, as CO_2. This is based on the same data and methods that predicted currently observed California refinery emissions within 1 percent on average. However, ARB proposes to implement an inaccurate and unreliably benchmark and a flawed assistance factor that gives away for free the vast majority of allowances that refineries already can know they could buy later at a profit on cheaper, higher-carbon crude. Thus, ARB’s proposal will not achieve this reduction any more than it will prevent the emissions increase discussed above. Therefore, approximately 7.8 million tonnes/year of available emissions reductions and 19.6 million tonnes/year of avoidable emissions increases, for a refinery emissions excess above that which can be achieved in 2020 totaling 27.4 million tonnes/year, can be expected from ARB’s flawed proposals. (CBE2)

Response: We allocate free allowances to the industrial sector for two purposes: (1) to provide transition assistance, and (2) to prevent leakage. Transition assistance provides industrial sectors at the outset of the program to avoid sudden or undue short-term economic impacts, flexibility to comply, and incentives to innovate to a low-carbon economy. We believe our benchmarking methodology is appropriate and will encourage greenhouse gas efficiency in production of the primary refinery products that we identified. In a market-based program such as cap-and-trade, the goal of benchmarking is not to set an allowable level of emissions from each facility or to anticipate the emissions from each facility based on any set of correlated factors. Rather, the benchmark is used to allocate free allowances to assist facilities for the cost of compliance, to prevent leakage and to incentivize them to reduce GHG emissions and continue efficient in-state production.

We analyzed a wide variety of proposals for refinery benchmarking. Our approach is outlined in Appendix A to the second 15-day changes to the regulation. We create a first compliance period approach based on the simple barrel benchmark for the simple facilities and the Solomon EII approach for the complex facilities. For the second and subsequent compliance periods, we will allocate to all refiners using the “Carbon Dioxide Weighted Tonne” approach. This metric is based on the refinery benchmarking conducted for the European Union’s Emissions Trading Scheme.

We do not agree that our approach is inaccurate, that the assistance factor is inappropriate, or that our approach supports poor performance. We do not agree that our approach creates an incentive to switch to lower-quality sources of crude. We believe that complexity-adjusted allocation methods are neutral to crude quality. That is, they neither excessively penalize nor reward refineries sourcing poorer quality crude. We do not believe these methods create an incentive to switch to poorer quality crudes. The phase-out of free allocation and switch to auctioning as the primary method for allocation to the refining sector by the third compliance period will penalize facilities with more emission-intensive processing, including more emissions-intensive processing due to crude quality.

With respect to data use, we use an average of the three most current years of product output and emissions data in developing the simple barrel product benchmark. We have confidence in the accuracy of emissions data reported to us under the mandatory reporting program, beginning with the 2008 data year. We used product data reported voluntarily to ARB and compared this information to product data that is reported to the California Energy Commission (CEC) under the Petroleum Industry Information Reporting Act. This product information is made publicly available by the CEC at a statewide level of aggregation in the CEC’s *Weekly Fuels Watch Report*. On a case-by-case basis, we considered high-quality emissions data from earlier years for establishing baseline emission levels for allocation purposes. We agree that it is necessary to continue to review the allowance allocation to refineries as part of an ongoing program review.

Coke Calcining

C-74. Comment: CARB has established a benchmark for petroleum coke calcining that is noted as consistent with the Europe benchmark. This may or may not be appropriate for our specific calcining operation at our Contra Costa Carbon Plant. We will be in contact with CARB staff to understand the CARB basis and make recommendations for our operation as appropriate. (CONOCO2)

Response: Thank you for your participation in developing the coke calcining benchmark. We believe we selected an appropriate benchmark.

Soda Ash

C-75. Comment: Table 9-1 references NAICS Code 212391, Potash, Soda, and Borate Mineral Mining. This U.S. industry comprises establishment primarily engaged in developing the mine site, mining, and/or milling, or otherwise beneficiating (i.e. preparing) natural potassium, sodium, or boron compounds. Dry lake brine operations are included in this industry, as well as establishments engaged in producing the specified minerals from underground and open pit mines. To more accurately reflect the product mix for the compounds designated on the Code and for this type of operation in California, modify "Benchmark Units" as follows:

Allowances / Short Ton of Soda Ash Equivalent (Soda Ash, Biocarb, Borax, V-Bor, DECA, PYROBOR, Boric Acid, ~~and~~ Sodium Sulfate, Potassium Sulfate, Potassium Chloride and Sodium Chloride. (SVM2)

Response: This change in the benchmark units was inadvertently left out of final 15-day changes to the regulation, but will be incorporated when we make further changes to the regulation sometime next year. The units have been changed in the definition of "Soda Ash Equivalent" in the Mandatory Reporting Regulation, which is the basis for allocation, so the oversight will not affect the industry's allocation.

Steel

C-76. Comment: The Proposed Benchmark for Cold Rolled and Annealed Steel Sheet Production in Appendix B cites that "the ease of developing product-based benchmarks depends on the homogeneity of products within the benchmarked industrial sectors." The Appendix then goes on to list only one benchmark for Cold Rolled and Annealed Steel Sheet (CRS) Production. However, there are two types of annealing processes that result in different steel properties, which, in turn, result in two different CRS products. Steel can be annealed using either a batch annealing (BA) process or a continuous annealing (CA) process, and "BA" or "CA" is typically part of the CRS product description. Batch annealing is a multi-day process where up to several dozen coils are stacked in a furnace, and heated until the correct properties are obtained. In a continuous annealing process, the steel is uncoiled and passes in loops through a furnace for several minutes heating a cross section of the strip for several minutes. Continuous annealed material has a fine grain structure and is more resilient than batch annealed material which has a coarse grain structure and excellent formability. It is not a product that is simply differentiated by technology. Each process creates a unique product and therefore, each process should have its own benchmark. (UPI)

> **Response:** We investigated the difference between BA and CA to understand the implication to the benchmark. Because of the difference in process (BA uses lower temperature and longer time; whereas, CA uses higher temperature and a much shorter time), CRS from BA and CA could have different characteristics in terms of formability and so on. However, since the products can be used for the same end-use for most applications, we concluded that CRS can be grouped, regardless of technology.

C-77. Comment: The benchmark for Tin Steel Plate Production is listed as 0.0197 on page 10 of the Appendix. UPI is the only company that produces this product, and through communication with Mihoyo Fuji of the Air Resources Board, we came to the conclusion that our emission intensity for this product to be 0.03536. The Appendix states that the "staff selected a benchmark based on the "best-in-class" value (i.e., the emissions intensity of the most GHG-efficient California facility)." Since UPI is the only California facility that produces this product, the benchmark should reflect our current emission intensity levels. (UPI)

> **Response:** We reviewed the number and concluded that two years' worth of emissions had been mistakenly removed from the numerator in the initial benchmark calculation. This error made the benchmark number significantly lower than intended. We corrected the error.

C-78. Comment: UPI currently runs an Acid Processor (AP) in concurrence with our Pickle Line Tandem Cold Line (PLTCM) which produces Pickled Steel Sheet Product. The AP uses natural gas to regenerate hydrochloric acid which is then returned to the pickle line. Because UPI is the only facility that recycles and regenerates our spent acid, the natural gas used should not be counted against our emission intensity benchmark for our Pickled Steel Sheet Product. (UPI)

> **Response:** After careful consideration, we decided not to include the acid processor emissions directly in development of the Pickled Steel Sheet product benchmark. Free allocation will be given to UPI based on energy benchmarking for this unit.

Leakage

Miscellaneous

C-79. Comment: CARB could provide clarity regarding the potential adjustment to all industrial assistance allocations described in section 95870(e)(3) by referencing this potential adjustment in section 95899(a) and section 95891(a). (APC2)

> **Response:** We believe that the description found in section 95870(e)(3) is sufficient.

C-80. (multiple comments)
Comment: We are concerned that CARB is overestimating the likelihood of leakage risk and this is resulting in the subsidization (via free allocations) of carbon intensive industries. There are also significant costs from the free allocation of valuable allowances since these public monies could instead be spent on lowering the costs of the Cap and Trade program. Leakage risk analysis should be re-evaluated before the second compliance period to take into account transportation costs and the ability of non-Californian companies to compete with California producers. (KUSTIN13)

Comment: UCS is concerned that CARB is overestimating the likelihood of leakage and that this is resulting in the subsidization (via free allocations) of carbon intensive industries, such as refineries. As discussed, there are significant costs from the free allocation of valuable allowances since these public monies could instead be spent on lowering the costs of the cap-and-trade program. A reassessment of leakage risk should be undertaken which takes into account transportation costs and the ability of non-Californian companies to compete with California producers. Leakage risk analysis should be re-evaluated before the start of the second compliance period. (UCS7)

Comment: The proposed level of allocation to the industrial sector is much higher than is needed to combat leakage. Your own Economic and Allocations Advisory Committee found that the need for free allowances to address leakage is small. The biggest recipients of these free allowances in the staff proposal are the oil extraction and refining industries, which actually have a low susceptibility to leakage. We ask you to re-classify petroleum extraction and refining as low leakage risks, and to reduce their free allocations accordingly. (SIERRACLUBCA5)

> **Response:** We believe that free allocation to some industrial sources is a desirable means of minimizing leakage and providing transition assistance to existing California businesses. Transition assistance is designed to ensure that these businesses will not incur significant financial impacts in the beginning of the program, and to provide them with a reasonable planning horizon to begin making cost-effective emissions reductions. After the first compliance period, transition assistance will be phased out, and the level of free allocation to all but the most trade-exposed industrial sources will decline. Before the start of the second compliance period, we will evaluate the need for free allocation for the

prevention of emissions leakage, paying special attention as new information that could improve the technical accuracy of the assessment becomes available.

C-81. (multiple comments)
Comment: It is premature to make a determination of leakage risk less than 100 percent for any industrial sector past the first compliance period. The leakage analysis is insufficient to justify this. There is adequate time to do a leakage risk analysis prior to the 2015 compliance time period. The analysis should include the level of participation by other states and jurisdictions in the program as a key metric for how much each industry sector is at risk for leakage. CMTA reaffirms the comments on this topic made to CARB on December 9, 2010. There is not substantial evidence in the record to justify the leakage categorization less than 100 percent for any industrial sector. (CMTA3)

Comment: The leakage analysis is insufficient to justify less than 100 percent allowance allocation to the industrial sector in future compliance periods. It is also premature to make this decision. There is time to do such analysis prior to the 2015 compliance time period. This decision should depend on the level of participation by other states and jurisdictions in the program as a key metric for how much each industry sector is at risk for leakage. (CALFP3, AB32IG3)

Comment: The Industrial Environmental Association (IEA) continues to believe that the methodology and calculations to establish leakage categories need further review and refinement. The categories do not accurately reflect or attempt to measure how highly sought after some of these businesses are by other states and countries, with offers of financial incentives, fast-track permitting and less regulation. Industries, such as pharmaceuticals, aeronautics and specialty manufacturing are all at high risk to leave the state and should be treated accordingly in the leakage classifications. (INDENVASSOC2)

Response: We believe that the assessment methodology and framework we established is the best available technique that can be applied to all covered sectors, uniformly using publically available information. We believe that it is essential that carbon pricing is applied broadly to ensure that cost-effective emissions reductions are achieved. To this end, it was critical to classify sectors in different leakage risk categories (high, medium, and low) to minimize leakage from relatively high-risk industries while avoiding undue distortions to carbon pricing caused by overcompensating relatively low-risk industries. That said, we will monitor economic impacts to covered sectors, and will evaluate the leakage assessment methodology before the start of the second compliance period; paying special attention as new information becomes available that could improve the technical accuracy of the assessment.

C-82. Comment: The Regulation seems to conclude through use of a very simplistic analysis, that industry can be subjected to a significant level of additional cost and trade exposure before leakage will occur. When a sector operates in a global market, against global competition, where the prices are set by global supply and demand, the only way to fully mitigate trade exposure (short of a global GHG policy) is through 100 percent free allocation. Any less free allocation exposes California industry to incremental costs to which their competitors (both international and other states) are not exposed. It is really a matter of how much trade exposure and how much leakage of jobs and emissions California policymakers are willing to accept and impose on California industry. The trade exposure of the refining industry is well documented. Until a critical mass of states and countries adopt carbon policy that results in a similar cost of carbon, California should freely allocate 100 percent of allowances to trade-exposed industry. Further, the Regulation must contain a commitment and process to evaluate the continuing extent of trade exposure of California industry subject to the Cap and Trade Regulation. A clear commitment to and process outlining a periodic review of the Cap and Trade language could serve this purpose. (BP2)

> **Response:** As is demonstrated in Appendix K of the Staff Report, the trade exposure of the refining industry, using the ratio of imports and exports relative to domestic market size, was medium. We used the best available information and analysis tools, incorporating methods from other programs such as the EU ETS, the proposed Australian program, and the analysis from the Waxman-Markey bill, to complete our leakage risk analysis. That said, we will monitor economic impacts to covered sectors and evaluate the leakage assessment methodology before the start of the second compliance period, paying special attention as new information becomes available that could improve the technical accuracy of the assessment.

C-83. Comment: CCEEB recommends that ARB establish a test to determine if an industry is trade exposed. The ARB's trade exposure test should rely on two criteria: (1) is there a federal program; and (2) is there linkage to broad markets (i.e., larger or equal to the California market)? Allocations should be evaluated every three years in relation to the trade exposure test and other market indicators, such as the repots and recommendations by an independent market monitoring committee. (CCEEB3)

> **Response:** These comments fall outside the scope of the First 15-Day Change Notice. While no further response is required, we want to assure the commenters that we will provide a level of transition assistance designed to ensure that California businesses will not incur significant financial impacts in the beginning of the program, and to provide them with a reasonable planning horizon to begin making cost-effective emissions reductions.
>
> As noted in the Staff Report, we are committed to monitoring how covered sectors, especially those who receive free allocation, address carbon costs once the program is in place. But until the program is in place, we will not have the data to substantiate or negate the concerns raised.
>
> Per Board Resolutions 10-42 and 11-32, we will continue to review information concerning the emissions intensity and trade exposure of different industries in

California. We will recommend changes to the Board on leakage risk determinations, if needed, prior to the allocation of allowances for the second compliance period starting in 2015 for industries identified in Table 8-1 of the cap-and-trade regulation. We will update the Board annually on the status of the cap-and-trade program, including, to the extent feasible, information on shifts in business activity that may result in emissions leakage and changes in market share for covered entities and sectors.

C-84. Comment: We understand that ARB is continuing to review where industries are placed on Table 8-1. We intend to seek further dialogue with ARB regarding the appropriate placement of our industry, in accordance with the applicable criteria. (UNITEDAIRLINES2)

Response: We had further dialogue with the commenter and do not believe the placement of aircraft manufacturing support activities for air transportation in Table 8-1 warrants change at this time.

Cement/Lime/Gypsum

C-85. Comment: CARB recognized in its December 16, 2010, Resolution that the "cement sector is particularly well-suited as a pilot project for the development and consideration of a border adjustment measure." As a result, CARB directed its staff to consider a border adjustment for cement and to implement it if is feasible and necessary.

CARB's proposed "best-in-class" benchmark will, by design, impose immediate costs on California cement producers that will not be borne by cement producers outside of California. CSCME has provided evidence to CARB of the California cement industry's high vulnerability to leakage. This evidence includes the magnitude of GHG intensity of cement production, extremely limited cost-effective abatement opportunities, the fact that cement is a fungible commodity sold primarily on the basis of price, high fixed costs that incentivize maximizing capacity utilization, and exposure to unregulated competition. These incremental costs, along with the high leakage vulnerability of California cement producers, heighten the need for prompt implementation of a border adjustment measure to minimize leakage.

CARB has shown an understanding of the particular vulnerability of the cement sector to leakage, and this demonstrates the necessity of a border adjustment measure. Moreover, CSCME is prepared to assist CARB by providing data and analysis necessary to develop a border adjustment measure, ensuring that implementation of a border adjustment measure for cement is also feasible. (CSCME4)

Response: We classified cement as high-leakage risk and provided free allocation at a level we believe is sufficient to minimize this leakage risk. However, we believe that the cement sector is able to pass some of the cap-and-trade program costs to consumers. Therefore, we believe, at this point there is insufficient evidence to warrant implementing a border adjustment in addition to free allocation. Per Board Resolution 10-42, we will review the issues related to implementation of a border adjustment to impose obligations on importers of cement that are equivalent to those faced by California cement manufacturers under the cap-and-trade regulation, and to implement such a provision, if it is feasible and necessary, to avoid leakage in the cement sector. We will continue working, with input from stakeholders, on the possibility of implementing border adjustments for maximizing leakage protection.

C-86. Comment: The annual Industry Assistance Factor for the Gypsum Product Manufacturing (GPM) industry should be 100 percent for the entire period 2013 through 2020. It is our position that in assigning a "medium" leakage risk classification to the GPM industry, ARB has understated the risk leakage for the industry. In assigning a leakage risk classification to an industry, ARB applies a methodology that assigns equal weight to the concepts of emissions intensity and trade exposure. The GPM industry should not be evaluated as an "emissions intense" industry. We are concerned that ARB may be understating the local trade exposure risk to the industry. Gypsum board is a consistent quality, commodity material that is often transported by rail. As a consequence, gypsum board can be produced in a specific state or country and transported over land and sold in a different state or country. While ARB is correct in its assessment that gypsum board is not readily imported from or into the State of California from locations outside of North America, the Appendix K methodology and its reliance on national and regional data may be understating the potential intra-regional trade exposure for gypsum products in the State of California. ARB has not taken this attribute fully into account when assigning the risk leakage classification to the GPM industry. (GA)

Response: These comments fall outside the scope of the First 15-Day Change Notice. While no further response is required, we want to assure the commenters that we will provide a level of transition assistance designed to ensure that California businesses will not incur significant financial impacts in the beginning of the program, and to provide them with a reasonable planning horizon to begin making cost-effective emissions reductions.

As noted in the Staff Report, we are committed to monitoring how covered sectors, especially those who receive free allocation, address carbon costs once the program is in place. But, until the program is in place, we will not have the data to address the concerns raised.

Per Board Resolutions 10-42 and 11-32, we will continue to review information concerning the emissions intensity and trade exposure of different industries in California. We will recommend changes to the Board on leakage risk determinations, if needed, prior to the allocation of allowances for the second compliance period starting in 2015 for industries identified in Table 8-1 of the cap-and-trade regulation. We will update the Board annually on the status of the cap-and-trade program, including, to the extent feasible, information on shifts in business activity that may result in emissions leakage and changes in market share for covered entities and sectors.

C-87. Comment: The lime industry in California is more vulnerable to carbon leakage than the cement industry. To minimize this vulnerability, the proposed special CAF for the cement industry in Table 9-2 should be extended to the lime industry. CARB has proposed that, for the cement industry, the rate of decline of the cap should be applied only to energy-related emissions because there is no method available to reduce so called "process emissions." On this score, the lime industry is indistinguishable from the cement industry. Like the cement industry, the lime industry would need to decrease fuel-related emissions at more than twice the rate of decline of the overall cap in order for the industry to "keep pace with" the CAF proposed for all industries except the cement industry. The "chemical process" in the creation of cement referred to by CARB staff (i.e., release of CO_2 from limestone, or $CaCO_3$, also known as "calcination") is the same process inherent in the production of lime. Furthermore, lime produced in California has a lower GHG intensity than virtually all other lime produced in the United States. Because lime in California is produced with non-solid fuels, which are less GHG intensive than coal or coke, calcination emissions from the lime produced in California represent a higher percentage of total GHG emissions than the national average. Furthermore, under CARB's regulations, an industry's GHG Intensity is measured in terms of metric tons of CO_2e per million dollars of value added (CO_2e/\$M value added). As set forth in Appendix K to CARB's proposed regulation, the lime industry's GHG intensity is estimated to be 29,398 CO_2e/\$M value added, more than twice that of the cement industry. Trade intensity is defined as the value of a sector's imports and exports, divided by the value of its shipments and exports. CARB has classified the lime industry's trade intensity as low (and the cement industry's as medium). However, as recognized by CARB, in assessing an industry's overall exposure to carbon leakage, GHG intensity is far more important than trade intensity. Even if a sector is currently not exposed to foreign competition, imports from states not subject to carbon constraints (as well as foreign countries) are inevitable if a sector's GHG-related costs in California increase substantially. It is a virtual certainty that the lime industry's GHG-related costs in California will be very substantial. The industry has an extraordinary GHG intensity, and more than half of its GHG emissions are irreducible. Moreover, unlike the cement industry, the lime industry in California is already using non-solid fuels, therefore foreclosing GHG reduction opportunities through fuel switching. If the lime industry in California is subject to an unduly severe CAF, lime production will undoubtedly relocate to states or countries that do not face comparable GHG regulations. Such displacement of lime production and jobs outside the state expressly contravenes AB 32's mandate to minimize leakage to the extent feasible. Furthermore, this leakage will result in significantly greater overall GHG emissions because lime production will relocate to facilities using coal and coke, as opposed to the non-solid fuels used in California. (NLA)

Response: In the Second 15-Day Change Notice, section 95891, Table 9-2 was modified to define a different cap adjustment factor for sectors with process emissions greater than 50 percent, including nitrogenous fertilizer, cement, and lime manufacturing. In the previous proposal, we identified only cement manufacturing as an activity associated with significant level of process emissions for which no cost-effective abatement opportunities are currently available. Stakeholders in other sectors whose activities also release process emissions raised a concern in comments. After careful consideration, we determined that sectors with activities that are associated with process emissions greater than 50 percent are eligible for a lower cap adjustment factor, taking into consideration the potential impact from the emissions that do not currently have cost-effective abatement opportunities. A cap adjustment factor for all industries ensures equitable incentives to all producers to minimize leakage as a result of the cap-and-trade program.

Food Manufacturing

C-88. (multiple comments)
Comment: Food manufacturing is the only industry for which CARB has aggregated up to the 3-digit level per the North American Industry Classification System (NAICS). Every other industry is disaggregated at least to the 4-digit level. Using 3-digit level data obscures important differences among industry segments. For example, sector 3114 food processors are grouped with poultry processors in sector 3116, which have a very different energy use pattern. Food processors appear to be more energy intensive than the rest of the food manufacturing sector. Thus, the energy intensity measure for sector 3114 is diluted unless the NAICS code designations are expanded. CLFP recommends that the NAICS Code designation be expanded. (CALFP3)

Comment: We are concerned with the designation of food manufacturing processing being categorized in the “medium” Leakage Risk Classification. Additionally, food manufacturing is located in the second Industry Assistance Factor tier in Table 8-1, and should be moved to the top industry assistance factor tier due to price pressures from international markets. The Regulation states that the Industry Assistance Factor is essentially the ability an industry has to pass-on carbon costs. With low-cost competitors throughout the world, even a minimal increase in cost could displace certain market segments as demonstrated in the previously listed reports. Ag Council believes the formula for trade exposure and emissions leakage should be reevaluated to give special consideration to agricultural import and export markets. Even a minimal increase in costs could displace U.S. markets, giving more ground to domestic and international competitors. Food processing should be moved from the “medium” to the “high” leakage category in Table 8-1 due to increasing international and domestic markets. The EU’s Emission Trading System (ETS) recognized the food processing industry as being especially vulnerable to leakage. While some food processing sectors were given 100 percent free allowances, others were considered under the de-minimis category and therefore do not have to participate. California is no different as many of our commodities compete for market space in a domestic and global economy. (ACC4)

Comment: The formula for trade exposure and emissions leakage should be reevaluated to recognize the complexity and impact of agricultural import and export markets. Food processing should be moved to the “high” leakage risk category, due to increasing competition from international and domestic markets. (CFBF)

Comment: The Cap and Trade proposal has designated food processing in the “medium leakage” emissions category. ARB’s determination of the leakage category is based partly on the ability to pass on costs, coupled with domestic and international trade pressures. While it is typically difficult to pass on cost for food products, under the current economic conditions, it is even more difficult. Foreign producers enjoy the benefits of generous government subsidies and target their prices below our domestic products. California food processors are competing in a global market, and any price signal that applies to products from our State alone could cause job losses in California. We urge ARB to designate food processing in the “high leakage” category for the purposes of Cap and Trade allowances. California’s food processors are voluntarily taking steps to become more energy efficient and adopt readily available technologies. We must not put them at such a great disadvantage in the domestic or global marketplace. By granting additional flexibility to the food processing industry under the high leakage designation, we will protect the California agricultural economy by securing jobs and tax revenue for the State, as well as providing consumers with safe domestic food. (CASTLEG)

Comment: Food manufacturing is located in the second Industry Assistance Factor tier and should be moved to the top industry assistance factor tier. The Industry Assistance Factor is essentially the ability an industry has to pass-on carbon costs. With low-cost competitors throughout the world, even a minimal increase in cost could displace local U.S. markets, giving more ground to domestic and international competitors. (CFBF)

> **Response:** These comments fall outside the scope of the First 15-Day Change Notice. While no further response is required, we want to assure the commenters that we developed a system for providing appropriate level of free allowance to transition California industries to innovate toward a low-carbon economy and prevent trade risks. We are committed to protecting against emissions leakage, which will in turn protect against economic leakage. We designed the regulation to minimize leakage by placing covered entities on an equal footing with their non-covered competitors.
>
> Because of the lack of available data, aggregating the food processing industry was necessary in our analysis. Per Board Resolutions 10-42 and 11-32, we will, during implementation, continue to review information concerning the emissions intensity and trade exposure of different industries in California, and to recommend to the Board changes to the leakage risk determinations, if needed. We are committed to monitor how covered sectors address carbon costs once the program is in place. We will work with affected and interested parties to identify additional sources of information at the state level that could improve our ability to monitor leakage. Should we find that leakage is occurring or the potential for it to occur is determined despite the safeguards in the regulation, we will examine mechanisms to address leakage.

