Final Statement of Reasons for Rulemaking, Including Summary of Public Comments and Agency Responses

PUBLIC HEARING TO CONSIDER ADOPTION OF A PROPOSED CALIFORNIA CAP ON GREENHOUSE GAS EMISSIONS AND MARKET-BASED COMPLIANCE MECHANISMS REGULATION, INCLUDING COMPLIANCE OFFSET PROTOCOLS

Public Hearing Date: December 16, 2010
Agenda Item No.: 10-11-1

I. GENERAL

A. Action Taken in This Rulemaking

In this rulemaking, the Air Resources Board (ARB or the Board) is adopting a new regulation to implement a California cap-and-trade program. The regulation was developed pursuant to the requirements of the California Global Warming Solutions Act of 2006, also known as Assembly Bill 32 (AB 32). The regulation is codified at sections 95800 to 96023, Title 17, California Code of Regulations (CCR). The cap-and-trade regulation will reduce greenhouse gases (GHG) from major emission sources (covered entities) by setting a firm cap on GHG emissions while employing market mechanisms to cost-effectively achieve the emission reduction goals. The cap for GHG emissions from major sources will commence in 2013 and decline over time, achieving GHG emissions reductions throughout the program's duration. The cap is measured in metric tons of carbon dioxide equivalent ($MTCO_2e$). Covered entities will be allocated some permits to emit (allowances), able to buy allowances at auction, purchase allowances from others, or purchase offset credits.

The cap-and-trade program will establish the total amount of GHG emissions that major sources would be allowed (permitted) to emit in the aggregate. ARB will distribute allowances to emit GHG emissions. The total number of allowances created would be equal to the total aggregate cap amount set for cumulative emissions from all covered entities. Each allowance will permit the holder to emit one $MTCO_2e$ of GHG.

Starting in 2012, the proposed regulation will include major GHG-emitting sources, such as electricity generation (including imports), and large stationary sources (e.g., refineries, cement production facilities, oil and gas production facilities, glass manufacturing facilities, and food processing plants) that emit more than 25,000 $MTCO_2e$ per year. The program will expand in 2015 to include fuel distributors (natural gas and propane fuel providers and transportation fuel providers) to address emissions from transportation fuels, and from combustion of other fossil fuels not directly covered at large sources in the initial phase of the program.

The years 2013 and 2014 are known as the “first compliance period,” and the years 2015–2017 are known as the “second compliance period.” The first compliance period would include sources responsible for more than one-third of the economy-wide GHG emissions in California. Starting with the second compliance period, the program would include sources responsible for about 85 percent of GHG emissions.

The rulemaking was initiated by the October 28, 2010, publication of a notice for a public hearing scheduled on December 16, 2010. A Staff Report: Initial Statement of Reasons, entitled “Proposed Regulation to Implement the California Cap-and-Trade Program” (Staff Report or ISOR) was also made available for public review and comment starting October 28, 2010. The Staff Report, which is incorporated by reference herein, contains an extensive description of the rationale for the proposal. These documents were also posted October 28, 2010, on ARB’s internet site for this rulemaking at: http://www.arb.ca.gov/regact/2010/capandtrade10/capandtrade10.htm.

On December 16, 2010, the Board conducted a public hearing to consider the staff’s proposal as set forth in the Staff Report. During the comment period that commenced on November 1, 2010, and ended at noon on December 15, 2010, the Board received 800 separate written comments and multiple copies of form letters. At the hearing the Board received oral testimony from 150 persons and an additional 35 written statements and other submittals.

At the conclusion of the hearing, the Board adopted Resolution 10-42, in which it directed the Executive Officer to take several actions including making the originally proposed regulation with a number of proposed modifications available for formal public comment. Staff suggested these modifications in response to public comments made after issuance of the original proposal. The text or narrative description of each modification was contained in a nine-page document entitled, “Public Hearing to Consider Adoption of a Proposed Regulation to Implement a California Cap-and-Trade Program–Staff’s Suggested Modifications to the Original Proposal,” which was distributed at the beginning of the hearing and included as Attachment B to Resolution 10-42. In addition, staff released a document entitled, “Appendix 1: Staff Proposal for 15-day Changes to Address Electricity Sector Allowance Allocation,” which was also released at the Board Hearing on December 16, 2010. Appendix 1 includes staff’s proposal on subsequent 15-day changes to address electricity sector issues.

Resolution 10-42 directed the Executive Officer to incorporate the modifications described in Attachment B into the originally proposed regulatory text, with such other conforming modifications as may be appropriate. The Executive Officer was directed to make the modified regulation (with the modifications clearly identified) and any additional documents or information available for a supplemental public comment period. He was also directed to consider any comments on the modifications received during the supplemental comment period. The Executive Officer was then directed to (1) adopt the modified regulation as it was made available for public comment, with any appropriate additional non-substantial modifications; (2) make additional modifications available for public comment for an additional period of at least 15 days; or (3) present the regulation to the Board for further consideration if he determined that this is warranted.

In preparing the modified regulatory language, the staff made various additional conforming revisions in an effort to best reflect the intent of the Board at the hearing. The staff also identified several additional conforming modifications that are appropriate in order to make the regulation work as effectively as possible. These post-hearing modifications were incorporated into the text of the proposed regulation, along with the modifications specifically identified in Attachment B to Resolution 10-42.

The text of the proposed modifications to the regulation, with the modified text clearly indicated, was made available for a supplemental 15-day comment period starting on July 25 and ending on August 11, 2011 at 5:00 p.m., by issuance of a Notice of Public Availability of Modified Text and Availability of Additional Documents and a "Modified Regulation Order" containing the modified regulatory text (the First Notice of Modified Text). Additional documents (Appendix A *Staff Proposal for Allocating Allowances to Electricity Distribution Utilities*, and Appendix B *Development of Product Benchmarks for Allowance Allocation*) were also posted on ARB's internet site on July 25, 2011. Appendix A was subsequently revised and re-posted on July 27, 2011. ARB received 192 written comments during the supplemental comment period ending August 11, 2011 at 5:00 p.m.

In light of the supplemental comments received during the first 15-day change comment period, the Executive Officer determined that additional modifications were appropriate. A Second Notice of Public Availability of Modified Text (the Second Notice of Modified Text) and a "Modified Regulation Order" containing the modified regulatory text (the Second Modified Text Document) were posted September 12, 2011, on ARB's Internet site for the rulemaking. The second 15-day change comment period ended September 27, 2011, at 5:00 p.m., by which time 114 additional written comments were received.

With respect to each of the two notices of modified text, on the Internet posting date the notices and all attachments were mailed to four parties for whom ARB staff did not have electronic mail addresses, as required by section 44(a), title 1 CCR. At the same time, the notices and all attachments were electronically distributed to all other parties identified, per section 44(a), title 1, CCR, in accordance with Government Code section 11340.85, and to all persons that have subscribed to the following ARB's listserves (number of subscribers are provided in parentheses): capandtrade10 (1,315), capandtrade (4,976), cc (7,921), ghg-rep (3,348), and ghg-ver (3,798).

After considering the comments received during the supplemental comment periods, the Executive Officer determined that it was appropriate to present the modified regulatory language to the Board for further consideration. Subsequently, on October 20, 2011, the Board considered the modified regulatory language and adopted the cap and trade regulation. The adopted regulation reflects the final modifications that were made available for the two supplemental comment periods. The following sections are affected by the adoption of California Code of Regulation, title 17, subchapter 10, new article 5, which contains new sections 95800, 95801, 95802, 95810, 95811, 95812, 95813, 95814, 95820, 95821, 95830, 95831,95833, 95834 95832, 95840, 95841, 95841.1, 95850, 95851, 95852, 95852.1, 95852.1.1, 95852.2, 95853, 95854, 95855, 95856, 95857,95858, 95870, 95890, 95891, 95892, 95893, 95910, 95911, 95912, 95913, 95914, 95920, 95921, 95922, 95940, 95941, 95942, 95943, 95970, 95971, 95972, 95973, 95974, 95975, 95976, 95977, 95977.1, 95977.2, 95978, 95979, 95980, 95980.1, 95981, 95981.1, 95982, 95983, 95984, 95985, 95986, 95987, 95988, 95990, 95991, 95992, 95993, 95994, 95995, 95996, 95997, 96010, 96011, 96012, 96013, 96020, 96021, 96022, and 96023.

This Final Statement of Reasons (FSOR) includes only comments directed toward the regulation, and updates the Staff Report by identifying and providing the rationale for the modifications made to the originally proposed regulation. The FSOR also contains a summary of the comments received on the proposed new regulation during the formal regulatory process and ARB's responses to those comments.

B. Incorporation of Materials by Reference

The following documents are incorporated by reference in the regulation:

(1) ASTM 6751-08, "Standard Specification for Biodiesel Fuel Blendstock (B100) for Middle Distillate Fuels," approved September 15, 2007, revised October 1, 2008;

(2) ASTM D1835-05, "Standard Specification for Liquefied Petroleum (LP) Gases," April 1, 2005;

(3) ASTM D6751-09a, "Standard Specification for Biodiesel Fuel Blend Stock (B100) for Middle Distillate Fuels," approved September 15, 2007, revised October 1, 2008;

(4) ASTM D6866-10, "Standard Test Methods for Determining the Biobased Content of Solid, Liquid, and Gaseous Samples Using Radiocarbon Analysis," August 6, 2010; and

(5) Z'berg-Nejedly Forest Practices Act of 1973, as amended January 1, 1998.

(6) The California Energy Commission's *Guidelines for California's Solar Electric Incentive Programs,* Third Edition, June 2010. This document can be accessed at: http://www.arb.ca.gov/regact/2010/capandtrade10/2ndguidelines.pdf.

The following documents are ARB-drafted documents that are were incorporated by reference into the cap-and-trade regulation when it was adopted on October 20, 2011. These documents were considered by the Board at the December 16, 2010 public hearing and any subsequent modifications to the documents were made available during the first and second 15-day change comment periods in accordance with the

Administrative Procedure Act (Government Code section 11340 et seq.). The final date of these documents will be the date of approval by the Office of Administrative Law.

- Compliance Offset Protocol U.S. Forest Projects
- Compliance Offset Protocol Livestock Projects
- Compliance Offset Protocol Ozone Depleting Substances Projects
- Compliance Offset Protocol Urban Forest Projects

C. Supporting Documents and Information

In accordance with Government Code section 11347.1, ARB has added to the rulemaking record the following documents that support the proposed action:

Staff Proposal for Allocating Allowances to the Electricity Distribution Utilities: This document describes the process ARB staff used to gather utility data and the assumptions made in projecting utility resource profiles, explains the proposed method for allocating allowances to the electricity sector, and clarifies which entities are eligible to receive allocations reserved for the electricity sector. The document can be accessed at: http://www.arb.ca.gov/cc/capandtrade/meetings/072011/electricity-allocation.pdf.

Development of Product Benchmarks for Allowance Allocation: This document describes the framework for establishing the benchmarks for allowance allocation for industrial products. This document can be accessed at: http://www.arb.ca.gov/cc/capandtrade/meetings/072011/product-benchmarks.pdf.

Additionally, it was clarified that certain economic analysis documents were made available during the 45-day public comment period but inadvertently left out of the original public notice listing of available documents. One relates to the compliance pathway analysis related to boilers contained in the Proposed Regulation to Implement the California Cap-and-Trade Program: Supplemental Materials for the Compliance Pathways Analysis (Staff Report Chapter V and Appendix F). The other relates to the compliance pathway analysis related to process heaters also contained in the Proposed Regulation to Implement the California Cap-and-Trade Program: Supplemental Materials for the Compliance Pathways Analysis (Staff Report Chapter V and Appendix F). Both of these documents can be accessed at: http://www.arb.ca.govregact/2010/capandtrade10/capandtrade10.htm.

The addition of the above noted documents to the record was announced in the first 15-day notice, and the notice invited public comment on the addition of these documents to the record.

In the second 15-day notice, two additional documents were either added to the rulemaking record or incorporated into the regulation, and the notice invited public comment on the addition of these documents. They are:

- Appendix A to Second 15-Day Cap-and-Trade Regulatory Text: Refinery Allocation Methodology. This document can be accessed at: http://www.arb.ca.gov/regact/2010/capandtrade10/2nd15dayappa.pdf.

- The California Energy Commission's *Guidelines for California's Solar Electric Incentive Programs,* Third Edition, June 2010. This document can be accessed at: http://www.arb.ca.gov/regact/2010/capandtrade10/2ndguidelines.pdf.

D. Fiscal Impacts

The Executive Officer has determined that the proposed regulatory action would create costs or savings, as defined in Government Code sections 11346.5(a)(5) and 11346.5(a)(6), to State agencies or in federal funding to the State. The proposed regulatory action would create costs and would impose a mandate on some State and local agencies, but would not create costs or impose a mandate on school districts. Seven California public universities, the California Department of Water Resources (DWR), several municipal utilities and one county correctional facility would have a compliance obligation under the proposed regulation. These entities would be required to surrender allowances or offsets equal to the amount of their GHG emissions during the compliance period.

Because the regulatory requirements apply equally to all covered entities and unique requirements are not imposed on local agencies, the Executive Officer has determined that the proposed regulatory action imposes no costs on local agencies that are required to be reimbursed by the State pursuant to part 7 (commencing with section 17500), division 4, title 2 of the Government Code, and does not impose a mandate on local agencies or school districts that is required to be reimbursed pursuant to section 6 of article XIII B of the California Constitution.

The Board's Executive Officer has also determined that pursuant to Government Code Section 11346.5(a)(5), the regulatory action will affect small businesses. Because very few small businesses have enough emissions to be regulated directly under the cap-and-trade program, most foreseeable small business impacts will result from changes in energy expenditures. An analysis on how implementation of the program could affect expenditures that small businesses make on electricity and natural gas, and how such shifts could affect their profitability, demonstrated that most sectors would experience less than a two percent change in the share of revenue spent on energy and are not likely to face competitiveness issues relative to out-of-state businesses. A detailed description of these impacts is included in Chapter VIII and Appendix N of the Staff Report.

E. Consideration of Alternatives

A discussion of alternatives to the initial regulatory proposal is found in Chapter IV of the Staff Report. Specifically, the following alternative approaches were considered by the Board:

- Do not implement the cap-and-trade program, and do not replace it with an alternate approach to achieve additional emissions reductions (no project).
- Implement additional source-specific regulations designed to achieve the AB 32 goals in place of the cap-and-trade program.
- Implement a carbon fee in place of the cap-and-trade program.
- Link a California cap-and-trade program to a federal cap-and-trade program.

For the reasons set forth in Chapter IV of the Staff Report, in staff's comments and responses at the hearings, and in the FSOR, the Board has determined that none of the alternatives considered by the agency or that have otherwise been identified and brought to the attention of the agency would be more effective in carrying out the purpose for which the regulatory action was proposed or would be as effective and less burdensome to affected private persons than the action taken by the Board.

This page intentionally blank.

II. MODIFICATIONS MADE TO THE ORIGINAL PROPOSAL

The following discussion addresses all substantive modifications made to the originally proposed regulatory text. It does not include modifications to correct typographical and citation errors, numbering errors, grammar errors, or the rearranging of sections and paragraphs for structural improvements; nor does it include all of the minor revisions made to improve clarity. These modifications were explained in detail in the Notices of Public Availability of Modified Text; the first which was issued for a 15-day public comment period beginning on July 25, 2011, and ending on August 11, 2011, and the second which was issued for a 15-day public comment period beginning on September 12, 2011, and ending on September 27, 2011.

Part A. below summarizes the modifications and the rationale for the changes made in the 1st 15-Day Change Notice. Part B. summarizes the modifications and the rationale for the changes made in the 2nd 15-Day Change Notice.

A. First 15-day Changes

1. Purpose (Section 95801)

No modifications made to this section.

2. Definitions (Section 95802)

Several definitions were added or modified. Many of the new or modified definitions are necessary to implement the "first deliverer" approach for the electricity sector, as well as to implement the benchmarking approach for distribution of allowances for several different sectors. Definitions were also added or modified to improve clarity and to ensure that the terms used in the cap-and-trade regulation are consistent with those used in the Mandatory Reporting of Greenhouse Gas Emissions Regulation (MRR). Adding these definitions was required to ensure that all terms contained in the regulation have the same meaning to the regulated public.

Section 95802 was modified to include a definition for "carbon dioxide supplier," "geologic sequestration," and "process unit" to reflect changes to sections 95812(c)(3) and 95852(g).

3. Covered Gases (Section 95810)

No modifications made to section 95810.

4. Covered Entities (Section 95811)

Section 95811 specifies which entities are covered by the regulation. One modification was made to section 95811(g) which specifies that suppliers of carbon dioxide (CO_2) will be referred to as "carbon dioxide suppliers" for purposes of the regulation. This change was made to simplify the regulation such that only one term would be used for carbon dioxide suppliers instead of multiple terms (e.g., suppliers of carbon dioxide, suppliers of CO_2, carbon dioxide suppliers, CO_2 suppliers).

5. Inclusion Thresholds for Covered Entities (Section 95812)

Section 95812(a) was modified to specify that reported and verified annual emissions must be reported and verified pursuant to the verification sections of the MRR. This modification is necessary to be consistent with the MRR, and to clarify that a covered entity's annual emissions must both be reported and verified.

Section 95812(b) was modified to specify that an entity will be classified as a covered entity if the reported or reported and verified annual emissions in any data year from 2008 to 2011 exceed the thresholds identified in sections 95812(c) and (d), and to remove the term "aggregated." This modification is necessary to be consistent with the MRR.

New section 95812(c) was modified to clarify the existing applicability thresholds for covered entities.

New section 95812(c)(3) was added to replace original section 95812(c) and specify that the inclusion threshold for carbon dioxide suppliers is based on the amount of CO_2 captured from production process units and production wells, and supplied for commercial application or geologic sequestration. This change was required to ensure that all CO_2 created and potentially emitted in California by carbon dioxide suppliers would be covered, and to align with the federal greenhouse gas reporting regulation.

New section 95812(c)(4) was inserted to be consistent with how the MRR categorizes these sources for reporting purposes.

Section 95812(d) was modified to include assigned emissions levels consistent with the MRR. This change is necessary so covered entities that do not receive a positive verification are still included in the regulation.

Section 95812(d)(2) was modified to be consistent with the changes made to section 95812(c)(2).

Various other minor and non-substantive clarifications were also made to section 95812.

6. Opt-In Covered Entities (Section 95813)

Minor and non-substantive clarifications were made to section 95813 to better organize the section and otherwise clarify who can be an opt-in covered entity.

7. Voluntarily Entities and Other Registered Participants (Section 95814)

Original section 95814(a)(1) was deleted and folded into section 95814(a). Original sections 95814(a)(2), (a)(2)(A), and (a)(2)(B) were replaced with new sections 95814(a)(1) and (2) to make the section more clear.

New section 95814(a)(3) creates a new type of voluntarily associated entity (VAE) that will take only temporary control of compliance instruments when it provides clearing services for transactions. Defining this new VAE allows ARB to specify a new type of account that can only be used by that type of entity, which ARB can then conditionally exempt from the holding limit. This section specifically adds derivatives clearing organizations registered with the U.S. Commodity Futures Trading Commission as eligible. Staff is requesting comment on whether the new VAE category captures the types of clearing entities expected to be active in carbon markets.

Section 95814(b)(1)(D) was modified to specify that entities approved as Early Action Offset Programs, pursuant to subarticle 14, do not qualify to hold compliance instruments, but may qualify as a Registered Participant. This modification was necessary to ensure consistency between Offset Project Registries and Early Action Offset Programs, as, in many cases, they may be the same entities.

8. Compliance Instruments Issued by the Air Resources Board (Section 95820)

Section 95820(a)(3) was modified to remove the requirement for the Executive Officer to place allowances into a holding account within 15 days of the effective date of the regulation as it is unlikely there will be a system with a holding account available within 15 days to meet this requirement.

Minor and non-substantive clarifications were made to section 95820 to correct cross-references within the regulation.

9. Compliance Instruments Issued by Approved Programs (Section 95821)

Minor and non-substantive clarifications were made to section 95821 to add consistent terminology and correct cross-references within the regulation.

10. Registration with ARB (Section 95830)

Section 95830(b) was modified to delete references to linking to external programs approved by ARB. This text was deleted because any additional registration requirements will be addressed in subarticle 12 at the time the regulation is modified to include linkage.

New section 95830(c)(2) exempts entities registering to provide clearing services from having to meet the information disclosure requirements of 95830(c)(1)(D) for the compliance instruments it holds for the purposes of clearing transactions. This provision was added to avoid burdening entities providing clearing services with having to report transaction information that ARB will be getting directly from the entities involved in a transaction.

Section 95831(d)(1)(A) was modified to change the timing for registration from 45 days to 30 days because 30 days gives entities enough time to submit all the information needed to register. Section 95831(d)(1)(B) was modified to change the auction timing due to the change in compliance obligation start date from 2012 to 2013.

New section 95830(f) adds the requirement that registered entities must update their registration information within 10 days of a change in that information. The section allows ARB to revoke, suspend, or restrict an entity's registration or impose penalties if an entity fails to update its registration information. This section is necessary because ARB will rely on registration information to conduct market oversight and enforce rules on holding and purchase limits. These efforts will be undermined if entities are not required to update the information.

New section 95830(g) adds provisions concerning the confidentiality of the information gathered through registration. New section 95830(g)(1) identifies beneficial holdings disclosures and information on the identity of real persons as information that should be treated as confidential. Section 95830(g)(2) allows for other registration information to be made public. ARB is proposing these conditions to balance the need for market transparency with the protection of information on individuals.

11. Account Types (Section 95831)

New section 95831(a)(5) creates a new type of holding account, called an Exchange Clearing Holding Account, for entities providing exchange clearing services. Entities transfer compliance instruments to clearing entities on a temporary basis while a transaction is being cleared. The clearing entity then transfers the compliance instruments to the designated account of the entity receiving the allowances as part of the transaction being cleared. Creating this account will allow ARB to exempt an entity clearing transactions from the holding limit.

Original section 95831(b) was moved to new section 95921(f), because the text deals with account restrictions that may be imposed for rule violations, and that section deals with the conduct of trading.

Original section 95831(c)(5), now section 95831(b)(5), was modified to clarify how the Forest Buffer Account functions and when ARB may place ARB offset credits into the Retirement Holding Account from the Forest Buffer Account. These changes were made for clarification purposes and to align these requirements with the updated requirements in section 95983.

New section 95831(b)(6) creates a holding account, called the Voluntary Renewable Electricity Reserve Account, under the control of the Executive Officer. This provision is needed to implement section 95870(c). The Executive Officer will place allowances into the account, which may then be retired as part of the voluntary renewable energy set-aside. The account will be closed when the allocation of allowances is depleted.

Various other minor and non-substantive clarifications were made to section 95831 to add and correct cross-references within the regulation.

12. Designation of Authorized Account Representative (Section 95832)

Sections 95832(a)(4), 95832(a)(6), and 95832(d) were modified to specify that an authorized account representative and any alternative account representative must attest to the validity of their application for an account with the accounts administrator under penalty of perjury and under the laws of the State of California. This addition is necessary to ensure that all information submitted is true and complete under penalty of perjury.

Various minor and non-substantive clarifications were also made to section 95832 to correct cross-references within the regulation and to fix numbering.

13. Disclosure of Direct and Indirect Corporate Associations (New Section 95833)

New section 95833 is composed generally of modified text that originally appeared as sections 95914(a) through (d). In addition to moving these sections, staff made two changes to the original text. The section requires all registered entities to identify if they share specific types of relationships with other registered entities. This information is needed to monitor for suspicious activity in the market program and ensure market rules are not circumvented.

New section 95833(a)(2) was modified from original text to clarify an existing requirement that an entity holding compliance instruments on behalf of another entity in a beneficial holding relationship is considered to have a direct corporate association with the other entity. New section 95833(a)(4) was added to exempt from the corporate association requirements any entities already subject to state or federal rules which prohibit the sharing of market information between entities that have a formal corporate affiliation.

New sections 95833(d)(1) through (4) were moved from section 95914. No substantive changes were made to this text.

14. Disclosure of Beneficial Holding (New Section 95834)

New section 95834 provides detailed provisions for an existing requirement that any entity holding compliance instruments on behalf of another entity disclose the relationship to ARB. New section 95834(a)(1) defines when a beneficial holding relationship exists. Specifically, such a relationship can only exist between two registered entities. It also defines an agent as the entity holding allowances owned by a second entity, which is defined as the principal.

New section 95834(a)(2) creates a type of beneficial holding relationship for electrical distribution utilities that may need to hold compliance instruments on behalf of entities with whom they have electricity delivery contracts that may not explicitly determine which party to the contract has the responsibility to surrender compliance instruments. ARB has held extensive discussions with electric utilities on this issue, and is requesting comment on whether the proposed requirements address this concern.

New section 95834(a)(3) allows entities which have disclosed a corporate association pursuant to section 95833 to utilize the beneficial holding arrangements.

New section 95834(b) contains requirements for the disclosure of beneficial holding relationships. New section 95834(c) contains requirements applying to an entity that may serve as an agent for more than one principal. The requirements are necessary to prevent the disclosure of market information between market participants and to prevent opportunities for collusion.

15. Compliance Period (Section 95840)

Section 95840(a) was modified to exclude 2012 from the first compliance period and accommodate the new compliance obligation start date of January 1, 2013.

16. Allowance Budgets Calendar Years 2013–2020 (Section 95841)

Section 95841 was modified to remove the allowance budget for 2012 to accommodate the new compliance obligation start date of January 1, 2013.

17. Voluntary Renewable Electricity (New Section 95841.1)

New section 95841.1 was added to clarify the treatment of voluntary renewable electricity, reflecting the intended changes identified in Resolution 10-42 and in Attachment B of the resolution. Staff worked with stakeholders to clarify the role of voluntary renewable electricity in reducing greenhouse gas (GHG) emissions after the cap-and-trade program is in place, in order to support increased voluntary investment in renewable resources. “Voluntary renewable electricity” refers to renewable electricity that, unlike renewable electricity used for the Renewable Portfolio Standard, is not the subject of a mandate. Once the cap is set, voluntary renewable electricity can only reduce GHG emissions if it is tied to a reduction in the total amount of allowances. New section 95831(b)(6) explains that a Voluntary Renewable Electricity Reserve Account will be set up to hold allowances that may be retired to account for voluntary renewable electricity. This section explains what is required to demonstrate that Renewable Energy Credits (RECs) or renewable electricity is eligible to count toward the retirement of allowances from this account.

New section 95841.1(a) explains the program requirements for voluntary renewable electricity. It directs the end-user, the Voluntary Renewable Electricity (VRE) participant, or the entity acting on behalf of the end-user to meet the requirements of section 95841.1 in order to have the REC or electricity count toward retirement of allowances. This section also clarifies that the eligible electricity must meet California load.

New section 95841.1 (b) explains the reporting requirements, including required attestations that the end-user, or entity acting on behalf of the end-user claiming credit for the voluntary renewable electricity or the Renewable Energy Credit (REC), has not also authorized the use of the claim in any other program. This section also describes the reporting required to demonstrate the claimant's ownership and quantity of the renewable electricity or RECs, and what documentation is needed to apply for allowance retirement. The requirements include that the generator of voluntary renewable electricity be registered as eligible for the Renewable Portfolio Standard (RPS) with the California Energy Commission, to ensure that the voluntary renewable electricity meets the same standards required for the RPS. This section also requires VRE participants with claims to RECs or electricity from generators with a nameplate capacity of less than or equal to 200 kilowatts (kW) to aggregate with other participants. This requirement enables administrators to manage the number of applications and fractions of allowances to be retired.

New section 95841.1(c) describes how the amount of allowances to be retired is calculated.

New section 95841.1(d) provides that a generator or REC marketer will fulfill the attestation requirements of section 95841.1(b) if it participates in a tracking system that will be developed by ARB, once the tracking system is approved by the Executive Officer.

18. General Requirements (Section 95850)

New section 95850(b) was added to specify that a covered entity's compliance obligation is based on its verified emissions, rounded to the nearest whole ton, or their assigned emissions pursuant to the MRR. This modification is necessary to clarify that an entity's compliance obligation will be based on their verified emissions rounded to the nearest whole ton, in the case that an entity reports its emissions in decimal form.

Section 95850(c) was changed from requiring a 10-year data retention period to a 7-year period, to be consistent with the Western Climate Initiative (WCI) essential reporting requirements. Stakeholders also commented that a 10-year period is too long, given how much reporting data they must hold on to.

New section 95850(c)(4) requires that covered entities retain their detailed verification reports as required pursuant to the MRR for at least seven years. This was included to require that a covered entity retain all records associated with reporting and compliance obligations.

Various minor and non-substantive clarifications were made to section 95850 to ensure consistent terminology within the regulation.

19. Phase-in of Compliance Obligation for Covered Entities (Section 95851)

Various minor and non-substantive clarifications were made to section 95851 to correct cross-references and add consistent terminology within the regulation.

20. Emission Categories Used to Calculate Compliance Obligations (Section 95852)

Section 95852(a) was divided into subsections and modified to specify that a covered entity has a compliance obligation for assigned emissions. This modification was made to specify that if ARB has assigned emissions for the sources subject to a compliance obligation, then the facility will have a compliance obligation equal to the value of every $MTCO_2e$ of assigned emissions. New section 95852(a)(2) was included to specify that beginning in 2015, combustion emissions resulting from burning specific fuels are not included when calculating an entity's compliance obligation. This modification was made to clarify that the compliance obligation for these specified fuels is at the supplier level in 2015. These provisions apply only for stationary combustion, and not suppliers. These changes are necessary to ensure compliance obligations are calculated as accurately as possible.

Section 95852(b) was modified to specify how the compliance obligation is calculated for electricity marketers and retailers that import electricity, and for natural gas suppliers—who will subtract out the fuel supplied to entities subject to the cap (e.g., electricity generators) and whose obligation is based on the end user's combustion of the fuel. This modification was necessary to clarify the reference to the applicability section, and to explain that electricity deliveries are subject to the new provision prohibiting resource shuffling. In addition, the reference to thresholds was added to clarify that first deliverers have a compliance obligation only if they exceed the applicable threshold.

New section 95852(b)(1) was added to prohibit resource shuffling and minimize the potential for leakage. Leakage occurs if an entity providing electricity into California changes the identified source of the electricity, to a facility that utilizes a cleaner fuel or technology solely to claim a lower compliance obligation. In this scenario, the total actual emissions within the interconnected western electricity grid are not reduced. New sections 95852(b)(1)(A) and (b)(1)(B) contain the specific attestations that first deliverers must sign and deliver to ARB to certify that their deliveries do not include any resource shuffling. These sections work in conjunction with the newly added definition of "resource shuffling" in section 95802, and are necessary to ensure the integrity of the cap-and-trade program.

New section 95852(b)(2) clarifies that, in order to make a specified delivery claim, a first deliverer must report pursuant to the MRR, including reporting the facility's assigned identification number, and that first deliverers must be the facility operator or have ownership rights to the electricity generated by the facility. This section was added to clarify what a first deliverer must provide for it to claim a facility-specific emission factor for an electricity delivery. These sections are necessary to ensure integrity of the cap-and-trade program.

New section 95852(b)(3), in conjunction with a new definition for replacement electricity in section 95802, sets out requirements for claiming the emission factor of a variable renewable resource (wind, solar, or run-of-the-river hydroelectric) for “substitute” electricity that is delivered in place of the real-time generation. This provision is necessary to address utility concerns about the treatment of renewable electricity, and to strike a balance between recognizing the value of variable renewable electricity and limiting the possibility for double-counting of emission reductions in cases where electricity from a variable renewable resource cannot be directly delivered to California.

New section 95852(b)(4) requires direct delivery for electricity with a facility-specific emission factor lower than the default emission factor. “Direct delivery” is newly defined in section 95802. Section 95852(b)(4) is needed to ensure that claims for electricity from a specific facility are for electricity that is actually delivered to serve California load, and is not used to serve a load outside of California. This requirement is among those needed to prevent resource shuffling and leakage.

New section 95852(b)(5) requires that electricity generated from biomethane, in order to receive a zero emission factor, must meet reporting requirements pursuant to the MRR. This is added to ensure that claims for electricity from biomethane are supported by the reporting of all data necessary to demonstrate that the electricity is not subject to a compliance obligation.

In conjunction with a new definition of qualified exports, new section 95852(b)(6) allows a credit against a first deliverer’s compliance obligation based on emissions from electricity that is exported at the same time that the first deliverer is importing electricity. This provision is necessary to address stakeholder concerns regarding “simultaneous exchanges” and recognizes that this kind of exchange is similar to the wheeling of electricity through California, in that not all of the electricity being imported is actually used to serve California load.

New section 95852(b)(7) was added to include the equation for how ARB will assign a compliance obligation for electricity deliveries from jurisdictions that are not linked to the California program. Staff is seeking stakeholder input on the variables in the equation, and the equation itself, on how to assign a compliance obligation.

New sections 95852(c)(1) through (c)(4) were added to specify that suppliers of natural gas must report emissions delivered to all end users in California. These sections further specify that ARB will provide information that will enable the supplier of natural gas to subtract out the emissions attributed to covered entities for which it provides natural gas. This will leave the remaining balance of carbon dioxide equivalent (CO_2e) emissions that receive a positive or qualified positive emissions data verification statement or assigned emissions as the compliance obligation for the natural gas supplier. The amount of emissions subtracted for the covered entities as customers of the natural gas supplier will equal the amount of CO_2e emissions that received a positive or qualified positive emissions data verification statement or were assigned emissions. These sections were added to clarify how the compliance obligation will be determined for suppliers of natural gas.

Section 95852(d) was modified to specify that the compliance obligation for suppliers of petroleum products is not only for imports or deliveries into California. This is necessary to clarify what fuel delivery types are subject to a compliance obligation and which are not.

Section 95852(g) was modified to specify that carbon dioxide suppliers have a compliance obligation only for CO_2 produced in-state and either (1) supplied for in-state utilization, or (2) exported out-of-state for geologic sequestration. The compliance obligation for in-state supply of CO_2 was added because it was mistakenly omitted in the regulation. Carbon dioxide supplied for geologic sequestration can only be exempt from a compliance obligation if it is verified to be geologically sequestered through use of a Board-approved quantification methodology. Imports from carbon dioxide suppliers were excluded because CO_2 imports are relatively small and those imports would need free allocations to ensure similar treatment as in-state production of supplied CO_2. Instead of providing free allocation of allowances for a relatively small amount of CO_2, ARB chose to monitor imports; if CO_2 imports increase, ARB will reassess its treatment of imported CO_2. Exports were, for the most part, excluded from a compliance obligation because the potential emission of CO_2 would occur out of state. An exception is made for CO_2 exported for purposes of geologic sequestration (i.e., this CO_2 *will* have a compliance obligation) because ARB does not want to incentivize out-of-state geologic sequestration without rigorous assurance that the CO_2 will remain permanently stored underground.

Section 95852(h) was deleted and moved to new section 95852(i) to incorporate the correct numbering structure and put it at the end of section 95852.

New section 95852(h) was added to specify emissions categories used to calculate compliance obligations for oil and gas producers, to be consistent with the MRR for purposes of entities that report and hold a compliance obligation.

21. Compliance Obligations for Biomass-Derived Fuels (Section 95852.1)

Section 95852.1 was clarified to accurately reflect source categories and fuel types that have a compliance obligation, and that other biomass CO_2 reported under the MRR has a compliance obligation. This clarification is necessary to ensure that regulated entities' compliance obligations are correctly calculated.

22. Eligibility Requirements for Biomass-Derived Fuels (New Section 95852.1.1)

New section 95852.1.1(a) was added to require emissions from biomass-derived fuels to be verified under the MRR and receive a positive or qualified positive emissions data verification statement or assigned emissions to be exempt from a compliance obligation. These requirements were originally found in MRR section 95131(i)(1)(A); however, staff moved them into this section in the cap-and-trade regulation so that all provisions defining a compliance obligation are in one regulation.

New section 95852.1.1(a)(1) specifies that the contract shuffling date for purchasing any biomass-derived fuel must be in effect prior to January 1, 2012, and remain in effect or have been renegotiated with the same California operator within one year of contract expiration. This section is necessary to prevent contract shuffling wherein contracts are being diverted to California by entities seeking to avoid a compliance obligation for fossil fuels. Contract shuffling could allow fossil emissions to increase in states where the biofuel was previously combusted, which could result in no net change in emissions and emissions leakage. The January 1, 2012, date was changed from the original date in the MRR of January 1, 2010, in response to stakeholder comments that staff needed to allow time for contracts to go through the California Energy Commission (CEC) process for RPS certification.

New sections 95852.1.1(a)(1)(A) and (B) were added to provide the requirements that biofuel has to meet once a signed contract is in place. These sections are necessary to clarify how new and increased production for purposes of contract shuffling will be treated.

New section 95852.1.1(a)(2) was added to specify that fuel provided under any contracts after January 1, 2012, must be for additional biomass-derived capacity, and not a transfer of existing biomass fuel from out of state. This section is necessary to prevent emissions leakage.

New section 95852.1.1(a)(3) was added to specify that the biomass fuel must meet the requirements in sections 95852.1.1(a)(1) and (a)(2), and a verifier must be able to track the fuel back to a previous contract. This section is necessary to track where the fuel is coming from and to prevent double-counting of the fuel in case it is under another contract.

New section 95852.1.1(a)(4) specifies that once a certification program is in place, a fuel that meets the requirements of sections 95852.1.1(a)(1) and 95852.1.1(a)(2) will always be considered to have met the requirements in section 95852.1.

New section 95852.1.1(a)(5) specifies that if the biogas or biomethane is used at the site of production, and is not transferred to another operator (therefore not requiring a contract), then the operator must demonstrate that the fuel has been used or combusted in California prior to January 1, 2012. This section is necessary to make sure that the fuel was not previously used to produce useful energy transfer, or was being sent elsewhere and is now diverted to a capped entity, resulting in emissions leakage.

Section 95852.1.1(b) specifies that as part of a biomass-derived fuel's eligibility to avoid a compliance obligation, no party may sell, trade, give away, claim, or otherwise dispose of any of the carbon credits, carbon benefits, carbon emissions reductions, carbon offsets, or allowances, howsoever entitled, attributed to the fuel production that would prevent the resulting combustion from not having a compliance obligation. This section was necessary to specify that Generation of Renewable Energy Credits is allowable and will not prevent a biomass-derived fuel that meets this section's requirements from being exempt from a compliance obligation. However, to prevent double-counting of the environmental attributes of utilizing biomass derived fuel, the section prevents another source from claiming the benefits realized or using the benefits to fulfill a compliance obligation, or for any other purposes.

23. Emissions without a Compliance Obligation (Section 95852.2)

Section 95852.2(a) was modified to further clarify which types of waste sources do not have a compliance obligation. This modification did not exclude any sources that were included in the original regulation. Also in this section, staff deleted text that would not allow biogas from digesters to be exempt from a compliance obligation. This change was made based on staff's recommendation endorsed by the Board under Attachment B of draft Resolution 10-42.

New section 95852.2(a)(9) was added to specify that emissions from geothermal generating units and geothermal facilities do not hold a compliance obligation. Stakeholders submitted comment letters stating that emissions from geothermal facilities should not be classified as fugitive or process emissions, and should therefore not have a compliance obligation. Based on these comments, staff concluded that although geothermal facilities must report, they will not hold a compliance obligation. ARB will monitor their activities via the CEC renewable programs.

Sections 95852.2(a)(10) through (12) were included to clarify which source categories count toward the applicable reporting thresholds but do not count toward a covered entity's compliance obligation.

Section 95852.2(b) clarifies which fugitive and process emissions count toward a reporting threshold but do not count toward an entity's compliance obligation.

Sections 95852.2(b)(4) through (17) were included to align with the WCI Reporting Committee's revised list of "reporting only" emissions sources. This updates the sources listed in the Final Essential Requirements for Mandatory Reporting. Emissions data from these source types will be submitted for information only, and will not be subject to a compliance obligation.

Original sections 95852.2(d)(2)(A) through (F) have been removed. Based on stakeholder comments, staff determined that there are many conversion technologies that can be used to make a clean fuel from municipal solid waste, including anaerobic digestion. This language could be interpreted to apply these limitations to all forms of conversion, not just gasification. Original provisions 95852.2(d)(2)(E) and (F) have been removed as well so that the limitations imposed on gasification are not applied to all municipal solid waste conversion to clean burning fuel.

Various minor and non-substantive clarifications were also made to section 95852.2, to include the correct hierarchy in the numbering structure and consistency with the terminology used in the MRR for these sources.

24. Effect of Status Verification Statement on Calculation of Compliance Obligations (Section 95852.3)

This section was removed from the regulation because it is duplicative of language that exists in MRR section 95103.

25. Calculation of Covered Entity's Triennial Compliance Obligation (Section 95853)

Sections 95853(a), (b), (c), and (d) were modified to clarify that an entity's compliance obligation is calculated as the total of the emissions that received a positive or qualified positive emissions data verification statement, or were assigned by the Executive Officer. These revisions are necessary to clarify that when a reporting entity that holds a compliance obligation under the cap-and-trade regulation fails to submit an emissions data report or fails to obtain a positive or qualified positive emissions data verification statement by the applicable deadline, the Executive Officer will develop an assigned emissions level for the reporting entity, as specified in section 95131(c)(5)(A) through (C) of the MRR.

26. Quantitative Usage Limit on Designated Compliance Instruments—Including Offset Credits (Section 95854)

New section 95854(a) was originally expressed as part of the "O" term in the equation in this section and was moved into its own section to make it more clear which compliance instruments are subject to the quantitative use limit. This original text was also modified to include a reference to ARB offset credits (section 95820(b)), which was inadvertently omitted from the original regulatory text.

The text in new section 95854(b) now references section 95854(a), to make it clear which compliance instruments are subject to the quantitative usage limit. This text, as well as the modified text in the O_o and S terms of the equation, establishes that the quantitative usage limit applies to the triennial compliance obligation, not to the annual compliance obligation. This modification was made in response to stakeholder comments. Staff agrees with stakeholders, who have indicated that applying the limit to each annual surrender is overly complicated, and there is no benefit to the program when applying it annually.

Section 95854(c) was added to clarify that sector-based offset credits may only be used for up to 25 percent of the 8 percent total limit on designated compliance instruments, increasing to one-half of the 8 percent in the second compliance period. This reflects the intended changes identified for this section in Attachment B of Resolution 10-42.

27. Annual Compliance Obligation (Section 95855)

Section 95855 was modified to be consistent with section 95853 and the MRR.

28. Timely Surrender of Compliance Instruments by a Covered Entity (Section 95856)

Sections 95856(a) and (d) were modified to provide additional time for an entity to meet its annual surrender obligation. Changing the date to November 1 provides consistency between the annual surrender and triennial surrender. The extended deadline will also allow allocations to be distributed for the following year based on verified data.

Section 95856(e) was clarified to provide consistent terminology and process with the MRR. This section provides detail on what information will be needed to determine the triennial compliance obligation.

Minor and non-substantive clarifications were also made to section 95856, to add consistent terminology and correct cross-references within the regulation.

29. Untimely Surrender of Compliance Instruments by a Covered Entity (Section 95857)

Section 95857(b)(4) was modified to provide a covered entity time to acquire compliance instruments from an auction or reserve sale before being required to provide ARB the number of compliance instruments assessed for an untimely surrender. This change is necessary because several commenters were concerned that the originally proposed regulation did not allow enough time to acquire excess compliance instruments, and the immediacy of the surrender would create an unstable market. By extending the time for the untimely surrender obligation to be due after an auction and a reserve sale, ARB expands an entity's ability to comply with the excess emissions surrender obligation without resorting to the secondary market.

Section 95857(c) was rewritten to outline the consequence of not meeting the untimely surrender obligation. Section 95857(c)(1) indicates that ARB will determine the number of violations. Section 95857(c)(2) indicates the entity will have a new untimely surrender obligation that includes the original untimely surrender obligation that has not been satisfied. This new obligation is due immediately. These changes are necessary because a new time frame is created by the changes to 95857(b)(4), and additional rules regarding the calculation of the obligation are necessary in the event of a partial surrender. This section is necessary to inform all regulated parties of the consequences of missing the untimely surrender obligation deadline.

Section 95857(d) was modified to transfer three-fourths of the untimely surrender amount to the Auction Holding Account instead of to the Allowance Price Containment Reserve. This change was made in response to stakeholder concerns that putting the untimely surrender allowances in the Allowance Price Containment Reserve would tighten the allowance market for all participants.

Minor and non-substantive clarifications were also made to section 95857 to add consistent terminology and correct cross-references within the regulation.

30. Compliance Obligation for Under-Reporting in a Previous Compliance Period (New Section 95858)

New section 95858 was added to address cases when the Executive Officer finds there has been under-reporting by an entity after it has submitted compliance instruments to meet its compliance obligation. These provisions are necessary so that entities with a compliance obligation know what action the Executive Officer will take in the event they are found to have under-reported their emissions.

New section 95858(a) provides that entities that are found to have under-reported their emissions by less than five percent must not take any further action to replace the deficient compliance instruments. This corresponds with the requirements of the MRR.

New section 95858(b) provides that entities that are found to have under-reported their emissions by more than five percent must surrender compliance instruments in the amount calculated pursuant to the formula in this section. This amount equals the amount of emissions determined by the Executive Officer minus the reported and verified emissions and minus five percent of the reported and verified emissions. The reported and verified emissions are multiplied by five percent and subtracted out because the MRR allows for an understatement of up to five percent in reporting. Requiring entities that under-report emissions to surrender compliance instruments equal to 105 percent of the under-reported emissions, ensures the environmental integrity of the program.

New section 95858(c) was added to provide entities required to turn in compliance instruments for under-reported emissions a six-month period to submit them to ARB. Staff included a six-month period to give covered entities enough time to acquire sufficient compliance instruments and avoid any short-term shocks to the market. This section also specifies which compliance instruments may be used to meet this requirement and provides that if the entity turns in all of the compliance instruments within the six-month period they are not subject to the excess emissions obligation under section 95857. If the entity turns them in within the six months, ARB considers the submittal to be a timely surrender.

31. Disposition of Allowances (Section 95870)

Section 95870(a) was modified to change the date of creation of the Allowance Price Containment Reserve to July 18, 2012, to accommodate the change in the auction schedule in 2012. Since no allowances will be issued for 2012, the reserve will be filled only with allowances issued from 2013 through 2020. Section 95870(b) was modified to change the date at which the Executive Officer would transfer future vintage allowances to the Auction Holding Account. Both changes are necessary to reflect the change in dates of the first auction and reserve sales.

Section 95870(b) also was modified to increase the amount of future vintage allowances auctioned each year from two percent to 10 percent of future allowance budgets. This change is required to respond to stakeholder concerns about preparing for the second compliance period, when the program size increases due to the addition of the transportation fuels and upstream natural gas sectors. The increase in the advance auction will allow covered entities to accumulate allowances for the second compliance period while diminishing the need to bank allowances from the first compliance period, which might otherwise tighten the first compliance period's market more than is optimal.

New section 95870(c), was added to include new language as directed in Resolution 10-42 to specify how many allowances will be set aside for Voluntary Renewable Electricity reductions. Section 95870(e), which was originally reserved as a placeholder for the allocation to voluntary renewable energy allowance set aside was deleted.

Original section 95870(c), now section 95870(d), was modified to reflect an increased number of allowances available for allocation to electrical distribution utilities. Additionally, Table 8-1 has been updated to clarify the relationship between activities that produce products at risk for leakage and the sectors in which these activities occur.

32. General Provisions for Direct Allocations (Section 95890)

Section 95890 was modified to better clarify how verification impacts eligibility for free allocation.

33. Allocation for Industry Assistance (Section 95891)

In section 95891(b), the formula was modified to change the timing of output data, in response to stakeholder concerns about prolonged exposure to recessionary output levels. A "true-up" term was added to the equation to ensure that the amount of allocation received for a given year is corrected to actual production for that year. The assistance factor (determined by leakage risk) and the cap decline factor were clarified to be a function of activity rather than of sector.

The product benchmarks for industrial activities, as presented in Table 9-1 of section 95891(b), were added per Resolution 10-42, to allow allowances to be allocated under the product-based approach. The product outputs used to establish the product benchmarks were altered from the proposal outlined in staff's Initial Statement of Reasons (ISOR) as necessary.

The name of the "thermal energy based allocation calculation methodology" in section 95891(c) was renamed the "energy-based allocation calculation methodology" to more explicitly recognize the impact of electrical energy carbon costs and cost recovery. A new term was derived from a heat rate based on the pending Public Utilities Commission Qualified Facility settlement to quantify the expected carbon cost recovery in the price of power sold from an industrial facility. Equivalent adjustments were made when establishing the values of the product-based benchmarks. The formula was also altered to show how allocations to any combined heat and power facilities will receive allowances under this approach.

In section 95891(c)(1), text was added to explain that under the energy-based approach, the baseline annual amount of California GHG allowances directly allocated to each eligible entity will be representative of current activity but provide appropriate credit for early voluntary reductions in GHG emissions. The descriptions of data sources that ARB will use to allocate under this methodology were clarified, and it was explained that, if necessary, the Executive Officer will solicit additional data to establish a representative baseline allocation. This change is necessary to ensure that covered entities clearly understand how the allowances are allocated among eligible entities.

The cap decline factor table (Table 9-2) in section 95891(c) was altered slightly to show that this factor impacts the allocation to electrical distribution utilities, as well as to industrial facilities, and to remove the year 2012 to accommodate the change in compliance obligation start date.

34. Allocation to Electrical Distribution Utilities for Protection of Electricity Ratepayers (Section 95892)

This section was modified to show how many allowances each electrical distribution utility will receive as a portion of the total electricity sector allocation created in section 95870. This allocation to each utility is presented in Table 9-3 of section 95892(f). Appendix A explains how these values were derived.

Additionally, Table 9-3 was added to include the specific percentage allocation of allowances to individual electrical distribution utilities.

Section 95892(a) was added to explicitly state ARB's intent that allowances allocated to electrical distribution utilities be used for ratepayer benefit, and any proceeds from the sale of allowances be similarly used for ultimate ratepayer benefit.

Section 95892(c) was modified to delete the existing requirement that electrical distribution utilities offer all allowances in their limited use holding accounts to auction within the year they were received. New section 95892(c)(1) requires that one-sixth of all 2013 vintage allowances in limited use holding accounts must be consigned to auction in each of the two auctions scheduled for 2012. Section 95892(c)(2) recreates the existing consignment requirement for auctions taking place in calendar years after 2012. These changes were needed to accommodate the decision to have two auctions of vintage 2013 allowances in 2012 before the beginning of the first compliance period in 2013.

As detailed in footnote 22 of the ISOR for the cap-and-trade regulation, some generators and industrial steam producers have reported that some existing contracts do not include provisions that would allow full pass-through of carbon costs associated with cap-and-trade. Staff is evaluating this issue to determine whether some specific contracts may require special treatment on a case-by-case basis. In several cases, staff is aware and encouraged that parties are in the process of, or already have, negotiated new contracts to resolve this issue. Staff believes that bilateral contract negotiations would provide the best resolution of this issue. Should contract renegotiation not be possible in all cases, staff will continue discussions with counter-parties to consider how this issue should be resolved in the regulation.

Section 95892(d) requires auction proceeds from consigned allowances to be used only for ratepayer relief. Some stakeholders have expressed concerns with these provisions. Staff is requesting comments on these provisions.

Section 95892(e) was modified to require reporting of the use of allowance value to ARB. These changes are necessary to ensure that allowance value is being used for ratepayer benefit, consistent with ARB's stated policy.

Section 95892(f) was added to clarify that any use outside of ratepayer benefit of allowance value is prohibited under this regulation. This section is necessary to ensure that all entities subject to the regulation are aware of the limited use of allowance value pursuant to this regulation.

35. Reserved for Allocation to Natural Gas Distribution Utilities for Protection of Natural Gas Ratepayers (Section 95893)

No modifications were made to section 95893.

36. Auction of California GHG Allowances (Section 95910)

Section 95910(a) was modified to match the new schedule of auctions and reserve sales. This was necessary to accommodate covered entities' verification deadlines in the MRR and the decision to have two auctions in 2012 and four from 2013 forward.

Section 95910(c)(1) modifies an existing provision that one-fourth of the allowances allocated for auction each year will be sold at each auction, to reflect the decision to begin such auctions in 2013.

Section 95910(c)(2) was modified to have the existing requirements for the advance auction begin in 2013, not 2012. One-half of the 2015 vintage allowances allocated to the advance auction will be sold at each of the two auctions taking place in 2012. This clarification is necessary because the forward auction for the 2015 vintages will be provided over two auctions, in contrast to the forward auction of 2016 vintage allowances, which will be provided over four auctions.

Section 95910(d)(4) was modified to reflect the change in the auction schedule. For auctions beginning in 2013, the allowances must now be consigned to the auction at least 75 days prior to the auction. The modified provisions require that for the two auctions in 2012, the consignments need occur only 10 days before the auction, because the number of allowances to be consigned is set in the regulation and will be known in time to be included in the auction notice.

37. Format for Auction of California GHG Allowances (Section 95911)

Section 95911(b)(4)(A) was added to clarify that unsold, non-consigned allowances at auction will be allocated equally to the three tiers of the Allowance Price Containment Reserve. Any allowances remaining after this division will be deposited in the lowest-priced tier. Section 95911(b)(4)(B) was added to clarify that unsold future vintage allowances will be returned to the Auction Holding Account for sale at the next auction.

Section 95911(b)(6) modifies the effective dates of the reserve price and the reserve price escalator to reflect the new schedule for auctions. The reserve price for the sale of vintage 2015 allowances in 2012 was changed to reflect the value of the reserve price that would prevail in 2015.

Original section 95911(c) was deleted to remove a reference to provisions on disclosable bidding associations. ARB removed the existing provisions for disclosable bidding associations after changes to corporate associations and beneficial holding rules rendered the bidding association provisions unnecessary.

New section 95911(c) was reorganized for clarity, and in particular that the original text does not apply to the advance auction. The purchase limit for the advance auction will be 25 percent. A higher purchase limit was chosen for the advance auction because staff concluded that there is a lower risk of market manipulation after the advance auction compared with the current vintage auction, due to the lower proportion of each year's allowance budget sold at the advance auction and because future vintage allowances cannot be used for current compliance.

38. Auction Administration and Registration (Section 95912)

New section 95912(a)(2) was added to allow the Executive Officer to designate a financial services administrator to execute the financial transactions required for the market program's implementation. These changes were necessary because it is highly probable that the Executive Officer will contract for these services. Clarifications were also made regarding the confidentiality of auction-related data in new section 95912(f).

Several new provisions were added, on the maintenance of auction registration (new section 95912(d)), restriction on communicating confidential information (new section 95912(e)), and the protection of confidential information by the Executive Officer (new section 95912(f)). Original section 95912(e) on the provision of false information was moved to section 95914(c), along with other provisions regarding auction participation and prohibited behavior, because it was more contextually appropriate to include those provisions in the requirements for auction participation.

39. Sale of Allowances from the Allowance Price Containment Reserve (Section 95913)

Section 95913 was modified to provide clarification on the sale of allowances from the allowance price containment reserve.

Section 95913(a) was modified to clarify that a financial services administrator will conduct the financial transactions for sales from the Allowance Price Containment Reserve Account. This is necessary to make clear that ARB will not actually be conducting financial transactions, and that they will occur only through a third party.

Section 95913(c) was modified to clarify that only covered entities that are registered with the cap-and-trade program shall be eligible to purchase allowances from the Allowance Price Containment Reserve Account. This clarification and limitation is necessary because the purpose of the Allowance Price Containment Reserve Account is to protect covered entities from the possibility of allowances being unavailable. If all registered participants were able to purchase from the Allowance Price Containment Reserve Account, the policy of ensuring that allowances are available would be substantially undermined.

Staff made two changes to accommodate the change in start date for the compliance obligation in the cap-and-trade program. In section 95913(c)(3)(A) the date of the first reserve sale was changed from 2012 to 2013. In sections 95913(d)(2) and (3) staff changed the effective dates for setting the prices in each tier, as well as the price escalation mechanism, to reflect the new compliance obligation start date.

Section 95913(e)(2) was modified to include the role of a financial services administrator in the processing of the bid guarantee.

To address stakeholder concerns, section 95913(f)(3) was modified to implement a new process for determining the number of allowances purchased from the Allowance Price Containment Reserve. This change was made in response to stakeholder comments that the original bid process in original section 95913(e)(1) was unnecessarily cumbersome, and together with the tie-breaking procedure could result in bidders paying too much for, or not getting, the allowances they need. Some stakeholders recommended that ARB replace bidding on specific tiers of the reserve with a process in which bidders specify a quantity and a maximum price, and the bids are filled with the lowest-priced allowances available. ARB requests comment on whether this process represents a simplification and reduces uncertainty.

Various other minor and non-substantive clarifications were also made to section 95913.

40. Disclosure of Direct and Indirect Corporate Associations (Section 95914)

Section 95914 was renamed Auction Participation and Limitations and modified to move original text regarding disclosable corporate associations to new section 95833 in subarticle 5. Text regarding the application of corporate associations to the holding limit was also moved to section 95920. Text was also added to clarify how the corporate and bidding association rules are applied to the purchase limit at auction. Text relating to provision of false information and protection of confidential information was moved from section 95912(e) to section 95914(c). These changes were necessary to place the language in the appropriate context within the regulation.

41. Identifying Disclosable Bidding Associations (Section 95915)

Section 95915 has been deleted. The expanded requirements on corporate associations in new section 95833, and beneficial holdings in new section 95834, have made the existing requirements on disclosable bidding associations unnecessary. Parts of section 95915(e) were also moved to section 95914.

42. Trading (Section 95920)

Original section 95920(a) on general prohibitions on trading was moved to section 95921. Text on the holding limit (originally in section 95920(b)) was significantly rewritten for clarity and several new subsections added. New section 95921(a) reference the definition of corporate association to new section 95833.

New section 95921(b) adds new provisions explaining that the holding limit does not apply to allowances contained in a limited use holding account. In addition, allowances held by a clearing entity will be counted against the holdings of the entity to whose account the instruments will be transferred when the transaction has been cleared. The section adds a requirement that if a transaction is discovered to violate the holding limit after the transaction has been discovered, then the transaction may be reversed and a penalty applied.

New section 95920(c) was added to clarify that the holding limit will be applied separately to allowances which can be used for current compliance and to allowances from future vintages that cannot be used for current compliance.

New section 95920(d)(1) contains the existing holding limit formula to be applied to allowances that can be used for current compliance. New section 95920(d)(2) contains an extensive clarification of the calculation of the existing limited exemption from the holding limit in section 95920(d)(1). Stakeholders had commented that the language did not convey that the exemption was cumulative through the compliance period, nor was it clear how the exemption would be calculated based on emissions reports.

New section 95920(e) contains a formula for calculating the holding limit for future vintage allowances that cannot be used for current compliance. The formula is similar to the one in section 95920(d)(1), except that the “base” parameter was multiplied by three and the formula is calculated using the entire compliance period budget rather than a single budget year.

43. Conduct of Trade (Section 95921)

Section 95921(a) was rewritten to address the handling of violations that are detected before the transaction is registered, as well as those that are detected after the transaction is registered. Specifically, the section now addresses the consequences of violating the requirements of subarticle 11 at two possible times: if the violation is discovered before the transaction is recorded (section 95921(a)(1)(A)) and if the violation is discovered after the transaction is recorded (section 95921(a)(1)(B)). These clarifications were necessary to inform covered entities and participants in the cap-and-trade program of the consequences of violating the various restrictions in subarticle 11. New section 95921(a)(2) was added to clarify that the account numbers to be used in transactions between registered entities are those of holding accounts.

A new section 95921(b)(3) was added to make explicit that violations of subarticle 11 also subject participants in the cap-and-trade program to penalties pursuant to section 96013. This addition is necessary to make explicit the scope of the penalties available to ARB in the event of a violation of the restrictions of subarticle 11, and to make clear that the specific actions of sections 95921(a)(1) and (a)(2) are not exclusive.

New section 95921(d) was added to provide provisions on the protection of confidential market information. New sections 95921(e) and (f) were added to move existing provisions in other sections to this section, with some clarifications.

44. Banking, Expiration, and Voluntary Retirement (Section 95922)

No modifications were made to section 95922.

45. General Requirements (Section 95940)

No modifications were made to section 95940.

46. Procedures for Approval of External GHG ETS (Section 95941)

No modifications were made to section 95941.

47. Approval of Compliance Instruments from External GHG ETS (Section 95942)

No modifications were made to section 95942.

48. Reserved for Linkage (Section 95943)

No modifications were made to section 95943.

49. General Requirements for ARB Offset Credits (Section 95970)

Section 95970 was modified to distinguish between an ARB offset credit and a registry offset credit, and to establish the requirements that each must meet. These clarifications were necessary because the originally proposed language could have been interpreted to mean that any offset credit could be used in the cap-and-trade program, without limiting them to ARB-issued offset credits.

Various minor and non-substantive clarifications were also made to section 95970.

50. Procedures for Approval of Compliance Offset Protocols (Section 95971)

No modifications were made to section 95971.

51. Requirements for Compliance Offset Protocols (Section 95972)

Section 95972(c) was added to require that all Compliance Offset Protocols must specify the geographic location where they are applicable. This requirement clarifies that compliance offset protocols can only be applicable in North America. This change was necessary because stakeholders were confused about the possible location of the offset projects for which ARB would issue ARB offset credits.

Section 95972(a) was also modified to require that Compliance Offset Protocols include standardized methods. As discussed in the ISOR, this ensures a consistent implementation of all offset projects within a project type.

52. Requirements for Offset Projects Using ARB Compliance Offset Protocols (Section 95973)

Section 95973 was modified to address stakeholder comments by clarifying the eligibility criteria for offset projects. The text was also modified to address requirements that unintentionally would prohibit early action offset projects from being able to transition to Compliance Offset Protocols based on the offset project commencement date. A new section 95973(c) now makes it clear that early action offset projects may have commencement dates prior to December 31, 2006, which is consistent with the requirements in section 95990.

Section 95973(d) was added to clarify that offset projects developed on lands related to federally recognized Indian Tribes are eligible only if the Offset Project Operator or Authorized Project Designee demonstrates the existence of a limited waiver of sovereign immunity between the Tribe and ARB, entered into pursuant to section 95975 of this article. This modification also clarifies the categories of lands to which this requirement applies. This new provision is needed to ensure Offset Project Operators or Authorized Project Designees meet the requirements for listing in section 95975.

Various minor and non-substantive clarifications and updates were also made to section 95973.

53. Authorized Project Designee (Section 95974)

Section 95974 was modified to clarify when an Offset Project Operator may identify an Authorized Project Designee in response to stakeholder comments, and to correct and add several cross-references within the regulation.

54. Listing of Offset Projects Using ARB Compliance Offset Protocols (Section 95975)

Section 95975(a)(3) was deleted and moved to section 95975(b) to place the language in the appropriate context within section 95975.

Language was added to section 95975(c)(2) to specify that all Offset Project Operators or Authorized Project Designees specifically submit to California's jurisdiction to resolve any disputes regarding enforcement of the regulation against the Offset Project Operator or Authorized Project Designee. This change is necessary to make clear to Offset Project Operators or Authorized Project Designees that by participating in California's cap-and-trade program in this capacity, they will be subject to California's jurisdiction, regardless of the offset project's physical location.

New section 95975(c)(3) was added to include additional attestations that must be made when an offset project is listed. Original section 95975(c)(4) was deleted and moved to section 95975(d) to place the language in the appropriate context within section 95975.

New section 95975(c)(5) requires that an Offset Project Operator or Authorized Project Designee disclose any offset credits issued for the same project for any other purposes in any other program. This is to address stakeholder concerns regarding any double-counting of the GHG reductions or GHG removal enhancements in multiple programs.

New section 95975(l) was added to clarify that a Tribe, in addition to meeting the other offset project listing requirements, must also enter into a limited waiver of sovereign immunity with ARB related to the Tribe's participation in the cap-and-trade program prior to the listing of any offset project being developed on lands related to the Tribe, as specified in section 95973(d). This ensures ARB's ability to pursue judicial remedies, if necessary, regarding these offset projects when enforcing the requirements of the Compliance Offset Protocols and the cap-and-trade regulation.

Various minor and non-substantive clarifications were also made to section 95975 to ensure consistency in terminology and references throughout the regulation.

55. Monitoring, Reporting, and Record Retention Requirements for Offset Projects (Section 95976)

Section 95976(d) was modified to address stakeholder concerns about a calendar year reporting period with a fixed annual "verification period." To address these stakeholder concerns, the new requirements cover a reporting period that is not tied to the calendar year.

The record retention requirements in section 95976(e)(2) were changed to 15 years following the issuance of ARB offset credits due to stakeholder concerns about an unnecessarily long record retention requirement for forestry projects.

Various minor and non-substantive clarifications were also made to section 95976.

56. Verification of GHG Emission Reductions for GHG Removal Enhancements from Offset Projects (Section 95977)

Section 95977(e) was moved to a new section 95977.1 in response to stakeholder comments that the references in original section 95977 throughout the regulation were very lengthy and hard to follow. Additional modifications were made to the timing for the verification schedule (sections 95977(b) and (c)) and the submittal of Offset Verification Statements (section 95977(d)), to be consistent with the new offset reporting schedule in section 95976(d) and to clarify the verification cycle.

Various minor and non-substantive clarifications were also made to section 95977 to ensure consistency in terminology throughout the regulation.

57. Requirements for Offset Verification Services (New Section 95977.1)

New section 95977.1 was added in response to stakeholder comments that the references in the original section 95977 to other sections throughout the regulation were very lengthy and hard to follow.

Original section 95977(e)(1), now new section 95977.1(a) dealing with rotation of verification bodies, was modified to clarify that the rotation of verification bodies must occur on an offset project basis. The intent of the language was not changed. These clarifications were made in response to stakeholder comments that it was unclear if the rotation of verification bodies every six years applied at the individual offset project level or Offset Project Operator level.

Original section 95977(e)(2)(C)(iv), now new section 95977.1(b)(3)(D) dealing with site visits for offset projects, was modified to allow site visits to be conducted at least once every six years for those forest offset projects approved for less-intensive verification. These changes were made in response to stakeholder comments that annual site-visit verifications for forest projects are cost-prohibitive and unnecessary. Staff agrees that as long as on-site verification is conducted at least once every six years, there is reasonable assurance.