Glass

C-89. (multiple comments)
Comment: During recent discussions between GANA members and CARB staff regarding the flat glass industry benchmark, staff suggested that the flat glass industry look at the provisions made for the cement industry in terms of calculating allocations because the flat glass and cement industries have similar process emissions challenges. Like the cement industry, an average of 25 percent of the CO_2e emissions from flat glass production is from the reaction of three primary glassmaking raw materials: soda ash, limestone and dolomite. The raw batch material fed into the furnace is supplemented to the extent possible by combining it with cullet (broken glass from the downstream trimming and cutting operations of the furnace line). The ability to reduce the process GHG emissions generated from the reactions of carbon containing raw materials in the glass production process is limited, however, by two factors over which flat glass manufacturers have no control: limited availability of cullet suitable for use in flat glass furnaces to meet strict product specifications and the lack of any substitutes for the basic carbon containing raw materials. In fact, most flat glass furnaces already optimize the use of cullet to the extent possible for operational and energy efficiency reasons. The imposition of the Cap and Trade program is highly unlikely to yield or prompt any additional improvement in this regard in the near future. For these reasons and given the precedent already established for the cement industry, GANA requests CARB include a cap adjustment factor for the flat glass industry that applies the yearly reduction only to the fuel portion of the flat glass emissions as in the following Table 1. (GANA2)

Comment: Cap Adjustment Factor Table 9-2 Section 95891.
Given the approach already approved for the cement industry, PNA is proposing a cap adjustment factor for the flat glass industry that applies the yearly reduction only to the fuel portion of the flat glass emissions as in the following Table 1.

Table 1 – Cap Adjustment Factors (Existing and Proposed Flat Glass Industry)

Budget Year	**Cap Adjustment Factor (c) for All Other Direct Allocation**	**Cap Adjustment Factor (c) for Cement Manufacturing (NAICS 327310)**	**Cap Adjustment Factor (c) for Flat Glass Manufacturing (NAICS 327211)**
2013	0.981	0.991	0.986
2014	0.963	0.981	0.972
2015	0.944	0.972	0.958
2016	0.925	0.963	0.944
2017	0.907	0.953	0.930
2018	0.888	0.944	0.916
2019	0.869	0.935	0.902
2020	0.851	0.925	0.898

PNA asks that CARB consider these additional adjustments to the program to guard against flat-glass industry leakage from the state. PNA believes that TCO coated-glass production is especially susceptible to leakage, particularly to Asia. These additional adjustments would also lower the risks associated with the planned investments in the PNA Lathrop facility that would allow the site to produce coated glass products that can be used in renewable energy and energy efficient building applications. (PNA)

Comment: We understand that ARB staff has suggested that the flat glass industry review the provisions made in the Cap and Trade Rule for the cement industry with regard to calculating allocations because process emissions contribute significantly to the total emissions of both industries (section 95891, Table 9-2). Roughly 25 percent of the CO_2e emissions associated with flat glass production stem from three primary glassmaking raw materials: soda ash, limestone and dolomite. Our ability to reduce these process emissions is extremely limited. The raw batch material feed into the furnace is supplemented by combining it with cullet (*i.e.*, broken glass from the downstream trimming and cutting operations of the furnace line). The ability to reduce the process emissions generated from the reactions of carbon-containing raw materials in the glass production process is limited by availability and suitability of cullet for use in flat glass furnaces to meet strict product specifications, and the lack of any substitutes for the basic carbon-containing raw materials. For this reason, the Cap and Trade Rule is highly unlikely to yield any additional improvement in this regard in the near future. Therefore, Guardian supports the recommendation from the Glass Association of North America (GANA) that ARB establish a cap adjustment factor for the flat glass industry that applies the yearly reduction only to the fuel portion of the flat glass emissions as in the following Table 1.

Table 1 – Cap Adjustment Factors (Existing and Proposed Flat Glass Industry)

Budget Year	Cap Adjustment Factor (c) for All Other Direct Allocation	Cap Adjustment Factor (c) for Cement Manufacturing (NAICS 327310)	Cap Adjustment Factor (c) for Flat Glass Manufacturing (NAICS 327211)
2013	0.981	0.991	0.986
2014	0.963	0.981	0.972
2015	0.944	0.972	0.958
2016	0.925	0.963	0.944
2017	0.907	0.953	0.930
2018	0.888	0.944	0.916
2019	0.869	0.935	0.902
2020	0.851	0.925	0.898

(GIC)

Comment: PPG endorses, and hereby adopts as if set forth in full, the comments of GANA regarding the need to revise the cap adjustment factor for the flat glass industry in Table 9-2 of the proposed regulation (see section entitled “Cap Adjustment Factor Table 9-2 section 95891” in GANA letter to CARB, dated August 11, 2011). Under the harmonization of the MRR rule with federal GHG reporting requirements, process emissions from glass production (i.e., CO_2E emissions resulting from carbon in the raw materials used to make glass) will be included in a glass production facility's total reported CO_2E emissions. However, the raw materials for glassmaking are not amenable to substitutions, so the portion of total CO_2E emissions attributable to process emissions likewise will not be amenable to reduction under the annually declining cap. Other than the use of more cullet—which is a very limited option for the flat glass industry, with correspondingly limited impact on the carbon content of or emissions from the raw material batch—there are no CO_2E emission-related efficiencies that can be achieved with respect to the raw materials used in making glass. Thus, compliance with the annually declining GHG cap must be achieved almost solely by reducing combustion-related CO2E emissions. To subject the flat glass industry to the same declining cap that applies to other industries with more flexibility to reduce CO_2E process emissions would be an unfair burden. PPG fully supports GANA's proposed modifications to the cap adjustment factor for the flat glass industry, and urges the Board to adopt the revised cap adjustment factors set forth in Table 1 in GANA's August 11, 2011 comment letter. (PPG1)

Comment: While indirect emissions are not part of the proposal, any plan which does not address the negative financial impact of indirect emissions for electrical usage in the fiber glass industry will have the same negative impacts to California jobs and greenhouse gases. (NAIMA2)

> **Response:** These comments fall outside the scope of the First 15-Day Change Notice. However, with regard to the requests to change the cap adjustment factor for the glass manufacturing industry, we note that we modified Table 9-2 (section 95891) in the Second 15-Day Change Notice to define a different cap adjustment factor for sectors with process emissions greater than 50 percent. In the previous proposal, we identified only cement manufacturing as an activity associated with a significant level of process emissions for which no cost-effective abatement opportunities are currently available. However, stakeholders in other sectors whose activities also release process emissions raised a concern in comments. After careful consideration, we determined that sectors whose emissions intensity and leakage risk is high, with activities that are associated with process emissions greater than 50 percent, are eligible for a lower cap adjustment factor, taking into consideration the potential impact from the emissions that do not currently have cost-effective abatement opportunities. A cap adjustment factor for all industries ensures equitable incentives to all producers to minimize leakage as a result of the cap-and-trade program. The glass sector does not fit into the category of high emissions intensity, high leakage risk, and majority process emissions; and therefore, no adjustment is made to the cap adjustment factor for this sector.
>
> We do not believe it is necessary to add provisions to the regulation to include indirect emissions associated with electricity at this time. In the program framework, an adjustment factor was not made for power purchased in establishing the product-based benchmarks. This is because purchased power

may not create an indirect carbon cost in all California utility service territories. It is ARB's goal to see a carbon price properly embedded in all utility rates. If and when this occurs, the compensation for these indirect carbon costs could be incorporated into the product benchmarks (or reductions in these costs created in some other fashion) to help minimize leakage. We will revisit this issue once the California Public Utilities Commission proceeding addressing utility costs and revenue issues associated with greenhouse gas emissions concludes.

C-90. (multiple comments)
Comment: The State's fiber glass plants are readily subject to leakage that should entail free allowances for all three compliance periods. (NAIMA2)

Comment: Fiber glass companies should be treated the same as the other segments of the glass industry and be given 100 percent allowances for all compliance periods through 2020. Fiber glass insulation (mineral wool) has been given a medium level of allowances, which equates to 100 percent in 2012–2014; 75 percent in 2015–2017; and 50 percent in 2018–2020. The other two glass sectors (flat glass and glass packaging) received 100 percent allowances for all three compliance periods. CARB has justified that distinction based on its perception of the effect of foreign competition on each segment of the glass industry. CARB's technical appendices on leakage and allowance allocation seem to focus on international leakage (relocation of industry from California to other countries). But the statutory definition of leakage is not restricted to the international context. There is no reasonable justification for CARB restricting leakage consideration to international leakage. CARB has acknowledged the limits of its analytical approach using only international leakage. CARB should recognize that if the California fiber glass operations are not economically viable as a result of AB 32, some of NAIMA's California members might close their plants or significantly reduce capacity. The fiber glass insulation production capacity in other jurisdictions will be able to adequately supply the California market, thereby increasing emissions in those jurisdictions. This fact is particularly relevant because industry product resources are and will continue to be underutilized for many years due to current economic conditions and the downturn in the construction industry. If CARB is serious about preventing leakage from the State of California, it must carefully weigh the manufacturing potential of plants nationwide. The presence of 40-plus plants in the U.S. is the most effective argument for giving fiber glass plants 100 percent allowances for all compliance periods through 2020. NAIMA has prepared and presented detailed capacity data for the entire fiber glass industry. This detailed data demonstrated that the U.S. fiber glass industry, as a whole, has the capacity to compensate for any closure of California plants. Because CARB had previously invited this additional data and promised to consider it in calculating the Assistance Factor for allowances afforded the fiber glass industry, NAIMA was greatly disappointed and disheartened that CARB informed the industry that the data provided by NAIMA could not be considered or calculated until after the implementation of the Cap and Trade Program. CARB has assured NAIMA that application of domestic data would occur sometime in 2012 and definitely before 2014. Given the importance of this issue to NAIMA and as an indicator that CARB is in earnest about considering that data in a timely fashion, NAIMA requests that when allowances are assigned for the fiber glass industry that it convey this information relating to Assistance Factors. As an alternative, CARB could put 100 percent as a placeholder for the fiber glass industry for the second and third phases of the Cap and Trade Program. Modify Table 8-1: Industry Assistance, for Fiber Glass Manufacturing as follows:

> 2012–2014 – 100 percent
> 2015–2017 – To Be Determined
> 2018–2020 – To Be Determined. (NAIMA2)

Comment: The potential impact of AB 32 on California insulation production; the ability of existing insulation manufacturing facilities elsewhere in North America to increase or maintain their production to meet market opportunities in California; the potential for transportation-related emissions to increase if in-state insulation manufacturing is replaced by insulation manufacturing in other jurisdictions; and the absence of greenhouse gas regulations in relevant jurisdictions outside California, is most relevant and most important to developing an accurate assessment of leakage risks associated with the mineral wool sector. (NAIMA2)

Comment: Most of the out-of-state manufacturing facilities likely to increase production in response to plant closures (or manufacturing slowdowns) in California do not face any cap on greenhouse gas emissions. If insulation production were to shift from California facilities to out-of-state facilities (whether as a result of California plant closures or manufacturing slowdowns), any emissions reductions achieved in California would almost certainly be offset by emissions increases in other jurisdictions. It is entirely possible that if insulation production were to shift from California facilities to out-of-state facilities, overall greenhouse gas emissions would actually increase. First, the insulation products manufactured at California facilities tend to be of extremely high quality, and therefore provide more energy efficiency benefits to end users than do imported products from China. Second, California's manufacturing facilities are among the most energy-efficient production in the mineral wool sector. And third, the greenhouse gas emissions associated with transporting insulation products from out-of-state facilities to the California market would be extremely high (and, like the greenhouse gas emissions from out-of-state production, essentially unregulated). (NAIMA2)

> **Response:** These comments fall outside the scope of the First 15-Day Change Notice. However, with regard to the assertions that fiberglass was inappropriately categorized with respect to leakage risk, we disagree. We developed a system for free allowance allocation to provide transition assistance for industry to innovate toward a low-carbon economy and prevent trade risks. As noted in Board Resolution 10-42, we will report to the Board annually on all shifts in business activity that may result in emissions leakage and changes in market share for covered entities and sectors. If needed, we will adjust allowance allocations to correct unintended consequences.

C-91. Comment: PPG supports CARB's decision to protect flat glass manufacturing facilities in California by providing a 100 percent assistance factor in the disposition of annual GHG allowances to the industry (proposed Table 8-1). PPG believes that this decision will help to avoid emissions leakage and the lost production and lost employment that likely would otherwise occur in the flat glass industry in California in the absence of that level of assistance. (PPGI)

Response: No response is necessary.

C-92. Comment: Guardian supports ARB's proposal to offer free allocations to flat glass manufacturers in California in order to help prevent leakage from this energy-intensive, trade-exposed industry. (GIC)

Response: No response is necessary.

Hydrogen

C-93. (multiple comments)
Comment: Since liquid hydrogen is very energy-intensive and highly trade-exposed, the Panel believes liquid hydrogen should be categorized as a HIGH leakage risk. We urge ARB to maintain the distinction between gaseous and liquid hydrogen. Table 8-1 Industry Assistance should be changed to indicate that liquid hydrogen has a high leakage risk classification. We also urge ARB to recognize this distinction throughout the draft regulations and supporting documents particularly section 95114 of Attachment 1 of the Proposed 15 Day Modifications on Subchapter 10 of the "Proposed Amendments to the Regulations for the Mandatory Reporting of Greenhouse Gas Emissions". The Industrial Gases Panel is available to work with ARB staff to provide additional information on liquid hydrogen and the potential economic and environmental impacts of liquid hydrogen shipments into California. (IGPACC)

Comment: Liquid hydrogen is a different product from gaseous hydrogen used in refining applications. Liquid hydrogen serves different downstream manufacturing operations, is readily transportable across California borders and requires additional production methodology and equipment. Further, liquid hydrogen production has a material indirect GHG emission footprint due to the significant electricity consumed in the liquefaction process. For this reason, liquid hydrogen should be treated as a distinct product with its own unique product benchmark. Since liquid hydrogen is very energy intensive and highly trade exposed, we believe liquid hydrogen should be categorized as a "High" leakage risk. (APC2)

Comment: CARB should classify liquefied hydrogen production as a high leakage activity because it is highly energy and emissions intensive. Characterizing liquefied hydrogen as a medium leakage risk will impose a significant CO_2 compliance obligation, which will provide a strong competitive advantage to out-of-state competition that can easily truck or rail liquefied hydrogen into California and elsewhere in the United States. Such displacement of hydrogen production would create economic and jobs impacts in

California and would increase overall CO_2 emissions levels due to increased vehicle traffic. (PRAXAIR2)

> **Response:** We agree that liquid hydrogen should be added to Table 8-1 as a separate activity under industrial gas manufacturing. Liquid hydrogen was given industry assistance factors for all three compliance periods based on a medium leakage risk classification. We are committed to protecting against emissions leakage, which will in turn protect against economic leakage.
>
> Per Board Resolutions 10-42 and 11-32, we will, during implementation, continue to review information concerning the emissions intensity and trade exposure of different industries in California, and to recommend to the Board changes to the leakage risk determinations, if needed. We are committed to monitor how covered sectors address carbon costs once the program is in place. We will work with affected and interested parties to identify additional sources of information at the state level that could improve our ability to monitor leakage. Should we find that leakage is occurring or that the potential for leakage exists despite the safeguards in the regulation, we will examine mechanisms to address leakage.

C-94. Comment: Liquid hydrogen should be categorized as a high leakage risk. (IGPACC)

> **Response:** We believe that our leakage risk determination for liquid hydrogen as medium is supported by available data and is expected to be protective of leakage risks. Leakage risk is classified using emissions intensity and trade exposure as central measures.
>
> We analyzed emissions intensity data for all industrial sectors. We then selected natural break points in the emissions intensity spectrum. Industrial sectors are placed into the high, medium, and low categories of emissions intensities based on these break points. For assessing trade exposure we considered various approaches before choosing trade share as the metric to classify industrial sectors for trade exposures.

Refineries / Oil & Gas

C-95. (multiple comments)
Comment: CARB should classify the California refining sector as "high risk" for emission leakage through 2020 and issuance allowances on this basis. Crude oil and petroleum products are world commodities with strong competition in energy markets. Exposing California refiners to the additional cost of carbon from process emissions will place these local businesses at a disadvantage relative to international manufacturers. (CONOCO2)

Comment: The refining industry is clearly under trade pressure from fuel imports. The proposed reduction of the Assistance Factor from 100 percent in the first compliance period to 75 percent and then 50 percent in the subsequent second and third compliance periods, respectively, leaves in-state production capacity vulnerable to increased dependence on imports (and hence supply disruptions and the loss of jobs within the state). Industry experts anticipate this import pressure to materially increase over the next several years, thereby increasing the industry sectors leakage risk to “High”, where no reduction in the Assistance Factor would be imposed. (APC2)

Comment: The California refining industry is heavily trade exposed and clearly subject to leakage because refined products can, and regularly do, enter the state from refineries in other regions and from international sources. The California refining industry should be classified as a Highly Trade Exposed Industry, and not as a Moderately Trade Exposed Industry. ARB staff has been made aware of discrepancies in census economic data, discrepancies between CEC data (which more accurately reflects the full slate of California refinery products) and EIA data that reflects only a portion of the sector. These discrepancies as well as new commodity flow data suggest a more robust review of trade exposure for refining is in order. We believe that a comprehensive review of these issues will lead ARB to conclude that the California Refining Industry is Highly Trade Exposed and should be treated as such in the Cap and Trade Regulation. ARB Staff should convene a public process to review recent federal and state trade and commerce and energy data from federal and State sources and re-evaluate the trade-exposure of the California refining industry. (WSPA3)

Comment: The Regulation correctly acknowledges the reality that California industry will be subjected to trade exposure as a result of the Cap and Trade program. California industry will be competing against global and interstate competition that are not similarly regulated, and are therefore not subject to the same costs. Competitive pressure resulting from trade exposure to unregulated parties can be especially acute in state or regional programs in the form of both neighboring states *and* international competition, particularly in coastal states such as California where there is ready access to international trade infrastructure like the California Ports facilities. If not properly and adequately mitigated, this trade exposure can and will result in leakage of both emissions and jobs from California to unregulated areas. While acknowledging the need to address trade exposure through free allocation, the Regulation includes a very quick path to auction of some 50 percent of refinery allowance needs by 2018. CARB staff appears to use a simplistic, static model that assesses market dynamics before the imposition of a carbon price and assumes little or no change in behavior resulting from the carbon policy. This static model also ignores the cumulative impact of other regulations and other differences in operating cost between California industry and its competitors. CARB’s analysis also fails to consider the competitive effects of California produced product that is exported to neighboring states. This is an inadequate and deeply flawed method for informing a critical part of the design of the Regulation. A recent study evaluated the leakage potential for the U.S. refining industry resulting from a carbon policy. The EnSys study models the impact on the refining industry of the allocation scenario contained in the federal Waxman-Markey (WM) proposal—a proportion of free allocation that approximates the 50 percent in 2018 contained in the CARB Cap and Trade Regulation. Rather than taking a static look at behavior before and after the imposition of a carbon price, the EnSys model projects how industry is likely to operate under a given scenario. The EnSys study concludes that because this sector operates as part of and interacts within the global refining industry, "the impacts of WM on US refining and US petroleum imports dependency would be substantial" in that it "de-levels" the playing field in the global refining sector. The study concludes "the underlying reason the potential impact on US refining is so severe is that allowance costs substantially raise operating and capital costs of US refineries, rendering them less competitive versus non-US refiners in regions that do not bear any carbon costs." The impact on coastal refineries, such as those in California, is especially pronounced. (BP2)

Comment: The California refining industry should be classified as a High Intensity Trade Exposed Industry, and not as a Moderately Trade Exposed Industry. The California refining industry is heavily exposed to market leakage since refined products can enter California from out-of-state and international refineries operating under less stringent environmental standards with little to no market barriers. An objective review of the information and data provided to ARB will lead to the conclusion that the California Refining Industry is Heavily Trade exposed and should be treated as such in the Cap and Trade Regulation. ARB has been provided information which identifies discrepancies in census data and discrepancies between CEC data that more accurately reflects the full slate of California refinery products. ARB has also been provided information which identifies discrepancies in EIA data which does not accurately reflect the full slate of California refinery products. This data highlights the importance of exports to Arizona and Nevada (states which can import products from the Rocky Mountains or Gulf Coast), and likely serves as the basis for the artificially low estimates of the energy intensity attributed to the California Refining Sector. Tesoro has attached a graph from Facts Global Energy which represents refineries that have been for sale, sold or shutdown since 2008 by region of the world. The EU has had the most plants both for sale and shutdown which is consistent with the competitive disadvantage of their markets from importation of fuels originating from countries such as India that are not subject to GHG and other regulatory costs. The graph shows North America as having the 2nd most plants shutdown for many of the same reasons; imported fuels taking market share in an oversupply situation. This graph supports the conclusion that refined products move and trade across the globe negatively affecting competitive markets making California refineries highly trade exposed. (TESORO2)

Comment: The oil and gas sector is part of a complex world marketplace with prices set beyond the control of any market player or government for that matter. Actions in the regulatory sphere have the distinct possibly of acute leakage if not handled properly. As noted, California production is subject to the highest levels of environmental review and oversight. If the AB 32 regime gets it wrong and skews the economics of domestic production it will lead to widespread curtailment of domestic production, which in turn, will lead to increased use of imported crude feedstocks, crude produced under less stringent environmental controls. Leakage remains a distinct possibility from the sector considering the considerable uncertainty posed by the development of a California only Cap and Trade regime. (CIPA)

Comment: ARB's proposed revisions propose a refining industry "assistance factor as determined by the leakage risk of the product" that would be used with ARB's benchmark in an equation (section 95891) allocating free emissions allowances. The intent and effect of this assistance factor is to exempt the California refining industry from having to purchase emissions allowances for 100 percent of its emissions through 2014 and the vast majority of its emissions through 2020. ARB's rationale for is that this assistance factor is to prevent or manage "leakage." ARB claims that if California refineries are required to buy emissions credits, then this will reduce their profits so much that they will partially or fully shut down production; refineries elsewhere will increase production and ship gasoline, etc. to California instead; and that will result in equal or greater total emissions because refineries elsewhere are as dirty as California refineries or dirtier. ARB provides no evidence that this has happened despite decades of refinery environmental requirements here and elsewhere. It provides no evidence that California refineries will reduce production due to the cost of ARB's emission credits. It provides no evidence of the capacity or costs of increasing refinery production elsewhere and then shipping products instead of crude. As part of the latter failure, ARB fails to present analysis of increased costs for shipping motor fuels due to the volume expansion of the fuels over that of crude and/or their increased volatility and fire hazard. ARB does not even show the possibility of the impact it claims because it provides no evidence of equal or higher average emissions intensities at refineries outside California. With respect to the California refining industry, ARB's "leakage risk" rationale lacks factual or scientific support. (CBE2)

Comment: (Subsequent correspondence from the commenter indicated an error in the original submission that has been corrected in this comment) ARB ignores substantial evidence that its assistance factor is incorrect. Review of data on imports, exports, and movements of refined products shows that California has become and remains a net exporter of gasoline and other refined products. This shows that decades of refinery environmental requirements in California which often were the first of their kind and/or most progressive anywhere have not resulted in any sign of the "leakage" problem that ARB now claims will occur.

ARB ignores this evidence that its assistance factor analysis is incorrect. Long-term major capital commitments to expanded and continued refining infrastructure have been built in recent years at California refineries in El Segundo, Wilmington-Carson, Benicia, Martinez, Rodeo, Richmond and Bakersfield. ARB ignores this evidence. At least one well documented measure could reduce statewide refinery emissions by approximately 20 percent or 7.8 million tonnes per year below current levels by 2020 for about 80 cents per barrel crude. However, ARB's proposed emissions credits would be even cheaper and more profitable for refineries. Considering that refinery crude costs have fluctuated by nearly $100 per barrel in recent years while California fuels production stayed here, this evidence indicates ARB's leakage concern is misplaced. Further, ARB's own U.C. advisors warned that including the oil industry in a multi-sector Cap and Trade scheme will not work because oil companies would buy the allowances instead of clean up since oil is so firmly and uniquely entrenched. Instead of forcing them to shut down, ARB's allowance price will not even make refineries clean up. Finally, ARB ignores the California refining industry's extreme-high emissions intensity and the lower average emissions intensity in every other U.S. refining region. ARB inappropriately ignores the fact that, even if California refinery production was replaced by large increases in fuels imports from refineries elsewhere, which will not happen as shown above, total emissions could be reduced due to the lower emissions intensities of refineries elsewhere. Thus, the equal shift or increase in emissions ARB fears is impossible in the first place. It is not appropriate for ARB to ignore substantial evidence that its assistance factor is incorrect. (CBE2)

Comment: Classification of Leakage Risk for Petroleum Refineries and Industrial Gas Manufacturing should be designated as "High" as defined in section 95870(e) of the 15-Day Modification Package and consistent with the criteria employed in Appendix K of October 2010 Proposed Rule. At a minimum, CARB should re-evaluate the leakage risk preceding each subsequent compliance period and determine if the proposed reduction in the Assistance Factor is warranted. (APC2)

Comment: ARB's assistance factor would seek to maintain or increase California refinery fuels production. ARB assumes that if California fuels production is reduced it will be replaced by equally or more carbon-intensive fuels produced elsewhere. In contrast, ARB's Low Carbon Fuel Standard (LCFS) was established to replace high-carbon fuels, primarily refined petroleum fuels, with low-carbon fuels, targeting a 10 percent reduction in transport fuel cycle emissions by 2020. If the LCFS replaces refinery fuels with lower carbon fuels, equal or higher-emission fuels would not replace them. Thus, unless ARB assumes that its LCFS will fail, it will be impossible for ARB's assistance factor assumption to be realized. Conversely, if ARB's assistance factor succeeds in maintaining or increasing California refinery fuels production, the success of the LCFS will be impossible. Therefore, ARB's assistance factor for refineries and its LCFS are in direct and irreconcilable conflict. ARB cannot have it both ways. ARB inappropriately ignores this clear evidence that its assistance factor is unnecessary and inappropriate. (CBE2)

> **Response:** These comments fall outside the scope of the First 15-Day Change Notice. While no further response is required, we want to assure the commenters that we developed a system for providing an appropriate level of free allowances to transition California industries to innovate toward a low carbon economy and prevent trade risks. We are committed to protecting against emissions leakage, which will in turn protect against economic leakage. We designed the regulation to minimize leakage by placing covered entities on an equal footing with their non-covered competitors, with an appropriate level of allowance allocations.

Per Board Resolutions 10-42 and 11-32, we will, during implementation, continue to review information concerning the emissions intensity and trade exposure of different industries in California, and to recommend to the Board changes to the leakage risk determinations, if needed. We are committed to monitor how covered sectors address carbon costs once the program is in place. We will work with affected and interested parties to identify additional sources of information at the state level that could improve our ability to monitor leakage. Should we find that leakage is occurring or that the potential for leakage exists despite the safeguards in the regulation, we will examine mechanisms to address leakage.

In our second 15-day changes to the regulation, based on additional information provided by stakeholders, we updated Table 8-1 with a change to reclassify coke calcining as a high-leakage risk activity, and we inserted a new approach for allocation to the petroleum refining sector in section 95870(d)(2)(A-B) in response to a stakeholder comment. In the first compliance period, a total amount of allowances will now be assigned to the refining sector. This sector allocation will then be divided among individual refiners using the new method specified in section 95891(d). In the second and third compliance period, there will no longer be a sector allocation determined for the refining sector. The amount allocated to each individual refinery will be based on the product output-based allocation approach and the "CO_2 weighted ton" benchmark. These changes and the associated impacts are detailed in Appendix A to the Second 15-Day Change Notice.

Under the new text, complex refiners' allowances are allocated based on a methodology initially proposed by the Western States Petroleum Association. This approach allocates allowances based on the following factors: (1) historical emissions from for each refinery, (2) the Solomon Energy Intensity Index (EII) for each refinery, (3) an adjustment factor to reduce competitiveness impacts of allowance allocation between in-state refineries, and (4) future emissions for each refinery.

Solar

C-96. Comment: Solar remains concerned about the assistance factor category for our industrial sector. We recommend staff further evaluate the mechanisms for evaluating Trade Exposure for our industry sector. It is our understanding that staff will be revisiting leakage. We look forward to working with them in 2012, or sooner if possible. (SOLARTURBINES3)

Response: This comment falls outside the scope of the First 15-Day Change Notice. No further response is required.

Other Allocation-Related Comments

C-97. Comment: Section 95890(c) should not be removed until ARB has decided how to allocate allowances to natural gas utilities for the protection of their small customers. Section 95893 is still reserved for Allocation to Natural Gas Distribution Utilities for Protection of Natural Gas Customers, so when ARB addresses that question it should have this subsection available so as to not limit the potential methods of distributing allowances to individual natural gas utilities. Modify section 95890(c) as follows:

> <u>(c) Reserved for Natural Gas Distribution Utilities.</u> (SEMPRA3)
>
> **Response:** We removed this section for clarity. We are committed, per Board Resolution 11-32, to continue discussions with stakeholders on the issue of allowance allocation issues associated with emissions from natural gas combustion. We note that (1) the decision has not been made to allocate allowances to Natural Gas Distribution Utilities and (2) the importance of the price signal in motivating greenhouse gas reductions in this sector.

C-98. Comment: ARB's refinery benchmark and assistance factor increase costs to the public. The excess emissions from California refineries that would result from ARB's flawed proposal will increase the emissions reduction burden on other sectors, cause failure to meet total climate emissions targets, or both. ARB inappropriately ignores this potential for increased emissions to increase health impacts and related costs to Californians. ARB also inappropriately ignores the higher jobs factors for the other sectors that would be burdened with making deeper emissions cuts if ARB exempts oil refining as proposed. U.S. Economic Census data show that the refining industry is next to last in jobs per dollar annual sales, shipments, receipts or revenue. Other major employment sectors such as public transportation and manufacturing of the green technology refiners might buy should they be required to clean up create more than ten times as many jobs per dollar. Thus, ARB's proposed windfall for oil refineries will not only poison us, it will result in less future job opportunities for Californians. ARB ignores these costs. (CBE2)

> **Response:** The benchmarks and assistance factors are based on similar methods as those used in other market programs. The cap-and-trade program is not expected to increase emissions, and all stationary sources such as refineries are still subject to all other local and state laws that limit their air emissions. The declining cap provides certainty that overall GHG emissions will be reduced in California for the covered sectors. Oil refineries are not exempted from the program, as suggested in the comment. They will be subject to the declining cap and will have to compete for the declining number of allowances each year as the program is implemented. The cap-and-trade program provides certainty for investment in green technology and green jobs in California. We disagree that the benchmarks will provide a windfall for oil refineries.

D. AUCTION

Disposition of Allowances - Advance Auction

D-1. Comment: Section 95870(b) changes the Auction Reserve transfer requirement from two percent to 10 percent. WSPA does not understand the need for this increase. WSPA recommends that the two percent transfer authority be retained. (WSPA3)

> **Response:** We modified this section to allow covered entities facing a greatly expanded compliance obligation in the second compliance period to physically hedge their future compliance needs without needlessly tightening the supply of allowances in the first compliance period.

D-2. Comment: EDF supports the proposed increase of the advance auction from two percent to ten percent, as long as this advance auction cannot be turned into a form of an implicit borrowing. Although these advanced emissions allowances can only be used in the credit period from which they were purchased (thus leading to price discovery of that period), the extra amount of emissions available for trading at an early time makes the presence of a robust allowance tracking system at the outset even more important. We do not foresee significant problems with allowing a larger percentage of allowances to be auctioned in this pool and believe that the forward auction will provide benefits beyond that of simple price discovery, such as raising additional funds for energy efficiency investment and community benefits. (EDF4)

> **Response:** No response is needed.

Unsold Allowances

D-3. (multiple comments)
Comment: SMUD continues to suggest that current vintage allowances that remain unsold at auction remain in the Auction Holding Account for a reasonable period, rather than being transferred to the Containment Reserve Account. The slight change necessary for conformance with the change in section 95857(d) is to section 95831(b)(4), which establishes an Allowance Price Containment Reserve Account, and states that the serial numbers of allowances used to fulfill an entity's excess emissions obligation pursuant to section 95857(d) will be transferred to this account. This subpart of section 95831 is no longer necessary and should be deleted. SMUD also suggests that allowances that remain unsold in a quarterly auction should be returned to the Auction Holding Account unless the unsold allowances are from a vintage at least one year prior to the auction in which they remain unsold. Unsold allowances in one auction do not necessarily imply that subsequent auctions will also have unsold allowances, particularly with lumpiness in allowance allocations and in investments that reduce need for allowances. Here, and in Section 95911, the regulations should be modified to keep unsold allowances in the Auction Holding Account until it is reasonably clear that they are not required in current auctions. Transferring to the Allowance Price Containment

Reserve Holding Account prematurely simply is a recipe for ratcheting up allowance prices unnecessarily. Modify section 95831(4) and 95991 as follows:

> (4) A holding account to be known as the Allowance Price Containment Reserve Account:
>
> > (A) Into which the serial numbers of allowances allocated by ARB for auction that remain unsold at auction in the year following their vintage year will be transferred.;
> > ~~(B) Into which the serial numbers of allowances directly allocated to the Allowance Price Containment Reserve under subarticle 8 pursuant to section 95870(a) will be transferred.~~;
> > (B~~C~~) Into which the serial numbers of allowances submitted to fulfill an entity's excess emissions obligation pursuant to section 95857(d)(c) will be transferred~~.~~; and
> > (C~~D~~) From which the Executive Officer will authorize the withdrawal of allowances for sale to sell to covered entities pursuant to section 95913.
>
> (4) Disposition of Allowances Allocated for Auction when an Auction Settlement Price Equals the Reserve Price.
>
> > (A) Unsold ~~current vintage~~ allowances from a vintage prior to the current year shall be transferred equally to the three tiers in the Allowance Price Containment Reserve Account. If the number of allowances unsold is not divisible by three, the transfer of the final allowances shall be to the lowest priced tier.
> > (B) Unsold future and current vintage allowances auctioned pursuant to section 95910(c) will be returned to the Auction Holding Account for sale at the next auction. (SMUD3)

Comment: The Allowance Reserve is not the proper place for any allowances unsold at auction, paid as penalties, or removed from the Voluntary Renewable Electricity Reserve Account. In each of these cases, the allowances should be returned to the general market via quarterly auction. First ARB staff has expressed concern that returning allowances unsold at auction to future auctions would only continue to produce an oversupply of allowances in these future auctions. However, due to the intrinsic nature of discrete quarterly auctions, allowance demand and resultant auction clearing prices will likely fluctuate significantly in response to external factors. Even if allowance demand is thin in one quarter, it may not always be thin. Instead, the quantity demanded in future auctions will respond to many conditions, such as weather, fuel prices, or offset availability. For example, the electricity industry may demand more allowances than average in the third quarter of a very hot year as electricity demand increases across the State. However, compliance entities may not have been able to predict such weather-related conditions in previous auctions and procure enough allowances to fill their high need. Simply because demand in the market was not high enough to clear at $10, the regulated community should not then be forced to pay Allowance Reserve prices—$40 or more—in the future. (SCE3)

Comment: PG&E appreciates the change ARB made to move unsold future vintage allowances to the Auction Holding Account for sale at the next auction, and PG&E believes similar treatment should apply to current vintage allowances. PG&E has concerns with the proposal described in 95911(b)(4) to move unsold current vintage allowances that are not from the Limited Use Holding Accounts to the three APCR tiers in equal proportion. While dividing them equally among the tiers is better than the previous proposal to move them to the highest tier, PG&E continues to advocate that these unsold allowances be allocated to the next auction instead of the APCR. Unsold allowances in one auction are not necessarily indicative of a long-term oversupply. Modify section 95911(b)(4)(A) as follows:

> (A) Unsold current vintage allowances ~~shall be transferred equally to the three tiers in the Allowance Price Containment Reserve Account. If the number of allowances unsold is not divisible by three, the transfer of the final allowances shall be to the lowest-price tiers.~~ auctioned pursuant to section 95910(c) will be returned to the Auction Holding Account for sale at the next auction. (PGE4)

> **Response:** We made changes to section 95857(d) to transfer allowances used to cover an excess emissions obligation to the auction holding account. We also made a change to section 95831(b)(4) to eliminate this source of allowances from the provisions used to define the Allowance Price Containment Reserve. Instead, we added this source of allowances to section 95831(b)(2), which defines the auction holding account.
>
> We did not make the changes recommended by the commenter to have the allowances remaining unsold at auction be held in the auction holding account for sale at the next auction. We disagree with the assertion in the comments that the auctions will quickly dissipate any oversupply of allowances. Instead, we added provisions to section 95911(b)(4) to direct that unsold allowances would be held in the auction holding account and only returned to future auction if (1) two auctions achieve an auction settlement price above the auction reserve price, and (2) the amount of unsold allowances returned to auction does not increase the number of allowances to be auctioned by more than 25 percent.

D-4. (multiple comments)
Comment: We ask that ARB retain the provision directing allowances unsold at auction to the allowance price containment reserve. In place of the reserve, a few stakeholders at the July 15, 2011, workshop on the Discussion Draft suggested these allowances be made available at the subsequent auction. We agree with staff's position that this could facilitate consistent over-allocation of allowances and inhibit price discovery. Rather than lock-in a mechanism that could lead to consecutive auctions clearing at the floor price, a pitfall of the Regional Greenhouse Gas Initiative (RGGI) system that ARB should strive to avoid, the most appropriate use of unsold allowances is to backfill the allowance reserve. The program's banking provisions provide ample opportunity for entities to guard against the risk of future allowance shortages; should market conditions lead to an unexpected shortage. However, ARB has designed the allowance

reserve to introduce additional liquidity. It is vital that ARB maintain a provision to fill the reserve (when allowance prices are at the floor) to provide the cost-containment function of the reserve as envisioned if allowance prices spike. (KUSTIN16)

Comment: CE2 supports the language in sections 95911(b)(4)(A) and (B) that requires unsold current vintage allowances to be transferred to the Price Containment Reserve, equally to the three tiers. We recommend unsold future vintage allowances should also be transferred to the Price Containment Reserve rather than returned to the Auction Holding Account. (CE2CC)

> **Response:** We agree that the method of handling allowances remaining unsold at auction must not perpetuate an oversupply of allowances. However, we disagree that the only way to do this is to transfer the unsold allowances to the reserve. We contend that the new provisions of section 95911(b)(4) will keep the unsold allowances out of the auction until the oversupply has been cleared. This will help limit price increases below the reserve.

D-5. Comment: Section 95911(b)(4)(A) and (B) proposes to deposit unsold allowances from the current vintage to the Allowance Price Containment Reserve Account. MSCG recommends a modest variation to this approach. We believe that a provision allowing auction participants to provisionally bid for amounts above the otherwise applicable purchase limits would be beneficial. Such provisional bids would only be filled if some quantity of allowances would otherwise go unsold. Only then, after filling both "standard" and provisional" bids, should unsold allowances be deposited in the Allowance Price Containment Reserve Account. Such an approach would better meet the needs of the market, without increasing any concerns related to market concentration (holding limits would still be applicable) or undue impact on price, or ability of compliance entities to fairly gain access to allowances in auctions. If allowances in an auction would otherwise go unsold, one party buying a quantity in excess of otherwise applicable purchase limits cannot have an undesirable negative impact on the market. Similarly, if adopted, the same type of provision would be equally useful in the future vintage allowance auctions. (MSCG3)

> **Response:** We agree that the approach suggested in the comment would increase market liquidity by getting allowances to entities that value them. However, we believe the revised procedure for returning unsold allowances to future auction will accomplish that end without the risk of perpetuating market oversupply. The new provisions of section 95911(b)(4) will keep the unsold allowances out of the auction until the oversupply has been cleared.

D-6. Comment: We recommend that ARB revise the heading of section 95911(b)(4) to remove "when an Auction Settlement Price Equals the Reserve Price." Given the auction rules, see section 95911(d)(4), there may be times when there are unsold allocated allowances and the Auction Settlement Price does not equal the Reserve Price. (PGE4)

Response: While we agree that allowances can remain unsold when the auction settlement price is above the auction reserve price, all unsold allowances never leave the auction holding account. The process of re-auctioning the allowances is also not affected. Also, the title of this section does not circumvent or conflict with any other requirements of the regulation as the title itself does not require any action.

D-7. Comment: PG&E recommends ARB further define what occurs when there are unsold consigned allowances. According to section 95911(b)(3)(B), when the auction clears at the auction reserve price, allowances are sold in equal proportion from each consigning entity. As per (b)(5)(A) "Allowances consigned to auction from limited use holding accounts that remain unsold at auction will be returned to the respective source accounts." To address the situation in which the proportion returned does not result in a whole number of sales from a consigning entity, PG&E recommends ARB sell in proportion to the consigned quantity rounded down. After that, the remaining consigned allowances are each assigned a random number and selected to be sold beginning with the lowest number until quantity supplied matches quantity demanded. The consigned allowances that are not sold are then returned to the respective source accounts. Modify section 95911(b)(3)(B) as follows:

(B) When there are insufficient winning bids to exhaust the allowances from a consignment source in section 95911(b)(3)(A), the auction operator will sell an equal proportion of allowances from each consigning entity rounded down. If, as a result of rounding down, there are fewer allowances sold than demanded, then the auction operator will assign a random number to each unsold bundle of 1,000 metric tons of CO_2e from a consignment source in section 95911(b)(3)(A). Beginning with the lowest random number assigned and working in increasing order of the random numbers assigned, the auction operator shall sell allowances assigned the random number until the quantity of allowances sold equals the quantity of allowances demanded. (PGE4)

Response: We disagree that the change is needed. We would always be able to find a whole number to use when calculating how many allowances to sell from each consignment source. There is, therefore, no advantage to the proposal.

Allowance Price Containment Reserve

D-8. Comment: PG&E is concerned that ARB may allow covered entities in potentially linked GHG emissions trading systems to buy from the APCR. By allowing entities from outside of California access to the APCR, it is possible that the price protections for Californians, including California electric distribution ratepayers, may be compromised. PG&E views this as a critical issue in the overall design of any linkage with other programs. (PGE4)

Response: Section 95913 contains provisions implying that non-California entities in ETS to which California has linked could access the reserve. However, we anticipate that the linked systems would have similar Reserve provisions. If they do not, then the reserve may have much less ability to buffer price increases. We expect that, since linkage will be accomplished through a subsequent regulatory project, the linking regulation will specify how the reserve will operate in the linked programs.

D-9. Comment: ARB noted that their goal in making changes to section 95913 was to simplify and allow the APCR to fill from the lowest price. PG&E agrees with this objective, but the changes as written in the Regulation do not allow for bids to clear from the Reserve efficiently. Modify section 95913(c)(3)(A), 95913(e)(2)(E), and 95913(f) as follows:

(A) The first Reserve sale will be conducted on March 29 ~~8~~, 2013.

(E) The financial services administrator will evaluate the bid guarantee and inform the reserve sale administrator of the value of the bid guarantee once it is found to conform to this section and is accepted by the financial services administrator. The financial services administrator will also inform the bidding entity at least 5 days prior to the auction date if the bid guarantee is found to conform to this section and is accepted by the financial services administrator.

Section 95913(f).

(f) Purchase Determinations.

(1) The reserve sale administrator will conduct sales from each tier in succession, beginning with the lowest to the highest priced tier, until either all allowances are sold from the reserve or all the accepted bids are filled.

(2) The reserve sale administrator will only accept a bid

(A) If acceptance of the bid would not result in violation of the holding limit pursuant to section 95920(b); or

(B) If acceptance of the bid would not result in a total value of accepted bids for a covered entity greater than the value of the bid guarantee submitted by the covered entity pursuant to section 95913(e)(2).

(3) If the sum of bids at the tier price, including bids at prices in higher tiers, which are accepted by the reserve sale administrator is less than or equal to the number of allowances in the tier, then:

(A) The reserve sale administrator will sell to each covered entity the number of allowances for which the entity submitted bids for that tier, including those at higher priced tiers, which were accepted by the reserve sale administrator.

~~(B) If allowances remain in the tier after the sales pursuant to section 95913(f)(3)(A) are completed, the reserve sale administrator will assign a random number to each bundle of 1,000~~

~~allowances for which entities submitted a bid for the tier above the current tier being sold. Beginning with the lowest random number assigned and working in increasing order of the random numbers assigned, the reserve sale administrator shall sell allowances to the bidder assigned the random number until the remaining allowances in the tier are sold or all bids have been fulfilled.~~

(4) If the sum of bids accepted by the reserve sale administrator for a tier, including bids at prices in higher tiers, is greater than the number of allowances in the tier, the reserve sale administrator will determine the total amount to be distributed from ~~each~~ the tier to each covered entity using the following procedure.

(A) The reserve sale administrator will calculate the share of the tier to be distributed to each bidding entity by dividing the quantity bid by that entity and accepted by the reserve sale administrator by the total quantity of bids which were accepted by the reserve sale administrator; and

(B) The reserve sale administrator will calculate the number of allowances distributed to each bidding entity from the tier by multiplying the bidding entity's share calculated in section 95913 (f)(2)(A) above by the number of allowances in the tier, rounding the number down to the nearest whole number.

(C) If allowances remain in the tier after the sales pursuant to section 95913(f)(4)(B) are completed due to the rounding down of each bidding entities share, the reserve sale administrator will assign a random number to each bundle of 1,000 allowances for which entities submitted a bid for the tier, including bids at prices in higher tiers, that was not fulfilled. Beginning with the lowest random number assigned and working in increasing order of the random numbers assigned, the reserve sale administrator shall sell allowances to the bidder assigned the random number until the remaining allowances in the tier are sold.

(5) After completing the sales for each tier the reserve sale administrator will repeat the processes in sections 95913(f)(3) and (f)(4) above for the next highest price tier, considering bids in those higher priced tiers adjusted for any allowances awarded in sales of the lower priced tiers, until all bids have been filled or until the Reserve is depleted. At that time the reserve sale administrator will inform the Executive Officer of the sales from the Reserve to each participant. (PGE4)

Response: We agree that a clearer and more efficient system is needed for purchases from the reserve and revised the procedure in section 95913(e) of the regulation. However, the new procedure is different than the one proposed in the comment.

In the new procedure, each bidder specifies a single bid price and quantity. Beginning with the lowest priced tier, the administrator will fill bids made at that tier price. If any allowances remain, they will be used to fill bids placed at the next higher tier price. This process is repeated until all allowances are sold or all bids are filled. While this is not the same as the procedure proposed in the comment, we believe that it serves the same purpose in allowing bidders to purchase the cheapest allowances available.

We disagree with the suggestion that the financial services contractor be given only five days to make a decision on whether the bid guarantee is acceptable. Turnaround time will depend on workload, and we will not jeopardize the integrity of the auction to meet an arbitrary timeline.

D-10. (multiple comments)
Comment: Changes were made to section 95913, governing the sale of allowances from the Allowance Reserve, to clarify the bidding process. The bidding process for the Allowance Reserve should identify each regulated entity's maximum willingness-to-pay for Allowance Reserve allowances. Once this willingness-to-pay is identified, in order to facilitate low-cost compliance, all bids should flow down to the lowest available price level. In essence, entities with a higher willingness-to-pay should not necessarily have to pay more for these allowances if they are available at lower prices, which SCE believes was the intent of the changes to section 95913. SCE supports the increased flexibility, allowing bids to be filled from the lowest tier first, but ARB should clarify section 95912(f)(1) to confirm that the clearing price for filled bids is the tier price, not the bid price. (SCE3)

Comment: Section 95913(f)(3)(B) specifies the procedure for selling remaining allowances at one tier level to bidders at the next higher tier level, but does not specify if such sales are to be made, which prices will be used. The provision should explicitly state if the price of the tier from which the allowances remain or the price from the higher tier from which bidders are randomly selected applies to the sale of such allowances. (SCAQMD4)

Response: We agree with the comment, and modified section 95913(f)(3)(B) so that the price charged to the bidder will be the price of the tier from which the allowance is sold, not the price bid.

D-11. Comment: It is likely that there will be participants in Reserve auctions that will request bids at multiple tiers with the caveat that if a bid is accepted at a lower-priced tier that the bid(s) at higher-priced tiers be inactivated. Section 95913(e)(1) should explicitly allow or explicitly disallow this type of bidding. If it is allowed, section 95913(e)(2) should include a provision for the bid guarantee in such cases to adequately cover the most expensive potential result rather than the sum of all bids (e.g., if bids are placed at three tiers but a maximum of two bids are to be accepted, then a bid guarantee in the sum of the two highest bids would be sufficient). (SCAQMD4)

Response: Section 95913(e)(1) clearly states that bidders submit a single bid price and a single quantity. There is no mention of the bid process suggested by the commenter.

Reserve Floor Price

D-12. Comment: The $10 California GHG auction reserve price has no basis. ARB should provide the rational for how the $10 price was determined. If ARB is interested in a true market-driven system, the open market should determine the allowance price. (VALERO2)

Response: The auction reserve price is one of the components of a linked regional market program for which consistency across the individual programs is especially important. For this reason, we will work closely to evaluate this issue with other WCI jurisdictions when evaluating their programs for possible linkage. We may propose an adjustment to the reserve price as part of changes made to link California's program with the programs established by WCI partner jurisdictions.

We chose the $10 reserve price for two reasons. First, we are concerned that through recessionary economic conditions or forecasting error the cap-setting procedure may accidently lead to the creation of excess allowances. Throughout the regulatory process, we heard concerns from environmental groups that the cap would be unintentionally set too lax—a condition sometimes referred to as oversupply or over-allocation. The over-allocation condition occurs if too many allowances are supplied to covered entities relative to expected business-as-usual emissions levels. If the cap is set too loose, prices will be lower than expected, and a weakened incentive to reduce emissions will be created. The reserve price mechanism would correct this condition by transferring excess allowances to the Allowance Price Containment Reserve, where they will be available in times of high prices. Second, we are adapting the approach used in the federal Waxman-Markey proposal (HR 2454), which proposed a reserve price of $10 with an inflator mechanism of five percent per year plus inflation.