A new requirement was added to original section 95977(e)(2)(C)(iv)(a.), now new section 95977.1(b)(3)(D)(1.) that requires the offset verification team to review the listing information submitted by the Offset Project Operator or Authorized Project Designee. This requirement is needed to ensure the offset verification team is satisfied that all of the correct documentation was submitted by the Offset Project Operator or Authorized Project Designee.

Original section 95977(e)(2)(C)(xvii), now new section 95977.1(b)(3)(Q), was modified to change the term “errors” to “discrepancies” in the formula for calculating offset material misstatement. This change was necessary because the definition of offset material misstatement uses the term “errors” twice with two different meanings, and the terminology for the calculation of offset material misstatement in this provision needs to be consistent with the revised definition.

Original section 95977(e)(2)(C)(xviii)(d)(i), now new section 95977.1(b)(3)(R)(4.)(a.), was modified to require that a verification body must submit verification reports to Offset Project Registries with the Offset Verification Statement. This provision is necessary to ensure that the Offset Project Registries possess all pertinent information regarding the offset project.

Original section 95977(e)(2)(C)(xviii)(d)(iii), now new section 95977.1(b)(3)(R)(4.)(c.), was modified to disallow the use of Qualified Positive Offset Verification Statements for certain project types, if specified in the Compliance Offset Protocol. The revisions to Compliance Offset Protocol U.S. Forest Projects disallows the use of Qualified Positive Offset Verification Statements because, for forest projects, ARB must ensure that all protocol requirements are met, including sustainable harvesting requirements.

Original sections 95977(e)(2)(C)(xix)(a.) through (c.) were modified and/or deleted and replaced with new sections 95977.1(b)(3)(R)(5.) through (7.). These changes reflect the deletion of Offset Project Registries from the appeals process for Adverse Verification statements. This was clarified to be consistent with the MRR, and it reflects stakeholder comments that the appeals process should only be limited to determinations made by the Executive Officer of ARB and that ARB should be the only one to make these determinations.

Various minor and non-substantive clarifications were also made to the original section 95977(e) which is now part of section 95977.1. These include general clarifications to ensure consistency of terminology and correct section references within the regulation.

58. Additional Project-Specific Requirements for Offset Verification Services (New Section 95977.2)

New section 95977.2 was added to replace the original section 95977(f) in response to stakeholder comments that the references in the original section 95977 to other sections throughout the regulation were very lengthy and hard to follow. No substantive changes were made to the actual text.

59. Offset Verifier and Verification Body Accreditation (Section 95978)

Various minor and non-substantive changes were made to section 95978 for consistency in terminology within the regulation.

60. Conflict-of-Interest Requirements for Verification Bodies for Verification of Offset Project Date Reports (Section 95979)

Section 95979 was modified to include new Board-directed text in Resolution 10-42 that clarifies the conflict-of-interest requirements as they pertain to air districts. Changes were also made to include personal or family relationships as a medium for potential for conflict of interest to strengthen the conflict-of-interest requirements between verifiers and Offset Project Operators and Authorized Project Designees. This is also consistent with the MRR.

Various minor and non-substantive clarifications were also made to section 95979 for consistency in terminology within the regulation.

61. Issuance of Registry Offset Credits (Section 95980)

The process for issuance of registry offset credits and ARB offset credits was clarified by revising sections 95980 and 95981 and adding new section 95980.1 and 95981.1. Sections 95980 and 95980.1 apply specifically to the issuance of registry offset credits; sections 95981 and 95981.1 apply specifically to the issuance of ARB offset credits.

Section 95980 was modified to apply only to the issuance registry offset credits issued by an Offset Project Registry. Registry offset credits are not allowed to be used for compliance in the program, because only compliance instruments issued by ARB or an approved program for linkage may be used for compliance.

Various minor and non-substantive clarifications were also made to section 95980 to ensure consistency of terminology and correct section references within the regulation.

62. Process for Issuance of Registry Offset Credits (New Section 95980.1)

New section 95980.1 was added to clarify the process by which a registry would issue registry offset credits. The processes for issuing both registry and ARB offset credits were originally in section 95981. This new section and new section 95981.1 were added to establish the difference between the processes for issuing a registry offset credit and those for issuing an ARB offset credit, and to provide clarity.

63. Issuance of ARB Offset Credits (Section 95981)

Section 95981 was modified to apply only to the issuance of ARB offset credits. ARB offset credits can only be issued by ARB because they are able to be used for compliance. The issuance of both ARB offset credits and registry offset credits were originally in section 95980. This modified section and modified section 95980 clarify the difference between the issuance of ARB offset credits and registry offset credits. In addition, new attestations that must be made by Offset Project Operators and Authorized Project Designees were added to the process for issuing ARB offset credits (new section 95981(c)). This will help to ensure that all program requirements are met before ARB offset credits are issued. To ensure that stakeholders are not confused, and for ease of review, the previous section 95981 is shown in complete strikeout, and new section 95981 is underlined.

64. Process for Issuance of ARB Offset Credits (New Section 95981.1)

New section 95981.1 was added to clarify the process by which ARB would issue ARB offset credits. The processes for issuing both registry and ARB offset credits were originally in section 95981. This new section and new section 95980.1 were added to establish the difference between the processes for issuing a registry offset credit and an ARB offset credit, and to provide clarity. Only ARB can issue compliance instruments, including ARB offset credits that can be used for compliance. ARB offset credits are issued by ARB once ARB receives all attestations required by offset project developers, authorized project designees, and verification bodies. This section also clarifies that ARB will make the final determination on whether or not a registry offset credit meets the requirements to meet all requirements of the regulation.

65. Registration of ARB Offset Credits (Section 95982)

Section 95982 was modified to include minor and non-substantive clarifications, and to improve consistency in terminology.

66. Forestry Offset Reversals (Section 95983)

Section 95983(a) was modified to delete text that was duplicative of text in section 95983(a)(3). Text in section 95983(a)(3) was revised for clarity, without changing the intent.

The timing for Offset Project Operators or Authorized Project Designees to notify ARB of an intentional reversal was changed in section 95983(b) from six months to 30 days. Staff believes that since the notification is based on the discovery of the reversal, as opposed to its occurrence, that 30 days is sufficient for notification. Section 95983(b)(1)(A) was moved to section 95983(b), and section 95983(b)(1)(B) was moved to section 95983(b)(1), to provide clarity without changing the original text's intent. Section 95983(b)(2) was modified to clarify how ARB offset credits are retired from the Forest Buffer Account in the event of an unintentional reversal and to remove an inaccurate citation.

Sections 95983(c)(1) and original section 95983(c)(2) were modified and/or deleted to clarify the process for notifying ARB of an intentional reversal. ARB will not notify the Offset Project Operator or Authorized Project Designee of its determination because the occurrence of an intentional reversal is required to be verified in new section 95983(c)(2) within one year of the occurrence of an intentional reversal. This verification will determine if there is an intentional reversal.

New section 95983(c)(3) replaces original section 95985(e), which requires that Offset Project Operators or Authorized Project Designees replace ARB offset credits with valid compliance instruments in the case of an intentional reversal. The original replacement timing was 30 days, and staff changed it to 90 days to give entities enough time to acquire allowances at auction or purchase additional ARB offset credits in the market. A new requirement was added to section 95983(c) that states that ARB offset credits will be retired from the Forest Buffer Account if the reversed tons are not replaced by the Offset Project Operators or Authorized Project Designees within the 90 days. This ensures that the system is made whole and that the environmental integrity of the program is intact. If the Offset Project Operator or Authorized Project Designee does not replace the ARB offsets within the 90 days, and ARB offset credits are retired from the Forest Buffer Account, ARB will assess penalties pursuant to section 96014. This allows the program to be made whole and still requires that the “bad actors” are appropriately penalized for not making the program whole.

New section 95983(c)(4) was added to clarify what happens in the case of an early forest project termination. These provisions were added to deter forest project owners from terminating their offset projects early, given permanence requirements that require the sequestration of carbon for 100 years. If there is an early project termination, ARB will retire ARB offset credits from the Forest Buffer Account and notify the Offset Project Operator or Authorized Project Designee of the retirement. This ensures that the system is made whole and that the environmental integrity of the program is intact. The Offset Project Operator or Authorized Project Designee must replace all of the reversed tons calculated pursuant to Compliance Offset Protocol U.S. Forest Projects to ARB within 90 calendar days. If the Offset Project Operator or Authorized Project Designee does not replace the ARB offsets within the 90 days, and ARB offset credits are retired from the Forest Buffer Account, ARB will assess penalties pursuant to section 96014. This allows the program to be made whole and still requires that the “bad actors” are appropriately penalized for not meeting the requirements of this article and not making the program whole.

Sections 95983(d) and (e) were modified and deleted respectively, to combine the requirements for the disposition of forest offset projects in one section dealing with all reversals. This change was made because there was no need to have two sections. New section 95983(d)(3) was added to replace the text in original section 95983(e)(2), which was deleted for reasons stated above.

Various minor and non-substantive clarifications were also made to section 95983 to provide consistency in terminology and correct references within the regulation.

67. Ownership and Transferability of ARB Offset Credits (Section 95984)

Section 95984 was modified to specify for which purposes an ARB offset credit can be used. These changes were needed to make it clear to market participants how an ARB offset credit can be used within the cap-and-trade program. Additionally, a numbering structure was added to this section for readability.

Various minor and non-substantive clarifications were also made to section 95984.

68. Invalidation of ARB Offset Credits (Section 95985)

Section 95985(a)(2) was deleted and moved to section 95985(a). Section 95985(a)(1) was deleted because it was mistakenly included in the original regulation. All offsets will be retired once they are used for compliance, therefore we cannot require that all retired offsets be invalidated.

Section 95985(b) was modified in response to stakeholder comments to include a statute of limitations within which ARB would be able to invalidate an ARB offset credit. Staff determined that an eight-year time limit was sufficient to allow two verification bodies to review all the related offset project documentation, since verification bodies must be rotated once every six years. This gives ARB sufficient time to review all verification-related material.

Original section 95985(b)(1) was deleted because the reversals and replacement of forest-related offsets is being handled in section 95983. Original section 95985(b)(2), now section 95985(b)(1), and new sections 95985(b)(2) through (b)(4), clarify the conditions under which ARB would invalidate an ARB offset credit. These changes respond to stakeholder concerns that they could not quantify the invalidation risk because the conditions were too broad.

In addition, staff added new sections 95985(b)(5) and (6) to include a couple of exceptions to the eight-year limit under which invalidation would have a five-year time limit. The exceptions encourage a quicker verifier rotation so that any issues that may occur may be uncovered sooner, further enhancing the integrity of the offset program.

Original section 95985(c) was deleted and moved to new section 95985(e) to provide the correct sequencing in this section due to the inclusion of new sections 95985(c) and (d). New section 95985(c) was pulled out of original sections 95985(d) and (e) and identifies the current holder or retiree of the ARB offset credits in question. This was added because this party is referenced several times in this section and allows staff to reference this section, as opposed to writing it out in each provision. New section 95985(d) provides a dispute resolution process to allow entities to submit additional information to ARB before a final determination is made for invalidation. These provisions were added in response to stakeholder comments that there should be a notification and due process associated with invalidations.

As mentioned above, new section 95985(e) was moved from original section 95985(c). These provisions are generally the same except that new section 95985(e)(2) was added to allow for the dispute resolution process mentioned above.

Original section 95985(d), now section 95985(f), was modified to change the replacement timing from 30 days to 90 days, to give entities enough time to acquire allowances at auction or purchase additional ARB offset credits in the market.

Original section 95985(e), now section 95985(g), was modified to clarify that the forest owner is responsible to replace any ARB offset credits that are invalidated due to violations of 95985(b). Original section 95985(f) was deleted because it duplicated requirements in section 95983(a) and because replacements of ARB offsets due to forest sector reversals are now all handled in section 95983.

New section 95985(h) was added to explicitly state that ARB maintains its enforcement authority for any violations under this article, even in the event of an invalidation.

Various minor and non-substantive clarifications were also made to section 95985 to provide consistent terminology and section references within the regulation.

69. Executive Officer Approval Requirements for Offset Project Registries (Section 95986)

Section 95986(c) was modified to remove the requirement that an Offset Project Registry apply for a holding account. This provision was mistakenly included in the original regulation and conflicts with section 95814, which states that Offset Project Registries may not hold compliance instruments.

Section 95986(c)(1)(E) was modified to change the amount of professional liability insurance that Offset Project Registries must maintain from fifty million dollars to five million dollars. This change reflects stakeholder comments that the dollar amount was too high and that insurance was not offered at that level of coverage. Sections 95986(c)(2)(A)(1.) and (2.) were modified to specify what type of conflict-of-interest policies Offset Project Registries must have. These changes were made to clarify the types of policies that are acceptable by ARB.

New section 95986(c)(2)(F) was added to clarify how the Offset Project Registry application process applies to large organizations that may have a dedicated subdivision that wants to provide registry services. This is in response to stakeholder comments that potential Offset Project Registries could be part of a larger organizational structure, and that the original language could preclude them from meeting application requirements.

Section 95986(c)(3)(C) was modified to remove the requirements that Offset Project Registries track prices and counter parties. These were removed in response to stakeholder comments that Offset Project Registries do not have the capability to track them.

Section 95986(d)(1) was modified to make it clear that Offset Project Registries cannot be Offset Project Operators or Authorized Project Designees for those offset projects developed under Compliance Offset Protocols. This change was made in response to comments that Offset Project Registries should be able to act in this capacity for those projects that are voluntary and that will not come in to the compliance offset program.

New section 95986(d)(3) was added to be consistent with the new text added in section 95986(c)(2)(F).

The changes to section 95986(h) and the addition of new section 95986(i) clarify the level of expertise and training that Offset Project Registries and their staff must have to be approved, including an examination process. These changes were necessary to clarify the requirements for stakeholders who plan to apply to be an approved Offset Project Registry.

The Offset Project Registry approval process was also strengthened to require that their staff take training and demonstrate knowledge about ARB Compliance Offset Protocols and regulatory requirements.

Original section 95986(j), now section 95986(k), was modified to clarify what happens to offset projects that reside at an Offset Project Registry, whose approval has been suspended or revoked. These offset projects may transfer to another approved registry and continue its current crediting period. This change was necessary because stakeholders were concerned that their offset projects could be ineligible if an Offset Project Registry's approval was suspended or revoked.

Various minor and non-substantive clarifications were also made to section 95986 to provide consistent terminology and section references within the regulation.

70. Offset Project Registry Requirements (Section 95987)

Section 95987(a) was modified to clarify that Offset Project Registries can also list offset projects not developed using Compliance Offset Protocols. Offset projects developed under a manner other than by using the Compliance Offset Protocols would not be eligible to be issued ARB offset credits, and the Offset Project Registry must make it clear that these offset projects do not qualify for compliance. This change was made in response to comments that Offset Project Registries should be able to act in a registry capacity for those projects that are voluntary and that will not come in to the compliance offset program.

Section 95987(c) was modified to add a timing component of 15 days for an Offset Project Registry to submit any new conflict-of-interest documentation to ARB once it receives it from an Offset Project Operator and Authorized Project Designee. This text was added because it was unintentionally omitted from the original regulation.

Section 95987(e) was modified to change the number of in-person audits that Offset Project Registries must perform from 20 percent to 10 percent. Staff reduced the number of in-person audits because ARB will also have an audit program that will include in-person audits, in addition to those performed by Offset Project Registries. ARB will also have access to the audit results collected by Offset Project Registries.

Section 95987(f) was added to require Offset Project Registries to review each verification report before accepting a verification opinion for an offset project listed using a Compliance Offset Protocol. This text was added to provide greater assurance to ARB and Offset Project Registries that the verification opinions are accurate.

New section 95987(k) was added to explain that any insurance mechanisms developed by an Offset Project Registry are not required to be purchased or used by any parties involved in ARB offset credit transactions, thus ensuring that other private entities may develop insurance mechanisms.

Various minor and non-substantive clarifications were also made to section 95987 to provide consistent terminology and section references within the regulation.

71. Record Retention Requirements for Offset Project Registries (Section 95988)

Section 95988 was modified to change record retention requirements for Offset Project Registries to 15 years. This change was made to be consistent with the new record retention requirements for Offset Project Operators and Authorized Project Designees in section 95976.

72. Recognition of Offset Credits for Early Action (Section 95990)

The original section 95990(a) was moved to new section 95990(b) for purposes of providing clarity within this section.

The original section 95990(c) is now new section 95990(a). These sections were moved to provide clarity within section 95990. New section 95990(a), original section 95990(c), was modified to change the dollar amount of professional liability insurance that Early Action Offset Programs must hold from two million to one million. This change was made in response to stakeholder comments that currently operated voluntary registries only hold one million dollars. This section was also modified to remove the requirements that Early Action Offset Programs track prices and counter parties. This was removed in response to stakeholder comments that Early Action Offset Programs do not have the capability to track them.

New section 95990(a)(3) now includes requirements for Early Action Offset Programs that are similar to requirements identified in section 95986(d) for Offset Project Registries. These requirements are necessary since both types of entities will be fulfilling similar functions within the offsets program, and many of these entities may be acting in both capacities.

Original section 95990(b) is now new section 95990(c). These sections were moved to provide clarity within section 95990. New section 95990(c)(3) was added to the list of original requirements. This section requires that GHG reductions or GHG removal enhancements must result from an early action offset project listed prior to January 1, 2013. Originally the timing was tied to the offset project commencement date of January 1, 2012. Staff made this change because the acceptance of early action offset credits is tied to vintage years as opposed to offset project commencement. The date was changed from 2012 to 2013 because the offset program will not be implemented by January 1, 2012. Original sections 95990(b)(5)(D) and (E) were combined into new section 95990(c)(5)(D), original section 95990(b)(5)(E)(i) was deleted, and original section 95990(b)(5)(E)(ii) was moved into new section 95990(c)(5)(D). These changes were made because once the requirement to have a conservation easement was deleted, the requirements for all the forest projects are the same and do not need to be in separate provisions. The requirement for conservation easements was deleted because it is not needed, since all projects are required to contribute to the Forest Buffer Account.

Original section 95990(d) was moved to new section 95990(j). New section 95990(d) was added to require that Offset Project Operators, Authorized Project Designees, or each holder of early action offset credits that submitted them for issuance of ARB offset credits register with ARB. All entities implementing an offset project must register with ARB to ensure the agency has all necessary information about the owners of an offset project. These requirements are similar to those for an offset project coming in directly under an ARB Compliance Offset Protocol.

Original section 95990(e) was moved to new section 95990(h)(6). New section 95990(e)(1) was added to include listing requirements for early action offset projects. These requirements are similar to those required of Offset Project Operators and Authorized Project Designees bringing in a compliance offset project under an ARB Compliance Offset Protocol. Listing is necessary to ensure that ARB has access to all information regarding early action offset projects. New section 95990(e)(2) was added to require Early Action Offset Programs to make specific information regarding early action offset projects publicly available. This is necessary to ensure that the public has access to all information regarding early action offset projects.

The changes to this section also clarify what happens to the crediting periods of early action offset projects once they transition to ARB Compliance Offset Protocols.

Section 95990(f) was modified to clarify the requirements for regulatory verification of early action offset projects. New section 95990(f)(1) includes new requirements that the verifier performing the re-verification services must be different than the one that did the initial verification for the Early Action Offset Program. This ensures that the review is completely independent and unbiased. The new requirements include a desk review of each Offset Project Data Report (new section 95990(f)(3)) by an ARB accredited verification body based on all original early action offset project documentation. A desk review by an independent body that is accredited by ARB is sufficient to determine if the information originally submitted regarding the offset project is complete and accurate. Staff has also included provisions to allow all Offset Project Data Reports for an individual offset project to be included in one desk review (new section 95990(f)(3) in response to stakeholder concerns that re-verification costs may be exceedingly high.

Section 95990 was further modified to include a threshold based on offset material misstatement in section 95990(f)(4) that, if found to be exceeded during the desk review, would trigger full offset verification services for the Offset Project Data Reports that exceed the threshold. Staff set this threshold at three percent or more, or 25,000 metric tons CO_2e ($MTCO_2e$), whichever is smaller. The 25,000 $MTCO_2e$ threshold is the same as the threshold for inclusion of covered entities in the cap-and-trade program and staff anticipates that three percent would be around this level as well. This provision allows for the same verifier that performed the desk review to conduct the full verification services, because at this point in the process staff believes that the review by the same verifier is still independent and unbiased. However, it may not be done by the verification body that did the initial verification under the Early Action Offset Program for reasons mentioned above. This provision also allows all Offset Project Data Reports that exceed the threshold and must undergo full offset verification services to be done as one verification service. This was included in response to stakeholder concerns that re-verification costs may be exceedingly high. Sections 95990(f)(4)(A) through (E) replace original section 95990(f)(3) and include all the requirements that must be met to ensure that the early action offset credits are verified according to regulatory verification requirements of all ARB offset credits, as found in section 95977.1.

Staff is seeking stakeholder comments on potential ways to facilitate the regulatory verification of early action offset credits that is efficient, does not require multiple verifiers to look at the same offset project data, and potentially provides a single, shared cost for verification services for an Offset Project Data Report.

New section 95990(g) was moved from original section 95990(f)(2) and modified so that conflict of interest is now assessed only against any party that holds more than 30 percent of the early action offset credits issued in each data year. Originally the regulation required that conflict of interest be assessed against all holders of the early action offset credits. Staff made this modification to reflect stakeholder concerns that applying conflict of interest to all early action offset credit holders is unnecessary and overly burdensome.

New section 95990(h) was added to clarify the criteria that early action offset credits must meet to be issued as ARB offset credits. These requirements are similar to the issuance requirements for ARB offset credits in new section 95981. New sections 95990(h)(1), (3), and (4) provide that ARB offset credits will be issued for those early action offset credits that meet the requirements of sections 95990(c), (e), and (f). New section 95990(h)(2) requires that all the GHG reductions or removal enhancements must be achieved by December 31, 2014. This is because beginning on January 1, 2015, all offset projects must use Compliance Offset Protocols and are no longer eligible to be brought into the compliance program if they are using Early Action Offset Program protocols approved pursuant to this section. New section 95990(h)(5) requires that Offset Project Operators, Authorized Project Designees, or each holder of early action offset credits that submit them for issuance of ARB offset credits to submit multiple attestations to ARB before any ARB offset credits are issued for GHG reductions or GHG removal enhancements achieved by the early action offset project. ARB requires these attestations in new section 95981.1 for compliance offset projects as well. These attestations are needed to specify that all listed parties specifically submit to California's jurisdiction to resolve any disputes regarding enforcement of the regulation against these parties. This change is necessary to make clear to the listed parties that by participating in California's cap-and-trade program in this capacity, they will be subject to California's jurisdiction regardless of the offset project's physical location. New section 95990(h)(6) was moved from original section 95990(e).

New section 95990(i) was added to clarify the process for how ARB offset credits will be issued for purposes of early action. New sections 95990(i)(1)(A) through (C) specify that one ARB offset credit will be issued for each early action offset credit that meets the requirements of section 95990(h) if the offsets occurred under the identified protocols in these sections. New section 95990(i)(1)(D) identify conditions that must be met for an ARB offset credit to be issued if the projects are using one of the identified protocols in this section. New section 95990(i)(1)(D)(i) requires that a portion of offset credits calculated pursuant to Compliance Offset Protocol U.S. Forest Projects be placed into the Forest Buffer Account. Like compliance offset projects, early action forest projects are also subject to reversals; therefore, these projects must also contribute ARB offset credits into the account to cover any potential losses. New section 95990(i)(1)(D)(ii) specifies that the ARB offset credits may come from a buffer account that is already being run by an Early Action Offset Program or may be subtracted from the total ARB offset credits issued at the time of conversion. The first case is identified because stakeholders have made ARB aware that some voluntary registries have already required their forest projects to contribute to a buffer account. If those registries will release the offsets to ARB, they will be accepted to meet this requirement. The second case is designed to cover those offset projects that have not contributed to a buffer account already or cannot get the offsets released to ARB by the voluntary registry. New sections 95990(i)(1)(D)(3.) and (4.) were included to identify what happens in the event that there is a reversal from an early action forest offset project. These provisions treat reversals the same way as they are treated for compliance offset projects pursuant to section 95983. This ensures that all forest offset credits are meeting the same standards.

New section 95990(i)(1)(E) provides the requirements that early action offset projects using Climate Action Reserve Forest Project Protocol, version 2.1 must meet only if they plan to transition their early action offset projects to Compliance Offset Protocol U.S. Forest Projects. If the offset project will not transition to the compliance program, they would follow the rules in section 95990(i)(1)(D). Offset projects transitioning into the compliance system must recalculate their baseline based on the requirements in Compliance Offset Protocol U.S. Forest Projects. If they would have been issued more early action offset credits after they recalculate their baseline, ARB will issue them ARB offset credits in that additional amount; otherwise they will be issued ARB offset credits on a 1:1 basis. These provisions are necessary because the project baselines for offset projects using Climate Action Reserve Forest Project Protocol, version 2.1, need to be recalculated as averaged baselines.

New section 95990(i)(2) through (4) outline the process that ARB will use to notify the Early Action Offset Program that ARB offset credits have been issued to replace their early action offset credits. These provisions are necessary so these programs can retire the appropriate offsets in their own systems, to avoid the same GHG reductions or GHG removal enhancements being credited twice in multiple systems.

New section 95990(j) was moved from original section 95990(d) and modified to include a timeframe of 15 days for ARB to notify the original holders of the early action offset credits that they have been issued ARB offset credits. This section further requires that those claiming that the early action offset credits belong to them must prove they own them and register for ARB. These steps ensure that ARB has transferred the ARB offset credits to the correct parties, and that ARB can track their participation in the market.

New section 95990(k) was added to clarify how early action offset projects transition to compliance offset projects. New sections 95990(k)(1)(A) through (C) specify that early action offset projects using Early Action Offset Program protocols identified in the provisions must use the specified Compliance Offset Protocols and must begin using the Compliance Offset Protocols by December 31, 2014. These provisions are necessary so Offset Project Operators and Authorized Project Designees know which Compliance Offset Protocols they must use and the timing for when they must transition. New section 95990(k)(1)(D) specifies that early action offset projects using Climate Action Reserve Forest Project Protocol, Version 2.1, must recalculate their baselines pursuant to Compliance Offset Protocol U.S. Forest Projects. This provision is necessary to ensure consistency across all forest projects in the compliance program. New section 95990(k)(1)(E) requires that all early action offset projects using Climate Action Reserve Forest Project Protocol versions 3.0 through 3.2 subtract any optional pools that are excluded from Compliance Offset Protocol U.S. Forest Projects beginning with the last reporting period. This provision is necessary to ensure consistency across all forest projects in the compliance program because these pools will be excluded for any new projects coming into the program beyond December 31, 2014.

New section 95990(k)(2) was added to clarify that all early action offset projects which transition to a Compliance Offset Protocol will begin a new crediting period. This provision was included to provide clarify for stakeholders on the length of eligibility for transitioned offset projects.

New sections 95990(k)(3) and (4) was added to require that once an early action offset project transitions, it must meet all the requirements that all compliance offset projects must meet if they begin under Compliance Offset Protocols. These requirements can be found in sections 95973, 95975, 95976, 95977 through 95978, 95980.1, and 95981.1. These provisions are necessary to ensure consistency across all offset projects in the compliance program beginning in the second compliance period, 2015.

New section 95990(l) was added to provide that ARB offset credits issued for early action offset credits are also subject to the invalidation provisions in section 95985. These provisions are necessary to ensure that there are replacement measures in place in the event that an ARB offset credit is found to be invalid, and also to ensure consistency across all offset projects in the compliance program beginning in the second compliance period, 2015. Further, this provision states that if an ARB offset credit that was originally an early action offset credit is invalidated, and the covered entity or retiree is no longer in business, the holder of the original early action offset credits that submitted them for issuance of ARB offset credits must replace the invalidated offsets only if they have been used for compliance or retired by ARB. These requirements are placed upon the Offset Project Operator or Authorized Project Designee for compliance offset projects; however, since a holder of the early action offset credits can apply for issuance of ARB offset credits under the early action provisions, as opposed to the Offset Project Operator or Authorized Project Designee, staff has put the onus of replacement on those parties that brought them into the compliance program.

Various minor and non-substantive clarifications were also made to section 95990 to provide consistency in terminology and ensure correct references within the regulation.

73. Sector-Based Offset Credits (Section 95991)

No modifications were made to section 95991.

74. Procedures for Approval of Sector-Based Crediting Programs (Section 95992)

No modifications were made to section 95992.

75. Sources for Sector-Based Offset Credits (Section 95993)

No modifications were made to section 95993.

76. Requirements for Sector-Based Offset Crediting Programs (Section 95994)

No modifications were made to section 95994.

77. Quantitative Usage Limit (Section 95995)

No modifications were made to section 95995.

78. Reserved for Sector-Specific Requirements (Section 95996)

No modifications were made to section 95996.

79. Reserved for Approved Sector-Based Crediting Programs (Section 95997)

No modifications were made to section 95997.

80. Jurisdiction (Section 96010)

No modifications were made to section 96010.

81. Authority to Suspend, Revoke, or Modify (Section 96011)

No modifications were made to section 96011.

82. Injunctions (Section 96012)

No modifications were made to section 96012.

83. Penalties (Section 96013)

Section 96013 was modified to include minor clarifications.

84. Violations (Section 96014)

Section 96014(b) was modified to clarify that each compliance instrument not surrendered on the appropriate surrender date is a single, separate violation. The section was also clarified to allow the violation to accrue every 45 days instead of each day the compliance instrument remains unsurrendered. These changes were made in response to stakeholder concerns about market volatility if a covered entity was required to obtain a significant number of allowances in a very short period of time, as initially drafted. These changes allow greater time to obtain the compliance instruments, and thus maintain market stability. Other clarifications were made based on stakeholder concerns regarding intent.

Section 96014(c) was added to the regulation to clarify that any act of deception in working with ARB will subject an entity to additional penalties under the provisions of this regulation. Section 96014(c) lists specific violations that may be contained in records submitted to ARB that will result in additional penalties against an entity that does not comply with the provisions of this regulation. Section 96014(d) was added to the regulation to ensure that regulated entities are aware that any violations assessed pursuant to section 96014 do not relieve the entities of their obligations under the remaining provisions of the regulation.

85. Severability, Effect of Judicial Order (Section 96020)

No modifications were made to section 96020.

86. Confidentiality (Section 96021)

No modifications were made to section 96021.

87. Jurisdiction of California (Section 96022)

Section 96022 was modified to include a provision that clarifies that any entity that participates in the market program is subject to California's jurisdiction.

88. Reserved Provisions (New Section 96023)

Section 96023 was added to reserve subsequent sections for any future rulemaking needs.

89. Modifications to Compliance Offset Protocol Urban Forest Projects

Minor, non-substantive changes were made to this protocol to ensure consistency between the regulatory requirements for offsets and the compliance offset protocols.

This protocol was also modified to clarify that offset projects on lands related to federally recognized Indian Tribes are eligible under this protocol only if the Tribes enter into a waiver of sovereign immunity with ARB related to the Tribes' participation in the requirements of this protocol and the cap-and-trade regulation. This ensures ARB's ability to pursue judicial remedies, if necessary, regarding these offset projects when enforcing the requirements of this protocol and the Cap-and-Trade Regulation; similar to ARB's ability to pursue judicial remedies regarding all other offset projects commenced under this protocol.

90. Modifications to Compliance Offset Protocol Livestock Projects

Minor, non-substantive changes were made to this protocol to ensure consistency between the regulatory requirements for offsets and the compliance offset protocols.

This protocol was also modified to clarify that offset projects on lands related to federally recognized Indian Tribes are eligible under this protocol only if the Tribes enter into a waiver of sovereign immunity with ARB related to the Tribes' participation in the requirements of this protocol and the cap-and-trade regulation. This ensures ARB's ability to pursue judicial remedies, if necessary, regarding these offset projects when enforcing the requirements of this protocol and the cap-and-trade regulation; similar to ARB's ability to pursue judicial remedies regarding all other offset projects commenced under this protocol.

91. Modifications to Compliance Offset Protocol Ozone-Depleting Substances Projects

This protocol was modified to add CFC-113 as an eligible refrigerant, and a carbon ratio was added for CFC-115. The leakage rate was changed to include the impact of California's Refrigerant Management Program. Staff also clarified that a third-party must verify compliance with the United Nations Technical and Economic Assessment Panel (TEAP) requirements.

This protocol was also modified to clarify that offset projects on lands related to federally recognized Indian Tribes are eligible under this protocol only if the Tribes enter into a waiver of sovereign immunity with ARB related to the Tribes' participation in the requirements of this protocol and the cap-and-trade regulation. This ensures ARB's ability to pursue judicial remedies, if necessary, regarding these offset projects when enforcing the requirements of this protocol and the cap-and-trade regulation, similar to ARB's ability to pursue judicial remedies regarding all other offset projects commenced under this protocol.

Minor, non-substantive changes were made to this protocol to ensure consistency between the regulatory requirements for offsets and the compliance offset protocols.

92. Modification to Compliance Offset Protocol U.S. Forest Projects

This protocol was clarified to require that the 10-year look-back at management activities on project lands is independent of past ownership, to avoid crediting a regrowth of trees that were recently harvested.

Staff made clarifications to the protocol regarding verification requirement, stating that forest projects are not eligible to receive qualified positive offset verification statements, specifying the number of sample plots to be measured and which statistical tests to use, requiring that the project acreage be verified, requiring the verification team to include a person with demonstrated competence in forest biometrics and modeling, and including requirements for less intensive verification, which requires site visits once every six years after initial verification.

This protocol was also modified to clarify that offset projects on lands related to federally recognized Indian Tribes are eligible under this protocol only if the Tribes enter into a waiver of sovereign immunity with ARB related to the Tribes' participation in the requirements of this protocol and the cap-and-trade regulation. This ensures ARB's ability to pursue judicial remedies, if necessary, regarding these offset projects when enforcing the requirements of this protocol and the cap-and-trade regulation, similar to ARB's ability to pursue judicial remedies regarding all other offset projects commenced under this protocol.

Minor, non-substantive changes were made to this protocol to ensure consistency between the regulatory requirements for offsets and the compliance offset protocols.

B. Second 15-day Change Modifications

1. Purpose (Section 95801)

No substantive changes were made to this section.

2. Definitions (Section 95802)

Definitions were added to support allowance allocation including "carbon dioxide weighted tonne," "Solomon energy intensity index," "Solomon Energy Review," and "enhanced oil recovery."

Section 95802(a)(273) was added to define tissue products in general, including tissue products manufactured using through air drying technology. The definition for "through air dried tissue," previously in section 95802(a)(265), has been removed.

Section 95802 was modified to more closely align with the federal greenhouse gas (GHG) reporting regulation's definition of carbon dioxide supplier. In addition, this section was modified to clarify that the source category is focused on upstream supply, and it does not include the listed activities and uses. Carbon dioxide used in carbon capture and geologic sequestration (CCGS) and carbon dioxide-enhanced oil recovery (CO_2-EOR) is excluded from the cap-and-trade regulation in a different way than how the federal GHG reporting regulation excludes it. Whereas the federal reporting regulation contains separate reporting categories for carbon dioxide suppliers, CCGS, and CO_2-EOR, ARB does not yet include these reporting categories within our Mandatory Reporting Regulation (MRR), though we signal in section 95852(g) that these activities and uses will be excluded from a compliance obligation through a to-be-developed quantification methodology.

Many of the modified definitions are necessary to clarify the "first deliverer" approach for the electricity sector, accommodate the inclusion of the calculation of a compliance obligation for this sector, and respond to stakeholder comments. Modifications were made to the definitions of "electricity importer," "direct delivery," "imported electricity," "purchasing-selling-entity," "qualified export "marketer," "resource shuffling," and "specified source of electricity." These changes were made to either clarify staff intent in response to stakeholder comment or to conform to changes in section 95852. A new definition of "California balancing authority" was added to accommodate clarifications made. The term "eligible renewable resource" was added, and the terms "variable renewable resource" and "replacement electricity" were deleted to reflect changes made to account for renewable portfolio standard (RPS)-eligible electricity imports. Several other definitions were modified to improve clarity.

Modification to the term "voluntary renewable electricity" was needed to correct a typographical error. Changes were also made to respond to stakeholder comments to clarify that the definition also applies to the electricity underlying the renewable energy credit (REC), and to strengthen the definition to prevent double-counting of the electricity.

The term "voluntary renewable electricity aggregator" was modified to accommodate changes made in section 95841.1.

Section 95802 was modified to include clarified definitions for terms used in revised section 95834, which contains the procedure governing beneficial holdings relationships. Definitions were modified for "Agent," "Beneficial Holding," and "Principal" to clarify the roles of the participants in beneficial holding relationships.

Several definitions relating to how compliance instruments are handled in accounts were modified for clarity. These include "Issue," "Hold," and "Retire." Finally, the definition of the term "Proceeds" was modified to reflect that proceeds will also result from sales from the Allowance Price Containment Reserve.

3. Covered Gases (Section 95810)

No substantive changes were made to this section.

4. Covered Entities (Section 95811)

Section 95811(a)(8) was modified to clarify that "oil and natural gas systems" be referred to as "petroleum and natural gas systems," to harmonize with the MRR.

Section 95811(e)(3) was clarified to identify that the term "consignee" is defined in the MRR. To avoid confusion and the potential for inadvertent non-compliance, the MRR regulation includes a clear definition of this term.

5. Inclusion Thresholds for Covered Entities (Section 95812)

Modifications were made to section 95812(c)(2)(B) in response to stakeholder comments. Modifications were made to clarify that the applicability is based on the electricity importer's sources of delivered electricity, including how this applies to specified and unspecified electricity sources.

Section 95812(c)(2)(C) was deleted because this section was no longer necessary due to the modification made in 95812(c)(2)(B).

Section 95812(c)(3) was modified to more clearly describe the threshold for CO_2 suppliers. The changes clearly state which sources of CO_2 must be included when assessing the total CO_2 for comparison against the threshold for applicability for the cap-and-trade program.

6. Opt-in Covered Entities (Section 95813)

No substantive changes were made to this section.

7. Voluntarily Associated Entities and Other Registered Participants (Section 95814)

No substantive changes were made to this section.

8. Compliance Instruments Issued by the Air Resources Board (Section 95820)

No substantive changes were made to this section.

9. Compliance Instruments Issued by Approved Programs (Section 95821)

No substantive changes were made to this section.

10. Registration with ARB (Section 95830)

Section 95830(b) was modified to consolidate several requirements concerning eligibility and restrictions into one place for clarity. New section 95830(b)(1) clarifies that entities must qualify to participate in the cap-and-trade program pursuant to 95811, 95813, or 95814 prior to registering. New section 95830(b)(2) replaces and clarifies a requirement previously contained in section 95831(a)(1) that an entity cannot apply for more than one registration. New section 95830(b)(3) replaces the original text of section 95830(b). Staff consolidated the requirements in the same section to clarify the sequence of qualifying for participation, registering, and holding compliance instruments. These modifications also address stakeholder comments indicating confusion over the requirement that each entity registers once and has only one set of accounts.

11. Account Types (Section 95831)

Section 95831(a)(1) was modified to clarify that each registered entity will have no more than one holding account, compliance account, limited use holding account, or exchange clearing holding account. The existing requirement was vague, stating only that each registered entity could gain approval for a "set" of accounts.

New section 95831(a)(4)(C) was added to clarify that the Executive Officer may transfer allowances into an account, or out of an account for surrender compliance, or when closing an account.

New section 95831(b)(2)(D) was added to be consistent with a change in section 95857(d)(1) in the first 15-day Change Notice that redirects three of the allowances submitted to fulfill an untimely surrender obligation be placed in the auction holding account.

Section 95831(b)(4) was modified to reflect a decision to direct allowances to the auction holding account rather than the Allowance Price Containment Reserve

(Reserve). Existing section 95831(b)(4)(A) was eliminated due to the change in section 95911(b)(4) that allowances remaining unsold when an auction settlement price equals the auction reserve price will be returned to the auction holding account for two consecutive auctions rather than go to the reserve. Existing section 95831(b)(4)(B) was then renumbered as section 95831(b)(4)(A). Existing section 95831(b)(4)(C) was eliminated due to the revisions to section 95857(d)(1) that redirects three of the allowances submitted to fulfill an untimely surrender obligation to the auction holding account, not to the reserve, as specified in the existing text. Section 95831(b)(4)(D) was then renumbered as section 95831(b)(4)(B).

Staff agreed to make the changes after stakeholders commented that having unsold allowances placed in the reserve would unnecessarily reduce the supply of allowances to the market.

New section 95831(c) was added to explain the procedure for closing accounts in the tracking system. New section 95831(c)(1) explains that the Executive Officer will close an entity's accounts when the entity has informed ARB that it has ceased operations, pursuant to section 95101(h). New section 95831(c)(2) creates a provision to close inactive accounts held by voluntarily associated entities on the tracking system. If these entities do not transfer allowances into or out of their accounts during a three-year period, then their accounts may be closed. This requirement is being added to ensure that the tracking system does not have to track too many dormant accounts, and so that only entities seeking to actively participate in the cap-and-trade system will register.

New section 95831(c)(3) was added to explain the procedure for dealing with accounts closed by the Executive Officer. Any compliance instruments remaining in the account that are not needed to fulfill a compliance obligation will be consigned to the auction pursuant to section 95910(d) on behalf of the registered entity.

12. Designation of Authorized Account Representative (Section 95832)

No substantive changes were made to this section.

13. Disclosure of Direct and Indirect Corporate Associations (Section 95833)

Several changes were made to the criteria determining a direct corporate association in section 95833(a)(1). These changes are intended to make the criteria for direct corporate association apply only to instances where one entity has clear control over another. Staff is proposing this change so that the imposition of joint holding and purchase limits applies only to cases where control is clear.

Section 95833(a)(1)(A) was modified so that a direct corporate association exists only when an entity holds more than 50 percent (changed from 20 percent) of any of three measures of share ownership. Section 95833(a)(1)(B) was modified so that a direct corporate association exists only when an entity holds or can appoint more than 50 percent of another entity's board of directors. Section 95833(a)(1)(C) was modified so that a direct corporate association exists only when an entity holds more than 50 percent of the voting power of another entity. Existing section 95833(a)(1)(D) was eliminated because staff agreed with stakeholder comments that the provision was too vague. Staff is proposing the changes because the previous threshold of 20 percent would have included entities without effective control over affiliates.

Section 95833(a)(2) was modified to require that two entities that are registered in the cap-and-trade program and that share a common parent not registered into the system have a direct corporate association. Staff is proposing this change to account for cases in which two registered entities are sister corporations by virtue of having a common unregistered parent. Eliminated from the section is an existing requirement involving beneficial holdings, which is no longer needed due to revisions in section 95834(c).

Section 95833(a)(3) was modified to clarify the requirements for determining whether entities have an indirect corporate association. Section 95833(a)(1)(A) was rewritten for clarity. Section 95833(a)(1)(A) was rewritten to apply the same criteria as in section 95833(a)(1), but stating that the threshold for entities having an indirect corporate association is 50 percent after multiplying the percentages at each link in a chain of direct corporate associations. Staff is proposing the changes because the previous threshold of 20 percent would have included entities without effective control over affiliates.

Section 95833(c) was modified to state that when the measures contained in sections 95833(a)(1), (2), or (3) yield a value of 25 percent or more, then the entities involved have a disclosable corporate association. Staff is proposing this change so that ARB can be aware of levels of corporate affiliation that do not indicate an entity has effective control over affiliates but nevertheless warrant regulator knowledge for market monitoring purposes. Reporting this lower level of affiliation does not result in imposition of joint holding or purchase limits.

Section 95833(d) contains the text moved from section 95833(c). In addition, section 95833(d) now includes a requirement that entities with a disclosable corporate association must provide the required information.

Section 95833(e) contains text that was moved from existing section 95833(d). The revision also changes an incorrect reference from section 95834(c) to 95833(c).

14. Disclosure of Beneficial Holding Relationships (Section 95834)

Section 95834(a)(1) was rewritten to remove the declaration that a beneficial holding relationship exists when an entity holds compliance instruments in its holding account that are owned by a second registered entity. Section 95834(a)(1) now explains the role of “agent” consistent with definition 6, which was originally contained in section 95834(a)(1)(A). Section 95834(a)(2) now explains the role of “principal” consistent with definition 209, which was originally contained in section 95834(a)(1)(B).

The text originally in section 95834(a)(2) was moved to section 95834(a)(3). The text has been modified to eliminate the notification by a utility serving as agent to ARB that a beneficial holdings arrangement exists. This requirement was replaced by the new procedure in 95834(b) that requires both the agent and principal to inform ARB of beneficial holdings relationships.

Additionally, section 95834(3)(B) was modified so that the disclosure of the beneficial holdings relationship must be confirmed by the principal in the relationship. The text, previously in section 95834(a)(2)(B), was moved to new section 95834(a)(2)(C).

Existing section 95834(a)(3) was renumbered to section 95834(a)(4). It was also modified to clarify the requirements for members of a corporate association that are establishing a beneficial holdings relationship.

Section 95834(b)(1) was modified to require both the agent and the principal in a beneficial holding relationship to report the existence of their relationship to the Executive Officer. Section 95834(b)(2) was modified to require confirmation of transfers of compliance instruments within the beneficial holding relationship. New section 95834(b)(3) states that after confirmation by the principal, compliance instruments held by the agent will count against the holding limit of the principal. Staff is proposing the changes to clarify that a beneficial holdings arrangement is an agreement and cannot exist unilaterally.

These changes to section 95834 were made for clarity.

15. Compliance Periods (Section 95840)

No substantive changes were made to this section.

16. Allowance Budgets Calendar Years 2013–2020 (Section 95841)

No substantive changes were made to this section.

17. Voluntary Renewable Electricity (Section 95841.1)

Section 95841.1(a) was modified to correct the year when allowances can begin to be retired. This change is needed to align with the modified start date of the first compliance period.

Section 95841.1(b)(1) was modified to correct the reference to the sections of the regulation which contain the eligibility requirements for renewable generators.

In section 95841.1(b)(1), an addition was made to accommodate stakeholder comments that it is not always economical for all renewable generators to register with the CEC's tracking system. The addition provides an alternative requirement for generators to meet similar stringency and verification requirements developed by the CEC.

Section 95841.1(b) was modified to respond to stakeholder comments and provide another option for documentation for the purchase and sale of qualified electricity or associated RECs.

Section 95841.1(b)(1)(F) was modified to respond to stakeholder comments and to clarify the attestation requirements that the program participant must follow.

Sections 95841.1(b)(2) and (3) were modified in response to stakeholder comment. The changes made clarify that the reporting requirements are directed toward the Voluntary Renewable Electricity participant and that the identification of the generator is the certification number. Additional modifications were made to allow for the alternative generator program requirements noted in section 95841.1(b)(1).

18. General Requirements (Section 95850)

Section 95850(b) was modified to clarify that the compliance obligation is based on the emissions that have a compliance obligation, not all emissions that are verified under the MRR.

Section 95850(c)(1) was modified to require record retention for 10 years, as was originally proposed in the 45-day regulation. This amount of time ensures that entities retain records to cover the period under which ARB could require additional compliance instruments if there were under-reporting in a previous compliance period, but only going back eight years.

Section 95850(c)(4) was added to specify that verification reports are to meet the requirements specified in the MRR.

19. Phase-In of Compliance Obligation for Covered Entities (Section 95851)

No substantive changes were made to this section.

20. Emission Categories Used to Calculate Compliance Obligations (Section 95852)

Section 95852(a)(1) was modified to clarify that the biofuel must be of a type listed in section 95852.2 and be procured in compliance with section 95852.1.1 in order to be exempt.

Section 95852(b) was modified to accommodate the calculation of the compliance obligation for first deliverers. Because this new section was added, most of the numbering within this section was changed.

New section 95852(b)(1) was in response to stakeholder comment. This section contains the calculation of a compliance obligation for first deliverers of imported electricity, which was previously contained in the MRR. A more simplified version was previously in section 95852(b)(7) of this regulation. The requirements regarding resource shuffling have been moved to 95852(b)(2).

Section 95852(b)(2) now contains the requirements to prevent resource shuffling. Modifications were made to respond to stakeholder comments regarding the use of the term “fraud.” The term “fraud” has been removed as well as other language that could impede typical electricity market activity, which was not staff’s intent. Additional language clarifies that a company’s agent must sign the attestations, as well as when the attestations must be submitted.

Section 95852(b)(3) previously addressed “replacement electricity,” which is now addressed in section 95852(b)(4). Section 95852(b)(3) now contains requirements for first deliverers to claim an emission factor from a specified source of electricity. The section was also modified to clarify what criteria must be met for electricity importers to claim a compliance obligation based on the emission factor of a specified source. A new criterion is that the electricity must be directly delivered to ensure a clear connection between the specified source and the electricity delivered into California. This section no longer requires electricity to be tracked through a contract chain of custody because stakeholder comments indicated in many cases they purchase the electricity from a marketer, and they do not always have access to all of the upstream contracts.

The previous section 95852(b)(4) was deleted because its requirements no longer apply, given changes to the accounting for specified sources of electricity. The new section 95852(b)(4) replaces the previous requirements for “replacement electricity,” and now includes an RPS adjustment. The RPS adjustment provision accomplishes the purpose of reducing a deliverer’s compliance obligation by accounting for renewable imports that staff previously addressed through the “replacement electricity” requirements. Stakeholders expressed concern with the requirement that replacement electricity would only apply to variable renewable electricity, and that the use of the term “replacement electricity” pursuant to the definitions in section 95802 required the replacement electricity to come from the same balancing authority area. Stakeholders claimed that they are mandated under State statute to meet RPS requirements and had anticipated that most, if not all of those deliveries that meet RPS requirements would avoid a compliance obligation under this regulation. Stakeholders argued that since the allocation to benefit ratepayers is based on consideration of cost burden, the “replacement electricity” provisions would unnecessarily increase ratepayer costs by requiring a compliance obligation under this regulation for electricity considered to have GHG reduction benefits under RPS mandates. Section 95852(b)(4)(B) clarifies that the RPS adjustment must be for deliveries of electricity within the reporting year. Section 95852(b)(4)(C) clarifies that the RPS adjustment is calculated by applying the default emissions rate to the eligible megawatt-hours (MWhs). Section 95852(b)(4)(D) was added to clarify that an RPS adjustment cannot be used to avoid a compliance obligation for any other source of electricity when the renewable electricity is directly delivered to the California grid. Section 95852(b)(4)(E) was added to ensure that when the California program is linked with similar programs there is no inaccurate accounting of renewable electricity that would allow the same renewable electricity to avoid a compliance obligation in multiple jurisdictions. Finally, the definition for “replacement electricity” was deleted from section 95802.

Section 95852(b)(5) was deleted and replaced with a new section, 95852(b)(5). The original section was no longer needed because the exclusion of emissions from biofuels is accomplished by the new compliance obligation equation for electricity importers.

Modifications were made to the new section 95852(b)(5), previously section 95852(b)(6). The modifications were made to detail the requirements for claims of qualified exports and the calculation of the qualified export adjustment that is a term (QE) in the equation in 95852(b)(1). This section was also modified in response to stakeholder concerns that it could be possible for resources to be shuffled, which would allow a claim for a lower emission factor and could potentially negate a valid compliance obligation. This was not staff's intent. In response to these stakeholder concerns, modifications were made to clarify the limitations of this adjustment and clarify data requirements. A modification was also made to allow claims of qualified exports, regardless of whether or not the importer is a purchasing-selling-entity (PSE), since that term is specific to e-tags.

Section 95852(b)(7) was deleted. It was no longer needed because the full equation for a compliance obligation for first deliverers of imported electricity was moved from the MRR to this regulation.

Section 95852.2(b)(18) was modified to clarify that imports by carbon dioxide suppliers and carbon dioxide supplier exports not intended for geologic sequestration do not hold a compliance obligation.

New section 95852(c)(1) was added to harmonize with the requirements for suppliers of natural gas specified in the MRR.

Section 95852(c)(2) has been modified to subtract emissions based on the utility bill-delivered gas and not on the gas reported for emission calculations. This will prevent a natural gas supplier from having a compliance obligation based on meter inaccuracies.

Section 95852(c)(3) has been modified to require that natural gas be reported in millions of British thermal units (mmBtu), not in volume.

Section 95852(c)(4) has been clarified to describe exactly how the compliance obligation for suppliers of natural gas will be calculated. The compliance obligation will be based on the supplier's reported emissions less ARB's calculated emissions from deliveries to covered entities that are customers of the supplier.

Section 95852(e)(2) was clarified to identify that the term "consignee" is defined in the MRR. To avoid confusion and the potential for inadvertent non-compliance, the MRR regulation includes a clear definition of this term.

Section 95852(g) was modified to align with the changes in the definition for carbon dioxide suppliers (section 95802).

21. Compliance Obligations for Biomass-Derived Fuels (Section 95852.1.)

Section 95852.1 was clarified to reduce redundant wording. The reference to "source categories" in this section is not relevant, as the first paragraph indicates that "this section only addresses biomass-derived fuels."

Section 95852.1(b) was modified to use the term "non-exempt biomass-derived CO_2" which is a CO_2 emission resulting from the combustion of fuel not listed under section 95852.2(a) or that is not verifiable under section 95131(i) of the MRR and is required to hold a compliance obligation.

22. Eligibility Requirements for Biomass-Derived Fuels (Section 95852.1.1.)

Provision 95852.1.1(a) was modified to clarify that, although there is no absolute requirement for biofuel contracts to meet the criteria, there is a benefit (in terms of a reduced compliance obligation) if the contract does meet the criteria. The heading of this section refers to the general term "biomass-derived fuels," and so does section (a)(1); thus this section was modified to refer to biomass-derived fuels, not only biogas and biomethane.

New section 95852.1.1(a)(1)(C) was added to accommodate the time required for certification of new RPS projects. Staff has heard from stakeholders concerned that many operators will not want to risk taking delivery of any substantial volumes of biofuel until CEC certification is received. Purchasers have an incentive to submit certification applications to the CEC promptly because certification, if granted, is backdated to the date the certification application was submitted. These modifications should also better reflect the way in which the CEC certifies facilities as RPS eligible with respect to particular fuels.

Section 95852.1.1(a)(2) was split up to make it easier to read the requirements of the provision, as well as to specify that the recovery of the fuel be destroyed without producing useful energy transfer if a facility invests in converting a flare to a generator or undertakes other equipment modification.

Previous section 95852.1.1(a)(4) was removed. Staff received several comments urging ARB to simplify the "once in, always in" concept. ARB requires annual verification of the biomass derived fuels prior to the implementation of a certification program. ARB's intent is for any adequately verified biomass-derived fuel to continue to remain eligible for the compliance exemption. Since ARB has rigorous verification requirements, and will further be developing a certification program for biomass-derived fuels, this provision is unnecessary.

Section 95852.1.1(b) was modified to clarify that a certain number of offsets can be created and sold separately from the biofuel, in addition to RECs, and the biofuel will still avoid a compliance obligation under the cap-and-trade program. Staff received several comments stating that it was not clear whether biogas projects are prohibited from claiming ARB-issued offsets or offsets from other programs. Thus, this modification was made to clarify eligibility of offsets from biomass and biogas projects.

23. Emissions without a Compliance Obligation (Section 95852.2.)

Section 95852.2(a)(1) was modified to remove confusion by referring to the methods described in the MRR regarding the biogenic fraction of solid waste materials.

Section 95852.2(a)(4)(C) was removed in response to comments received from stakeholders who claimed that tracking and enforcement of sources of wood and wood wastes is extremely difficult for energy generators. However, provisions 95852.2(a)(4)(A) and (B) remain because they are needed to report under MRR section 95103(j).

Section 95852.2(a)(8)(A) was modified to include plant, since it is identified in the definition of "biogas."

Provision 95852.2(a)(9) was moved to 95852.2(b) to clarify that the process, vented, and fugitive emissions from geothermal generating units and geothermal facilities, including geothermal geyser steam or fluids, do not hold a compliance obligation.

Provision 95852.2(a)(11) was deleted because mobile equipment emissions are not reported under the MRR.

Section 95852.2(b) was modified to delete redundant source categories and source type emissions not reported under the MRR (which should not count toward applicable reporting thresholds per section 95852.2). The modifications correct for double-counting the compliance obligation for natural gas and local distribution companies. These modifications were also made to clarify, in response to comments received, that vented and fugitive emissions from natural gas systems will be reported to ARB under the MRR and that the cap-and-trade compliance obligation for these emissions will be based on section 95122.

Section 95852.2(b)(5) was modified to specify that produced water emissions, in addition to storage tanks, are sources that must report emissions, but do not have a compliance obligation.

Section 95852.2(c) was added to the regulation to exempt emissions from military facilities from holding a compliance obligation through December 31, 2013. The Department of Defense (DoD) has raised several legal and practical issues related to its participation in the cap-and-trade program. While ARB does not agree with all of DoD's assertions, ARB will continue to evaluate options related to DoD's ability to reduce GHG emissions. ARB also recognizes that the military does not produce a product, and is therefore unable to pass the carbon cost on to a consumer or end user. These reasons combine to support a temporary exemption. This exemption allows ARB and DoD to work together to craft a direct regulation for military facilities, without potential ramifications to national security interests and that would achieve the equivalent GHG benefits of participation in the cap-and-trade program.

Various minor and non-substantive clarifications were made to section 95852.2 to ensure consistent terminology within the regulation.

24. Calculation of Covered Entity's Triennial Compliance Obligation (Section 95853)

No substantive changes were made to this section.

25. Quantitative Usage Limit on Designated Compliance Instruments—Including Offset Credits (Section 95854)

Section 95854(c) was modified to add back text that was inadvertently left out during the first 15-day changes to the regulation to apply the same quantitative usage limit to sector-based credits in both the first and second compliance periods.

26. Annual Compliance Obligation (Section 95855)

Minor clarifications were made to this section.

27. Timely Surrender of Compliance Instruments by a Covered Entity (Section 95856)

Section 95856(b)(2) was modified to clarify which vintage of compliance instruments is valid to meet a compliance obligation. The change explains that a compliance instrument from a vintage within or before the year for which a compliance obligation is calculated may be used to satisfy an annual obligation for that year. A compliance instrument issued for the last year of a compliance period, or from a previous vintage, may be used for a triennial obligation for that compliance period. The change is needed because stakeholders commented that the original text would have required entities to match vintages of allowances to emissions in a compliance period year by year, rather than for the total over the compliance period.

28. Untimely Surrender of Compliance Instruments by a Covered Entity (Section 95857)

Section 95857(b) was modified to allow entities to use offset credits to meet up to one-fourth of the untimely surrender obligation, as long as the offset usage does not violate the quantitative offset usage limits for the applicable compliance period. This modification was made in response to stakeholder comments and to clarify staff's original intent that the quantitative offset usage limit applies to the portion of offsets to meet the compliance obligation. No offsets are allowed to satisfy three-quarters of the untimely surrender obligation, since these allowances return to the auction account.

29. Compliance Obligation for Under-Reporting in a Previous Compliance Period (Section 95858)

Section 95858(c) was clarified to state that the penalty provisions in section 96014 do not apply during the six months within which the entity can obtain and surrender the compliance instruments to cover the under-reporting from a previous compliance period. This change was overlooked in the first 15-day version of the regulation.

Section 95858(d) was added to limit the requirement to surrender compliance instruments for under-reporting to the previous eight years. This change was in response to stakeholder comments.

Also, various minor and non-substantive clarifications were made to section 95858.

30. Disposition of Allowances (Section 95870)

The timing of allowance allocation activities was updated in section 95870(a), (b), (c), and (d) in response to stakeholder comment. Allocation to accounts controlled by the Executive Officer will now occur immediately after the creation of these accounts. Allocation to electrical distribution utilities and industrial covered entities will now occur in November of the year prior to the allowance budget year being distributed. A special allocation of 2013 vintages to electrical distribution utilities is now planned in July 2012, to allow for consignment auctions by utilities of one-third (one-sixth at each of two auctions) of 2013 allowances in 2012.

A new approach for allocation to the petroleum refining sector was inserted in section 95870(d)(2)(A-B) in response to stakeholder comment. In the first compliance period, a total amount of allowances will now be assigned to the refining sector. This sector allocation will then be divided among individual refiners using the new method specified in section 95891(d).

In the second and third compliance periods, there will no longer be a sector allocation determined for the refining sector. The amount allocated to each individual refinery will be based on the product output-based allocation approach and the "CO_2 weighted tonne" benchmark. These changes and the associated impacts are detailed in Appendix A.

Based on additional information provided by stakeholders, Table 8-1 was updated with changes to the oil and gas extraction and tissue manufacturing activity categories, and to reclassify coke calcining as a high-leakage risk activity.

Section 95870 Table 8-1 was modified to define tissue manufacturing as a leakage-exposed activity, which includes tissue manufacturing using through air dried technology.

31. General Provision for Direct Allocations (Section 95890)

No substantive changes were made to this section.

32. Allocation for Industry Assistance (Section 95891)

Section 95891(a) was updated to indicate that the choice of allocation methodology is based on classification of "activities" rather than "industries" in Tables 8-1 and 9-1. This change clarifies that a facility within a given industry may conduct multiple activities and that the operator of a facility may receive allocation under both the product-based and energy-based allocation methodologies (based on the assigned allocation approach for each separate activity). The assignment of allocation method was also updated to allow for the new petroleum-refining approach created in 95891(d).

The nomenclature in the equation for the product output-based allocation calculation methodology was changed slightly to improve clarity.

The energy-based allocation calculation methodology specified in section 95891(c) was modified based on stakeholder comment. The text was updated to clarify that the combined heat and power (CHP) exclusion in the "steam consumed" term applies only to steam produced from CHP units on site. Allocations for on-site CHP unit activities are captured in the $F_{Consumed}$ term. Steam imported from an off-site CHP unit is included in the $S_{Consumed}$ term. The "electricity sold" term was altered slightly to clarify that this term captures all power exported or sold from a facility. The subscripts for the assistance factor and cap decline factor were updated to show that these factors vary by activity, rather than by sector.

In section 95891(d), a new methodology for allocating to individual operators in the petroleum-refining sector in the first compliance period was added in response to stakeholder comments about the impact of the prior proposal on equity in the refining sector in the first compliance period.

Under the new text, complex refiners' allowances are allocated based on a methodology initially proposed by the Western States Petroleum Association. This approach allocates allowances based on the following factors: (1) historical emissions from for each refinery, (2) the Solomon Energy Intensity Index (EII) for each refinery, (3) an adjustment factor to reduce competitiveness impacts of allowance allocation between in-state refineries, and (4) future emissions for each refinery.

The Solomon EII is a complexity-adjusted measurement of refinery energy efficiency developed by Solomon Associates. Solomon Associates has been developing energy-efficiency benchmarking relied upon by the industry for the past 30 years. They maintain an extensive database of more than 500 refineries' energy consumption and process data, covering over 85 percent of global refining capacity, which is used to develop the EII values. The Solomon EII is the industry standard for comparing energy efficiency across refineries globally. California refineries that have a Solomon EII value represent over 90 percent of refining capacity in the State.

Staff believes that the EII is the most appropriate performance metric for complex facilities in the first compliance period. This metric is well understood by all complex facilities and has been recognized under the U.S. Environmental Protection Agency's (EPA's) ENERGY STAR Program.

Simple refineries that do not have an EII value, or those without a representative EII value as determined by the Executive Officer, are allocated to using the "simple barrel" product benchmark proposed in the first 15-day package. The value for this simple benchmark has been updated from 0.0465 allowances/barrel of primary refinery products to 0.0462 allowances/barrel. This change was made to reflect additional data provided by covered refineries and the inclusion of 2010 data in the development of the benchmark. A limit on the amount of allowances a facility can receive was imposed based on historical emission levels consistent with stakeholder comments. This will prevent any excessive rewards due to free allocation under the simple barrel metric.

For the second and subsequent compliance periods, the new text allocates to all refiners using the “Carbon Dioxide Weighted Tonne” approach. This metric is based on the refinery benchmarking conducted for the European Union’s Emissions Trading Scheme. See Appendix A for more information on refinery allocation.

Product-based emissions efficiency benchmark values in Table 9-1 were updated based on stakeholder comment. Section 95891 Table 9-1 was modified as follows:

- New product metrics were created for the oil extraction and petroleum refining sectors.

- The hydrogen production benchmarks were updated to ensure equity between merchant hydrogen plants and refinery-owned hydrogen production allocated to using the “Carbon Dioxide Weighted Tonne” metric.

- The tissue benchmark was modified to: (1) redefine benchmarked product unit, and (2) to correct a unit conversion error. With the information collected from stakeholders, staff initially believed that there were two tissue manufacturing facilities that used through air drying (TAD) technology. However, during the 15-day comment period, it was brought to staff’s attention that there is one facility that used the TAD technique and another facility that used the conventional technique. Working with stakeholders, staff gathered information on different tissue manufacturing technologies to redefine the product unit. Staff concludes that the tissue produced from a TAD dryer and conventional dryer have reasonably comparable functionality, even though TAD tissues are high-end products with superior softness, fluffiness, and absorbency. Staff also modified the benchmark value by correcting errors caused by a product unit conversion (metric tons to short tons).

- The linerboard benchmark was modified because staff obtained more precise data sets from a facility that manufactures linerboard.

- The medium benchmark was modified to correct the typographical error in the third decimal place.

- The cement benchmark was modified to correct the amount of clinker consumed for the best-in-class (benchmark) facility. In the benchmarked year, this facility blended and consumed some amount of clinker produced in the previous year. The previous year amount was not properly accounted for in the initial calculation. Staff corrected the error.

- The tin steel plate production benchmark was modified because of an erroneous calculation. Two years' worth of emissions had been mistakenly removed from the numerator in the initial benchmark calculation. This error made the benchmark number significantly lower than intended. Staff corrected the error.

In section 95891, Table 9-2 was modified to define "sectors and activities associated with process emissions greater than 50 percent", rather than "cement manufacturing." In the previous proposal, staff identified only cement manufacturing as an activity associated with a significant level of process emissions for which no cost-effective abatement opportunities are currently available. However, stakeholders in other sectors whose activities also release process emissions raised a concern in comments. After careful consideration, staff determined that sectors with activities that are associated with process emissions greater than 50 percent are eligible for a lower cap adjustment factor, taking into consideration the potential impact from the emissions that do not currently have cost-effective abatement opportunities.