Finally, we do not consider the prices observed in markets, such as RGGI, as representative of the marginal cost of abatement or production of offsets. These prices are instead the result of the over-allocation problem that we are determined to prevent in California. We note that the RGGI auction reserve price, which follows market prices, has not corrected for the oversupply. We have been clear that dealing with oversupply is a key function of the auction reserve price mechanism.

D-13. Comment: The Utilities request the following addition to clarify the allowance price for 2016 future allowance prices. Modify section 95911(b)(6)(A) as follows:

(A) For auctions conducted in calendar year 2012 and 2013 the Reserve Price shall be $10 per metric ton for CO_2e for vintage ~~2012~~2013 allowance. For auctions conducted in 2012, the Reserve Price shall be ~~and $11.58~~ $10 per metric ton of CO_2e for vintage 2015 allowances. For auctions conducted in 2013, the Reserve Price shall be $10 per metric ton of CO_2e for vintage 2016 allowances. (MID3)

Response: We disagree that the language is not clear and did not make the change. All auctions in 2012 and 2013 will use the base $10 auction reserve price.

Auction

Auction General

D-14. Comment: Section 95910(a)(1) states that the first auction will be held on August 15, 2012. This date is before these rules will be considered by the CARB Board. (SCAQMD4)

Response: The cap and trade regulation was adopted by the Board on October 20, 2011, and will become effective before the first auction date.

D-15. Comment: Section 95910(c)(2) designates the auction of allowances from future budget years. The Utilities are concerned that this section is somewhat ambiguous and request clarification particularly as to the early auction of 2014 allowances. The RPR indicates that in 2012 allowances from the 2015 budget will be auctioned, and in 2013 allowances from the 2016 budget will be auctioned, and so forth. It does not address the future auction of any allowances from the 2014 budget. The Utilities suggest it may be helpful for CARB to provide a matrix of what allowances are going into each auction and at what reserve price. (MID3)

Response: Section 95910(c)(2) does not explain the advance auction of 2014 allowances because vintage 2014 will never be part of the advance auction. The first vintage to be sold at the advance auction will be 2015. All auctions in 2012 and 2013 will use the base $10 auction reserve price.

D-16. Comment: Section 95910(c)(2)(A) states that at each auction in 2012, one-half of the allowances designated for advance auction will be from the 2015 budget. It was our understanding that program participants could consign their own allowances for auction. If so, then what happens if they consign allowances from future years in a way that prevents one-half of them from coming from year 2015? (SCAQMD4)

Response: Entities may only consign allowances from the allowances they receive through direct allocation, which does not include future vintage allowances.

D-17. Comment: We support ARB's proposal to make one third of vintage 2013 allowances available to entities in 2012 through two auctions scheduled in August and November. Following ARB's decision to begin enforcement of the program in 2013, we agree with staff that there is still opportunity and value to the program to begin auctioning of allowances in 2012. Holding an auction for the electric utility sector in August 2012, as proposed, will reinforce confidence in the market that the program will continue as planned and help facilitate early price discovery. In addition, the proceeding underway at the California Public Utilities Commission (CPUC) will ensure that the electric utilities have the authorization they need in time to begin collecting costs and distributing revenues from the sale of emission allowances. (KUSTIN16)

> **Response:** No response is needed.

D-18. Comment: It is necessary to clarify that it is CARB and the Executive Director that have the authority to move allowances out of the Limited Use Holding accounts for the consignment auctions. Modify section 95910, 95910(d)(4)(A) and (B) as follows:

> Section 95910. ~~Timing Of~~ Auction Of California GHG Allowances.
>
> (A) For the auctions conducted in 2012, allowances designated for consignment pursuant to section 95892(c) must be transferred by the Executive Director to the Auction Holding Account at least 10 days before each auction.
>
> (B) Beginning in 2013, allowances consigned to auction through a transfer by the Executive Director to the Auction Holding Account at least 75 days prior to the regular quarterly auction will be offered for sale at that auction. (MID3)
>
> **Response:** Section 95910(d)(1) states that an entity may consign allowances to the Executive Officer for sale at auctions. The consignment is the request made by the entity to the Executive Officer, which according to section 95910(d)(4)(A) must be completed within 10 days of auction. We believe these provisions are sufficient to give the Executive Officer authority to transfer the allowances as needed. There is no need to make the change recommended in the comment.

D-19. Comment: PG&E believes that ARB adjusted the consignment requirement to 75 days prior to auction in order to allow ARB to process information and publically release auction information 60 days before the auction. However, PG&E recommends that the consignment requirement be 65 days before each auction starting in 2013 as we believe this 5-day window provides ARB sufficient time to sum allowance quantities from the consigning entities and publish auction information sixty days prior to auction. Modify section 95910(d)(4)(B) as follows:

> (B) Beginning in 2013, Allowances consigned to auction through a transfer to the Auction Holding Account at least 65 days prior to the regular quarterly auction will be offered for sale at that auction. (PGE4)

Response: We proposed the 75-day time period not only to allow us to complete the necessary administrative tasks but also to give auction participants time to adjust their auction purchase strategies to the level of consignment. If we did not add this provision, the consigning entities would have an advantage over other auction participants in having some advance knowledge of the level of consignment. Auction participants would know the number of allowances that will be consigned during the year, but not the timing. We believe they need the longer time limit to revise their purchase strategies once we publish the number of allowances consigned, since they could not have anticipated the actual number of allowances being offered for sale.

Auction Frequency

D-20. (multiple comments)
Comment: The modified program rules provides for a quarterly auction schedule, which is inconsistent with the most recent research and analysis conducted in connection with the management of carbon market auctions in Europe. Based on this research and recent market experience, the European Union now requires that, starting in 2013, all auctions be conducted on a weekly basis or more frequently. The concern with infrequent auctions (including quarterly auctions) is that they may result in price volatility and price spikes when the auctions are held and provide more opportunities for the exercise of market power between each such auction. More frequent auctions provide better price signals and help smooth price volatility. As an alternative to the purchase limits and position limits, IETA recommends that ARB consider conducting auctions more frequently, including for example on a monthly basis. (IETA3)

Comment: Research conducted by Linklaters indicates that the most efficient way to address the risk of market manipulation is to hold auctions frequently. More auctions reduce the risk of market abuse because of the decreased value at stake in smaller auctions. They also minimize price volatility experienced at the time of allowances auctions and the risk of any market player exercising market power between auctions. For those reasons, most agencies managing carbon markets have moved to a weekly auction schedule, including in Europe and Germany where, by law starting in 2013, auctions must be held on a weekly basis or more frequently. RGGI is an outlier whose design dates back to 2006/2007. The RGGI quarterly auction schedule, however, has been largely untested because the RGGI market is long and trading activity is low, which materially diminish the incentives for any players to manipulate the markets. If ARB is concerned about the potential for market abuse that may arise from modifications to the auction purchase limit and/or the holding limit, it can adopt the approach used in most carbon markets for fighting market abuse and increase the frequency of auctions. (CHEVRON3)

Comment: The Cap and Trade Regulation currently provides for quarterly auctions for allowances for each of the compliance periods. This frequency does not reflect the most recent research and analysis conducted in connection with the management of carbon market auctions in Europe. Based on the most recent data, the European Union now requires that, starting in 2013, all auctions be conducted on a weekly basis or more frequently. The concern with infrequent auctions (including quarterly and monthly auctions) is that they provide more opportunities for speculators and financial intermediaries to manipulate markets between the auctions. Another concern is that infrequent auctions increase price volatility and can result in price spikes around the time auctions, which result in market inefficiencies. More frequent auctions provide better price signals and help smooth price volatility, which are crucial elements for long-term planning purposes. Although RGGI has a quarterly auction schedule, this design feature essentially dates back to 2006 and does not build upon recent experience with carbon markets. Furthermore, the RGGI market design has not been fully tested because the market is long, activity is slow and prices are low. Accordingly, the WSPA members do not believe RGGI is a useful or realistic precedent in this respect for the California market. For example, in the EU ETS phase 2, the UK had larger, less frequent auctions (6-8 per year), where market volatility was directly attributable to the auctions. On the other hand, Germany had weekly, smaller auctions, and the market largely absorbed the volume without noticeable price impacts. Increase auction frequency to monthly to both address issues of market volatility and reduce the opportunity for market manipulation due to the predictability of compliance entities to use each auction so that they can cost optimize due the holding limits. Modify section 95910(a) as follows:

(1) In 2012, auctions will be held on August 15 and monthly thereafter on the 15th of every month.
(2) Beginning in 2013, auctions shall be conducted on the 12th business day of every month throughout the end of the program in December 2010. (WSPA3)

Response: We disagree with several unsupported assertions made in the comments. First, a quarterly auction does not necessarily provide more opportunities for speculators to manipulate the market. Covered entities that purchase allowances to match recent emissions or forecast emissions between auctions will simply purchase a larger amount at each auction. A change in auction frequency may change volumes purchased at each auction, but they do not change the purchasing strategy used by covered entities. They do not have to purchase on the secondary market between auctions.

Second, infrequent auctions do not cause increased variability or price spikes. These originate from changing assessments of supply and demand conditions. We do agree that under certain assumptions of how covered entities behave that increased auction frequency could help the market adjust to external shocks. There is also great value to auction participants in having the purchases of non-covered entities be spread out over several auctions.

We are aware of new program developments in the EU, although the attribution of the level of market price volatility solely to auction frequency is too speculative. We will be following the EU experience closely to help us determine the value of more frequent auctions.

We did not choose a quarterly format only because RGGI operates with that format. Our stakeholder consultations held in 2009 and 2010 brought up other factors affecting our decision. First, stakeholders did believe the quarterly format was operating successfully at the time. Second, both stakeholders and staff were concerned with the ability of all covered entities to participate in frequent auctions due to the costs and time commitments. Some California covered entities have extensive experience with auctions and commodity markets and have resources to conduct extensive auction and secondary carbon market participation; others do not. We believe retaining the quarterly format will give covered entities time to develop the capabilities for more frequent auction participation. Third, we have not operated auctions or financial activities on this scale before and must develop the contract services, internal procedures, and enforcement mechanisms needed for successful implementation. We note that the EU ETS auctions are generally conducted by national ministries with extensive experience in market operations. Auctions pose no great institutional challenges for them.

We concluded that the quarterly format can be successfully implemented without damaging the market. At the same time, we do see some value in moving to a more frequent auction once we develop the institutional capability, stakeholders develop familiarity with the process, and we can review a longer period of market information from the EU ETS. We could then change the auction schedule through another rulemaking, if needed.

Auction Purchase Limit

D-21. (multiple comments)
Comment: Providing an exception to purchase limits solely for electrical distribution utilities (section 95911(c)(4)(B)) is not supportable. This potentially provides an unfair competitive advantage over independent generators, and creates two cost tiers between IOUs and any and all other compliance entities. Such a market design is simply not equitable. It would be best not to have discriminatory purchase limits among classes of market participants at all. Somewhat less inequitable would be to design a limit that is the higher of the “generic” limit, or some quantity related to an entity’s reasonably expected compliance obligation. MSCG strongly recommends removal of part B. Alternatively, design a non-discriminatory set of limits that does not have disparate treatment of one class of market participant relative to others. (MSCG3)

Comment: The purchase limit on allowances discriminates against independent power producers (IPPs) in favor of Utility Owned Generation (UOGs). The purchase limit should be modified to reflect individual Covered Entities compliance obligations. The utilities’ exemption from the purchase limit should be deleted, section 95911(c)(4)(B). In addition, section 95911(c)(4)(A) should be modified to set a large covered entities purchase limit based on its compliance obligation. Modify section 95911(c)(4) as follows:

(4) For the auction of current vintage allowances:

(A) The purchase limit for covered entities and opt-in covered entities will be 10 percent of the allowances offered for auction. Upon an application by a covered entity, CARB may determine that the established Purchase Limit disadvantages the covered entity unreasonably, and CARB may establish a unique purchase limit for the covered entity scaled to the appropriate magnitude of the covered entity's compliance obligation.

(B) ~~The purchase limit does not apply to electrical distribution utilities receiving a direct allocation of allowances pursuant to section 95892(b) and subject to the monetization requirement pursuant to section 95892(c). This provision shall not be interpreted to exempt said electrical distribution utilities from any other requirements of this article; and~~ The purchase limit for all other auction participants is four percent of the allowances offered for auction. (IEPA2)

Response: We added the exclusion to deal with the imposition of a requirement that the electrical distribution utilities be required to consign their entire direct allocation of allowances to auction rather than use them for their compliance needs, as other recipients of direct allocations are allowed. We set the purchase limits reflecting the ability of other covered entities to use their direct allocations for their own compliance. Thus, the provision remedies a provision that would otherwise place utilities in a non-competitive position. Given the consignment requirement, and the need for utilities to purchase above their direct emissions in order to cover emissions from long-term contracts, the exemption from the purchase limit does not give the utilities an advantage over other covered entities or create an inequity as the comment suggests.

D-22. Comment: We oppose proposals to relax an individual entities' purchase limit should allowances remain unsold at auction. As ARB has designed the program, unsold allowances should fill the reserve to provide a cost containment function that is accessible to all parties. Allowing certain firms to bet on future shortfalls by stockpiling allowances at an auction invites the sort of market speculation and manipulation that can undermine confidence in the program and inhibit performance of the market. (KUSTIN16)

Response: We did not propose to relax the purchase limit in case an auction results in unsold allowances. Instead, unsold allowances will be returned to later auction after two auctions reach a settlement price above the auction reserve price. At that point, all auction participants will have an equal opportunity to bid on the allowances.

D-23. Comment: ARB has increased the auction purchase limits for allowances of future vintage years but did not change the policy on the purchase limits applicable to current vintage years and the position on holding limits. The primary concern with the purchase limit contained in the Regulations is that the limit is set below the compliance requirements of certain large covered entities. ARB's proposal that covered entities cannot purchase in an auction, or hold in their account, a sufficient quantity of allowances to meet their legal obligations is without basis. ARB has essentially designed its market to guarantee that large entities will be short in every auction and required to go into the secondary market to buy their allowances at a premium from speculators and financial intermediaries. This is a fundamental market flaw that provides an opportunity for such players to corner the market and, as such, it is unacceptable, especially in light of the State's experience with energy markets. Chevron has included expert analysis from the international law firm Linklaters LLP which is recognized worldwide for its expertise with commodities and carbon markets. According to research conducted by Linklaters, no other major current commodities or carbon market contains position limits such as those included in the proposal.

The proposal's position limit is actually a rule developed by the Commodities Futures Trading Commission (CFTC) to regulate futures commodities markets for the purpose of minimizing financial exposure of market participants. The CFTC rule is not intended to curb the risk of market manipulation and its extension to spot (or inventory) markets for this purpose is untested and not supported by empirical data and proper analysis. Similarly, Linklaters has indicated that no other carbon market contains purchase limits similar to those included in the proposal, except for the Regional Greenhouse Gas Initiative (RGGI). In RGGI, however, the purchase limit is 25 percent, not 10 percent, and no covered entity's compliance obligation in RGGI exceeds that 25 percent purchase limit. To address this issue, ARB does not need to remove the proposed purchase limits or position limits. The simple fix is to permit covered entities to bid and hold a quantity of allowances up to the limit contained in the current proposal, or a quantity equal to that covered entity's compliance obligation (at a minimum), whichever is greater. (CHEVRON3)

> **Response:** First, the commenter is not correct in its assertion that the holding limit was developed by the CFTC to regulate futures markets. The holding limit was developed in consultation with Jeffrey Harris, who was formerly employed at the CFTC. His recommendations were specific to the carbon market being developed by California and the other WCI jurisdictions.
>
> Second, consideration of position and purchase limits is not unprecedented. The EU ETS members have identified position and purchase limits as backstops that could be introduced as needed in case anti-competitive conditions emerge. The commenter is correct in that the three national programs reviewed (France, the UK, and Germany) and EU ETS did not select fixed purchase and holding limits as did California. However, the review of these programs contained in the comment shows that the programs did consider the fixed limits to be valid, but preferred to use them as a last resort. Instead, they chose a method they considered superior: imposing a bid limit if the size of a bid poses a risk of anti-competitive behavior. This is similar to the use of "responsibility levels" or variable position limits in U.S. commodity markets. However, we do not have the

authority to use such approaches because they require a level of discretion in their application that we do not have under the Administrative Procedure Act that governs our rulemaking. In addition, we understand that the EU ETS members also are considering, and have the authority to impose, purchase limits after the program has begun operation if problems arise. If we did not include such limits in the current regulation, we would have to undertake a new regulation. This would not be a quick process, so it is clear that we do not have the flexibility that the EU ETS members have in keeping purchase limits in reserve.

We do not consider the RGGI example to be relevant to our market. Our cap decreases immediately, and we anticipate that there will not be a large supply of compliance instruments that are not committed to covering compliance obligations due in 2015. The RGGI market did not take this approach, with the result that the market has built up a cushion of allowances in circulation that make manipulations difficult and reduce the need for strict purchase limits.

Third, all registered entities can keep in their holding accounts up to about 6 million MT of allowances in the first compliance period and about 11 million MT in the second compliance period, all of which will be available for trading. The comment does not explain why this is not sufficient to provide market liquidity or for covered entities to meet their obligations. In addition, we set the revised purchase limit to 15 percent to reflect the emissions of the largest emitters, net of the direct allocation they receive from ARB.

D-24. Comment: The modified regulation's 10 percent auction purchase limit disadvantages entities with large compliance obligations. While entities with small compliance obligations may be able to procure all their compliance needs for a year in a single auction, entities with larger compliance obligations would not. We see no compelling need for a purchase limit and would prefer that it be eliminated. If ARB retains the purchase limit, we recommend raising it to 25 percent for all market participants, including IOUs. This limit is consistent with that used in the Regional Greenhouse Gas Initiative. Modify section 95911(c)(4) as follows:

(4) For the auction of current vintage allowances:

(A) The purchase limit for covered entities and opt-in covered entities will be ~~10~~ <u>25</u> percent of the allowances offered for auction; <u>and</u>

~~(B) The purchase limit does not apply to electrical distribution utilities receiving a direct allocation of allowances pursuant to section 95892(b) and subject to the monetization requirement pursuant to section 95892(c). This provision shall not be interpreted to exempt said electrical distribution utilities from any other requirements of this article; and~~

(~~C~~<u>B</u>) The purchase limit for all other auction participants is four percent of the allowances offered for auction. (WPTF2)

Response: The statement in the comment that large entities cannot obtain sufficient allowances to cover their emissions is not correct. Covered entities will need to purchase at auction a number of allowances equal to their direct emissions, less the direct allocation they receive from us. We increased the purchase limit to 15 percent and believe that this limit is large enough to allow covered entities to purchase their net allowance needs at auction. This means covered entities would not need to purchase on the secondary market. The rationale for the limits themselves is included in the responses to the 45-day comments.

D-25. Comment: The proposed regulation's 10 percent purchase limit needs to be increased to accommodate the size of large independent generators such as Calpine, which may realistically need to purchase more than 10 percent of the available allowances in any auction to meet their compliance obligation. Calpine recommends that the auction purchase limit for covered entities during the first compliance period generally be kept at 10 percent of the total number of allowances available any given auction, but with an opportunity for any covered entity or group of covered entities with a corporate association to exceed this limit, so long as its total purchase of allowances of any vintage year does not exceed 125 percent of its average annual verified emissions during the preceding three calendar years, plus, for any entity with less than three years' reported emissions data, an additional amount that represents a reasonable estimate of the entity's anticipated emissions during that calendar year. This would allow large affiliated entities, such as Calpine, to satisfy their anticipated compliance obligation through purchases at auction, while still avoiding the potential for covered entities to engage in market manipulation by purchasing an amount of allowances grossly in excess of their anticipated compliance obligations for any calendar year. As an alternative to the foregoing proposal, CARB could adopt a substantially higher auction purchase limit, such as the 25 percent limit applicable to Regional Greenhouse Gas Initiative (RGGI) states. Modify section 95911(c)(4)(A) and (B) as follows:

(A) The purchase limit for covered entities and opt-in covered entities will be 10 percent of the allowances offered for auction<u>, except for any covered entity or group of covered entities with a corporate association, which may purchase an amount of allowances in excess of 10 percent during any auction, so long as the total purchase of allowances of any vintage year does not exceed 125 percent of the entity's or group of entities' average annual verified emissions during the preceding three calendar years or, in the case of an electrical distribution utility acquiring allowances on behalf of second registered entity with whom it has established a beneficial holding relationship pursuant to section 95834(a)(2), 125 percent of the second entity's verified emissions during such three calendar years, plus, for any entity with less than three years' reported emissions data, an additional amount that represents a reasonable estimate of the entity's anticipated emissions during that calendar year; and</u>
(B) ~~The purchase limit does not apply to electrical distribution utilities receiving a direct allocation of allowances pursuant to section 95892(b) and subject to the monetization requirement pursuant to section 95892(c). This provision shall not be interpreted to exempt said electrical distribution utilities from any other requirements of this article; and~~ (CALPINE3)

Response: We raised the purchase limit to 15 percent and believe this change addresses the commenter's concerns. This reflects the emissions of the largest emitters, net of the direct allocation they receive from ARB.

D-26. Comment: PG&E does not support raising the 10 percent purchase limit in advanced auctions to 25 percent as described in section 95911(c)(3). The advanced auction purchase limit should be consistent with the other auctions. Such a high limit may lead to hoarding and increases the potential for market manipulation in the program. (PGE4)

Response: We set the purchase limit for the advance auction to 25 percent, higher than for the current vintage auction, for two reasons. First, in addition to giving a forward price signal, the advance auction allows larger entities that need to physically hedge future compliance needs without excessively tightening the supply of current vintage allowances. This is especially critical ahead of the expansion of program scope in 2015. Second, we imposed the purchase limits to help prevent some manipulative schemes that could be played, especially toward the end of a compliance period. These schemes cannot be played using allowances that cannot be used for compliance. Also, it should be noted that only 10 percent of any future vintage will be sold at advance auction. Thus, the purchase limit will prevent any entity from purchasing more than 2.5 percent of a vintage from the advance auction.

D-27. Comment: Auction Purchase Limits in section 95911(c) should be waived or increased in the event that allowances would otherwise go unsold in an auction. (CE2CC)

Response: We modified the regulation so that unsold allowances will be returned to auction after two consecutive auctions have reached an auction settlement price above the auction reserve price. They will no longer go to the Allowance Price Containment Reserve. We do not agree with the proposal in the comment to raise the purchase limit, since one of the objectives of the limit is to reduce the potential for concentration of holdings. We believe our proposal to return the unsold allowances to auction meets the objective of keeping the unsold allowances in the market, instead of taking them out of the market and placing them in the reserve.

D-28. (multiple comments)
Comment: Section 95911(c)(1) sets the purchase limits that any entity is allowed to purchase at each quarterly auction. WSPA believes that the auction purchase limit is unreasonably low that will inhibit longer-term planning. WSPA recommends that the purchase limits be deleted or significantly increased. (WSPA3)

Comment: ARB has increased the purchase limit for future vintage allowances for a single entity from 10 percent of the allowances offered per auction to 25 percent. The limit applicable to current vintage year allowance remains at 10 percent. This approach will prevent covered entities with compliance obligations in excess of the limits from purchasing a sufficient number of allowances at each auction that they need to comply with the law. The limitation is a market design flaw because it will create an artificial short on the large covered entities that could result in opportunities for other participants to exercise disproportionate market power. It also places such large covered entities at a competitive disadvantage vis-à-vis other covered entities with compliance obligations below the limit. IETA notes that no carbon market currently in operation contains a similar purchase limit, except for RGGI. In RGGI, however, the purchase limit is 25 percent and the largest covered entity requires less than 15 percent of the allowances under the cap to comply. In order to prevent this unintended effect, IETA recommends the auction purchase limits be revised to provide that all covered entities may purchase up to an amount equal to each individual entity's compliance obligation, plus the current proposed 4 percent limit granted to non-covered entities. This will ensure that all parties will be on a level playing field and avoid the result of creating a competitive disadvantage to some entities and not others. (IETA3)

> **Response:** We raised the purchase limit for covered entities in the first compliance period from 10 percent to 15 percent. We believe this will be sufficient for every covered entity to meet its compliance needs (net of direct allocation) from the auction.
>
> We are currently in discussions with other members of the WCI on both the holding and purchase limits. We expect that some revisions may be necessary, in part to recognize different regulations and laws in the different jurisdictions, and in part to recognize the different market structure that we face after linking. Any changes to the limits would be part of a separate rulemaking that links the programs, not this regulation.

D-29. (multiple comments)
Comment: While the Utilities are supportive of the changes to the Auction Purchase Limit, the Utilities are concerned that applying the purchase limit only to the first compliance period contradicts the intent of this provision. Modify section 95911(c)(2) as follows:

> ~~2) The auction purchase limit will apply to auctions conducted from January 1, 2012 through December 31, 2014~~. (MID3)

Comment: PG&E does not support the lack of Auction Purchase Limits in the second and third compliance periods as noted in section 95911(c)(2). PG&E believes Auction Purchase Limits should apply to all three compliance periods. Without sufficient Auction Purchase Limits, there is potential that market speculators have the ability to hoard allowance supply simultaneously driving up compliances prices and expediting the depletion of the APCR—both of which result in higher costs for electric distribution utility customers. Modify section 95911(c)(2) as follows:
(2) The auction purchase limit will apply to ~~auctions conducted from January~~

~~1, 2012, through December 31, 2014.~~ all auctions. (PGE4)

Response: Going forward, we expect that linking to WCI or to other ETS would also lead to changes in the purchase limit. Since these linking arrangements would take the form of new regulations with new purchase limits, we concluded that setting a purchase limit now to last through 2020 would be misleading.

D-30. Comment: Linklaters' review of the regulations governing major carbon and commodities markets in the countries identified demonstrates that the holding limit included in the Regulations is unprecedented. In proposing the holding limit, ARB has taken a rule designed by the CFTC to prevent systemic risk in the futures market and has applied it to an Inventory Carbon Market. The purpose of the rule was not to curb potential market power issues, but rather to protect the market from systemic risk that arises where any one market participant takes on too large a position. In proposing the holding limit ARB has taken a rule designed by the CFTC to prevent systemic risk in the futures market and has applied it to an inventory carbon market. We are aware of no date, information, or research that demonstrates or otherwise purports to show precisely what positive impact the holding limit rule will have on the inventory carbon market. (CHEVRON3)

Response: The comment is correct in that the three national programs reviewed (France, the UK, Germany) and EU ETS did not select fixed purchase and holding limits as did California. However, the review mentioned in the comment shows that the programs did consider the fixed limits to be valid, but preferred to use them as a last resort. Instead, they chose a method they considered superior: imposing a bid limit if the size of a bid poses a risk of anti-competitive behavior. This is similar to the use of "responsibility levels" or variable position limits in U.S. commodity markets. However, we do not have the authority to use such approaches because they require a level of discretion in their application that we do not have under the Administrative Procedure Act that governs our rulemaking. In addition, we understand that the EU-ETS members also are considering, and have the authority, to impose purchase limits after the program has begun operation if problems arise. If we did not include such limits in the current regulation, we would have to undertake a new regulation. This would not be a quick process, so it is clear that we do not have the flexibility that the EU ETS members have in keeping purchase limits in reserve.

D-31. Comment: The holding limit will have unintended negative impacts. As currently drafted, the holding limit will result in lower market liquidity, because it will force covered entities with compliance obligations above the limit to take allowances out of the market by moving them into a compliance account. In a market where the underlying size is already low, this measure will exacerbate the ability of any participate to manipulate markets. (CHEVRON3)

Response: The comment is correct in that the largest entities will have to place a large share of their allowances in their compliance account under the limited exemption. However, we disagree with the commenter on two grounds. First, the comment overstates the impact on liquidity, because covered entities going short to take advantage of what appear to be profitable opportunities to sell instruments may end up losing money if an observed price increase turns out to be permanent. Second, the holding limit allows all entities to hold a large number of allowances that can be sold. In 2013, this limit will be about 6 million MT, and the limit rises to over 11 million MT in 2015. We believe that this amount is sufficient to give covered entities flexibility in market operations.

Auction Purchase Limit – Corporate Associations

D-32. Comment: NCPA supports the inclusion of provisions within the proposed regulation that ensure registered entities are not able to collude and adversely impact the allowance market and auction operations. Provisions regarding the disclosure of corporate associations and the imposition of auction purchase limits are necessary tools to meeting this objective. These restrictions, however, must be implemented in a manner that does not impede the regular business operations of entities such as JPAs that may have a compliance obligation under the program, yet be comprised of member utilities that also have their own compliance obligations. (NCPA3)

Response: We revised the level of control used to define when a direct or indirect corporate association exists, from 20 percent to 50 percent, using the measures defined in section 95833(a)(1). We also revised the procedures for handling of allowances that are directly allocated. These procedures make it easier for members of a JPA to ensure that allowances directly allocated to members of a JPA can be placed into the compliance accounts of the JPA itself without triggering any affiliation rules.

D-33. Comment: Existing language in section 95914(e)(2)(C) would allow a group of entities with a disclosable corporate association to purchase all allowances available at an auction rather than collectively limiting them to the auction purchase limit, contrary to section 95911(c)(1). Modify section 95914(e)(2)(C) as follows:

(C) Each associated entity's allocated purchase limit share times the auction purchase limit ~~number of allowances being auctioned~~ becomes the purchase limit for that entity. (SCAQMD4)

Response: We agree and made the appropriate change.

D-34. Comment: Corporate Association Consolidation - Liquidity is critical to market functionality and to cost containment. The proposed rule includes position holding limits and purchase limits that apply to companies and any indirectly affiliated entities. This policy effectively punishes the larger companies for having expanded their investments in California without controlling interests. This policy would also compromise fair competition by requiring that companies communicate their trading and holding positions to third parties who have a competitive interest in the market. At a minimum, the exception in Section 95920(f) of the proposal should be applied to the purchase limit in Section 95911. (CHEVRON3)

> **Response:** We removed section 95920(f) and replaced it with new section 95833(a)(4) so that the exception applies to all instances where corporate association rules come into play, not just in the holding limit as pointed out by the commenter. The intent of a number of revisions to section 95833 is to ensure that we are applying corporate association rules to instances where control occurs.

D-35. Comment: WSPA understands the need for disclosure of direct and indirect corporate contacts in order for the cap and trade system to be transparent and to allow ARB to monitor for market manipulation. The problematic issue is the conditions that attach to the activities of direct and indirect corporate entities. For example, section 95911(c) limits the number of compliance instruments that can be bought at any specific auction by an entity or a “group of entities with a disclosable corporate association.” These limits are set at 25 percent of the future vintage compliance instrument and 10 percent of the current vintage compliance instruments that are available at any given auction. Section 95920 also limits the number of compliance instruments that can be held by an entity or group of entities with a disclosable corporate association. These two limits create significant legal and pragmatic compliance difficulties for joint ventures, partnerships, and limited liability companies. For instance, in order to determine compliance with these requirements, the equity owners of these joint business relationships would be required to disclose their bidding strategy and compliance instrument ownership positions to each other. This problem is further exacerbated when the two or more equity owners are competitors in either the same or other industrial sectors. Such disclosures may be prohibited by both state and federal antitrust laws and regulations. In addition, the two or more equity owners may also hold disclosable corporate associations with numerous other unrelated joint venture, partnerships or limited liability companies, thus creating an extremely complex web of inter-company communications and reporting requirements which are pragmatically and legally difficult or even legally infeasible. We note that in 95833(a)(4) there is an exception that does not require entities to take “other action” that violates “other rules”. The section does not provide any guidance on what the entities must do or provide in these cases. Rather than providing a pathway for compliance, it adds additional uncertainty and compliance exposure. WSPA supports the disclosure requirements of section 95833 that give ARB or the market administrator the opportunity to monitor these direct and indirect corporate associations for inappropriate activity. WSPA recommends the auction and holding account limits apply only to the specific joint venture, partnership or limited liability company and not be applied to entire group of associated corporate entities and their own unassociated disclosable business entities. (WSPA3)

> **Response:** We agree with the concerns expressed in the comment. However, we believe the modification to section 95833(a)(4) addresses these concerns. In addition, in the second 15-day Change Notice, ARB raised the requirements

determining when an entity has control over another. The specific measures of control listed in 95833(1) now must show a level of control of 50 percent or greater, up from 20 percent. If control is not established, there is no need for disclosures that could involve state or federal prohibitions.

Auction Administration and Registration

D-36. Comment: PG&E still seeks additional detail in the Regulation on auction design including credit management process, default management process, definition of security and rating requirements, credit terms, revenue shortfall allocation, and settlements. (PGE4)

> **Response:** The regulation sets out the rules that registered entities must follow, which in this case includes the bid guarantee and information submission for auction and Reserve sale participation. Generally, administrative processes such as the ones listed are not included in the regulation beyond the specification of the rules themselves.

D-37. Comment: Section 95912(c) contains language that is redundant to the new language in section 95912(c)(2) which provides that "an entity will be required to complete an auction registration application at least 30 days prior to an auction in which it intends to participate." This latter expression is more precise. Modify section 95912(c) as follows:

> (c) Auction Registration Requirements. ~~An entity that intends to participate in the auction must complete an auction registration at least thirty~~ 30 ~~days prior to the auction.~~ (MID3)

> **Response:** Section 95912(c)(2) is not redundant because it lists the information that an entity must provide when applying to participate in an auction.

D-38. Comment: Regarding sections 95912(c)(2)(D) and 95912(b)(3), the standards for approving an auction registration should be defined explicitly, including the criteria for consideration of "any previous or pending investigation with respect to any alleged violation of any rule, regulation, or law associated with any commodity market or exchange" in the decision to approve or deny. (SCAQMD4)

> **Response:** The information disclosure requirements in section 95912(c) are designed to aid us in market surveillance efforts, including those to determine whether an entity is under investigation for behavior in related markets. The information will aid us in detecting manipulative schemes that involve transactions in related markets, such as our cap-and-trade market and carbon futures markets, for example. Section 95914(c) contains the rules governing whether the Executive Officer will accept a registration.

D-39. Comment: PG&E is concerned about the burden to satisfy requirements in section 95912(c)(2). As written, the requirement seems too broad, particularly, section 95912(c)(2)(D), which states that "The identification of any previous or pending investigation with respect to any alleged violation of any rule, regulation, or law associated with any commodity market or exchange." PG&E seeks clarity on the requirements, since market participants are already required to disclose any Beneficial Holding relationships as part of their registration application and subsequent updates, the requirement appears redundant. (PGE4)

> **Response:** The information disclosure requirements in section 95912(c) are designed to aid us in market surveillance efforts, including those to determine whether an entity is under investigation for behavior in related markets. The information will aid us in detecting manipulative schemes that involve transactions in related markets, such as our cap-and-trade market and carbon futures markets, for example. There is no connection between this disclosure requirement and the beneficial holdings requirement. Section 95914(c) contains the rules governing whether the Executive Officer will accept a registration, which focus more on provision of false information as a reason for rejection.

D-40. Comment: PG&E recommends that section 95912(c)(2)(E) be modified to be consistent with section 95912(k)(3) which describes the transfer of allowances to winning bidders' Holding Account or Compliance Account. Modify section 95912(c)(2)(E) as follows:

> (E) The applicant's holding account number <u>and compliance account number</u>. (PGE4)

> **Response:** An entity's compliance account is tied to its holding account. Disclosure of a holding account number is sufficient to allow the Executive Officer to complete the activities in section 95912(k)(3).

D-41. (multiple comments)
Comment: PG&E recommends that the Executive Officer notify the entity within five days whether its application is approved (section 95912(c)(3). (PGE4)

Comment: Section 95912(c)(3) requires EO approval of an entity's registration before an entity may participate in an auction. However, there is no timeline for EO approval. WSPA recommends that the regulation require the EO to approve or deny a registration within 10 days of the completed registration submittal by any entity. (WSPA3)

Comment: The following additional language is needed to ensure that an entity having a compliance obligation is not precluded from participating in an auction due to delays in CARB's processing of a timely registration request. Modify section 95912(c)(3) as follows:

(3) The Executive Officer must approve an entity's auction registration before that entity may participate in an auction; provided that if the entity submits an auction registration as set forth in 95912(c)(2) the Executive Officer shall act on the registration prior to the auction. (MID3)

Response: The time needed for approval will depend on the number of applications received. In addition, the processing time for a first-time application would be higher than for a renewal. At the start of the program, we expect to process a large number of applications, as all covered entities will most likely apply to participate in the first auction. After that, the processing time should decrease due to the provision that entities may retain their auction registration through compliance with program rules. They would only be required to update the information disclosed. Given that we expect processing time to decrease dramatically after the program begins, and that we see no benefit to placing a limit on processing time, we did not make the recommended change.

D-42. Comment: Regarding section 95912(d)(2), has consideration been given to an exemption for the case of a change occurring less than thirty days prior to an auction? Without such an exemption, there is the possibility that an unavoidable change occurring at an inopportune time could result in a compliance problem for a covered entity or opt-in covered entity. Modify section 95912(d)(2) as follows:

(2) An entity approved for auction participation must inform the auction operator at least 30 days prior to an auction when reporting a change to the information disclosed or no more than two days after the change occurs, whichever is later, otherwise the entity may not participate in that auction. (SCAQMD4)

Response: We included the requirement to ensure that we have the information needed to analyze the bids and make the determinations that bids conform with rules. These include bid guarantees, purchase limits, and holding limits (section 95912(j)), as well as certification of the auction itself (section 95912(k)(1)). The information in the application includes identifications of corporate associations, beneficial holdings, and pending legal investigations. We need time to check this information for consistency against other sources and then make a large number of calculations for rules such as holding and purchase limits. We cannot accept the suggested timeline because we would not have enough time to perform the necessary work. In addition, the timeline may compromise the ability of our contracted market monitor to prepare for its assessment of conduct of the auction.

D-43. (multiple comments)
Comment: Section 95912(e) prohibits a registered entity from communicating "information on auction participation" with any other entity. This appears to be quite broad. We suggest identifying what kind of information may not be communicated, and specifying that information may be communicated to an entity authorized to obtain such information for law enforcement purposes. For example, a District Attorney may be

investigating possible collusion of fraud. (SCAQMD4)

Comment: Section 95912(e) contains restrictions on the communication of information on auction participation that do not work as currently written for electric distribution utilities that are regulated by the CPUC due to the current language forbidding those entities from sharing auction participant information with their respective regulators and Procurement Review Groups. Modify section 95912(e) as follows:

> (e) A registered entity may not communicate information on auction participation with any other entity that is not part of an association disclosed pursuant to section 95914, except as requested by the auction operator to remediate an auction application <u>or for a registered entity to consult with its regulators or any group authorized pursuant to regulatory order to review procurement activities.</u> (PGE4)

> **Response:** We did not make the suggested change to section 95912(e) because we believe other changes to the regulation (specifically section 95833(a)(4)) satisfies the commenter's concern. We modified section 95833(a)(4) at the request of electrical utilities. The modified language makes clear that we are not adding any rules that contradict state or federal rules governing the conduct of regulated entities.

D-44. Comment: Deadlines should be established for ARB decision-making processes to provide entities with a degree of certainty. Modify section 95912(k) as follows:

> (k) Following the auction, the Executive Officer will:
>> (1) Certify whether the auction was operated pursuant to this article <u>within 5 days</u>;
>> (2) After certification, <u>immediately</u> direct the auction operator financial services administrator to: (CCEEB3)

> **Response:** We cannot make the change suggested in the comment because we cannot accept a restriction on our ability to investigate potential market manipulation or other misconduct. We do not believe that preempting such investigation with an arbitrary deadline would provide auction participants with greater certainty.

D-45. Comment: In section 95914 we are not sure if there is any provision for appeal of the EO's decision to exclude violating participants from future auctions. Perhaps the Executive Officer's discretion can be limited so it will not be arbitrarily executed by defining what punishment is proportional to the violation. (SCAQMD4)

> **Response:** Section 95914 sets forth actions the Executive Officer may take in

response to violations. We have a process for addressing violations. The process can include discussions with the alleged violator. We did not make the change suggested because we have demonstrated through years of enforcement how our procedure operates.

D-46. Comment: Regarding section 95914(d)(4), the intent of the phrase "to entities that are not subject to exclusion pursuant to section 95914(d)(1)" is unclear because section 95914(d)(1) identifies information that entities approved for action participation may not disclose but does not identify any entities that are or are not subject to exclusion. Any exceptions to the disclosure prohibitions of section 95914(d)(1) should be explicitly stated. (SCAQMD4)

Response: Entities excluded from the disclosure rules in section 95914(d)(1) include auction participants qualifying pursuant to section 95914(d)(2) and (3). These two sections describe allowable information sharing. In addition, information sharing prohibitions, along with any of provisions dealing with associations among entities, are subject to the general exclusion contained in section 95833(a)(4). We believe these exclusions are clear.

D-47. Comment: The Utilities suggest the following minor clarification to ensure that the threshold for triggering the application of this article is not unreasonably set too low. Modify section 95914(c) as follows:

(c) If the Executive Officer determines that a bidder has intentionally provided false or misleading information, or has withheld material information in its application, or has violated any part of the auction rules set forth in subarticle 10, then: (MID3)

Response: Section 95914 sets forth actions that the Executive Officer may take in response to violations. We have a process for addressing violations. The process can include discussions with the alleged violator. We did not make the change suggested because we have demonstrated through years of enforcement how our procedure operates. In addition, the requirement to prove intent is rarely achievable. Imposing it would limit our ability to deal with many legitimate violations.

D-48. Comment: MSCG recommends that the prohibition against disclosing Qualification status (section 95914(d)(1)(A)) be eliminated. It is unclear to MSCG what the potential harm to the market may be from simply revealing that a company has qualified to bid in the auction. It is normal business practice in many circumstances to simply represent to potential clients and/or customers that MSCG is qualified, and is an eligible market participant, as a way to promote our capabilities when soliciting business. For this reason, we recommend that the prohibition on revealing qualification status be eliminated. (MSCG3)

Response: Sections 95914(d)(2) and (3) describe cases in which information can be shared. We believe that these cases would address the concern of how the disclosure rules in section 95914(d)(1) could affect the commenter's business.

Outside Scope of 15-Day Changes

D-49. Comment: The following revision is necessary to maintain internal consistency within section 95911(d). Section 95911(d)(5) describes only procedures for where the quantity of allowances is "greater than." This is because if the number of allowances bid for is equal to the number of allowances available, then no resolution would be required.
Modify section 95911(d)(4)(B) as follows:

(B) The total quantity of allowances contained in the bids at the next lower bid price is greater than ~~or equal to~~ the number of allowances yet to be ~~awarded~~ sold… (MID3)

Response: We did not change the regulation based on the comments. As currently written, there is clarity in how sections 95911(d)(4)(B) and 95911(d)(5) relate to each other.

D-50. Comment: PG&E suggests that ARB add additional language to section 95911(d)(4) to ensure that each potential bid situation is addressed. Modify section 95911(d)(4) as follows:

(4) Beginning with the highest bid price, bids will be considered in declining order by price and entities submitting bids at that price will be sold allowances until either:

(A) The next lower bid price is less than the auction reserve price, or there are no additional bids, in which case the ~~current price~~ Reserve Price becomes the auction settlement price; or

(B) The total quantity of allowances contained in the bids at the next lower bid price is greater than or equal to the number of allowances yet to be sold, in which instance, the next lower bid price becomes the auction settlement price and the procedure for resolution of tie bids in section 95911(d)(5) shall apply. (PGE4)

Response: We did not change the regulation based on the comments. We believe that the current requirements adequately cover the potential situations that need to be addressed through regulatory text.

Bid Guarantee

D-51. (multiple comments)
Comment: The Regulation contains a requirement to provide the auction administrator with assurances in the form of bonding, cash, or a letter of credit. This requirement is really unnecessary and burdensome for compliance entities with large physical assets in the state and/or who may be investment-grade, credit-rated companies. Bid guarantees should allow demonstration of sufficient physical assets or investment-grade credit rating. (BP2)

Comment: WSPA notes that the Regulation contains a requirement to provide the auction administrator with assurances in the form of bonding, cash, or a letter of credit. This requirement is unnecessary and does not add certainty or improve the stability of the C/T program. This is especially ineffective and burdensome for entities with large physical assets in the state and/or who may be investment-grade, credit-rated companies. WSPA proposes that ARB should develop an open credit threshold on a sliding scale based on the published credit rating of the company. Some companies may have a published credit rating for the parent company that would need to be used for its sub companies. Modify sections 95912(h)(1)(E), 95913(e)(2)(E), and (F) as follows:

> <u>(E) Proof of publicly reported credit rating higher than ARB established credit threshold for auctions and allowance reserve bids.</u>
>
> <u>(F) Substantial asset base within the State.</u> (WSPA3)

Comment: Section 95912(h) requires that registrants of an auction provide a bid guarantee to the auction administrator at least one week prior to auction. The bid guarantee must be in one or a combination of the following forms: 1) a bond, 2) cash in the form of a wire transfer or certified funds, 3) an irrevocable letter of credit. Most municipal utilities carry bond covenants and restrictions that limit their ability to post assets as collateral, plus the cost for a letter of credit is significant. For electric distribution utilities, LADWP's preferred alternative to the ARB's bid guarantee requirements is to rely on a high bond rating as the basis for creditworthiness, such as "AA" or above to qualify an entity to participate in a quarterly auction. There are also creditworthiness provisions outlined in master agreements such as those available through the Western Systems Power Pool (WSPP) or Edison Electric Institute (EEI) that could be used as the basis for participation by utilities in a quarterly auction. ARB has tools available through enforcement and penalties for any default that might occur. Modify section 95912(h) as follows:

> (h) Registrants must provide a bid guarantee to the financial services administrator at least one week prior to the auction.
>
> > (1) The bid guarantee must be in one or a combination of the following forms:
> >
> > > (A) A bond issued by a financial institution with a United States banking license.

(B) Cash in the form of a wire transfer or certified funds, such as a bank check or cashier's check.
(C) An irrevocable letter of credit issued by a financial institution with a United States banking license; or
(D) If California participates in a joint auction with one or more Canadian Provinces pursuant to section 95912(b) then bonds or irrevocable letters of credit issued by a financial institution with a Canadian banking license will be acceptable.

(2) The amount of the bid guarantee must be greater than or equal to the sum of the value of the bids submitted by the auction participant.
<u>(3) A POU may submit documentation for its most recent high bond rating of "AA" or greater in lieu of a bid guarantee.</u> (LADWP4)

Comment: Minimize unnecessary bureaucratic requirements. Investment grade credit-rating should be permitted in lieu of bid guarantees in sections 95912(h) and 95913(e)(2). (CCEEB3)

Comment: PG&E continues to advocate that the bid guarantee requirements outlined in section 95912(h) be modified to consider auction sales for consigning entities in addition to bids. Modify section 95912(h)(2) as follows:

> (2) The amount of the bid guarantee must be greater than or equal to the sum of the value of the bids submitted by the auction participant<u> less the consignment quantity multiplied by the Reserve Price</u>. (PGE4)
>
> **Response:** These comments fall outside the scope of the first 15-day changes to the regulation. We responded to similar comments in the 45-day responses to comments. Inclusion of the bid guarantee in the language of sections 95912(h)(1) and (2) and section 95913(e)(2) did not change from the initially proposed regulatory language, and therefore was not subject to comment under the first 15-day changes to the regulation. Because the comments fall outside the scope of the notice, no further response is required.

Replenish Allowance Price Containment Reserve

D-52. (multiple comments)
Comment: CalChamber agrees that an allowance reserve is necessary, especially if intended as a cost-containment mechanism to moderate allowance prices. The allowance price reserve however is set too high. CARB is proposing to sell allowances through a Reserve Tier system where beginning 2013, allowances from the first tier will be sold at $40/metric ton, allowances from the second tier will be sold at $45/metric ton, and allowances from the third tier will be sold at $50/metric ton. The tier reserve system along with the escalating cost of the reserve throughout the compliance years negates

the overall purpose of the reserve, which is to serve as a cost-containment mechanism. We are concerned about the potentially high cost of allowances under this reserve system. We are also concerned about the manner in which CARB intends to fill the reserve by taking from the industry allowances. These are allowances that covered entities should receive freely in order to minimize economic leakage, but instead will be used to fill the price containment reserve at excessively high prices, negating the leakage issue and the overall point of a cost containment reserve. (CALCHAMBER3)

Comment: The Joint Utilities support the inclusion of the Allowance Price Containment Reserve (Reserve) in the Regulation as an essential tool to address the potential for higher-than-expected allowance prices. Because a robust Reserve is necessary to ensure long-term market success under a wide range of plausible scenarios, we believe CARB should establish a procedure in the Regulation to automatically replenish the Reserve if it becomes depleted. With language in the Regulation identifying the triggering event and action to be taken, the market will have assurance that a timely and effective remedy will be in place. (JOINTUTILITIES)

Comment: We offer these comments based on our experience in the California energy crisis and our desire to see a sustainable and successful Cap and Trade market that sets an example for others to follow. The market failure related to this crisis essentially defeated many of the goals of market deregulation, caused PG&E's bankruptcy, severe financial hardship for other utilities and adverse consequences for consumers and the California economy. Designing a Reserve that will successfully support this program under a wide range of scenarios greatly reduces the possibility that a cap and trade program will experience similar market failure, and defeat the important goals of AB 32. In part because of this experience, PG&E commissioned a study by Charles River Associates to assess the adequacy of the Reserve under a wide range of scenarios. The study concluded that either greater-than-expected economic growth or less-than-expected emissions reductions from program measures and offsets will result in a partial depletion of the Reserve. From this analysis, PG&E concludes that market failure, under certain conditions, is plausible. A robust Reserve is necessary to manage allowance prices and ensure long-term market success, and we believe the ARB should establish a procedure in the Cap and Trade Regulation to automatically replenish the reserve should it become depleted. We urge ARB to develop appropriate regulatory language that creates a process to replenish the reserve in the event 1/3 of the APCR allowances are sold. This process may include, but is not limited to an increase in availability of offsets for compliance purposes, temporary suspension of tracking and program compliance obligations, and adjustments to program allowance budgets. We offer these proposals in the spirit of ensuring the Cap and Trade market will be robust, will work for our customers, will provide additional emissions reductions at a fair price, will support the goals of AB 32, and will be an example for others to follow. (PGE4)

Comment: SCPPA thanks ARB for proposing the Allowance Price Containment Reserve (Reserve) to address the potential for higher than expected allowance prices. Because a robust allowance reserve is necessary to manage allowance prices and ensure long-term market success, the ARB should establish a procedure in the

Regulation to automatically replenish the reserve if it becomes depleted. With language in the Regulation identifying the triggering event and action to be taken, the market will have assurance that a timely remedy will be in place. SCPPA stands ready to work with ARB staff and concerned stakeholders to develop appropriate regulatory language that creates a process to replenish the reserve if it becomes depleted and provides for temporary suspension of the cap-and-trade market and related compliance obligations if the balance in the reserve drops to zero. The proposed language below is offered in the spirit of ensuring the Cap and Trade market will be robust, will work for our customers, will provide additional emissions reductions at a fair price, and will be an example for others to follow. Modify section 95913(c) as follows:

(c) Timing, Eligible Participants, ~~and~~ Limitations, <u>Reserve Replenishment and Market Stabilization.</u>

<u>(5) Replenishing the Reserve and Market Stabilization.</u>

<u>(A) When the Reserve is fully depleted, the Executive Officer shall make available for purchase by each Covered Entity sufficient allowances to allow that Covered Entity to fully satisfy any remaining compliance obligation. Only Covered Entities with a combined Holding Account and Compliance Account balance of zero shall be able to purchase such allowances. Such allowances shall be offered at the allowance price of the third tier of the Reserve at the time the Reserve contained 40 MMT or fewer allowances available for purchase. Purchases of such allowances shall be transferred directly into a Covered Entity's Compliance Account.</u>

(B) Whenever the Reserve is fully depleted, the Executive Officer and Market Monitoring Board shall report to the Board within 3 months. The report shall make recommendations to the Board on program modifications necessary to replenish the Reserve and to enable allowance prices in each quarterly allowance auction held pursuant to section 95910 to clear at or below the first tier of the Reserve. (SCPPA6)

Comment: SEu supports ARB's inclusion of the Allowance Price Containment Reserve (Reserve) in the Cap-and-Trade Regulation as an essential tool to address the potential for price spikes and a market meltdown that would overflow into electricity markets. Because a robust Reserve is necessary to ensure the long-term success of the Cap-and-Trade program, ARB should establish a procedure in the Cap-and-Trade regulation to replenish the reserve should it become depleted. With language in the regulation identifying the triggering event and action to be taken, the market will have assurance that a timely remedy will be in place. The approach outlined below is only one of several alternatives to accomplish the market stabilization goal, but would ensure the Cap-and-Trade market will provide additional emissions reductions at a fair price. Modify Section 95913(c) as follows:

Section 95913 (c) Timing, Eligible Participants, ~~and~~ Limitations, <u>and Reserve</u>

Replenishment.