33. Allocation to Electrical Distribution Utilities for Protection of Electricity Ratepayers (Section 95892)

Section 95892(a) was updated to show how the amount allocated to an individual electrical distribution utility will be calculated based on the total sector allocation and Table 9-3.

In section 95892(b), the language was modified to fully include electrical cooperatives and to clarify that publicly owned utilities (POUs) and cooperatives may only ask for allocations to be placed into compliance accounts of facilities they (or a Joint Powers Agency) operate.

Section 95892(c) was clarified so that all allowances placed into limited use holding accounts must be offered at the consignment auction, not just those controlled by investor-owned utilities (IOUs).

Section 95892(d) was changed so that equal limitations apply to both the use of auction proceeds from the sale of allowances and the value of allowances freely allocated and used for compliance.

Section 95892(d)(3)(A) was moved to 95892(d)(4).

Text addressing rebates of allowance value in Section 95892(d)(3)(B and C) was removed because staff determined this language suggested a particular requirement for use of auction proceeds, and ARB does not have authority to appropriate funds. The use of revenue obtained from consignment of allowances is the responsibility of the

California Public Utilities Commission (CPUC) for investor-owned utilities and the governing Boards of publicly owned utilities.

Section 95892(e) was modified to clarify how utilities will report the use of allowance value to ARB.

Table 9-3 was updated to correctly identify several electrical distribution utilities (EDU) as Investor- Owned Utilities or Rural Electricity Cooperatives. The apportionment of allowance value was also changed based on stakeholder comment and improved availability of end-use customer load data for Western Area Power Administration (WAPA) and Lassen utility districts. After reviewing the discussion included in Appendix A to the last round of 15-day changes, WAPA identified a misspecification in their accounting of end-use customer load and provided an updated profile of their historical resource mix. After careful review, staff determined that it was appropriate to update the load forecasts for WAPA and Lassen. These changes resulted in very minor redistributions of allowance value. Additionally, edits were made to correct formula and data entry errors included in the previous version of the workbook used to populate table 9-3. These changes resulted in a minor redistribution of allowance value for all utilities.

34. Reserved for Allocation to Natural Gas Distribution Utilities for Protection of Natural Gas Ratepayers (Section 95893)

No substantive changes were made to this section.

35. Auction of California GHG Allowances (Section 95910)

Section 95910(c) was modified to clarify the process used for the two auctions that will be conducted each quarter. Section 95910(c)(1) was modified to clarify that the auction of allowances from the current budget year may also include allowances from earlier budget years. This provision is needed to accommodate the two other changes. First, allowances remaining unsold at auction will be returned to auction for two consecutive auctions instead of being sent to the reserve. Second, allowances used to fulfill an untimely surrender obligation will go to the auction holding account, not the reserve. Both of these changes may result in older vintage allowances being auctioned.

The requirement that, beginning in 2013, one quarter of the allowances allocated for auction each budget year will be offered at each auction was moved from section 95910(c)(1) to new section 95910(c)(1)(A). New section 95910(c)(1)(B) clarifies that allowances consigned to the auction pursuant to 95870(f) will also be sold at the current vintage auction. New section 95910(c)(1)(C) clarifies that allowances remaining unsold at previous auctions may also be returned to the current vintage auction pursuant to section 95911(b)(4).

Section 95910(c)(2)(B) was modified to clarify that one-quarter of the future vintage allowances designated for auction in each budget year will be offered at each auction. New section 95910(c)(2)(C) clarifies that allowances remaining unsold at previous future vintage auctions may also be returned to the future vintage auction, pursuant to section 95911(b)(4).

Section 95910(d)(2) was modified to correct a reference to the source of allowances when accounts are closed.

36. Format for Auction of California GHG Allowances (Section 95911)

Section 95911(b)(3)(A)3 is modified to reflect changes to section 95911(b)(4), which makes allowances unsold at auction eligible for re-auction at a later time, instead of being redirected to the Allowance Price Containment Reserve (Reserve).

The existing text in section 95911(b)(4)(A) redirected unsold allowances to the reserve. This text was replaced with a provision to return unsold allowances to the auction holding account. The modified section now allows for them to be re-auctioned after two consecutive auctions reach an auction settlement price above the auction reserve price. Existing section 95911(b)(4)(B), which returned allowances unsold at future vintage auctions to the auction holding account, was also removed. This section was replaced by new section 95911(b)(4)(B), which returns unsold future vintage allowances to the auction holding account, and includes the provision that they can be re-auctioned after two consecutive future vintage auctions reach an auction settlement price above the auction reserve price.

Staff included the modifications to section 95911(b)(4) after many stakeholders observed that redirecting unsold allowances to the reserve when a market is initially over-allocated may result in the market being artificially short in later years. Staff agreed that the original provisions could make the market tighter, at least until market prices rose to the level of the reserve tier prices. Staff believes the delayed release mechanism will ensure that any initial over-allocation could be remedied without a significant effect on prices.

New section 95911(b)(4)(C) added a provision concerning allowances that return to the auction holding account if they remain unsold when an auction settlement price equals the auction reserve price. Staff is proposing that the allowances will be re-auctioned at a later date. However, returning too many allowances to a single auction could result in the auction being oversupplied yet again. Staff is proposing a limit on the number of allowances sent back to each auction, equal to no more than 25 percent of the number of allowances already designated for a particular auction. This provision would spread the supply of re-auctioned allowances over multiple auctions.

Section 95911(c)(4)(A) was modified to raise the purchase limit for the first compliance period from 10 percent to 15 percent for industrial entities. Staff determined the change was needed after reviewing new data on emissions and in response to comments, the entry of new facilities, and the effect of the allocation of allowances by ARB on net compliance needs.

37. Auction Administration and Registration (Section 95912)

No substantive changes were made to this section.

38. Sale of Allowances from the Allowance Price Containment Reserve (Section 95913)

Section 95913(f)(3)(B) was modified to clarify that the price charged for an allowance is the price of the tier from which it was purchased, not the bid actually submitted. The change is necessary because the process allows bids to a higher tier to be fulfilled with allowances from a lower-priced tier if they are available. Staff agrees with stakeholders who commented that the procedure did not specify whether the bid or the tier price is to be used.

39. Disclosure of Direct and Indirect Corporate Associations (Section 95914)

Section 95914(e)(1) and (2) are modified to reflect the changes in section 95833 governing the process for determining when a corporate association exists. Instead of there being a single category of “disclosable” corporate association, there are three separate categories of association. The lower level of association, disclosable, does not result in a joint purchase limit for its members. The same change was made to section 95914(e)(3).

Section 95914(e)(2)(C) was modified to correct the calculation of the purchase limit for each member of a corporate association. The member’s purchase limit should equal the entity’s allocated share of the association’s limit times the purchase limit, not the number of allowances auctioned.

Section 95914(e)(3)(A) was modified to clarify the process used when an association does not allocate shares of the purchase limit among its members.

40. Trading (Section 95920)

Section 95920(a) was modified to clarify that the holding limit will be applied to a group of entities with a direct or indirect corporate association. The change was needed to reflect a change to the classification of corporate associations in section 95833(a).

Section 95920(b) was modified to replace the term “transaction” with the term “transfer request.” The change is needed to clear up confusion between the act of transferring control of a compliance instrument on the tracking system and the underlying agreement in the secondary market between entities which would result in a transfer. This change was made to sections 95920(b)(3) and (4).

The term “transaction” means an understanding among registered entities to transfer the control of an allowance from one entity to another, either immediately or at a later date. The “transfer” of a compliance instrument means the removal of the serial number of a compliance instrument from one account and placement into another account. In the California cap-and-trade program, a transfer will be effected through a “Transfer Request” submitted by an authorized account representative or an alternate authorized account representative to the accounts administrator to register a transfer of allowances between accounts into the tracking system.

Section 95920(b)(4) was also modified to update a reference to section 95921. This change was needed to reflect modifications to section 95921.

Section 95920(c) was modified to clarify how the holding limit will apply to allowances that can be used for compliance in the current compliance year separately from those that cannot be used for compliance. Section 95920(c)(1) was modified to clarify a reference to section 95856(b), which defines the vintages that can be used for current compliance.

Section 95920(c)(1)(A) was modified to clarify that, in any year, allowances from previous years may be used for compliance. Section 95920(c)(1)(C) was modified to clarify that allowances purchased at the advance auction may be usable during the current compliance year, but not the current compliance period.

Section 95920(c)(2) was modified to be consistent with section 95856(b), to state that the ability to use allowances changes with each year, not with each compliance period. That is, vintage 2015 allowances could be used for compliance surrender in 2016, but vintage 2016 and 2017 allowances that had been purchased at advance auction could not.

Section 95920(f) was eliminated because changes to section 95920(a) render the section redundant.

Existing section 95920(g) was renumbered to section 95920(f). Section 95920(f)(1) was modified to clarify that the holding limit is applied only to allowances, not all compliance instruments. In addition, the holding limit applies jointly to members of direct and indirect corporate associations, not to members of a disclosable corporate association. This change was also made to sections 95920(f)(2), (3), and (4).

Section 95920(f)(4) was modified to use the newly defined term “transfer request” in place of the term “transaction.” This was to clarify that the accounts administrator will not accept deficient transfer requests. Some stakeholders expressed concern that the provision would require the automatic unwinding of the transaction that resulted in the transfer request.

Section 95920(h) was renumbered to section 95920(g) and clarified so that the holding limit will evaluate a beneficial holding by an agent against the holding limit of the principal for whom it is held.

41. Conduct of Trade (Section 95921)

Sections 95921(a)(1) and (2) were modified to clarify that all requests for transfer of compliance instruments between accounts on the tracking system must meet the requirements of this article before the accounts administrator will register them into the tracking system. The changes were needed to emphasize the distinction between the transfer request and the underlying transaction that results in the request. Existing section 95921(b) was replaced completely. Stakeholders expressed concern that the text would have required them to automatically unwind the underlying transaction if the accounts administrator determined the transaction violated a requirement. New section 95921(b) outlines the procedure to be followed when the accounts administrator finds a deficiency in the transfer request submitted pursuant to 95921(a).

New section 95921(b)(1) describes the procedure when a deficiency is detected in a transfer request before it is recorded into the tracking system. New section 95921(b)(1)(A) requires the accounts administrator to inform both the Executive Officer and the entity submitting the request of the deficiency. New section 95921(b)(1)(B) states that the entities submitting the request may resubmit the request with the deficiency corrected within the three-day time limit set pursuant to section 95921(a)(1)(A). New section 95921(b)(1)(C) states that if entities fail to submit the corrected transfer request within the time limit, they must either withdraw the transfer request or submit a new request for transfer.

Staff created this procedure to ensure that some quality control checks are made when a transfer request is submitted. Staff anticipates that most deficiencies will be minor, such as failure to include correct account numbers, compliance instrument serial numbers, or other required information fields. Staff believes that these problems should be remedied within the existing requirement to submit a transfer request within three days of the settlement of a transaction that results in a request for transfer.

Staff also intends to develop the capacity to make checks for compliance with other rules, such as holding limits, prior to registering the transfer into the tracking system.

Whether the entity submitting the deficient transfer request corrects the deficiency before or after the transfer is recorded into the tracking system, staff has proposed the above changes to ensure that either the correction is made or the transfer will be reversed on the tracking system. Ultimately, ARB must be able to use its control over the recognition of transfers between accounts as the final method of ensuring compliance with the regulation.

New section 95921(b)(2) was added to describe the procedure to be used when the accounts administrator detects a deficiency in a transfer request after it is recorded into the tracking system. New section 95921(b)(2)(A) requires the accounts administrator to inform both the entities submitting the request and the Executive Officer of the deficiency. New section 95921(b)(2)(B) provides the entities that submitted the deficient transfer request five business days to correct the deficiency before the Executive Officer may instruct the accounts administrator to reverse the transaction on the tracking system.

Existing section 95921(b)(3) was removed, as it is not necessary to restate ARB's existing penalty provisions.

Minor modifications were made to section 95921(c) to clarify the information submitted with each transfer request and that the request must be submitted before any transfer is recorded into the tracking system. A requirement for the transfer request to include the time of the transaction and transaction settlement was removed from sections 95921(c)(1) and (2). Staff agrees with stakeholders who commented that these times are not meaningful for many transactions and should not be required.

Section 95921(e) was modified to deal with cases in which a registered entity may acquire and hold allowances on behalf of another entity. Section 95921(e)(1) was modified to remove a prohibition on transactions in which parties fail to disclose ownership interests in the compliance instruments involved. The replacement text states that an entity cannot purchase and hold allowances for another entity except when part of a beneficial holdings relationship disclosed to the Executive Officer pursuant to section 95834. This modification is needed to clarify to entities when they must create and disclose a formal beneficial holding relationship.

New section 95921(e)(2) states that if an entity acquires a compliance instrument on behalf of another entity that is not part of a disclosed beneficial holdings relationship, then the entity cannot hold that instrument but must immediately transfer it to the other entity by specifying the other entity's account number in the transfer request. This provision is added to allow agents to purchase on behalf of clients, as long as they do not hold the instruments in their own accounts.

The text for existing section 95921(2) was renumbered to 95921(e)(3).

New section 95921(g) modifies the information required for transfer requests when submitted by holders of exchange clearing holding accounts. New section 95921(g)(1) exempts these entities from having to include dates, prices, and beneficial holdings information in transfer requests. This information would be in the transfer requests submitted by the entities using the exchange clearing accounts to transfer control of compliance instruments. Staff agrees with stakeholders who commented that requiring this information would be an unnecessary requirement.

New section 95921(g)(2) requires that holders of exchange clearing holding accounts must retain transactions records, including the information listed in 95921(c), for 10 years. New section 95921(g)(3) requires the holders of these accounts to make records available within 10 days of a request from ARB. These provisions allow ARB access to transaction data when needed for investigation while reducing the duplication of information in the tracking system.

42. Banking, Expiration, and Voluntary Retirement (Section 95922)

No substantive changes were made to this section.

43. General Requirements (Section 95940)

No substantive changes were made to this section.

44. Procedures for Approval of External GHG ETS (Section 95941)

No substantive changes were made to this section.

45. Approval of Compliance Instruments from External GHG ETS (Section 95942)

No substantive changes were made to this section.

46. Reserved for Linkage (Section 95943)

No substantive changes were made to this section.

47. General Requirements for ARB Offset Credits (Section 95970)

Minor and non-substantive clarifications were made to section 95970.

48. Procedures for Approval of Compliance Offset Protocols (Section 95971)

A numbering structure was added to this section to support the inclusion of new provisions in this section. New section 95971(b) was added in response to stakeholder comments to include a periodic review of approved Compliance Offset Protocols.

49. Requirements for Compliance Offset Protocols (Section 95972)

Section 95972(a)(4) was modified in response to stakeholder comments and to clarify that Compliance Offset Protocols can be approved if they can eliminate the conditions that pose a risk of leakage.

Section 95972(a)(9) was modified in response to stakeholder comments and to clarify that eligibility will be based on a standardized approach and not a project-specific approach.

Also, various minor and non-substantive clarifications were made to section 95972.

50. Requirements for Offset Projects Using ARB Compliance Offset Protocols (Section 95973)

Section 95973(a)(2) was modified in response to stakeholder comments that the language was unclear in how it applies to early action offset projects transitioning to Compliance Offset Protocols. Section 95973(c) specifies that these early offset projects may have an earlier offset project commencement date.

Also, various minor and non-substantive clarifications were made to section 95973.

51. Authorized Project Designee (Section 95974)

Section 95974(a)(2) was modified to clarify additional responsibilities an Offset Project Operator may delegate to an Authorized Project Designee. This change allows an Authorized Project Designee to perform additional administrative functions on behalf of the Offset Project Operator.

52. Listing of Offset Projects Using ARB Compliance Offset Protocols (Section 95975)

Section 95975(l)(1) was modified to clarify that the limited waiver of sovereign immunity must include a consent to suit by the State of California, Air Resources Board, rather than a consent to suit independently by ARB and/or the State of California. This change was made in response to stakeholder comments and is necessary to ensure the requirements of the waiver pertain clearly to ARB as part of the State of California.

An additional modification in section 95975(l)(3) was added to acknowledge the fact that federal approval may not always be necessary for projects located on Indian lands, as defined by 25 U.S.C. section 81(a)(1), and that the Tribe will need to provide ARB with documentation to either demonstrate approval or show that approval is not required. This change was made in response to stakeholder comments and is necessary to clarify the requirement.

Various minor and non-substantive clarifications were made to section 95975.

53. Monitoring, Reporting, and Record Retention Requirements for Offset Projects (Section 95976)

Section 95976(a) was modified in response to stakeholder comments that the regulation should recognize that some protocol-specific monitoring equipment requirements exist in ARB's Compliance Offset Protocols.

Also, various minor and non-substantive clarifications were made to section 95976.

54. Verification of GHG Emission Reductions or GHG Removal Enhancements from Offset Projects (Section 95977)

Section 95977(b) was modified in response to stakeholder comments that annual verifications for offset projects that produce very few offset credits each year are a significant cost burden. Staff agrees with these comments and included a threshold that projects must meet to qualify for a two-year verification cycle.

Also, various minor and non-substantive clarifications were made to section 95977.

55. Requirements for Offset Verification Services (Section 95977.1.)

Section 95977.1(b)(2) was modified to clarify the timing for submitting an update to a conflict-of-interest evaluation, to ensure that the most accurate information related to the verification team for an offset project is available and meets the conflict-of-interest requirements for the regulation.

Section 95977.1(b)(3)(A) was modified to require the Offset Project Developer or Authorized Project Designee to make all relevant offset project information available to the verification team.

Section 95977.1(b)(3)(B) was clarified to indicate key dates included as part of an offset project verification.

Section 95977.1(b)(3)(C) was clarified with a title to specify key discussions a verification team must have with the Offset Project Operator or Authorized Project Designee.

Section 95977.1(b)(3)(D) was modified to accommodate the changes to the offset verification cycle for small projects in section 95977(b).

Section 95977.1(b)(3)(D)(2.)(i.) was modified in response to stakeholder comments to allow flexibility to the verification team to conduct some verification services offsite and not during the time spent at the offset project site.

Section 95977.1(b)(3)(I) was modified to require a verification team to clearly show how the riskiest sources of offset project information were reviewed for accuracy. This is needed to provide written documentation that the verification team fulfilled its regulatory verification requirements.

Section 95977.1(b)(3)(R)(4.)(a.) was modified to clarify the timing of the submittal of the detailed verification report to the Offset Project Developer, Authorized Project Designee, or Offset Project Registry. This change was needed to ensure that the detailed verification report was completed and finalized at the same time as the Offset Verification Statement.

Section 95977.1(b)(3)(V) was modified to include additional information a verification body must provide to ARB or an Offset Project Registry as part of oversight of the verification program. This change is necessary to ensure that offset verification service costs are commensurate with the complexity of the offset project being verified.

Also, various minor and non-substantive clarifications were made to section 95977.1.

56. Additional Project-Specific Requirements for Offset Verification Services (New Section 95977.2.)

No substantive changes were made to this section.

57. Offset Verifier and Verification Body Accreditation (Section 95978)

No substantive changes were made to this section.

58. Conflict-of-Interest Requirements for Verification Bodies for Verification of Offset Project Data Reports (Section 95979)

Section 95979(b)(2) was modified to apply conflict-of-interest requirements on the previous five years of activity between an offset verifier and Offset Project Operator or Authorized Project Designee, to add integrity to the offset verification program and align with similar requirements in the MRR.

Section 95979(b)(4) was clarified regarding when the same offset verification body can provide offset verification services to the offset project and to align with similar requirements in the MRR.

Section 95979(c) was modified to align the time period with the requirements in 95979(b)(2), but for instances where there is a potential for a low conflict of interest.

Section 95979(f)(3)(A) was modified to state that if an emerging conflict of interest can be mitigated and is disclosed to ARB, then the verification body will not be subject to revocation or suspension proceedings. This change was necessary to clarify that timely notice and mitigation of an emerging conflict of interest would not jeopardize the accreditation of a verification body.

59. Issuance of Registry Offset Credits (Section 95980)

New section 95980(b) was added to include a deadline for an Offset Project Registry to determine the completeness of a submission by a project operator.

Original section 95980(b), now section 95980(c), was modified to clarify when the initial crediting period for an early action offset project that transitions to a Compliance Offset Protocol begins.

60. Process for Issuance of Registry Offset Credits (New Section 95980.1.)

Section 95980.1(a) was modified to support the inclusion of the completeness deadline added to new section 95980(b) and allow the Offset Project Registry 15 days after its determination to issue registry offset credits.

61. Issuance of ARB Offset Credits (Section 95981)

New section 95981(c) was added in response to stakeholder comments requesting that staff include a deadline for ARB to determine the completeness of a submission by a project operator.

Original section 95981(d), now section 95981(e), was modified to clarify when the initial crediting period for an early action offset project that transitions to a Compliance Offset Protocol begins.

Also, various minor and non-substantive clarifications were made to section 95981.

62. Process for Issuance of ARB Offset Credits (Section 95981.1)

Section 95981.1(a) was modified to support the inclusion of the completeness deadline added to new section 95981(c) and to allow ARB 15 days after its determination to issue ARB offset credits.

Section 95981.1(d) was modified to shorten the time period from 30 to 15 days for ARB to notify project operators that the information they submitted was incomplete and request additional information. This change was made in response to stakeholder comments that the process for the ultimate issuance of ARB offset credits was too lengthy.

Also, various minor and non-substantive clarifications were made to section 95981.1.

63. Registration of ARB Offset Credits (Section 95982)

No substantive changes were made to this section.

64. Forestry Offset Reversals (Section 95983)

Sections 95983(c)(3) and (c)(4) were modified to make it clear that ARB offset credits must only be replaced if there have been ARB offset credits issued to the offset project. Also, in response to stakeholder comments, staff changed the timing for replacing the reversed tons in section 95983(c)(3), new section (c)(3)(B), and new sections 95983(c)(4)(2) and (c)(4)(3), from 90 days to six months. This will alleviate concerns that entities will not have enough time to find sufficient compliance instruments.

New section 95983(d)(1) was added to clarify that ARB will compensate for reversals out of the Forest Buffer Account in the case of project termination due to unintentional reversal. This will ensure that permanence obligations are fully upheld for all GHG reductions or removal enhancements achieved by the offset project.

Also, various minor and non-substantive clarifications were made to section 95983.

65. Ownership and Transferability of ARB Offset Credits (Section 95984)

No substantive changes were made to this section.

66. Invalidation of ARB Offset Credits (Section 95985)

Section 95985(b) was modified and now focuses only on clarifying the timeframe in which ARB may invalidate ARB offset credits. The eight year statute of limitations in original section 95985(b) was moved to new section 95985(b)(1). The other part of original section 95985(b,) regarding what may trigger invalidation, was moved to new section 95985(c). Original section 95985(b)(1) was deleted in response to stakeholder comments that ARB would invalidate an ARB offset credit based on clerical errors and any errors that would not affect the number ARB offset credits that were issued.

Original section 95985(b)(2) was moved to new section 95985(c)(1). New sections 95985(c)(1)(A) through (c)(1)(C)(3.) were added to include a process by which ARB would determine if there was an overstatement in the number of GHG emission reductions and GHG removal enhancements that were credited with ARB offset credits. This includes a notification process and identifies the information that ARB will look at to determine if there was an overstatement. New section 95985(c)(1)(B) was added to provide the equation that ARB will use to determine the amount of the overstated GHG reductions and GHG removal enhancements. All provisions in sections 95985(c)(1) were added in response to stakeholder comments that invalidating all of the ARB offset credits associated with an Offset Project Data Report is overly burdensome and unnecessary to maintain the environmental integrity of the program.

Original section 95985(b)(3) was moved to new section 95985(c)(2). Original section 95985(b)(4) was moved to new section 95985(c)(3).

Original section 95985(b)(5) was deleted and replaced with new section 95985(b)(1)(A). The statute of limitations was changed from five years to three years for ozone depleting substances projects, because ARB believes that three years is sufficient time for any new information regarding an Offset Project Data Report for that project type to be discovered.

Original section 95985(b)(6) was deleted and replaced with new section 95985(b)(1)(B). These new provisions clarify that offset projects developed under the other three Compliance Offset Protocols may also qualify for a three-year statute of limitation if a different verification body verifies a subsequent Offset Project Data Report from that offset project within three years. This provision provides some flexibility to Offset Project Operators to switch verification bodies before the six-year verification body rotation requirement is reached, so that the project can be reviewed by a different verifier, which could bring to light any irregularities in the offset project data or confirm the validity of the offset project implementation and subsequently issued ARB offset credits.

Original section 95985(b)(7) was moved to new section 95985(c)(4)(A). New section 95985(c)(4)(B) was added to clarify that reversals for forest offset projects do not trigger an invalidation, and that reversals will be handled according to section 95983. This provision was added to alleviate stakeholder concerns that any reversal would trigger invalidation and that the forest owner would have to double compensate for those tons.

New section 95985(d) was added to immediately block any transfers of ARB offset credits after ARB makes an initial determination to investigate the applicable Offset Project Data Report. This provision will prevent the holders of potentially invalidated ARB offset credits from transferring them (and any associated replacement liability) to other unwitting parties.

Original sections 95985(c) through (c)(3) were moved to new sections 95985(e) through (e)(3).

Original sections 95985(d) through (d)(4) were moved to new sections 95985(f) through (f)(4). New section 95985(f)(4)(A) was added to provide notice of ARB's final determination to invalidate ARB offset credits to affected parties. New section 95985(f)(4)(B) was added to provide notice of ARB's final determination to invalidate ARB offset credits to programs that are linked with California's cap-and-trade program.

Original sections 95985(e) and (e)(1) were moved to new sections 95985(g) and (g)(1). New sections 95985(g)(1)(A) and (g)(1)(B) were added to support the new provisions added in section 95985(c)(1). If ARB invalidates only a portion of the ARB offset credits from an Offset Project Data Report, ARB must determine how many and which ARB offset credits to remove from each parties Compliance and/or Holding Accounts. The formula in section 95985(g)(1)(A)(1.) will be used to determine how many ARB offset credits will be removed from the accounts of the affected parties, and section 95985(g)(1)(A)(2.) will be used to determine which ARB offset credits will be removed from the accounts of the affected parties.

New section 95985(g)(1)(B) was added to make clear that, if ARB offset credits are invalidated due to either reason in section 95985(c)(2) or (c)(3), all of the ARB offset credits in Holding and/or Compliance Accounts for the applicable Offset Project Data Report will be invalidated. The intent of this requirement did not change; however, stakeholders wanted the language to be more clear.

Original section 95985(e)(3) was deleted because these parties are covered under new section 95985(g)(2).

Original sections 95985(e)(2) and (e)(4) were moved to new sections 95985(g)(2) and (g)(3) respectively.

Original section 95985(f) was moved to new section 95985(h). A numbering structure was added to new section 95985(h) for readability and the addition of new provisions under this section. New section 95985(h)(1) clarifies that only ARB offset credits in the Retirement Account must be replaced by the parties identified in section 95985(e)(2). New section 95985(h)(1)(A) was added to support the new provisions added in section 95985(c)(1). If ARB invalidates only a portion of the ARB offset credits from an Offset Project Data Report, ARB must determine, through the formula in this section, how many ARB offset credits that each party identified in section 95985(e)(2) must replace.

New section 95985(h)(1)(B) was added to require that the parties identified in section 95985(e)(2) must replace the ARB offset credits within six months of being notified by ARB. They must replace ARB offset credits in the amount calculated pursuant to section 95985(h)(1)(A).

New section 95985(h)(1)(C) was added to require that if the parties identified in section 95985(e)(2) do not replace the ARB offset credits within six months, each unplaced ARB offset credit is a violation.

New sections 95985(h)(1)(C)(1.) through (h)(1)(C)(3.) require that the Offset Project Operator replace the ARB offset credits in the event that the parties identified in section 95985(e)(2) are no longer in business. This will ensure that the environmental integrity of the program is preserved and the cap is made whole.

New section 95985(h)(1)(D) was added to determine which ARB offset credits will be removed from the accounts of the parties identified in section 95985(e)(2).

New section (h)(1)(E) was added to provide notice of which ARB offset credits were invalidated to the parties identified in section 95985(e)(2). New section 95985(h)(1)(F) was added to provide notice of which ARB offset credits were invalidated to programs that are linked with California's cap-and-trade program.

The invalidation requirements in original section 95985(f) were moved to new sections 95985(h)(2)(A) and (h)(2)(B). New section 95985(h)(2) adds a numbering structure to the original requirements in section 95985(f) for readability, and only addresses replacement of ARB offset credits that were invalidated for reasons identified in section 95985(c)(2) or (c)(3). The requirements were unchanged in substance, except that the parties identified in section 95985(e)(2) must replace the ARB offset credits within six months instead of 90 days. This will alleviate concerns that entities will not have enough time to find sufficient compliance instruments.

New section 95985(h)(2)(C) was added to provide notice of which ARB offset credits were invalidated to the parties identified pursuant to section 95985(e)(2). New section 95985(h)(2)(D) was added to provide notice of which ARB offset credits were invalidated to programs that are linked with California's cap-and-trade program.

Original section 95985(g) was moved to new section 95985(i). A numbering structure was added to new section 95985(i) for readability and the addition of new provisions under this section. New section 95985(i)(1) clarifies that only ARB offset credits in the Retirement Account must be replaced by the Forest Owner. New section 95985(i)(1)(A) was added to support the new provisions added in section 95985(c)(1). If ARB invalidates only a portion of the ARB offset credits from an Offset Project Data Report, ARB must determine, through the formula in this section, how many ARB offset credits that the Forest Owner must replace.

New section 95985(i)(1)(B) was added to require that the Forest Owner must replace the ARB offset credits within six months of being notified by ARB. They must replace ARB offset credits in the amount calculated pursuant to section 95985(i)(1)(A).

New section 95985(i)(1)(C) was added to require that if the Forest Owner does not replace the ARB offset credits within six months, each ARB offset credit not replaced is a violation.

New section 95985(i)(1)(D) was added to determine which ARB offset credits will be removed from the accounts of the Forest Owners.

New section 95985(i)(1)(E) was added to provide notice of which ARB offset credits were invalidated to the Forest Owner. New section 95985(i)(1)(F) was added to provide notice of which ARB offset credits were invalidated to programs that are linked with California's cap-and-trade program.

The invalidation requirements in original section 95985(g) were moved to new sections 95985(i)(2)(A) and (i)(2)(B). New section 95985(i)(2) adds a numbering structure to the original requirements in section 95985(g) for readability, and only addresses replacement of ARB offset credits that were invalidated for reasons identified in section 95985(c)(2) or (c)(3). The requirements were unchanged in substance except that the Forest Owner must replace the ARB offset credits within six months instead of 90 days. This will alleviate concerns that entities will not have enough time to find sufficient compliance instruments.

New section (i)(2)(C) was added to provide notice of which ARB offset credits were invalidated to the Forest Owner. New section 95985(i)(2)(D) was added to provide notice of which ARB offset credits were invalidated to programs that are linked with California's cap-and-trade program.

Original section 95985(h) was moved to new section 95985(j).

Also, various minor and non-substantive clarifications were made to section 95985.

67. Executive Officer Approval Requirements for Offset Project Registries (Section 95986)

New section 95986(c)(2)(A)(3.) was added to require that conflict-of-interest and confidentiality requirements be in place for any contractors of Offset Project Registries. This new section provides additional integrity to the offset program.

Section 95986(c)(2)(F) was modified to clarify that the prohibition for serving as an offset project consultant applies at the subdivision level for those applicants that have designated a subdivision to provide registry services.

Section 95986(d)(1) was modified to allow ARB to monitor for any potential conflicts of interest between an offset project registry and offset project developer who lists their offset project on the offset project registry but also contracts for other non offset project-related consulting services.

New section 95986(d)(4) was added to require that Offset Project Registries have a certain amount of knowledge in operating a registry before they may be approved. This requirement will ensure that Offset Project Registries have the demonstrated knowledge and experience necessary to perform registry services.

New section 95986(d)(5) was added to require an Offset Project Registry to have a primary business in the United States, to ensure a physical presence in the geographic region where ARB will issue offsets. This will better facilitate any in- person audits ARB may wish to pursue at the Offset Project Registry offices.

New section 95986(j) was added to ensure that the Offset Project Registry had experience in specific activities required to successfully implement an offset program.

New sections 95986(k)(5)(A) through (C) were added to require that Offset Project Registries undergo a performance review before they can be reapproved to provide registry services. These provisions were added in response to stakeholder comments that ARB should include a performance review of Offset Project Registries before reapproving them.

Original section 95986(k)(3), now section (l)(3), was modified to allow offset projects that must transfer to another registry in the event their current registry's approval is revoked to qualify for a one-year crediting period extension. These modifications were made in response to stakeholder comments that switching Offset Project Registries could cause a delay in the reporting of GHG reductions and GHG removal enhancements, and subsequently cause those reductions to be ineligible for crediting.

Also, various minor and non-substantive clarifications were made to section 95986.

68. Offset Project Registry Requirements (Section 95987)

Sections 95987(b), (g), and (h) were modified to clarify that Offset Project Registries must only make the listed information publicly available for offset projects developed under Compliance Offset Protocols. This clarification was made because the Offset Project Registries do not need to meet these requirements for offset projects that are developed for voluntary purposes.

Also, various minor and non-substantive clarifications were made to section 95987.

69. Record Retention Requirements for Offset Project Registries (Section 95988)

This section was modified to clarify that Offset Project Registries must only meet the record retention requirements for offset projects developed under Compliance Offset Protocols. This clarification was made because the Offset Project Registries do not need to meet these requirements for offset projects that are developed for voluntary purposes.

70. Recognition of Offset Credits for Early Action (Section 95990)

Section 95990(a)(2)(B) was modified to clarify that Early Action Offset Programs must only be able to track ownership and transactions for early action offset projects developed under the methodologies identified in this section. This clarification was made because the Early Action Offset Programs do not need to meet these requirements for offset projects that are developed under other protocols.

Section 95990(a)(2)(C) was modified to clarify that Early Action Offset Programs must only track early action offset credits from offset projects that qualify for early action under this section. This clarification was made because the Early Action Offset Programs do not need to meet these requirements for credits that may not be used under this article.

Section 95990(a)(3) was modified to clarify that the requirements in this provision apply to designated subdivisions, if the applicant designates a subdivision to be an Early Action Offset Program.

Section 95990(a)(3)(A) was modified to prohibit Early Action Offset Programs from acting as offset project consultants for early action offset projects registered on their own registry. This was included to prevent conflict of interest.

New section 95990(a)(3)(D) was added to require an Early Action Offset Program to have a primary business in the United States, to ensure a physical presence in the geographic region where ARB will issue early action offset credits. This will better facilitate any in-person audits ARB may wish to pursue at the Early Action Offset Program offices.

Section 95990(c)(3) was modified to change the latest date that early action offset projects can register or list their projects with an Early Action Offset Program from January 1, 2013, to January 1, 2014. This modification will allow ARB time to approve Offset Project Registries and ARB-accredited verifiers to process and verify offset projects developed under Compliance Offset Protocols.

Section 95990(c)(5) was modified to require that only the most current version of any protocol may be used at the time the project is initiated. This ensures that an early action offset project is not using an out-of-date protocol.

New sections 95990(d)(1), (e)(1)(A), and (h)(5)(A) were added to clarify that Offset Project Operators or Authorized Project Designees for forest and urban forest offset projects that do not transition their early action offset projects to Compliance Offset Protocols must register with ARB for issuance of ARB offset credits. For these projects, the holders of the early action offset credits may not register, list, meet the attestation requirements, and seek issuance of ARB offset credits. Staff is requiring the project proponents to register in these cases, to ensure that the CO_2 sequestered and credited by ARB remains sequestered, and that ARB has enforcement authority in the case of reversals from these projects.

New sections 95990(d)(2) and (d)(3), (e)(1)(B) and (e)(1)(C), and (h)(5)(B) and (h)(5)(C) were added to clarify that either the Offset Project Operator or Authorized Project Designee, or the holders of early action offset credits may: register; list; meet the attestation requirements; and seek issuance of ARB offset credits for forest or urban forest offset projects. This is contingent upon the forest or urban forest projects do transition to Compliance Offset Protocols and any offset projects developed under the methodologies listed in section 95990(c)(5)(A) and (C). Staff is allowing the holders of these credits to take actions for these early action offset projects because there is no risk of reversal for those offset projects developed under the methodologies listed in section 95990(c)(5)(A) and (C). If the forest or urban forest offset project is transitioning into the compliance offset program, ARB can monitor and address reversals in the future because the Offset Project Operator or Authorized Project Designee will be part of the compliance offset program.

New section 95990(e)(2) was modified to require that the parties identified in section 95990(e)(1) submit the required information. The structure of these provisions was changed for clarity.

Original section 95990(e)(2), now new section 95990(e)(3), was modified to require that Offset Project Registries clearly indicate which offset projects are part of the compliance offset program. This requirement was added to provide transparency.

Section 95990(f)(3)(A) was modified to require that the verifier review the Offset Verification Statement in addition to the Early Action Verification Report.

Section 95990(f)(3)(B) was modified to require that, during the desk review, the verifier review the data checks that were conducted in the original verification performed under the Early Action Offset Program. This provision was added in response to stakeholder comments to streamline the requirements for regulatory verification of Early Action Offset Credits.

Section 95990(f)(3)(C) was modified to require that the ARB accredited verifier determine with reasonable assurance whether or not they agree that a positive offset verification statement should have been issued under the Early Action Offset Program after reviewing the documentation from the original verification conducted under the Early Action Offset Program. “Reasonable assurance” is defined in the regulation. This provision was added in response to stakeholder comments to streamline the requirements for regulatory verification. Instead of issuing another verification statement, the ARB verifier must make an attestation to ARB regarding its findings.

Section 95990(f)(3)(D) was modified to support the changes in provision 95990(f)(3)(C).

Section 95990(f)(4) was modified to require that the ARB verifier recommend to ARB that full verification services be performed if the verifier cannot concur with reasonable assurance that a positive verification statement should have been issued. Staff removed the three percent or 25,000 metric ton CO_2e threshold. This provision was added in response to stakeholder comments to streamline the requirements for regulatory verification by evaluating the original verification on the threshold of five percent offset material misstatement. If the offset material misstatement was greater than five percent it would not have been issued a positive verification statement under the Early Action Offset Program. The verifier must prepare a report for ARB detailing why full verification services are warranted. ARB will make the final decision to avoid conflicts of interest in the verifier recommending the additional verification services to be performed.

New section 95990(f)(5) was added to support the modifications in section 95990(f)(4). The provision requires ARB to review the information in the report prepared by the verification body.

New section 95990(f)(6) was added to support the modifications in section 95990(f)(4). The provision requires that ARB make a final determination as to whether full verification service must be provided. If ARB finds that a positive verification statement should not have been issued, then full verification services must be performed.

New section 95990(f)(7) was added in response to stakeholder comments and to clarify the implications of a second desk review on credits that have already been transferred to ARB. This provision was included to make it clear that if a desk review has successfully been completed, no further reviews are triggered by subsequent early action verification activities for that early action offset project.

Section 95990(h)(3) was modified to support the changes made to section 95990(f)(3)(C).

New section 95990(h)(6) was modified to require that the parties identified in section 95990(h)(5) submit the required attestations. The structure of these provisions was changed for clarity. If the Offset Project Operators or Authorized Project Designees do not transfer over the early action offset projects, ARB must have parties identified as responsible for the offset credits that are brought into the system to ensure ARB's enforcement authority.

New section 95990(i)(1)(D)(1.) was added in response to stakeholder comment and to require that Early Action Offset Programs release all the credits in their buffer accounts for forest projects to ARB. This will ensure that permanence requirements are met for all early action offset projects that come over to ARB.

New section 95990(i)(1)(D)(1.)(a.) was added to clarify that credits with vintages from 2001 through 2004 that are released to ARB by the Early Action Offset Program will be given a special series of unique serial numbers and will be placed in ARB's Forest

Buffer Account. This provision is necessary so that ARB can easily identify these credits, since they may not be used in the compliance offset program.

New section 95990(i)(1)(D)(1.)(b.) was added to clarify that the credits with vintages from 2001 through 2004 that are released to ARB by the Early Action Offset Program may only be retired by ARB in the event of a reversal. It further clarifies that these vintages may not be used to satisfy ARB's Forest Buffer Account requirements under this section. This provision is necessary because these credits will still be considered voluntary credits, and not compliance offsets. ARB cannot allow voluntary credits to be used for compliance purposes. Retaining these credits in ARB's Forest Buffer Account will ensure that in the event of a reversal the atmosphere is made whole by retiring all voluntary and compliance offsets issued to the project.

Original section 95990(i)(1)(D)(2.), now new section 95990(i)(1)(D)(3.), was modified to support the changes in section 95990(i)(1)(D)(1.) and to determine how many ARB offset credits would be issued after Forest Buffer Account contributions are met, if the Offset Project Operator or Authorized Project Designee is the party that transferred the early action offset credits into the ARB system. In this case, the total number of ARB offset credits issued will be at the project level.

Original section 95990(i)(1)(D)(2.)(a.), now new section 95990(i)(1)(D)(3.)(a.), was modified to support the changes in section 95990(i)(1)(D)(1.) and describe how ARB will determine if one ARB offset credit will be issued to the Offset Project Operator or Authorized Project Designee for each early action offset credit issued to the early action forest offset project. In this case, if the total number of credits released to ARB from the buffer of the Early Action Offset Program that meets the requirements of this section is greater than or equal to the number of ARB offset credits that need to be put into ARB's Forest Buffer Account, the project will be issued one ARB offset credit for each early action offset credit, and its Forest Buffer Account contribution will be satisfied.

Original section 95990(i)(1)(D)(2.)(b.), now new section 95990(i)(1)(D)(3.)(b.), was modified to support the changes in section 95990(i)(1)(D)(1.). It describes how many ARB offset credits will be issued to the Offset Project Operator or Authorized Project Designee for each early action offset credit issued to the early action forest offset project, if the total number of credits released to ARB from the buffer of the Early Action Offset Program is less than the number of ARB offset credits that need to be put into ARB's Forest Buffer Account. Based on these factors, the Offset Project Operator or Authorized Project Designee can determine how many ARB offset credits they can be issued after satisfying the Forest Buffer Account contribution.

New section 95990(i)(1)(D)(4.) was added to support the changes in section 95990(i)(1)(D)(1.) and to determine how many ARB offset credits would be issued after Forest Buffer Account contributions are met, if the holder of the early action offset credits is the party that transferred the early action offset credits into the ARB system. In this case, the total number of ARB offset credits issued will be at the individual holder level.

New section 95990(i)(1)(D)(4.)(a.) was added to support the changes in section 95990(i)(1)(D)(1.). It describes how ARB will determine if one ARB offset credit will be issued to the holder of the early action offset credits for each early action offset credit issued to the early action forest offset project. In this case, if the total number of credits released to ARB from the buffer of the Early Action Offset Program that meets the requirements of this section is greater than or equal to the number of ARB offset credits that need to be put into ARB's Forest Buffer Account, the holder will be issued one ARB offset credit for each early action offset credit, and its Forest Buffer Account contribution will be satisfied.

New section 95990(i)(1)(D)(4.)(b.) was added to support the changes in section 95990(i)(1)(D)(1.). It describes how many ARB offset credits will be issued to the holder of the early action offset credits for each early action offset credit issued to the early action forest offset project, if the total number of credits released to ARB from the buffer of the Early Action Offset Program is less than the number of ARB offset credits that need to be put into ARB's Forest Buffer Account. Based on these factors, the holder can determine how many ARB offset credits they can be issued after it satisfies its Forest Buffer Account contribution.

Section 95990(i)(1)(E) was modified to make the calculation in this section optional. This means that the Offset Project Operator or Authorized Project Designee of the early action offset project may use this calculation to determine if it would be eligible to be issued additional ARB offset credits over and above those than it was issued under the early action offset credits criteria. If they choose not to do the calculation, they would still be issued ARB offset credits on a one-to-one basis. This provision was made optional in response to stakeholder comments that some projects may not want to go through the complicated process to be issued additional ARB offset credits.

Sections 95990(i)(1)(E)(2.), (i)(1)(E)(2.)(a.), and (i)(1)(E)(2.)(b.) were modified to provide clarity based on stakeholder comments that the text as written was unclear.

Sections 95990(j)(1) and (j)(2) were deleted and replaced with new provisions to support the changes and clarifications made to sections 95990(d), (e)(1), and (h)(5) for Offset Project Operators or Authorized Project Designees, or holders of early action offset credits.

Section 95990(k)(1) was modified to remove the requirement that early action offset projects may transition to Compliance Offset Protocols no earlier than January 1, 2013. This requirement was removed due to stakeholder comments that early action offset projects should be able to use Compliance Offset Protocols as soon as they are finalized through the rulemaking process.

Section 95990(k)(1)(D) was modified to ensure that no previously credited carbon stocks under an Early Action Offset Program would inadvertently be re-issued ARB offset credit the first year the project transitions to the Compliance Offset Protocol.

Even though the baselines would be recalculated, credit would be based on the increase in carbon stocks from the last credits issued, based on the re-calculated baseline.

Section 95990(k)(3)(C) was modified to allow GHG reductions and GHG removal enhancements that occur in 2014 under an early action protocol to be verified by September 30, 2015. This change was made in response to stakeholder comments that ARB should streamline the requirements for early action offset projects with those for offset projects using Compliance Offset Protocols by allowing early action offset projects to have nine months to verify their Early Action Data Report.

New sections 95990(l)(1) and (l)(2) were added to replace original section 95990(l). New section 95990(l)(1) provides that early action offset credits from non-sequestration offset projects may be invalidated pursuant to the relevant provisions for non-sequestration offset projects in section 95985. New section 95990(l)(1)(A) provides that if the parties identified in section 95985(e)(2) are no longer in business and the Offset Project Operator or Authorized Project Designee transitioned the early action offset credits to ARB, then the Offset Project Operator must replace the invalidated ARB offset credits. New section 95990(l)(1)(B) provides that if the parties identified in section 95985(e)(2) are no longer in business, and the holder of the early action offset credits transitioned them to ARB, then the holder that transitioned them must replace the invalidated ARB offset credits. New section 95990(l)(2) provides that early action offset credits from forest offset projects may be invalidated pursuant to the relevant provisions for forest offset projects in section 95985.

Also, various minor and non-substantive clarifications were made to section 95990.

71. Sector-Based Offset Credits (Section 95991)

No substantive changes were made to this section.

72. Procedures for Approval of Sector-Based Crediting Programs (Section 95992)

No substantive changes were made to this section.

73. Sources for Sector-Based Offset Credits (Section 95993)

No substantive changes were made to this section.

74. Requirements for Sector-Based Offset Crediting Programs (Section 95994)

No substantive changes were made to this section.

75. Quantitative Usage Limit (Section 95995)

No substantive changes were made to this section.

76. Reserved for Sector-Specific Requirements (Section 95996)

No substantive changes were made to this section.

77. Reserved for Approved Sector-Based Crediting Programs (Section 95997)

No substantive changes were made to this section.

78. Jurisdiction (Section 96010)

No substantive changes were made to this section.

79. Authority to Suspend, Revoke, or Modify (Section 96011)

Section 96011(c) was deleted because it was redundant to section 96011(a).

80. Injunctions (Section 96012)

No substantive changes were made to this section.

81. Penalties (Section 96013)

No substantive changes were made to this section.

82. Violations (Section 96014)

Section 96014(b) was modified to provide a periodic calculation for penalties. This new requirement recalculates penalties every 45 days instead of every day. The change was made in response to stakeholder concerns about large penalties accruing if the period for recalculation was every day.

83. Severability, Effect of Judicial Order (Section 96020)

No substantive changes were made to this section.

84. Confidentiality (Section 96021)

No substantive changes were made to this section.

85. Jurisdiction of California (Section 96022)

No substantive changes were made to this section.

86. Reserved Provisions (Section 96023)

No substantive changes were made to this section.

87. Modifications to Compliance Offset Protocol Urban Forest Projects

This protocol was modified to require an urban forester to be involved in the review of the project and offset project data report. The verification team must also include a forester or urban forester. These changes were necessary to ensure that the right experts were involved in the documentation preparation and review for this project type.

88. Modifications to Compliance Offset Protocol Livestock Projects

This protocol was modified to allow identical engines to share a biogas flow meter and any mention of thermocouplers for flares have been expanded to include engines. Both of these changes were in response to stakeholder comments.

The requirements for adjustments to metered biogas flow data in Section 6.1 have been replaced with a more conservative method to ensure a rigorous accounting methodology within the protocol.

Additional minor and non-substantive changes were also made to this protocol.

89. Modifications to Compliance Offset Protocol Ozone Depleting Substances Projects

This protocol was modified to include the updated leakage rates in Table 5.4. The leakage rates were updated to reflect the impacts of ARB's Refrigerant Management Program. This change had already been made to the baseline calculations, but was inadvertently left out of Table 5.4.

CFC-13 was added as an eligible gas and incorporated into the methodology based on information from U.S. EPA and others. The incorporation required changes throughout the protocol, including addition of 10-year cumulative emission rates, carbon ratios, and substitute emissions.

Additional minor and non-substantive changes were also made to this protocol.

90. Modification to Compliance Offset Protocol U.S. Forest Projects

This protocol was modified to make the definition for "Forest Owner" consistent with the cap-and-trade regulation which was modified in response to stakeholder comments.

The eligibility of offset projects was also modified to allow projects that were part of other voluntary programs to register under the Compliance Offset Protocol if the offset project owners had met legal requirements before transitioning from the other voluntary programs. Stakeholders were concerned that only projects previously registered at the Climate Action Reserve would be allowed to transition to the Compliance Offset Protocol.

Clarifications were made to the language related to projects on tribal lands.

Additional minor and non-substantive changes were also made to this protocol.

This page intentionally blank.

III. SUMMARY OF COMMENTS MADE DURING THE 45-DAY COMMENT PERIOD AND AGENCY RESPONSES

Chapter III contains all comments submitted during the 45-day comment period and the subsequent Board hearing that were directed at the proposed regulation or to the procedures followed by ARB in proposing the regulation, together with ARB's responses. The 45-day comment period commenced on November 1, 2010, and ended on December 15, 2010, with additional comments submitted at the December 16, 2010, Board hearing on the proposed regulation. Comments specifically addressing the Mandatory Reporting of GHG Emissions are included and responded to in the Mandatory Reporting Regulation's (MRR) Final Statement of Reasons, which can be found on the MRR's regulatory web site (http://www.arb.ca.gov/regact/2010/ghg2010/ghg2010.htm).

We received almost 1,000 letters on the proposed regulation during the 45-day comment period, and almost 150 oral testimonies during the December 16, 2010, Board hearing. Commenters included representatives from every sector covered by the regulation (e.g., electricity, industry, and fuel distributers); community, political, and religious groups; environmental organizations; environmental justice groups; financial services providers; governmental agencies and representatives; universities and non-profit research groups; verification bodies; and many interested private parties. To facilitate ease of use, comments are categorized into one of 16 sections below, and are grouped for response wherever possible.

Table III-1 below lists commenters that submitted comments during the 45-day comment period up to and at the Board Hearing, identifies the date and form of their comments, and the Reference Code assigned to each.

A. LIST OF COMMENTERS

Table III-1: Comments Received During the 45-Day Comment Period

Abbreviation	Commenter
3DEGREES	Ian McGowan, 3Degrees Written Testimony: 12/14/2010
AAVB	Tod Delaney, Association of Accredited Verification Bodies Written Testimony: 12/9/2010

B. AB 32 / CAP-AND-TRADE DESIGN

This section includes general programmatic and policy comments and responses about how the cap-and-trade program is and/or should be structured in the context of AB 32. AB 32 placed ARB in charge of ensuring that the State's greenhouse gas emissions are reduced to 1990 levels by 2020 and authorizes the Board to utilize market-based compliance mechanisms (e.g., a cap-and-trade program) to meet this goal. Major topics within this section concern development of the regulation; collaboration and coordination with other agencies; the level of the "cap" or allowance budget (i.e., maximum allowed greenhouse gas (GHG) emissions by all covered entities in each year; sections 95840–95841 and table 6-1 of the regulation); implementation, including program monitoring and adaptive management; treatment of different covered sectors; interaction of the regulation with the Low-Carbon Fuel Standard; cost-effectiveness; and potential linkage with Western Climate Initiative (WCI) partner states and provinces and other cap-and-trade programs (sections 95940–95943).

AB 32

General

B-1. Comment: Combine trading with direct regulation (now or in the future). (USFLAW)

> **Response:** We agree. ARB is pursuing both direct command-and-control regulations, such as, but not limited to, the low carbon fuel standard, advanced clean car regulation, stationary refrigeration regulation, and a market based cap-and-trade regulation to reduce GHG emissions. In addition, ARB has adopted a regulation entitled "Energy Efficiency and Co-Benefits Assessment of Large Industrial Facilities." We will use the findings of these assessments to identify additional measures that could be taken on a source-specific basis through direct regulation.

B-2. Comment: NextEra Energy supports the majority of the elements contained within the proposed regulation, including but not limited to the ability to use offsets to meet a compliance obligation; the establishment of cost containment mechanisms; banking of allowances; a three-year compliance period; the price floor; the cost containment reserve auction, the quarterly allowance auction; limited protection for economically disadvantaged industries; an emission threshold for applicability; a multi-sector program, and the placeholder for inclusion of voluntary renewable energy accounting under the cap and trade program. (NEXTERAENERGY)

> **Response:** Thank you for your support.

B-3. Comment: ARB must protect public health and require industries to pay the full cost of the pollution they emit. (AFFONSO)

Response: The regulation is designed to reduce GHG emissions in California, improve the environment, and protect public health. Covered entities must turn in allowances equal to their GHG emissions. The declining cap on emissions ensures that there will be emission reductions. The price of allowances will depend on the cost of available emission controls.

B-4. Comment: Include carbon fees to fund important programs. (CPC1)

Response: We considered alternatives to the cap-and-trade program, and implementing a carbon fee was one of the alternatives considered; however, we determined that a cap-and-trade program was more favorable. Details on why we chose cap-and-trade over a carbon fee can be found in Chapter IV of the Staff Report.

B-5. Comment: There are no comparisons given that show the people what our costs are today and what the costs and changes would be to us tomorrow with the implementation of AB 32. (SACREB)

Response: Appendix N of the Staff Report provides ARB's economic analysis that evaluated costs incurred to the general public as part of the implementation of the cap-and-trade regulation. Cost impacts on consumers would result from changes in energy prices. Households that consume less energy will be less affected by higher prices than those that consume more energy.

Voluntary Efforts/Early Action

B-6. (multiple comments)
Comment: The Sonoma County Water Agency supports the adoption of the proposed regulations for the Cap and Trade program. However, as we have discussed with ARB staff, we have two main concerns:

1. How will the Cap and Trade regulations impact voluntary compliance programs for GHG reductions, and in particular those administered by local agencies and special districts? Although we are not asking for specific amendments to the regulations at this time, we are preparing concepts and proposals for future revisions to the regulations to ensure full recognition and accounting for emissions reductions from viable, voluntary compliance programs.

2. ARB must ensure that the cap and trade regulations do not create an inadvertent windfall for utilities and fuel distributors who claim allowance credit for GHG emissions reductions that are actually resulting from the actions and accomplishments of voluntary local programs. That is, the county makes the investment in GHG reductions, and another entity is able to discharge their surrender obligation without actually making the investment and incurring the cost of the emissions reduction.

What the regulations do not accomplish is a framework to encourage, retain, energize and reward the many voluntary efforts in California to reduce carbon emissions. SCWA would like to work with ARB through the AB 32 implementation process to develop a clear set of policies, and potentially regulations, that accomplish the following goals:

- Support the development of a community-scale accounting protocol (GHG Accounting Protocol), which is consistent with regulatory and voluntary reporting requirements and frameworks, to assist local governments in the measurement of GHG emissions in their communities.
- Request that CARB become signatory to an MOU or formal partnership with ICLEI and others (U.S. EPA, The Climate Registry, etc.) to develop and adopt the Protocol.
- Develop a list of best practice measures for public-sector (local government) Programs.
- Assign CARB staff to serve on a high-level steering committee to provide strategic direction on the development of a community-scale emissions reduction protocol (GHG Reduction Protocol)—participate in regular meetings, assist in the development and implementation of a public engagement plan, assemble technical committees, determine reporting and inventory processes and concept development.
- Ensure consistency with the Western Climate Initiative's regional Cap and Trade program and work to inform or incorporate broader national/international standards as they pertain to local government participation in the Program. (SCWA)

Comment: It is unclear how businesses that have already undertaken early and voluntary GHG emission reduction actions will receive credit. (SDCHAMBER)

Comment: As the State of California transitions to a mandatory greenhouse gas emission reduction program, the Council believes it is critical to recognize early action taken by businesses and other entities to reduce emissions and to credit them for the prior investments that have been made to reduce emissions through the deployment of efficiency, renewables, and other measures. (BCFSE)

> **Response:** We recognize the benefits of voluntary GHG reduction programs. Subarticle 14, section 95990 includes a process for accepting early action offset credits from qualified existing offset projects. The regulation allows eligible offset credits and ongoing projects under protocols developed for four project types to transition into the compliance offset program. Projects using the offset protocols are subject to verification and enforcement requirements that are specified in the regulation. These proposed project types include: U.S. Forest Projects, Urban Forest Projects, Ozone Depleting Substances Projects, and Livestock Manure Projects. It should be noted that offset credits are only available from non-capped sectors. Many voluntary efforts reduce emissions from the electricity, natural gas, or transportation fuel sectors, which are capped. Also, the regulation requires that allowances distributed to utilities must be used for ratepayer benefit.

The benchmarking method used to support direct allocation of allowances is also designed to benefit capped entities that have already undertaken action to reduce GHG emissions.

B-7. Comment: The usage of recycled glass deserves early action credit since it meets all of the necessary qualifications. The regulations for the glass manufacturing sector should permit an early action credit of a three percent energy savings for each 10 percent of recycled content and an equivalent offset for carbonate raw material usage which would have otherwise been utilized. (OWENSIL)

Response: The glass manufacturing sector is subject to the cap, and any reductions achieved by an individual facility would result in that facility having to surrender fewer GHG allowances. Offset credits cannot be generated for activities that reduce emissions in capped sectors. Offset credits for those reductions would be double-counted within the cap-and-trade program. Therefore, offset credits can only be issued for activities that are not capped.

Emissions Levels/Targets/Forecasts

B-8. (multiple comments)
Comment: When considering the 2020 emission limit of 427 million metric tons of carbon dioxide equivalent ($MMTCO_2E$) of GHGs, what method of GHG accounting is used? (ASMMANDEVORE2)

Comment: When considering the 2020 emission limit of 427 million metric tons of carbon dioxide equivalent ($MMTCO_2E$) of greenhouse gases in conjunction with the Western Climate Initiative (WCI), will emissions leakage be considered? (ASMMANDEVORE1)

Response: The statewide 2020 emission limit of 427 $MMTCO_2e$ is based on the net amount of GHGs emitted to and removed from the air through forest sequestration of CO_2. The 2020 emission limit is California's 1990 emissions based on an inventory of the amount and type of GHGs emitted by different sources on an annual basis. The 2020 emissions limit was endorsed by the Board at its December 2007 hearing. California's program has been designed to minimize emissions leakage. As part of the regular program monitoring, ARB will monitor for potential leakage. Furthermore, as ARB proceeds to link with the Western Climate Initiative, potential emission leakage issues will be identified and addressed.

B-9. Comment: The regulation should contain a clear updated summary and accounting of emission reduction goals and contributions from various measures. Since there have been updates to emissions forecasts, necessary emission reductions to get to 1990 levels, and contributions from various measures, it would be useful to see all these numbers reconciled and summarized in a single place in the regulation. This would include an update to Table 2 of the Scoping Plan. (BP)

Response: We agree and released a status update on AB 32 Scoping Plan measures that includes revised GHG emissions reduction estimates for recommended measures in the Scoping Plan. This information is posted on ARB's website at: http://www.arb.ca.gov/cc/scopingplan/status_of_scoping_plan_measures.pdf.

B-10. (multiple comments)
Comment: The aim to return California's emissions to 1990 levels by 2020 lacks ambition, and does not respond to demands by developing countries facing climate change who are calling for wealthy states like California (that use a disproportionate amount of our global atmosphere related to global population) to reduce emissions much more radically. (CTW)

Comment: Please do your best to strengthen the Proposed California Cap on Greenhouse Gas Emissions and Market-Based Compliance Mechanisms Regulations (LANEW)

Comment: Please make sure our GHG emissions are reduced by providing as low as possible caps for all GHG emitters, which are reduced annually to reach scientific targets. (DISENHOUSE)

Response: AB 32 authorizes ARB to implement a comprehensive, multi-year program to reduce GHG emissions in California. This statute includes the goal of reducing California's GHG emissions to 1990 levels by 2020. ARB's regulations must meet all AB 32 requirements, balancing technical feasibility, cost-effectiveness, improving public health, attaining ambient air quality standards, and many other objectives. We believe that cap-and-trade regulation appropriately balances these objectives.

Cap-and-Trade

General

B-11. Comment: We support your idea to hire an expert to look at the impact of the regulation on the state energy markets. (WSPA2)

Response: Thank you for your support.

B-12. Comment: We commend CARB for designing the Cap and Trade regulation with numerous flexible cost-containment mechanisms, in particular banking, rolling three-year compliance periods, and offsets and linkage. (CLIMATEWEDGE)

Response: Thank you for your support.

B-13. Comment: Cap and trade models are not successful prophylactic measures and have proven to be ineffective tools for phasing out carbon use. Pollution trading is an ineffective air quality policy with the arguable exception of the Acid Trading Program. Due to over allocation of allowances, low carbon prices, fraudulent transactions and banking (which may result in short term reductions followed by a spike in emissions when banked credits are utilized), pollution trading programs do not significantly reduce air pollution. Additionally, pollution trading often does not result in emissions reductions because of difficulty monitoring and enforcing emission reductions. (CRPE1)

> **Response:** We do not agree that a well-designed cap-and-trade regulation is an ineffective tool at reducing GHGs. The declining cap on emissions ensures there will be emission reductions.
>
> We used several years' worth of emissions data to determine the number of allowances that would be made available. It is unlikely that the California market will be over allocated. Banking is a necessary design feature intended to prevent price variability. It also provides an incentive for covered entities to make early reductions.
>
> We will implement a market tracking system that will track and monitor compliance instruments (allowances and offset credits). The cap-and-trade regulation also has provisions that provide market oversight. These provisions involve information disclosures to assist in monitoring the market and prohibitions on trading activities that involve fraud, reporting false or misleading information, misrepresentations, and other commonly used techniques used to manipulate markets.
>
> The premise that pollution trading programs do not significantly reduce air pollution is contradicted by experiences in other programs. The RECLAIM program in the South Coast Air Quality Management District has achieved reductions well beyond original expectations and continues to show increased reductions, including in areas adversely impacted by pollution and consistent with the ozone SIP for the South Coast Air Basin. As noted, the federal Acid Rain program has also gone well beyond the original emission reduction estimates and has lowered control costs over what would otherwise have occurred under a command-and-control system. In both cases, as in other market-based regulatory systems, adjustments have been made as problems are identified, and cost-effective emission reductions continue to occur.

B-14. Comment: It is important that the cap-and-trade rule encourage innovations that convert GHGs to stable non-GHG forms. Calera urges ARB to revise the proposed Cap and Trade rule to encourage out-of-state sources to reduce emissions through any means, including conversion of greenhouse gases to non-GHG forms. Specifically, add the following definition: "'Carbon Conversion' means the generally permanent conversion of carbon dioxide to non-GHG forms, such as carbonate, calcium carbonate, magnesium carbonate, bicarbonate, and other stable chemicals that are not greenhouse gases and will not readily revert to GHG forms." Also modify the definition of "greenhouse gas emission reduction" as follows: "Greenhouse gas emission reduction" or "GHG emission reduction" or "greenhouse gas reduction" or "GHG reduction" means a calculated decrease in GHG emissions relative to a project baseline over a specified period of time and shall include chemical conversion of greenhouse gases to stable non-GHG forms." (CALERACORP)

Response: No response necessary.

B-15. Comment: I recommend putting a cap on the number of "tradable" permits or exceptions. It doesn't make sense to allow one company to pollute as much as it can while other companies scrape their levels back and trade allowances with the major polluter. In particular, the largest polluters should have to reduce emissions or pay fines, rather than grab someone else's allotment. (SIRCAR)

Response: The commenter is misguided in how the covered entities can 'pollute' under the program. The tradable permits under the cap-and-trade program are issued in a number designed to ensure we get the reductions needed to reach the AB 32 target. The prices paid for tradable permits will reflect the cost of direct reductions in emissions. Emitters can observe this price and determine whether it is cheaper to purchase permits or make reductions. Even recipients of a direct allocation will have an incentive to make reductions so they could sell permits to others that face higher compliance costs. Nothing in the cap-and-trade regulation allows larger emitters to emit more emissions than allowed by air permits issued by the local air districts. Having the ability to purchase extra allowances does not equate to unlimited rights to emit.

Transparency

B-16. Comment: Data should be provided in a database download dump that would ideally be in the native database language SQL. Alternatively, Excel or CSV spreadsheets should be published for each dataset, with a unique identifier for each installation, company, etc. that is used throughout the dataset, so that the dataset can be imported into a database. Our recommendations for provisions of public data in relation to the trading scheme are as follows:

- All relevant data should be made available at an installation level. This enables the maximum levels of transparency;
- Company ownership of installations, including parent company ownership, should be published;
- Installations should be grouped and identified by sectors of the economy at the most disaggregated level possible, i.e. by product type or service;
- Data about installation level emissions (current and historic) and any free allocations should be released;
- The use of offsets for compliance should be recorded separately from the use of allowances;

- Details of the projects generating the offsets used for compliance at an installation level should be made publicly available;
- All benchmarks used for free allocations, including adjustments for variations in production levels, should be made public;
- The total volume of emissions issued by auction and held in reserves should be regularly published (at least once a quarter);
- Volumes of allocations removed in response to voluntary uptake of green tariffs or through voluntary cancellation should be published regularly (at least annually);
- Changes in scope between compliance periods should be clearly labeled and made public so that an accurate picture of aggregate emissions over time can be developed. If new entrants are not clearly labeled in order that they may be disaggregated from existing participants, aggregate data becomes distorted and of limited use in analysis of performance; and
- Any transactions between installations that involve the transfer of flue gases for fuel, accompanied by allowances, should be recorded and made publicly available. This does not happen currently in Europe and makes analysis of performance under the scheme unnecessarily difficult. (SANDBAGCC)

  Response: We agree that it is important to have public data readily available in a user-friendly format. Currently, mandatory emissions reporting data can be downloaded from the ARB website. Beginning in 2012, the market tracking system will compile information on holders of compliance instruments (allowances and offset credits) and trading of compliance instruments among market participants. We will ensure that auction and trade data information is easily accessible from the ARB website. Benchmarks used for free allocations are included in the regulation.

Collaboration/Coordination

B-17. Comment: There are several provisions in the proposed regulations and protocols that may require support by CAL FIRE or warrant further exploration with the Board of Forestry and Fire Protection. CAL FIRE suggests clarification or incorporating into the regulation language that directs or allows ARB to work with CAL FIRE and the Board of Forestry and Fire Protection to address these needs. (DFFP1, DFFP2)

> **Response:** We agree that it would be good to work with our sister State agencies throughout implementation of the cap-and-trade regulation and plan to do so on a number of provisions of the regulation. For example, we plan to work with CalFire and the Board of Forestry and Fire Protection as we implement the U.S. Forest Protocol.

B-18. Comment: There should be coordination and consistency between California's program and federal regulations. Businesses should not be asked nor expected to use different protocols and inventory formats for GHG reporting. (SDCHAMBER)

Response: We agree that it would be desirable to have businesses meet State and federal requirements using one set of protocols. As stated in Resolution 10-42, the Board directed the Executive Officer to work with U.S. EPA on the development of a federal regulatory framework to grant delegation or equivalency to California's climate change program where appropriate. ARB is aligning the GHG reporting regulations with federal requirements. We are also working toward a unified reporting system to satisfy both State and federal requirements while minimizing duplicative or conflicting reporting obligations for facilities subject to both rules.

B-19. (multiple comments)
Comment: SCAQMD recommends that there be a report to the CARB Board in three months regarding how local air districts are being utilized in various aspects of the program, including emission verification, offset verification, and protocol development. This can help ensure better collaboration in the future and enable appropriate use of local air district resources and expertise. (SCAQMD1)

Comment: The draft regulation specifically prohibits local air districts from performing multiple functions related to the cap on Greenhouse Gas Emissions compliance program. However, SCAQMD has staff resources and expertise that can help ensure successful implementation of the program and other stationary source programs under AB 32. The potential conflict of interest issues applicable to for-profit businesses do not exist for a local air quality agency like SCAQMD. Our organization is a sister regulatory agency with public health as the primary motivation. We are not for-profit, and would approach any function with the motivation to do what is right, not to generate income or ensure repeat business. We request the ability to perform multiple functions in the cap and trade program, including verification of emission reports. (SCAQMD1)

Response: We agree that districts can play an important role in helping ARB implement the cap-and-trade regulation. However, we do not believe the report suggested by the commenter is necessary. In Resolution 10-42, the Board directed the Executive Officer to develop amendments to the cap-and-trade regulation to provide for air district verification of offsets. The regulation has been amended to reflect this.

In addition, Board Resolution 11-32 directed the Executive Officer to partner with the air quality management districts and air pollution control districts in the implementation of the cap-and-trade regulation, including, but not limited to, an evaluation of the impacts of the cap-and-trade program on industrial source greenhouse gas permitting and implementation of the Adaptive Management Plan. The Board further directed the Executive Officer to report back periodically to the Board on the nature and extent of this partnership, with the first report due in the first quarter of calendar year 2012.

Working Group/Advisory Group

B-20. (multiple comments)
Comment: The Board should establish working groups of covered entities to assist staff in identifying potential compliance and market operational problems that should be addressed before the program commences. (CCC, MAZOWITA)

Comment: We ask that cost implications be recognized and also for a panel to be set up to monitor these kinds of costs and agriculture have a seat at the table because we're the ones paying the bill. So hopefully we can be a part of the panel. (CCGG)

> **Response:** We agree that we need to carefully monitor industry progress toward compliance with the regulation, as well as the operation of the markets. However, we do not see the need for working groups of covered entities, as suggested by the commenter. As discussed in Resolution 10-42, the Board directed the Executive Officer to hold public consultations over the next year to identify potential obstacles to compliance and, as necessary, incorporate or enhance compliance assistance mechanisms into the program. The Board also directed the Executive Officer to contract with an independent entity with appropriate expertise to monitor and provide public reports on the market's operation, including auctions and reserve sales, on a quarterly basis and recommend appropriate action, which could include taking corrective action prior to the next auction, adding future allowances to the allowance reserve or future auctions, or temporarily suspending trading in the market. We will continue to meet with stakeholders as the regulation is implemented and update the Board on progress in implementing the regulation.

B-21. Comment: The resolution should provide for periodic reports back to the Board on the availability of necessary regulatory tools and guidance, the results of the independent market evaluation, the determination of the equivalency of California's program with EPA regulations, and the identification and resolution of potential compliance and market operational problems identified by the recommended covered entity troubleshooting work group. (CCC, MAZOWITA)

> **Response:** We agree that periodic reports should be provided to the Board on the operation of the cap-and-trade program. As discussed in Resolution 10-42, the Board directed the Executive Officer to update the Board annually on the status of the cap-and-trade program. In addition, the Board directed the Executive Officer to hold public consultations over the next year to identify potential obstacles to compliance and, as necessary, incorporate or enhance compliance assistance mechanisms into the program. While the resolution language does not specifically mention all of the specific areas suggested by the commenter, we believe the broad language in Resolution 10-42 provides for reports to the Board on any issues of concern, including those mentioned by the commenter.

B-22. (multiple comments)
Comment: We think that it might be useful to have a joint CARB and air district implementation working group for cap and trade so we can discuss with CARB staff steps of the program as it moves forward and discuss and resolve issues. We've used this for other programs, and it's been quite successful. (BAAQMD)

Comment: An advisory committee with participation by a CARB Board member would be an effective tool to further enhance the collaborative partnership that SCAQMD and other air districts would like to forge with CARB on AB 32 programs. We recommend the following Resolution language to improve on-going coordination with local air districts:

Add: BE IT FURTHER RESOLVED that the Board directs the Executive Officer to establish an Advisory Committee with air districts to facilitate their involvement in implementation of this regulation and other AB 32 programs. The Executive Officer is directed to report back to the Board in three months regarding progress for this effort. (SCAQMD1, SCAQMD2, SCAQMD3)

Comment: To help ensure more productive collaboration in the future, CAPCOA suggests a report to the CARB Board in three months regarding how local air districts are being utilized in various aspects of the program, such as emission verification. We also respectfully suggest that the Board consider whether an advisory group with participation by a Board member, would enhance the collaborative process. (CAPCOA1)

> **Response:** As discussed in Resolution 10-42, the Board directed the Executive Officer to establish a Board Member-facilitated dialogue with CAPCOA regarding involvement of the districts in the implementation of the cap-and-trade regulation, development of compliance offset protocols, and other AB 32 programs. We believe this will accomplish the goals of the working group suggested by the commenter, as well as the language in Board Resolution 11-32 that directed the Executive Officer to partner with the air quality management districts and air pollution control districts in the implementation of the cap-and-trade regulation, including, but not limited to, an evaluation of the impacts of the cap-and-trade program on industrial source greenhouse gas permitting and implementation of the Adaptive Management Plan. The Board further directed the Executive Officer to report back periodically to the Board on the nature and extent of this partnership, with the first report due in the first quarter of calendar year 2012.

Public Process

B-23. Comment: Rural county governments have largely felt excluded from the process because of ARB's focus on urban and suburban needs. Participating in ARB workshops is challenging for rural citizens due to distance and the lack of availability of broadband in rural communities. If the Cap and Trade program will truly benefit California citizens in the long run, we urge you to initiate an outreach program in rural areas to provide education and the kinds of thoughtful discussion opportunities that have thus far been lacking in the AB 32 implementation process. We have seen countless jobs leave rural communities, and while ARB touts the growth of the green job market, we have yet to see these jobs readily available in rural counties. Citizens in rural areas are concerned that cap and trade will exacerbate unemployment while raising costs for energy, housing, and other goods and services. Many business owners see the cap and trade program as just another regulatory scheme that will cost them money and possibly force them out of state, or worse, out of business entirely. (RCRC)

Response: The rule development process provided ample opportunity for input from all California citizens, including residents and governments of rural counties. As discussed in Appendix D of the Staff Report, we held over 30 public workshops during the development process. These meetings were also available via webcast. In addition, we maintained an ARB Public Meetings Webpage, where staff made available all workshop materials and comments posted by stakeholders on program options. Rural residents that were unable to attend workshops in person or by webcast had the opportunity to submit comments in writing, or by contacting ARB staff by phone or electronic mail. For these reasons, we do not believe that an outreach program specific to rural areas is needed.

Regarding the economic impacts of the regulation, we analyzed the potential impacts on businesses in detail using two different economic models. Based on these analyses, we made an initial determination that the regulation would not have a significant statewide adverse economic impact directly affecting businesses and little or no impact on the ability of California businesses to compete with businesses in other states.

B-24. (multiple comments)
Comment: The Board's resolution should commit to provide for one or more additional public hearings, or to reopen the record, prior to the commencement of the program, to enable stakeholders to comment further as more information becomes available regarding key program components. (CCC, MAZOWITA)

Comment: An incomplete regulation will exacerbate an already difficult economy and will create an uncertain regulatory environment that will discourage economic growth and future investment. It is unlikely that several of these pending issues will be resolved before year's end. With a 2012 implementation date, CARB must fill in the blanks on several of these missing elements. We urge CARB to implement any changes via an open forum, involving stakeholder input and public comment. If CARB intends to utilize the 15-day notice update process for current placeholder language, it's important they keep stakeholders apprised of any and all changes throughout this process. Stakeholders must have the opportunity to comment on the cumulative impact of all decisions prior to the market opening in 2012. We also urge CARB to include a periodic review process for the Cap and Trade regulation. (CALCHAMBER1)

Response: The rule development process provided ample opportunity for input from interested stakeholders. As discussed in Appendix D of the Staff Report, we held over 30 public workshops during the development process. Participation was possible at these workshops in person or via webcast. In addition, we maintained an ARB public meetings web page, where staff made available all workshop materials and comments posted by stakeholders on program options. Regarding proposed modifications to the original proposal, Resolution 10-42 committed staff to conduct one or more workshops on the proposed modifications and to provide the opportunity for public comment before the regulatory language was released for the formal 15-day public comment period. Staff did that and is also committed to providing continual public updates, with opportunities for stakeholder comment, on the implementation of the regulation. We also changed the compliance date from January 1, 2012, to January 1, 2013, to provide additional time to prepare for implementation of the regulation.

Implementation

B-25. Comment: California industry is faced with State, local, and federal requirements for air emissions that threaten to conflict, duplicate, or otherwise increase costs above that necessary to achieve our individual and collective policy goals. The current political and legal situation is confusing, and entities are struggling to predict and plan for what may be coming in the next years. A policy statement from CARB that recognizes the situation and puts a high priority on addressing these questions to protect the California economy would be welcome and provide some confidence that CARB will not proceed in a manner that puts California industry at risk. For example, we recommend that CARB resolve to modify the timeline, content, and implementation strategy of the state cap and trade program to avoid these excess costs and burdens. (CMTA1, AB32IG)

Response: We developed the cap-and-trade regulation recognizing the importance of achieving mandated GHG reductions in the most cost-effective manner possible. We analyzed the potential economic impacts on industry, as discussed in Chapter VIII and Appendix N of the Staff Report, and designed the cap-and-trade regulation to minimize the costs to industry while maximizing the benefits for California's economy. Based on the results from two economic models, the Executive Officer made an initial determination that the regulation would not have a significant statewide adverse economic impact directly affecting businesses, and little or no impact on the ability of California businesses to compete with businesses in other states. In addition, as discussed in Resolution 10-42, the Board directed the Executive Officer to hold public consultations over the next year to identify potential obstacles to compliance and, as necessary, incorporate or enhance compliance-assistance mechanisms into the program. The Board also directed the Executive Officer to work with CPUC, CEC, CAISO, and other interested parties to monitor the proposed cap-and-trade program, including the effect of the cap-and-trade program on the State's energy markets, and to monitor to the extent feasible the ability of affected entities to pass on costs. For these reasons, we do not believe that it is necessary to modify the timeline, content, and implementation strategy as suggested by the commenter. Nevertheless, the compliance start date was changed from 2012 to 2013, to ensure that all the regulatory elements are in place and fully functional.

B-26. Comment: We are concerned that CARB has not yet been able to confidently propose the details required to understand and implement the cap and trade program. Many of the tools, provisions, and methods still being developed by CARB will provide crucial information for companies planning for future operations, capital projects, supply and distribution, etc. There is no indication that the information will be forthcoming in advance of the last quarter of 2011, mere months before start of the market in 2012. The 15-day update process to fill-in these blanks will be developed with staff and the full implications of all the decisions will not be knowable until very late in the year. We are concerned that the public will not have a meaningful opportunity to comment on the total impact of all allocation decisions prior to market opening in 2012. (AB32IG)

Response: The compliance start date was moved from 2012 to 2013 to ensure that all the regulatory elements are in place and fully functional.

B-27. Comment: The Cap and Trade regulation, as proposed, should be scaled back, implemented slowly and be flexible to ensure that California's businesses do not suffer serious economic or other unintended consequences as a result of this regulation. (SDCHAMBER)

Response: We disagree that the cap-and-trade regulation should be scaled back. We analyzed the potential economic impacts on industry in detail, as discussed in Chapter VIII and Appendix N of the Staff Report. Based on the results from two economic models, the Executive Officer made an initial determination that the regulation would not have a significant statewide adverse economic impact directly affecting businesses and little or no impact on the ability of California businesses to compete with businesses in other states. Regarding flexibility, the major feature of the cap-and-trade regulation is that it provides more flexibility than traditional regulatory approaches.

B-28. Comment: Implementation of the Cap and Trade program should be deferred if necessary rules and infrastructure to enable entity compliance are not in place in a timely manner. WPTF proposes a provision in the cap and trade regulation or in the resolution that requires ARB to develop and adhere to a clear schedule for development of the rules, linkages and infrastructure necessary for implementation and compliance by capped entities, and that provides an automatic deferral of the start date for the cap and trade program if the schedule is not met. (WPTF)

Response: The compliance start date was moved from 2012 to 2013 to ensure that all the regulatory elements are in place and fully functional. We have initiated activities to develop the necessary rule implementation infrastructure for the regulation, including a market tracking program to trade allowances and offsets; contracts for an auction services provider; a financial services provider; and a market monitor. We are also committed to providing continual public updates, with opportunity for stakeholder comment, on the implementation of the regulation.

B-29. Comment: CARB has performed extensive re-analysis of the business as usual projection for 2020 taking into account the downturn in the economy, reduction measures that are now moving forward, as well as those reduction measures expected to occur in the future. This new projection leaves 18 $MMTCO_2e$ that must be reduced, presumably by the cap and trade program. However, CARB is continuing to design a cap and trade program to reduce approximately 30 $MMTCO_2e$. The Sanitation Districts recommend that CARB take advantage of the smaller reductions needed in the proposed program to design a more modest cap and trade program that can be ramped up in the future after CARB gains experience in operating such a program. The new projections also indicate a reduced urgency in getting a market up and running, so there is more time for staff training, establishing the necessary tools to run the program, beta testing and market simulations. We believe that taking this approach will ultimately lead to a more certain market that will serve as a solid foundation when more sectors are brought into the program in the future, as well as allowing more time to work out linkages to other cap and trade programs. Our fear is that proceeding too rapidly without a proper foundation will lead to an unstable market and inflated allowance prices, with their negative "trickle-down" effect. (LASD1)

Response: The cap-and-trade regulation was designed to cap emissions and put a price on carbon. The program will ensure that California meets the 2020 goal, including emission reductions that are not obtained from direct measures. At this time, reductions from direct measures in 2020 are simply estimates. Obtaining emission reductions from measures such as energy efficiency depend on continual funding, as well as successful implementation of efficiency programs. The regulation is designed to achieve at least 18 $MMTCO_2e$, rather than the 30 MMT mentioned by the commenter. Regarding the concern that we are proceeding too rapidly, we moved the compliance start date from 2012 to 2013 to ensure that the regulatory elements are in place and fully functional.

B-30. (multiple comments)
Comment: The Sanitation Districts are very concerned that implementation of the proposed program is proceeding at too rapid a pace which could lead to higher than anticipated allowance prices. The trickle-down effect of this will negatively impact California's downturned economy further. The Sanitation Districts suggest that CARB take a slower, more modest initial approach to implementing a cap and trade program, allowing time for beta testing the market mechanisms, allowing time for learning from mistakes, building in more frequent overall program evaluation, creating dispute resolution procedures outside of the court system, allowing the development of a robust offset market and establishing the necessary linkages to allow for a healthy trading market. (LASD1)

Comment: We are concerned that the proposal remains significantly incomplete and lacks sufficient regulatory guidance for timely compliance when the AB 32 program commences. Much of the unfinished business includes material components of the program, including the allocation of allowances to the power, fuels and industrial sectors; selection of emission factors for various source types (particularly as the ARB intends to use both higher-tier emission factors than EPA uses for its reporting program as well as highly-conservative missing data provisions); the allowance tracking system; the auction system; the registration process; and various other critical components. (CCC, MAZOWITA)

> **Response:** Benchmarks and allocation to all sectors are described in the regulations. In addition, the compliance start date was moved from 2012 to 2013 to ensure that all the regulatory elements are in place and fully functional. We have initiated activities to develop the necessary infrastructure for the regulation, including a market tracking program to trade allowances and offsets; contracts for an auction services provider; a financial services provider; and a market monitor.

Program Monitoring

B-31. (multiple comments)
Comment: It is imperative that the regulation provide sufficient flexibility to review and make corrections as needed. This will afford stakeholders and the public an opportunity to remain engaged with the program and offer insight on how to improve elements of the program moving forward. (NRDC1)

Comment: The Cap and Trade regulation should include a requirement for periodic review and update. AB 32 requires a review of the Scoping Plan in 2013, but it is unclear whether this requirement includes a review of the cap and trade regulation. The resolution language should also include examples of issues to be included in the review. (BP)

Comment: Built-in review of the program's effectiveness is needed. As with all new programs, especially one this complicated, it is necessary for regular reviews of its effectiveness. WIRA recommends the regulation, or adopting resolution, contain language requiring periodic public reviews by the Board on the various elements of the programs to ensure that it is working as intended and to evaluate any unintended consequences. (WIRA1)

Comment: The regulation should provide for program review and possible modification. It is extremely important, both for the sustainability of the program and its relevance as a model for other programs at the State and federal level, that California gets the design right. We believe it is important that the regulation provide for program monitoring and possible modification. Key economic and program indicators should be monitored, and a periodic program review mandated so that any inadvertent problems with the program can be corrected before major damage is done to the economy. The provisions for program monitoring and review in the recently adopted Renewable Energy Standard would be an appropriate model for this regulation. (WPTF)

Comment: The proposed rule is very complex and there are still many unresolved issues. The uncertainty in the implementation, possible implications on the economy, and complex compliance requirements argue for a review period where progress and issues can be identified and addressed. ARB should implement a review period at the end of the second year of the first compliance period (by 1/1/14) to review the program and identify areas of concern. This review should include monitoring of key indicators using criteria developed by staff and Cap and Trade participants. The review period should conclude with a peer-reviewed report presented to ARB Board members. (WSPA1)

Comment: NCPA agrees that ongoing monitoring of the Program is important. While CARB has stated that it is "committed to review and revise policies, protocols, and procedures as more information becomes available," the proposed regulation itself is devoid of any references to the form and procedure for this monitoring, nor does it address the manner in which the necessary policy and procedure revisions will be carried out. Since the ISOR contemplates CARB conducting evaluations in advance of each of the compliance periods with sufficient time to adjust the Program if warranted, NCPA recommends that the proposed regulation be revised to add language that would address a formal review process for the Program. Each review would take place at least once each compliance period, with the first review to start mid-way through the first compliance period. Regulated entities must have some assurances regarding the viability and stability of the underlying program. That is especially important in the context of the new cap-and-trade program, where the State is dealing with the provision of essential services in a potentially volatile market. Accordingly, the proposed regulation should also include provisions that would govern its review and necessary corrective actions. Such language would prescribe the review schedule, as well as the range of issues and criteria that would be considered during the review, and provide a vehicle to address necessary corrections. Such a review process would better enable CARB to develop criteria and processes by which to undertake future adjustments, if necessary. Furthermore, ideally, as California links with the WCI partner jurisdictions, the ongoing review of the State's own program would serve to support the administrative record that would be developed for purposes of linking rulemakings contemplated in sections 95940, 95941, and 95942. (NCPA1)

Comment: Monitoring of the program will be crucial to its success. Given limitations on resources available to CARB, it would make sense to involve entities such as transit districts, air districts, and local governments as much as possible in the implementation and monitoring of the program. (ASMDICKINSON)

Comment: We strongly urge CARB to clearly establish and communicate to the market the conditions under and process by which the rules of the Cap and Trade system may be adjusted in the future. (CLIMATEWEDGE)

Comment: The Staff Report (at II-56 and following) discusses monitoring and reviews of the Cap and Trade regulation. However, this is not set out in the regulation itself. The Cap and Trade regulation should contain a provision setting out the features that will be reviewed every three years to determine whether the regulation needs to be revised, and which sections may be revised. Even if these provisions are broad, they will provide useful indications of possible changes. Apart from urgent changes, a notice period of at least one year should be given for all changes to the Cap and Trade regulation that will require significant changes to the behavior of covered entities. (SCPPA1)

Comment: WIRA recommends the proposed regulation, or adopting resolution contain language requiring periodic public reviews by the Board on the various elements of the programs to ensure that it is working as intended and to evaluate any unintended consequences. (PMTPETRO1)

> **Response:** We do not believe it is necessary to include regulatory language to require regular updates. However, we are committed to regular reviews of the implementation of the regulation, periodic updates to the Board, and proposed modifications to the regulation, as needed. As discussed in Resolution 10-42, the Board directed the Executive Officer to update the Board annually on the status of the cap-and-trade program. We believe the broad language in Board Resolution 10-42 provides for reports to the Board on any issues of concern.
>
> Further, we agree that we need to carefully monitor industry progress toward compliance with the regulation, as well as the operation of the markets. We have initiated activities to develop the necessary rule implementation infrastructure for the regulation, including a market tracking program to trade allowances and offsets; contracts for an auction services provider; a financial services provider; and a market monitor. We are also committed to providing continual public updates, with opportunity for stakeholder comment, on the implementation of the regulation.

B-32. Comment: CARB should build in an explicit adaptive management process to adjust the free allocation to the industrial sector based on specified evaluation metrics. As a condition of free allocation, CARB should require industrial sector emitters to provide detailed information on production input costs and revenue to enable a more rigorous, analytical understanding of the extent to which free allocation protects consumers and prevents leakage, or to what extent allocation needs adjustment to avoid windfall profits. This information would be kept confidential at the individual firm level, though it could be released at the sector level so that proprietary information would not be compromised. (KUSTIN10, EBERHARD)

> **Response:** ARB will continue to monitor leakage during the implementation process. Should ARB identify that leakage is occurring, we will develop appropriate responses to rectify it. We have included features in the cap-and-

trade regulation, such as periodic updating of leakage risks to adjust or phase out free allocations. We will work with the California Public Utilities Commission to ensure that the proposed allowance value directed to the electric distribution utilities is used for the benefit of residential, commercial, and industrial ratepayers that might otherwise face indirect costs from implementation of this regulation, and for the purposes of AB 32.

As noted in the Staff Report, we are committed to monitoring how covered sectors, especially those that receive free allocation, address carbon costs once the program is in place. In addition, for allocation purposes, we are collecting product data from almost all sectors at risk for leakage. The data set from this collection will also serve as a key monitoring step in detecting leakage. During program implementation, we will assess whether it is necessary to collect such confidential business information as production input costs and product revenues to determine if businesses incur windfall profits as a result of free allocation. We anticipate that the combination of rigorous benchmark formulas and basing the free allocation on production data should ensure that free allocation for leakage purposes does not result in windfall profits or a sustained oversupply of free allowances.

Per Resolution 10-42, we will continue to review information concerning the emissions intensity and trade exposure of different industries in California. We will recommend changes to the Board on leakage risk determinations, if needed, prior to the initial allocation of allowances for the first compliance period starting in 2013 for industrial sectors not identified in Table 8-1 of the cap-and-trade regulation. And prior to the initial allocation of allowances for the second compliance period starting in 2015 for industries identified in Table 8-1 of the cap-and-trade regulation. We will update the Board annually on the status of the cap-and-trade program, including, to the extent feasible, information on shifts in business activity that may result in emissions leakage and changes in market share for covered entities and sectors.

Additional Efforts

B-33. Comment: All participants must realize that a cap and trade system does not replace our State's other GHG mitigation policies. Thus, we need to stay the course and expand implementation activities related to energy efficiency and other clean energy policy initiatives. This particularly includes public benefits charge funding for energy efficiency programs. (CEEIC)

Response: The cap-and-trade program is a key element of an overall strategy to reduce California's GHG emissions to 1990 levels by 2020. This market-based program is used to supplement, rather than replace, direct regulation approaches. It is also designed to work in concert with other measures, such as standards for cleaner vehicles, low-carbon fuels, renewable electricity, and energy efficiency. The program will also complement and support California's existing efforts to reduce criteria and toxic pollutants.

Additionally, as discussed in Resolution 10-42, the Board directed the Executive Officer to work with the California Public Utilities commission and publicly owned utilities to ensure that the proposed allowance value could include investment in energy-efficiency programs and renewable energy projects that achieve environmental and public health co-benefits.

Delay Action

B-34. (multiple comments)
Comment: SCE supports a delay in implementation of the Cap and Trade program for a full evaluation of the market rules. (SCE1)

Comment: ARB should revise the proposed rule to ensure that no reductions in GHG emissions are forced to occur before January 1, 2015. This recommendation is not sought for purposes of delay. It is sought so that the program can be effectively implemented and the costs reduced by appropriate planning. There is no emergency that justifies a different approach. Despite dire warnings about the consequences of delay, it is clear that California, acting on its own, is not going to change the imminence of any such impacts. It is better to systematically plan for these changes than to induce an economic emergency. (HOR)

Comment: We think that ARB should consider delaying implementation for the smaller emitters less than 100,000 tons per year until 2015 to allow the regional markets to develop or the global markets and to become firmly established and viable. (INDENVASSOC)

Comment: ARB should consider delaying implementation of the regulation for smaller emitters (<100,000 TPY) until 2015 to allow regional or global markets to be established and viable for broader industry participation. (SOLARTURBINES1)

Response: We will not delay compliance for smaller sources until 2015. We modified the regulation to begin the compliance obligation in 2013. It is important to include these smaller sources in the early years of the program to provide a robust market and for linkages to the Western Climate Initiative. We will initiate all elements of the program throughout 2012, including establishing market infrastructure, conducting trainings, holding auctions, and developing linkages with partners in the Western Climate Initiative. These proposed changes ensure that all essential elements of the program are developed and tested before we move into the first year of compliance in 2013. This provides the market with certainty about the program's direction as it starts over the next 18 months.

We disagree with the comment that the cap-and-trade approach instituted in Europe is a failure. However, that there may be lessons to be learned from the

European Union (EU) Emissions Trading Scheme (ETS). A recent press release claims that cap-and-trade has failed to reduce GHG emissions in Europe. The claim appears to be misguided given that the EU ETS are all reporting substantial GHG emission reductions. The claim comes from recent work that shows that the carbon embedded in international trade flows has increased substantially since 2020. Some initial analyses have tried to examine the net balance of embedded carbon in trade flows, which show that for the key European countries and the EU as a whole, the net trade impact is a net increase in embedded GHG emissions in trade flows. While domestic emissions are declining in these countries, the net embedded emissions in trade flows more than compensate for the domestic reductions. Note that this circumstance does not mean that cap-and-trade is a failure in Europe. The emissions covered by cap-and-trade are declining. The emissions not covered by cap-and-trade are increasing. Cap-and-trade is not inducing the increase in the embedded carbon as is evidenced by even larger increases in net embedded carbon estimated for the U.S. (which has no cap-and-trade, and little in the way of climate initiatives at this time). The studies of embedded carbon explicitly make the point that cap-and-trade is not inducing this embedded carbon issue. So, the claim that cap-and-trade is a failure in Europe is not really true. Information about the EU experience relating to both successes and challenges was considered during the development of the California cap-and-trade regulation.

Economic Harm/Burden

B-35. Comment: The program incurs an administrative cost with no practical impact. (MSCG2)

Response: We are unclear why the commenter believes the cap-and-trade regulation will have no impact. Under the regulation, GHG emission will be capped and reduced by 2020. We developed the regulation to minimize administrative costs associated with implementation and maximize emission reductions. In the Staff Report, we describe an auction design based on a set of objectives that minimizes administrative and transaction costs to participants.

The market tracking system (MTS) will record information about the holders of compliance instruments and trades of compliance instruments among market participants. The primary goal of the MTS will be to support the effective implementation of the cap-and-trade regulation and to reduce the costs and administrative burden associated with long-term cap-and-trade responsibilities.

In addition, revisions to the Mandatory Reporting of Greenhouse Gas Emissions Regulation are intended to align California's reporting requirements with federal reporting rules recently enacted by U.S. EPA. We are working toward a unified reporting system to satisfy both State and federal requirements while minimizing duplicative or conflicting reporting obligations for facilities subject to both rules.

B-36. Comment: November's federal elections have all but guaranteed that there will be no effort to establish a federal cap and trade market nationally. Given this development, California's efforts to implement a cap and trade will only add to the burden of California businesses and families struggling under a continuing recession. Despite assurances to the contrary, we believe that California's Cap and Trade will be unique in the U.S for some time, as evidenced by continued shrinking of the Western Climate Initiative's member states. California, by going it alone, risks grave economic harm and risks recovery from the recession if there are no other strong market partners. California jeopardizes the progress it has made as a leader in air quality and as a supporter of green business should its rush to implement an incomplete regulation. (CALFP1)

> **Response:** We analyzed the potential economic impacts on industry in detail, as discussed in Chapter VIII and Appendix N of the Staff Report. Based on the results from two economic models, the Executive Officer determined that the regulation would not have a significant statewide adverse economic impact directly affecting businesses and little or no impact on the ability of California businesses to compete with businesses in other states. The regulation was designed to address potential leakage concerns by providing free allowances to energy-intensive trade-exposed sectors.
>
> We will continue to work with our partners in the Western Climate Initiative to identify, evaluate, and implement policies to reduce GHG emissions, including the design and implementation of a regional cap-and-trade program.

Cap/Allowance Budget

B-37.

Comment: The "cap" excludes agriculture, biofuels and bioenergy, which are significant sources of GHG emissions. Treating biofuels and bioenergy as zero emissions and excluding them from the cap is not supported by the best science or ARB's own analysis and it violates AB 32's mandate to achieve the maximum reductions. (CRPE1)

> **Response:** We believe that the regulation supports the mandates outlined in AB 32, including technological feasibility and maximizing the amount of GHG reductions. The commenter is correct in that agriculture is an uncapped sector and does not have a compliance obligation. Under the regulation, agriculture will be encouraged to be more efficient as the carbon price signal is passed through on transportation fuels, electricity, and natural gas. Agriculture can participate through projects that generate offset credits. The fossil fuel portions of biofuels and bioenergy are under the cap and have a compliance obligation. However, biomass-derived fuels are exempt from a compliance obligation since CO_2 emissions resulting from the combustion of biomass are considered biogenic.

Separately, facilities must report biofuel data as part of the mandatory reporting regulation.

B-38. Comment: The SO2 allowance program under the federal Clean Air Act was originally set above the then current emission level from regulated sources, in order to allow the regulated units to adjust to the cap and plan strategies for compliance after the cap declined. The result was that the allowance prices remained reasonable and the market was somewhat predictable and efficient. And the program worked. ARB should follow the federal example and set the cap at a level that does not immediately induce shortages in the first year of the program. (HOR)

Response: We considered all examples from other market-based systems when determining how to set the cap. The cap provides for a modest decline on the order of 2 percent from forecast emissions in 2013, the first year with a compliance obligation in the regulation. Then the cap declines at approximately 3 percent for subsequent years. The cap is based on the best available information that included reported facility-specific information collected as part of the mandatory reporting regulation and improved statewide GHG emissions forecasts.

B-39. (multiple comments)
Comment: California has suffered a significant economic downturn that has resulted in a significant decline in fuel use. The current baseline (which may be close to 165 MMT per year) cannot be used as a reliable predictor of CO_2e emissions in 2012. It is very likely that this cap will end up being well below the normal "business as usual" emissions of CO_2e. (HOR)

Comment: The proposed "cap" begins in 2012 at 165.8 $MMTCO_2e$, the amount ARB estimates will be business as usual for the covered entities. Absolutely no reductions will be required that year. The cap fails to meet the requirements of AB 32 to achieve the maximum technologically feasible reductions. (CRPE1)

Response: We adjusted our estimates to take into account for the economic downturn and the changes in fuel use are reflected in the baseline. The initial 2012 allowance budget of 165 MMT per year was selected based on projected 2012 emission levels and using mandatory reporting data to ensure accuracy in cap setting. Covered entities will be required to reduce emissions starting in 2013, when the compliance obligation begins. AB 32 requires ARB to balance many objectives, including achievement of the maximum technologically feasible and cost-effective GHG reductions.

B-40. (multiple comments)
Comment: The proposed caps are not set in line with the full potential for cost effective abatement within the State and also includes generous offsetting provisions from the outset which will significantly weaken investment signals in capped sectors. The clarity of targets for the period 2012-20 is good. However, the fact that there is no continuation

beyond 2020, and no sign of Federal legislation to replace it, is a serious weakness and one that needs to be addressed as soon as possible. (SANDBAGCC)

Comment: The most serious concern relating to the current proposals relates to the lack of a cap post 2020. With some sectors only entering the system in 2015 they are being given only a 5 year timeline of required reductions. This is not a long enough payback period to justify investment in emissions abatement and will likely mean that participants view the regulation as a requirement to offset and little else. There will certainly be little incentive to over comply and bank since the value of banked credits will likely fall to zero in the event of the regulation stopping in 2020. We recommend that at the earliest possible opportunity new regulations are agreed that create targets beyond 2020, either in the form of 2050 targets or as a continuing annual reduction rate with no sunset clause. (SANDBAGCC)

Comment: We are glad to see that ARB is proposing a very clear, specific annual allowance budget for nine years, through 2020. It would be better if this was even longer. We encourage ARB to at least commit to publishing a fixed budget on a rolling basis. For example, publishing an updated nine-year budget, on a rolling basis, after the conclusion of each three-year compliance period. While there is no "magic" length of time that is clearly ideal, it is our sense that a longer period than nine years would better serve the market. Regardless of how far into the future the budget is published, ARB should be clear about how it will go about adding additional years to the back end of the schedule on an ongoing basis, and we encourage ARB to provide those periodic extensions earlier rather than later. The longer the 2021 allowance budget remains a mystery, the more "noise" is injected into the market, and the less comfortable market participants become with the price signal the market provides. (MSCG2)

> **Response:** Annual allowance budgets are described in the regulation. We considered all stakeholder comments when determining the length and duration of allowance budgets. The cap-and-trade regulation will use a nine-year cap that is divided into annual budgets, each of which specifies the number of allowances created for each year. We will evaluate the need to extend the allowance budgets to future years during periodic reviews of the regulation. We believe that we are meeting the legal mandates of AB 32 to reduce GHG emissions to 1990 levels by 2020. We recognize the importance of the 2006 Executive Order S-3-05 that orders an 80 percent reduction below 1990 levels by 2050. We will continue to implement both directives. We believe that the cap-and-trade program will provide a cost signal to covered entities so that they can make choices to investment in clean energy technologies to comply with the regulation.

B-41. (multiple comments)
Comment: CARB has dramatically reduced the 2020 allowance budget for the cap-and-trade program, which will increase the economic burden on California's electric customers. CARB has lowered the 2020 allowance budget to 334 million metric tons MMT CO_2e (from 365 MMT CO_2e in its 2008 Scoping Plan), but has not changed its overall 2020 carbon goal from 427 MMT CO_2e (1990 emissions levels, consistent with

AB 32). SCE requests clarification as to why CARB's adjustment in its allowance budget appears to shift the burden of carbon reduction more heavily to capped sectors. (SCE1)

Comment: CARB's adjustment of the 2020 Cap and Trade target from Scoping Plan levels using mandatory reporting data is flawed and inconsistent with AB 32.
As CARB has acknowledged, the 2008 Scoping Plan's estimate of the target for the 2020 allowance budget was 365 MMT CO_2e. The proposed regulation reduces the 2020 allowance budget from 365 MMT CO_2e to 334 MMT CO_2e, but lacks a clear discussion of the new numbers behind this adjustment. In the absence of this data, SCE requests clarification on CARB's methodology and updated emissions estimates. SCE is particularly concerned that the burden for emissions reduction will fall much more heavily on capped sectors, while the burden for reduction on uncapped sectors has correspondingly contracted. CARB provides a short explanation of this adjustment in Appendix E of the proposed regulation, and states that due to improved emissions estimates, they have revised the 2008 broad scope emissions number from 440 MMT CO_2e to 403 MMT CO_2e, a decrease of 8.5 percent. Accordingly, CARB staff decreased the cap by 8.5 percent, from 365 MMT CO_2e to 334 MMT CO_2e. This revision in the 2020 cap number lacks satisfactory reasoning, and supporting data and details are not present in the proposed regulation. SCE requests that CARB clarify its adjustment in emissions reductions by providing stakeholders with the following detailed information and allow for stakeholder input concerning the implementation of any changes to the 2008 Scoping Plan's reductions requirements.

1. A full breakdown of the initial, unadjusted estimates used in the Scoping Plan to define the emissions reductions required to meet AB 32 targets by 2020. These data points include but are not limited to:
   a. 2012 emissions levels;
   b. Total 2020 BAU emissions levels and 2020 emissions levels under AB 32;
   c. A breakdown of the 2020 BAU emissions levels and 2020 emissions levels under AB 32 between the capped and uncapped sectors; and
   d. Emissions reductions (from 2012 to 2020) required by each measure under AB 32.
2. The adjusted numbers corresponding with each initial data point listed above.
3. CARB's methodology and reasoning relating to this adjustment. (SCE1)

Comment: The proposed regulation is based on a new, poorly documented 31 MMT increase in the stringency of the cap and trade program that primarily impacts EITE entities. Since back-up data was not provided to change the programmatic cap that was adopted in the Scoping Plan, the allowance budget should not be revised as proposed in the proposed regulation. The Scoping Plan provided a preliminary estimate of 365 MMT. The cap-and-trade proposed regulation proposes a substantially lower allowance budget of 334.2 MMT. This equates to an additional 31 MMT reduction. The method to establish the preliminary estimate of 365 MMT was clearly described in the December 2008 Scoping Plan. In the cap-and-trade proposed final regulation, Staff used emissions data for calendar year 2008 to adjust the proposed allowance budget for 2020 (see Appendix E, page E-8). In the Scoping Plan, projected emissions from sources outside in the cap-and-trade program were 57 MMT in 2020. In the final draft regulation, the 57 MMT has increased to 85 MMT. This adjustment reduces the allowance budget in 2020, which impacts the allowance budgets for the entire program. We recommend that ARB restore the allowance budget to the documented level shown in the Scoping Plan of 365 million metric tons. This would require a change in the allowance budget for the year 2020 in section 95840. (DOWCHEM1)

Comment: CCEEB is concerned that the cap in this regulation exceeds previously defined scoping plan levels, driving the program reductions below 1990 emissions levels. CCEEB recommends that ARB clearly articulate the rational for this increased compliance obligation and the reasons why the emission estimates are higher when the economy, production, and business are down, and reconcile this data with the updated GHG forecast. (CCEEB1)

Comment: The proposed regulation includes specific allowance budgets for each year that are in error due to inappropriate adjustment to the Scoping Plan 2020 GHG target. The Scoping Plan clearly sets the 2020 target for AB 32 at 1990 emission levels, and sets the target for the sectors covered by the Cap and Trade program at 365 MMT. However, the budget for 2020 in Table 6-1 of the Proposed Regulation is 334.2 MMT CO_2e. The proposed regulation can change the 2020 target to the extent the scope of sectors participating in the Cap and Trade program is changed. Staff provided information in discussions that the exclusions were for non-covered emissions in capped sectors. Staff calculated a new broad scope 2020 allowance budget of 334 $MMTCO_2e$ by multiplying the Scoping Plan 365 $MMTCO_2e$ 2020 budget estimate by the ratio of the improved estimate of 2008 broad scope emissions (403 $MMTCO_2e$) to the 2008 emissions inventory estimate for broad-scope sector categories (440 $MMTCO_2e$). However, in the Scoping Plan, the Recycling and Waste sector was omitted from the industrial sector. Assuming that landfill gas and wastewater treatment were already deducted in the Scoping Plan, the method used by ARB to reduce covered sector emissions double counts the Recycling and Waste sector emissions. The 11.7 MMT in this sector should be excluded before creating the ratio since they were excluded in the Scoping Plan. This means that 403 would be divided by 429.3 and multiplied by 365 totaling 342.6 MMT. (SEMPRA1)

Comment: The proposed rule and ISOR fail to provide details on the calculations used in arriving at key elements of the rule, including the Annual Budget Amounts, the cumulative offset use limit, and the calculation of amounts placed into the reserve. It is particularly important to provide a clear description of the calculation resulting in the 8.5 percent reduction in the 2020 allowance cap from 365 MMT identified in the Scoping Plan to 334.2 MMT identified in the rule. (ANALYSISGRP)

Comment: The AB 32 goal of reducing statewide emissions to 1990 levels by 2020 establishes a hard target for the economy-wide emissions level (427 MMT CO_2e). ARB's Scoping Plan initially estimated the 2020 cap for sources covered by the Cap and Trade program at 365 MMT CO_2e. The proposed regulation revises the 2020 cap level for sources covered by the program to 334.2 MMT CO_2e. This presumably means that the expected emissions from sectors and sources outside of the cap and trade program have increased, as the overall economy-wide emissions level in 2020 should remain constant at 427 MMT CO_2e. However, ARB has indicated that the revised estimate is based on better facility level data for emissions from sources covered by the Cap and Trade program. DRA requests that the difference in cap calculations should be further explained in Appendix E: Setting the Program Emissions Cap, as the credibility of the 2020 cap calculation is critical to the cap and trade program. It is important that both capped and uncapped sources share the responsibility of emissions reductions in California. (DRA)

Comment: Staff is proposing to lower the original cap by 34 MMTCO_2e because of the recession and the updated emission inventory. The advancement of the reductions does not allow a transition period into the program. We believe that this will lock in a recession and prevent growth and recovery by the affected entities. The cap level should stay at the original level and be lowered as needed to reach the goals of AB 32 by 2020. (AGCOALITION)

Comment: The Utilities would like clarification regarding the revised 2020 allowance budget as presented in section 95841 (Table 6-1). The AB 32 Scoping Plan included a preliminary allowance budget estimate of 365 MMT in 2020. However, the proposed regulation includes a substantially lower allowance budget of 334.2 MMT in 2020. The Scoping Plan clearly articulated that the primary goal of AB 32 is to reduce GHG emissions to 1990 levels, which CARB established in its 2004 GHG inventory as being 427 MMT. Subtracting 57 MMT of emissions from sectors outside of the cap, plus a safety margin of 5 MMT, creates the annual allowance budget cap of approximately 365 MMT. In order to justify this change in the 2020 allowance budget, the emissions outside of the cap would have to increase from 57 MMT to 85 MMT (427 MMT – 334 MMT). The Utilities would like more justification from CARB as to why the emissions outside of the cap are expected to increase by so much more than originally projected and request that this analysis explain the differences between the original and updated forecasts. (MID1)

Comment: PG&E requests further clarification and examination of the Cap and Trade program's allowance budget for the year 2020 as established in section 95840. The Scoping Plan included a preliminary estimate of 365 MMT. The Cap and Trade regulation proposes a substantially lower allowance budget of 334.2 MMT. Given the importance of the year 2020 allowance budget to the Cap and Trade program, it must be a credible and well-supported number. PG&E appreciates staff's assistance in providing background information on staff's projections of year 2020 emissions from sources outside the Cap and Trade program, but would like to better understand why the forecast has increased by such a large amount. PG&E therefore requests additional information related to ARB staff's revised forecasts of emissions outside the Cap and Trade program. (PGE1)

Response: The Scoping Plan included a preliminary estimate of the cap-and-trade program 2020 allowance budget. In the cap-and-trade regulation, we incorporated an improved approach of estimating the allowance budgets and estimate budgets for all years from 2012-2020. Because of allowance banking, the program stringency is best evaluated by considering all years.

The starting allowance budget was initially set to equal the expected emissions for the year that a covered entity enters the cap-and-trade program. With this approach, the allowance budgets enable emissions to continue as expected under business-as-usual (BAU) conditions in the first year of a sector's inclusion in the program. The initial budget for 2012 was selected based on the projected 2012 emission levels. This BAU estimate reflects the current economic downturn and incorporates reductions achieved by 2012 from other Scoping Plan measures. Although 2012 is no longer a compliance year, the allowance budgets developed using this starting point remain unchanged. After accounting for expected offset use, the initial budget level provides flexibility for capped sources to increase emissions if necessary in the first few years of the program, beyond emission levels that are currently projected (see Figure E-3 in Appendix E of the Staff Report).

Many commenters focused on our methodology for calculating the cap-and-trade 2020 target and the difference from Scoping Plan preliminary 2020 cap levels. We calculate the economy-wide 2020 target required by AB 32 to be 427 MMT. The estimated cap in the Scoping Plan was 365 $MMTCO_2e$, and in the regulation the value is 334 $MMTCO_2e$. The primary drivers for this difference are: (1) the cap in the Scoping Plan estimate was based on entire sectors, rather than just capped emissions in each sector; (2) the Scoping Plan cap did not consider estimated offset use from in-state projects in 2020; (3) the Scoping Plan cap did not consider use of banked allowances in 2020; and (4) the Scoping Plan estimate did not consider some sources that are not counted by the regulation or certain types of transportation fuels that are used in small quantities.

As stated above, the 2020 level in the Scoping Plan did not consider the potential use of offset projects from in-state sources and banked allowances from prior year budgets. Offset credit use from in-state projects would result in additional emissions from capped sectors allowable due to reductions from non-capped sectors. Banked allowances could also allow for greater emissions from capped sources beyond the 2020 allowance budget. The Updated Economic Analysis of the Climate Change Scoping Plan completed in March 2010 carefully considered banking, and indicated that a drawdown of bank levels would likely be occurring in 2020 under most likely scenarios. The adjustment to the budget for 2020 was made after considering these factors and the 2008 facility-level data that was gathered through the mandatory reporting program that improved emissions estimates for the covered entities. Using these improved estimates, we calculated a broad-scope 2020 allowance budget of 334 $MMTCO_2e$.

B-42. (multiple comments)
Comment: Benchmarks must be reduced even further, while the dates for these caps to be made even earlier. Secondly, I believe the earlier we make the dates for meeting benchmarks of emissions and the earlier we start creating jobs with that goal in mind the better. We are currently in a global economic depression, and only by taking immediate action do we give the citizens of our country and of our world the ability to rise up out of this recession. Therefore, the caps and dates in the regulation should be reduced and brought closer to present time, respectively. (JACOBSONFRIED)

Comment: A more realistic time frame would either involve a later period for reducing the cap, or would involve a less restrictive cap in the early years. (HOR)

> **Response:** We disagree with any adjustments to the start and end dates. We will initiate all elements of the program throughout 2012. However, the first year of compliance for covered entities starts in 2013, to ensure that all central elements of the program are fully developed and tested. This provides the market with certainty about the program's direction. The cap declines at a steady level from 2013 to 2020 in order to meet the 2020 emissions goal.

B-43. (multiple comments)
Comment: We have significant concerns regarding the slope of the cap particularly in the first and second compliance periods. The first compliance period may be significantly impacted by the potential lack of supply of offsets and because it is unlikely that California's program will be broadly linked with other state, federal or international programs in the early years. Our concern is that the combined effects of the steeper cap slope and the tightening of the allowance due to reserve deductions and the increased auction and the potential entry of transportation fuels all in the second compliance period are likely to result in serious impacts to the economy. Chevron recommends that the cap slope be revised to reflect a smoother transition of 1 percent in 2013 and 2014, and 2 percent per year in the second compliance period. Even with these recommended changes, the AB 32 cap is still likely to be equally or more stringent than duplicative, command and control regulations under the Federal CAA scheduled to come into effect in 2011. ARB should consider proposing that reductions under AB 32 will constitute conformance with the CAA. (CHEVRON1)

Comment: The rate of reduction of the cap (cap slope) is too aggressive. The aggressive rate of reduction in the first compliance period is a particular concern because ARB does not expect to have linkage with other larger GHG cap and trade programs, and due to the limited protocols and administrative burdens, there will likely be a limited supply of offsets. These factors, coupled with the aggressive rate of reduction in the early years, place unreasonable pressure on sources that are struggling to identify and implement the best and most efficient methods to reduce GHG emissions. The aggressive cap slope, steep rise of allowance reserve deductions from the allowance pool, increased compliance obligations caused by ARB's finding of refining as a medium trade exposed sector, and the potential for placing transportation fuels under the cap (all scheduled to occur in the second compliance period), are likely to combine and cause adverse impacts to the economy in 2015. WSPA recommends that ARB significantly ease the required reductions in the first compliance period, decrease to 2 percent of the required reductions in the second compliance period and back-load more of the required emission reductions into the third compliance period. Back-loading will facilitate an orderly transition that may help achieve the emission reductions required under AB 32 and allow facilities time to implement their particular emission reduction strategies, and prevent significant economic impacts until California can realistically link its program to other GHG markets. Such linkage will allow California to achieve cost effective reductions without significant economic impacts. (WSPA1, WSPA2)

Comment: CCEEB recommends that the cap slope be revised to reflect a smoother transition of 1 percent in 2013 and 2014, and 2 percent per year in the second compliance period. This creates a smooth transition and realistically addresses the potential that California's cap and trade program will operate without the possibility of broad linkage to other State or federal programs in the first five years. (CCEEB1, CCEEB2)

> **Response:** We believe the cap trajectory and slope provides a gradual GHG emission reduction path toward the 2020 target. This is appropriate because the starting allowance budget levels are equal to expected GHG emissions for the year that a category of covered sources enters the cap-and-trade program. The allowance budget levels increase in 2015 as fuel suppliers are phased into the program to cover GHG emissions from distributed fuel use. We have also evaluated offset supply and believe that offset supply is unlikely to be a concern during the first compliance period. We will consider linkage with other jurisdictions as soon as practicable, as early as mid-2012.

B-44. Comment: The accuracy of the cap is significant in a modified “market based” regulatory system. Scarcity drives up prices of CO_2e, and therefore drives up prices of the underlying goods or services. A small scarcity generates significant market disruption and price spikes. A large scarcity results in massive economic disruption that will make the program unsustainable. The inability to know in advance whether the cap will be too high or too low means that individual market participants have no way of knowing how to bid for or price compliance instruments. It is therefore essential to set the cap at the “correct” level to achieve the purposes of the proposed rule.
Ensure that the cap is set for a period of at least five years at a level that exceeds existing emissions levels. This will allow for an orderly transition to a lower-cap environment, constrain growth in GHG emissions, and avoid unproductive price spikes or reductions in economic activity. (HOR)

> **Response:** Setting the cap above existing emission levels for five years would require having to decline the cap at a very rapid rate to meet the 2020 goal. However, we believe the regulation includes cost-containment mechanisms that protect against market disruption and price spikes. We established an allowance reserve account, which allows covered entities access to allowances at set prices

as a hedge against higher costs and helps reduce compliance costs without compromising the environmental goals of the cap-and-trade program.

B-45. Comment: Carbon allowances should be like voting. We have one person one vote. Why not one person one carbon allowance? A person should be able to benefit from selling his carbon allowances to, say, Chevron. There would be much less administrative overhead to tax carbon as it comes out of the ground or into California. (KRINOCK)

Response: We do not agree with the commenter's suggestion that each person should directly receive allowances. It would not be administratively efficient to allocate allowances to all residents of the State and ask them to participate in allowance trading. However, we recognize the public asset nature of the atmospheric carbon sink; in making decisions on allowance allocation we did consider the notion that the atmosphere is a global commons to which all individuals have equal claims.

We have performed an analysis of alternatives to the cap-and-trade program, including a carbon tax, and have found that none were as, or more, effective than a cap-and-trade program in carrying out the goals of AB 32. More information can be found in the Alternatives Analysis of the Staff Report. We also considered alternative points of regulation for the cap-and-trade program, including a fully "upstream" system where the obligation is assessed where fossil fuels are extracted or imported into California. We chose not to pursue this upstream approach due to administrative concerns including harmonizing with the existing framework for reporting of greenhouse gases which is primarily source-based.

Support the Cap

B-46. (multiple comments)
Comment: We are pleased to see that the proposed regulation contains several elements that I believe will make the program effective. These include a declining cap that starts at a level less than 2008 emissions and declines 2-3 percent per year to reach 1990 levels by 2020. (LUDLOW, UCS1, WALTERS)

Comment: Parts of the proposal are strong, such as setting a limit that declines each year, and setting a minimum price on carbon pollution. This steady price signal will help businesses make long-term investments in strategies to reduce global warming emissions. (MSCG2, FORMLETTER06)

Comment: We support the cap established in the regulation to reduce emissions by at least 18 $MMTCO_2e$ and potentially as much as 27 $MMTCO_2e$. This is consistent with the goals outlined in the Scoping Plan. (NC1)

Comment: TNC supports the overall declining cap. (NC2)

Comment: I support the declining cap. (CPC2)

Response: Thank you for your support.

Allocation Plan

B-47. Comment: ARB should revise the proposed rule to provide ample notice of the rules for allocation, rebate and other unfinished topics, each of which would take effect in 2015 or in later compliance periods. The key to efficient planning is clear advance notice of the rules and any changes. In order to make investments in the first few years of the program (instead of leaving California), businesses will need some confidence that the program will remain in place in a form that results in predictable costs and benefits. (HOR)

Response: We modified Subarticle 9 "Direct Allocation of California GHG Allowances" to address the commenter's concerns.

Opt-in Entities

B-48. (multiple comments)
Comment: The Proposed Regulation sets the 2020 allowance budget at 334.2 $MMTCO_2e$. This is a 30.8 $MMTCO_2e$ reduction from what was originally included in the Scoping Plan. CARB notes that the allowance budget has been adjusted downward from the estimated 2020 cap of 365 $MMTCO_2e$ that was set forth in the October 2008 Scoping Plan, due to the fact that reported data has allowed CARB to better estimate which sources within a capped sector will actually be part of the program. If the allowance budget has been reduced to reflect entities within "covered sectors" that are not actually "covered entities" within the scope of the program, then the allowance budget should be revised upward anytime one of those other entities is brought within the program by electing to be an opt-in covered entity. Accordingly, NCPA recommends that the allowance budget be revised upward to reflect this potential, or that the provisions of section 95813(e) be revised to allow an increase in the budget consistent with the increased demand for allowances consistent with the inclusion of each opt-in covered entity. (NCPA1)

Comment: Entities that are allowed to voluntarily enter the Cap and Trade program need to have their emissions added to the available allowance pool. Hundreds of thousands of allowances could potentially be taken out of the supply for regulated entities if their GHG emissions are not added to the cap. (AGCOALITION)

Comment: Section 95813(e) states that "Opt-in participation shall not affect the allowance budgets set forth in subarticle 6." To SMUD, this seems technically incorrect. An opt-in entity is bringing emissions under the cap and trade structure, and removing them from the category of remaining emissions that fall under the required AB 32 cap. If opt-in entities do not affect the budgets set forth in subarticle 6, the result will be that total emissions will be below the AB 32 cap, and that prices in the cap and trade market will be higher than necessary. SMUD recommends striking section 95813(e). (SMUD1)

Comment: If non-covered facilities "opt-in" to the cap-and-trade program, they are likely to do so because they can easily reduce energy use and seek to make a profit selling excess allowances. CARB needs to ensure that its provisions for allowing facilities to opt in address the potential that the facilities could increase the number of available allowances, dampening the incentive for covered facilities to reduce emissions. Just as the cap will be adjusted when transportation fuels are added to the program in 2015, the cap may need to be adjusted to account for the emissions associated with facilities that opt in. (USFLAW)

Comment: The allowance budgets set forth in Article 6 for the first compliance period should change as entities opt-in. The allowance budget is set for 2012 based on the expected GHG emissions of covered entities in 2012, with reductions in subsequent years. If the universe of covered entities changes, the allowance budgets should change accordingly. No change is necessary for 2015-2020 budgets since these opt-in customers would otherwise be part of the GHG emissions covered by the fuel providers. Modify section 95813(e) as follows:

> ~~(e) Opt-in participation shall not affect the allowance budgets set forth in subarticle 6.~~ (SEMPRA1, MID1)
>
> **Response:** As mentioned in the Staff Report, the purpose of including opt-in covered entities is to incentivize entities to implement more efficient processes and technologies to reduce their GHG emissions, so they can receive a higher number of direct allocations of allowances based on the product output-based benchmarking technologies. Because an opt-in participant's annual emissions must be below 25,000 $MTCO_2e$, only a few opt-in covered entities may participate in our program. The total GHG emissions from these potential opt-in covered entities are negligible.

Third-Party Participants

B-49. Comment: We have a concern about third-party market participants and possible market manipulation. WIRA is concerned about the ability of a non-obligated party's ability to participate in California's carbon market. Speculators in the oil and gas markets have historically affected price and reduced the efficiency of the open market. WIRA recommends CARB limit the eligibility or limit the participation, of non-obligated parties so that such influence on the carbon market can be minimized. (WIRA1)

> **Response:** We disagree with the commenter's suggestion that we should limit the eligibility and participation of third-party market participants in the carbon trading market. Third-party market participants will ensure a more liquid market. As discussed in Chapter II of the Staff Report, we designed the regulation to prevent market manipulation. For example, we included information with strong market oversight and disclosures in the rules to assist in monitoring the market.

We also included provisions prohibiting trading activities involving fraud, reporting false or misleading information, misrepresentations, and manipulations that are commonly used in other markets. We also included provisions to prevent entities from "cornering" the market. Finally, as stated in Resolution 10-42, we will contract with an independent entity with appropriate expertise that will monitor and provide public reports on the operation of the market, including auctions and reserve sales, on a quarterly basis, and recommend appropriate action. Such action could include taking corrective action prior to the next auction, adding future allowances to the allowance reserve or future auctions, or temporarily suspending trading in the market.

Compliance Plan

B-50. Comment: The Board should direct staff to prepare a plan that specifies the tools and guidance that covered entities will need to comply with the regulations, including such components as the allowance tracking system, the registration process, the leakage assistance allocation, the auction process and the process by which the Executive Officer shall determine emissions in the event positive or qualified positive verification is not attainable, among other components. The Board should direct staff to prepare a plan that specifies the compliance activities affected by these tools and guidance. The Board should direct staff to prepare a plan that specifies the timeline, milestones and deadlines for staff development of these tools and guidance. The resolution should further provide that the identified aspects of the AB 32 program shall not commence unless the necessary tools and guidance are available to covered entities no less than six months prior to the date on which covered entities will need such information to commence operation under the cap and trade program. (CCC, MAZOWITA)

Response: Staff reported to the Board on the status of implementation activities at the August 24 Board meeting, including a schedule for development of a market trading system and training for market participants. We will provide tools and guidance to help covered entities understand and comply with the regulation. We do not anticipate developing a compliance plan. However, we will consider using tools, such as a guidance document for implementation, to help covered entities comply with a regulation.

We will monitor whether the cap-and-trade program is meeting the objectives set forth in AB 32. Much of the monitoring information collected as a part of normal program management includes: emissions data reports from the mandatory reporting regulation; allowance price and use from the market tracking system; and offset project annual reports from the compliance offset program. Additionally, we will emphasize monitoring for potential emissions increases and economic leakage during implementation.

Using the results of monitoring, we will regularly evaluate (at a minimum once every three-year compliance period) whether the objectives identified by AB 32 are being achieved. We will conduct the evaluation sufficiently in advance of the end of each compliance period to allow for sufficient time to adjust the cap-and-trade program, if warranted, before commencement of the next compliance period. If we determine during the periodic review that the cap-and-trade program is not achieving the objectives as defined by AB 32, or if substantial, unanticipated adverse economic or environmental effects are identified (e.g., substantial leakage), we will revise the operation and/or design of the program accordingly.

Sectors/Facilities/Alternative Fuels

Cross-Sector Equity

B-51. (multiple comments)
Comment: Regulations should avoid picking “winners and losers” and instead focus on treating all sources equitably, so that the market and public can decide the most cost-effective outcome. ARB should review the regulation to ensure that it is fairly structured and can be applied equitably; remove situations where subsidies can occur or where allowances or allocations are not apportioned equitably; and ensure that fees or assessments are fairly applied. (WSPA1, WSPA2)

Comment: A cap and trade system that distinguishes emissions from different sectors for differential treatment does not result in market consistency, or equitably distribute economic burden and opportunity, and is a serious violation of the intent of a cap and trade program. This is the case when it comes to the regulation’s treatment of the electricity sector. The most egregious example is the use of auction revenue to mitigate the price impact of carbon costs in this sector, and in this sector only. (BP)

Response: We considered cross-sector equity issues when developing the regulation. We believe that the costs of the cap-and-trade program are equitably distributed through the overall approach. The regulation relies heavily on free allocation in the program’s early years. In the regulation, we used emissions intensity as a measure of the impact that carbon pricing will have relative to a sector’s economic output. Sources with higher emissions per unit of output are considered to be more emissions intensive. We also looked at trade exposure as a measure of a sector’s ability to pass through a cost. The number of allowances allocated to an individual facility is based on an emissions efficiency benchmarking approach.

In industrial sectors that are impacted by carbon allowance cost and cannot pass through those costs to customers without suffering a competitive disadvantage, free allowances are distributed. The approach is somewhat different for the electricity sector, which generally can pass costs through to end-users of electricity. However, the electricity sector is also subject to many additional costs, such as that of the Renewable Portfolio Standard. The regulation does not regulate the use of auction revenue.

Glass

B-52. Comment: Given the number of unresolved issues related to setting an EEB in the container glass sector, CARB staff should continue to work with sector representatives to finalize an appropriate sector EEB by June 2011. (SMITHS)

> **Response:** We will continue to work with the container glass industry to establish the output-based benchmark (noted in this comment as the EEB). The final regulation includes a benchmark for container glass. The commenter recommends establishing an EEB for the container glass manufacturing sector employing nationwide data, not California-only data. We disagree that the benchmark should be based on data that is not representative of what occurs in California. Over-estimating the benchmark for facilities in California could lead to an over-allocation of allowances to any given industry. Furthermore, the validity of much of the California data can be verified due to reporting required for the MRR; this is not the case for national data.
>
> We do not think it is necessary to expand the process for establishing an EEB to depend on electrical consumption data, as no benchmarks include electrical consumption. We do agree that there is a need for adequate review of any sector-specific EEB-setting methodology proposed by CARB staff. It is important to note that much of the data used to determine benchmarks is confidential. However, as part of ongoing work with industry, staff provided data and discussed its use with a representative of the container glass industry that was approved for access to the confidential data. We have not received questions or comments from industry since that discussion.

Transportation Fuels

B-53. Comment: CTA requests that CARB remove diesel fuel outside the declining cap pursuant to statutory requirements which state in plain English the definition of cost-effectiveness inherent in the legislative intent of AB 32. Capping emissions from the combustion of fossil fuels for transportation purposes is in no way the lowest cost means of achieving the requirements of Health and Safety Code section 38501(h). Health and Safety Code section 38505(d) defines cost-effective or cost-effectiveness and transportation fuels under the cap basically violate this section by adopting the least cost-effective carbon strategy with the highest cost. Adopting diesel fuel under a declining cap in conjunction with a low carbon fuel standard violates the spirit and letter of the law passed by AB 32 and threatens thousands of transportation related jobs throughout the state. In addition, it encourages the use of less clean, out-of state fuels and increases statewide emissions. (CTA)

> **Response:** Including transportation fuels and fuel suppliers in the cap-and-trade program will help achieve the objective of reducing emissions by 2020, and help to drive the long-term transition to cleaner fuels well into the future. Additionally, including these fuels in the program provides a consistent price on GHG pollution

throughout the economy and ensures a level playing field across all fuels and consumers. We believe that there are important benefits from the inclusion of transportation fuels and fuels for residential, commercial, and small industrial users.

The commenter states that subjecting diesel to a declining cap in conjunction with the Low Carbon Fuel Standard (LCFS) violates the spirit and letter of AB 32 because they are not cost-effective ways to lower carbon emissions. The LCFS regulates fuel producers by requiring them to reduce the carbon intensity of their fuels 10 percent by 2020. This is accomplished by creating various "fuel pathways" for fuels based on their lifecycle emissions, accounting for feedstocks, production processes, transporting fuels, and other means. Thus, the LCFS works in conjunction with the cap-and-trade regulation to help meet the objectives of AB 32.