(5) Reserve Replenishment.

(A) When the Reserve is fully depleted, the Executive Officer shall make available for purchase to each covered entity or opt-in covered entity sufficient allowances to allow that covered entity or opt-in covered entity to fully satisfy any remaining compliance obligation at the allowance price of the third tier of the Reserve at the time the Reserve is fully depleted.

(B) Only Covered Entities with a Holding Account balance of zero shall be able to purchase such allowances.

(C) Purchases of such allowances shall be transferred directly into a Covered Entity's Compliance Account.

(D) Within 3 months of the time the Reserve is fully depleted, the Executive Officer and Market Monitor shall make a recommendation to the Board on program modifications necessary to replenish the Reserve. (SEMPRA3)

Comment: ARB should specify in the regulation a method to replenish the APCR in the event that the reserve is stressed. With language in the regulation identifying the triggering event and action we will take, the market will have assurance that a timely remedy will be in place. Thus, ARB should specify a method to replenish the APCR in the event that 1/3 of the reserve allowances are sold. (PGE4)

Comment: ARB should outline a method for repopulating the Allowance Reserve in the event that it is stressed, or when at least one-third of the allowances in it are sold. As a mechanism to contain compliance costs, the Allowance Reserve can only be successful if there is sufficient supply of compliance instruments available for regulated entities. It is crucial that ARB have a method in place well before the Allowance Reserve approaches any level of stress, as efforts to evaluate the situation then will be too late to offer any resolution. (SCE3)

Comment: SCE recommends that the Allowance Reserve should offer a stable price ceiling in addition to the price floor. While the Allowance Reserve operates to provide allowances at a set price to regulated entities, unless there is a determined method to repopulate the Allowance Reserve, the market cannot be assured that there is any real long-term cost containment. (SCE3)

Response: The Reserve is not intended to completely eliminate the risk that allowance prices rise to unacceptably high levels as the commenter suggests. We have been clear that there is no "hard price cap" in the program. We rejected that approach as leading to interference with market price signals. We created the reserve to serve as a buffer against higher prices. The Board has directed staff to monitor depletion of the reserve and make recommendations for program revision as needed.

D-53. Comment: SMUD understands the desire, with a new market, to provide market certainty to those making determinations about whether to invest in a given reduction measure. We also understand that a floor price for allowances offered at auction is one way to ensure certainty, and that normal market discounting of future payoffs implies a need for an escalation of that floor price beyond normal inflation in immature markets. However, as markets mature, such investment signals will no longer be necessary. The 5 percent escalator in the proposed regulations will eventually result in excessive prices for allowances, in particular if carried beyond the 2020 timeframe. For a program with such strong complementary policies, the notion of forcing the floor price up to arbitrarily high levels seems punitive towards market participants who are trying to balance the high costs of complementary programs with the Cap and Trade costs. SMUD would recommend that ARB signal its intent to reflect maturing markets by tapering the 'above inflation' escalation off over time so that the escalation ends at no greater than the rate of inflation in the last year of the program. Modify section 95911(b)(6) as follows:

> (B) For auctions conducted in calendar years after 2013 the Reserve Prices shall be the Auction Reserve Prices for the previous calendar year increased annually by 5 percent plus the rate of inflation as measured by the Consumer Price Index for All Urban Consumers. <u>Beginning in 2016, the adjustment beyond the rate of inflation shall be reduced by 1 percent annually, leading to an increase in 2020 equal to the rate of inflation.</u> (SMUD3)

> **Response:** This comment falls outside the scope of the first 15-day changes to the regulation. We did not change the language specifying the method for determining the inflation rate of the Reserve Prices for auctions conducted in the calendar years after 2013 from the initially proposed regulatory language, and therefore it was not subject to public comment under the first 15-day changes to the regulation. No further response is required.

Auction Administration and Registration

D-54. (multiple comments)
Comment: ARB should notify market participants via e-mail if their bids were not accepted due to a violation of credit or holding purchase limit (section 95912(h)). (PGE4)

Comment: PG&E recommends ARB specify the timeline for which payments are collected and revenues distributed as described in section 95912(k). PG&E recommends that financial settlements occur by the end of the month in which the auction takes place. (PGE4)

> **Response**: We did not change the regulation based on the comments. Both of the comments are related to program implementation and do not have to be specified in the regulation.

Implementation: System-Testing, Tools, Training, and Forms

D-55. (multiple comments)
Comment: The Regulation contains detail in various sections regarding the availability of allowances for auction from various sources and at various times. It would be helpful to regulated parties and market participants for the Regulation to include a single table that shows very clearly for each year of the program: auction timing, source of allowances that will be auctioned, allowance vintage and number of allowances (even if approximate). (BP2)

Comment: PG&E supports ARB's decision to conduct two auctions in 2012 prior to the start of the compliance obligation. However, it is critical to test the robustness of the auction systems, design, and protocols through market simulations in the first half of 2012. Equally important is to test the auctions potential vulnerability to manipulation through "table top" and other market simulation exercises, with oversight by market auction experts. Through such testing, ARB would be able to identify possible weaknesses in the design and undertake remedies prior to commercial and financial commitments being made in the first two auctions in 2012. (PGE4)

Comment: PG&E has additional questions associated with the administration of the auction which are not addressed in the proposed regulatory language. These questions are listed below. If ARB opts to not include this type of detail in the Regulation, PG&E requests clarification regarding where this type of detail will be presented.

> 2. Per section 95912(g), "All bids shall be submitted to the Executive Officer and will be considered binding offers for the purchase of allowances under the rule of the auction." We request clarification on how the bids be submitted, the format of the bids, if there will be a template, and if it will be through a website. (PGE4)
>
> **Response:** These comments fall outside the scope of the first 15-day changes to the regulation. We have initiated activities to develop the necessary rule implementation infrastructure for the regulation, including contracts for an auction services provider, and a financial services provider. We are also committed to providing continual public updates, with opportunity for stakeholder comment, on the implementation of the regulation. Because the comments fall outside the first 15-day changes to the regulation, no further response is required.

D-56. Comment: What are the consequences for the auction administrator or financial services entity if they release confidential information? (PGE4)

> **Response:** The consequences will be specified in the contracts that we sign with the service providers. These have not yet been written, so we do not know what form they will take.

Miscellaneous

D-57. Comment: Section 95911(b)(4)(A) requires that unsold allowances be transferred into the Allowance Price Containment Reserve. WSPA believes that putting the unsold allowances into the reserve, as opposed as into the next auction, will artificially reduce the abundance of allowances and inflate a reserve that may not be needed and increase compliance costs. WSPA recommends that the unsold allowances should be put into next auction not to the reserve. (WSPA3)

> **Response:** We made the suggested change that unsold allowances be kept in the auction holding account for later auction. However, they will not be available at the next auction, as the commenter suggests. In order to deal with potential oversupply of allowances in the market, the allowances will not return to auction until two consecutive auctions have reached a settlement price above the auction reserve price.

D-58. Comment: CMTA reasserts comments made on December 9, 2010, for those elements of the cap-and-trade rule that have not been modified in the 15 day package, including our comments regarding the need for more information to set price collar levels for the allowance containment reserve account and that penalties for noncompliance should be less punitive and not take allowances out of the market. (CMTA3)

> **Response:** This comment was previously submitted during the 45-day comment period, and falls outside the scope of the first 15-day changes to the regulation. No further response is required.

D-59. Comment: Auctions are unknown and depend upon many variables. The unpredictability of auctions is not a positive point for conducting business in California. (NAIMA2)

> **Response:** This comment falls outside the scope of the first 15-day changes to the regulation. We did not change the inclusion of auctions in Subarticle 10 from the initially proposed regulatory language, and therefore it was not subject to comment under the first 15-day changes to the regulation. No further response is required.

D-60. Comment: The percentage limitation on purchase of GHG allowances at auction in sections 95911(c) and 95914(e) and the holding limit in section 95920(f) and (g) may prove to be too restrictive if and when CARB's ETS links to other GHG emission trading systems around the country. If we believe that such limits are necessary at this stage in the Cap and Trade program, PPG urges the Board to consider revising and expanding the purchase and holding limits in the future if and when the program is linked to other emission trading systems. (PPG1)

Response: We are currently in discussions with other members of the WCI on both the holding and purchase limits. We expect that some revisions may be necessary, in part to recognize different regulations and laws in the different jurisdictions, and in part to recognize the different market structure that we face after linking. Any changes to the limits would be part of a separate rulemaking that links the programs, not this regulation.

E. COMPLIANCE OBLIGATION

Municipal Solid Waste

E-1. (multiple comments)
Comment: The Commerce Refuse to Energy Facility located in the City of Commerce and the Southeast Resource Recovery Facility located in the City of Long Beach provide reliable and cost-effective solid waste disposal capacity to manage the needs of the residents and businesses of Los Angeles County. These facilities are equipped with the best available air emissions control technology and are currently reducing GHGE on a net basis. Additionally, the waste going to these two facilities has the potential to generate electricity for 55,000 homes in Los Angeles County. The previous draft of the regulations provided an exemption for existing waste to energy facilities due to the critical public service they provide. If these facilities have to bear the financial burden of compliance obligations, they may be forced to shut down, increasing the amount of waste sent to landfills for disposal in more remote locations. This would not only result in an increase in disposal costs for the County of Los Angeles residents but would also undoubtedly increase GHGE in the State, in contradiction to the goals of AB 32. Therefore, the County urges you to reinstate the exemption from compliance obligations for existing waste-to-energy facilities located in California. (CLADPW)

Comment: The Sanitation Districts are very concerned that CARB staff removed from the discussion draft of the 15-day amendments, language in section 95852.2 that excluded from compliance obligations, "Direct combustion of municipal solid waste with energy recovery in an existing permitted facility." We have not been provided with an adequate reason why this occurred. We therefore request that the language be re-inserted for the reasons described below. By way of review, the CARB Board passed a resolution at the 12/16/10 Board Meeting requiring "the Executive Officer to determine and report back to the Board a mechanism to satisfy all the risk of emissions leakage and compliance obligations of existing municipal waste-to-energy facilities in the proposed cap and trade program." Working to this end, the Sanitation Districts and Covanta Energy, have provided extensive analysis of the leakage to landfills that would occur if the three existing waste to-energy facilities in the State were placed in the Cap and Trade program. The analysis rested on a determination that if the post-recycled waste received by the facilities were instead landfilled, there would be a net increase in greenhouse gas (GHG) emissions. In this analysis, we remained conservative and used defaults that are consistent with the analysis CARB performed in estimating the AB 32, 1990 landfill GHG emissions inventory, and in the Early Action Landfill Methane Reduction Regulation. It is also consistent with defaults EPA has established for the NSPS for landfills and in many other documents, such as the Climate Action Registry Local Government Protocol and many of their offset protocols that rely on landfill methane avoidance. In addition to the basic analysis, many sensitivity analyses were performed (e.g., operating the landfill gas collection system operation past 70 years; a very conservative assumption), with all results pointing to the same conclusion; landfilling municipal solid waste that would otherwise be managed at a waste-to-energy facility, would result in a net increase in GHG emissions. Finally, as a further conservative measure, no credit was taking for additional GHG savings from post-combustion recycling and from avoided fossil emission from the utilities, which would normally be included in a true life-cycle analysis. In addition to the life-cycle analysis, we also addressed the question of why post-recycled waste would instead be landfilled if the existing waste-to-energy facilities were in the cap and trade program. Essentially, the three waste-to-energy facilities have no ability to control the incoming municipal solid waste, so there would be no opportunity to reduce fossil-fueled CO_2 emissions, leaving the purchasing of allowances as the only option for meeting compliance obligations. Furthermore, these facilities cannot spread the cost of allowances to a consumer base since their customers would instead choose the cheaper option of landfilling, leading to a net increase in GHG emissions (as outlined above). Clearly, requiring waste-to-energy facilities to be included in the Cap and Trade program will have the unintended consequence of incentivizing landfilling, and increasing GHG emissions. It would also have the unintended consequences of diverting funds local governments could use for municipal programs that support recycling or composting. Some environmental groups have opposed providing an exclusion from compliance obligations for these three facilities on the basis that beneficial recycling and composting will be reduced, and GHG emissions will be increased due to the burning of plastics, but if disposed of instead, plastics would not decompose. To the first point, waste-to-energy does not impact recycling or any other beneficial use of MSW, and in fact, these facilities complement these activities. The waste these facilities receive are post-recycled, or after any other beneficial use a region decides meets its diversion goals. If required diversion goals are increased, the waste-to-energy facilities would continue to receive waste that is post-recycled, but now meeting the higher diversion rates. To the second point, it is correct that burning plastics creates anthropogenic CO_2 and landfills sequester plastics. However, the lifecycle analysis provided to CARB assumes these facts, and yet the results consistently show that landfilling post-recycled waste instead of managing the same waste in a waste-to-energy facility results in a net increase in GHG. Also, bear in mind our analysis does not account for the fossil energy avoided due to managing the plastics, or any fossil-based MSW in a waste-to-energy facility, which would further increase the advantage waste-to-energy facilities have in reducing GHG emissions. (LASD3)

Comment: The 15-day modification discussion draft contained in section 95852.2, language that excluded from compliance obligations, "Direct combustion of municipal solid waste with energy recovery in an existing permitted facility." CCEEB appreciated the insertion of this language. However, when the draft 15-day modification language was released, this exclusion was removed. We request that the language contained in the discussion draft be re-inserted into section 95852.2. The owners/operators of these facilities have previously demonstrated to the satisfaction of CARB staff that the existing waste-to-energy facilities cannot spread the cost of allowances to a consumer base; haulers would simply take the post-recycled waste to the cheaper option, landfills, resulting in much higher levels of GHG. The facilities would have no choice but to absorb the cost of the allowances creating a huge financial burden for already financially strapped governments. Re-inserting the language is consistent with the Resolutions requirement to determine a “mechanism to satisfy all the risk of emissions leakage and compliance obligations of existing municipal waste-to energy facilities in the proposed Cap and Trade program." (CCEEB3)

Comment: Currently, in the proposed 15-Day Language, energy from waste is treated as a carbon source with its GHG impact determined solely by stack emissions, regardless of the benefit of reduced methane emissions realized by keeping waste out of landfills. Without a mechanism to recognize the benefits of energy from waste, there will be a leakage of GHG emissions to an uncapped sector. We request that ARB exclude the energy from waste facilities from the Cap and Trade program.

The California Cap and Trade program disregards the benefits of energy from waste as a tool to reduce GHG emissions in the waste sector and considers energy from waste a capped emission source. Conversely, landfills are an uncapped sector. Energy from waste facilities will be required to purchase compliance obligations, but landfills will not, despite landfills being a greater source of emissions per ton of post recycled waste managed. The current draft regulations do not provide a way to evaluate the avoided methane emissions from landfilling that these facilities prevent. We propose that the Cap and Trade program evaluate the GHG emissions between energy from waste and landfills.

Inclusion of energy from waste facilities in the Cap and Trade program ignores the scientifically recognized GHG benefits of this technology and will ultimately result in more GHG emissions generated in California. Covanta Energy and its community partners support a compliance obligation exemption for the three existing Energy-from-Waste facilities in California. An exemption is consistent with the major Cap and Trade systems currently in place: energy from waste facilities are is not included in either the European Union Emission Trading Scheme or the Regional Greenhouse Gas Initiative (RGGI). Inclusion of these facilities in the Cap and Trade program will introduce a significant economic burden on these facilities. This additional burden, and the fact that landfills face no compliance obligation under the program, raises a significant risk that waste will be diverted to landfills. Diversion of waste to landfills, as shown in the conservative analysis completed, will result in emissions leakage and higher GHG emissions from the state. Additionally, communities will lose revenues generated from the sale of electricity at these facilities. These are revenues that these communities use to fund their recycling programs. (COVANTA)

Comment: In California, there are three operating WTE facilities for MSW. These rule compliant facilities are conventional WTE facilities wherein the entire quantity of delivered MSW, except for white goods, is thermally treated. As a result, all of the non-biogenic materials are sources of CO_2 emissions. On the contrary, the City's Alternative Technology facility(ies) has a pre-processing system that will recover plastics and other non-biogenic materials from delivered MSW prior to it being processed for energy recovery. As a result, the remaining portion of the MSW for energy recovery is nearly 100 percent biogenic or mixed with a negligible portion of non-biogenic materials. The Bureau recommends that CARB amend section 95852.2(a)(7)(A) to not limit the exemption to only the biogenic fraction of the feedstock but include the entire MSW feedstock. (CLABS)

Comment: Section 95852.2(b)(5), Emissions without a Compliance Obligation, should not be limited to only the existing waste to energy facilities, but to also include new waste to energy facilities that can demonstrate that they can contribute toward achieving California's AB 32 goals set by the state legislature. (CLABS)

Comment: WM requests that a comprehensive GHG lifecycle assessment be used to determine relative GHG emissions of WTE facilities. A comprehensive life cycle assessment would find significantly fewer GHG emissions are released into the atmosphere when waste is generated into energy at a WTE facility, as compared to other energy generation and waste management methods. (WM3)

Comment: WTE technology has been proven in life-cycle assessments to lessen the amount of greenhouse gas emissions into the atmosphere as compared with alternative waste management and energy generation options. These life-cycle assessments have been conducted for individual WTE facilities as well as the WTE industry as a whole. WTE's direct and indirect greenhouse gas benefits are recognized by a large number organization and interests. The European Union Emission Trading Scheme, the European Environment Agency, and the Regional Greenhouse Gas Initiative all focus on lowering release of greenhouse gases into the atmosphere and, as part of their design, WTE is appropriately excluded from Cap and Trade requirements. California's Cap and Trade program should do the same. (WM3)

Comment: WM is concerned about CARB's recent reversal of its recognition of WTE's ability to lower greenhouse gases. The draft regulations initially proposed that the three existing WTE facilities would be excluded from a Cap and Trade compliance obligation, but the 15-day comment proposal eliminates this exclusion. This reversal threatens facilities' operations and could significantly increase municipal costs of waste management, environmental impacts from truck traffic and distance to disposal, and greenhouse gas emissions. If CARB imposes the Cap and Trade compliance obligation on existing WTE facilities, more waste will be disposed in landfills, more pollution will be emitted from increased transportation, more fuel will be consumed, fewer metals and recyclables will be recovered and more greenhouse gases will be emitted into the atmosphere. We strongly urge CARB to exclude WTE from any compliance obligation under the Cap and Trade Regulations. (WM3)

Comment: The Task Force supports providing a compliance obligation exemption for the three existing waste-to-energy facilities in California. These facilities were originally permitted under state legislation that mandated full support for these facilities. The three existing waste-to-energy facilities are equipped with the best available air emissions control technology and are currently reducing GHGE on a net basis due to avoided landfill methane. Los Angeles County residents depend on the two facilities located in Long Beach and Commerce for solid waste disposal services. Since neither facility can control their incoming, post-recycled waste stream to reduce GHGE, their only option is to purchase GHG allowances. Requiring these facilities to purchase allowances through the cap and trade program could result in severe unintended negative consequences. Therefore, we request that the full exemption provided to the existing waste to energy facilities be reinstated as provided in the previous draft of the regulation. (TASKFORCE)

Comment: Imposing a CO_2e allowance purchase requirement on WTE facilities would be the wrong choice on both policy and legal bases, and would result in more rather than less greenhouse gas (GHG) emissions in California. The Board recognized that fundamental reality in its July 8, 2011, Notice of Availability of Cap and Trade Discussion Draft and Workshop, explaining that such a requirement for WTE facilities would be counterproductive because including emissions from these facilities in Cap and Trade would cause statewide GHG emissions to increase as a result of diversion of waste to landfills. We commend the Board's straightforward recognition that an allowance purchase requirement for WTE facilities would be the wrong choice for California, and strongly encourage the Board to implement that position in the new regulations. (LGCRE2)

Comment: WTE facilities' life-cycle GHG emissions are lower than GHG emissions from landfills with energy recovery. WTE is a very clean and reliable energy source, reflecting State and federal requirements for the most advanced emissions control technology. In addition, WTE facilities are already highly efficient, and efforts to increase efficiency will continue entirely independent of the Cap and Trade program since efficiency improvements increase energy production and thereby reduce the net cost of recovering energy from waste. Although improved efficiency increases energy production, it does not reduce the amount of material that requires WTE processing or the CO_2e emissions that result. Unlike other stationary combustion sources, the purpose of a WTE facility is to make full use of a particular fuel, that is, to manage non-recyclable MSW through combustion with energy recovery, which is the best use for the portion of the waste stream that cannot be recycled. Unlike the combustion sources that are a primary focus of AB 32, WTE facilities' only means to reduce their GHG emissions would be to curtail service to their communities. That course of action would mean more waste disposal in landfills, however, and higher GHG emissions compared to processing the same waste at WTE facilities. Also, the concept of "cost-effective" allowance trading is not an option in the case of WTE facilities. Instead, WTE facilities will confront a continuing, long-term requirement to purchase CO_2e emission allowances at substantial additional cost, which is a requirement that will not apply to landfill CO_2e emissions. Consistent with these realities, none of the proposals considered by the 111th Congress for Cap and Trade regulation of GHGs would have applied to WTE facilities. Similarly, the Regional Greenhouse Gas Initiative also excludes WTE from Cap and Trade regulation. The only other alternative—purchasing CO_2e allowances—will mean a substantial permanent addition to the cost of WTE, which is already more costly than the less preferred alternative, landfilling. That sizeable new cost burden will jeopardize the ability of California's WTE facilities to continue to operate. Each of the scenarios just noted is clearly inconsistent with Cal. Code section 41516, which encourages WTE facilities as a means to "help alleviate the environmental and economic problems associated with municipal waste disposal, while at the same time producing additional supplies of energy and raw materials." For each of these reasons, the Board's proposed Cap and Trade Regulations and CO_2e allowance requirement should be modified to exclude WTE facilities. In the interest of achieving a significant future reduction in waste management sector GHG emissions in California, the same policy should also apply prospectively to new WTE capacity. (LGCRE2)

> **Response:** When the Board first considered the cap-and-trade regulation in December 2010, some stakeholders raised concerns about including waste-to-energy facilities in the cap-and-trade regulation. In response to this concern, the Board directed the staff to investigate whether including waste-to-energy facilities in the cap would result in "leakage" of greenhouse gas emissions. We do not expect that placing waste-to-energy facilities under the cap will increase greenhouse gas emissions. It is also not supported that including these facilities under the cap will lead to diversion of waste materials to other waste streams.
>
> There are important policy reasons to include waste-to-energy facilities in the cap. The cap-and-trade regulation is designed to both place an enforceable and declining cap on greenhouse gas emissions, and to send a price signal to encourage more efficient energy use. As part of this program, it is important to create a level playing field in order to send a consistent price signal. If we were to remove waste-to-energy facilities from the cap, it would inappropriately incentivize electricity generated by these facilities, since they would not be subject to the price signal. In addition, one of our partners in the Western Climate Initiative, British Columbia, is also planning to include waste-to-energy facilities as a covered sector in their cap-and-trade program.
>
> We recognize that the waste management system in California is complex and that it is important to consider the broader picture of waste management, which includes landfills, waste-to-energy facilities, recycling, and composting, as well as reduction in the use of resources at the front end. The Board has directed the Executive Officer to continue to work with Cal/Recycle and other stakeholders to evaluate opportunities for different options for handling of waste as directed in Board Resolution 11-32.