B-54. Comment: CARB's projected baseline emissions inventories do not appear to account for the expected shift from petroleum transportation fuels to biofuels in the future (see http://www.arb.ca.gov/cc/inventory/data/tables/2020_ghg_emissions_forecast_2010-10-28.pdf). While some of this increase may be accomplished with lower carbon biofuels, this shift would set back CARB's efforts to achieve 2020 GHG goals unless transportation biofuels are included in cap and trade or the overall level of the cap and trade is reduced to account for leakage due to expected increasing levels of transportation biofuels. We strongly recommend that emissions from all transportation liquid fuels be treated equally and fuel providers should be held accountable under the cap for the carbon emissions of all biofuels. (KUSTIN03)

Response: The cap-and-trade regulation will help transition California away from carbon-intensive fossil fuels to cleaner and more-efficient fuels. The fossil fuel portions of biofuels and bioenergy are under the cap. Transportation fuels and fuel suppliers will have a compliance obligation. However, biomass-derived fuels are exempt from a compliance obligation since CO_2 emissions resulting from the combustion of biomass are considered biogenic. Emissions from biomass-derived fuels must be reported and verified pursuant to the MRR. Source categories that are not listed under section 95852.2 (Emissions without a Compliance Obligation) or that have not received a qualified positive or positive verification statement must be reported as "other biomass CO_2." Other biomass emissions that cannot be verified pursuant to the MRR are not considered biomass-derived, and will hold a compliance obligation.

B-55. Comment: The regulation does not contain sufficient design information on the important issue of transportation fuels. More detail is needed. BP strongly urges CARB staff to consider use of a fee on transportation fuels linked to the price of carbon in the cap and trade system. (BP)

Response: ARB considered the use of a carbon fee, either alone or in concert with a cap-and-trade program, and determined that the proposed cap-and-trade program provides acceptable price certainty while assuring that emissions do not exceed the 2020 target. For further details, please see the Analysis of Alternatives to the Proposed Regulation in the Staff Report. Further, as noted in the Supplement to the Scoping Plan Functional Equivalent Document (pages 94-95) there are significant challenges to adopting a fee in California. (see http://www.arb.ca.gov/cc/scopingplan/document/final_supplement_to_sp_fed.pdf)

Further details on the incorporation of transportation fuels into the cap-and-trade program in the second compliance period will be released as part of future rulemakings for the cap-and-trade regulation, and will occur in the first compliance period.

B-56. Comment: Placing diesel fuel under a declining cap as part of the Cap and Trade Program in 2015 will cause warehousing in California irreparable harm. Leakage of cargo and the associated value added services that California warehouse and supply chain partners provide to other ports, specifically Seattle, Houston, Panama and Canada do not improve overall carbon emissions. CARB must not adopt such an economically devastating regulation on California warehouse businesses without understanding the industry and careful economic monitoring through annual reporting back to this board. IWLA requests CARB abandon placing transportation emission under a declining cap. If you must move ahead against our counsel, we ask for the following safeguards to be put in place so that CARB doesn't inadvertently cause significant damage to CA's economy and irreparable harm to California third party logistics providers. IWLA is seeking:

1. Annual reporting of diesel prices of California and other port facilities including Washington, Texas, British Columbia and Panama.
2. Working to ensure a robust offset program to achieve compliance obligations post 2015 and ensure linkage to other programs.
3. Waiting until 2018 to place diesel fuel under the cap and reopening the discussion prior to 2015 of placing fuels under the cap to ensure a reliable, adequate, affordable supply of fuels to the consumers.
4. Expand offset use from eight percent to 25 percent so that warehousing can engage in distributed energy solutions for dealing with climate change instead of expensive fuel mandates. (IWLA1, IWLA2)

Response: The cap-and-trade program calls for periodic reviews, during which ARB staff will analyze fuel prices in California and neighboring states to ensure that prices in the State are not significantly higher than other regional prices. If we determine that the cap-and-trade program is not achieving the objectives as defined by AB 32, or if substantial, unanticipated adverse economic or environmental effects are identified (e.g., substantial leakage), we will revise the operation and/or design of the program accordingly. There are also several cost-containment measures that are integrated into the program, including the use of offsets, three-year compliance periods, and the Allowance Price Containment Reserve.

The fossil-fuel portions of biofuels are under the cap and have a compliance obligation. However, biomass-derived fuels are exempt from a compliance obligation since CO_2 emissions resulting from the combustion of biomass are considered biogenic. Separately, facilities must report biofuel data as part of the mandatory reporting regulation.

We have chosen to allow the use of offsets—up to the specified limit of eight percent—for compliance in the proposed cap-and-trade program.

B-57. Comment: We strongly advocate that transportation fuels should be included in the program from the start, while emissions from trade exposed, heavy industries should be brought in at a later date. This would make defending the proposal against claims of competitiveness impacts easier and should also have made agreeing a more ambitious target easier. Additional costs in electricity and fossil fuel markets can be passed through since the demand cannot easily be met by imports from uncapped states/countries or, where it can, the requirement to comply with caps can also be applied to the imported commodity. (SANDBAGCC)

Response: We do not agree that transportation fuels should be included in the first phase of the program. The program will expand in 2015 to include fuel distributors to address emissions from combustion of transportation fuels and combustion of natural gas and propane at sources not covered in the first phase of the program.

Including transportation fuels in the program in 2015 provides a consistent price on GHG pollution throughout the economy and ensures a level playing field across all fuels and consumers. We believe that there are important benefits of including transportation fuels and fuels for residential, commercial, and small industrial users. We also believe that it is appropriate to initially bring these fuels into the program on a reporting-only basis for the first compliance period. This will provide time for ARB and transportation fuel deliverers to work through any issues in the reporting system before they have a compliance obligation in 2015.

B-58. Comment: ATA supports ARB's decision to maintain a phase-in approach for the incorporation of transportation fuels during the second compliance period in 2015 as opposed to requiring compliance for all sources beginning in 2012. As noted in ATA's comments on the PDR, the phase-in approach allows for the smoother implementation of a complex regulation, while also allowing additional time for harmonization with regulations in other jurisdictions, especially given the interstate nature of transportation fuel consumption and associated emissions. (ATAA)

Response: No response necessary.

B-59. Comment: ATA raised several key concerns regarding the draft regulation and appreciates that aspects of those concerns have been favorably addressed. First, ATA appreciates that the regulation more clearly excludes aircraft fuel from coverage under the regulation and no longer includes a placeholder for the inclusion of additional fuels in the future. Consistent with ATA's earlier comments, the exclusion of aircraft fuel is necessary and appropriate in light of federal preemption of State regulation in this area. (ATAA)

Response: No response necessary.

B-60. Comment: The Cap and Trade program should not be extended to transportation consumer emissions as provisions of other federal and State programs address these. Additionally, fuel providers should not be responsible for these emissions that are directly consumer related. Transportation emissions should be considered only if a formal review determines that this action is necessary and implementation would be more cost-effective than other policy approaches. The proposed regulations include GHG emissions from consumer use of transportation fuels under the emissions cap starting in 2015 (section 95812(d)(1)). This results in a clear overlay to the existing federal Renewable Fuels Standard, the California Low Carbon Fuel Standard (LCFS), and State/federal vehicle GHG performance standards. Transportation GHG emissions are substantially addressed through current federal and State programs (i.e. federal fuel economy programs, federal renewables programs and State LCFS programs). Cap and Trade is not well-suited to address emissions from millions of distributed point sources such as automobiles. Inclusion of transportation fuel emissions within the Cap and Trade program will add a volatile carbon cost to the price consumers already pay for GHG control measures such as LCFS and vehicle efficiency standards. In addition, fuels under the cap will increase administrative complexity and the market price of emission allowances for all the other capped sectors. Specifically, a carbon cost of $20 per ton would add a fuel cost burden in excess of $3 billion per year to the California economy. In addition to individual consumers, much of this cost will fall on businesses and municipalities which will impact small business owners, truck drivers, city bus and trash services, construction companies, rail services, and others. This carbon cost, along with the cost of compliance for LCFS and federal programs, will be embedded into the costs of all goods and services that rely on transportation. CARB should not extend the Cap and Trade program to consumer emissions from use of transportation fuels. Instead, CARB should allow existing federal/State programs to address GHG emissions in this sector. (CONOCO)

Response: We believe that cap-and-trade's market-based approach is the most cost-effective and practical approach to lower emissions throughout most of California's economy. There are numerous sectors that are covered by direct regulation and the cap-and-trade regulation. For example, the electricity sector is subject to the Renewable Portfolio Standard as well as the cap-and-trade regulation. We believe that the cap-and-trade-program is complementary to existing renewable and LCFS standards and to other State or federal laws.

The LCFS regulates fuel producers by requiring them to reduce the carbon intensity of their fuels 10 percent by 2020. This is accomplished by creating various "fuel pathways" for fuels based on their lifecycle emissions, accounting for feedstocks, production processes, transporting fuels, and other factors. While the LCFS will incentivize the use of lower carbon, non-petroleum fuels, it does not address emissions from petroleum refineries. The cap-and-trade program addresses both facility emissions that occur from fuel production (beginning in the first compliance period) and accounts for combustion emissions from the fuel that is produced and sold in California (beginning in the second compliance period).

Placing a price signal on transportation fuels will reduce the consumption of transportation fuel; driving investment in newer, more fuel-efficient vehicles. Any GHG reductions resulting from federal regulations or the LCFS at covered entities would be counted as emission reductions under the cap-and-trade program.

We agree that cap-and-trade is not well-suited to address emissions from millions of distributed point sources such as automobiles. However, our approach is not to apply cap-and-trade to the end user (vehicle drivers), but to the fuel suppliers, who will be responsible for fuel that is combusted. By taking this "upstream" approach in the regulation, we avoid the challenges of applying it to millions of "downstream" users.

Agriculture/Food Processing

B-61. Comment: Many of the assumptions made throughout the document do not apply to agriculture or food processing. Therefore an industry-wide study should be conducted to fully understand the impacts to the food processing sector. We are hopeful that our analysis of the following assumptions will assist CARB staff when trying to determine appropriate participation for the agriculture and food processing sectors. (ACC3, CALFP1)

Response: We worked with, and received input from, the food processing and agriculture industry when developing the regulation. ARB is committed to continue to work with the agricultural and food processing industry to re-evaluate their leakage risk and associated allocation assistance factor and how the cap-and-trade regulation is affecting these sectors.

B-62. Comment: Assumptions on pay-back periods are faulty because CARB assumes pay-back periods on an annual basis. On page F-7, the regulation states that pay-back periods on capital costs are under three years. Many food processors operate only a few months out of the year, so this pay-back period on technology adaptation would have to be tripled or quadrupled to create a more accurate projection for our industry. (ACC3)

Response: We agree with your comment that facilities that operate only a few months out of the year will have a longer payback period than facilities that operate year round. The abatement cost curves use averages across industries to produce estimates on cost, cost savings, and GHG reductions. We made estimates to reflect lower utilization of some food processor facilities in the abatement cost curves by assuming a lower capacity factor for food processor boilers in the compliance pathways analysis. While these estimates may not be valid for all facilities in an industry, ARB staff believes them to be accurate for the industry as a whole.

Bioenergy/Waste-to-Energy

B-63. Comment: Under "Excluded Emissions" in CARB's proposal, a host of emissions would be subject to reporting thresholds, but would not be subject to a covered entity's compliance obligations. Several coal plants are contemplating the change to biomass fuel, which means biomass fuel will be at a premium and difficult to obtain, causing "green" electricity prices to go up and possible offline periods when biomass plants can't get fuel. (CONSTELLATIONENERGY)

Response: The updated economic evaluation of California's climate change scoping plan did not indicate that the use of biomass would increase in response to the proposed regulation. Increased use of biomass is already incentivized by existing regulations such as the renewables portfolio standards (RPS) and the low-carbon fuel standard. The RPS requires publicly owned utilities to obtain 33 percent of their energy from renewable resources, including biomass. Most utilities are challenged to achieve the renewable target despite the availability of biomass as a renewable fuel. Increased use of biomass for energy generation created by other state policies and initiatives, such as the Renewable Portfolio Standard, is discussed in the cap-and-trade FED (see pages 351-352).

B-64. Comment: Net emissions from all bio-energy, as determined by methodologies that CARB should develop, should be included under the cap and generate compliance obligations. (EDF1)

Response: The fossil fuel portions of biofuels are under the cap and have a compliance obligation. However, biomass-derived fuels are exempt from a compliance obligation since CO_2 emissions resulting from the combustion of biomass are considered biogenic. This is consistent with existing U.S. EPA framework. Separately, facilities must report biofuel data as part of the mandatory reporting regulation.

Research and Development

B-65. (multiple comments)
Comment: The proposed regulation does not adequately address the unique aspects of many company's operations, particularly in the Southern California area. Southern California represents substantial research and development operations. Predicting research and development activities several years in advance is problematic and impractical. (SDCHAMBER)

Comment: The proposed regulation does not adequately address the unique Research and Development aspects of Solar's San Diego operations. In comparison with typical manufacturing, predicting research and development activity several years in advance is problematic and impractical. (SOLARTURBINES1, SOLARTURBINES2)

Comment: The proposed regulation does not adequately address the unique aspects of research and development operations, particularly those that are closely tied to manufacturing and production facilities. It's also very difficult to predict research and development activities several years in advance. (INDENVASSOC)

> **Response:** We believe that the regulation adequately addresses research and development (R&D) operations, particularly those that are closely tied to manufacturing and production facilities. We've worked to understand greenhouse gas emissions from R&D with entities that conduct these operations. In one case we've developed an allocation benchmark specifically for turbine testing that covers research and development emissions. In the Staff Report, we note that auction revenue could potentially be used to create a low-carbon investment fund that would incorporate research, development, and demonstration of low-GHG industrial technologies.

Refineries

B-66. (multiple comments)
Comment: The industrial sector has zero tonnes of specific reduction requirements, including for the largest sources such as the oil industry. According to CARB, the entire Cap and Trade regulation will get an18 to 27 $MMTCO_2e$ reduction by 2020, but none of these reductions are required to be achieved by oil refineries. The regulation and Staff Report make it clear that no entity is required to reduce emissions at their site. AB 32 requires ARB to consider the significance of the contribution of each source or category of sources (in adopting a regulation). There is no way this can be argued as meeting AB 32's requirement to maximize reductions, and to reduce co-pollutants. CBE urges CARB to correct this egregious error. We suggest an alternative proposal. CARB should perform a thorough evaluation of Reasonably Available Control Measures necessary to meet CARB's requirements under AB 32 for maximum reductions, to reduce smog in non-attainment zones, and toxics in overburdened heavily industrial areas. Additional reductions could be achieved from the following:

- Requiring In-State reductions from industrial boilers and heaters, which CARB has already identified;

- Removing industrial exemptions for methane from smog regulations;
- Requiring implementation of specific refinery by refinery measures identified in the industrial energy efficiency audits;
- Limiting emissions and conversion to processing Heavier Crude at oil refineries (which is not cancelled out by adding polluting ethanol to gasoline); and
- Requiring oil refineries to switch fossil fuel electricity use to clean alternative energy sources (since oil refineries use significant electricity) (CBE1)

Comment: Cap and Trade industrial GHG reductions are tiny and can be beefed up. If instead achieved in-state, they would generate local jobs, health benefits, and be verifiable. (CBE1)

Comment: I am extremely disappointed with the proposed Cap and Trade approach you are considering. The proposed Cap and Trade approach has been tried in Europe and completely failed. You should vote to delay this proposed Cap and Trade approach and send it back to staff to develop a regulation-based approach that can guarantee achievement of AB 32 goals. (STEWARTJ)

Comment: The seemingly straightforward category of "oil refineries" is being parsed into bits, with oil refineries that process intermediate materials being exempted, and even removed from the definition of oil refineries in the regulation, despite the fact that they are inherently part of an oil refining company's overall production process. It's unclear whether the re-defined refinery portions are included in the capped emission estimation of 34 MM tonnes or not, but it is clear they are exempted from the caps. This approach undermines the requirement to adopt regulations that achieve technologically feasible GHG reductions from sources and categories of sources because it allows large unregulated oil refining emissions. The last sentence in the "Petroleum refinery" definition should be struck, as this definitional difference has no relation in determining whether such facilities emit large amounts of GHGs, criteria pollutants, or toxics. CARB should use standard industrial classification codes for oil refineries used by EPA and remove baseless exemptions, to prevent large unregulated oil refining emissions. For GHG purposes, there is similarly no justification for treating some refinery facilities as exempt without at least providing an emission threshold above which they are subject to regulation. Other entities must abide by simple emission thresholds (>25,000 metric tonnes), so this exemption also represents an unfair business practice, with oil refineries getting a sweetheart deal. (CBE1)

Comment: CARB originally considered direct control of oil refinery reduction measures and found them feasible, but later lumped oil refineries and industrial sources in with all other Cap and Trade sources, despite findings that direct controls were feasible. If CARB made these fixes for industrial sources and as well for other sources causing health impacts in California (such as agricultural and electrical sources), the severe impacts caused by Cap and Trade, and the ineffectiveness of it, would be greatly lessened. (CBE1)

Comment: The Staff Report expresses valid concerns about a program that applied facility-specific caps to all facilities. But the Staff Report evaluates only the most extreme version of this option. First, facility caps could be applied only to facilities in the State's most polluted areas. Second, the impact of facility caps would depend upon their stringency. The Staff Report rejects caps that would require each facility to reduce its proportional share of emissions. But a cap would not have to be that stringent. A cap that prevented the facility from increasing emissions would eliminate the risk of violating AB 32's requirement that the trading program prevent increases, while still providing substantial flexibility. If facility increases are as unlikely as the Staff Report claims, then such caps could ensure that the program complies with AB 32 without having a significant impact on covered facilities. To further AB 32 goals of complementing the State's efforts to achieve air quality, facility caps could, however, go farther than simply preventing increases. The caps could be set somewhat below the level of existing emissions. Such an approach could still be more flexible than the one that the staff rejected, because the level could be set somewhere between current emissions and the full proportionate share of reductions. The staff rejected facility caps because of their impact on cost-effectiveness. But a full assessment of cost-effectiveness should take into consideration not only the costs of pollution control, but the benefits of reducing pollution in heavily polluted areas. Thus, varying requirements depending upon the benefits of pollution control could be more, not less, cost-effective from the state's perspective. (USFLAW)

Comment: Impose individual facility caps for facilities in heavily-polluted areas. (USFLAW)

> **Response:** The commenters' concern is that GHG emission reductions should be achieved through direct regulation rather than a market-based, cap-and-trade compliance mechanism. Since these comments pertain to the overall GHG reduction strategy laid out in the AB 32 Scoping Plan, the comments are not applicable to the cap-and-trade rulemaking. However, we believe that inclusion of industrial sources in the cap-and-trade program provides a cost-effective method of achieving greenhouse gas reductions. The results of ARB's Industrial Energy Efficiency Audit Regulation will be used to evaluate the need for any future direct regulation.
>
> We disagree that we have created a "sweetheart deal" or inappropriately excluded any petroleum refining facilities than from coverage under cap and trade. The generic inclusion threshold (>25,000 metric tons CO_2e) applies to all refineries and related activities.

B-67. Comment: GHGs from oil refineries overall are getting worse due to switches to dirtier crude oil, running counter to other industries (such as electric power plants) that are switching to lighter feedstocks. A recent peer-reviewed study published by CBE Senior Scientist Greg Karras in the journal *Environmental Science and Technology* found that very large increases in GHG emissions are occurring due to the switching to dirtier crude oil at oil refineries, underlining the importance of accurate inventories and forecasts, and controls and limits addressing this switch. The new study provides a detailed evaluation of data nationally, which shows in detail how sharp this increase is. The paper found that "fuel combustion increments observed predict that a switch to heavy oil and tar sands could double or triple refinery emissions and add 1.6−3.7 gigatons of carbon dioxide to the atmosphere annually from fuel combustion to process the oil." We urge CARB to review the attached publication, and to address this issue. (CBE1)

> **Response:** The comment is outside the scope of the regulation. The choice of feedstock for an oil refiner is not prescribed by the regulation. If, however, the use of dirtier crude oil causes a refinery's GHG emissions to increase, then their compliance obligation will increase, and the increased cost of carbon will be incorporated into the final fuel cost. This provides an incentive to use the clean feedstocks.

Hydrogen Plants

B-68. Comment: Just one hydrogen plant can emit over a $MMTCO_2e$ per year (such as at the ConocoPhillips Rodeo facility), so it is almost certain that the total of 2.22 MMT listed for hydrogen plants now is actually much higher and getting even bigger than listed in the CARB chart. CBE has previously provided a partial list of additional hydrogen plant projects in comments to CARB, and we incorporate those by reference. CBE also previously requested that CARB perform a more detailed assessment of planned hydrogen plants expansions at refineries, and we included the following chart in both written comments submitted, and in testimony at a CARB hearing. Due to new hydrogen plants added, or in the process of being built, in the last decade, about 6 $MMTCO_2e$ emissions were added. This is a continuing trend that needs to be reined in. (CBE1)

> **Response:** We agree that hydrogen plants are significant sources of greenhouse gas emissions. Operators of new hydrogen plants will need to report their greenhouse gas emissions to ARB. The operators of these facilities will need to surrender compliance instruments to match against these emissions, so entities that are investing in such facilities will have to consider the cost of carbon when planning any new facilities. These emissions will be covered by the cap, but will not increase the total size of the cap, so any new emissions from hydrogen facilities will need to be counterbalanced by reductions elsewhere

B-69. Comment: Hydrogen Energy is in the process of a comprehensive regulatory review process to construct the nation's first industrial-scale low carbon power plant with carbon capture and sequestration. The proposed facility will use Integrated Gasification Combined Cycle (IGCC) technology to manufacture hydrogen from petroleum coke (a by-product of the refining process) or blends of petroleum coke and coal, as needed. Over two million tons of carbon dioxide (CO_2) is expected to be captured annually and used for EOR where it will result in sequestration in deep underground geological formations. In order to account for and recognize the benefits of a bold project like the

Hydrogen Energy project in California, and to send the policy signals that will lead to further investments in low-carbon power with CCS, CARB should specifically acknowledge the benefits of carbon capture and storage. The sooner CCS is available, the greater the cumulative benefit to the atmosphere. The need for early deployment of CCS is particularly pressing because of the long lead times in the power generation industry. Several years are required to design, permit and build a power plant, with Hydrogen Energy expected to be operational in California during the middle of this decade. (HECA)

> **Response:** We agree that carbon capture and sequestration (CCS) can play a critical role in reducing GHGs. However, these technologies are not currently commercially available. Inclusion in the regulation would be premature. We have been involved with CCS research studies and will continue to monitor developments in CSS and propose regulatory amendments to address it, as necessary.

Miscellaneous Facilities

B-70. Comment: All renewable energy performs significantly better than nuclear energy. Nuclear power also has serious adverse contamination effects on people and the environment for thousands of years for all phases from cradle to grave that far exceed dangers of all other energy sources. Nuclear power is not an acceptable contender in reducing global warming emissions. (MICHETTI)

> **Response:** The cap-and-trade regulation places a compliance obligation on certain entities that are responsible for GHG emissions. Nuclear power does not emit GHG emissions, and is not addressed by this regulation.

Cost-Effectiveness

B-71. Comment: ARB should closely monitor the Implementation of the Scoping Plan to ensure the State meets AB 32 emission reduction targets in a cost-effective manner. We recommend the following:

- The suite of programs ARB and its sister agencies are adopting under AB 32 are complex, and in the case of the electric sector in particular, rely on continuously evolving advanced technologies and challenging and unpredictable transmission and permitting conditions, among other uncertainties. For these reasons, PG&E believes that Scoping Plan updates are critical, and should be more frequent than the five-year cycle that the statute provides as a minimum. In particular, and as it relates to the Cap and Trade regulation, PG&E recommends that the relative cost-effectiveness of programs must remain a key consideration as California moves forward to achieve AB 32's goals;
- ARB should establish a clearer process for evaluating comparative cost effectiveness as an integral part of Scoping Plan review. Since AB 32 calls for maximizing cost-effectiveness, ARB should establish a clearer process to assess

each program measure to determine the cost per ton of CO_2-equivalent reductions;

- ARB should perform a comparative evaluation to determine the relative cost-effectiveness of each program measure vis-à-vis other programs and the Cap and Trade market;
- ARB should make adjustments to the program measures to maximize the extent to which regulated parties are able to pursue the most cost-effective measures, and to either improve the cost-effectiveness of the more costly programs, delay their compliance targets if cost trajectories are trending downward, or suspend programs entirely in favor of other program measures or the Cap and Trade market. This cross-measure comparison could also be used to expand programs that prove to be more cost-effective than others. PG&E proposes that these cross-measure assessments be performed at least every two years, and ARB would modify the programs as necessary in order to minimize higher program costs and to more accurately determine cost and emissions reduction trajectories. In the electric sector, existing reporting requirements should provide ample data to determine the reductions achieved by each of the program measures, while the Cap and Trade market provides a real-time allowance price by which to evaluate its comparative cost-effectiveness; and
- ARB should employ a comparative approach to cost-effectiveness evaluation, adjust program requirements as required to improve their cost-effectiveness and allow reductions to be achieved through switching to more cost-effective program measures or rely on more reductions through the Cap and Trade system when necessary. PG&E recommends that comparative cost-effectiveness analysis be a key component of Scoping Plan review, and that such review occur at least every two years rather than the statutory minimum of five years. Such review may, as noted, have the effect of greater reliance on reductions through Cap and Trade as AB 32 implementation through other programs evolves. (PGE1)

Response: The commenter's recommendations refer to the Scoping Plan and the need for a comparison of the cost-effectiveness of the various regulations developed in response to AB 32. The comments do not relate specifically to the current rulemaking on the cap-and-trade regulation. Nevertheless, as discussed in Chapter VIII of the Staff Report, the cap-and-trade regulation is designed to achieve the required emission reductions at the lowest cost to society. Specifically, the regulation is estimated to achieve the needed emission reductions at allowance prices in the range of $15 to $30 per metric ton in 2020. Should this estimate not prove to be accurate, the program has established price containment measures that would come into effect to mitigate excessively high prices.

B-72. Comment: The structure of the proposed Cap and Trade rule will place an overwhelming financial penalty on industry for relatively small "market-driven GHG emission reductions." This is because the Cap and Trade regulation focuses on "total carbon emissions" and not on reducing carbon emissions to meet the goals of AB 32. Even to the extent that GHG emissions are reduced to meet the 2020 goal, the ongoing financial burden of the existing carbon emissions will continue and have real-world impacts on our refining operations that are not adequately addressed. We anticipate the cost of this program to Valero and ultimately California businesses and consumers could approach $500 million by 2020 at the floor (minimum) price mandated by this regulation with little or no environmental benefit. (VALERO)

> **Response**: As discussed in Chapter VIII of the Staff Report, the cap-and-trade regulation is designed to achieve the emission reductions required by AB 32 in the most cost-effective manner. The regulation also establishes price containment measures that would come into effect to mitigate excessively high prices should they occur. Insufficient information was provided by the commenter on how their cost estimates were made in order for us to be able to respond to this comment.

B-73. Comment: ARB should closely monitor the Cap and Trade program, and the implementation of the Scoping Plan, to ensure the State meets AB 32 emission reduction targets in a cost-effective manner. (BCFSE)

> **Response:** As discussed in Chapter VIII of the Staff Report, the cap-and trade regulation is designed to achieve the required emission reductions in the most cost-effective manner. The regulation is estimated to achieve the needed emission reductions at allowance prices in the range of $15 to $30 per metric ton in 2020. Should these prices prove to be inaccurate, the program has established price containment measures that would come into effect to mitigate excessively high prices. We are committed to regular public updates on the status of AB 32 implementation, including the cap-and-trade regulation.

B-74. Comment: The time frame for implementing the cap contemplates virtually immediate changes to business as usual in California. The changes do not allow for rational planning or for alternative strategies for achieving the implicit emissions limit. For example, a utility may need to plan for additional renewable energy purchases, which may require new facilities to be constructed. There is a 2-3 year planning cycle for such construction and renewable generation. Independent power producers may need to purchase offsets (instead of allowances) in order to continue operation at past levels. Offset projects take some time to organize and receive approval. Fundamentally, if 2012 is the first compliance year, the only available option for compliance other than purchasing allowances is to reduce output or curtail operations. (HOR)

> **Response**: We moved the compliance start date from 2012 to 2013 to ensure that the regulatory elements are in place and fully functional. The regulation provides flexibility in compliance via many mechanisms, including purchasing allowances and the use of offsets.

B-75. Comment: The rationale presented for a cap and trade scheme covering 85 per cent of California's GHG emissions is that it establishes a price signal to drive long term investment in cleaner fuels and energy efficiency encourages implementation of the lowest-cost abatement first, which gives flexibility to covered entities. However, based on global experience of Cap and Trade schemes, these assumptions are highly questionable. Carbon prices are incredibly volatile and prone to major crashes–in large part because “carbon” is a commodity that does not exist as a single entity outside of the numbers displayed on trading screens. The result is that these markets emit, at best, a very weak signal. The practice of “hedging” carbon permit prices against shifts in energy prices and currency exchanges cancels out this signal altogether In theory, a “robust carbon price” would make dirty industry uneconomic. In practice, such a price is of a different order of magnitude to current prices–mainstream economists estimate ten times or more of what it currently trades. A high and stable price would at best encourage companies to invest in changes that push the problem off their books. Such a price could not solve the problem of “locking in” pollution. In chasing after the cheapest short-term cuts, cap and trade tends to encourage quick fixes to patch up outmoded power stations and factories–delaying more fundamental changes. (CTW)

> **Response**: We agree that a stable price signal on fossil based fuels is necessary to drive long-term investment in cleaner fuels, to encourage energy efficiency, and to do so in the most cost-effective manner. The cap-and-trade regulation includes a number of features designed to provide some predictability in cost, including limited use of offsets, banking, and an allowance reserve and reserve price. We do not agree that the California market will see similar outcomes as existing carbon markets. Lack of a high or stable price signal in the other markets was the result of over allocation of allowances, which was the result of inadequate information on actual emissions. We used several years’ worth of verified emissions data to determine the number of allowances that will be made available. It is unlikely that the California market will be over allocated.
>
> The price containment mechanisms along with an entity’s ability to hedge, provide further price stability should non-controllable events occur, such as a prolonged drought or rapid economic expansion. We believe a market-based approach is best as it provides a demand-side response to an allowable price signal across the entire economy. We believe that the price signal established through the cap-and-trade program would provide an incentive for investment in energy efficiency and clean fuels. The design of the cap-and-trade program provides a reasonable compromise between achieving emissions reduction requirements while not significantly affecting the economy.

Low Carbon Fuel Standard

General

B-76. Comment: In April of 2009, CARB issued Resolution 09-31 on the Low Carbon Fuel Standard, which directed CARB staff to “evaluate as part of the Cap and Trade rulemaking whether displacing petroleum transportation fuels with electricity leads to a cross-sector shift in GHG compliance obligations.” SCE urges CARB to conduct a long-term study on the cross-sector shift in order to make educated policy decisions early on, especially as plug-in electric vehicles steadily increase their market share. (SCE1)

> **Response:** Notwithstanding potential local or regional impacts on electrical infrastructure, staff has estimated that displacing petroleum-based transportation fuels with electricity would not lead to a significant cross-sector shift in GHG compliance obligations before 2020 because the electricity projected to be supplied to the State's electric vehicle fleet in the foreseeable future is estimated to be less than two percent of the total State vehicle fleet's energy needs. For example, in the California Energy Demand 2010-2020 Adopted Forecast, the California Energy Commission estimated that electric vehicles would consume 4,400 gigawatt-hours (GWh) of electricity in 2020; whereas, the total estimated electricity demand in 2020 would be 320,000 GWh. Additional long-term study may be justified to further examine impacts in the 2035+ timeframe if the PEV market continues to grow.

B-77. Comment: Include appropriate reform of CEQA and air quality regulations so that low carbon fuels and technologies rapidly receive required product or facility performance verifications, certifications and permits. The responsible ARB Executive should submit periodic reports to the Board regarding obstacles, proposed solutions and degree of success. (CCC, MAZOWITA)

> **Response:** ARB does not have the authority to reform CEQA. However, we will periodically monitor implementation of both the LCFS and the cap-and-trade regulation and report to the Board periodically on implementation of these regulations.

Support LCFS Credits

B-78. (multiple comments)
Comment: In the LCFS Final Regulation Order, which became effective April 15, 2010, CARB stated that LCFS credits may be used for compliance with other GHG reduction programs, including CARB's AB 32 Cap and Trade program. CARB staff raised the possibility of linkage to the LCFS program throughout the Cap and Trade rulemaking process and discussed the possibility with stakeholders in workshops. However, the proposed regulation makes no mention of LCFS credits for compliance purposes or linkage to the LCFS program. LCFS credits will only be valuable in the Cap and Trade program during the first compliance period, before the transportation sector is added to the program. SCE supports the use of LCFS credits in the Cap and Trade program, and strongly recommends that CARB allow LCFS credits to be used for compliance purposes in the proposed regulation's Cap and Trade program. (SCE1)

Comment: Allow cap and trade allowances to qualify as credits within the California Low Carbon Fuel Standard. California's LCFS (section 95485), allowances and offset credits used for compliance within the proposed Cap and Trade program would not qualify as credits within the LCFS. The California LCFS imposes significant compliance challenges and uncertainties. In fact, the program becomes infeasible starting as early as 2014 when existing biofuel blending alternatives make it impossible to achieve mandated GHG fuel standards as currently designed. The current LCFS program allows carbon credits to transfer from the LCFS to the proposed cap-and-trade program but fails to provide the reverse exchange. CARB should adopt provisions that would allow fuel producers and importers regulated under the California LCFS to meet all or part of their annual LCFS compliance obligation with allowances and qualifying offset credits from the Cap and Trade program. This approach does not compromise the integrity of Cap and Trade or LCFS program/targets and enhances the feasibility of the LCFS. This would directionally ease some of the major compliance concerns with LCFS. Failure to adopt this recommendation disproportionately imposes large carbon costs on transportation consumers and leaves the program vulnerable to isolated market volatility dynamics. We seek the Board's resolution to improve cost-effectiveness and feasibility of the LCFS program by allowing the use of allowances and credits from the Cap and Trade program for compliance. (CONOCO)

Comment: To the extent that ARB proceeds with both the Cap and Trade and the Low Carbon Fuel Standard (LCFS) regulations, ARB should provide a means by which allowances and/or credits may be used and transferred between programs to satisfy compliance obligations. The LCFS program will potentially be the most cost-intensive program under AB 32, second only to the proposed Cap and Trade regulation. Depending on the availability of “approved crudes” not classified as High Carbon Intensity Crude Oils (HCICO), coupled with the availability and costs associated with blending biofuels, the impact to Valero of the LCFS regulations could easily reach $100s of millions by 2020. Initial costs of this program in 2011 alone may exceed $10 million. These costs are in addition to the Cap and Trade costs. The ability to find cost-effective GHG emission reductions that could be commensurate with the carbon reduction requirements under the LCFS will be critical for an industry facing costs of this magnitude. The LCFS program, through the life-cycle analysis of feedstock and fuel products, reduces the obligations for carbon reductions into a simple total tonnage of CO_2. From a scientific standpoint, nature is indifferent as to the means of emission reductions, whether a renewable fuel, an offset, or some other emission reduction within a facility’s operation. Consequently, there is no scientifically justifiable reason why a reduction that generates a credit under the Cap and Trade cannot be applied for compliance purposes to the reduction obligations under the LCFS. Transportation fuel carbon is already planned for inclusion under the statewide carbon cap. The flexibility to apply emission reductions interchangeably between programs will have no impact on the cap, compliance, or the reduction obligations required by AB 32, should ARB proceed with massively expensive program. (VALERO)

Comment: The regulation is silent on the question of allowing credits created pursuant to California’s LCFS to be traded within the proposed cap and trade structure, indicating that such trades are not contemplated in the structure. The OWG has previously supported inclusion of LCFS credits in the cap and trade, and remain convinced that LCFS credits should be allowed in the cap and trade structure, at least for the years prior to the inclusion of the transportation sector under the cap. (OFFSETSWG1)

Comment: Why are credits not fungible between the LCFS and Cap and Trade? Given the importance of transportation fuels in the market, it would seem prudent to evaluate and resolve this aspect of AB 32 carefully and only after extensive study. (WSPA1)

Comment: The issue of linking cap and trade credits with the low carbon fuel standard needs some additional conversation. (WSPA2)

Comment: SCE requests that CARB clarify whether LCFS credits can be used in the cap-and-trade program, as LCFS credits can provide another way for covered entities to meet their compliance obligations. (SCE1)

Comment: ARB has already developed protocols under the LCFS. These protocols can also be used to develop credits under the Cap and Trade program. This will provide additional economic stimulus for the development of alternative low-carbon fuels. (WM1)

Comment: CARB has already adopted protocols under low carbon fuel standard. Make those credits available to transfer into the cap and trade system as soon as possible. That will further provide a value for those kinds of reductions. (WM2)

> **Response:** Currently, the LCFS allows the export of LCFS credits to other programs that will accept them, but it does not allow importation of credits into the LCFS program. This is to ensure that the fuel providers act appropriately to provide low-carbon fuels. As required by the LCFS regulation, staff is conducting a formal review of the LCFS and may consider the credit options in the LCFS, including an assessment of credit options.
>
> We do not believe it is appropriate to allow LCFS credits to be transferred into the cap-and-trade system. Credits have different definitions in each regulation and are subject to different protocol requirements. For example, the LCFS looks at lifecycle carbon intensity, while the cap-and-trade program looks only at direct emissions. If credits were fungible between the two systems complex emission reduction overlaps, or unintended double-crediting for reduction could occur. Currently, the cap-and-trade program considers reductions in direct emissions as the result of compliance with LCFS to be recognized and counted as a benefit toward a capped entity's compliance obligation. We prefer to maintain the simplicity of this overlay and not complicate things with interchangeable credits between the two systems.

Linkage

General

B-79. Comment: IETA is pleased to see ARB's Cap and Trade draft regulations consider the issue of linkage, not only with other WCI jurisdictions but with other regional and international schemes as well. Based on evidence and experience, linking regional and worldwide emissions trading markets would provide greater market liquidity while encouraging the realization of the most cost-effective reduction opportunities for GHG emissions. (IETA1)

> **Response:** No response is necessary

B-80. (multiple comments)
Comment: The proposed regulation is doomed to failure because of the limited participation by other jurisdictions and the demise of a federal cap and trade program. The California only program, which the Board appears determined to pass before it is fully baked, poses huge risks of harm to jobs and the California economy due to among other factors, economic leakage. Moreover, the associated GHG emissions leakage will undermine any integrity the Board may have hoped for in the program. We believe that many proposed aspects of the program will unnecessarily exacerbate this risk and CARB should give full consideration to both the limited linkage to competing jurisdictions and the incompleteness of the regulation and put this measure over until it is complete and there are enough real trading partners to avoid massive leakage. This damn the torpedoes, full speed ahead whether the regulation is complete or not mentality reminds us of the ill-fated electricity deregulation scheme and we believe that CARB's rush to pass the Cap and Trade Regulation before it is ready will blow up, just as deregulation blew up, as soon as allocation gives way to auction with the only question being how dire the resulting economic consequences. (PLOTKIN)

Comment: IETA's membership is appreciative of progress in adapting flexible approaches and would like to stress the importance of the considering future linkages to comparable markets that have broadly symmetrical regulations. (IETA2)

Comment: CERP supports linkage with other programs and urges ARB to move forward with linkage with qualified programs as soon as possible in 2011. (CERP1)

Comment: The regulation needs to demonstrate a greater sense of urgency on linking with other programs. This should include a specific timeline for evaluation and decision, and consideration of other cost control measures should significant and timely linkage not be accomplished. CARB should state in the resolution (or elsewhere before adoption of the regulation), what specific programs will be considered for linkage, and the timeline by which decisions on specific linkages will be rendered. CARB must accept that if no linkage is attained by a date certain early within the first compliance period, then a reconsideration of linkage criteria should occur and/or other, additional cost-control measures (such as additional use of offsets) should be implemented. (BP)

Comment: The ARB Board Resolution adopting final AB 32 regulation should reflect the Staff Report's statement on the importance of linkage and offset availability. The Staff Report recognizes the importance of California linking to other cap and trade programs but the regulation itself does not yet establish a path to achieving that linkage. We believe that strong support from the Board is needed to ensure that linkage with WCI partners in 2011, and linkage with the EU after 2013 can become a reality. (CHEVRON1)

Comment: If a California cap-and-trade program is linked with others through the Western Climate Initiative (WCI), California should negotiate reciprocity with other WCI participants. (NEXTERAENERGY)

Comment: The Western Climate Initiative (WCI) is not yet fully in place as originally proposed to be an integral link for California's Cap-and-Trade. (SDCHAMBER)

Comment: Linkage to WCI and other Cap and Trade Programs is mentioned in the Cap and Trade Regulation; however such linkages are not expected to be in place until late 2011. To date, California and New Mexico are the only states who intend to participate in the WCI, and New Mexico's plans for participation are subject to change. A California only Cap-and-Trade Program in lieu of a regional program will be too restrictive and limited, and should not be implemented until other state partnerships are in place. (MWDSC1)

Comment: At this point it appears the only imminent linkage is at the regional level with the WCI, which can only happen if other participants can agree to the program's implementation and will be ready for the 2012 start date. Without linkage to other programs, a California-only Cap and Trade program ignores the opportunity for economic growth and puts California at significant economic risk. It is important that CARB create a program that California can seamlessly interface with the WCI partners with ultimate linkage to a national and international platform. (CALCHAMBER1)

Comment: ARB should ensure that its Cap and Trade program will link directly to a U.S. federal program and to regional programs such as WCI. Although California has been a leader with respect to climate change, California businesses will suffer and environmental goals will not be met if regulators do not closely coordinate and link market programs. CLFP believes that a "go-it-alone" approach is not a viable option. (CALFP1)

Comment: The Council is encouraged that the California Air Resources Board envisions linking its Cap and Trade program with other WCI Partners to create a regional market system. We are also encouraged by indications that California is discussing opportunities to link with the Cap and Trade program in the Regional Greenhouse Gas Initiative (RGGI) states. These linkages will be critical for consistency among programs and will facilitate what we hope will be an eventual transition to a national program. (BCFSE)

Comment: We are very concerned about the proposed regulation because of the limited participation by other jurisdictions including those in WCI and the dim prospect of a federal cap and trade program anytime on the horizon. This poses huge risks of harm to jobs and the California economy due to economic leakage, and the associated GHG emissions leakage would undermine integrity of the program. (AB32IG)

Comment: In designing its program, California should strive for compatibility with the European Union trading system and offset policies. Given the importance of interstate and international trade to California's economy, we must design our program to ensure that California companies are appropriately positioned to compete under any future federal or international program. (LADWP1)

Comment: CARB has always maintained that in order to be effective the cap and trade program must be part of a regional multi-state effort, yet the regulation before you does not propose linking to any specific programs outside California at this time. If widespread equitable linkage cannot be accomplished, serious consideration should be given to postponing a cap and trade regulation. (CAHISPCHMBR)

> **Response:** We recognize the importance of linkage with other jurisdictions to provide an additional cost containment mechanism, prevent leakage, and secure additional GHG reductions. Staff analyzed the potential of a cap-and-trade program on California businesses, and the proposed regulation includes methods to reduce competitiveness loss through the allocation process.
>
> The proposed regulation establishes a framework for linkage and considers the issue of linkage with other GHG emissions trading systems. Subarticle 12 of this regulation provides possibilities for linkage, including procedures to evaluate external GHG emissions trading system. Establishing linkage with other programs will require further assessment and establishment of a formal rulemaking process under the APA before allowances and/or offset credit from an external program can be used for compliance with this regulation. When evaluating whether we should link to another program, we will consider criteria that the potential linked program must meet, to ensure that the linked program has provisions for cost-containment, market tracking, registration, monitoring, reporting, verification, and enforcement that are reliable and sufficient to ensure its environmental integrity. California is a partner state of WCI and has been actively involved in WCI activity and the design element. We are looking to link to WCI partner states and provinces that may be ready to implement their cap-and-trade programs in the near term. We modified the first compliance year from 2012 to 2013 to ensure a robust program. The WCI partner jurisdictions—Quebec, Ontario, and British Columbia—are in the process of developing and adopting cap-and-trade programs.

To ensure harmonization with other national programs, our mandatory GHG reporting requirements are in alignment with the U.S. EPA mandatory program, where appropriate.

Duplicative Regulations

B-81. (multiple comments)
Comment: Southern California Edison believes the nature of climate change problems would best be addressed at a national or international level. While SCE supports the use of a cap and trade program to efficiently reduce emissions, we remain concerned that, as proposed, the market design and the operating rule will not work as expected. The proposed rules are extremely complex and today have not been adequately tested. Of course, California learned the hard way from the electricity crisis that the complexity of an untested creates opportunity for market manipulation. SCE suggests the Board should take time to get this market right. We hope the Board will instruct staff to condition the start of the cap and trade market on some crucial readiness criteria which include not at a minimum developing some market simulation and testing processes and implementing them into the market monitor prior to the beginning of the program. (SCE2)

Comment: The resolution should state the Board’s intention that the AB 32 program, as a robust economy-wide carbon cap and trade program, provides the best approach to regulate California’s GHG emissions and to encourage strategic low-carbon technology development and that the overlay of federal GHG regulation would be neither necessary nor beneficial, particularly in light of the additional cost, time delay and multiple agency administrative resources that implementation of such duplicative federal regulations would require. (CCC, MAZOWITA)

Comment: CCEEB is concerned that California businesses will be subject to duplicative GHG regulations from the state and federal government. CCEEB recommends that ARB clearly state their intent to not subject California's businesses to duplicative GHG regulations. (CCEEB1, CCEEB2)

Response: We recognize the importance of harmonization between State and federal GHG emissions reduction requirements. In Resolution 10-42, the Board directed the Executive Officer to work with U.S. EPA on the development of a federal regulatory framework to grant delegation or equivalency to California’s climate change program where appropriate.

We will begin to test market infrastructure components in 2012 and compliance requirements for covered entities start in 2013. This change ensures that all central elements of the program are developed and tested in 2012 before we move into the first year of compliance in 2013.

Additionally, our mandatory GHG reporting rule is harmonized with the U.S. EPA mandatory reporting rule. In the event that the U.S. EPA cap-and-trade program becomes available, our cap-and-trade program design element can easily transit into the U.S. EPA program.

B-82. Comment: The cap and trade program under AB 32 is likely to be equally or more stringent than the command and control regulations under the Federal CAA scheduled to come into effect in 2011. ARB should consider proposing that reductions under AB 32 will constitute conformance with the CAA. (WSPA1, WSPA2)

Response: We are working closely with U.S. EPA on how U.S. EPA will implement greenhouse gas measures, including equivalency for state greenhouse gas emissions reduction programs.

C. ALLOCATION OF ALLOWANCES

This section includes comments and responses about how allowances (permits to emit CO_2e) are distributed for free to eligible covered entities, and primarily refer to sections 95870 and 95890–95893 of the regulation. Major topics within this category concern the amount of and justification for free allocation, benchmarking (especially the methodologies and data used to develop the benchmarks, and sector-specific concerns about the methodologies), and leakage (especially concerns about the risks and monitoring of leakage). Comments concerning free allocation of allowances to the electric distribution utilities are found in the section entitled “Electricity.” Comments concerning the use of auction proceeds are found in the section entitled “Use of Auction Proceeds.”

Free Allocation

Support Free Allocation

<u>No/Little Auctioning at Start</u>

C-1. (multiple comments)
Comment: IETA would like to stress the importance of avoiding the temptation to have extremely high auctions at the onset of the program. (IETA2)

Comment: A system that imposes costs immediately, as a result of an auction or taxes or other immediately effective cost increases, will drive businesses and perhaps individuals out of California. Allocating allowances for free to regulated entities maintains the integrity of the cap, while avoiding immediate economic incentives to leave California. (HOR)

Comment: A well-designed auction system may be the optimal approach to reach our carbon reduction targets. However, full auction of allowances at the beginning of a cap- and trade-program may be too abrupt a transition, and may pose high short-term costs to capped companies. A free allocation system, on the other hand, should reward companies that have already made significant investments in energy efficiency and carbon reduction, and should not penalize those that produce goods in California. (LADWP1)

> **Response:** We agree and proposed such an allocation/auction system in the Staff Report. The purpose of the allocation of allowances is to provide transition assistance upon the start of the cap-and-trade program (via distribution of free allowances at the start of the program), prevent leakage (by continuing free distribution for activities prone to leakage), and encourage in-state production (by distributing allowances based on production). We believe it is especially important, given current economic conditions, to provide regulated entities the opportunity to invest in low-carbon technologies. The comments address leakage, which we considered prior to the publication of the Staff Report. Our

leakage analysis is described in more detail in Appendix K of the Staff Report. We are committed to continue to monitor leakage throughout the implementation and progression of the cap-and-trade program. We believe the proposed regulation is designed to minimize leakage to the fullest extent feasible.

Rate of Decline of Free Allocation

C-2. (multiple comments)
Comment: Dow is concerned about the rapid decline in allocated allowances. While approximately 97 percent of allowances are to be initially allocated to industry (including over 50 percent to electric utilities) during the program's first compliance period (2012 through 2014,) this number decreases to 42 percent by 2020. Dow is supportive of the high initial allocation, but believes the 55 percent decline in allocated allowances in only six years is problematic. At the rate proposed by ARB, industry will find it very difficult to adjust to the increased costs of auction, threatening competitiveness, jobs and consumer energy prices. Significant time and capital investment are needed to meet long-term emission reductions goals and transition California to a lower-carbon economy. Dow recommends exponentially phasing in more auctioning over a longer period time, where initial auctions would be small and gradually increase at a steeper rate. This will help participants acclimate to the market, keeping costs down and improving efficiency. (DOWCHEM1)

Comment: Significantly limit the reductions in the Assistance Factor for stationary sources. Arguments regarding high vs. medium trade exposure notwithstanding, limiting the changes in the Assistance Factor to one percent or two percent per compliance period would provide the refining sector more of the trade exposure protection we seek, but would also limit the financial impacts and allow for resources to be spent on actual reductions as opposed to simply buying carbon allowances, without providing any tangible environmental benefit. (VALERO)

Comment: IETA is concerned about the rapid decline in allocated allowances. ARB is planning on allocating the bulk of allowances to the utility and industrial sectors beginning in 2012. IETA recommends phasing in the decline in allocated allowances over a longer period time, where initial auctions would be small and gradually increase at a steeper rate. This will help participants acclimate to the market and permit time for large capital investments to yield emissions reductions, keeping costs down and improving efficiency. (IETA1)

Response: We believe the auction system is the fairest and most transparent way to distribute allowances. This is supported by the recommendations of the Economic and Allocation Advisory Committee. The auction will also help maximize incentives for continued investment in clean and efficient technologies and provide revenue that can be reinvested for public benefit. The allocation provision of the regulation was designed to provide a soft start for the cap-and-trade program and the transition toward a greater reliance on auctioning is necessary as transition and leakage risk decreases over time. We believe the rate of transition from free allowances to auction is appropriate.

Method of Free Allocation – Historical, Percentage of Cap

C-3. Comment: Allocate allowances to regulated entities in rough accordance with their past usage. No regulated user should be required to submit allowances without receiving an allocation representing a "share" of the cap.

Issue allowances for free to all regulated entities reflecting a share of the cap. The value of allowances is and should be *driven* by the established limit or cap on overall use. (HOR)

Response: The commenter's request to distribute allowances in accordance with past usage is a "grandfathering" approach. This approach rewards entities with high emissions. Instead, our proposal to distribute allowances based on an efficiency-based benchmark rewards entities who have taken early actions to reduce greenhouse gas emissions. We believe it is critical to allocate allowances to industrial entities at risk of emissions leakage. We analyzed the potential for emissions leakage by looking at emissions intensity and trade exposure. To determine which industry sectors were at risk of emissions leakage, we developed a methodology to assess a sector's emissions intensity and trade exposure and presented this in Appendix K of the Staff Report. We also stress the importance of the proposed transition toward a greater reliance on auctioning which will help maximize incentives for continued investment in clean and efficient technologies and provide revenue that can be reinvested for public benefit.

Free Allocation for Duration of Program

C-4. Comment: We recommend CARB allocate allowances without charge throughout the duration of the program. The implementation of this recommendation will foster a more robust liquid emissions market. Requiring sources to purchase an increasing quantity of credits through state sponsored auctions will unnecessarily increase the cost of the program, prompt facilities to move out of state, and render sources less able to develop and implement controls. Instead, CARB should utilize a simple, "free" allocation system. Under this proposal, sources are provided a declining emissions cap, or allowance checkbook. For sources in operation in 2011, the cap would be at a level that is just shy of their 2011 emissions. New sources are either given a special allocation, which may be set aside from the initial allocation, or allowed to buy surplus allowances from existing sellers.

We support the use of free allocations as opposed to 100 percent auctions. Historically, successful emissions trading programs have relied upon allowance distribution systems. Here, each source in operation at the commencement of the program is given an initial allocation that starts in year one and extends (at a declining rate) through the program's duration. We are unaware of any successful pure auction system where existing and new sources secure their initial and ongoing allowances through an auction. The free distribution allocation method puts tons into circulation, and rewards sources that discover they can benefit economically by reducing their allowance needs and selling their surplus. In contrast, a primary auction is another form of a carbon tax; one that delivers revenues to the government without the obligation to make prudent decisions regarding the use of such monies. An allocation system gives sources their allocations well into the future (in some cases, indefinitely). In contrast, an auction forces participants to purchase near and long term allowances, begging the question as to how sources will recover these costs (of course, the ultimate bill is delivered to the customer who purchases the products) or finance emissions reductions. In addition, the lack of regulatory certainty wreaks havoc with capital planning by sources to install the very technologies that could achieve long term emission reductions.

Market liquidity and diversity will be relatively higher under a free allocation system and lower under an auction system. Giving 30 years worth of allowances to covered sources will ensure that sources have a base amount of allowances that they can either use or sell. The availability of these allowances, especially at the outset of this program, allows sources to purchase in the spot market as well as execute options, leases, swaps, and forward transactions for near term and future year allowances, all with variable terms and conditions and counter party credit quality. Withholding allowances, and making them only available through government sponsored auctions will have an unfavorable impact on liquidity, cost to society of the program, and how great a benefit to the environment is realized. An auction drains cash from emitters, resulting in less available capital to invest in reducing emissions. An auction puts sources in a cost minimization mode (they do what’s necessary to acquire the least amount of allowances at the outset), rather than a profit maximization mode (‘over-compliance’ can free up allowances that can be sold) that comes with a free allocation. An auction severely disadvantages existing emitters over new sources. In an auction, new entrants have the choice of tailoring their purchases and facility designs in perfect synchronization. Existing polluters have plants designed for an environment where emissions were unregulated. In contrast, new entrants have the unfair advantage of being able to design their plant for the new environment. Auctions discriminate against existing emitters who have a higher cost-base. (CANTORCO2E)

Response: We believe the auction system is the fairest and most transparent way to distribute allowances. This is supported by the recommendations of the Economic and Allowance Advisory Committee. The purpose of the initial allocation of allowances is to provide transition assistance and minimize leakage upon the start of the cap-and-trade program. The proceeds from the auction system will provide revenue that can be reinvested for public benefit and used to invest in emerging technologies to help California meet our long-term emissions-reductions goals. We believe the design of the cap-and-trade program demonstrates certainty of emissions reductions, and that we will meet the goals of AB 32 and specifically, the 2020 target.

Free Allocation so as Not to Be Taxed

C-5. Comment: I would suggest that you allocate allowances in a way that doesn't cost industries anything. They should be able to rely upon the stream of credits and plan around it. If you impose an auction requirement upon them, it will be taxable to contribute to leakage as businesses consider moving out of state to avoid these costs. (MARGOLIS)

Response: The proceeds from the auction system would provide revenue that can be reinvested, as appropriated by the legislature, for public benefit and used to invest in emerging technologies to help California meet our long-term emissions-reductions goals. We analyzed the potential for emissions leakage and developed a methodology to assess a sector's emissions intensity and trade exposure. We assigned the appropriate level of free allocation to minimize leakage and provide transition assistance. We believe that greater levels of auctioning are appropriate as transition risk diminishes.

Free Allocation Combats Leakage

C-6. Comment: RCRC supports the proposed free allocation of allowances to the industrial sector. As recently outlined in a letter to you by the Southern California Leadership Council, Dun & Bradstreet estimates show that approximately 2500 companies have left the state since January 2007, taking with them nearly 70,000 jobs. History shows that when companies in unregulated sectors face heavy regulation, many of them simply relocate to other states or even other countries in order to escape the burdensome costs of compliance. We believe the free allocation proposal is a good faith effort by ARB to prevent more businesses from moving their operations out of state so that Californians can retain these jobs. (RCRC)

Response: Thank you for your support.

CO_2 Suppliers

C-7. Comment: Our Golden Eagle refinery sells CO_2, a byproduct of hydrogen we manufacture, to a third party which purifies the CO_2 and distributes it to final uses. The proposed regulation defines the point of regulations for industrial CO_2 as the supplier of CO_2 because they are involved in the sale and delivery of the gas for commercial use. Because process emissions associated with hydrogen production include all process CO_2 emissions, CO_2 purchased from hydrogen plants by CO_2 suppliers should not be subject to a requirement for allowances. Doing so would in essence double count this CO_2 in terms of the allowance calculation. (TESORO)

Response: It was never our intent to subject supplied CO_2 to a compliance obligation every time it changed hands. We modified the regulation to clarify that for CO_2 supplied in-state, the producer or extractor of the CO_2 holds the compliance obligation.

Food Manufacturing

C-8. Comment: Ag Council appreciates CARB's first three years of free allowances to avoid extreme market fluctuations. (ACC3)

Response: Thank you for your support.

Hydrogen as Transportation Fuel, Facilities (Non-Refinery), and Refinery Based

C-9. (multiple comments)
Comment: Whereas other distributed transportation fuels will not be subject to a compliance obligation for their inherent carbon-footprint until the second compliance period, the compliance obligation resulting from production of hydrogen as a transportation fuel will be imposed immediately under the first compliance period. Air Products encourages CARB to provide free allocation of allowances for such hydrogen fuel to prevent an increased barrier for deployment of this long-term transportation solution.

Allowance allocations must be provided for hydrogen production, regardless of it source —captive or third-party supply. Any presumption that third-party hydrogen suppliers can simply pass-on the full cost of allowances required to satisfy their compliance obligation to their respective hydrogen customers ignores the complexity, limitations, variety of commercial agreements/arrangements between supplier and customer. Equitable treatment can be assured by applying a consistent benchmark for, and allocating the resulting allowances to, both captive and third-part hydrogen producers.

Allowance allocations attributable to hydrogen production should be provided directly to the hydrogen producer, regardless of whether they are inside the refinery or a third-party producer. There are several reasons to support this position:

- Contractual terms limit the degree and expediency of any cost recovery (or allowance transfer), between the hydrogen producer who bears the compliance obligation and the customer for the hydrogen.
- Where a single third-party hydrogen producer supplies multiple refinery customers from one or more plants, connected by a pipeline distribution system, allocation of the hydrogen producer's compliance obligation between multiple customers could require disclosure of confidential business information between customers, creating anti-trust concerns.
- Should an interim allocation benchmark approach be required (as noted above), direct allocation of allowances based on the proposed "model" benchmark is based on hydrogen production, not consumption—hence allowances would be directed to the hydrogen producer.
- Allowance allocations made to compensate hydrogen producers for hydrogen used as a transportation fuel (see comment below) can only, logically, be made directly to the hydrogen producer. Making all allowance allocations for hydrogen production directly to creates more consistent treatment under the program.

- Allocating allowances directly to the hydrogen producer is consistent with the EU ETS program and allows core consistent and effective linking of cap and trade programs in the future. (APC)

Comment: The final California cap and trade regulations should allot allowances for stand-alone hydrogen plants not associated with refineries. Section 95811(a)(4) of the proposed rule identifies operators of hydrogen production plants as covered entities and section 95890(a) states that a covered entity from the industrial sectors listed in Table 8-1 shall be eligible for direct allocations of California GHG allowances. However, hydrogen production plants are not listed in Table 8-1. Instead, Appendix K, Leakage Analysis, p. K-6, includes hydrogen plants as an associated process of petroleum refining: ("These plants and activities [petroleum refining] include hydrogen plants"). Table K-2: Sector Classification for Emissions Leakage Analysis, p. K-7, lists "Petroleum products mfg" as an aggregated sector and includes "industrial gas/hydrogen plant" as the description of one of these associated processes. And Table 8-1: Industry Assistance, assigns a "Leakage Risk" to "petroleum refining" as "Medium" and provides a 100 percent Industry Assistance Factor ("AF") for the first Compliance Period from 2012-2014; 75 percent AF for the second Compliance Period (2015-2017); and 50 percent AF for the last Compliance Period (2018-2020).

Praxair's Ontario hydrogen plant does not supply refineries. This plant, and any other company's stand-alone merchant hydrogen production plant that does not serve a petroleum refinery, will not have an opportunity to seek from a host petroleum refinery any allowances that have been directly allotted by CARB to the refinery. Because merchant hydrogen production is not listed as an industry eligible for direct assistance, our Ontario plant will be compelled to acquire allowances at auction or from third parties in the secondary markets, raising the cost of our hydrogen product.

Praxair's Ontario plant supplies liquefied hydrogen to customers in the aerospace/defense, steel, and glass manufacturing industries, among others. The U.S. government is a major customer for aerospace and defense-related needs. More than 50 percent of the Ontario plant's production used to meet customer demand outside of California, making this plant vulnerable to "activity shifting leakage" (e.g., production-related emissions shifting to out-of- state competitors not subject to the AB 32 program) from plants not subject to the GHG compliance costs. Moreover, there will be elevated competition for customers located within California from production occurring outside the state where production plus transportation costs can meet or beat in-state production and delivery costs.

Because hydrogen is such a light compound compared to carbon dioxide, for every ton of hydrogen product produced in a steam methane reformer ("SMR") there are ten tons of carbon dioxide byproduct. This energy-intensive production relationship magnifies the direct and indirect GHG compliance cost impact on Praxair's final price to its hydrogen customers. So, assuming the CO_2 allowances' initial cost in 2012 is $10 per metric ton (the floor price), the corresponding impact on our hydrogen product price is $100 per ton. At full production, this cost could amount to almost a million dollars annually, with such compliance cost burdens increasing as the presumed value of allowances increases and the allowance cap decreases over time.

Should Praxair not be allocated free allowances, the high incremental compliance costs for purchasing allowances will likely prompt two results: 1) Praxair buying allowances and incurring substantial incremental costs for product sold to customers, thus rendering our business uneconomic; and 2) our customers obtaining hydrogen from out-of-state producers, at substantial increased costs to the customer, but at the same time undermining our continued business operation viability. Increasing demand for out-of-state supply also has the unintended consequence of increasing GHG emissions from the liquid hydrogen- bearing tractor trailers that will need to travel substantially farther from states into California to supply in-state customers. Either outcome is inconsistent with some of the Act's stated purposes in section 38562: "to achieve cost-effective reduction" and "to minimize leakage."

Praxair met with CARB Staff on Monday, December 13, 2010, to discuss this leakage issue. We are currently in the process of compiling additional data as requested by CARB staff to help with the leakage risk analysis. We anticipate providing the information and continuing our dialogue with staff on the impacts to Praxair's activities and the justification for inclusion in Table 8-1.

At this time Praxair requests that the Board's Resolution adopting the draft regulations give specific instruction to allocate free allowances for stand-alone hydrogen production plants as a "High" Leakage Risk and to include such plants in Table 8-1 in Appendix A of the proposed rule. (PRAXAIR)

Comment: Air Liquide Large Industries addresses CARB's failure to allocate emissions allowances to hydrogen production facilities associated with refineries. Free allowances that are allocated for particular emissions within the refining sector (hydrogen plants) should be allocated to the party generating the emissions. Under the rule, Air Liquide and its competitors would be required to purchase allowances for emissions from their refinery-based hydrogen plants, and depending on the terms of their long-term contracts with their refinery customers, may or may not be able to recoup the cost of purchasing those allowances. CARB's treatment of refinery hydrogen plants and independent hydrogen plants creates potential unfairness and inefficiencies which would not exist if allowances were allocated to each party generating emissions associated with petroleum refining. We suggest the following:

1. The proposed regulation should be revised to avoid interfering with long-term contracts. CARB has recognized the importance of protecting parties of long-term contracts in the electric power generation industry, noting in Appendix J that these parties "may require special treatment." CARB should protect parties to such long-term contracts who may be unable to pass the costs of purchasing allowances through to their customers by allocating allowances to them.
2. CARB should encourage the efficient operation of independent hydrogen plants. CARB's allocation to refiners but not to independent hydrogen plants associated

with refineries could disrupt the efficient operations that have developed between refiners and independent hydrogen plants at California refineries.

3. CARB should avoid creating disincentives to efficient relationships between refiners and independent hydrogen plants. The proposed regulation may disrupt these efficient relationships by favoring the “in-sourcing” of hydrogen production by refiners. For example, if the refiner receives free allowances for the operation of its hydrogen plant but is required to reimburse a hydrogen plant operator for allowances (under a long-term contract that obligates the refiner to pay such costs) when it purchases hydrogen from an independent hydrogen plant, then the refiner may have an incentive to use its own hydrogen production facilities, resulting in less use of the most efficient, state- of-the-art facilities and leading to increased GHG emissions.
4. CARB should freely distribute to hydrogen plant operators to avoid any disincentive for refiners to use the most efficient hydrogen production facilities. The perception that the program unfairly imposes costs on parties to long-term contracts and causes economic harm to the most efficient producers of hydrogen would undermine the Cap and Trade program. These negative consequences will be avoided by allocating allowances to refineries and to independent hydrogen plant operators on the same basis.
5. CARB should accommodate existing long-term contracts, eliminate any incentives for inefficiency, and promote the use of efficient hydrogen plants associated with refineries by allocating allowances for particular emissions to the party generating the emissions. Minimally, CARB should allocate allowances to independent hydrogen production facilities associated with refineries in order to promote and avoid interference with long-term contracts, and allocate allowances to hydrogen facilities associated with refineries that are subject to long-term contracts that do not allow recoupment of the costs until the current contracts expire or are modified. (ALLI)

Response: We agree and recognize that equity issues exist between allocation to third-party production of hydrogen gas sold to petroleum refiners and refinery-owned hydrogen production. We believe that employing the CO_2 Weighted Tonne (CWT) approach for the refining sector is the best way to address this issue. We modified the regulation to present a separate benchmark for hydrogen gas based on the amount of hydrogen gas produced in Table 9-1 in section 95891(b). This value will be used to allocate to third-party hydrogen facilities. This value is derived from the hydrogen CWT function and is identical to the value that would be applied to refinery-owned hydrogen production under the CWT approach.

In addition, we modified the regulation to allow for a different allocation to liquefied hydrogen production facilities in the future if necessary. If, in the future, any carbon costs from purchased electricity are included in consideration of the product benchmark values, the high level of indirect emissions from liquefaction of the hydrogen would likely lead to a different benchmark value for liquefied hydrogen. The current framework could also allow for a change in the leakage risk classification for liquid hydrogen based on any new information that may arise as we continue to analyze leakage risk per the direction in Board Resolution 10-42.

We recognize the potential of hydrogen as a clean transportation fuel. However, we do not agree that it is appropriate to provide an explicit incentive for this use of hydrogen through free allocation. The purpose of allowance allocation is not to “pick winners” among the many greenhouse gas reducing technologies that may become more widely used in response to the carbon price signal created by the cap-and-trade program.

Natural Gas

C-10. (multiple comments)
Comment: ARB should administratively allocate allowances in a manner that fully recognizes the advantages of life cycle energy efficiency and the emission reductions associated with avoiding energy loss during the process of electric generation and distribution. The allowances allocated to each natural gas local distribution company (LDC) should be based on a percentage of natural gas deliveries reported under mandatory reporting. The formula used to calculate allowances should take into account increased usage of natural gas caused by customers who switch from electric appliances to gas fired appliances in order to avoid energy loss caused by consumption of fossil fuels for electric generation. More importantly, the allowance allocations should recognize the potential for end users to consider emission reduction opportunities associated with source energy consumption as recognized by the U.S. Department of Energy (Federal Register, Vol. 75, No. 161, Friday, August 20, 2010). Southwest would prefer that allocations be based upon 10-year weather-normalized usage data rather than the proposed 3-year normalization.

If the allowance calculation formula does not consider the emission reductions caused by switching from inefficient electric generation to direct combustion of fossil fuels by gas fired heat pumps (GFHP), the new GFHP technology will be lost from the limited opportunities for natural gas customers to have a real impact on reduction of GHG emissions. The cap and trade regulations may expose small end users of natural gas to greater price risk than small end users in the electric sector since there are fewer mitigation options; however, this price impact does not seem to correlate with significant reductions in the use of natural gas.

ARB should directly allocate allowances to natural gas LDC based on the sector’s proportionate share of the total capped sector emissions, giving consideration to increases in the use of natural gas as an end-use fuel to increase overall efficiency and achieve corresponding reductions in GHG emissions. Gas LDCs are rate regulated by the CPUC or a local governing board, so any increased costs associated with the issuance or purchase of allowances must be approved for recovery by the CPUC. As such, ARB can be assured any allowances provided will be used to further the purposes of AB 32 and for the benefit of small gas consumers. Further, rates can be structured to provide appropriate price signals. Most natural gas LDCs have low income customer programs that provide a bill discount. Without an administrative allocation of allowances to the natural gas sector, these low-income customers will likely experience rate increases from the incorporation of the cost of allowances. (SWGASCORP)

Comment: Consider allowance allocation to natural gas suppliers in ways that protect low-income natural gas consumers. The thoughtfulness that has and will go into the proposed allocation and ultimate use of allowance value for the utility and industrials sectors needs to be applied to the natural gas sector as well. The basic goal should be to avoid price spikes for low-income consumers through free allocation or impact mitigation (e.g., dividend). The guidance in the proposed rule does not make it clear that at least some of the value of allowances will be used to protect natural gas customers. (EDF1)

Comment: If ARB wants to subject small natural gas customers to the Cap and Trade Program, then it is essential to allocate allowances to the sector to reflect the unique position of this sector. At a minimum, this means that the regulations should provide the following:

1. ARB should allocate allowance value to natural gas local distribution companies (LDC) based on the sector's proportionate share of total capped sector emissions in 2015.
2. ARB should administratively allocate 90 percent of the allowances for customer benefit, which natural gas LDCs will be required to put up for auction or surrender for compliance during the period 2015-2020.
3. Revenues generated from the sale of the 10 percent of allowances in auctions should be allocated to the natural gas LDCs for the benefit of the customers to fund customer energy efficiency (CEE) and other greenhouse gas reduction programs.
4. For simplicity, it is reasonable to adopt a split of allowances for each natural gas LDC based on deliveries to customers in some multi-year historical period (e.g. 2011-2013 for allocations in 2015). Because natural gas usage varies based on different temperature conditions for a subset of customers, using a three-year average will provide an averaging of the weather conditions.

This approach is somewhat similar to the treatment of electric LDCs, except that electric LDCs do not have a compliance obligation. Without an allocation of allowance value, in the ARB modeling of AB 32, the impact of the cap-and-trade and other complementary policies was higher on small natural gas consumers than on any other sector. The impact of carbon costs associated with cap and trade may expose small end users to greater price increases than small end users in the electricity sector since there are fewer mitigation options. The modeling also revealed that this price impact appears to have limited effectiveness for obtaining significant additional GHG reductions. (SEMPRA1)

Comment: DRA recommends free allocation of allowances to natural gas distribution utilities, beginning in 2015 when they are covered under the cap and trade program, analogous to how investor-owned utilities are treated in the electricity sector. Similar to electricity customers, it is important to protect natural gas customers from significant rate impacts. (DRA)

Comment: Small natural gas customers will not be placed under the cap until 2015. PG&E recommends ARB defer its decision on how to allocate allowances to the sector. PG&E has not yet determined whether the efficiency goal for small natural gas customers is achievable and is not aware that such a study has been completed. PG&E notes that energy efficiency is the primary if not exclusive means for reducing emissions in this sector. Achieving this level of emissions depends on the rate of economic growth in the State, the efficacy of State building and appliance standards, sufficient funding for energy efficiency from the CPUC, municipal utility boards and other sources, and the effectiveness of utility-sponsored programs. PG&E recommends this issue be carefully assessed and natural gas LDC allowance allocation be reviewed at a later date in light of this assessment. (PGE1)

> **Response:** We acknowledge the above comments regarding the allocation of allowances associated with distributed use of natural gas. As indicated in the Staff Report and Resolution 10-42, we are continuing to evaluate all proposals presented. We will initiate a public process to determine how, and if, allowances should be allocated for natural gas distribution utilities, prior to coverage of the sector beginning in 2015. We note the importance of transparent price signals for fuel consumers in achieving reductions in this sector.

Refineries / Oil and Gas

C-11. Comment: The currently proposed rule would create a 100 percent free allowance allocation factor for the oil extraction industry from 2012 to 2020. We recommend that CARB auction a greater portion of allowances for this sector. The cap and trade system will set national and international precedents that should be consistent with AB 32 and LCFS goals of reducing lifecycle GHG emissions. If free allocations are given for oil production, they should be based on the most efficient producer to provide an incentive to switch from energy intensive processes such as steam injection to carbon dioxide injection and other less GHG intensive oil production processes. The current proposal could set a precedent could also be applied in other regions to provide allocation subsidies to highly GHG intensity transportation fuels such as tar sands. (ICCT1, ICCT2)

> **Response:** We believe it is critical to allocate allowances to industrial entities at risk of emissions leakage. We analyzed the potential for emissions leakage by looking at emissions intensity and trade exposure. Further, we developed a methodology to assess a sector's emissions intensity and trade exposure and presented this in Appendix K of the Staff Report. We believe the crude petroleum and natural gas extraction sector is at a high risk of emissions leakage, therefore justifying the need for a high industry assistance factor. We believe this initial allocation for the crude petroleum and natural gas extraction

sector will provide an opportunity for this sector to invest in low-carbon technologies. We will continue to evaluate leakage risk moving forward per the direction in Board Resolution 10-42. It is also important to note that the sector will not receive 100 percent free allowances. The industry assistance factor is only one component of the determination of free allowances. The other factors are the cap decline factor (which will decline two to three percent each year) and the benchmark, which is set at 90 percent of the sector's California average emissions intensity.

Transportation Fuels

Support for 100 Percent Auction

C-12. (multiple comments)

Comment: We are pleased that all the allowances for both the electricity and transportation sectors will be auctioned either directly or through consignment, creating price signals to advance technologies that are less GHG intensive. (NC1)

Comment: We support fully auctioning allowances in the transportation sector. (LUDLOW, USC1, WALTERS)

Comment: We support auctioning 100 percent of permits for transportation fuels. (CANFIELD1, CIPAL, CPC1, CPC2, FORMLETTER01, FRIEDENBERG, HANSON, ICCT1, ICCT2, SONOMAFCC)

Comment: Unlike certain other industries, the public policy justification for free allowances is not present in the application to the fuels sector. Furthermore, with a three-year delay in application, these entities are allowed time to invest in energy-efficient technologies while their emissions are recorded and reported to CARB. (GREENLINING1)

Comment: We agree with CARB's proposal to auction allowances required for the carbon content of transportation fuels delivered to end-users when they are brought into the cap in 2015. (ICCT1, ICCT2)

Response: We will continue evaluating the treatment of transportation fuels in the cap-and-trade program, including the effects of allowance distribution to different sectors within the transportation sector, and propose any necessary changes to the regulation before the start of the second compliance period in 2015. We note the importance of transparent price signals for fuel consumers in achieving reductions in this sector.

Free Allocation

C-13. (multiple comments)
Comment: If transportation fuels are included in cap and trade, create a fixed-price allowance program for the sale of those fuels. The proposed regulations place the burden of compliance for consumer transportation emissions with the owner of the fuel at the fuel terminal (see section 95811(d)). CARB assumes that fuel providers can fully embed the cost of compliance in product price. Fuel providers should not be exposed to unnecessary financial risks for consumer emissions for which they have no direct control. CARB regulations appropriately place the point of regulation for transportation consumer emissions at the fuel terminal. In the event that fuel emissions remain under the cap, this provision will help facilitate cost pass-through, reducing the risk of refinery stranded costs and providing a more consistent carbon price signal for consumers. If it is determined necessary to include emissions from the consumer use of transportation fuels in the cap and trade system, the program should be designed to:

- Create a clear carbon price signal for consumers;
- Reduce obligated party exposure to allowance price volatility with respect to the consumer compliance obligation; and
- Help companies manage working capital requirements associated with the consumer emissions compliance obligation.

ConocoPhillips has considered various options for managing transportation fuel emissions in a cap and trade program. We believe the program elements of a fixed price allowance outlined below could address some of the identified concerns:

- The State would set aside the volume of allowances necessary to cover transportation consumer emissions from use of gasoline and diesel fuel.
- The State would establish a set price for those allowances based on some average of recent allowance market prices. That price would be adjusted periodically;
- Only obligated fuel providers could purchase the set-aside allowances at the established price noted above. (CONOCO)

Comment: Transportation fuels are proposed to be subject to the Cap and Trade beginning in 2015. The current proposal has no provisions for free allowances to cover transportation fuels and thus we expect an additional penalty in excess of $350 million, increasing each year, based on the floor price of carbon. The expenditures contemplated by this draft regulation are so significant that they cannot be absorbed by industry and remain viable. If industry cannot include the cost of doing business in the price the consumer pays for its product, industry will fail or choose another venue in which to conduct business. Valero recommends that ARB provide free allowances to cover transportation fuels. Over 90 percent of the allowance costs associated with this regulation will be to cover transportation fuels in 2015. This approach is not transparent to businesses or consumers. To facilitate a more efficient allocation of company resources, allowances should be freely distributed to cover the vast majority of fuels, reducing annually at 1 percent or less (1 percent is approximately an additional $3.6 million annually, based on the floor price). This change will bring the costs associated with the Cap and Trade regulation more in-line with the expected reductions and minimize the economic impact to businesses and consumers. (VALERO)

Comment: The issue of how transportation fuel emissions might be included in the State cap and trade program is critical to the ability of in-state refiners to continue to provide adequate, reliable and affordable supplies of fuel to California consumers. ARB should develop a process to work with the California refining industry to evaluate all aspects, impacts and policy interactions of the treatment of transportation fuels in the AB 32 program. WSPA recommends that fuels not be placed under the cap until: i) an additional study of the impacts and alternatives are completed; and ii) there are widespread cap and trade programs that include fuels throughout the US and the world. (WSPA1)

> **Response:** We will continue to evaluate the treatment of transportation fuels in the cap-and-trade program, including the effects of allowance distribution to different sectors within the transportation sector, and propose any necessary changes to the regulation before the start of the second compliance period in 2015. We note the importance of transparent price signals for fuel consumers in achieving reductions in this sector.

Universities

C-14. (multiple comments)
Comment: The University believes that there is no supportable basis for allocating free allowances to industrial facilities, such as heavy manufacturing, while not also allocating free allowances to the University and other public entities which operate sources covered by the regulations. The draft cap and trade rule provides two distinct rationales for allocating allowances to industrial sector facilities: transition assistance, and leakage prevention. CARB intends to provide transition assistance to industrial facilities to prevent "sudden or undue short-term economic impacts" during the cap and trade program's initial compliance periods. The University agrees with CARB's rationale for transition assistance, but is concerned that under the proposed regulation, transition assistance will not be extended to public agencies that are regulated within the industrial sector. These public agencies, including University of California campuses and medical centers, and California State University campuses, are no less subject to severe financial impacts during initial compliance periods than are other facilities that are regulated in the industrial sector. The University therefore advocates making the following additions in the high leakage risk category of Table 8-1, "Industry Assistance": Colleges and universities (NAICS 611310), and Hospitals (NAICS 622110). These institutions should receive an allocation of allowances for transition assistance according to the Thermal Energy Based Allocation Methodology described in section 95891, "Allocation for Industry Assistance," subsection C. (UC1)

Comment: The cost to comply with the program by purchasing allowances would of course come out of general funds and would have to either come out of tuition and fees or state funding, which is unlikely given the dire strait of budget situation. So we ask for transition assistance. (UC2)

> **Response:** We disagree that the universities require free allocation. The universities are not facing a leakage risk. However, we are committed to continuing to evaluate whether the costs imposed on public entities are preventing greenhouse gas reduction opportunities from being realized due to capital constraints. One possible option under consideration is to recommend to the Legislature that auction proceeds be provided for transition assistance.

Other

C-15. Comment: Transition assistance is needed for public agencies regulated within the industrial sector. The Cap and Trade regulation provides two rationales for allocating allowances to industrial sector facilities: transition assistance and leakage prevention. According to the Initial Statement of Reasons, CARB intends to provide transition assistance to industrial facilities to prevent "sudden or undue short-term economic impacts" during the Cap and Trade Program's initial compliance periods. The District agrees with CARB's rationale for transition assistance, but is concerned that under the proposed regulation Order, transition assistance will not be extended to public agencies regulated under the industrial sector. Public agencies, including the District, are no less subject to severe financial impacts during the initial compliance periods than are other facilities regulated in the industrial sector.

Therefore, we feel that public agencies that fall within the industrial sector should be eligible for industry assistance, in the form of free allowances, and be included in Table 8-1: Industry Assistance, page A-76 of the proposed regulations. Alternatively, another approach that would be workable for public agencies is for CARB to provide public agencies, regulated in the industrial sector, the opportunity to achieve AB 32 compliance by purchasing GHG offsets to cover only those emissions over the industrial cap level. This incremental approach would be less shocking to public agency operating budgets. (CCCSD)

> **Response:** The regulation was modified to clarify that Table 8-1 applies to activities rather than to NAICS codes. Public agencies that undertake any of the activities identified in Table 8-1 are eligible for free allocation.

C-16. Comment: Simply assign the distribution utilities, at least the investor-owned ones, Auction Revenue Rights (ARRs) than go through the ritual of formally allocating the allowances to the utilities, then having them formally consign them back for auction. Similarly, we believe it would be better to assign ARRs to trade-exposed businesses, rather than actually give them allowances. (MSCG2)

> **Response:** We do not agree that Auction Revenue Rights are preferable to the consignment auction requirement for Investor Owned Utilities (IOUs) as

proposed. We believe the current framework highlights total allowance value given to the utilities and the need to use this value for the benefit of ratepayers in a way that is consistent with the goals of AB 32. As described in Appendix J of the Staff Report, distribution of utility proceeds from the sale of allowances at auction will be subject to limitations imposed by either the California Public Utilities Commission (CPUC) or by the governing bodies of publicly owned utilities (POUs). Additionally, the revenue stream generated from the sale of allowances at auction or through free allocation and use for compliance will be accounted for along with all other revenues and costs in the ratemaking actions of the CPUC and the governing bodies of the POUs. While allocation of ARRs to trade-exposed businesses might increase transparency about the amount of value embodied in leakage minimization and prevention of transition risk, ARRs would add administrative burden and would subject the recipient businesses to allowance price risk when compared to free allocation. We declined to take this approach, and instead relied on direct allocation to trade-exposed businesses for leakage prevention and transition assistance.

Free Allocation Methodology

Miscellaneous

C-17. Comment: The Kaswan PDR comments are incorporated here by reference. Of the seven options included in the original memo, I would suggest focusing on the following four options (options that could be used individually or in combination): (3) Create incentives for greater reductions in heavily-polluted areas (through differentiated allowance allocation, fees, higher allowance prices, or enhanced allowance retirement requirements. (USFLAW)

Response: We disagree with the recommendation to have different rules for facilities in different types of communities. Our analysis of the potential for localized air quality impacts indicates that there is very little chance of increased co-pollutant emissions in communities. We will monitor the implementation of the cap-and-trade regulation through an adaptive management process to identify and address any unanticipated impacts, especially localized impacts on communities, and will develop and implement appropriate responses to rectify them, including considerations of the approaches the commenter suggested here, in a public process. We agree that proceeds from the direct auction of allowances provide an opportunity for the most impacted and disadvantaged communities in California. Board Resolution 10-42 directs the Executive Officer to deposit a minimum of 10 percent of annual proceeds generated from the direct auction of allowances in the Air Pollution Control Fund for appropriation by the Legislature to programs and projects that reduce greenhouse gas emissions or mitigate direct health impacts of climate change and promote green collar employment opportunities in the most impacted and disadvantaged communities in California.

Adjustment upon Linkage

C-18. Comment: Table 6-1 in section 95841 (p. A-60) sets out California GHG Allowances Budgets for each year of the cap and trade program. The ISOR states: "Each time California links to a WCI partner jurisdiction from which California imports electricity, staff will need to reevaluate these annual budgets." This important statement should be reflected in the regulation itself, either in section 95841 or in subarticle 12 on linkage to external greenhouse gas emissions trading systems. If the amounts of freely allocated allowances may also change due to linking, this should also be mentioned in the regulation. (SCPPA1)

> **Response:** We do not agree with the commenter's proposal to include the statement, "Each time California links to a WCI partner jurisdiction from which California imports electricity, staff will need to reevaluate these annual budgets," in section 95841 or subarticle 12 of the cap-and-trade regulation. A linkage to a partner jurisdiction would require a separate regulatory action. We cannot currently anticipate all potential regulatory text changes that would be required under such a rulemaking. The impact on annual budgets is an example of a potential regulatory change that would be evaluated during such a rulemaking.

Recovery of Allowances – Lien Mechanism

C-19. Comment: CCAP recommends the cap and trade regulation include a lien mechanism, at least with respect to any allowances distributed through free allocation, to allow ARB to recover outstanding allowances to protect the integrity of the cap and trade program. (CCAP1)

> **Response:** We disagree with the commenter's suggestion. We do not believe a lien mechanism should be included in the cap-and-trade regulation in order to recover outstanding allowances. We believe the commenter's concern is addressed by the allowance allocation approach we have developed. Specifically, the updating nature of industrial allocations under the product-based allocation approach should address concerns about over-allocation of allowances to individual industrial facilities.

New Entrants

C-20. Comment: CLFP recommends that new processes and plant expansions added to existing facilities should be regarded as new entrants into the program and provided free allocations. (CALFP1)

> **Response:** Our preferred approach to treatment of expansion at incumbent facilities is to address this issue using updating product-based allowance allocation.

Shutdown of Facilities

C-21. (multiple comments)
Comment: Provide for the ability to use allowances and credits that result from shutdowns or curtailments. The regulation and supporting documents indicate that facilities may not retain nor gain allowances if they cease operations. This could be a logical provision. Depriving sources of the ability to gain revenue from the shutdown of emitting units will encourage older and inefficient emitting units to stay on line. Knowing that it will forfeit its allowances and credits, a source operator will be inclined to keep the source operating as long as feasible. This will have the dual effect of discouraging equipment replacement, thereby keeping inefficient sources online; and keeping credits from the market, thereby reducing supply. (CANOTRCO2E)

Comment: The proposed rule denies an allocation of allowances to facilities or businesses that shut down operations. For example, if there is a source that is relatively inefficient in using fossil fuels, it is incentivized to continue operating in order to maintain its allocation of allowances. It would either sell or use the allowances, depending on its own usage profile. An optimal profile might be to continue operating at a low level in order to obtain allowances that can be sold at a higher profit than would occur as a result of operation. (HOR)

> **Response:** We do not agree that the regulation promotes the use of inefficient units. Our industrial allocation approach is based on emissions efficiency benchmarks. Product-based benchmarking is based on emissions intensity per unit product. An inefficient unit relative to these benchmarks will be disadvantaged relative to a more efficient unit. The number of allowances received is proportional to the amount of product produced, so a facility that operates at a low level will not obtain the same level as it would at a higher level of operation.

Ability to Appeal Allocation

C-22. Comment: The regulations (Subarticle 9: Direct Allocations of California GHG Allowances) are silent on whether the allocation is appealable. (CAPCOA1, CAPCOA2)

> **Response:** The regulation does not provide for an appeal process because we do not believe there is a need for an allocation appeal process.

Order of Allocation

C-23. Comment: Section 95870 of the proposed regulation prioritizes allowance allocation in the following order: 1) Allowance Price Containment Reserve; 2) Advance Auction; 3) Allocation to Public Utilities; and 4) Allocation to Industrial Covered Entities. According to section 95870(d)(3), the total number of allowances allocated to industrial covered entities can be reduced in order to ensure that there are sufficient allowances available for the electric distribution utilities. If there are not enough allowances, then what remains will be prorated equally across all eligible covered entities. AB 32, however, requires ARB to design measures to minimize leakage to the extent feasible. Consequently, it seems unfair to favor assistance to the public utilities over industrial covered entities. A more equitable approach would be to prorate the remaining allowances between the electric distribution utilities and the industrial entities. (CACC)

Response: Our justification for allocation to electrical distribution utilities is fundamentally different from the reasons for allocation to industrial sectors. The industrial allocation approach is designed to provide transition assistance and minimize emissions leakage. The electrical utility allocation is designed to protect electricity customers and reward these customers for utility investment in renewable energy and energy efficiency. Any allowance allocated to electrical distribution utilities must be used exclusively for the benefit of retail ratepayers of each electrical distribution utility, consistent with the goals of AB 32, and may not be used for the benefit of entities or persons other than ratepayers. Industrial allocation is not subject to the same limitations. We prioritized allocation to electrical utilities because of the differences between these two allocation categories.

Pro-Rata

C-24. (multiple comments)
Comment: Section 95870(d)(3) provides that if the amount allocated to industry exceeds the amount of allowances available, then the number of allowances available will be prorated equally across "all eligible covered entities." SCE seeks clarification as to whether the pro rata cuts to allocation apply to just the industrial sector, or to all parties receiving a direct allowance allocation. (SCE1)

Comment: Under the heading "Allocation to Industrial Covered Entities," section 95870(d)(3) (p. A-75) provides for pro-rating of allowances allocated for the purposes of industrial assistance. However, there is a reference to pro-rating allowances across "all eligible covered entities." This is a broad term that could be construed to include entities in other sectors such as electrical distribution utilities. To avoid confusion, the term "all eligible covered entities" should be replaced with "all eligible industrial covered entities." (SCPPA1)

Response: We agreed and modified the previous section 95870(d)(3), now section 95870(e)(3), to read "all eligible industrial covered entities."

Opt-In Entities

C-25. Comment: Section 95813(d) (p. A-43) allows opt-in entities to receive freely allocated allowances subject to subarticles 8 and 9. This is too broad. Given that opt-in entities are highly unlikely to be electrical distribution utilities, the cross-references should be more specific and should refer to the allowance allocation provisions applying to industrial entities. Modify this section as follows:

An opt-in covered entity may be eligible to receive freely allocated allowances subject to subarticles 8 and 9 under sections 95870(d), 95890(a), and 95891. (SCPPA1)

Comment: The Utilities appreciate CARB's desire to encourage reductions in emissions from entities without compliance obligations and understand that opt-in covered entities are intended to come only from the Industrial Sector. The Utilities request further clarification of this intent. If such clarification is not provided and the opt-in provision is too broadly interpreted, opt-in covered entities from the electric sector could skew the allowance allocation for electric distribution utilities with a mandated compliance obligation, which would obviate the cost effectiveness of the cap-and-trade program. No entity would be excluded from participating in the cap-and-trade program through the changes recommend by the Utilities above because non-obligated entities that desire to participate in the emission reduction goals can participate as VAEs. Modify section 95813(a) and (d) as follows:

(a) An entity that meets the requirements of section 95811(a), but does not exceed the inclusion thresholds set forth in section 95812 (b)(1) may elect to voluntarily opt-in to the cap-and-trade program.

(d) An opt-in covered entity may be eligible to receive freely allocated allowances subject to ~~subarticles 8 and 9~~ 95891. (MID1)

> **Response:** We do not agree that section 95813(d) is too broad or that it should be modified. To become an opt-in covered entity pursuant to section 95813 the entity must meet the requirements of 95811, which defines covered entities. This section does not include electrical distribution utilities (although some electrical distribution utilities may also be covered entities because they are a first deliverer of electricity). Table 9-3 specifies which entities are eligible to receive free allowances allocated to the electricity sector in section 95870(d).

Greater Detail Required

C-26. (multiple comments)
Comment: It is noteworthy that CARB staff has failed to determine levels for allocation that we urgently need to know, yet CARB staff is willing to commit immediately to impose a massively burdensome new charge on manufacturers for unspecified and unjustified purposes in the future. In fact, by indicating now that costs will be significantly higher in future compliance periods due to the proposed auction, CARB could cause immediate economic harm and leakage as entities start preparing to reduce their California footprint to minimize costs.

While the proposed budget cap for the first year is intended to provide the California economy most of the allowances it needs to operate as usual, there will be winners and losers within each industry sector. For entities operating facilities less efficient than the benchmark, there will be immediate new obligations to purchase allowances to make up the difference between their free allowances and what is needed to operate. At this time they do not know how many allowances they will receive for free, and they don't know when they will get this crucial information. This uncertainty will exacerbate an already difficult economy and will discourage manufacturing investment and new hiring.

Because total allowances in the system is capped, a too generous allocation for one sector will operate to the detriment of others, both within and without each sector. Unless we understand all the benchmarks and allocation determinations soon, the public will not have a meaningful opportunity to comment on the total impact of all allocation decisions prior to the market opening in 2012.

For this reason, we recommend that CARB resolve to require staff to provide the Board and the public a report on the progress toward establishing benchmarks by April 30, for review by the CARB Board at the May meeting, with a target to have final determination on benchmark methodologies, procedures needed and documentation requirements no later than June 30, 2011. (CMTA1, CMTA2)

Comment: CARB has not provided adequate justification for the proposed allocation scheme. Regardless of the framework used however, EDF encourages CARB to explain their allocation assistance scheme reasoning more completely. (EDF1)

Comment: ARB has not proposed a plan of allocation for the allowances. For example, it has not stated whether allowances will be allocated on the basis of past emissions, or how the emissions baseline might be calculated. Each regulated entity has some idea of how the cap relates to overall demand, and how it might affect that entity's operations and costs. But without understanding the allocation plan, the actual impacts and costs cannot be assessed or anticipated. It is not possible to comment on the proposal because there is no proposed allocation plan, which is the heart of the proposed rule. The proposal is incomplete in fundamental ways. (HOR)

Comment: The regulation proposes that most allowances be freely allocated at least at the program's onset, primarily to assist the most leakage prone industries. Yet, the regulation lacks critical details for the allowance allocation of various industry sectors in future compliance periods. There remains uncertainty as to how allowances will be allocated to these sectors. CalChamber encourages CARB to make this critical design detail available as soon as possible so that compliance entities have certainty and can make decisions moving forward. (CALCHAMBER1)

Comment: As of today, the companies don't have their benchmarks. That's a big concern. They'd like to be able to come back if you have that within the 15 days and be able to comment again. (INDENVASSOC)

> **Response:** We have finalized the allowance allocation system as directed by Board Resolution 10-42, including benchmarks for allocation to industrial sectors. Please see Appendix B to the first 15-day change to the regulation for an explanation of the development of product benchmarks for allowance allocation,

and Table 9-1 in Section 95891 of the regulation for the updated product-based emission efficiency benchmarks.

Third-Party Reductions / Disadvantaged Communities

C-27. Comment: Carve out allowances from the cap to credit verified third-party reductions achieved in disadvantaged communities. While the AB 32 Scoping Plan notes the important roles to be played by all communities of California, the current proposal has only weak links between the cap-and-trade program and the communities that are currently at risk from a variety of environmental health risks, and that also face the greatest risks of climate change. These same communities are poised to be a part of the solution, and that solution may include a variety of measures including household and commercial building energy efficiency investments, regional transportation and land use planning, agricultural conservation strategies, and urban forestry. Some system for incentivizing reductions from third party community benefits organizations, land managers and municipalities should to be built into the program to leverage the important opportunity to engage and reward investments that benefit California's disadvantaged communities.

EDF continues to support the idea of setting aside allowances to credit actions by third parties that demonstrate verified emissions reductions. CARB need only embrace protocol development for community-based, within-capped-sector reductions achieved by third parties, and set aside allowances to credit such reductions once they are verified. Because these credits would be given for emissions reductions that are achieved in capped sectors, we emphasize that such a program must be funded by allowances taken from under the cap, rather than using allowances that are "on top of" the cap. (EDF1)

Response: While we encourage such GHG-reducing measures as those listed above, we did not directly allocate allowances to incentivize these actions. We believe the cap-and-trade program will encourage these actions through either price signals due to coverage of the capped sectors or through our compliance offsets program. Additional AB 32-related programs such as SB 375 and existing energy-efficiency programs will also help motivate these actions. Auction proceeds could potentially be an appropriate source of funding for some of these activities.

We agree that proceeds from the direct auction of allowances provide an opportunity for the most impacted and disadvantaged communities in California. Board Resolution 10-42 directs the Executive Officer to deposit a minimum of 10 percent of annual proceeds generated from the direct auction of allowances in the Air Pollution Control Fund for appropriation by the Legislature to programs and projects that reduce greenhouse gas emissions or mitigate direct health impacts of climate change and promote green collar employment opportunities in the most impacted and disadvantaged communities in California.

Disadvantaged Communities

C-28. (multiple comments)
Comment: We urge CARB to include provisions in the regulation to set aside a minimum four percent of allowances from the industrial and electricity sector from the outset of the program to be made available through auction and dedicate the revenue to the Community Benefits Fund. Funds should be used for programs or projects in the most impacted and disadvantaged communities identified by CARB to air pollution and climate change mitigation measures (i.e., home energy efficiency investments, pollution control measures, smart growth land use planning), community public health programs (i.e. mitigating health impacts of climate change, community health improvement, public health preparedness), and to promote green collar employment opportunities in these communities (i.e. investment in worker transition programs). We recognize that the Legislature must direct the specific uses of funds collected under the cap and trade program, but we believe that CARB must establish the important precedent of setting aside funds for protection of the most vulnerable communities. (KUSTIN11, KUSTIN12)

Comment: CCAP joins other organizations here in urging that specific language be included in the rule's reference the work of the Economic Allocation Advisory Committee and specific recommended uses for allowance value, including investments in infrastructure to support smart growth as well as adaptation work to ensure health urban communities and protection of our natural resources. (CCAP2)

Comment: Include provisions in the regulation to initiate a Community Benefits Fund (CBF) from the outset of the Cap and Trade Program. Set aside a minimum 4 percent of allowances from the industrial and electricity sector from the outset of the program to be made available through auction and dedicate the revenue to the Community Benefits Fund. Funds should be used for programs or projects in the most impacted and disadvantaged communities identified by CARB to:

- Air pollution and climate change mitigation measures. (i.e., home energy efficiency investments, pollution control measures, smart growth land use planning)
- Community public health programs (i.e. mitigating health impacts of climate change, community health improvement, public health preparedness)
- Promote green collar employment opportunities in these communities. (i.e. investment in worker transition programs) (KUSTIN02, SIERRACLUBCA4)

Comment: We urge CARB to carve out allowances from the outset of the program to be used for a Community Benefits Fund (CBF). Inclusion of a community investment program has been broadly supported by community-based, environmental justice, health, and environmental organizations throughout the development of the Cap and Trade program. AB 32 requires CARB to “direct public and private investment toward the most disadvantaged communities in California.” While the CBF is noted in the staff report as a possible use of allowance value, there is not a specific recommendation to create and operate a fund by a certain date. We urge CARB to include provisions in the regulation to set aside a minimum of 4 percent of allowances from the industrial and

electricity sector from the outset of the program, and from the transportation and natural gas sectors when they are included in the program in 2015, and dedicate the revenue to the CBF. We recognize that the Legislature has ultimate authority over the use of funds collected under the program, but we believe that CARB should include a carve out in the regulations for the creation of a CBF, and a recommendation to the legislature that these funds be used to protect and benefit our most vulnerable communities.
CARB should recommend that funds be used for programs or projects in the most impacted and disadvantaged communities CARB has identified to:

- Reduce GHG emissions (i.e., home energy efficiency investments).
- Mitigate public health impacts of air pollution and climate change (i.e., pollution reduction strategies, public health programs).
- Promote green collar employment opportunities within these communities (i.e., investment in worker transition programs). (KUSTIN10, EBERHARD)

Comment: ARB should clearly define how the Community Benefits Fund would be used. We recommend that ARB set aside at least four percent of allowances from industrial and electricity sectors for use by the most impacted and disadvantaged communities for public health protections. We note that AB 1405 (deLeon) called for setting aside 10 percent of allowances. Community benefit funds should target programs and projects for air pollution and climate change mitigation measures, community public health programs, and local green collar employment opportunities. (CATHCHAR1, CIPAL)

> **Response:** Per Board Resolution 10-42, ARB will deposit a minimum of 10 percent of annual proceeds generated from the direct auction of allowances in the Air Pollution Control fund for appropriation by the Legislature for programs and projects that reduce GHG emissions or mitigate direct health impacts of climate change, and promote green collar employment opportunities in the most impacted and disadvantaged communities in California. Although we cannot mandate how these funds will be spent, we believe this demonstrates the Board's support for achieving the goals outlined in the comments above. Per Board direction, we are developing recommendations to the Legislature and the Governor on the use of these funds.

EU ETS

C-29. Comment: The world's largest cap and trade scheme is the European Union Emissions Trading Scheme (EU ETS). In the first phase of the scheme, from 2005-2008, however, far too many emissions permits were handed out to these industries—largely as a result of intensive corporate lobbying—a practice that will almost certainly take place in California too.

The fundamental problem of "overallocation" and avoiding necessary domestic action remains too. The EU's figures for 2008 show an overall reduction in emissions of around 50 million tonnes, but these figures were inflated by over 80 million tonnes of credits from carbon offsets, mainly from the Clean Development Mechanism (CDM) which gives credits for “emissions-saving projects” in developing countries (for more on the problems with this see below). In other words, more than the entire claimed “reduction’” was generated by projects outside of Europe.

With a further surplus of permits, another price collapse in the EU ETS followed. Allocations for the second phase of the scheme were made on the assumption that European economies would keep growing. The recession has reduced output and power consumption, leaving companies with a surplus of permits. This is already storing up problems for the third phase of the EU ETS too. The main reason why the price of EUA permits in phase 2 has not collapsed to zero is that it is now possible to “bank” them—in other words, to hold onto them for use in the third phase of the scheme, which will run from 2013 to 2020.

Surplus allowances will dog carbon market. The World Bank estimates a surplus of 970 Mt CO_2e (million tonnes) by the end of phase 2. This would account for almost 40 per cent of the “reduction” that the EU claims will be required of power companies and industries covered by the ETS in phase 3 of the scheme. This figure might yet be higher if companies decide to purchase a significant number of offset credits and “bank” these too. The net result of this could be that the EU ETS will require very few domestic emissions reductions before 2020, and quite possibly none at all. (CTW)

> **Response:** We do not agree that California’s cap-and-trade program will over-allocate allowances. We studied the strengths and weaknesses of all existing cap-and-trade programs, including the EU-ETS and learned from these systems in developing our program to avoid over- or under-allocating allowances. We determined that a soft start, under the current economic conditions, dictates greater reliance on free allocation of allowances in the early years of the program. We view this free allocation as critical to avoid, adding an immediate cost to covered industries that could inhibit their ability to invest in emissions reductions. Unlike the first phase of the EU ETS, the free allocation proposed in California relies on ambitious emissions intensity benchmarks developed using reported actual emissions, minimizing the potential for over-allocation. As the program progresses, we propose a transition to a heavier reliance on auctions for allowance distribution while still minimizing leakage where risk exists.
>
> The commenter notes that allocations for the second phase of the EU ETS were made on the assumption that European economies would keep growing, leading to a surplus of permits because of the recession. In this regulation, free allocations will be based on future actual reported production data, not assumptions. The allocations will be “trued-up” so production data years match the emission data years. This mechanism will prevent over-allocation of allowances due to overestimates of economic growth.
>
> The commenter further notes that reductions in the EU ETS were “inflated” by credits from CDM offset projects. ARB recognizes that some CDM credits created during this period may have been non-additional. ARB does not

currently plan to accept CDM credits until these issues in that system are resolved. Furthermore, all future offset protocols will need to be approved by the Board after a public process. In this regulation, offsets must be generated in accordance with strict protocols adopted by the Board and are limited to eight percent of each entity's compliance obligation.

In addition, we are committed to monitor the implementation of our program and make adjustments as necessary.

Allocation Based on Production Only

C-30. Comment: CARB staff proposes free allocation of allowances for all industrial sectors for the first compliance period, but not for the second and third periods. We recommend the free allowance distribution up to the output-based benchmark for each sector in all compliance periods up to 2020. (CMTA1)

Response: We do not agree. We are allocating free allowances to industrial sectors for as long as their leakage risks remain for the second and third compliance periods. See also responses to Comments C-2 or C-31.

Auction Preferred, Avoids Over-Allocation

C-31. Comment: Under an auction system, the market (rather than the state) chooses the winners. Those who can adjust their operations in a fashion that results in fewer emissions and those who elect to purchase allowances determine which solutions advance. This is preferable to the situation where a team of well-meaning government officials have a windfall of monies to spend on solutions that are unfunded by the market. There are a number of instances where the European experience of 'windfall profits' in the EU Emissions Trading Scheme (EU ETS), illustrates why free-allocation should be avoided. In Europe, there was a small amount of over-allocation to particular industrial sectors in a small number of Member States. This was because some individual Member States were using the EU ETS as a way of providing indirect subsidies to local industry, to better enable them to compete with industry in other Member States. The European Commission caught most of these and slashed their allocations, but some slipped through. Windfall profits from over-allocation were not material however. The material windfall profits were made in the electricity industry, the industrial sector which was universally under-allocated across Europe. On average, European electricity generators received free allocations amounting to around 85 percent of their needs and had to buy the remaining 15 percent on the market. Consequently, they raised all of their electricity prices by 100 percent of the marginal purchase cost of the allowances acquired. They used emissions trading as an excuse to increase prices by more than costs, and thus secure windfall profits. This occurrence is the clearest demonstration that competition in the European electricity sector is not as fierce as the generators would have you believe. Thus, windfall profits in the electricity sector are an issue for electricity regulation, not emissions trading. It is important to note that the ability to increase prices by more than costs is a function of regulation and competition, and independent of whether allowances are auctioned or allocated. (CANTORCO2E)

> **Response:** We agree that auction is the fairest and most transparent means of distributing allowances. The cap-and-trade regulation is designed to gradually transition from mostly free allowance distribution to a system in which most allowances are auctioned. This transition provides regulated sources time to get used to the market and the need to procure allowances. This approach gradually introduces a carbon price on goods that consumers purchase while simultaneously ensuring that emission reductions occur. We recognize that the long-term success of the program will require significant investment in emissions reductions. However, under current economic conditions, an early emphasis on auction could hamper the ability of California sources to invest in low-carbon technologies. Further, freely allocating allowances in the early years of the program will help prevent leakage. Allocating the allowances for free using emissions-efficiency benchmarks will reward companies that have already made investments in energy-efficiency and carbon reductions, and will not penalize those that produce goods in California. The overall allocation approach includes: creation of an Allowance Price Containment Reserve for cost-containment purposes, a Voluntary Renewable Electricity reserve, free allocation to the industrial sector for transition assistance and leakage prevention, free allocation to electrical distribution utilities on behalf of ratepayers, and auction of the remaining allowances.

Oppose Free Allocation

Maximize Auctioning, Minimize Allocation

C-32. Comment: We recommend the maximum use of auctioning as the method of allocating allowances, subject to a short initial period of adjustment. (UCS3)

> **Response:** We agree that auction is the fairest and most transparent means of distributing allowances. We recognize that the long-term success of the program will require significant investment in emissions reductions. However, under current economic conditions, an early emphasis on auction could hamper the ability of California sources to invest in low-carbon technologies. Further, freely allocating allowances in the early years of the program will help prevent leakage. Allocating the allowances for free using emissions-efficiency benchmarks will reward companies that have already made investments in energy efficiency and carbon reductions, and will not penalize those that produce goods in California.

Higher than Needed for Leakage

C-33. (multiple comments)
Comment: The Advanced Technology Development report notes that subsidizing GHG intensive products through GHG allowance allocations can create a barrier to this

transition (see page 1-10). The Economic and Allocations Advisory Committee found that the need for free allowances to address leakage is small.

We believe that the proposed regulation relies too heavily on giving producers such as refineries and oil productions free allowances based on the amount of petroleum they produce or refine (i.e., the higher the level of production, the higher the level of subsidy) as discussed further below. We recommend focusing more on assistance to both producers and end-users who take action to help meet California's ambitious GHG goals and provide associated environmental and economic benefits. We believe that cleaner and more efficient vehicles, fuels, and transportation systems are important examples of these opportunities. (ICCT1)

Comment: While I agree with many of the steps outlined in the AB 32 Scoping Plan, I am concerned by the over-allowance of free pollution credits to the industrial sector in the Cap and Trade design. I urge you to revisit, revise, and phase out free allocation to the industrial sector. The proposed level of free allocation to the industrial sector is likely much higher than is needed to combat leakage. (TAYLORE)

Comment: We urge ARB to heed the advice of EAAC, who recommended that ARB rely on auctioning as the method for distributing allowances. While we appreciate the worry that auctioning might encourage industries to leave the state, we note that ETAAC recommended that allowances be limited to no more than 15 percent. According to ETAAC, this would more than adequately compensate energy intensive industries for potential leakage. (CATHCHAR1)

Comment: I urge you to revisit, revise, and phase out free allocation to the industrial sector. The proposed level of free allocation to the industrial sector is likely higher than is needed to combat leakage. Several research studies have found that the "leakage" claims of the industrial sector are exaggerated and subsidizing these industries through free allowances creates barriers to transitioning to a cleaner economy. CARB should build in an explicit adaptive management process to adjust the free allocation to the industrial sector based on specified evaluation metrics. Please take advantage of the favorable public climate that California currently enjoys around addressing climate change and implementing AB 32 by taking much-needed bold actions and removing the massive allowance giveaways outlined in the current rules. (MOYNAHAN, CLCV)

Comment: The proposed level of free allocation to the industrial sector is likely much higher than is needed to combat leakage and should be revisited and revised.
All stakeholders agree that we must prevent leakage of industrial jobs out of California. However, excessive allocation beyond what is needed to avoid leakage is akin to subsidizing GHG-intensive products and services, a consequence counter to our need to transition to cleaner and efficient alternatives. The proposed allowance allocation in the industrial sector will concentrate resources primarily among large oil, cement, and chemical companies instead of providing transition assistance to a broad range of small and large businesses.

We believe that CARB has been overly generous in giving more allowances than are actually needed to prevent leakage. The proposed free allocation to the industrial sector is worth billions of dollars. Any portion of that amount that is not necessary to maintain competitiveness and prevent leakage will be pocketed by the industry while the price of carbon is passed on to their customers, resulting in a windfall profit to the industry. CARB must strive to ensure that any free allocation is absolutely necessary to maintain competitiveness, prevent leakage, and does not result in any windfall profit.

Although there is little information available specifically on the competitiveness concerns of California industries, there is research to suggest that a much smaller portion of allowances would sufficiently protect against leakage. For example, a newly available report from UCLA Professor Matthew Kahn and Erin Mansur of Dartmouth College, *How Do Energy Prices, and Labor and Environmental Regulations Affect Local Manufacturing Employment Dynamics?*, finds that leakage claims of industrial sector firms are overblown: “Energy prices are only a significant determinant of locational choice for a handful of manufacturing industries such as primary metals” (p. 24). Empirical evidence from the EU ETS also suggests that leakage will not be a significant problem large enough to warrant long-term giveaways that eventually act more as crutches than investments. ETAAC also recognized that subsidizing GHG-intensive processes and products through free allowance allocation creates barriers to transitioning to a cleaner, more efficient economy. (KUSTIN10, EBERHARD)

Comment: 100 percent free allocation to first tier industrial emitters is excessive. Another option would be to tax the resulting windfall profits so that a portion of that allowance value is recaptured and can be used for public purposes. Industry-specific benchmarks encourage manufacturers using current technologies to add some moderate efficiencies to their processes, but may disadvantage out-of-the-box innovators that produce carbon negative cement products (for example, Calera, Inc.) and shield current technologies which would otherwise become less economical due to the carbon price. We urge CARB to reduce the free allocations to the minimum amount suggested by the EAAC. (CPC1)

Comment: Commit to maximize the use of auctioning as a method of allocating allowances. The value of allowances CARB proposes to freely distribute to the industrial sector amounts to billions of dollars and will far exceed the amount needed to address potential emissions leakage from trade-exposed industries. The economic “dream team” that was assembled to advise CARB on cap and trade design, the Economic and Allocation Advisory Committee, stated in its report that “relatively little allowance value would be needed under this mechanism to address leakage.” Many economic research reports from the US and Europe suggest that leakage risks can be accounted for through less than 20 percent free allocation. For example, Resources for the Future calculates that “only about 15-20 percent of allowances are needed to compensate energy-intensive industries, for their loss of producer surplus, so the huge bulk of allowances could still be auctioned.” Stanford’s Professor Larry Goulder and colleagues find that “under a wide range of cap and trade designs, freely allocating less than 15 percent of the total allowances prevents profit losses to these most vulnerable industries. Allocating 100 percent of the allowances substantially overcompensates these industries, in many cases causing more than a doubling of profits." UCLA Professor Matthew Kahn and Erin Mansur from Dartmouth College find that "energy prices are only a significant determinant of locational choice for a handful of manufacturing industries such as primary metals." This provides further evidence that 100 percent free allocation is excessive. (UCS1, WALTERS, LUDLOW)

Comment: We urge ARB to pay close attention to the recommendations of its own Economic and Allocation Advisory Committee (EAAC). The EAAC recommended that ARB rely on auctioning as the method for distributing allowances, and was against supporting industry profits with allowance value, except when it is a byproduct of efforts to prevent potential leakage. Both EAAC and the Economic and Technology Advancement Advisory Committee of the Air Resources Board found that 10 to 15 percent of allowances would more than adequately compensate energy intensive industries for potential leakage. (CIPAL)

Comment: While we understand that the industrial sector has some uncertainty with respect to trade exposure and potential leakage, we believe that the current regulatory proposal to freely allocate the majority of allowances to the industrial sector through 2020 without a clear process for potentially increasing the auction of allowances could result in an excessive amount of free allowances needed to address leakage and delay progress toward more efficient technologies. (NC1)

Comment: TNC recommends language that would facilitate greater auction of allowances for the industrial sector over time. We believe that the current regulatory proposal to freely allocate the majority of allowances to the industrial sector through 2020 without a clear process for potentially increasing the auction of allowances could result in an excessive amount of free allowances needed to address leakage and delay progress toward more efficient technologies.

As advised by the Economic and Allocation Advisory Committee (EAAC), the industrial sector should need very little allowance value to address leakage issues. We, therefore, urge CARB to amend its regulations to create benchmarks and a process to facilitate a greater amount of auctioned allowances in the industrial sector over time to ensure that this sector has the proper incentives to transition to more efficient technologies and reduce GHG emissions by 2020. (NC2)

Comment: We recognize the need to address leakage risk for trade-exposed industries and strongly support transitional assistance in the form of some percentage of allocations being distributed for free. The goal is to assist and to provide compensation to bring California production facilities to cost parity with competing facilities in non-capped areas. This can be accomplished with a relatively small percentage of the total allowance value. One hundred percent seems excessive and risks overcompensation. We urge staff to evaluate and reassess the impact of free allocation. (UCS4)

Comment: The proposed level of allocation to the industrial sector is much higher than is needed to combat leakage. Your own Economic and Allocations Advisory Committee found that the need for free allowances to address leakage is small. The biggest recipients of these free allowances in the staff proposal are the oil extraction and refining industries, which actually have a low susceptibility to leakage. We ask you to re-classify petroleum extraction and refining as low leakage risks, and to reduce their free allocations accordingly. (SIERRACLUBCA4)

Comment: We are concerned that the assistance factors in the proposed regulation are overly generous and will devote allowance value to industry profits at the expense of consumer welfare. Studies at the U.S. and EU level indicate that only about 10-20 percent of free allowances are needed to prevent leakage. While California-specific data is required to determine the competitiveness concerns of the program, CARB should ratchet down free allowances in the industrial sector should the data show that the allocation formula is overcompensating for leakage risk. (NRDC1)

Comment: Preventing leakage is an important policy objective, particularly given current economic conditions. However, the provisions in the regulation do not appear to be warranted by the available evidence on the likelihood of emissions leakage as a result of AB 32, or the magnitude of allowance allocations necessary to ameliorate it. Drawing on a review of the scholarly literature, the CARB-convened Economic and Allocation Advisory Committee (EAAC) concludes that—addressing leakage through free allocation would require a very small share of allowance value. Despite this finding, CARB proposes an allocation scheme that may use generous benchmarks and fail to phase out the free allocation over time for the vast majority of covered industrial emissions. Instead, CARB proposes using a constant assistance factor of 100 percent for significant portions of industrial emissions. (EDF1)

Comment: In general, the provisions for specific industries, including cement and the petroleum extraction and refining, appear to be more generous than needed if the purpose of the allocation is to avoid creating an incentive for these businesses to leave the state. (EDF1)

Comment: We recognize the need to address leakage risk for trade-exposed industries and strongly support transitional assistance in the form of some percentage of allocations being distributed for free. The goal is to assist and to provide compensation to bring California production facilities to cost parity with competing facilities in non-capped areas. This can be accomplished with a relatively small percentage of the total allowance value. One hundred percent seems excessive and risks overcompensation. We urge staff to evaluate and reassess the impact of free allocation. (UCS4)

> **Response**: We agree that auction is the fairest and most transparent way to distribute allowances. We are allocating allowances to the industrial sector for two purposes: (1) to provide transition assistance, and (2) to prevent leakage. Transition assistance provides free allocation to the industrial sector at the outset

of the program to avoid sudden or undue short-term economic impacts and promote a transition to a low-carbon economy. This transition assistance will decline as covered entities gradually adjust to the carbon price and adopt energy- and carbon-saving strategies. The regulation does not provide 100 percent free allocation to industrial emitters.

Free allocations will decline over time based on two main factors. One is the "cap decline" factor, which is what ensures that we will reduce emissions to meet the 2020 goal. The cap declines at 2 percent each year for the first compliance period, and then at 3 percent a year from 2015 through 2020. The second factor is based on the risk of emissions leakage. We have conducted an extensive analysis of leakage risk with a peer-reviewed methodology used in existing cap-and-trade programs. This methodology combines two considerations: trade exposure, and the degree to which greenhouse gas emissions influence the cost of the end product. The methodology is described in greater detail in the Staff Report and Appendix K of the Staff Report. Sectors that have high leakage risk will continue to receive a high percentage of allowances for free through 2020. Sectors with medium or low leakage risk will see reductions in their free allocations beginning with the second compliance period in 2015. These percentages of free allowances are detailed in the regulation. Per direction in Board Resolution 10-42, we are committed to revisit the leakage analysis before 2015, and to adjust leakage risk as necessary to reflect the results of the revisited analysis.

We do not agree that the proposed regulation over-allocates free allowances to prevent leakage. AB 32 directs the Air Resources Board to design all GHG regulations to minimize leakage to the extent feasible. The California cap-and-trade program was designed to not unduly disadvantage California industry. Introducing an environmental regulation in one jurisdiction can cause production cost and prices in that jurisdiction to increase relative to costs in jurisdictions that do not introduce comparable regulations. This can precipitate a shift in demand away from goods produced in the implementing jurisdiction toward goods produced elsewhere. As a result, the reduction in production and emissions in the implementing jurisdiction is offset by increased production and emissions elsewhere.

Too Many Free Allowances

C-34. (multiple comments)
Comment: We are disappointed by the amount of free allowances given to the industrial sector emitters, and by the delayed move towards auctioning. We urge CARB to ensure 100 percent of permits are auctioned. (CPC1)

Comment: In the industrial sector, the free allocations are excessive and should be reduced. (FORMLETTER01, FRIEDENBERG, HANSON, KUNKEL, SONOMAFCC)

Comment: In the industrial sector, the free allocations are excessive and should be reduced. Free allocations based on industry-specific benchmarks encourage some moderate efficiencies, but may disadvantage innovators (for example, a new company that produces carbon negative cement products). How many free allowances would a start-up get in relation to an incumbent cement factory? Free allocations may prevent "leakage" of the old technology by shielding business-as-usual from the carbon price. (CARBONSHARE)

> **Response:** We do not believe that the proposed regulation over-allocates free allowances to the industrial sectors. At the beginning of the program, most allowances are distributed for free to help provide a soft start for the program. Industry assistance is necessary to provide a smooth transition into the cap-and-trade program for industrial covered sources that face a competitiveness risk. The level of assistance allocated will decline over time to a minimum level necessary to prevent emissions leakage as industrial sources adapt to carbon constraints. The allocation system is also designed to reward those who have taken early action and have invested in energy efficiency and GHG emission reductions, and it will encourage continued investment in efficiency and clean energy in the future.
>
> In response to the CarbonShare, a new entrant would be allocated according to its industry. A start-up cement factory would be allocated according to its production, similar to other existing cement facilities.

C-35. Comment: As advised by the Economic and Allocation Advisory Committee (EAAC), the industrial sector should need very little allowance value to address leakage issues. We, therefore, urge CARB to amend its regulations to create benchmarks and a process to facilitate a greater amount of auctioned allowances in the industrial sector over time to ensure that this sector has the proper incentives to transition to more efficient technologies and reduce GHG emissions by 2020 (NC1)

> **Response:** We agree that auction is the fairest and most transparent way to distribute allowances. We do not agree that the proposed regulation over-allocates free allowances to the industrial sector. At the beginning of the program, most allowances will be distributed for free to help provide a soft start for the program. The allocation system is designed to reward those who have taken early action and have invested in energy efficiency and GHG emission reductions, and it will encourage continued investment in efficiency and clean energy in the future. Our program is designed to transition into more heavy reliance on auctions beyond the initial period. Per Board Resolution 10-42, we added product benchmarks to the regulation.
>
> Free allocations will decline over time based on two main factors. One is the "cap decline" factor, which ensures that we will reduce emissions to meet the 2020 goal. The cap declines at 2 percent each year for the first compliance period, and then at 3 percent a year from 2015 through 2020. The second factor

is based on the risk of emissions leakage. Staff has conducted an extensive analysis of leakage risk with a peer-reviewed methodology used in existing cap-and-trade programs. This methodology combines two considerations: trade exposure, and the degree to which greenhouse gas emissions influence the cost of the end product.

C-36. Comment: Industrial sources should not benefit from free allocations. ARB has proposed to freely allocate allowances to industry at the outset of the program and on an on-going basis potentially lasting the entirety of the program. This amounts to an effective delay in emissions reduction and a missed opportunity for Valley communities, contrary to the specific intent of AB 32. By freely allocating allowances, ARB denies low-income, industrial-hosting, communities much needed revenue and the opportunity for green economic developments. Free and widespread allocations do not incentivize reductions, but rather reward pollution. If ARB adopts a Cap and Trade regulation, it should set a price on allowances that ensures allowances are not over allocated and that incentivizes reductions. Set a price on allowances from industrial sources that will incentivize reductions in CO_2 and criteria pollutants. (CVAQC, FRESNOMINISTRY)

Response: We do not agree that the proposed regulation over-allocates free allowances to the industrial sector, nor that we reward pollution. At the beginning of the program, most allowances should be distributed for free to help provide a soft start for the program. The allocation system is designed to reward those who have taken early action and have invested in energy efficiency and GHG emission reductions, and it will encourage continued investment in efficiency and clean energy in the future.

Free allocations will decline over time based on two main factors. One is the “cap decline” factor, which ensures that we will reduce emissions to meet the 2020 goal. The cap declines at 2 percent each year for the first compliance period, and then at 3 percent a year from 2015 through 2020. The second factor is based on the risk of emissions leakage. Staff has conducted an extensive analysis of leakage risk with a peer-reviewed methodology used in existing cap-and-trade programs. This methodology combines two considerations: trade exposure, and the degree to which greenhouse gas emissions influence the cost of the end product. Sectors which have high leakage risk will continue to receive a high percentage of allowances for free through 2020. Sectors with medium or low leakage risk will see reductions in their free allocations, beginning with the second compliance period in 2015. ARB has committed to revisit the leakage analysis before 2015, and to adjust leakage risk as necessary to reflect the results of the revisited analysis.

We agree that proceeds from the direct auction of allowances provide an opportunity for the most impacted and disadvantaged communities in California. Board Resolution 10-42 directs the Executive Officer to deposit a minimum of 10 percent of annual proceeds generated from the direct auction of allowances in the Air Pollution Control Fund for appropriation by the Legislature to programs and projects that reduce greenhouse gas emissions or mitigate direct health impacts of climate change and promote green collar employment opportunities in the most impacted and disadvantaged communities in California.

C-37. Comment: The level of free allocation proposed in the draft cap and trade rule will result in a huge wealth transfer from California's consumers to the industrial sector. In order to avoid this magnitude of corporate welfare, some part of this allowance value should be used to develop and promote low carbon-emitting industrial processes, as well as other societal benefits such as assistance transitioning for workers and small businesses. (UCS1, WALTERS, LUDLOW)

Response: We do not agree that the amount of free allocations is excessive. At the beginning of the program, most allowances will be distributed for free, to help provide a soft start for the program. The allocation system is designed to reward those who have taken early action and have invested in energy efficiency and GHG emission reductions, and it will encourage continued investment in efficiency and clean energy in the future.

As stated in Resolution 10-42, the Board directed the Executive Officer to deposit a minimum of 10 percent of annual proceeds generated from the direct auction of allowances in the Air Pollution Control fund for appropriation by the Legislature for programs and projects that reduce greenhouse gas emissions or mitigate direct health impacts of climate change. As further stated in Resolution 10-42, the Board agrees with several uses of allowances recommended by the Economic and Allocation Advisory Committee. In Chapter II and Appendix J of the Staff Report, we discussed several uses for Air Pollution Control Fund proceeds, including the creation of a Community Benefit Fund. Such a fund could be used to promote projects that simultaneously reduce GHGs and co-pollutants, finance adaptation/preparedness for climate change health impacts, create improvements to mass transit and land use planning, facilitate natural resource conservation, and support non-utility energy-efficiency programs. Additionally, we also discussed a Low Carbon Investment Fund to promote projects that support a green technology workforce training program. We will initiate a public process to develop recommendations on the uses of allocation proceeds. We anticipate that the uses for allocation revenue in the Staff Report will be further developed.

C-38. Comment: CARB staff proposes that free allowances in the first compliance period be followed by auctions in the second and third. We believe 100 percent free allocation for the first round is too high. SB-Cal agrees with language submitted to CARB by ETAAC. The level of free allocation proposed in the draft cap and trade rule will result in a huge wealth transfer from California's consumers to the industrial sector. In order to avoid this magnitude of corporate welfare, some part of this allowance value should be used to develop and promote low carbon-emitting industrial processes, as well as other societal benefits such as assistance transitioning for workers and small businesses. (SBCA2)

Response: We do not agree that the amount of free allocations is excessive. At the beginning of the program, most allowances will be distributed for free, to help provide a soft start for the program. The allocation system is designed to reward those who have taken early action and have invested in energy efficiency and GHG emission reductions, and it will encourage continued investment in efficiency and clean energy in the future. The regulation does not provide 100 percent free allocation to industrial emitters.

We do agree that part of the annual auction proceeds should be used in the community. Per Board Resolution 10-42, we will deposit a minimum of 10 percent of annual proceeds generated from the direct auction of allowances in the Air Pollution Control fund. These funds are for appropriation by the Legislature for programs and projects that reduce GHG emissions or mitigate direct health impacts of climate change, and promote green collar employment opportunities in the most impacted and disadvantaged communities in California.

C-39. Comment: I appreciate the desire to design a system that can protect against sudden or undue short-term economic impacts and "leakage" that might put California businesses and facilities at a disadvantage. Clearly, retaining industrial production within California has potential for greenhouse gas (GHG) emissions reductions, in and of itself. Moreover, the draft framework raises legitimate concerns about the additional costs from a cap and trade scheme on California's long-term economic prospects. Resolving these challenges are important goals, but might be achieved through mechanisms other than extensive free allocation of allowances, which was a key design flaw in the European Union (EU) emissions trading system. We must find the delicate balance between requiring the polluter to pay and the possible negative economic consequences of applying that principle. Free allocation of allowances will not necessarily result, for example, in the State or other large procurement entities purchasing California-produced or manufactured goods. While allowances might help offset a possible competitive disadvantage California industries could experience from industries out of state, allowances don't compel large procurers in California to procure within the California marketplace. Incentivizing in-State production and in-State procurement might have two possible GHG emissions reduction advantages: the emissions reductions achieved by the regulated in-state industry and the emissions reduction that could result from the avoided out of state or international transport. A specific carbon adder based on distance travelled might be considered. (ASMSKINNER)

Response: We do not agree that the amount of free allocations to be excessive. At the beginning of the program, most allowances will be distributed for free, to help provide a soft start for the program. We studied the strengths and weaknesses of all existing cap-and-trade programs, including the EU-ETS, and learned from these systems in developing our program to avoid over- or under-allocating allowances. We determined that a soft start, under the current economic conditions, dictates greater reliance on free allocation of allowances in the early years of the program. We view this free allocation as critical to avoid adding an immediate cost to covered industries that could inhibit their ability to invest in emissions reductions. Unlike in the EU ETS, free allocation relies on reported actual emissions and product data, minimizing the potential for over-allocation.

The allocation system is designed to reward those who have taken early action and have invested in energy efficiency and GHG emission reductions, and it will encourage continued investment in efficiency and clean energy in the future. The allocation system also takes production into account, so that in-state production is encouraged.

No Free Allowances to "Biggest Polluters"

C-40. (multiple comments)
Comment: We urge ARB to enact full auctions for all sectors from the outset of the Cap and Trade program. (CIPAL)

Comment: I am concerned and disappointed by the details of the cap and trade component. I don't think you should give away pollution allowances; you should charge for them. Polluting businesses will not do anything to reduce their polluting emissions if you just give away the pollution allowances. (BOOZ)

Comment: It concerns me that you might enact provisions allowing businesses that pollute free credits to pollute. This makes no sense; why reward polluters? If we are to have a comprehensive clean air policy and reduce carbon emissions then the biggest polluters must be held responsible to clean up their act. (SEECH)

Comment: I'm disturbed that you're considering carbon credit giveaways. This is necessary neither politically nor in practical terms and seriously undermines the purpose of the overall proposal. Please charge the utilities and other large polluters the true value of their credits. (LUVAAS)

Comment: I'm concerned with the details of the cap and trade component. By giving away the vast majority of pollution allowances, your proposal would financially reward the biggest polluters. This provides a clear disincentive for polluting businesses to reduce their greenhouse gas emissions, and therefore, would weaken the impact of California's landmark climate bill. Therefore I'm requesting that the final program include requirements that large-scale emitters pay for their emission credits. This will not only help fund the program, but also act as a powerful incentive to reduce emissions prior to any "trading." (GRASSETTI)

Comment: Please ensure that there is a minimum cost for all carbon emissions and that in the cap and trade schemes, no polluting is free—all permits must have costs associated with them. (DISENHOUSE)

Comment: Cap and Trade can result in no solution if too many pollution credits are given away for free. I, and judging from the defeat of the Texas Oil initiative in Nov, most Californians want implementation of AB 32. Pollution credits should be phased out quickly, or become exorbitantly expensive quickly, otherwise there's no incentive. Assessments of the amount of pollution should be made independently of the polluters proposals. (PRESSBURGER)

Comment: I suggest that all rights to pollute enter a market; there should be no free ride. (MILLERKENDR)

Comment: Please listen to the California electorate and implement AB 32 in a way that does not give away pollution allowances to the biggest polluters. This would remove the financial incentive for them to reduce their greenhouse gas emissions, which is the entire point of AB 32. (HARRISM)

Comment: I currently understand that the cap and trade component would give away the majority of pollution allowances. By doing so, this seems to reward the biggest polluters and weakens the intent of the climate bill. Please remove the allowance giveaways in the current rules and resume helping California to be a leader in this important endeavor. (STEINMAN)

Comment: I want to make sure that the largest polluters are held to the same standards as all the others. Please remove the huge giveaways that are in the rules for the largest polluters and hold all polluters to the same accountability and standards. (ROBERTSJ)

Comment: The California Air Resources Board is seriously out of touch with the citizens of California if it is contemplating giving away pollution credits to big polluters. The lopsided recent defeat of Proposition 23 should make that clear enough. Please do not coddle big corporations. Please do not reward big polluters for polluting by giving away pollution credits to them. (MACHEN)

Comment: I can't believe that you would even think of giving the worst polluters credits to do what they want. It is bad for the environment and it is obviously bad for people. California has been a leader for a long time and we need to make the rest of the nation take note. You need to be aware that your reputation as a law maker is on the line and being recorded. Do you want to be known as a sell out or do you want to stand up and lead the charge to a better society? I'd rather have a better environment! (NDRC)

Comment: While I agree with many of the steps outlined in the AB 32 Scoping Plan, I am concerned and disappointed by the details of the cap and trade component. By giving away the vast majority of pollution allowances, your proposal would financially reward the biggest polluters. This provides a clear disincentive for polluting businesses to reduce their greenhouse gas emissions, and therefore, would weaken the impact of California’s landmark climate bill. (FORMLETTER05)

Comment: Corporate polluters already transfer the health costs of their pollution to the public; do not add to that injustice by giving away the "emissions credits." (KENNEDYA)

Comment: I would prefer to see fewer permits given out for free, which allows the state to create winners and losers (mostly perpetrating the winners in the existing system in which pollution is free for polluters but taxpayers have to deal with the problems it creates). A real market system would not only be fair, it would also raise more money. (AMENTA)

Comment: Make sure that industry does not get a free ride by being allowed greater than needed allowances for pollution. Dentists, as small hazardous waste generators, must follow strict protocols regarding mercury and other waste into the water and landfill. Surely large corporations with much bigger profits can be held to high standards for air pollution. (STEINBORN)

Comment: Carbon pollution should be expensive for those who produce it. Please do not take it easy on businesses just because they have lots of money to spend lobbying for their interests. (RIEVE)

Comment: I do not favor your giving big business the opportunity to escape financial consequences for failing to reduce their emissions. This economy is market driven, and only by requiring businesses to pay for the consequences of their actions (or inactions) will they find the fortitude and the technology to make substantive reductions in their carbon footprint. (BOYDC)

Comment: Why are you even considering NOT auctioning 100 percent of allowance permits to industry? Is such corporate welfare really necessary? We are in the situation we are, precisely because industry has had a free ride in polluting our environment to the content of their bottom lines until now. Let's see a little accountability. (EICHELBERGER)

Comment: The industries that have been contributing carbon to the atmosphere shouldn't be rewarded by getting free allocations. Instead we need a free market that auctions off the available permit allocation and uses the funds to pursue additional actions that can help reduce emissions in other ways. (TERSOL)

Comment: Putting a price on carbon pollution will signal investors that there will be a cost to fossil fuel development. This principle should be applied throughout the program, so that there is a price for polluters to pay all the way down the line. The high value of the allowances to be freely distributed gives a permit to the biggest polluters and also constitutes a gross form of corporate welfare. The plan should quickly move to 100 percent auctioning, and have the money be used to subsidize the growing green energy industry in the state, which will help it to become competitive with China and continue to create decent jobs in the state. (MINAULT)

Comment: Auction the credits; don't give them to high-energy users. (DAWID)

Comment: I am quite concerned about one aspect of the cap and trade section of the Act, namely the proposal to give away most pollution allowances to businesses. This provision undermines the whole purpose of cap and trade, which is to create financial incentives to pollute less. Giveaways to large polluters make a mockery of the Global Warming Solutions Act. (HAYDEN)

Comment: The biggest polluters should not be rewarded. I am concerned and disappointed that the implementation of AB 32 will involve giving away pollution allowances to the biggest polluters. I have faith that your Board will not disincentivize the companies that have done the worst to hurt our environment to clean up their act. I see this as a big flaw in the cap and trade plan.