E-2. Comment: Section 95852.2 (a)(1) excludes from a compliance obligation such "[s]olid waste materials, including the biogenic content of solid waste materials that are not 100 percent biomass, as determined by methodology specified in ASTM D6866, based on exhaust sampling or fuel sampling (and fuel usage recordkeeping) at the specified frequency and tires which may use alternative tests." The sentence referencing tires may need to be edited and, at the least, requires a comma after "frequency" to differentiate tires from the methodology delineated for other solid waste. The sentence raises questions with regard to testing of other segregated industrial wastes listed as excluded from the Municipal Solid Waste definition if collected separately from MSW. Are tires the only segregated waste to be provided an alternative test, or may all industrial waste materials segregated from the municipal waste collection system use alternative tests appropriate for the material to determine the biogenic content and, thus, exclusion from compliance obligations? We support the use of consensus-based standards and tests best suited for the waste material for determining compliance obligations. (WM3)

> **Response:** The sentence in question was removed as part of the second 15-day changes to the regulation. No further response is required.

E-3. Comment: The BioEnergy Producers Association strongly supports the revision to Section 95852.2 (a)(7)(B) on page A-91 of the revised regulations ("Municipal Solid Waste"), which deletes the language following subsection (B), "Conversion to a clean burning fuel." Retention of the original language, which is derived verbatim from a scientifically inaccurate definition of "gasification" in PRC 40117, would have effectively eliminated "conversion to a clean burning fuel" from eligibility by requiring qualifying conversion processes to have zero emissions. (BPA)

> **Response:** No response is necessary.

Biomass/Biofuels

E-4. (multiple comments)
Comment: We support ARB's added language in section 95852.1.1(a)(2), which clarifies that an increase in fuel production includes "any amount over the average of the last three calendar years of production." We believe ARB should consider adding efficiency increases and the conversion of biogas to beneficial uses to the definition of increased capacity. If a methane capture facility installs a higher efficiency generator and thereby produces more carbon neutral electricity, overall emissions will be reduced. In addition, if a facility invests in converting a flare to a generator or undertakes other equipment modification, overall emissions similarly decline. Therefore, both these instances should meet the "increased capacity" standard and fall under the compliance exemption. Modify section 95852.1.1(a)(2) as follows:

> (2) The fuel being provided under a contract dated after January 1, 2012 must only be for an amount of fuel that is associated with an increase in the biomass-derived fuel producer's capacity, new production or recovery of the fuel that was previously destroyed without producing useful energy transfer. Increased capacity is considered any amount <u>(i)</u> over the average of the last three calendar years production <u>or (ii) associated with an increase in the efficiency of the facility, including an increase as a result of equipment upgrades, modification or refurbishment.</u> (EM)

Comment: ABC supports ARB's added language in section 95852.1.1(a)(2), which clarifies that an increase in fuel production includes "any amount over the average of the last three calendar years of production." ABC believes ARB should consider adding efficiency increases and the conversion of biogas to beneficial uses to the definition of increased capacity. If a methane capture facility installs a higher efficiency generator and thereby produces more carbon neutral electricity, overall emissions will be reduced. In addition, if a facility invests in converting a flare to a generator, overall emissions similarly decline. Therefore, both these instances should meet the "increased capacity" standard and fall under the compliance exemption. Modify section 95852.1.1(a)(2) as follows:

> (2) The fuel being provided under a contract dated after January 1, 2012 must only be for an amount of fuel that is associated with an increase in the biomass derived fuel producer's capacity, new production or recovery of the fuel that was previously destroyed without producing useful energy transfer. Increased capacity is considered any amount over the average of the last three calendar years production <u>or an increase in the efficiency of the facility</u>. (ABC2)

> **Response:** This section was split in the second 15-day changes to the regulation to make it easier to read the provision's requirements, as well as to specify that the recovery of the fuel be destroyed without producing useful energy transfer if a facility invests in converting a flare to a generator or undertakes other equipment modification. We could not add the suggested specific text regarding the increase in facility efficiency, as we do not have methods to track and verify those changes.

E-5. Comment: The Bureau recommends that special consideration should be given to the conversion technologies that are identical or similar to that of the City's Alternative Technologies project due to the fact that the proposed facilities have a pre-processing system to remove plastics and other non-biogenic materials prior to processing for biofuel/bioenergy production, and to extend the exemption to the entire MSW feedstock processed by these facilities and not limited to just the biogenic fraction. (CLABS)

> **Response:** We did not make a change in the current regulation, but will continue to evaluate how efficient and accurate such systems are in ensuring that only exempt biomass-derived fuels are ultimately combusted for energy production. We may consider changes to the regulation upon further data and evaluation as part of a separate rulemaking. We cannot exempt entire streams of MSW feedstock unless we are positive that the entire feedstock only contains biogenic materials.

E-6. (multiple comments)

Comment: WM is concerned that the proposed regulations would still place a compliance obligation on any portion of a conversion technology's emissions that are not biomass derived. WM recommends that CARB apply a life-cycle assessment approach to determine if a broader exemption from a compliance obligation is suitable for various types of conversion technologies. Many conversion technologies are relatively new and have yet to be fully demonstrated on a commercial scale. From a policy standpoint, subjecting these emerging conversion technologies to a compliance obligation for the non-biomass portion will place a significant burden on development. Innovative and diverse technologies for the beneficial use of waste are essential for sustainability. Yet, the Cap and Trade burden being placed on the very technologies that can deliver sustainable living can make them uneconomical, and stop investment, and therefore stop development before it begins. (WM3)

Comment: Conversion technologies' enhanced material and energy recovery may result in reducing GHG emissions, even if the non-biomass portion of the feedstock is included. At the least, these technologies should have the opportunity to demonstrate this possibility. Energy derived from waste conversion technology warrants comprehensive life-cycle assessment to evaluate the avoided emissions that would occur if the waste were managed by an alternative method. WM strongly requests that the proposed regulations be amended to allow assessment of the life cycle GHG benefits of energy recovery from waste, and thereafter base Cap and Trade compliance obligations for waste conversion technologies on this assessment. In the alternative, CARB can recognize now that policy reasons dictate conversion technologies should not be subjected to the cap if they are to develop as an alternative to disposal and more polluting forms of energy generation. (WM3)

> **Response:** The cap-and-trade regulation only looks at direct emissions at the covered entities. A lifecycle analysis is beyond the scope of this regulation and its intended purpose. We are committed to looking at this issue further and amending the rule, if necessary, to ensure that the compliance obligation is equitably placed to incent direct reductions of GHG emissions for all sectors involved in waste, waste-to-energy, and recycling. At this time, we believe that the regulation incents direct reductions at the waste-to-energy facilities without increasing emissions elsewhere. Board Resolution 11-32 directs the Executive Officer to work with Cal/Recycle and other stakeholders to evaluate opportunities for different options for handling of waste in a way that provides equitable treatment to all sectors involved in waste handling.

E-7. (multiple comments)
Comment: We strongly support the decision by ARB to remove the language in section 95852.2(a)(7)(B) that would have established criteria for the conversion processes that are producing a clean burning fuel from the biogenic fraction of the municipal solid waste stream. These criteria are applicable only to gasification in the Public Resources Code, and are used to determine if a gasification facility is defined as a solid waste disposal facility and if the energy produced qualifies as renewable under the Renewable Portfolio Standard. Applying these criteria to all technologies that produce a clean-burning fuel in determination of GHG reductions would be a misinterpretation of State Statue. We are pleased that the ARB is establishing clear policy based on sound science that all biogenic emissions are climate neutral. (BPA2)

Comment: WM supports exclusion from the compliance obligation under the Cap and Trade Regulations for conversion technologies that generate clean fuel from the biomass-derived portion of municipal solid waste (MSW), as is currently proposed in the 15-day comment version. Support for conversion technologies will lead to cleaner fuel and advanced technologies. The term "conversion" may apply to anaerobic digestion, gasification, acid-hydrolysis, and other technologies that beneficially use waste. Restrictions that appeared in the previously adopted regulations (see revised Section 95852.2(a)(7)(B)) were misplaced, and we support their deletion in the current proposal. (WM3)

Response: No response is necessary.

E-8. Comment: Our understanding of ARB's intent is that generation and sale of verified generating Climate Reserve Tons (CRT) under the Climate Action Reserve Landfill Project Protocol is intended to be allowable and not prevent biomethane from being exempt from a compliance obligation. However, the current draft language of section 95852.1.1(b) is not consistent with this position and needs clarification as to the intent. Please modify section 95852.1.1(b) as follows:

> (b*)* An entity may not sell, trade, give away, claim or otherwise dispose of any of the carbon credits, carbon benefits, carbon emissions reductions, carbon offsets or allowances, howsoever entitled, attributed to the fuel production that would otherwise result in holding a compliance obligation for combustion CO_2. Generation of Renewable Energy Credits is allowable and will not prevent a biomass-derived fuel that meets the requirements in this section from being exempt from a compliance obligation. <u>Generation and sale of verified Climate Reserve Tons (CRT's) under the Climate Action Reserve Landfill Project Protocol for voluntary capture of landfill gas and upgrading to Biomethane is allowable and will not prevent a biomass-derived fuel that meets the requirements in this section from being exempt from a compliance obligation</u>. (SES)

Response: We do not believe a change is necessary. The Regulation allows CO_2 emissions from biogas from a landfill participating in the voluntary offset program to be exempt from a compliance obligation if used at a covered entity in lieu of a fossil fuel.

E-9. Comment: The Task Force strongly supports the revisions to section 95852.2(a)(7)(B) that do not require compliance obligations for all conversion processes that are producing a clean-burning fuel from the biogenic fraction of the municipal solid waste stream. The initial draft criteria outlined unworkable requirements that are applicable only to gasification as described in the Public Resources Code. The purpose of this section is to determine if a gasification facility is defined as a solid waste disposal facility and whether the electricity produced is considered renewable under the Renewable Portfolio Standard. Applying the said requirements to all technologies that produce a clean-burning fuel through conversion in determination of GHGE reductions would be a misinterpretation of State statue. (TASKFORCE)

Response: No response is necessary.

E-10. Comment: We support the determination in the draft regulation that exempts biogenic emissions from a compliance obligation. The scientific consensus to date has reinforced the fact that biogenic emissions of CO_2, such as those produced from facilities that utilize biomass as a fuel source or feedstock, are climate neutral. (TASKFORCE)

Response: No response is necessary.

E-11. Comment: Section 95852.1.1(b), which restricts biogas projects from receiving carbon credits, offsets or allowances “attributed to the fuel production that would otherwise result in holding a compliance obligation for combustion CO_2,” seems overly broad and counter to what ARB had indicated in the past with respect to offsets from biogas projects. It is not clear whether biogas projects are prohibited from claiming ARB-issued offsets or offsets from other programs (such as CAR). If it is the former, then ARB has already determined which projects are eligible to earn offsets through its protocols, and any adjustments with respect to offset project boundaries and which credits can be claimed should be made in the protocols themselves. If it is the latter, it is not clear what authority ARB has to restrict offsets that are issued by non-ARB programs. In any case, the combustion of biogas releases biogenic emissions, which should be treated as carbon neutral. If an offset protocol awards credits for avoided methane emissions, that is a separate “reduction” from the value associated with combusting a biogenic fuel, and awarding this credit does not result in “double counting” downstream carbon benefits. If ARB seeks to restrict offsets from the combustion of the biogenic fuel (but not from avoided methane emissions), it would be much clearer if this adjustment were made in the Livestock Offset Protocol or other future methane destruction credit protocols developed by ARB. We urge ARB to clarify (as it has for RECs) that generation or use of generation or use of offset credits from methane destruction projects under the Livestock Offset Protocol and any future protocols that provide for credit methane destruction will not prevent biomass-derived fuels from being exempt from compliance obligations. Modify section 95852.1.1(b) as follows:

(b) ~~An entity may not sell, trade, give away, claim, or otherwise dispose of any of the carbon credits, carbon benefits, carbon emission reductions, carbon offsets or allowances, howsoever entitled, attributed to the fuel production that would otherwise result in holding a compliance obligation for combustion CO2.~~ Generation <u>or use</u> of Renewable Energy Credits <u>or of offset credits that are available for methane destruction</u> is allowable and will not prevent a biomass derived fuel that meets the requirements in this section from being exempt from a compliance obligation. (ABC2)

Response: We changed the regulation to ensure that biogas projects continue to receive offset credits for the destruction of methane. This revision was included to clarify that one is allowed to receive offset credits and no compliance obligation for combustion CO_2 emissions subject to the limits of the paragraph.

E-12. (multiple comments)
Comment: Emissions from bioenergy, whether from combustion to generate electricity or from liquid transportation fuels, should be under the cap and should not be exempted

from compliance obligations. The Cap and Trade rule should provide incentives for the lowest-carbon fuels, rather than a blanket exemption for all bioenergy. The biomass exemption provides a perverse incentive to cut down forests, with all of their sequestered carbon for energy purposes, which would actually make global warming worse. (SIERRACLUBCA5)

Comment: We strongly support ARB's decision not to exempt emissions from the incineration of municipal solid waste from compliance obligations. ARB's proposal in the proposed modifications to maintain exemptions from compliance obligations for other sources of biomass, however, remains fundamentally flawed for these same reasons. As we stated in our comments submitted in response to the proposed Cap and Trade Regulation: "These emissions affect California's ability to achieve AB 32's objectives just as much as emissions from other sources. Moreover, the climate impacts of any particular biomass facility will vary greatly, depending on fuel characteristics and sources, secondary emissions associated with harvesting and processing, land use impacts, and effects on future sequestration" (Center for Biological Diversity letter, December 15, 2010). We also described that "unchecked expansion of biomass energy—particularly the use of woody biomass to generate electricity—represents a double threat to the climate and to California's forests. Public incentives for biomass, embodied in renewable energy standards and other policies, a both threatening to exacerbate greenhouse pollution and putting increased pressure on the nation's forests by increasing the demand for woody fuel" (Center for Biological Diversity comment letter, December 15, 2010). The Center for Biological Diversity also submitted comments on this topic in conjunction with a coalition of environmental organizations, in which we described why greenhouse gas emissions from the combustion of woody biomass should be included under the cap and generate compliance obligations. "Entities combusting these fuels should be excused from compliance obligations only to the extent that they can demonstrate that the production and use of the biomass fuel resulted in reduced or avoided greenhouse gas emissions over a timeframe relevant to AB 32, that is, by 2020" (Group comment letter, December 14, 2010). That is, any exemption from compliance obligations must be based on an explicit and source-specific determination of the GHG emissions associated with the production and combustion of the feedstock. In the case of forest biomass, such a determination would need to take into account fuel characteristics and sources, secondary emissions associated with harvesting and processing, land use impacts, and effects on future sequestration. The blanket exemption proposed in both the original draft Regulation and the proposed modifications satisfies none of these criteria, and thus lacks any factual basis. The proposed modifications to the Mandatory Reporting Rule include new requirements for the reporting of basic information about the source and mass of forest biomass material. Monitoring and reporting requirements, however, do nothing to address the problems created within the Cap and Trade system by a blanket exemption from compliance obligations for biomass combustion. (CBD4)

Comment: The Pacific Forest Trust appreciates the additions to the Mandatory Reporting Rule to gather information regarding the source of forest biomass being combusted at large biomass facilities (section 95103(j)(2)). However, we reiterate our previous comments that not all biomass is created equally: biomass from different sources can have dramatically different carbon emissions. California's biomass policies will likely evolve in the coming years, and we urge ARB to retain a leadership role in that interagency discussion and to work toward an approach that more fully captures the accounting nuances of biomass combustion. (PFT3)

Comment: TWS requests the inclusion of bioenergy emissions under the cap. Section 95852.2 exempts a number of fuel source categories from compliance obligations. Biomass, used correctly, can be a part of the solution to the climate crisis, but the science does not support a blanket exemption for biomass. Biomass utilization can actually increase greenhouse gas emissions and undermine the goals of AB32. While some biomass use will result in de minimis carbon emissions or net negative carbon emissions, biomass cannot be assumed to be "carbon neutral." The net carbon impacts of biomass utilization vary depending on a number of factors including the source of biomass, emissions associated with its transportation, the method and efficiency of its conversion to useable energy, and the type of fuel source displaced by the biomass in question. Furthermore, net long term GHG benefits of wildfire fuel reduction treatments have significant regional variability and may change over time. A Cap and Trade system that does not account for important and significant potential variability of GHG emissions from biomass utilization compromises not only the integrity of the program cap, but may also have the unintended impact of incentivizing detrimental impacts on air, water, soil and wildlife habitat. (TWS)

> **Response:** We want to correctly identify and separately treat biomass-derived fuels from fossil fuels. Section 95103(j) of the MRR states that the operator or supplier must separately identify, calculate, and report all direct CO_2 emissions resulting from the combustion of biomass-derived fuels as specified in section 95115 for facilities, and sections 95121-95122 for suppliers. Biomass-derived fuel emissions must be identified by the source of fuel, as described in section 95852.2 of the cap-and-trade regulation. A biomass-derived fuel not listed in that section will be required to hold a compliance obligation under section 95852.1. For a fuel listed under section 95852.2, reporting entities must also meet the verification requirements in section 95131(i) of this article, or the fuel must be identified as an Other Biomass-Derived Fuel and be subject to a compliance obligation under section 95852.1. By not including biomass-derived fuels under the cap, we are recognizing that the use of a biomass-derived fuel is preferred over the use of fossil fuels at capped sources for the purposes of achieving the AB 32 emissions target.
>
> The scope of this regulation is to apply a compliance obligation on direct emissions from capped entities. Any lifecycle analysis of biomass-derived fuel and its potential emissions or impacts beyond the emissions at the capped entities is not within the scope of this regulation. The cap-and-trade program will include transportation fuels under the cap starting in 2015, therefore GHG emissions associated with the transport of biomass material will be covered under the cap. The Board approved an adaptive management plan to monitor

and adjust the program for unanticipated adverse forestry impacts as a result of offset projects. We do not believe that exempting emissions from combustion of woody biomass will result in the harmful removal of woody biomass from forests, as there are existing environmental protection laws that serve to protect against the denuding of the forests. The data collected under the MRR will help us monitor increases in biomass-derived fuels, types of specific fuels, and source location, to monitor for any changes to the use of biomass-derived fuels as a potential result of this program. The reporting requirements in the MRR have been subject to a public review and comment process as part of that rulemaking.

E-13. (multiple comments)
Comment: The transportation biofuels exemption would provide an implicit subsidy for surface transportation biofuels consumption regardless of their GHG profile, allow conventional ethanol to receive a competitive advantage over lower carbon alternatives, remove an incentive to move to lower carbon biofuels, and create a market for low-cost high-carbon biofuels that would not otherwise exist in California. We recommend that CARB remove the exemption for transportation biofuels, or retain an exemption as either a blanket exemption regardless of emissions, or with emissions thresholds such as 50 percent or 60 percent reduction from conventional fuels similar to federal benchmarks for advanced biofuels and cellulosic biofuel. (ICCT3)

Comment: We strongly recommend that CARB make a clear commitment to reevaluate the transportation biofuels exemption. This process should occur in time to make all necessary revisions prior to the implementation of Cap and Trade phase II, when surface transportation combustion emissions will be included. This exemption effectively assigns all transportation biofuels zero GHG emissions, creating an implicit subsidy, regardless of their actual GHG profile. This is also the case for other types of biofuels. The blanket exemption for biofuels would create leakage as transportation biofuels increase, and disadvantage advanced technologies such as hybrid, plug-in, and fuel cells. We recommend the following language be included in the final Statement of Reasons and is incorporated in the report to the Board:

- A blanket exemption would allow leakage from the cap due to increasing uncapped biofuels consumption from increased consumption of E10, potentially E15, and also E85;
- A blanket exemption would remove the conservation incentive created by cap and trade for a sub-set of fuels;
- A blanket exemption would treat all biofuels equally regardless of whether they are less carbon intensive than petroleum fuels and disadvantage advanced technologies such as hybrids, plug-in vehicles, and fuel cell vehicles.

Several options will be evaluated in 2012 for consideration prior to implementation of Cap and Trade phase II. First, ARB could remove the exemption. Fuel suppliers could either treat transportation biofuels the same as other surface transportation fuels, or use LCFS accounting methods to justify reduced allowance obligations. Second, ARB could retain an exemption as either a blanket exemption regardless of emissions, or with emissions thresholds such as 50 percent or 60 percent reduction from conventional fuels similar to federal benchmarks for advanced biofuels and cellulosic biofuel. The evaluation will consider a number of factors such as: the extent to which upstream transportation biofuels production emissions are captured under other cap and trade systems of similar stringency to California; the amount of leakage that would occur under a blanket exemption; and the availability of LCFS accounting tools; and effect on incentives for the lowest carbon advanced transportation technologies. (ICCT3, KUSTIN15)

Comment: We are completely opposed to the transportation biofuels exemption. (EDLA)

Comment: ARB's projected baseline emissions inventories do not appear to account for the expected shift from petroleum transportation fuels to biofuels in the future. While some of this increase may be accomplished with lower carbon biofuels, this shift would set back ARB's efforts to achieve 2020 GHG goals unless transportation biofuels are included in Cap and Trade or the overall level of the Cap and Trade is reduced to account for leakage due to expected increasing levels of transportation biofuels. Suppliers of biofuels should be able to apply for credits for certain fuels using an emission crediting system consistent with adopted emission factors, the best science, and verifiable methodologies. Treating all transportation biofuels as zero emissions is not supported by the best science and the ARB's own LCFS studies. It is critical to the integrity of the AB 32 program that ARB not create an emissions loophole for transportation biofuels. (KUSTIN15)

> **Response:** The cap-and-trade regulation will help transition California away from carbon-intensive fossil fuels to cleaner and more-efficient fuels. The fossil fuel portions of biofuels and bioenergy are under the cap. Transportation fuels and fuel suppliers will have a compliance obligation. However, biomass-derived fuels are exempt from a compliance obligation, since CO_2 emissions resulting from the combustion of biomass are considered biogenic. Emissions from biomass-derived fuels must be reported and verified pursuant to the MRR. Source categories that are not listed under section 95852.2 (Emissions without a Compliance Obligation) or that have not received a qualified positive or positive verification statement must be reported as "other biomass CO_2." Other biomass emissions that cannot be verified pursuant to the MRR are not considered biomass-derived, and will hold a compliance obligation.
>
> Furthermore, California's Low Carbon Fuel Standard (LCFS) addresses all lifecycle emissions (not just fossil fuel) in its regulation. The LCFS is designed to reduce the carbon intensity of transportation fuels 10 percent by 2020. Since GHG lifecycle emissions from transportation fuels are already regulated through the LCFS, lifecycle emissions do not need to be addressed in cap-and-trade. California's Low Carbon Fuel Standard comes from Executive Order S-01-07, which mandates that a statewide goal is established to reduce the carbon intensity of California's transportation fuels by at least 10 percent by 2020. This standard applies to all transportation fuels unless otherwise noted in the law. Specifically with regard to transportation fuels, ethanol from biomass (Agriculture,

Municipal, and Forestry) is covered under the LCFS, while biomass electricity is excluded from the regulation. As noted in the LCFS regulation, “The California Low Carbon Fuel Standard regulation, title 17, California Code of Regulations (CCR), sections 95480 through 95490 (collectively referred to as the “LCFS”) applies to any transportation fuel, as defined in section 95481, that is sold, supplied, or offered for sale in California, and to any person who, as a regulated party defined in section 95481 and specified in section 95484(a), is responsible for a transportation fuel in a calendar year.

E-14. Comment: ABC urges ARB to modify section 95852.1.1(a)(4). This section states that once a certification program is in place, a fuel which meets the requirements of sections 95852.1.1(a)(1) and 95852.1.1(a)(2) will always be considered to have met the requirements in section 95852.1. The phrase “once a certification program is in place” does not seem necessary, since ARB requires annual verification of the biomass derived fuels prior to the implementation of a certification program. Moreover, it is not clear when a certification program will be in place and this phrase could be read in such a way that a biomass derived fuel is not “always considered to have met the requirements in section 95852.1” until the certification program is in place. We believe ARB’s intent is for any biomass derived fuel which is adequately verified to continue to remain eligible for the compliance exemption, and since ARB has put rigorous verification requirements in place to do so, and will further be developing a certification program for biomass derived fuels, this phrase seems unnecessary. ABC urges ARB to delete this phrase. (ABC2)

Response: We removed this phrase in the Second 15-Day Change Notice.

E-15. Comment: We wish to compliment ARB on your treatment of biomass under section 95852 of the proposed Cap and Trade Regulation. Section 95852.2 provides a well-reasoned listing of biomass sources that have been shown to have lower emissions levels of greenhouse gases when used for energy production than when disposed of using conventional means, such as landfill disposal and open burning. Biomass power production in California provides approximately twice the greenhouse-gas benefit of other renewable resources by avoiding energy production using fossil fuels, and reducing the emissions of greenhouse gases associated with the recycling of the carbon in the biomass if it is disposed of by other, more conventional means rather than being converted to energy. (CBEA3)

Response: No response is necessary.