If multi-million and multi-billion dollar companies can sell and trade their allowances for a profit, I don't think it will make them change to more efficient use of our land, skies and water. We want them to invest back into California not sell off their allowances and slowly adjust their levels of pollution. They need to be held accountable to be part of the solution, and we need to create the incentives and punishments to make that happen. (EDIRISINGHE)

Comment: I am concerned that by giving away most of the pollution allowances for free, polluting companies could receive windfall profits without incentive to reduce their carbon pollution. (FORMLETTER07)

Comment: I am concerned about the giving of too many pollution credits to polluting industries. Please phase out this program as soon as possible. (BLACK)

Comment: I don't think that carbon emission allowances should be given away. We should auction these allowances so that we don't have to raise taxes to pay for enforcement and administration. (FREUND)

Comment: The air board should not give away carbon credits for free to polluters. Carbon fees are one of the single most important incentives for reducing emissions. (COHEN2)

Comment: We urge you to strengthen the cap and trade regulation by committing to maximize the use of auctioning as a method of allocating allowances. (UCS1, WALTERS, LUDLOW)

Comment: No free allowances for polluting industries. Economic and environmental analyses show that controls will benefit the state financially, both in revenue generation and in reduced healthcare costs from fewer pollutants in the air. (MORRISS)

Comment: We are concerned with the giving away of credits. (EBCHR)

Comment: Please do not indulge industrial polluters with giveaways. I know the recession has forced some changes in the original idea but please stand strong and do not give away millions in carbon allowances to oil companies and other big polluters. (BUSH)

Comment: Excessive reliance on free allowances could result in windfall profits for industry with the most emissions, creating a perverse incentive to pollute. (CIPAL)

Comment: Giving away permits is sheer folly. You should be selling these permits and strongly penalizing, fining, and making the polluters pay for their pollution. (MANGELS)

Comment: I recommend that the program be strengthened by requiring more of the state's largest polluters to pay for their global warming emissions at auction instead of giving permits away for free. (MSCG1, FORMLETTER06)

Comment: Maximize the use of auctioning as a method of allocating allowances. The level of free allocation proposed in the draft cap and trade rule is a gift to industry at taxpayer's expense. (VARON)

Comment: There is no way that giving corporate polluters freebies will work to fight global warming. They must pay a good price for these permits so that at least there will be some improvement via state use of the moneys gathered to mitigate their activities. (YURMAN)

Comment: Get it right. No credits for big time polluters in California. (BECKER)

Comment: Commit to maximize the use of auctioning as a method of allocating allowances. (CADMANS, UCS2)

Comment: I hope that you will implement a plan that does not let the big polluters gain from any of your actions. Not only do large industries get a free ride for their externalized costs, but I would hate to see them rewarded with more pollution credits. Please stand firm for the health of our citizens and our economy. (EARHART)

Comment: It would be a bad idea to provide financial incentives to businesses that pollute, but giving away the vast majority of pollution allowances under the plan currently proposed will do just that. Please reconsider this portion of the implementation strategy. (GLOVER)

Comment: Every polluter that is allowed a credit or a pass on emissions only prolongs the time it will take us to get to alternative sources of power and green tech. (GRIGGS)

Comment: I am opposed to the notion of giving away permits for greenhouse gas emissions. Sea levels are already rising, mostly due to rising ocean temperatures, and California has a significant area of productive agricultural land already located below sea level, an area known as the "Delta." Further rises in sea level put that production and the state's economy at risk, and no measure than can help to avoid or delay this should be ignored. (MOORE)

Comment: No corporation should be allowed pollution credits for free. (ROLLEY)

Comment: I think that major creators of greenhouse gases should have fiscal responsibilities to pay for the damage. Commercial enterprises will respond to regulations that affect their bottom line. The State should not be in the business of giving permits to pollute. (NC4)

Comment: Please honor the California voters' wishes and keep AB 32 robust by not giving away allowances to polluters. Like a vast majority of Americans, I am sick to death of corporate giveaways. (DUNGAN)

Comment: The proposed cap and trade rules weaken the impact of our climate bill by giving away the vast majority of pollution allowances. Seize the mandate for bold, meaningful action and remove the massive allowance giveaways outlined in the current rules. The currently proposed pollution allowances in the first couple years where they're given away is a multi-billion dollar transfer of wealth to dirty industry. This is something that needs to be addressed going forward before CREDO Action and our members will think that AB 32 and the Climate Solutions Act is being implemented to its fullest. (FORMLETTER09, CREDOACTION)

Comment: The proposed cap and trade rules weaken the impact of our climate bill by giving away the vast majority of pollution allowances. Seize the mandate for bold, meaningful action and remove the massive allowance giveaways outlined in the current rules. (FEICHTL)

Comment: No on 23 was a mandate from the people of this state for the strongest program implementation under AB 32. Free pollution allowances weaken the impact of our climate action, and should be reduced. The industries involved have profited from polluting for far too long, and these "gifts" will only allow them to continue to do so. Please strengthen the rules to achieve the strongest possible implementation of our climate law. (ZIMMERMANK)

Comment: CARB's plan gives the biggest polluters credits to pollute for free. Imagine receiving such a lucrative reward for having bad business practices. This multi-billion dollar giveaway also undermines the goals of AB 32. (WEISS)

Comment: It is imperative to make sure our actions promote good air quality. Giving credits to major polluters is adverse to your mission. Please continue to keep California in the lead for enforcing clean air measures. (SMULEVITZ)

Comment: Please recommend the right and most effective course in our new climate law, cap and dividends and no to industry giveaways. Let's put money back into the hands of the people of California. (KOWALICK)

Comment: Make all emitters pay for 100 percent of their greenhouse gas emissions. Pollution allowances should not be given away to oil companies and other large emitters. Allowances should be auctioned off, with the money used for clean energy, green jobs, public transit, and low-income consumers. (STEWARTJ)

Comment: Strengthen your program by requiring more of the state's largest polluters to pay for their global warming emissions instead of giving permits away for free. By forcing polluters to pay for the emissions they generate through the purchasing of permits in an auction, we can then re-invest that money in making homes and businesses more energy efficient, increasing public transit options, and developing wind and solar projects in California. (DUTTON, FUTRELL)

Comment: I believe permits need to be offered at a cost, to help fund energy efficiency and for developing alternative energy sources. (SUSTAINDESIGN)

Comment: Please do not give free credits to polluters. Instead, force them to pay for the emissions they create by buying permits at auction. The resulting funds can be used to sustain and promote additional measures for easing the swift transition to a better environment. (TRI)

Comment: Please protect the public interest by making polluters pay for their greenhouse gas emissions. Pollution allowances should not be given away to oil companies and other large emitters. (FORMLETTER10)

Comment: We can help to finance this reform by forcing polluters to pay for their emissions by buying permits, rather than just giving away permits for free. (CADMANL)

Comment: I suggest that a significant percentage of the allowances be sold rather than given away. By selling more and giving away fewer allowances, the allowances should have greater initial value and would generate more revenue to be used for other activities, which will reduce GHG emissions. (ASMDICKENSION)

Comment: It seems only fair, and quite reasonable, for the largest polluters to purchase permits to generate their toxic emissions, and for that cost to fund the growth of non-polluting energy systems in California; as well as supporting public transit in every possible local and regional way, as our population expands beyond our capacity to handle its transportation needs. (PAYNE)

Comment: Global Polluters are being held accountable to decrease California's greenhouse emissions by 2020. Emission decline to 1990 levels is a surmountable goal. Adding a fee to the permits, purchased at an auction, will directly supply the investment needed to create a green and carbon-free economy. (SANSONE)

Comment: Please make the polluters be responsible. Make them pay for the damages they have already made, clean up their businesses, and pay for permits. (LOUIN)

Comment: Please do not sell out to the biggest polluters by "giving them" credits to pollute. (CANNON)

Comment: Do not give tax credits to businesses that pollute our environment. (PETRALIA)

Comment: Don't give large corporate polluters and breaks or free credits. (HUNTER)

Comment: Free pollution credits should not be an option. (GRACE)

Comment: I worked very hard to defeat Prop 23 and feel strongly that there should be a limit on the number of pollution credits (below what you are proposing) and a quicker reduction of those credits. (SCHEIBE)

Comment: I love the fact that I live in California where we take environmental issues seriously. We have put in motion many laws that the rest of the states eventually enact. We passed Prop 23 which is a strong environmental proposition but it needs to be even stronger, not weaker. If the corporations can spend money to fight the law, they can spend money to pay for their actions and pollution. Make them pay for permits and make them abide by them. Europe is way ahead of us on environmental issues of all kinds and we should be the leaders. (SALERNO)

Comment: Credits should be auctioned or bought. Europe's system is a cautionary tale of setting the carbon price too low and giving away credits. (BEAZLIE)

Comment: CARB should clearly state in the regulation that it intends to move toward 100 percent auctioning, and leave an opening to do so. (UCS1, VARON, WALTERS, LUDLOW)

Comment: We should have learned the lessons of the EU. And I don't see any justification for why we have billions of dollars in basically handouts to already wealthy corporate polluters. So I'd like some justification as to why. (CPC5)

Comment: Polluters are rewarded, rather than forced to change behavior. With the majority of permits still allocated for free, the EU ETS is effectively providing a subsidy stream for highly polluting industry. (CTW)

Comment: I do not support a cap and giveaway system that financially rewards big polluters. When are we going to get serious about global warming? (CHAVEZ)

Comment: It is unconscionable that the largest corporate and industrial polluters, with the collusion of their republican climate deniers and lobbyists, would be given billions of dollars of giveaways. The entire world knows the non-negotiable American consumerist way of life is at the heart of this crisis. Facing our responsibility, stepping back into a leadership position, and evolving won't destroy our way of life—it will make it better than ever, and ensure that it can go on for many generations to come. (MASSMANJ)

Comment: I appreciate your efforts to implement CARB. However, please do not let the biggest polluters profit further from their pollution. (LIPPER)

Comment: Thank you for your work on greenhouse gasses. Please correct the one portion of the bill that would allow the worst offenders to continue polluting. (PAHRE)

Comment: Please don't allow the biggest polluters to pollute more; there must be a better way to implement this plan! (STEINMANA)

Comment: Let's not give the Earth away to the biggest users, seems very silly. Everyone should pay their share! (TAUSSIG)

Comment: In attempting to lead the nation in regulating carbon emissions, we should set a decent example and make sure business pays its share for the pollution it creates. (MURPHYH)

Comment: Why would you help companies avoid compliance? Get rid of the giveaway to business. Stop the political games and just require what we need to fix the air quality. (MURDOCH)

Comment: We need to get really tough with polluters - They need to pay for the damage they have done. Last Thursday, I attended The Cleantech Roadshow Seminar sponsored by Morrison-Foerster. The panel discussion was quite enlightening. I'd suggest you contact them and implement their suggestions. (MILLERWILL)

Comment: I think it is essential to have a plan to reduce greenhouse gases that does not allow the big polluters to further profit from their pollution. (SAYBLE)

Comment: I am concerned about what appears to be a "give-away" in the industrial sector. The EU made the mistake of giving away too much in free allocations, and as a result, have yet to see significant changes from that sector. Please do not make the same mistake. (LINNEY)

Comment: In order to have a substantial dividend, I strongly urge ARB to reduce the use of allocations and offsets. I don't think the oil and gas industry needs an offset. (CANFIELD1)

Comment: Polluters must pay for the byproducts and results of their actions. If they do not, they are permitted license to be an elitist class of Fed and government backed criminals with citizens as their victims. This must be ended. CA citizens want a future—not the dark coal-smoke and petro-poisoned dirty past. Thank you for saving my life, and your children from dangerous criminal polluters who don't want to have to pay for their crimes nor submit to much needed regulations. I demand my liberty, and I demand their crimes be stopped. Now it's already an hundred years too late. (CERELLO)

Comment: I want a plan to reduce greenhouse gases that does not allow the big polluters to further profit from their pollution. (GRAVELLE)

Comment: Thank you for your work to reduce polluters. Please, make it tougher. Make polluters pay. (CIBILICH)

Comment: I cannot believe that anyone would let business off the hook with the incredible debt this State has. This is a way to raise much needed capital, and business is awash in money that they are not spending because of the economy. (PRICEK)

Comment: Please adopt a plan to reduce greenhouse gases. It is very important to me and my family that the plan does not include inducements to big polluters that would benefit them financially. I firmly believe that the larger polluters should be penalized in the new plan. (LIEBER)

Comment: Please go forward with a plan to reduce greenhouse gases that does not allow the big polluters to further profit from their pollution. Do not compromise the greenhouse reduction plan with credits for large or small companies to continue producing greenhouse gases unabated. (HUGHES)

Comment: To deal with the already present global climate change catastrophe, we must act forcefully at the state and local levels. This is where the proposal in front of CARB to grant free allocations to industry fails miserably. We favor a True Cost Pricing approach to economics, where the price of goods and services embody their true environmental costs. Sending environmentally accurate price signals to consumers helps them make environmentally-friendly choices, while rewarding companies that act more environmentally sound. [We] favor carbon taxes over cap and trade schemes, because carbon taxes provide the most direct path to internalizing carbon costs and also provide more predictability in cost, are simpler and faster to implement, and are less open to manipulation through the political, legislative and/or regulatory process. For these reasons, many Greens are extremely disappointed in the CARB staff recommendation to implement a cap and trade scheme instead of a carbon tax. Nowhere could this be clearer than in our opposition to the staff's recommendations to grant free allocations to covered industry. The relevant issue with these free allocations is not leakage risk, but whether California can provide leadership by showing that an economic model that honestly and fully internalizes the environmental costs of burning carbon can work for consumers and producers. Research has demonstrated that even with no free allowances, and even for energy-intensive industries, changes in retail electricity prices are likely to be small.

The irony in the rationale to grant free allocations is as the staff report states, "Free allocation needed to minimize leakage will be maintained until adoption of equivalent carbon-pricing policies by other jurisdictions eliminates the leakage risk." Is 'waiting for others' what leadership is all about? Putting aside that the political conditions which led to the adoption of AB 32 in California may not even be present in other states for some time, what happens if other states actually do adopt the same model as California? Since the proposed free allocation model fails to accurately internalize carbon costs, we will then have proved little about industries' actual ability to truly adapt to such costs, and therefore only have delayed needed and sufficient action to our planetary crisis. The absurdity of this free allowance is exactly why many Greens tends to favor carbon taxes over cap-n-trade, and why if the CARB board adopts the staff recommendation, it would be an abdication of historic proportion of our state's environmental leadership role. In the post COP16 world, we desperately need such an example. Therefore I urge you to rise to the occasion and seize this opportunity for global leadership. Please eliminate the free allowances from the regulations governing the cap and trade program you approve. (GREENPARTY)

Response: We agree that an auction is the fairest and most transparent way to distribute allowances. We believe the system of allowance allocations we designed under the cap-and-trade program will transition California into a low-carbon economy. AB 32 mandates the California Air Resources Board to design all greenhouse gas regulations to minimize leakage to the extent feasible. At the beginning of the program, most allowances will be distributed for free, to help provide a soft start for the program. The level of free allocation will decline over time to settle at a level needed to prevent leakage. As the program progresses, we will auction a greater portion of allowances. Because allowances can be traded, the program provides incentives for those with the most cost-effective reduction opportunities to reduce emissions quickly. The cap-and-trade program is expected to result in increased investment in efficient buildings and technologies, and in advanced fuels. Implementation of the program will, however, shift investment and growth within the overall economy toward those sectors driven by the production of cleaner and more efficient technologies. This free allocation does not transfer wealth from Californian's to "dirty industry" as contended by some commenters. Because our analysis shows that most industries are not able to pass cost along to consumers, no 'transfer of wealth' from consumers to industry is expected to occur. Without the allocation, we would expect some production would shift out of State (leakage) as described above. Furthermore, an updating output-based allocation approach is an incentive to increase output rather than increase profit; this disincentivizes passing through compliance costs more than is necessary to minimize leakage.

In response to Green Party, we have performed an analysis of alternatives to the cap-and-trade program, including a carbon tax, and have found that none were as, or more, effective than a cap-and-trade program in carrying out the goals of AB 32. More information can be found in the Alternatives Analysis of the Staff Report.

Further, we have designed the cap-and-trade program to be sufficiently stringent to reduce GHG emissions to achieve AB 32 goals. Covered entities will be subject to a declining emissions cap, spurring installation of more-efficient and lower-emitting technologies. These entities must turn in allowances or a limited number of offsets to match their GHG emissions. Because there is a decreasing cap on emissions, overall emissions will go down.

Different Allotment of Allowances

C-41. Comment: Carbon allowances should be like voting. We have one person one vote. Why not one person one carbon allowance? A person should be able to benefit from selling his carbon allowances to, say, Chevron. There would be much less administrative overhead to tax carbon as it comes out of the ground or into California. (KRINOCK)

Response: We do not agree with the commenter's suggestion that each person should directly receive allowances. It would not be administratively efficient to allocate allowances to all residents of the State and ask them to participate in allowance trading. However, we recognize the public asset nature of the atmospheric carbon sink; in making decisions on allowance allocation we did consider the notion that the atmosphere is a global commons to which all individuals have equal claims.

We have performed an analysis of alternatives to the cap-and-trade program, including a carbon tax, and have found that none were as, or more, effective than a cap-and-trade program in carrying out the goals of AB 32. More information can be found in the Alternatives Analysis of the Staff Report. We also considered alternative points of regulation for the cap-and-trade program, including a fully "upstream" system where the obligation is assessed where fossil fuels are extracted or imported into California. We chose not to pursue this upstream approach due to administrative concerns including harmonizing with the existing framework for reporting of greenhouse gases which is primarily source-based.

Benchmarks

General

Use Best Practices

C-42. (multiple comments)
Comment: We support requiring the industrial sector to base product benchmarks on best practices and allowing benchmarks to be dynamic over time, so that the rule provides additional incentives for using best practices to reduce emissions. (SIERRACLUCA4)

Comment: The product benchmark for the industrial sector should be adjusted to reflect best practices instead of 90 percent of industry average. (NC1, NC2)

Comment: EDF recommends that allocation benchmarks for the industrial sector should be more ambitious, based on best available technologies and practices worldwide rather than reflecting the current performance of California operators. (EDF1)

Comment: We urge you to approve California's landmark greenhouse gas cap and trade program and change the industrial sector benchmark to an industry "best practices" level rather than an industry average performance level in order to incentivize industrial emitters to achieve "best practices" in their industry and become more efficient. (FORMLETTER04)

Comment: The product benchmarks for industrial pollution sources should reflect sector-wide progress in attainment of the best practice technology and should reward early adopters. The current proposal leaves these benchmarks unchanged for the whole nine years and thus blunts incentives for adoption of innovative emission reduction technologies and leaves cost-effective emission reductions on the table. Setting aggressive targets pays dividends, as can be seen in the electric power industry where adoption of the Best Available Control Technology has achieved a 99 percent reduction in power plant NOx emissions. (LUDLOW, UCS1, WALTERS)

Comment: Transition assistance needs to be clearly linked to opportunities for change and evolution. Allocation benchmarks should be based on best available technologies and practices. (EDF1)

Comment: Rather than setting the benchmark according to average performance, we encourage CARB to peg the benchmark to industry “best practices” to ensure that only the most efficient facilities have all their allowances covered, and poorer performing facilities will have to purchase allowances. This will incentivize all facilities to adopt industry best practices. (NRDC1)

Comment: Set the industrial benchmark at industry best practices, not industry average. This will ensure that only the most efficient facilities get all their allowances covered while less efficient and poorer performing facilities will have to purchase allowances. This will encourage all facilities to implement industry best practices. (ENVENTREP1, ENVENTREP2)

Comment: The product benchmarks should be based on known best practices in the sector, and not on sector average performance, as is currently proposed. If the average sector performance is below what known best practices could achieve, then industries that received allowances based on average performance will not be incentivized to adopt best practices. The benchmark should be set at current best practices and be revisited regularly to determine whether best practices have evolved. If so, the benchmark should be revised accordingly. (KUSTIN10, EBERHARD)

Comment: The current proposal leaves benchmarks unchanged for the life of the program. This may result in industries receiving excessive allowances that provide windfall profits. The benchmark should be set at current best practices and be revisited regularly to determine whether best practices have evolved. If so, the benchmark should be revised accordingly. The electric power industry, for example, is subject to Best Available Control Technology requirements for criteria pollutants, which has resulted in a 99 percent reduction in power plant NOx emissions from new power plants since the Clean Air Act was adopted. Benchmarks should be technology forcing in recognition of goals far beyond 2020. (KUSTIN10, EBERHARD)

Comment: We urge the Board to base product benchmarking on best practices rather than business-as-usual average performance for the whole compliance period. Benchmarks should be dynamic, reflecting the latest technology, knowledge and practice, and these should be technology-forcing in recognition of our future emission reduction goals and where we need to get to. (UCS4)

> **Response:** We believe our approach for setting benchmarks is appropriate. Best practices, technology forcing, or best available technology benchmarks are in essence benchmark stringencies, frequently used in setting emission levels or standards. In a market-based program such as cap-and-trade, the goal of benchmarking is not for setting the level of emissions. It is used to allocate free allowances to assist facilities with the cost of compliance, to prevent leakage and to incentivize them to reduce GHG emissions. We do not believe it is necessary to add provisions to the regulation that create benchmarks that update with time, such as when there is an update to current best practices. Even though the regulation sets static benchmarks used to calculate allowances for allocation, the two other factors—cap decline factor and assistance factor—do decrease with time. Thus, the stringency of free allowances will increase with time. In addition, ARB regularly reviews regulation, and the Board can direct us to revisit benchmarks when needed.

Benchmarking Methodology

C-43. Comment: Benchmarking approaches as proposed are confusing and may not be appropriate for certain operations or products, (i.e., benchmarking factors such as energy consumption and efficiency as a benchmarking method may not be representative of the fuel actually used in the manufacturing process which may, for example, be provided by boilers.) Benchmarking factors need to be refined to better address unique industry operations. In addition, it is difficult for companies to comment on the regulation when their benchmark has not yet been provided to them. (SDCHAMBER)

> **Response:** We modified the benchmarking methodology in section 95891 to provide more details and clarity. As directed in Board Resolution 10-42, we added the product benchmarks for industrial activities to Table 9-1 of section 95891(b).

C-44. Comment: An overly complex allocation method is unnecessary, particularly when resulting environmental impacts are determined by the cap and not the allocation. The development of appropriate comparisons among facilities will be extremely resource intensive for regulatory agencies, and in some cases, will not be possible given the complexity and variability of production processes. While benchmark studies may provide helpful narrative or directional information regarding technologies and processes, there are a large number of subjective decisions, assumptions and generalizations made when developing benchmarks for a particular process or product that ultimately render the benchmark itself inappropriate when applied to a specific facility. If actual best performing facilities or processes are used as a benchmark it may be impossible to know why a facility or process does not meet a benchmark given the complexity of the assumptions underlying the benchmark value. (AFPA)

> **Response:** We do not agree. Benchmarking in a cap-and trade program is one tool used in designing an allowance allocation system to maximize economic efficiency, minimize leakage, encourage innovation, and reduce the burden of compliance while leveling the playing field in emissions allowance allocation. The benchmarking does not require a facility to meet the benchmark level of emission efficiency. It is used to determine the compensation via free allocation of allowances to reduce carbon cost faced by affected facilities.

C-45. Comment: For facilities with allocations for purchased steam use, the proposed 110 percent cap on allowances could inappropriately limit allocations to Energy Intensive Trade Exposure (EITE) entities undermining the goal to prevent leakage. As written, this section in conjunction with the ISOR suggests that the 110 percent limit applies to allowances received for purchased steam. Since allowance allocations are tied to purchased steam (in addition to onsite emissions), the proposed restriction might needlessly and inadvertently reduce allocated allowances. ARB should clarify in its final rule that the restriction in section 95891(c)(2) does not apply to allowances allocated for purchased steam at EITE entities. (DOWCHEM1, DOWCHEM2, DOWCHEM3)

> **Response:** We modified section 95891(c)(2) of the regulation to clarify how the restriction applies to purchased steam.

C-46. Comment: CARB should not expand the process for establishing an EEB to depend on electrical consumption data. (SMITHS)

> **Response:** The Emissions Efficiency Benchmark (EEB) for electricity $B_{Electricity}$ was used only for electricity sold or provided to off-site end users in calculating allowances to be allocated using the energy-based benchmark method in section 95891(c).

C-47. Comment: There is a need for adequate review of any sector-specific EBB-setting methodology proposed by CARB Staff. (SMITHS)

Response: We agree. In addition to reviewing available information and approaches, such as the European Union's Emissions Trading Scheme (EU ETS), we also get input on developing the methods we use from stakeholders through public workshops, ARB Board hearings, facility and sector-specific consultations, and in comments on the Staff Report and 15-day changes to the regulation.

Describe the Thermal Energy Methodology

C-48. Comment: The methods to establish thermal energy historical baselines in Section 95891(c)(3) are not clearly specified. Dow recommends that ARB specify the methodology that must be used to establish "average annual baseline values" and "historical baseline annual arithmetic mean amounts." Key terms and methods are not defined in the proposed regulation. Baselines cannot be determined with certainty until the methods for deriving baselines are more clearly specified in the regulation. (DOWCHEM1)

Response: We agree and modified section 95891 of the regulation to provide more detail and specificity for the energy-based (previously thermal energy-based) allocation calculation methodology.

Data Sources

C-49. Comment: GANA supports reliance upon multi-year output averaging for allocations. (GANA)

Response: In developing production efficiency benchmarks, we relied on representative data provided by facilities within a sector. In some cases, multiple years of data were available as the basis of the benchmark. In all cases we relied on data provided in our MRR reports if appropriate, or secondarily on data obtained during ARB sector surveys. We also collected data from industries specifically for the benchmarking analysis. When industries indicated that particular data years were not representative of actual operation, we relied on information provided to us voluntarily. In many cases, we used multiple data years if data were representative of actual industry operation.

C-50. Comment: Currently Section 95891(c)(1) prohibits ARB from using third-party verified 2008 data reported to the California Climate Action Registry (CCAR) as a basis for determining the average annual baseline values used to determine a number of allowances to be allocated. For Dow and other similarly affected facilities, CCAR inventories provide accurate third-party verified data. Dow Pittsburg voluntarily reported to CCAR for calendar years 2006 through 2008. Dow recommends the following modification to Section 95891(c)(1) of the draft regulations:

(1) Data Sources. In determining the average annual baseline values, the

Executive Officer may employ all available data reported to ARB under the MRR for data years 2008-2010 and third-party verified data reported to the California Climate Action Registry for data years 2000-20078. (DOWCHEM1)

Response: We agree and modified section 95891(1) of the regulation to allow the use other years of data reported to the California Climate Action Registry (CCAR).

C-51. Comment: Eleven years of historical greenhouse gas emissions data are not typically available for many entities. Section 95891(c)(2) establishes an absolute limit on the level of free allocation under the thermal energy-based allocation relative to historical GHG emissions levels from a given facility. This limit is set at 110 percent of the maximum annual emissions during the 11 year baseline period, from 2000 through 2010. A requirement to independently verify all intervening years would be expensive, time consuming and unnecessary. Dow recommends that ARB specify how the eleven year emissions baseline would be produced. Dow proposes the following language be added to Section 95891(c)(1) to address this issue:

(1) Data Sources. In determining the average annual baseline values, the Executive Officer may employ all available data reported to ARB under the MRR for data years 2008-2010 and third-party verified data reported to the California Climate Action Registry for data years 2000-2007. For years in which verified data are not available, covered entities may pursue either (a) reporting of missing years with The Climate Registry, (b) utilize third-party verified data reported to other entities as approved by the ARB, or (c) utilize third-party verified baseline reports of annual data that are reported to the local Air District for fuel use (as filed with annual data for air pollutant emissions) and annual bills from vendors of purchased steam. (DOWCHEM1)

Response: We modified section 95891(c)(1) and (2) to address this concern.

C-52. Comment: Operational variability at some facilities could end up masking early action and prevent the intended rewards from being recognized. Thus, the intended reward could actually be a penalty. Dow recommends that Section 95891(c)(1) be removed. ARB's Initial Statement of Reasons (ISOR) indicates that the intent of this section is to reward facilities for efficient steam use and "to prevent the level of this reward from becoming excessive." Dow Pittsburg has made many investments in energy efficiency and renewable energy since 2000. Dow Pittsburg would be a worthy recipient of rewards for early actions. Despite ARB's intent, the proposed provision might more likely penalize Dow Pittsburg for its operational variability than reward Dow for its historic de-carbonization efforts. (DOWCHEM1)

Response: We modified section 95891(c)(1) to address this concern.

Significant Growth

C-53. Comment: Using a historical baseline to determine allowance allocations results in an unnecessary penalty for operational variability from year to year as well as for growth. For industrial boilers and heaters, a thermal intensity benchmark per ton of product could be applied to ensure that efficiency does not decrease significantly during periods of growth. Dow proposes a new definition and the following new Section 95891(c)(5):

New definition in Section 95802(a)
Significant Growth. "Significant growth" means annual increases in steam and/or thermal use of up to 50% over the historic baseline at EITE entities.

New Section:
Section 95891(c)(5) Significant Growth. If significant operational growth occurs, baseline values for annual steam and/or thermal energy use shall be re-assessed based on expected activity levels as determined by the Executive Officer

Rationale: Significant operational growth will render a historical baseline determination inaccurate as a basis for determining allowance allocations. Existing facilities that change significantly should have their baselines adjusted so that their carbon costs may continue to be covered. This language parallels the "new entrants" language in section 95891(c)(3) and therefore, would also establish greater parity between expansions at existing facilities versus construction of new facilities.

Alternative Recommendation: Alternatively, Dow recommends the following modification to section 95891(c)(3) of the draft regulations (additions in underline, deletions in strikethrough):

"(3) New Entrants. Covered entities of facilities that were not in operation prior to 2011 and are eligible for free allocation under the thermal energy-based methodology shall be assessed a baseline annual steam and/or thermal energy use values based on expected activity levels as determined by the Executive Officer. For purposes of this provision, "new entrant" includes an existing facility that increases its reliance on efficient industrial boilers."

Rationale: This change would place expansions at existing facilities on an equal footing with construction of new facilities. Providing allowances to encourage incremental reliance on efficient industrial boilers will promote achieving key objectives of the Scoping Plan. Such parity is needed to maintain competition. (DOWCHEM1)

> **Response:** We disagree and do not believe it is necessary to add provisions to the regulation to update the baseline in the case of increased energy use at an incumbent facility. Our preferred allocation approach is to use product-based benchmarks, which are used for the majority of facilities under the cap-and-trade program. In the case of product-based allocation, growth would increase the

amount of product, thereby increasing the amount of free allocation. The energy-based allocation methodology is not the ideal method, and is only used for a small number of facilities whose products currently pose challenges to the use of the product-based allocation methodology. We believe that allowing for incumbent facilities in the energy-based allocation methodology to obtain more allowances for increased energy use may create perverse incentives to increase greenhouse gas emissions. If possible, we would like to work with facilities in the energy-based allocation methodology to develop product benchmarks and switch to the use of product-based allocation methodology for all facilities that are interested in expansion.

Non-Operation

C-54. Comment: CARB needs to clarify how it would determine a facility "output" of a unit that is currently non-operational. The use of the term "unavailable data" is unclear. The regulation should clarify that the calculation for annual average output should not include periods of non-operation. (PMTPETRO1, WIRA1)

Response: We modified section 95891(b) and added a “true-up” term ($O_{a,trueup}$) for adjusted outputs not properly accounted for in prior years’ allocations in the equation for calculating product benchmark-based allocations. We believe this modification, together with the annual updating of product outputs, adequately addresses production fluctuations.

Calculate Benchmarks Appropriately

C-55. Comment: Appropriate calculation of benchmarks is essential so that industry sectors know anticipated cost of compliance, and can plan for future operations, projects, expansion, etc. Under the current regulation, a facility that is more efficient than the proposed benchmark will receive more of its allowances freely while those less efficient facilities will have to purchase additional allowances. We agree with this concept so long as the benchmarks are set correctly. (CALCHAMBER1)

Response: We agree but do not believe it is necessary to add provisions to the regulation because our approach is expected to allow more-efficient facilities to receive more free allowances than facilities that are less efficient.

Set Benchmarks Early

C-56. Comment: It is our recommendation that work on benchmarking be completed as soon as possible so that affected parties can actually calculate their exposure and accurately forecast budgets for 2012. Affected entities need at least a year to prepare for the new cap and trade regime commencing in January of 2012, and the gaps in the current regulation make it difficult to accurately develop budgets and make investment decisions. (CACC)

Response: We agree and the product benchmarks for industrial activities were added per Resolution 10-42, and presented in Table 9-1 of section 95891(b). With the new compliance starting date of January 2013, facilities should have sufficient time to plan their compliance strategies.

C-57. Comment: The decision to allocate by benchmarks from the outset, rather than according to historical emissions trends, is very welcome and should help to prevent the accrual of ‘hot air’ in the system, which currently be-devils the EU system. The fact that benchmarks are tied to productivity, within an overall fixed cap, is also welcome as this again prevents rewards being handed out to those who are merely cutting back on production and helps to incentivize genuine investment in abatement. Officials should be wary of entering into lengthy discussions with industry about the number and nature of the benchmarks. There will be a tendency for every subsector of industry to plead for special treatment, proliferating the number of benchmarks, and arriving back at something close to historic grandfathering, which is clearly sub-optimal. (SANDBAGCC)

Response: No response necessary.

Cement

C-58. Comment: CARB calculates allowance allocations using a lagging estimate of output, which will result in persistent and severe under-allocation to the cement industry. (CSCME2)

Response: We agree and modified section 95891. We will adjust for any output not properly accounted for in prior years starting in 2014, using actual 2012 output.

C-59. Comment: CARB's lowering of the benchmark for all industries is arbitrary, inequitable, and undermines its efforts to minimize leakage. A critical decision in the construction of a benchmark is determining its stringency. In its Staff Report, CARB states that staff’s current thinking is that the targeted level of stringency would be created by evaluating each industrial sector’s emissions intensity during a historical base period and targeting the benchmark to allocate 90 percent of this level per unit product. For a variety of reasons, CSCME strongly disagrees with this approach of applying a uniform 10 percent "discount" to industry averages in order to form benchmarks. (CSCME2, CSCME3)

Response: We disagree and do not believe it is necessary to add provisions to the regulation to modify benchmarking stringency. We believe that benchmark stringency should reflect the emissions intensity of highly efficient, low-emitting facilities within each sector. In the Staff Report, we described a targeted level of stringency created by evaluating each industrial sector’s production-weighted average emissions intensity during a historical base period and then using that level to target the benchmark to allocate 90 percent of this level per unit product.

In subsequent work evaluating the benchmark values, we found that the stringency approach proposed in the Staff Report worked for many sectors but, in some cases, would set the benchmark at a level that was more stringent than the current emissions intensity of any existing California facility. For the sectors for which this occurred, we selected a benchmark based on the "best-in-class" value (i.e., the emissions intensity of the most GHG-efficient California facility).

C-60. (multiple comments)

Comment: CARB's failure to include indirect emissions in the benchmark is likely to significantly increase the risk of leakage. Another critical decision in the construction of an industry benchmark is the scope of emissions included in the numerator, in particular, the decision to include or exclude indirect emissions. As recognized by CARB in the Staff Report, the risk of emissions leakage is a function of the net increase in total policy-related costs, including the costs associated with direct and indirect emissions. The impacts associated with a unit increase in indirect costs, including those from electricity, are indistinguishable from a unit increase in direct costs, as both increase leakage. Increases in electricity prices are of paramount concern for many energy-intensive firms, including the cement industry. It is estimated that electricity prices represent 10 percent of total costs and 20 percent of variable costs for California cement facilities. Failure to offset these costs through policy design will result in increased leakage in cement and other industries. Despite these concerns, CARB proposes to exclude indirect emissions from the benchmark. (CSCME2)

Comment: ARB's proposal does not ensure that EITE entities costs associated with electricity purchases will receive adequate cost containment coverage of their emissions. Nor do the proposed regulations adequately specify requirements to the IOUs and POUs for cost recovery for electricity purchased by EITE entities.
Recommendation: ARB should address these competitive impacts in one of three ways:
1. ARB could provide an EITE entity a direct allocation of free allowances for power purchased from a distribution utility. To avoid double counting, ARB could then exclude these allowances from the allocation of free allowances to the entity's serving utility, OR
2. Alternatively, ARB could require the distribution utility to share the benefits of free allowance value with EITE entities through direct monetary rebates.
Dow recommends that ARB provide that IOUs and POUs must convey free allowance value to an EITE entity through a rebate or bill credit, rather than through continued or increased access to energy efficiency programs or through other future policies that will be developed by utilities and their governing boards and/or agencies, OR
3. Finally, ARB could require utilities to provide EITE customers with a direct allocation of free allowances for power purchased from the utility. No adjustment would be required to avoid double counting in this example.
Rationale: Competitiveness for EITE facilities can be maintained only to the extent that the proposed regulations are modified to ensure that all GHG compliance costs are recovered by EITE entities.

ARB does not intend to provide free allocation of allowances for the carbon costs associated with imported power because it assumes that carbon costs associated with these imports will be alleviated by the allocation of allowances to its interconnected utility. In Appendix J, ARB states, “Indirect carbon costs arising from purchased electricity from the grid will be reduced through compensation from distribution utilities that are given allowance value for the purpose of ratepayer protection.”

The proposed change would empower the capped entity to make the most cost-effective investments in GHG reductions rather than prescribing a particular approach. If an EITE entity procures power from an electric utility, the regulation is unclear about the level of coverage, nor how the value of allowances received by the utilities will be reconveyed to EITE customers. These details need to be specified. To achieve ARB’s stated objectives, the proposed regulation should be revised to provide explicit requirements that will ensure that carbon cost recovery by EITE entities for purchased electricity can be measured and ultimately achieved. (DOWCHEM1)

Comment: The proposed regulation’s use of the term “on-site” power is unclear. Dow recommends that ARB clarify this term with regard to assistance to Energy Intensive Trade Exposed facilities that purchase electricity from third party electricity generating facilities co-located at the EITE facility. Dow recommends that ARB assure that EITE entities will be fully compensated regardless of which entity they purchase electricity from. Effective transitional assistance to industrial facilities requires recovery of GHG compliance costs associated with power purchased from a utility or non-utility.
Rationale: In discussing thermal-energy based equations, the ISOR states, “Electricity purchased from off-site is not part of the thermal energy-based allocation equation but receives indirect compensation through [the] distribution utility to offset the expected indirect GHG costs, as described in Section 95892.” With these changes, the carbon costs associated with electricity consumed by all EITE entities will more likely be covered in a competitively neutral way.

ARB’s proposed regulations leave open critical gaps that may compromise its ability to adequately provide transition assistance to EITE entities. ARB proposes to provide free allowance allocations to EITE entities to “avoid imparting undue initial economic gain or loss” in the early program years and to prevent leakage. ARB notes that current competitiveness is maintained if the free allocation covers all of the EITE’s carbon costs:

Current competitiveness is maintained if: Free allocation = carbon costs – carbon cost recovered.

Table J-7, however, highlights a major gap in this framework. As shown below, while ARB intends to directly reduce carbon costs associated with heat consumption and on- site energy consumption, an EITE facility will be exposed to GHG compliance costs associated with “imported” power. (DOWCHEM1)

Response: We do not believe it is necessary to add provisions to the regulation to include indirect emissions associated with electricity at this time. In the program framework, an adjustment factor was not made for power purchased in establishing the product-based benchmarks. This is because purchased power may not create an indirect carbon cost in all California utility service territories. It is ARB's goal to see a carbon price properly embedded in all utility rates. If and when this occurs, the compensation for these indirect carbon costs could be incorporated into the product benchmarks (or reductions in these costs created in some other fashion) to help minimize leakage. We will revisit this issue once the California Public Utilities Commission Proceeding addressing utility costs and revenue issues associated with greenhouse gas emissions concludes.

C-61. Comment: CARB uses a data sample for establishing benchmarks that does not fully recognize historic investments in GHG efficiency or fully reward early action. Another critical issue in the construction of a benchmark is the choice of the data sample, including both the timeframe and the geographic scope. In establishing the benchmark for the California cement industry, CARB proposes to use California data from the 2009 Mandatory Reporting Rule ("MRR"). CSCME strongly disagrees with this approach for several reasons. First, by using California data, the benchmark will not fully recognize historic investments that California cement manufacturers have made in GHG efficiency relative to their out-of-state competitors. Second, the benchmark will not fully reward early action that the California cement industry has taken since the adoption of AB 32. (CSCME2)

Response: We disagree and believe the MRR 2009 data does match historical emissions levels and reflects historical investments in GHG efficiency. We reviewed California, national, and international emission/production data available for the past several years for the cement sector. These include the MRR, ARB industry survey, national data compiled by the Portland Cement Association (voluntarily provided by the Coalition of Sustainable Cement Manufacturing & Environment), and international data compiled by the World Business Council for Sustainable Development. We found that the MRR 2009 data was representative of historical emission levels over the past couple of years for California plants. We did not find a significant change in emission intensity due to early action (e.g., increase amount of biomass used in lieu of fossil fuel). We identify and use data from the most efficient operation among California facilities.

C-62. Comment: CARB ignores critical qualitative evidence in determining the trade exposure of the California cement industry, including nearly two decades of antidumping rulings. The California cement industry's extreme vulnerability to imports is evidenced by nearly two decades of antidumping rulings by the ITC. In support of these rulings, economists at the ITC analyze public and confidential firm-level data on price, market share, and profit. This is precisely the information that CARB would need to make a complete and accurate assessment of cost pass through ability. CARB should reclassify the California cement industry as "highly trade exposed." The weight of both quantitative and qualitative evidence conclusively demonstrates that the California cement industry has a high trade exposure, faces a high degree of competition from unregulated entities, and has extremely limited cost pass-through ability. CSCME recommends that CARB incorporate this evidence into its determination of the cement industry's trade exposure and place it within the "highly" trade exposure category. Although CARB has already designated the cement industry as "highly" leakage exposed, such a designation does not account for the fact that the cement industry's leakage risk is far beyond that of any other California industry's assessed risk. The combination of high trade intensity and high GHG intensity creates an extremely high risk of leakage for the California cement industry and justifies additional measures to minimize leakage in implementing AB 32. (CSCME2)

> **Response:** We do not believe it is necessary to add provisions to the regulation because the California cement industry is classified as a "high leakage risk" category and is therefore eligible for the highest level of compensation that ARB can provide in free allowance allocations for transition assistance and to mitigate leakage risks. We used a "trade intensity" metric to quantify the magnitude of competitiveness, as described in Appendix K of the Staff Report. Using that method, the cement industrial sector was placed in a medium category for trade intensity, with a trade share of 16 percent. However, we agree that competitiveness can be affected by various causes that may not be captured by a single metric. We intend to conduct additional analysis starting in 2013 while continuously monitoring the impact of the program on industrial sectors' competitiveness.

C-63. Comment: Create dynamic product output based benchmarks that reflect best practices in the cement sector. (UCS2, CADMANS)

> **Response:** We agree and set a best-of-class benchmark based on adjusted clinker and mineral additives produced for cement. The results are presented in Table 9-1 of section 95891(b), and the analysis is presented in Appendix B to the 15-day notice of changes to the proposed regulation.

Food Manufacturing

<u>*Product-Based Benchmark Not Appropriate*</u>

C-64. (multiple comments)
Comment: With approximately 400 agricultural commodities and even more byproducts on store shelves, it will be quite problematic for CARB staff to attempt to create product-based benchmarks for food processing. Management of a product-based system is beyond the scope of CARB's expertise. (ACC3, CALFP1)

Comment: Adopt the energy-based benchmark ("fallback") for food processors permanently. (CALFP1)

Response: We allocated free allowances to food processing facilities using the energy-based allocation calculation methodology, which bases allocation on the fuel and steam use of a facility.

Energy-Based Benchmark is Appropriate

C-65. Comment: Energy-based benchmarks are more acceptable to the food processing industry and would create a more streamlined system for CARB regulators. However, due to industry expansion, some flexibility should be allowed within the system to achieve collective goals of CARB and food producers.

A well-known industry set of standards and efficiency promulgated by a respected group, the American Society of Mechanical Engineers, should be used in place of CARB's proposed efficiency rule. These standards are familiar to processors, and were created over many years of study by a third party trade association. (ACC1, ACC3)

Response: The energy-based allocation calculation methodology was used to allocate allowances to food processors. As a clarification, we are not using an ARB-proposed efficiency rule for boilers, but are using, and recommending that affected facilities use, ASME PTC-4 for estimating boiler efficiency to estimate steam production.

Energy Efficiency Credit

C-66. Comment: Food processors have implemented energy efficiency measures for many years. These projects include flue gas recirculation and economizers for boilers as well as energy efficiency audits by third parties and utilities to optimize energy use. While more can be done, implementing the next generation of efficiency upgrades can be cost prohibitive for some facilities. CLFP recommends that CARB broaden the scope of qualified opportunities to receive credit for these investments in addition to clean burning fuels, such as Combined Heat and Power (CHP). (CALFP1)

Response: We believe that the energy-based allocation methodology provides both incentive for innovation and credit for early action.

Recognize EITE Nature of Food Manufacturing

C-67. Comment: In establishing an emissions benchmark, it is vital that CARB recognize that food processing is an energy intensive and trade sensitive sector that has a vital role in maintaining the California economy, and will be the key factor in any Central California economic recovery. (CALFP1)

Response: We recognize the role of food processors in the California economy and have designed an allocation system that accounts for the sector's contributions.

Comment: We are concerned that a three year average will produce a more punitive benchmark that does not reflect accurate energy needs. Because of the unique factors identified in the food processing industry, it would be more accurate for the industry benchmark to be set at the highest emissions level encountered in any one year operating period. Special consideration should be made for new facilities that do not have the operating history. For instance, new facilities with shorter baseline periods, in cases less than three seasonal years, should use the maximum full season operating emission rate. (CALFP1)

> **Response:** We disagree that it would be appropriate to allocate to food processing facilities based on the highest emission level encountered in any one operating period. The result of such an approach would likely be an allocation of allowances well beyond actual emission levels. Sale of these excess allowances would lead to windfall profits for the recipients of this free allocation. We did not adopt this approach.

Boiler Size Assumptions and Efficiency Benchmark

C-68. (multiple comments)
Comment: Staff assumptions regarding boiler size do not reflect agriculture or food processing industry standards or practices. Boilers currently used by most California food processors are larger than the averages that staff cites in support of its regulation. Boiler sizes range from 93 MMBtu to 183 MMBtu per hour natural gas input, significantly larger than the published estimates. Additionally, staff fails to take into account that all of the large processors return the boiler condensate to a deserter tank for reuse in the boilers at rates that are as high as possible and that the boilers utilized by food processors have blow down heat recovery units on all boiler systems and maintain steam traps in proper function. (CALFP1)

Comment: Staff has set boiler efficiency benchmark at 85 percent. This standard is set based on staff's own set of equations. Staff's need to employ a simple method for establishing CO_2e for individual industrial sites is understandable. However, staff's equations do not take into account the actual efficiency of steam production or end use in the food processing industry. This means facilities with very inefficient systems but low use won't be taxed at the same rate as a highly efficient facility with higher use. Order staff to utilize accepted ASME standards in calculating boiler efficiencies for food processors. (CALFP1)

Comment: I'd like to bring up the boiler efficiency calculations that were used for the allocation equation in J-4. In order for food processors to determine the annual steam production, it's necessary to use ASME equations for boiler efficiency. The only numbers available to food processors are fuel use and boiler efficiency. We use universally accepted methods for efficiency calculations, so we don't have an annual steam volume unless we can calculate it using our efficiency. Staff uses a number of 85 percent for fuel efficiency for their benchmarks for an efficient boiler. I assume that came from the ASME equation. You're going to push this efficiency and these boilers that we use to an extent that when you get above about 90 percent and you reach firing rates, it doesn't take long for something to go haywire and a boiler will explode. We need to continue to work with staff, and I think they will. And I appreciate the work that we've put in and the time. (DMF)

> **Response:** In developing the regulation, we developed the steam benchmark used in the energy-based allocation equation based on a highly efficient boiler of 85 percent efficiency. We selected this boiler efficiency benchmark after consideration of the industrial boiler efficiency technologies required to generate offset credits under the U.S. EPA Climate Leaders Program. A value of 85.7 percent for steam generation using natural gas is listed in the Department of Energy website. We are using, and we recommend affected facilities use, ASME PTC-4 for estimating boiler efficiency to estimate steam production. In gathering facility data for allowance allocation purposes, we determined that the default boiler efficiency factor of 85 percent for deriving the steam emission efficiency benchmark (B_{steam}) is achievable, stringent, and appropriate. Boiler size is not used in the ASME PTC-4 boiler efficiency calculations, and we are not attempting to use the parameters mentioned to set standards for boiler efficiency or food-processing technology standards.

Glass

Support

C-69. Comment: GANA supports establishment of separate CO_2 equivalent emission intensity benchmarks for container, flat, and fiber glass manufacturing sectors. (GANA)

> **Response:** No response necessary.

Use Nationwide Benchmark

C-70. (multiple comments)
Comment: GANA strongly urges CARB to include all applicable float glass furnaces operating nationwide in the establishment of the emission intensity benchmark for the flat glass sector, as opposed to restricting such scope to only California or the WCI region as the draft regulation currently contemplates. This will ensure that the benchmark established for purposes of applying CARB's cap and trade regulation is fully representative of actual industry operations over the course of a furnace campaign. During the course of a flat glass furnace campaign, many factors or variables will affect the GHG emissions intensity of the flat glass operation, including the age of the furnace, the types of products made, the types of burner technologies employed, the types of downstream value added processes employed, and repair periods such as cold repairs and hot holds. A benchmark developed on the basis of just the three float glass operations in California would not be representative of standard industry operations. In order to develop a nationwide average of flat glass industry operations, GANA suggests that CARB utilize the data that industry will submit in 2011 for its 2010 emissions as

required by the U.S. EPA federally mandated GHG reporting program. The data that will be submitted as part of the federal mandate will be verifiable, cover all or almost all flat glass furnaces nationwide, and include production data to an extent that it can be used to establish an accurate and representative industry average emission intensity. (GANA)

Comment: Establish an EEB for the container glass manufacturing sector employing nationwide data, not California-only data. (SMITHS)

> **Response:** We analyzed credible data available iteratively in deriving product benchmarks. On a case-by-case basis, national data may be used for developing the benchmark, but most frequently it is used as a check for the benchmark developed using California facility data. We consider various factors in establishing a product-based benchmark for free allowance allocation. We believe that the focus of benchmarking under cap-and trade is to create the correct incentive for California facilities to reduce GHG and protect them from leakage. This means that, in most cases, it is appropriate to avoid benchmarks differentiated by technology, fuel mix, size and age of the facility, climate circumstances, or raw material. Ensuring that all GHG emissions-abatement options remain viable is an integral part in our development of product benchmarks.

C-71. Comment: California's fiber glass insulation plants are the best performing in the nation. It is important to compare California's performance to that of the other mineral wool plants throughout the United States, as they would be the primary source of fiber glass insulation for the California market if the industry's California plants cannot supply the market. Based on the average performance of U.S. plants, NAIMA recommends a benchmark for the fiber glass (mineral wool) industry of 0.463 MT CO_2E per metric ton of glass pulled. One hundred percent of the average U.S. direct and process emissions are 0.463 MT CO_2E per metric ton of glass pulled. (NAIMA)

> **Response:** We analyzed California's fiber glass manufacturing activities in establishing a benchmark per short ton of fiber glass pulled. We believe that the focus of benchmarking under cap-and trade is to create the correct incentive for GHG reduction while protecting against leakage. Like the benchmarking of other sectors, the use of California production activities is appropriate. In our analysis of data, we used national and international data to check the benchmark we developed in Table 9-1 of section 95891(b). The benchmark in SI units is comparable to the suggested benchmark.

<u>Data Sources</u>

C-72. Comment: If CARB determines upon evaluation that none of the data available to it through the federal mandatory GHG reporting rule or other existing reporting programs is adequate to support the above proposals, then GANA requests a meeting with CARB to discuss other methods by which existing information may be supplemented or made available through mechanisms that can ensure the confidentiality of individual company information. (GANA)

> **Response:** We stand ready to meet and discuss issues related to the development and implementation of the regulation through mechanisms that can ensure confidentiality of individual company information.

Averaging Period

C-73. Comment: GANA proposes lengthening the output based averaging period to five years with provisions to drop the high and low years in order to account for furnace maintenance cycles in the flat glass industry. Using the average of three years output to calculate projected allocations will still be problematic and materially inadequate if that three year time period includes a year in which a hot repair, hot hold, or furnace cold tank repair (CTR) takes place. During a hot hold (idling conditions), no product is being produced but the furnace is kept hot. On average, a typical regenerative furnace uses 50 percent of the energy needed to operate the furnace at full production capacity, in order to maintain the heat in the furnace during a hot hold with no production. This amount of energy represents the minimum amount of heat needed to run the furnace and is independent of output. Hot holds are generally done for emergency repairs of the furnace and are not done very often. They can generally last up to a couple of months so they can affect the allocations given for a site in the following year when production is full under the currently proposed allocation method. Similarly for CTRs, there are periods of time in which fuel is being combusted for heat-up and initial raw material charge, but no product is being produced. Under the current draft regulations, these activities would result in under allocation for the following year during normal production. In order to account for this standard industry maintenance practice in a manner that reduces the likelihood of leakage while achieving the goals of the cap and trade program, GANA urges CARB in the final regulations to calculate the output factor used in the product-based allocation formula for the glass sector from the production in years t-2, t-3, t-4, t-5 and t-6, dropping the year representing the lowest production and the year representing the highest production and the arithmetically averaging the remaining three years to arrive at the output factor in the allocation formula. This approach ensures that flat glass sites will be adequately covered despite the potential distortion of the necessary maintenance periods. Additionally, this approach will also help protect the industry in the beginning few years of the program against the lingering impacts from the severe economic downturn by allowing the year that was most heavily impacted by it to be dropped from the average. This averaging method, in which the high and low years of the five are dropped, is the basis for the flat glass industry allocations in the European Union and has been found to be a reasonable and fair approach for that program. GANA appreciates staff's consideration for the longer output averaging period currently in the draft regulation but in order to further protect against leakage within the glass industry, GANA urges a further refinement of the method: using a five-year look-back period with a provision to factor out years impacted by heat-up periods and hot holds. (GANA)

Response: We added a "true-up" term ($O_{a,trueup}$) for adjusted outputs not properly accounted for in prior years' allocations in the equation for calculating allocations under section 95891. We believe this addresses the commenter's concern.

Production Stoppages

C-74. Comment: Ensure that container glass facilities with production stoppages (e.g., due to a cold repair) are not penalized using the "recent output" formula input. CARB has attempted to address this potential unfairness in the definition of "output." which states: "If three years of data are unavailable the Executive Officer may employ a shorter time period to calculate the annual average." CARB should clarify, however, that periods of suspended operation, including the diminished production levels following such suspensions, will not reduce the allocation of GHG allowances in following years as production returns to meet market demands. (SMITHS)

Response: We added a "true-up" term ($O_{a,trueup}$) for adjusted outputs not properly accounted for in prior years' allocations in the equation for calculating allocations under section 95891. We believe this modification, together with the annual updating of product outputs, adequately addresses production fluctuations.

Consider Different Technologies

C-75. Comment: Early discussions with CARB staff indicate a preference regarding glass melting furnace design and operation which essentially results in remedy selection. The concerning issue is that it appears that staff has limited understanding of the glass manufacturing process and the total energy requirements associated with different furnace designs and combustion technologies.

Staff should not determine remedy in a cap and trade scenario where the intent is to drive new technologies forward. Likewise staff should not determine the industry winners and losers due to a narrow focus on a portion of a process's GHG emission rather than the collective GHG footprint associated with the entire process. In some cases this may require the inclusion of indirect GHG emissions associated with electrical consumption or a bifurcation of glass manufacturing sector technologies.

The apparent preference of staff to oxy-fueled furnaces as opposed to regenerative furnaces is a poignant example. Although oxy-fueled furnaces will demonstrate a slightly lesser GHG emission footprint in direct emissions due to a lower fossil fuel combustion rate in comparison to a regenerative furnace, once the indirect GHG emissions associated with the electricity requirements for the production of oxygen is included with the direct emissions of each type of furnace the GHG emission gap is at a minimum eliminated.

CARB staff must take into consideration the need to bifurcate certain industry sector technologies to assure that an inadvertent unfair advantage is not provided to certain manufacturing companies and/or technologies. (OWENSIL)

Response: We developed a separate benchmark for container, flat, and fiber glass manufacturing, and the results are presented in Table 9-1 of Section 95891(b). We believe that the focus of benchmarking under the cap-and-trade program is to create the correct incentives for GHG reduction while preventing leakage. This means that, in most cases, it is appropriate to avoid benchmarks differentiated by technology, fuel mix, size and age of the facility, climate circumstances, or raw material.

Product Weight

C-76. Comment: Additional protection is necessary to protect the capacity of regulated sources rather than simply focusing on their actual emissions. Under the federal New Source Review program as well as California's State Implementation Plan, the analysis of a source's historical production is evaluated by accounting for the level of production that the source was capable of accommodating. See, e.g., 40 CFR section 52.21(b)(41)(ii)(c) (the "demand growth exclusion"). Thus, if a customer seeks a lighter bottle that requires less material, which thereby reduces the container glass furnace's glass pull rate, the source is not punished for making that lighter and more environmentally friendly product. By contrast, without a similar provision in the proposed Cap and Trade Program, a purely output-based calculation of GHG allowances would create a perverse disincentive for every manufacturer to avoid producing lighter products because, by doing so, that company would effectively forfeit payment of its ability to return to a heavier product afterward. (SMITHS)

Response: By reducing the amount of material used per bottle, a facility furnace can produce more bottles based on a constant glass pull rate. If this additional capacity is realized in the production side of a facility, this allows the facility to sell more bottles. Even though allocation is based on glass pulled, a facility will have the opportunity to sell more light bottles with the same emissions and allocation. That is a direct incentive from the cap-and-trade program to create lighter bottles. In addition, benchmarking on a per bottle basis poses data challenges requiring different benchmarks based on size and weight.

Hydrogen

C-77. Comment: In order to insure equitable treatment of all market participants, third-party owned/operated hydrogen production facilities must be included in benchmarking determination and the allowance allocations. (APC)

Response: We developed a separate benchmark for hydrogen gas based on the amount of hydrogen gas produced. The benchmark is presented in Table 9-1 in section 95891(b).

C-78. Comment: The principle objective of the benchmarking process should be to insure equitable treatment of all sector participants through methodology that appropriately reflects the emission performance relative to production output. The benchmarking method must provide both an accurate relative ranking, and an absolute (emissions per unit of production) measure for all sub-processes within the sector—specifically, petroleum refining and hydrogen production, including third-party hydrogen production. It is not possible to provide equivalent and equitable treatment of both captive and third party hydrogen plants using the "output barrel approach" as the emissions associated with captive hydrogen plants will not be differentiated from total refinery emissions and there are no "output barrels" directly associated with third-party hydrogen plants. (APC)

> **Response:** We recognize that equity issues exist between allocation to third-party production of hydrogen gas sold to petroleum refiners and refinery-owned hydrogen production. We believe that employing the CO_2 Weighted Tonne (CWT) approach for the refining sector is the best way to address this issue. We present a separate benchmark for hydrogen gas based on the amount of hydrogen gas produced in Table 9-1 in section 95891(b). This value will be used to allocate to third-party hydrogen facilities. It is derived from the hydrogen CWT function and is identical to the value that would be applied to refinery-owned hydrogen production under the CWT approach.

C-79. Comment: If an interim method would be necessary for the first compliance period, it still needs to be a method that maintains the equitable treatment of third-party hydrogen producers. We recommend that CARB adopt the absolute benchmark value (in tonnes CO_2-e/tonne hydrogen produced) that is being adopted as the EU ETS Phase 3 hydrogen benchmark and apply this benchmark as the basis for allowance allocations directly to the third-party hydrogen producers. (APC)

> **Response:** We agree. The Phase 3 EU ETS hydrogen gas benchmark is based on the CWT approach. We modified the hydrogen gas benchmark in Table 9-1 to align with this value.

Paper Industry

C-80. Comment: Facilities in California are typically already using a combination of natural gas as fuel and combined heat and power technology, and therefore, are already high performers from a GHG perspective. Under a sector averaging approach, the extremely low number of facilities that would comprise the benchmark in California—three paper manufacturers and two paperboard mills—would make it impossible to develop a reliable statistical measure of GHG performance. (AFPA)

> **Response:** We agreed that, from a statistical point of view, averaging data from three or two facilities has limitations. However, in developing benchmarks for industries with a low number of facilities in California, we analyzed different data

sets, including national data, to check the appropriateness of the benchmarks. From the perspective of the equitable distribution of free allowances to California facilities to minimize leakage risk, we believe that it is appropriate to use California facility data.

C-81. Comment: As we communicated in our January 2010 comments to CARB, AF&PA strongly supports the use of actual emissions as the basis for allowance allocations. The use of benchmarks, in particular, product-based benchmarks, as the basis for allocation is unworkable for several manufacturing sectors, including paper and paperboard, and arbitrarily creates winners and losers.

Unlike the cement and steel industries, most manufacturers, including the forest products industry, have large variation in products and processes. Due to this large variation, dissimilar products and processes would be placed in the same sector category under this approach. This results in a completely unrepresentative benchmark which will, in turn, over-allocate allowances to some facilities and under allocate allowances to others in a manner that is not based on their comparable efficiencies.

The industry has conducted an internal analysis of the allowance allocation method included in federal cap and trade legislation proposed earlier this year i.e.; sector GHG efficiency average by six-digit NAICS product code. This analysis of pulp and paper manufacturing, including the paper and paperboard sectors, showed no correlation between greenhouse gas emissions and product type. As a result, the distribution of allowances differs so significantly across facilities that it can be viewed as market distorting versus a reasonable “reward for early action” or a “correct incentive to produce a given product in the cleanest way (lowest emitting way) possible,” (page J-21) as intended. For example, the distribution of annual costs borne by an individual facility within a NAICS code ranged from an expense of $15 to $20 million (at a $20 allowance price) for some mills to $9 million in revenue for others. The magnitude of such costs will force facilities to close rather than invest in efficiency improvements. The application of such benchmarks in a regulatory setting is inappropriate. Furthermore, excessive spending to purchase allowances only serves to drain resources that could have been spent on capital improvements to reduce GHG emissions.

Rather than product type, our analysis shows that fuel type, and degree of integration and steam production, are the overriding factors that determine a facility’s greenhouse gases. In most cases, these factors are intrinsic to a facility’s operations and cannot be changed without changing the basic nature and/or configuration of the facility. For example, it would be unreasonable to expect a non-integrated paper or paperboard mill using natural gas, similar to those in California, to alter its operations so extensively as to begin producing, rather than purchasing, pulp (i.e., become integrated) and use biomass fuel. Any benchmarks developed for regulatory purposes should take these factors into account. (AFPA)

Response: We disagree with the commenter's approach taken to analyze the paper industry and used a different approach in our analysis. In our analysis, we disaggregated each of the products from each of the six-digit NAICS codes. We analyzed three different product types under NAICS code 322130 and one product type under 322121. Under these subcategories, we found a relationship between greenhouse gas emissions and production, and produced benchmarks accordingly. These benchmarks are found in Table 9-1 of sections 95891.