E-16. Comment: Section 95852.1.1(b) may go well beyond its intent. Because the section references “biomass-derived fuel,” it could be construed to include solid-fuel biomass. Moreover, it could be interpreted in such a way as to preclude the development of a protocol for the awarding of offsets for net reductions of greenhouse-gas emissions for the diversion of biomass from open burning, landfill burial, and other alternative fates to renewable energy production. We note that the definition of the REC that is used for RPS program compliance in California specifically excludes fuel-related attributes from the REC, a distinction that was enacted for the express purpose of allowing these attributes to be available to energy producers, if and when suitable protocols are developed. CBEA respectfully requests that the language be amended to clarify that this section does not refer to solid-fuel biomass. (CBEA3)

> **Response:** We modified this section to clarify that a certain number of offsets can be created and sold separately from the biofuel, in addition to RECs, and the biofuel will still avoid a compliance obligation under the cap-and-trade program. We made this modification to clarify eligibility of offsets from biomass and biogas projects. Any new offset protocols will be part of a separate rulemaking and, if warranted, we will change parts of the regulation to ensure that there are no inconsistencies.

E-17. Comment: Calpine supports the changes CARB made to the proposed regulation to clarify that emissions from geothermal generating units are exempt from the compliance obligation. However, because of an apparent error in the numbering of the relevant paragraphs, geothermal generating units, asphalt blowing at refineries, mobile equipment and well-site centrifugal and reciprocating compressors all appear to be classified as subcategories of combustion of biomass-derived portion of biomass-derived fuels (section 95852.2(a)(9)-(12)). Clearly none of these categories of emissions fit within the category of biomass combustion emissions. Calpine believes CARB's intent is clear in the 15-Day Modifications to exempt each of these categories, although the paragraphs were inadvertently numbered incorrectly. In the final rule, each of paragraphs (9) through (12) of section 95852.2(a) should be renumbered as their own independent subsection (b) through (e); what currently appears as subsection (b) should then be renumbered as subsection (f). (CALPINE3)

> **Response:** We made revisions to section 95852.2(b), which specifies that emissions without a compliance obligation include additional process, vented, and fugitive emissions from geothermal generating units; asphalt blowing at refineries; mobile equipment; and well-site centrifugal and reciprocating compressors.

E-18. Comment: CAPCOA supports reporting and verification procedures for biomass wastes that are workable within the existing practices of the biomass industry and does not support procedures that are a burden to, and discourage, the use of biomass wastes for renewable energy production. (CAPCOA2)

> **Response:** No response is necessary.

E-19. Comment: Clarify eligibility requirements for Biomass-Derived Fuels in section 95852.1.1(a). Although only certain types of biofuel contracts will meet the criteria in section 95852.1.1 for the combustion emissions to have no compliance obligation, this section should not prevent entities entering into contracts that do not meet the criteria. The change to the first line of section 95852.1.1(a) below is to clarify that, although there is no absolute requirement for biofuel contracts to meet the criteria, there is a benefit (in terms of a reduced compliance obligation) if the contract does meet the criteria. The heading of this section refers to the general term “biomass-derived fuels”, and so does section (a)(1). This term should be used throughout. There appears to be no reason to restrict this section to biogas and biomethane. This section refers to “contracts.” A “contract” should be defined to include transactions evidenced by recorded telephone calls, instant messaging, emails, and other types of electronic records that are commonly used for energy transactions. Section 95852.1.1(a) refers to assigned emissions. It is unclear how an assignment of emissions by the ARB relates to the reporting of emissions as biomass CO_2. Modify section 95852.1.1(a) as follows:

> (a) There is no compliance obligation for CO2 emissions from combustion of biomass-derived fuel procured under c~~C~~ontracts~~ for biogas and biomethane must~~ that meet one of the following criteria. Only the portion of the fuel that meets this criteria will be considered a biomass-derived fuel.~~ and is not subject to a compliance obligation if t~~ The emissions must be~~are~~ reported as biomass CO_2 in an emissions data report that has received a positive or qualified positive emissions data verification statement~~ or been assigned emissions~~: (SCPPA7)
>
> **Response:** We modified section 95852.1.1(a) to read as follows: "Biomass-derived fuel procured under contracts for biogas and biomethane must meet one of the following criteria. Only the portion of the fuel that meets one of these criteria will be considered biomass-derived fuel. Emissions from combustion of this fuel will not be subject to a compliance obligation when reported as Biomass CO_2 in an emissions data report that has received a positive or qualified positive emissions data verification statement and determined as exempt pursuant to section 95852.2 and 95103(g) of MRR."
>
> This modification clarifies that although there is no absolute requirement for biofuel contracts to meet the criteria, there is a benefit (in terms of a reduced compliance obligation) if the contract does meet the criteria. The heading of this section refers to the general term “biomass-derived fuels”, and so does section (a)(1); thus this section was modified to refer to biomass-derived fuels, not only biogas and biomethane.

E-20. (multiple comments)
Comment: “Certification” is referred to in section 95852.1.1(a)(4) but this term is not defined. Ideally, the term should be defined in both the MRR and the C&T Regulation. If fuel is from a certified facility, we understand that fuel will qualify as biomass-derived fuel. This should be clarified here. (SCPPA7)

Comment: The cross-references in section 95852.1.1(a)(4) do not appear to be correct. In relation to section 95852.1.1(a)(1) and (2), physical transfer of fuel under a contract could begin either before or after 90 days from contract execution, but not both. Section 95852.1 describes circumstances when biofuel does carry a compliance obligation, not requirements to be met in order for biofuel not to carry a compliance obligation. A better approach would be to clearly state the effect of receiving certification: If the biofuel production facility has been certified, biofuel from that facility will, as set out in paragraph (a), be biomass-derived fuel that is not subject to a compliance obligation. Modify section 95852.1.1(a)(4) as follows:

> (4) The fuel was produced at a fuel production facility that has been certified by an accredited certifier of biomass-derived fuels~~Once a certification program is in place, a fuel which meets the requirements of sections 95852.1.1(a)(1) and 95852.1.1(a)(2) will always be considered to have met the requirements in section 95852.1~~; or (SCPPA7)
>
> **Response:** Subsection 95852.1.1(a)(4) was removed. We require annual verification of the biomass-derived fuels prior to the implementation of a certification program. Our intent is for any adequately verified biomass-derived fuel to continue to remain eligible for the compliance exemption. Since we have rigorous verification requirements, and will further be developing a certification program for biomass-derived fuels, this provision is unnecessary.

E-21. Comment: An additional circumstance in which there may not be a contract for biofuel is where one entity owns both the fuel production facility and a separate generating facility at which the fuel is combusted. This situation applies to a SCPPA member, and should be included in section 95852.1.1. Modify section 95852.1.1(a)(5) as follows:

> (5) If the biogas or biomethane is used at the site of production~~,~~ and not transferred to another entity~~operator~~, or the fuel is used at another site owned or operated by the entity that produced the fuel, thus not requiring a contract, that~~e~~ entity ~~operator~~ must demonstrate one of the following:
>
> (A) The fuel has been combusted in California prior to January 1, 2013~~2~~; or
>
> (B) As of January 1, 2013, ~~T~~the fuel was not ~~previously~~ used to produce useful energy transfer. (SCPPA7)
>
> **Response:** We did not make the change at this time, but will further evaluate the implications for verifiability of this arrangement and consider adding it as part of a future rulemaking.

E-22. (multiple comments)
Comment: Section 95852.1.1(b) is very unclear. What types of credits would “otherwise result in holding a compliance obligation”? Is the intention of this section to allow offsets to be generated from avoided methane emissions at (e.g.) a landfill, as well as allowing the combustion of the biofuel to be zero-emissions, but only if the offsets are sold together with the biofuel? This accords with statements made by ARB staff in June 2011. If this is the ARB’s intention, SCPPA commends the recognition of the fact that the avoided methane emissions are separate from the emission reductions from using biogenic fuel in place of fossil fuel, and that no double counting arises. This recognition is in accordance with the science of emission reductions, with international

practice in offset markets and cap-and-trade programs, and with the ARB's own Compliance Offset Protocol for Livestock Projects. This protocol states on page 7 that it "does not account for carbon dioxide emission reductions associated with displacing grid-delivered electricity or fossil fuel use", meaning that offsets will not be issued for those emission reductions and that those emission reductions can therefore be recognized under the cap-and-trade program without creating double counting. However, as the offset-related and combustion-related types of emission reductions are separate from and additional to each other, there is no need to require the offsets to remain with the biofuel. Offsets for avoided methane emissions bear no relationship to the "compliance obligation for combustion CO_2." This situation is not equivalent to the relationship between renewable energy certificates (REC) and renewable energy, where either a REC or a megawatt hour of renewable energy can be counted as zero-emissions, but not both, as the REC is issued in respect of the zero-emission benefits of that megawatt hour of renewable energy. In the case of biofuel, emission reductions associated with displacing fossil fuel use are *additional to* the emission reductions associated with avoided methane emissions at (e.g.) the landfill. Separating the offsets from the biofuel does not strip the biofuel of its ability to reduce emissions by displacing fossil fuel. Once the step has been made to recognize that offsets can be generated for avoided methane as well as counting the biofuel combustion emissions as zero-carbon, there is no logical reason to require these two separate products to be sold together. Consider a biofuel purchaser that receives ARB offsets with its purchase of biofuel. Presumably that purchaser can use those offsets for compliance (subject to the quantitative limitation). Why should only the biofuel purchaser, and no other entity, be able to purchase those offsets and use them for compliance? Given the vagueness of the phrase "otherwise result in holding a compliance obligation for combustion CO_2," section 95852.1.1(b) as currently drafted could be interpreted in an even more limiting way, by prohibiting any sale of biofuel-related offsets (even to a biofuel purchaser). This interpretation should be clearly ruled out, as in this case the offsets would be rendered worthless (given that most biofuel producers do not have a compliance obligation of their own for which they could use the offsets they generate). Prohibiting biofuel offsets from being sold, or from being sold separately from the biofuel, would have negative consequences for both the offset market and the biofuel market. It would unnecessarily reduce the flexibility of biofuel producers to sell or otherwise transfer their products, it would reduce liquidity in the offset market, and it would be likely to increase the price of biofuel (as the price will need to incorporate the value of the offsets), without any additional environmental benefit. Section 95852.1.1(b) should be revised to allow offsets for avoided methane emissions, as well as RECs, to be generated in respect of biofuel and sold separately. Modify section 95852.1.1(b) as follows:

> (b) ~~An entity may not sell, trade, give away, claim or otherwise dispose of any of the carbon credits, carbon benefits, carbon emissions reductions, carbon offsets or allowances, howsoever entitled, attributed to the fuel production that would otherwise result in holding a compliance obligation for combustion CO2.~~ Generation ~~and sale~~ of Renewable Energy Credits <u>in respect of electricity from combustion of biomass-derived fuel, and offset credits in respect of avoided methane emissions at the site where biomass derived fuel is generated,</u> is

allowable and will not prevent <u>the CO2 emissions from combustion of</u> a biomass-derived fuel that meets the requirements in this section from being exempt from a compliance obligation. (SCPPA6)

Comment: Section 95852.1.1(b) is confusing, overbroad and unnecessary—and we urge ARB to delete it. The provision is overbroad in that it effects a sweeping restriction on offset credits and allowances. It is confusing in that it is unclear whether the restriction only applies to ARB issued credits and allowances, or also to credits and allowances from other programs—and, if it is the latter, it is unclear what authority ARB has to prohibit such uses. Additionally, the category of emissions and activities to which it applies is also vague and overbroad: "fuel production that would otherwise result in holding a compliance obligation for combustion CO_2." It is unclear to us what this means. In any event, this restriction is unnecessary to the extent that it applies to ARB offset credits because the regulations already clearly specify exclusive pathways for the creation of ARB offset credits: through the protocols. In particular, it is our understanding from discussions with ARB officials that the Livestock Protocol allows for offsets credits for avoided methane emissions, but not for emissions of biogenic CO_2 resulting from the use of biogas. Thus—if the intention of section 95852.1.1(b) is to prevent crediting for biogenic CO_2 emissions—it is not only overbroad and confusing, but also unnecessary. If ARB believes that it is not sufficiently clear in the Livestock Offset Protocol that credits are not available for biogenic CO_2 emissions, then it would be far better if ARB made the necessary modifications to the Protocol itself rather than utilize the overbroad and confusing language currently in section 95852.1.1. Moreover, it would be helpful for this provision to make clear (as it does for RECs) that generation or use of offset credits from methane destruction projects under the Livestock Offset Protocol—and any future protocols that provide credit for methane destruction—will not prevent biomass-derived fuels from being exempt from compliance obligations. Modify section 95852.1.1(b) as follows:

~~(b) An entity may not sell, trade, give away, claim or otherwise dispose of any of the carbon credits, carbon benefits, carbon emission reductions, carbon offsets or allowances, howsoever entitled, attributed to the fuel production that would otherwise result in holding a compliance obligation for combustion CO2~~. Generation <u>or use</u> of Renewable Energy Credits <u>or of offset credits that are available for methane destruction</u> ~~is~~ <u>are</u> allowable and will not prevent a biomass-derived fuel that meets the requirements in this section from being exempt from a compliance obligation. (CERP4)

Response: We modified section 95852.1.1(b) to clarify that a certain number of offsets can be created and sold separately from the biofuel, in addition to RECs, and that the biofuel will still avoid a compliance obligation under the cap-and-trade program. We received several comments stating that it was not clear whether biogas projects are prohibited from claiming ARB-issued offsets or offsets from other programs. Thus, we made this modification to clarify eligibility of offsets from biomass and biogas projects.

E-23. Comment: Plant material should be mentioned in section 95852.2(a)(8), as it is an important source of biogas and is identified in the definition of "biogas." (SCPPA6)

Response: We agree and made this change to section 95852.2(a)(8)(A).

E-24. Comment: Section 95852.2(a)(8)(B) refers to "waste." Arguments may arise as to whether a material constitutes "waste", particularly if the material is producing a useful product such as biogas. It would be clearer if the term "waste" were replaced with a more neutral term such as "material." Modify section 95852.2 as follows:

Emissions from the following source categories and from the combustion of the following fuel types count toward applicable reporting thresholds but do not count toward a covered entity's compliance obligation set forth in this article unless those emissions are reported as Other Biomass CO_2 under MRR. Emissions without a compliance obligation include:

(a) CO_2 ~~combustion~~ emissions from combustion of the following ~~biomass derived portion of~~ biomass-derived fuels:

(8) Biomethane and biogas from the following sources:

(A) All animal, plant and other organic material~~waste~~; or

(B) Landfills and wastewater treatment plants; (SCPPA7)

Response: We did not make this change. Not all organic material is eligible to be exempt from a compliance obligation. If it were, we would not need to list all of the particular types in this section. We believe "waste" is generally understood to mean material that is discarded because it has no use after a particular process has concluded.

E-25. Comment: When assessing which biofuels do not incur a compliance obligation, the regulation includes unnecessary specificity limiting the types of biofuel molecules considered. As currently written, these specifics will exclude many promising new technologies such as sugar-to-diesel, biobutanol and other "drop-in" fuels. The determination of what biofuels incur a compliance obligation should be based solely on the feedstock from which the fuel is manufactured. For example, if FAME biodiesel derived from vegetable oil is exempted, all biofuels made from vegetable oil should also be exempted. More inclusive language would avoid unintended barriers for new low-carbon biofuel molecules. Modify section 95852.2(a)(1), (2), and (3) as follows:

(1) Solid waste materials, including the biogenic content of solid waste materials that are not 100 percent biomass, as determined by methodology specified in ASTM D6866, based on exhaust sampling or fuel sampling (and fuel usage recordkeeping) at the specified frequency and tires which may use alternative tests, or any biofuel made from the biogenic content of these solid waste materials;

(2) Waste pallets, crates, dunnage, manufacturing and construction wood wastes, tree trimmings, mill residues, and range land maintenance residues; or any biofuel made from these specified types of wood materials or;

(3) All agricultural crops or waste; or any biofuel made from agricultural crops or waste or; (BP2)

Response: The Mandatory Reporting Regulation and the Reporting Tool will determine the fuels to be reported. Any biomass-derived fuels without a compliance obligation are listed in section 95852.2 of the cap-and-trade regulation. We will consider adding additional types of biomass-derived fuels as part of a future rulemaking. Our intent is not to discourage new biomass-derived fuels, but to make sure they are thoughtfully reviewed before exempting them from a compliance obligation.

E-26. (multiple comments)
Comment: We appreciate the revision to section 95852.1.1 to provide additional clarity. Unfortunately our conversations with other stakeholders over the past few weeks lead us to believe that the section is still subject to wide and contradictory interpretations. The following modification to the second sentence would clear up much of the confusion. Modify section 95852.1.1(b) as follows:

(b) An entity may not sell, trade, give away, claim or otherwise dispose of any of the carbon credits, carbon benefits, carbon emissions reductions, carbon offsets or allowances, howsoever entitled, attributed to the fuel production that would otherwise result in holding a compliance obligation for combustion CO_2. Generation of Renewable Energy Credits and generation of carbon offset credits from methane-related emission reduction activities, is allowable and will not prevent a biomass-derived fuel that meets the requirements in this section from being exempt from a compliance obligation. (TPI5)

Comment: PG&E's understanding of section 95852.1.1(b) is that an entity generating energy from biogas or biomass may sell carbon offsets as long as they retain sufficient "carbon credits, carbon benefits, carbon emissions reductions, carbon offsets or allowances" to make the CO_2 combustion emissions associated with the generation of energy zero net emitting. To improve clarity, PG&E recommends modifying the last sentence of the section. Modify section 95852.1.1(b) as follows:

(b) Generation of Renewable Energy Credits or offsets beyond those associated with the combustion of CO2 is allowable and will not prevent a biomass-derived fuel that meets the requirements in this section from being exempt from a compliance obligation. (PGE4)

Response: Section 95852.1.1(b) specifies that Generation of Renewable Energy Credits is allowable and will not prevent a biomass-derived fuel that meets this section's requirements from being exempt from a compliance obligation. However, to prevent double-counting of the environmental attributes of utilizing biomass-derived fuel, the section prevents another source from claiming the benefits realized or using the benefits to fulfill a compliance obligation, or for any other purposes. We modified this section to clarify that a certain number of offsets, in addition to RECs, can be created and sold separately from the biofuel, and that biofuel will still allow an entity to avoid a compliance obligation under the cap-and-trade program.

E-27. Comment: PG&E appreciates the clarifications that ARB made with respect to emissions without a compliance obligation. However, the tracking and enforcement of sources of wood and wood wastes is extremely difficult for energy generators and should be enforced by agencies with oversight of the harvesting of wood and wood wastes, not the ARB. An electricity generator burning wood waste meeting the California Energy Commission's (CEC) definition of biomass has no specific knowledge about the source of the wood being used in their operations. Accordingly, we recommend revisions to make it consistent with the CEC's definition of biomass. Modify section 95852(a)(4) as follows:

(4) Wood and wood wastes from timbering operations ~~identified to follow all of the following practices~~;

~~(A) Harvested pursuant to an approved timber management plan prepared in accordance with the Z'berg-Nejedly Forest Practice Act of 1973 or other locally or nationally approved plan;~~
~~(B) Harvested for the purpose of forest fire fuel reduction or forest stand improvement; and~~
~~(C) Do not transport or cause the transport of species known to harbor insect or disease nests outside zones of infestation or quarantine zones identified by the Department of Food and Agriculture and the Department of Forestry and Fire Protection, unless approved by these agencies.~~
(PGE4)

Response: We did not delegate our authority to oversee and enforce our regulations to another entity. The verification process is written to provide a consistent quality of rigor in review of all emissions with or without a compliance obligation under this program. Shifting part of that process to another entity or deferring to another process would affect the consistency and potentially the rigor of the program. The suggested deletions in the comment would make it impossible for us to verify that the biomass used was harvested in a sustainable manner under existing environmental regulations.

E-28. Comment: TNC urges ARB to continue to monitor the upstream carbon impacts related to the use of forest biomass for renewable energy. As stated in a previous letter submitted to ARB on April 8, 2011, while TNC acknowledges that there may be atmospheric and ecological benefits associated with the use of forest biomass for energy and fuels, such use may not be "carbon neutral" and may not always be ecologically beneficial. The current Cap and Trade Regulations effectively treat forest biomass (woody biomass) as carbon neutral by not requiring a compliance permit for this type of energy. We urge ARB to continue to monitor this issue closely as part of ongoing efforts to maintain the integrity of the cap and trade program and its impacts. In response to our comments and the comments of colleagues, ARB has made adjustments to the Mandatory Reporting Rule (MRR) to gather information that could help assess the carbon impact of forest biomass use for energy. We commend ARB for taking these actions, support those provisions, and will provide additional constructive comments on the MRR in a separate letter. As part of ARB's policy commitment to adaptive management, we urge ARB to adopt a process to periodically review the treatment of forest biomass for energy in the Cap and Trade program, including its GHG impacts and impacts to ecological sustainability. Furthermore, we request that ARB review the recommendations that will be developed for forest biomass through the Low Carbon Fuel Standard Sustainability Workgroup process and consider their application for forest biomass in the cap and trade program. (NC8)

> **Response:** Stakeholders have expressed their concerns over ARB excluding biomass from a compliance obligation by asserting that forest biomass would have an unfair economic advantage in comparison to energy sources with compliance obligations. The costs associated with collecting, processing, and transporting woody biomass waste in state is often greater than the value of the fuel that can be produced from these sources. Woody biomass is often considered an economically unviable energy source due to one (or many) of the following factors:
>
> - The source of woody biomass waste is often a great distance from the biomass power plant (or mill) facility;
> - Lack of infrastructure; and
> - Uncompetitive economics for biomass energy when compared with fossil fuel energy.
>
> Entities that use woody biomass for fuel will have to report certain types of data related to source and location to enable us to monitor this issue. ARB did not pursue an "adaptive management" approach to review the treatment of forest biomass in the cap-and-trade regulation.

E-29. Comment: Section 95852.1(b) of the regulation seems to be counterintuitive to the goals of AB 32. A facility producing biomass-derived fuels should not be required to abandon all carbon reduction credits and/or Renewable Energy Credits in order to ensure that the facility's emissions generated from the biogenic fraction of the feedstock does not count towards a compliance obligation. While we are in full support of establishing measures to prevent "double counting" of GHGE reductions, biogenic emissions are climate neutral and therefore should be exempt from compliance obligations without preconditions. Facilities utilizing the biogenic materials as a fuel source may have additional GHGE reduction benefits, and should be allowed to receive credit for those reductions so long as they are properly verified. Otherwise, there would be no incentive for developing new facilities utilizing biomass feedstock since such facilities would either be prohibited from realizing any carbon reduction benefits, or would be subject to potentially expensive compliance obligations. (CLADPW)

Response: We modified section 95852.1(b) to use the term "non-exempt biomass-derived CO_2," which is a CO_2 emission resulting from the combustion of fuel not listed under section 95852.2(a) or that is not verifiable under section 95131(i) of the MRR and is required to hold a compliance obligation. These fuel types may remain eligible to be exempt from a compliance obligation if they generate offsets for methane destruction as offset projects or if they also generate RECs.

E-30. Comment: CERP appreciates that ARB intends for a biomass derived fuel that is eligible for the compliance exemption under section 95852.1.1 to remain eligible for the compliance exemption in future years of the program. However, we urge ARB to clarify the language that attempts to codify this concept. Modify section 95852.1.1(a)(1) as follows:

(1) The contract for purchasing any biomass derived fuel must be in effect prior to January 1, 2012, and remain in effect or have been renegotiated with the same California operator within one year of contract expiration. (CERP4)

Response: We agree and made the change, except that the contract for purchasing any biomass-derived fuel must be executed prior to January 1, 2012, not necessarily be in effect by that date.

E-31. Comment: CERP respectfully requests that ARB add efficiency increases and the conversion of biogas to beneficial uses to the definition of increased capacity. If a methane capture facility installs a higher efficiency generator and thereby produces more carbon neutral electricity, overall emissions will be reduced. In addition, if a facility invests in converting a flare to a generator, overall emissions similarly decline. Therefore, both these instances should meet the "increased capacity" standard and fall under the compliance exemption. Modify section 95852.1.1(a)(2) as follows:

(2) The fuel being provided under a contract dated after January 1, 2012, must only be for an amount of fuel that is associated with an increase in the biomass-derived fuel producer's capacity, new production or recovery of the fuel that was previously destroyed without producing useful energy transfer. Increased capacity is considered any amount over the average of the last three calendar years production, an increase in the efficiency of the facility, or the conversion of a flare to a generator. (CERP4)

Response: We did not make this change because it is difficult to track and verify these types of changes. We will continue to evaluate this issue and consider rule modifications as part of a separate rulemaking.

Eligibility Requirements for Biomass-Derived Fuels, Section 95852.1.1

E-32. (multiple comments)
Comment: The phrase "once a certification program is in place" does not seem necessary, since ARB requires annual verification of the biomass derived fuels prior to the implementation of a certification program. Moreover, it is not clear when a