C-82. Comment: The European Union has developed GHG benchmarks for industry allowance allocation under its Emissions Trading Scheme. It should not be assumed that such benchmarks are applicable to U.S. operations. As policymakers work toward an international climate agreement, a global carbon market, and examine comparable actions by trading partners, it will become evident that many U.S. manufacturing sectors are less energy efficient than their international competitors. Due to poor economic health, historically lower energy costs, and high capital costs required to make investments in alternative fuels and energy efficiency, the U.S. Forest Products Industry GHG profile does not compare favorably against some of its international competitors, both in developed countries and in emerging economies where state of the art facilities are being built, frequently with government subsidies. International benchmarks used as the basis for sector crediting in developing countries or border adjustments will only serve to put many U.S. manufacturers at a competitive disadvantage and eventually out of business with a corresponding loss of hundreds/thousands of jobs. (AFPA)

Response: We disagree and do not believe it is necessary to add provisions to the regulation to modify benchmarking stringency. We believe that benchmark stringency should reflect the emissions intensity of highly efficient, low-emitting facilities within each sector. We believe the benchmark stringency we have selected will minimize leakage in the forest products sector.

Refineries / Oil & Gas

C-83. Comment: The criteria for determining which benchmark to use for the refining sector, is not specified. Nor is it fully understood how each of the options would impact WIRA members. (PMTPETRO1, WIRA1)

Response: Per Board Resolution 10-42, we finalized the allowance allocation system, including benchmarks for allocation to industrial sectors, prior to the start of the first compliance period in 2013. Benchmarking for the refining sector was completed in the second 15-day changes to the regulation.

Support

C-84. Comment: WSPA concurs that the upstream oil and gas sector is highly trade exposed and should receive an assistance factor of 1.0 for all three compliance periods. We recognize the benchmarking methodology for the upstream sector in the staff proposal as a credible first step. (WSPA1, WSPA2)

Response: No response necessary.

C-85. Comment: We share ARB staff's desire to ensure that the final refining benchmark is based on energy efficiency and that the final thermal and non-thermal differentiated upstream benchmark is completed from validated data. (CHEVRON1, CHEVRON3)

Response: No response necessary.

Use Best Practices

C-86. Comment: Any free allocations based on production should be based on the most efficient refinery and not reward refineries with higher GHG emissions due to the type of crude refined or their configuration. Benchmarks for any free allocations should be based on the type of intermediate or final product produced and whether the process begins with an unrefined or a partially refined intermediary product, and updated based on best practices similar to Best Available Control Technology for criteria pollutants. (ICCT1, ICCT2)

Response: Benchmarking is used as a tool in a cap-and trade program to compare GHG performance across similar industrial sectors. Our process in product benchmarking includes selecting appropriate products, examining emissions and expected carbon costs, and determining benchmark stringency. The operational specificities, hence energy requirements, for the production of the types of products are taken into account in developing the benchmarks. The goal of our approach is to provide flexibility for the affected facilities to comply, as well as incentives for technology innovation. Best practices, technology forcing, or best available technology benchmarks are in essence benchmark stringencies, frequently used in setting emissions standards. In a market-based program such as cap-and-trade, the goal of benchmarking is to allocate free allowances to assist facilities with the cost of compliance, to prevent leakage and to incentivize them to reduce GHG emissions. We set the product benchmarks to reflect the emission intensity of highly efficient, low-emitting facilities within each sector. We believe that our method and design will provide effective incentives for the affected industries to reduce emissions and stay operating in California.

Baseline Emissions

C-87. Comment: Our Coker Modification project, completed in 2008, has resulted in reduced CO_2 emissions of an estimated 462,000 tonnes/yr. In response to our request for "Early Action Credit" for this project CARB's letter of April 10, 2010, stated that the project would "save Tesoro millions of dollars per year in the form of either a reduced need to purchase allowances at auction or in the form of allowances given for free." While the WSPA proposed tempered Ell methodology may result in realizing these savings, appropriate setting of the baseline years as allowed in the regulation will ensure our investment is recognized; specifically, the historical baseline for emissions must be based upon the most representative certified data from the time period 2006-2010. We also request that ARB consider a specific treatment of this project if it becomes impossible to adequately address this issue within the scope of the allocation method. (TESORO)

Response: Our benchmark-based allocation system recognizes and encourages early action. Benchmarks are chosen to reward facilities who have historically chosen to employ low-GHG fuels and enhance their emission efficiencies of their production process. As stated, the Coker Modification project's reduction in CO_2 emissions would "save Tesoro millions of dollars per year in the form of either a reduced need to purchase allowances at auction or in the form of allowances given for free" under our cap-and-trade program.

C-88. Comment: The historical baseline emissions for refineries should be based upon the most representative certified data from the time period 2006-2010 using defined criteria. Quantities for 2013 and 2014 would be this same amount but adjusted by the cap adjustment factor. (WSPA1, WSPA2)

Response: We use an average of the three most current years of product output and emissions data in developing the simple barrel product benchmark. The data sources considered include ARB Mandatory GHG Reporting, ARB industry surveys, U.S EPA Mandatory Reporting, California Energy Commission fuel production data, European Union Emission Trading Scheme Studies, academic literature, and stakeholder-provided data. The first-period allocation to individual refineries offers flexibility to use 2006-2010 data in establishing representative emissions baselines.

Small Refineries

C-89. (multiple comments)
Comment: Cap and trade should be designed to encourage the manufacture of products to reward processes that use the least energy per unit of output. In refining, the more complex the refinery, the greater the greenhouse gas emissions needed to make a gallon of transportation fuel. WIRA member refineries are simple operations that have historically made it more difficult for them to meet your specifications. Here, however, the carbon emission WIRA members generate to make transportation fuels are less than the greenhouse gas emissions the big oil companies generated to make a gallon of transportation fuel. The allocations system should not ignore and disadvantage the efficiencies of the small and less complex WIRA members, and we'll continue to work with your staff to ensure the proper outcome. (WIRA2)

Comment: Full recognition of more efficient, less complex refiners by utilizing the simple barrel output method across the full slate of products. Efficiencies should not be averaged nor reduced in a manner that disadvantages small, less complex facilities to larger, more complex facilities. An energy intensity index approach may represent similar results; however, any manipulation within the index could disadvantage more efficient refiners. Kern is concerned that future efficiency reductions should not be weighted in a manner that rewards prospective efficiency over existing efficiency. It is clear that reductions from an inefficient facility will be easier and less costly to achieve than reductions from a facility that is already incurring costs to operate more efficiently. (KERNOIL1)

Comment: The larger and more complex the refinery, the greater the GHG emissions are per gallon of produced transportation fuel. This fact of the refining industry needs to be recognized specifically within the regulation. Currently, small and large refiners are categorized the same throughout the regulation. Staff should provide separate tiers within the regulation. This disaggregation would allow for a more tailored approach on the various aspects of the program, including benchmarking and leakage analysis. (WIRA1)

Comment: The regulation, as proposed, does not make a distinction between large complex refineries and smaller simpler refining operations of the type owned and operated by Paramount. Small, non-complex refineries are dramatically different from the larger complex refineries of major oil companies, and this difference needs to be acknowledged within the Regulation. With some relatively minor changes, the Board can alter the proposed program to acknowledge the distinction between large and small refineries, and recognize that small refineries actually produce transportation fuels with the lowest greenhouse gas profile available. Choosing a specific benchmarking metric at this point, without further analysis, could put independent refiners at a disadvantage in the market. In addition, since these small refiners survive on very thin margins which are often non-existent (unlike the majors, who make money on the production and marketing side of the business), so one mistake in CARB's regulatory program can lead to the quick demise of the few small refiners remaining in California. The larger and more complex the refinery, the greater the GHG emissions per gallon of transportation fuel produced. Currently, small and large refiners are categorized the same throughout the Regulation. Staff should provide separate tiers within the Regulation or find other ways to distinguish between large and small refiners. This disaggregation would allow for a more tailored approach on the various aspects of the program, including benchmarking and leakage analysis. (PMTPETRO1)

> **Response:** As stated in Appendix J of the Staff Report, we recognize the differences between simple and complex refineries. Our first-period allocation to refineries explicitly recognizes this difference by creating a category for complex facilities (those with a Solomon Energy Intensity Index value) and simple refiners (those without a Solomon Energy Intensity Index value). The CO_2 weighted tonne (CWT) approach that will be used beginning in the second compliance period is designed to account for the complexity of each facility and creates an equitable balance between simple and complex facilities.

Sector Allocation

C-90. Comment: Starting in the second compliance period, the free allowance quantity for the sector would vary according to the throughput-based benchmark calculation proposed in the regulation (see section 95891). The basis for the benchmark would be one that reflects refinery complexity. (WSPA1, WSPA2)

> **Response:** We agree. In the first compliance period, we use the simple barrel benchmark to determine an initial aggregate number of allowances available for the refining sector. Because of the complex nature of the refinery process (i.e., input, output, and configuration all impact emissions), the simple barrel approach to benchmark refineries has some limitations when used to allocate to individual facilities. To address this issue we developed an approach based on the Solomon Energy Intensity Index for complex facilities in the first compliance period. In the second and third compliance period, we use the CWT approach, which is a throughput-based benchmark that reflects refinery complexity.

Alternative Approaches

C-91. (multiple comments)
Comment: We have worked diligently with other WSPA members in the development of the tempered Ell approach to allocation for the first compliance period and are encouraged by your mention of this approach in the proposed regulation. Our internal work has shown the CWT methodology adopted in Europe is inadequate in terms of recognizing and rewarding improvements in processing technology or efficiency and that it exaggerates the carbon intensity differences between refineries relative to realistic opportunities to reduce carbon intensity. The tempered Ell approach allows a measured approach towards benchmarking for the first compliance period while developing a more comprehensive approach for the future. (TESORO)

Comment: For the first compliance period, WSPA proposes a tempered Energy Intensity Index (EII) methodology for refineries that would allocate direct free allowances based on a facility's Solomon EII metric and emissions, compared to the other sector facilities and the sector total emissions. WSPA has suggested that for the second and third compliance periods, a comprehensive, complexity-weighted methodology (yet to be developed) would be used to establish a benchmark and a basis for distribution of free allowances. (WSPA, WSPA2)

Comment: The Solomon Energy Intensity Index (EII) approach provides a better relative ranking of petroleum refining activities, but the fact that it solely considers energy consumption and does not effectively consider process emissions, the EII method does not reduce to an effective absolute measure (emissions per unit of production) as a benchmark. Further, since process emissions make up the predominant fraction of total GHG emissions from hydrogen production, this method will be particularly unfair for third-party hydrogen production. In order to establish a relationship between EII and GHG emissions, CARB will have to be very careful to separate refineries that produce hydrogen from those that purchase hydrogen—or include an allocation of the appropriate third-party energy consumption and GHG emissions associated with imported hydrogen dedicated to each refinery in the benchmarking analysis. (APC)

Comment: The actual energy efficiency difference between the most efficient refinery and the least efficient refinery is only 15 to 20 percent. Therefore, the benchmarking scheme used should not vary in the amount of coverage of emissions that are given out as free allowances by more than 15 to 20 percent. This percentage should be applied to the required percent reduction. For example, if the industry as a whole had to reduce emissions by 10 percent, then the difference between the percent allowances between the best in class and the worst in class should not be more than 15 to 20 percent of 10 percent or 1.5 to 2.0 percent (i.e., best gets 92 percent of required allowances and worst gets 88 percent). If the absolute percentage of 15 or 20 percent were used, then the best would get 110 percent and the worst would get only 70 percent of allowances needed. Clearly the best in class refinery cannot be three times more energy efficient than the worst, but that is the magnitude of the reduction required or allowances that need to be purchased if benchmarking is not applied fairly. The benchmarking issue has the potential to pick winners and losers and must be carefully developed and applied. (VALERO)

Comment: Create a refinery benchmarking process that does not reward or penalize individual refineries. CARB is proposing that allowances be distributed within the refining sector in part based on energy efficiency benchmarking (see section 95891(b)). The use of the Solomon Energy Intensity Index (Ell) has been suggested as a potential tool, but with the critical caveat that it include "tempering" to soften the competitive differences between more efficient refineries and less efficient refineries. We have two concerns. First, as proposed, benchmarking would begin immediately in January 2012. The additional and immediate competitive costs borne by some refiners would make them less competitive at a time when investments in energy efficiency are needed. Refineries should not be rewarded or penalized in the issuance of allowances based on current energy efficiency. Improvements in energy efficiency may be possible, but projects that would have significant impact (e.g. cogeneration units) would take up to four years to engineer, fund, construct and place in operation. Second, the Solomon Ell metric has traditionally been used as a relative indicator of energy efficiency versus peers. It was not envisioned or designed for any financial use. It is a theoretical tool, and is highly dependent on the user's data and assumptions. While the Ell has a correlation with GHG emissions, it is not precise in that it excludes significant process emissions of carbon dioxide from hydrogen plant operations and other sources. Lower refinery utilization (throughput) can significantly increase Ell without any changes to the facility. Solomon has also updated the tool in recent years, which can make year-to-year comparisons challenging. It is an imperfect tool for distribution of allowances to the refining sector. We recommend deferring benchmarking to 2015 to avoid immediate competitive impacts that would start in January 2012. Energy costs and the cap-and trade system will provide immediate incentive for energy efficiency improvement. If Solomon Ell or surrogate is selected as the benchmarking metric for refinery energy efficiency, the use of it should include significant phase-in and "tempering." This tempering would be a simple smoothing of the mathematical application of Ell to reduce the current and immediate competitive differences between various refineries. CARB should work with our industry to develop the best tool for greenhouse gas benchmarking for use as soon as possible and no later than 2015, incorporating best practices from the European system. (CONOCO)

Comment: We recommend employing the Carbon Weighted Barrel (CWB) approach as the benchmarking method for the Petroleum Product Manufacturing sector. Since the methodology distinguishes between the emissions resulting from each discrete processing step, it allows for a benchmark for hydrogen production to be defined which is representative of all production processes and producers. Therefore, this method allows for equitable allocation treatment of both captive and third-party hydrogen production. CARB would benefit from building directly on the work of the EU ETS Phase 3 program development. (APC)

Comment: More analysis of the refining sector is needed. Staff has acknowledged in the Staff Report and in recent meetings that many technical details still need to be analyzed with respect to the allocation distribution formula. It is currently unclear exactly how each of the benchmarking options proposed will affect WIRA members. A fuller understanding of CARB proposals is needed before a conclusion can be reached. WIRA is committed to working with CARB staff to resolve these technical issues and requests that the Board direct staff to continue these discussions with industry. Choosing a specific benchmarking metric at this point, without further analysis, could put independent refiners at a disadvantage in the market. (WIRA1)

> **Response:** We analyzed a wide variety of proposals for refinery benchmarking. Our approach is outlined in Appendix A to the second 15-day changes to the regulation. The first compliance period approach is based on the simple barrel benchmark for the simple facilities and the Solomon EII approach for the complex facilities. This approach includes the “tempering” requested by stakeholders to address transition risk. The second compliance period employs the CWT approach, which is a throughput-based benchmark that reflects refinery complexity. This approach is very similar to the Carbon Weighted Barrel (CWB) approach recommended by some stakeholders.

First Compliance Period

C-92. Comment: WSPA recommends that the free allowance quantity for the refinery sector be fixed for the first compliance period. For 2012, the free allowance quantity should be set at 100 percent of historical baseline emissions for the sector. Any baseline determination should recognize significant refinery expansion and configuration changes. (WSPA1, WSPA2)

> **Response:** The first compliance period starts in 2013; this is a change noticed in the first 15-day changes to the regulation. No free allowances will be given in

2012. The total amount initially allocated to the refining sector will be set based on the simple barrel benchmark for the first compliance period. The amount allocated to individual facilities will recognize expansion and configuration changes through the true-ups built in to the allocation approaches for all compliance periods.

Allocation to Oil and Gas for Electricity Use

C-93. Comment: Because upstream oil and gas operations are highly trade exposed, we propose that the sector receive the allowances for indirect electricity use directly, as opposed to the provision of giving those allowances to the distributors. Currently, the draft rule proposes that industrial customers receive energy efficiency programs or other indirect assistance instead of the direct rebates required to address carbon cost impacts on consumers and commercial sectors. Direct allowance distribution to the sector will more fairly address the impacts of higher energy costs that would otherwise disadvantage this highly trade exposed sector. These allowances for imported electricity can be deducted from the utility sector to prevent double counting. (WSPA1, WSPA2)

Response: We do not believe it is necessary to add provisions to the regulation to include indirect emissions associated with electricity at this time. In the program framework, an adjustment factor was not made for power purchased in establishing the product-based benchmarks. This is because purchased power may not create an indirect carbon cost in all California utility service territories. It is ARB's goal to see a carbon price properly embedded in all utility rates. If and when this occurs, the compensation for these indirect carbon costs could be incorporated into the product benchmarks (or reductions in these costs created in some other fashion) to help minimize leakage. We will revisit this issue once the California Public Utilities Commission Proceeding addressing utility costs and revenue issues associated with greenhouse gas emissions concludes.

Associated Gas with Oil Production

C-94. (multiple comments)
Comment: The draft rule may not clearly address associated gas with its level of GHG emissions. Associated gas requires considerable compression (i.e., electricity) along with gas treatment etc. If the associated gas is not included correctly along with the barrels of oil, the calculation will be in error. We will work with ARB staff to develop the correct method to benchmark for associated gas with oil production. (WSPA1) (WSPA2)

Comment: An additional NAICS code (211112) needs to be added to oil and gas extraction sector in table 9-1 on A-80. Product output could be a barrel of natural gas liquids by natural gas extraction. The point of regulation should be tied to the point of collection for the "position holder" definition used in the excise tax laws. If the proposed regulation is not harmonized with the excise tax proposed regulation, issues could arise in the context of fuel sold via an exchange agreement (2-3 party exchanges), in-tank transfers, or terminal product purchase agreement. (WSPA1, WSPA2)

> **Response:** The production of associated gas is accounted for in the oil extraction benchmarks. To accomplish this, we convert gas extracted into "barrels of oil equivalent" and use this as the metric for these benchmarks. We modified the regulation to include NAICS Code 211112. The benchmark for natural gas liquid production was included in Table 9-1 of section 95891(b).

Reduce Cap Adjustment Factor

C-95. Comment: Occidental concurs that the upstream oil and gas sector is an Energy-Intensive Trade-Exposed ("EITE") sector and should receive an Assistance Factor of 1.0 for all compliance periods. Without such EITE classification, inclusion of the upstream sector in a cap and trade program will create a disadvantage for California oil and gas production facilities relative to out-of-state (or out-of-country) competitors that do not face similar requirements. A final benchmarking approach must embody this complexity, which the single benchmark for non-thermal operations does not capture. There are many important factors that would allow appropriate definition of the non-thermal category and benchmark(s): Maturity of production operations; The use of non-thermal enhanced recovery methods; Special operating conditions; The extent of gas production and processing; The type of downhole fluid lifting technology used; The degree to which other operations at a facility are integrated with oil production operations; The GHG emissions profile for a facility's electricity. A benchmarking approach that does not consider these factors would significantly disadvantage certain upstream producers. It is imperative that the final methodology incorporate all relevant factors to allow for fair and equitable treatment of upstream operators. Occidental strongly urges the inclusion of a mechanism to reduce the initial rate of decline in the Cap Adjustment Factor for the upstream sector to avoid undue burdens on the competitiveness of affected California operations. (OPC)

> **Response:** We remain concerned about differentiating product benchmarks by process type or technology. Our goal is to remain neutral to technology choice to allow for choices that reduce greenhouse gases. For example, in the first 15-day changes to the regulation, we considered the use of the American Petroleum Institute's gravity metric (API gravity) to differentiate products in the oil production sector. This method resulted in two benchmarks, one for the production of heavy crude oil and one for production of light crude oil. This approach would have been more consistent with our "one product one benchmark" principle than an approach with a multitude of process technology-based benchmarks. However, in response to industry's comments on the first 15-day changes to the regulation, we reverted to the thermal and non-thermal framework for the second 15-day changes to the regulation due to concerns about heavily disadvantaging the extraction of light crude oil using thermal methods.

Soda Ash

C-96. Comment: Modify Appendix J, table J-4 as follows:
(1) NAICS Code 212391 has an ARB Classification of Soda Ash Mining and Manufacturing. The more appropriate classification would be: Potash, Soda and Borate Mining and Manufacturing.
(2) D.l.f.v. Product-Based Benchmarking: Soda Ash Mining and Manufacturing (NAICS 212391) I General Stationary Fuel Combustion Sources (Subpart C). The operation at Searles Lake referenced in this section produces multiple soda and borate products, previously produced potash and has the ability to produce potash in the future. The final paragraph in this section states that staff proposes using tons of soda ash produced as the output metric for this sector. A more representative metric would either be tons of product produced or tons of potash, soda and borate product produced. (SVM)

> **Response:** We modified our regulation to include NAICS Code 212391 in Table 9-1 of Section 95891. This code is defined as Potash, Soda, and Borate Mineral Mining, with a benchmark of 0.948 short ton of soda ash equivalent.

Solar Turbines

C-97. Comment: The proposed benchmarking approaches, and Allocation Assistance Factors for the purposes of emission allocations, do not appear to be appropriate for Solar's operations or products. The Industry Assistance Factor presented in Table J-3 and benchmarking process should be developed uniquely for Solar since we are the only operation in our industry classification and should reflect our limited ability to switch to lower carbon strategies. The regulation should not be adopted for our industry sector until the benchmarks are completed and verified. (SOLARTURBINES1, SOLARTURBINES2)

> **Response:** We modified our regulation to include NAICS Code 333611 in Table 9-1 of Section 95891. Under this NAICS code, we have added a benchmark for testing of turbines and turbine generator sets.

Leakage

General Concerns about Leakage

C-98. (multiple comments)
Comment: Please do not go forward with this. This is a recipe for disaster for all of California. Why should people or companies pay to pollute the air and then every company that can't afford to pay will end up leaving this state and then where does that leave us? (CMWEBER)

Comment: The state of CA does not need Cap and Trade. What we need is a government that will create jobs not additional taxes or ways to have business leave this state. Additional regulation will drive businesses out of the state. No on Cap and Trade. (PENCE)

Comment: We already have some of the strictest environmental laws in the country. Arizona is just miles away - please don't force us there or to Texas. We want to stay here. (LYNES)

Comment: Please no more regulations. Please do away with Cap and Trade. We need jobs in California not more questionable environmental regulations. What good are these regulations when industry just leaves the state and the country? (ROTH)

Comment: California cannot afford this program. By imposing these rules on California we will simply export more jobs the people who are doing the most pollution. (HERNDON)

Comment: I am opposed to the implementation of AB 32. I believe it will cause many, many companies to leave this state. As for the ones that you say will be "created" ie green jobs, this will only occur if the subsidies continue. With the current state of the Federal, State, and local budgets, I think this is improbable. Of course, you can always mandate that folks buy green products through your rulings. If this is the case, I, for one will leave the State as soon as possible. (COOKINHAM)

Comment: I am troubled with the go-it-alone approach of California in this and without consideration to the surrounding states. And I was impressed with Dr. Hanemann's remarks this morning that there has been inadequate attention to the leakage with regards to the surrounding states. I would strongly encourage you to give more attention to those impacts on our economic development. (SACHISPCHMBR)

> **Response:** We share your concerns that if energy-intensive trade-exposed (EITE) industries are not appropriately compensated, the program has the potential to create disadvantages for California facilities relative to out-of-state competitors that currently do not face similar requirements. If production shifts outside of California to a region not subject to GHG emissions-reduction requirements, emissions could remain unchanged or even increase. This is referred to as emissions “leakage.” AB 32 requires ARB to design measures to minimize leakage to the extent feasible, and the cap-and-trade program is designed to minimize leakage in several ways, including accounting for out-of-state and in-state electricity generation and by linking with partner jurisdictions in the Western Climate Initiative (WCI). ARB’s allocation approach is also intended to minimize emissions leakage for those in the industrial sector.
>
> We analyzed the potential for emissions leakage by looking at emissions intensity and trade exposure. “Emissions intensity” is a measure of the impact that carbon pricing will have relative to a sector’s economic output. Those with higher emissions per unit of output are considered to be more emissions intensive. “Trade exposure” is a measure of a sector’s ability to pass through a

cost. Without assistance, industries that are both highly emissions-intensive and trade-exposed have the potential to be negatively affected relative to competitors that do not face similar GHG emission reduction requirements. To minimize the potential for leakage, the program relies heavily on free allocation in the program's early years.

We believe that free allocation to industrial entities at risk of emissions leakage will help maintain the competitiveness of California industries. For as long as ARB assesses that the risk of leakage persists, allowances will be allocated for free to those at risk. We will monitor leakage and will report to our Board annually on shifts in business activity that may result in emissions leakage and changes in market share for covered entities and sectors**,** and will evaluate industries for changes in leakage prior to second and third compliance periods.

General Support for Addressing Leakage through Allocation

C-99. (multiple comments)
Comment: We support a modest amount of free distribution of allowances to a carefully considered subset of trade-exposed industries, subject to periodic review. (UCS3)

Comment: If the State of California proceeds to adopt a Cap and Trade program, such a program should be fair and not cause leakage. (SMITHS)

Comment: Free allocations are needed to provide an effective transition and protect against carbon leakage. (APC)

Comment: It's important to aid highly exposed, leakage prone industries through the free allocation of allowances, requiring medium or low leakage prone industries to purchase allowances in an auction in the second and third compliance periods will unnecessarily increase the cost of compliance for businesses. As long as California chooses to "go it alone" on cap and trade, the risk of leakage will remain high. CARB should take every step possible to avoid this scenario. (CALCHAMBER1)

Response: We agree that preventing leakage is important, and we designed our allocation system to prevent leakage. We determined which covered entities are at risk of leakage after analyzing available data on emissions intensity, trade exposure, or cost pass-through ability, as well as approaches used by other organizations. Per Resolution 10-42, we will update the Board annually on the status of the cap-and-trade program implementation, including, to the extent feasible, information on shifts in business activity that may result in emissions leakage and changes in market share for covered entities and sectors.

Adaptive Management for Allowance Allocation

C-100. (multiple comments)
Comment: A clear adaptive management process should be outlined in the regulations to evaluate and adjust the Industry Assistance Factors in Table 8-1 of the regulations so that the percentages do not necessarily remain static through 2020. (NC2)

Comment: Build in an adaptive management process to assess the impact of free allocation on industries and leakage over time and adjust free allocation as needed. (UCS1, WALTERS, LUDLOW)

Comment: CARB should build in an explicit adaptive management process to adjust the free allocation to the industrial sector based on specified evaluation metrics. (TAYLORE)

Comment: The proposed approach appears to offer no dynamic, adaptive response in the event of sustained oversupply other than to stockpile unsold allowances in the allowance reserve. Moreover, CARB has no plan for an ongoing assessment of whether free allocation results in windfall profits to particular sectors. Similarly, there is no means to adjust free allocation to the industrial sector in the event of a strong regional, national or international emissions cap (or similar policy) that reduces or eliminates the risk of leakage.

These concerns are magnified by in the absence of any requirement that allowance recipients document how the value of allowances is invested in lower-emitting, higher-efficiency processes or low-carbon sustainable fuels. This information needs to be identified as part of the rule-making process, not in retrospect after allowances are dealt out. This is particularly relevant to the second phase of the program. By 2014, when the allocation decision for Phase II must be made public, industrial and utility recipients of allowance value will have had ample opportunity to report on their use of allowance value.

If such information is not currently known to be available, then the onus should be on the receiving regulated entities to explain how their free allowance allocation will be used to prevent leakage and to transition their firm to be more competitive. (EDF1)

Comment: CARB should build in an explicit adaptive management process to adjust the free allocation to the industrial sector based on specified evaluation metrics. As a condition of free allocation, CARB should require industrial sector emitters to provide detailed information on production input costs and revenue to enable a more rigorous, analytical understanding of the extent to which free allocation protects consumers and prevents leakage, or to what extent allocation needs adjustment to avoid windfall profits. This information would be kept confidential at the individual firm level, though it could be released at the sector level so that proprietary information would not be compromised. After two years of data are collected, the ability to pass through costs would be assessed during the last year of the first compliance period. With this better understanding of the real importance of trade exposure and the risk of leakage, adjustments can be made for the second compliance period and going forward. (EBERHARD, KUSTIN10)

Comment: The current proposal lacks a schedule for reduction of free allocations, and there is no indication that CARB will phase out free allocations. The language remains vague in addressing any assessment methodology that will be used to evaluate at-risk sectors. Greenlining believes that a more specific and transparent assessment process must be developed before the first compliance period begins to effectively measure the need for free allocations.

Industrial sector emitters should be required to submit information on its production cost and revenues to ensure that free allocations do not result in windfall profits for these entities. To assess whether the free allocations are providing transitional assistance, CARB needs to also assess if entities are indeed using free allowances to invest in energy- efficiency or renewable sources. The information that entities provide will be confidential on an individual level, and be used to compose sector-wide analysis. Entities should be required to submit the information beginning in 2012, and CARB should provide an analysis that evaluates the sector's ability to pass through costs, and make adjustments to prevent leakage.

CARB's proposal stresses the considerable uncertainty in the industrial sector, and therefore it is crucial to develop a rigorous assessment methodology before the cap and trade program is implemented in 2012. It is regressive to give away free allocations to protect at-risk entities if consumers, especially low-income households and small businesses, will not be protected against the costs that entities are able to pass through. The best way to protect consumers is to carefully measure the need for free allowances and ensure that entities will not receive undeserved windfall profits. (GREENLINING1, GREENLINING2)

Comment: The regulation should also include monitoring procedures and an adaptive management process to assess the impact of free allocation on industries and leakage over time. (CPC1)

Comment: A clear adaptive management process should be outlined in the regulations to evaluate and adjust the Industry Assistance Factors in Table 8-1 of the regulations so that the percentages do not necessarily remain static through 2020. (NC1)

> **Response:** ARB will continue to monitor leakage during the implementation process. Should ARB identify that leakage is occurring, we will develop appropriate responses to rectify it. We have included features in the cap-and-trade regulation, such as periodic updating of leakage risks to adjust or phase out free allocations. We will work with the California Public Utilities Commission to ensure that the proposed allowance value directed to the electric distribution utilities is used for the benefit of residential, commercial, and industrial

ratepayers that might otherwise face indirect costs from implementation of this regulation, and for the purposes of AB 32.

As noted in the Staff Report, we are committed to monitoring how covered sectors, especially those that receive free allocation, address carbon costs once the program is in place. In addition, for allocation purposes, we are collecting product data from almost all sectors at risk for leakage. The data set from this collection will also serve as a key monitoring step in detecting leakage. During program implementation, we will assess whether it is necessary to collect such confidential business information as production input costs and product revenues to determine if businesses incur windfall profits as a result of free allocation. We anticipate that the combination of rigorous benchmark formulas and basing the free allocation on production data should ensure that free allocation for leakage purposes does not result in windfall profits or a sustained oversupply of free allowances.

Per Resolution 10-42, we will continue to review information concerning the emissions intensity and trade exposure of different industries in California. We will recommend changes to the Board on leakage risk determinations, if needed, prior to the initial allocation of allowances for the first compliance period starting in 2013 for industrial sectors not identified in Table 8-1 of the cap-and-trade regulation. And prior to the initial allocation of allowances for the second compliance period starting in 2015 for industries identified in Table 8-1 of the cap-and-trade regulation. We will update the Board annually on the status of the cap-and-trade program, including, to the extent feasible, information on shifts in business activity that may result in emissions leakage and changes in market share for covered entities and sectors.

C-101. Comment: As demonstrated in Appendix F, CARB's economic analysis does not evaluate the leakage impacts of AB 32 in any manner. This is a glaring omission that has been criticized by several policy experts and economists, including those on the Economic & Allocation Advisory Committee. In the absence of such analysis, CARB cannot confidently or convincingly state that its proposed approach is consistent with its mandate to minimize leakage to the extent feasible. (CSCME2)

Response: We do not agree. We detailed our leakage analysis in Appendix K of the Staff Report. The analysis included the mechanisms for addressing emissions leakage recommended by the Economic and Allocation Advisory Committee.

C-102. Comment: We support the language in Resolution 10-42, Attachment B, which takes a deeper look at leakage. And we're hopeful that the periodic review language will be increased beyond the once a compliance period to maybe monthly or so to truly evaluate the impacts this regulation could have on our industry. (ACC2)

Response: ARB will monitor the implementation of the cap-and-trade regulation as directed by the Board per Resolution 10-42. The details of our process for implementing the cap-and trade program, including leakage monitoring, are issues that will be developed before the start of compliance for the cap-and-trade program in 2013.

C-103. Comment: In its Statement of Reasons, CARB states that it will monitor the leakage situation and examine mechanisms such as a border adjustment or changes to the allowance distribution system should it find that leakage is occurring. However, CARB does not detail how it will conduct such monitoring. In addition, CARB does not incorporate any placeholder for such a program into the regulation itself. CSCME urges CARB to direct staff to develop a specific provision in the text of the proposed regulation or in a related rulemaking that develops an effective monitoring mechanism with specific triggers for the adjustment of the current approach to minimizing leakage in the event initial indicators show that leakage is occurring. It is critical that any monitoring mechanism provide for immediate intervention to respond to indications that leakage is occurring. (CSCME2)

Response: Details for monitoring leakage and mechanisms will be developed during implementation. For allocation purposes, we are collecting product data from almost all sectors at risk for leakage. The data set from this collection will be critical to detecting leakage. We will work with all interested parties to identify additional sources of information at the state level that could improve ARB's ability to monitor leakage. Should ARB find that leakage is occurring despite the safeguards in the regulation, ARB will examine mechanisms to address leakage, including border adjustments or changes to the allowance distribution methods in future amendments to the regulation.

C-104. Comment: Kern recommends that a mandatory review provision be included in the regulation. Leakage review should be conducted yearly while full review should be made at least every three years. (KERNOIL1)

Response: Per Resolution 10-42, we will update the Board annually on the status of the cap-and-trade program implementation, including, to the extent feasible, information on shifts in business activity that may result in emissions leakage and changes in market share for covered entities and sectors.

C-105. Comment: We recommend a mid-course update of the identification of sectors singled out for special treatment due to potential leakage. We support distributing free allowances only for the purpose of addressing emissions leakages associated with trade-exposed industries. However, CARB staff has noted that limitations on the availability of data and staff resources diminished the quality of the analysis that was performed to assess sectorial vulnerability. We recommend that CARB complete a reassessment of leakage risk by 2014 and specify how the protocol for special treatment of leakage would apply during 2015-2020. (UCS3)

Response: Per Resolution 10-42, we will, if needed, recommend changes to the Board on leakage risk determinations prior to the initial allocation of allowances for the second compliance period starting in 2015.

Cement

C-106. (multiple comments)
Comment: The resolution suggests that staff may be reconsidering the idea to allocate a hundred percent of allowances in the cement sector and I'd just like to caution against that. Auctioning should be our first priority allocation method absent some other evidence that leakage and trade exposure is a risk. In combating leakage for the cement industry the resolution suggests that we might be looking towards using some form of border adjustments to guard against leakage in that sector. We're supportive of making sure we have a level playing field to treat importers and in-state entities alike. I think the concern is to just to make sure that we don't use both border adjustments and pre-allowances to combat leakage in that sector. You can't really have it both ways. (NRDC3)

Comment: The regulation provides an inappropriately generous allowance allocation to the cement sector. EDF recommends CARB revisit the cement sector allocation and require firms receiving allowances to demonstrate how the value of those allowances is being used to avoid leakage. EDF recommends that CARB revisit this portion of the ISOR and provide additional justification for the leakage assistance given while taking into account the emerging trend of allowing for increased use of SCM blending in finished cementitious products used in roads and buildings throughout California and the western United States. (EDF1)

Comment: The persistent 100 percent assistance factor seems particularly inappropriate amidst claims by the cement industry that they are operated at state-of-the-art already. If that is the case, it is not at all clear how transition assistance will facilitate any transition. In putting forth this strong position on the cement sector allowance allocation, we observe that there is need to incentivize blended cement products, and to spur a transition from conventional fossil fuel-based power. The threat of this unintended possible consequence of a free allowance allocation is also exacerbated by the short 9-year program horizon. (EDF1)

Response: We believe our leakage risk classification of the cement sector is appropriate based on our analysis of available information. The cement sector has been classified as a sector with high emission intensity and medium trade exposure. We evaluated the feasibility of implementing border adjustments especially for the cement sector. However, at this point, we believe there are technical limitations and insufficient resources to implement such a border adjustment. Since border adjustment is not part of the program starting in 2012, free allocation is the primary mechanism to address transition and leakage risk. Per Resolution 10-42, we will keep evaluating the feasibility for border adjustment as part of future amendments to the regulation. As program implementation starts, we will monitor how the market participants will react. We will consider including reviews of emission reduction activities taken at covered facilities as part of monitoring.

We agree that increasing blending of substitutable cementitious materials (SCM) to cement is a viable emission-reduction option. We, not only as part of cap-and-trade, but also as part of other programs, will keep reviewing possible opportunities to incentivize increased blending. We note that the price signal in cap-and-trade should provide an incentive to increase blending of SCMs at the batch plant once the price signal is embedded in cement.

C-107. Comment: CARB ignores critical qualitative evidence in determining the trade exposure of the California cement industry, including nearly two decades of antidumping rulings. The California cement industry's extreme vulnerability to imports is evidenced by nearly two decades of antidumping rulings by the ITC. In support of these rulings, economists at the ITC analyze public and confidential firm-level data on price, market share, and profit. This is precisely the information that CARB would need to make a complete and accurate assessment of cost pass through ability. CARB should reclassify the California cement industry as "highly trade exposed." The weight of both quantitative and qualitative evidence conclusively demonstrates that the California cement industry has a high trade exposure, faces a high degree of competition from unregulated entities, and has extremely limited cost pass-through ability. CSCME recommends that CARB incorporate this evidence into its determination of the cement industry's trade exposure and place it within the "highly" trade exposure category. Although CARB has already designated the cement industry as "highly" leakage exposed, such a designation does not account for the fact that the cement industry's leakage risk is far beyond that of any other California industry's assessed risk. The combination of high trade intensity and high GHG intensity creates an extremely high risk of leakage for the California cement industry and justifies additional measures to minimize leakage in implementing AB 32. (CSCME2)

Response: As described in Resolution 10-42, we will continue to review information concerning trade exposure of different industries. The review focuses on identifying sectors not identified in section 95871 Table 8-1 of the regulation for inclusion prior to the initial allocation of allowances, and for adjusting allocations for sectors included in Table 8-1 for the second compliance period that will start in 2015. For the cement sector, we will continue to review trade-related information, including information from antidumping rulings by the International Trade Commission (ITC) as mentioned, to determine if the cement industry should be reclassified from medium to high trade exposure.

C-108. Comment: The major issue we face under a cap and trade program is our extremely high exposure to economic emission leakage, our extraordinarily high emission intensity exposure to the industry to compliance costs. And since cement is a globally fungible competitive commodity, we did not pass through the cost without losing market share to other alternatives. (CSCME3)

Response: We factored these concerns in calculating allowances for free allocation to the cement sector.

C-109. Comment: CSCME recommends the following modification to reduce leakage beyond levels achieved by the proposed regulation:

- Implement an incremental border adjustment that imposes obligations on imported cement that are comparable to those placed on domestic manufacturers;
- Revise the output factor so that allowance allocations and compliance obligations are based on the same level of output;
- Establish benchmarks based solely on the average GHG intensity of each industry or product;
- Allocate allowances directly to leakage-exposed industries to offset the costs associated with higher electricity prices;
- To the extent feasible, establish benchmarks using data that pre-date the adoption of AB 32; and
- Eliminate the cap adjustment factor for those industries deemed to be highly exposed to leakage. (CSCME2)

Response: As noted in the Staff Report, we are committing to monitoring how covered sectors, especially those who receive free allocation, address carbon costs once the program is in place. Should ARB find that leakage is occurring despite the safeguards in the regulation, ARB will examine all feasible mechanisms to address leakage, including border adjustments or changes to the allowance distribution methods in future amendments to the regulation. In the first set of 15-day regulation modifications, we determined a benchmark based on the "best in class" for the cement sector. This approach means that we expect at least one facility's emissions intensity to be at or below the benchmark at the outset of the program. In establishing these benchmarks, we used data available to us under our mandatory reporting requirements to the extent feasible and supplemented these data with industry-provided data if reported data were insufficient or unrepresentative. We believe that all industries should be treated equitably in the cap-and-trade program, and therefore the cap adjustment factor is necessary for all industries. However, we have kept the less-aggressive cap adjustment factor in the regulation for those sectors, including cement, which have more than 50 percent process emissions in their total production intensity.

C-110. Comment: The concept of a cap adjustment factor is fundamentally incompatible with CARB's mandate to minimize leakage to the extent feasible. By reducing the per-unit allowance allocation rate for all industries, regardless of their assessed leakage risk, the cap adjustment factor unnecessarily and arbitrarily exposes industrial sources to net compliance costs that will not be faced by unregulated competitors. In the event that CARB does not eliminate the cap adjustment factor, a differentiated cap adjustment factor for the cement industry is justified. CARB has appropriately and justifiably modified the cap adjustment factor for the cement industry to reflect the fact that process emissions limit the scope of its technologically-feasible and cost-effective abatement opportunities. However, rather than simply reducing the decline by half, CARB should calculate the cap adjustment factor as a weighted average between process emissions and combustion emissions, with the former receiving a factor of 1.0 and the latter receiving a factor equal to the general cap adjustment for that year. With this small revision, the cement industry's cap adjustment factor values would more precisely conform to the underlying policy rationale. (CSCME2)

> **Response:** We believe our proposed approach (reduce the declining factor for cement sector by 50 percent) is appropriate to take into consideration the high process emission ratio in the cement sector and to administer the program efficiently. As we have noted, a cap adjustment factor for all industries ensures equitable incentives to all producers, to minimize leakage as a result of the cap-and-trade program.

C-111. Comment: If exposed to significant competition from unregulated jurisdictions, domestic facilities must choose between passing realized costs through to consumers and suffer a loss of market share, absorb them and experience a loss of earnings and eventual disinvestment, or a combination of both. In any scenario, a transfer of output, jobs, investment, and other economic activity from inside the regulated jurisdiction to outside the regulated jurisdiction will result. The risk of emissions leakage is greatest within emissions-intensive, trade-exposed industries with relatively few cost-effective abatement opportunities and high differentials between the GHG intensities of domestic and imported products. The California cement industry exhibits precisely such characteristics. (CSCME2)

> **Response:** We recognize that the risk of emissions leakage is greatest within emissions-intensive, trade-exposed industries with relatively few cost-effective abatement opportunities and high differentials between the GHG intensities of domestic and imported products. We believe our approach to allocate free allowances for transition assistance and trade exposure protection will minimize leakage risks. In addition, ARB will monitor the implementation of the cap-and-trade regulation and will develop appropriate responses to rectify any identified issues.

C-112. Comment: The proposed cap and trade program does not minimize leakage. It exposes facilities within vulnerable sectors in general and the cement industry in particular to costs that are not imposed on out-of-state competitors. CARB has not revealed any analysis or substantiated its assertion that the proposed regulation minimizes leakage to the extent feasible. CARB's proposed approach to allowance allocation fails to minimize leakage in the industrial sector in general and the cement industry in particular. CARB has proposed to base the cement metric on the level of clinker production at a particular facility and adjusting it based on the average level of gypsum and limestone used in the cement shipped from that facility in the same year. CSCME supports this approach as a sound and practical method for implementing a cement benchmark in a manner that avoids artificial variations in measured output and eliminates perverse incentives. Furthermore, we recommend that the following formula be used to implement CARB's proposed approach: O=P(1+G/C+L/C) Where, O = cement output in a given compliance year, P = clinker production in a given compliance yea, G = gypsum consumption (i.e., ground) in a given compliance year, L = limestone consumption (i.e., ground) in a given compliance year, C = clinker consumption (i.e., ground) in a given compliance year. (CSCME2)

> **Response:** We believe the design of our system for free allowance allocation will minimize leakage. But until the program is in place, we do not have the data to substantiate the program's effectiveness. Our analysis for leakage is presented in Appendix K of the Staff Report. We considered various output metrics for calculating allowances before selecting the benchmarking metric of allowances per short ton of adjusted clinker and mineral additives produced. We agree that the strongest incentive to continue California production is to have allocation tied to the emissions obligation for a given year, as this comment suggests. We modified our allocation approach to address this concern in the first set of 15-day regulation modifications.

C-113. Comment: CSCME strongly supports the concept of differentiated assistance that is based on an objective assessment of each industry's leakage risk. CSCME also agrees with CARB's assessment that the cement industry is at a high risk of leakage and that an assistance factor of 1.0 throughout the 2012-2020 timeframe is appropriate and necessary. Nevertheless, CARB's leakage analysis can be improved in several respects to yield a more accurate and robust assessment of each industry's leakage risk. We believe that such refinements will bring the cement industry's extreme leakage exposure into better focus and highlight the need to consider this in all aspects of the allowance allocation formula. (CSCME2)

> **Response:** We agree. Per Resolution 10-42, we will continue to review information concerning the emissions intensity and trade exposure of different industries in California. We will recommend to the Board changes to the leakage risk determinations, if needed. In addition, we will monitor the implementation of the cap-and-trade regulation and will develop appropriate responses to rectify any identified issues.

C-114. (multiple comments)
Comment: CARB proposes to address leakage solely through allowance allocation. They have dismissed more effective approaches without sufficient cause or justification. Please consider the use of border adjustments to address leakage in the industrial sector, and provide a detailed proposal to combine allowance allocations and a border adjustment to provide maximum leakage protection. (CSCME2)

Comment: For a capital intensive industry like cement, any delay in adjusting the program to address leakage will cause irreversible damage that cannot be remedied with a border adjustment or other measure imposed "after-the-fact" when market share has been seriously eroded and recovery is no longer feasible. (CSCME2)

> **Response:** We believe, at this point, there are insufficient resources to implement border adjustment. Per Resolution 10-42, we will continue to review the technical and legal issues related to implementation of a border adjustment to impose obligations on importers of cement that are equivalent to those faced by California cement manufacturers under the cap-and-trade regulation, and to implement such a provision, if it is feasible and necessary, to avoid leakage in the cement sector. We will continue working, with input from stakeholders, on the possibility of implementing border adjustment for maximizing leakage protection.

C-115. Comment: CARB substantially underestimates the trade intensity of the California cement industry, and, misclassifies it as "moderately" trade exposed. In assessing the risk of leakage, CARB analyzes GHG intensity, and the extent to which industrial sectors could pass through compliance costs based on the level of trade exposure or intensity for each industry. According to CARB's analysis, the trade intensity of the national cement industry, as measured by the volume of trade as a share of domestic consumption, is 16 percent. This places it within CARB's "medium" trade intensity category. This national trade intensity, however, severely underestimates the degree of import competition in California. The California cement industry's trade intensity during 2003-2008 is estimated to be approximately 41 percent. This is more than twice as high as CARB's assessment of its trade intensity (16 percent) and well beyond CARB's "high" threshold (19 percent). Although the uniqueness of the data may preclude CARB from performing a similar analysis on all other industries, CARB cannot ignore this clear and convincing evidence when assessing the cement industry's trade exposure, especially given the acknowledged limitations of its current approach. (CSCME2)

> **Response:** We observed that the level of cement import varies significantly depending on the robustness of domestic market. When the demand is high, more cement is imported to meet the demand. As part of continued analysis, we will consider other factors suggested in addition to trade data.

Food Manufacturing

C-116. Comment: The formula for trade exposure and emissions leakage should be reevaluated to recognize the complexity and impact of agricultural import and export markets. Food processing should be moved to the "high" leakage risk category, due to increasing international and domestic markets. For example, peach imports from China increased 30 percent increase in 2010 compared to last year's volume. (ACC1, ACC3)

> **Response:** Our analysis of data supports classifying food processing as low in emissions intensity and medium in trade exposure, and a medium risk for

leakage. Staff is aware that there are different trade exposures among different subsectors (e.g., vegetable or fruits processing versus dairy) and some subsectors' trade exposure is high. However, using the current evaluation framework, no sector will be classified high in leakage risk if emission intensity is low, which is the case for all covered food facilities. Per Resolution 10-42, we will continue to review information concerning the emissions intensity and trade exposure of different industries in California. We will recommend to the Board changes to the leakage risk determinations, if needed. In addition, we will monitor the implementation of the cap-and-trade regulation and will develop appropriate responses to rectify any identified issues.

C-117. (multiple comments)

Comment: The staff report states that domestic competition will be problematic as it relates to the food and agricultural industry. A different approach should be taken for food processing in determining compliance costs and/or emissions intensity. The emissions intensity variable in the product-based allocation calculation should be replaced with another variable that truly represents the cost of compliance for the food industry. Staff should take more time to work with the food processing industry to determine an appropriate factor for this variable. (ACC1, ACC3)

Comment: Within the regulation, staff realizes the importance of domestic competition and the ability of emissions leakage to other states, granting easier access to California markets. Staff also observed that emissions intensity may not play a direct role in emissions leakage.

However, the report also states that emissions intensity is to serve as a "proxy" for compliance costs. This assessment is not accurate for the food industry. The California Air Resources Board (CARB) staff assumes a "low" emissions intensity for the food industry, while compliance costs are quite higher for food processing when domestic and international markets are lost to lower-priced competition and food processors are left competing with companies in an auction market that has no price caps for allowances. This is coupled with the fact that the vast majority of food processing is a seasonal industry in which emissions are generated. (ACC3)

Response: The commenters suggest that the emissions intensity variable in the product-based allocation calculation should be replaced with another variable that truly represents the cost of compliance for the food industry. We believe that that approach taken in the leakage analysis is appropriate to use for all sectors. The analysis is broken down into two measures of leakage: emissions intensity and trade exposure. Emissions intensity is strictly a measure of emission per value added and does not take into account other facilities in other regions. Instead, the trade exposure takes into account the risk associated with outside competition. In the leakage analysis, we compared this approach to the European Union Emissions Trading System (EU ETS) approach, but needed to include domestic competition. In our analysis, we found the food industry had a low emissions intensity relative to the rest of California industries and a medium trade exposure risk. This led us to place the food industry in the medium leakage risk category. We understand the concerns with the analysis, especially the access to data. Thus, we will continue to evaluate the risk of emissions leakage in accordance with Resolution 10-42 and make recommendations to the Board for any changes necessary to minimize this risk.

C-118. Comment: In Appendix L, the EAAC assumes companies will fluctuate to variable power sources, depending on the price available for those sources. The opportunity for fuel substitution is minimal in the short and long term because many of our food processors are already utilizing the cleanest forms of fuel and technology. Absent this transition, the analysis goes on to state that reducing output due to price increases is the second option to reduce greenhouse gas emissions. On page L-27, the report states “higher prices will elicit a reduction in the quantity demanded for these products, leading to a reduction in greenhouse gas emissions.” When applying this theory to the food industry, it underscores our concerns about emissions leakage and the need to protect our local food industry. (ACC3)

Response: In developing our approach, we considered the information in the Economic and Allocation Advisory Committee (EAAC) report as one piece of information. Our analysis includes other sources of data detailed in Appendix K of the Staff Report. We determine leakage risk using emissions intensity and trade exposure as two central measures. We analyzed emissions intensity data for all industrial sectors. We then selected natural break points in the emissions intensity spectrum. Industrial sectors are placed into the high, medium, low, and very low categories of emissions intensities based on these break points. For assessing trade exposure we considered various approaches before choosing trade share as the metric to classify industrial sectors for trade exposures. We believe that our leakage risk determinations are supported by available data and are expected to be protective of leakage risks.

C-119. Comment: It should be noted that facilities used to produce food are dedicated to the specific commodity. Movement from food production to another type of market, or even another type of commodity is highly unlikely due to the dedicated nature of the facilities. Equipment, facilities lay-out and labor are highly-specialized and cannot easily be transformed to other types of production. Should the cost of producing food become too high, a processor cannot enter another type of manufacturing without millions in costs to overhaul the entire plant. Additionally, a food processor cannot interchange between types of food produced because the equipment is so specialized. For example, a tomato processor cannot go into almond processing in the near future, without major investments. (ACC3)

Response: We recognize that industrial facilities are highly specialized and their processes are not easily interchangeable. We developed an allowance allocation system to provide industrial sectors with transition assistance that would incentivize them to innovate and protect them from leakage risk.

C-120. Comment: As experienced in many sectors of the food and agriculture industry, certain market segments could be flooded with imports in a matter of months such as the previously-stated case in the processed peach industry. CARB staff should be required to report to the Board on the findings of impacts on food processing as the regulation is underway so as to avoid these types of situations. (ACC3)

> **Response:** As noted in Resolution 10-42, we will report to the Board annually on all shifts in business activity that may result in emissions leakage and changes in market share for covered entities and sectors.

C-121. Comment: Emissions leakage for the food processing industry is our central concern in this regulation. Agricultural products are very sensitive to low-cost competitors in domestic and international markets. Many of these markets can flood segments of our industry in a matter of months, such as the current situation in the canned peach industry. (ACC2, ACC3)

> **Response:** We are committed to protecting against emissions leakage, which will in turn protect against economic leakage. As noted in the Staff Report, we are committing to monitoring how covered sectors, especially those who receive free allocation, address carbon costs once the program is in place. Should ARB find that leakage is occurring despite the safeguards in the regulation, ARB will examine mechanisms to address leakage.

C-122. Comment: Food manufacturing is located in the second Industry Assistance Factor tier (Industry Assistance Factor of 100 percent; 75 percent; 50 percent), and should be moved to the top industry assistance factor tier due to price pressures from international markets. Even a minimal increase in costs could displace U.S. markets, giving more ground to domestic and international competitors. (ACC1, ACC3)

> **Response:** The assistance factor is based on leakage risk classification. Our analysis of data supports classifying food processing as medium risk for leakage. As noted in Resolution 10-42, we will report to the Board annually on all shifts in business activity that may result in emissions leakage and changes in market share for covered entities and sectors.

C-123. Comment: Most California industrial sectors are global players. This is particularly true of the California food processing industry. Food processing is a highly competitive business that tends to be characterized by small financial margins, making our products sensitive to low-cost competitors in domestic and international markets. CLFP believes that if the compliance costs become too high, then a number of food processors will become uncompetitive, losing customers and business to competitors not burdened with added compliance costs. (CALFP1)

> **Response:** Our program is designed to provide industrial sectors with transition assistance and leakage risk protection. The food processing sector will be

allocated with appropriate levels of free allowances during all compliance periods if the risk remains.

C-124. (multiple comments)
Comment: In Appendix J, the regulation states that the industry assistance factor is the ability an industry has to pass-on carbon costs. Staff utilizes the NAICS classification standards to determine the leakage risk that will be assigned to each industry. In utilizing only a three-figure NAICS designation, the leakage risk for fruit and vegetable food processors is seriously diluted. As such, food processors will face serious difficulties in adapting to the low-carbon business landscape envisioned in the proposed regulation given the current economic downturn, the unique nature of the food processing industry in California, and the intense competition for national and international market share. (CALFP1)

Comment: CLFP recommends delineating the NAICS classification to a finer detail (four or six digits) for fruit and vegetable food processors. (CALFP1)

Response: We recognized the limitations of utilizing a three-digit NAICS classification for evaluating the food processing sector's leakage risks. Currently, data for higher-digit NAICS state-specific classifications are not available. We supplemented our analysis with data from other sources before finalizing our classification.

Leakage risk is mainly used for assigning assistance factors. The assistance factor used for the first compliance period is identical for all leakage risk levels. The allocation to industrial sectors for the initial period is not affected by potential misclassification of leakage risks. Per Resolution 10-42, we will, during implementation, continue to review information concerning the emissions intensity and trade exposure of different industries in California, and to recommend to the Board changes to the leakage risk determinations, if needed. We believe our system of allowance allocation to be equitable to all facilities within and across industrial sectors.

C-125. (multiple comments)
Comment: CLFP recommends developing a new matrix for determination of leakage risk for fruit and vegetable food processors. (CALFP1)

Comment: CLFP recommends staff to develop techniques to evaluate the trade exposures of the fruit and vegetable food processing industry and that staff include affected industry stakeholders in developing these alternative techniques. (CALFP1)

Response: Per Resolution 10-42, we will, during implementation, continue to review information concerning the emissions intensity and trade exposure of different industries in California, and to recommend to the Board changes to the leakage risk determinations, if needed. We will include stakeholders in our deliberations.

C-126. Comment: CLFP recommends staff to compile an industry study in concert with the CLFP and report to the Board on progress. (CALFP1)

> **Response:** This is an issue to be addressed during implementation of the regulation.

C-127. Comment: Ag and food processing are linked. You cannot separate us because the production would fall mightily. And anything that happens to us will also affect them. (CALFP2)

> **Response:** We recognize that agriculture and food processing are linked. We are not suggesting a separation of the linkage between agriculture and food processing. Free allocation is provided to industries based on their emissions intensity and trade exposure, and is not based on linkage to raw materials or their suppliers. Transition assistance is not necessary for industrial facilities emitting less than 25,000 CO_2e metric tons per year because they are not subject to a compliance obligation under the California Cap-and-Trade Program. The food processing facilities included are those that met the emissions threshold for receiving free allowances.

C-128. Comment: We request ARB staff to work with us to address leakage risk as specified in the California League of Food Processors written comments. In the development of the emission intensity matrix, staff has used a high level of segregation, thus combining unlike industries into one category. We request staff to increase the differentiation among our industry which will result in clearly showing a high leakage rate. Specifically, the United Nation's Commodity Trades Statistics Database uses a five digit differentiation as opposed to ARB's three. The statistics read that the U.S. imports 50 percent more dehydrated onion since 2007. China's garlic imports alone have risen from 50 million tons to 130 million. The international imports together account for 68 percent of the market share. The U.S. and California market shares have eroded due to international cost advantage. California, specifically the onion and garlic dehydration industry, has closed almost 40 percent of its capacity, eliminating 900 jobs over the past five years in the area, especially in the San Joaquin Valley. Continued erosion of our competitive position is a major factor when we consider operating and moving out of state and to foreign source productions. (OLAMWC)

> **Response:** Because of the lack of available data, aggregating the food processing industry was necessary in our analysis. Per Resolution10-42, we will, during implementation, continue to review information concerning the emissions intensity and trade exposure of different industries in California, and to recommend to the Board changes to the leakage risk determinations, if needed. The assistance factor used for the first compliance period is identical for all leakage risk levels, and allocations for the initial period will not be affected by potential misclassification. We will address this issue in deliberations during implementation.

C-129. (multiple comments)
Comment: The comments in this letter are focused on the GHG emission leakage analysis specific to biogum production at CP Kelco San Diego. CP Kelco is the only covered entity in the cap and trade program classified with NAICS code 311999 - All Other Miscellaneous Food Manufacturing. All facilities under the Food Manufacturing three digit code of 311 are classified by the Air Resources Board (ARB) as a "Medium" Leakage Risk facility. Based on data specific to CP Kelco San Diego, this facility is requesting to be re-classified by the Air Resources Board (ARB) as a "High" Leakage Risk facility. Failure to do so could lead to a net increase in GHG emissions from overseas competitors in China, contrary to the stated goal of AB 32. The other facilities with NAICS code 311 manufacture final food products or primary food ingredients. CP Kelco is unique in that this facility manufactures a product that is a property enhancer or trace ingredient in other food products. In contrast to most other food manufacturers, CP Kelco has a significant international market, particularly in Asia and Japan. Also in contrast to other food manufacturers, CP Kelco's products require a very complicated and energy intensive manufacturing process. (CPKELCO)

Comment: The three digit NAICS code 311 - Food Manufacturing covers an extremely wide range of manufacturing facilities. There are nearly 700 subsectors beneath the 311 three digit classification. For most other sectors, ARB has created classifications based on NAICS six digit codes, which results in a much smaller number of subsectors in the classification and much greater similarity for facilities within the classification. In a classification as broad as food manufacturing, it is difficult to state with any level of certainty that all manufacturing processes should have similar emissions intensity. In fact, it is very likely that some sub-sectors are as different in emissions intensity as facilities in distinct three-digit sectors. That is to say, that CP Kelco's emission intensity is just as likely to be similar to a facility in the glass manufacturing or paper manufacturing industry as it is to be similar to a facility in the breakfast cereal manufacturing fruit and vegetable canning industry. This is in fact the case, and more details are provided in the following section. Based on CP Kelco San Diego's unique attributes and the fact that this facility is the only covered entity with NAICS code 311999, it may be appropriate for ARB to separate this code from the remainder of the Food Manufacturing Sector for the purpose of GHG emission leakage analysis. (CPKELCO)

Comment: CP Kelco analyzed trade-sensitive data specific to the San Diego facility for comparison to the ARB Emissions Intensity metric. The result is an Emissions Intensity value (CO_2e/$M Value Added) that is several times higher than the Emissions Intensity value calculated for the Food Manufacturing classification in general. The value is high enough to place CP Kelco in the "Medium" Emission Intensity Classification and is high enough to qualify as one of the ten highest sectors for emissions intensity. CP Kelco may be able to share the data used in the calculation directly with ARB staff if an agreement can be reached to ensure that all trade-sensitive data will be kept confidential. Based on the site-specific data, it is clear that CP Kelco San Diego's Emission Intensity is higher than other facilities in the Food Manufacturing sector and that there is a greater risk for emissions leakage if the situation is not addressed. (CPKELCO)

Comment: CP Kelco's market is different from other businesses in the Food Manufacturing sector, since a higher percentage of the sales occur outside of California. Additionally, demand for the products produced by CP Kelco San Diego has increased more in foreign markets, notably in Asia and Japan, than in domestic markets, increasing the potential for manufacturing to also shift to those geographic areas. This will become more likely if the plant's costs increase as they would under the proposed Cap and Trade program, particularly if CP Kelco San Diego remains in the "Medium" Leakage Risk category. (CPKELCO)

Comment: The CP Kelco San Diego Emissions Intensity data demonstrates that the facility should be classified as at least "Medium" Emissions Intensity as opposed to the "Low" Emissions Intensity that applies to the remainder of the Food Manufacturing sector. The market share data for biogum production shows that CP Kelco San Diego has significant trade exposure. "Medium" Emissions Intensity and high trade exposure should classify CP Kelco San Diego as "High" Leakage Risk.

Based on recent experience, it is fairly clear that an increase in production costs will result in reduced market share for CP Kelco San Diego. It is expected that this market share would be absorbed by competitors in China that consume electricity and/or steam from coal-fired facilities. The transfer of biogum production from San Diego to another facility will result in not just a transfer of GHG emissions from San Diego to another state or country, but will result in a net INCREASE in GHG emissions and a loss of California-based jobs. As discussed above, the San Diego plant operates a very efficient, natural gas-fired cogeneration facility. Chinese biogum plants typically consume energy from coal-fired utilities. The electricity and steam supplied to the CP Kelco plant in Shandong, China is provided by a coal-fired plant that is located next door. These competitors utilize both less efficient technology and fuels that have higher GHG intensity. Based on these two factors, it is conceivable that production "leakage" from CP Kelco San Diego could result in the doubling of the GHG emissions associated with the transfer of biogum production from San Diego to other facilities outside the state. Re-classification of the CP Kelco San Diego plant from "Medium" Leakage Risk to "High" Leakage Risk would reduce the probability of this occurring. Since CP Kelco is the only covered entity in NAICS code 311999, it would be possible for ARB to simply add this code to the group of sectors in the "High" Leakage Risk classification. (CPKELCO)

Comment: The GHG leakage analysis presented for CP Kelco San Diego demonstrates that the facility should be classified as a "High" Leakage Risk and should be afforded the same protections provided to other facilities in this classification. Failure to do so would result in GHG emissions leakage and likely a significant net increase in global GHG emissions. The calculation of the Emissions Intensity metric requires the use of trade-sensitive data that CP Kelco is not able to disclose in this public document. CP Kelco is requesting to meet with ARB staff in person to discuss the analysis in more detail and potentially share the specific data used in the calculations if an agreement can be reached in order to ensure that the trade-sensitive data will be kept confidential. We look forward to hearing from you at your earliest convenience. (CPKELCO)

> **Response:** We recognize the limitations of utilizing the three-digit NAICS code 311 which covers a wide range of food manufacturing facilities for evaluating the food processing sector's leakage risks. Leakage risk is mainly used for assigning assistance factors. The assistance factor used for the first compliance period is identical for all leakage risk levels. Allocation for the initial period is not affected by any potential misclassification of leakage risks. Staff will work to evaluate leakage risk at a more disaggregated level to address CP Kelco's concerns prior to the start of the second compliance period.
>
> Currently food processing facilities are to be allocated using the energy-based allocation calculation methodology. As noted in Appendix J of the Staff Report, the option exists for product-based benchmarks to be developed in subsequent compliance periods for industries being allocated under the energy-based methodology during the first compliance period.
>
> We designed the regulation to minimize leakage by placing covered entities on an equal footing with their non-covered competitors. We are committed to monitor how covered sectors address carbon costs once the program is in place. We will work with affected and interested parties to identify additional sources of information at the state level that could improve our ability to monitor leakage. Should we find that leakage is occurring despite the safeguards in the regulation, we will examine mechanisms to address leakage, including border adjustments or changes to the allowance distribution methods.

Glass

<u>Flat Glass</u>

C-130. Comment: GANA supports recognition of the glass industry as a high leakage risk and a recipient of free allowances to help reduce the possibility of leakage from the glass industry. GANA supports this approach for the flat glass industry due to its energy intensity, its general inability to pass costs along to consumers, and its inability to respond quickly to any significant step change requirements to lower CO_2 emissions. GANA notes that some flat glass products are integral to the successful adaptation of "green" technologies like solar energy that form an integral part of the overall GHG reduction goals of AB 32. (GANA)

> **Response:** No response necessary.

C-131. Comment: GANA supports retention of the assistance factor at 100 percent for the flat glass industry. (GANA)

Response: No response necessary.

Fiber Glass

C-132. Comment: The challenge is to assist the California fiber glass insulation industry and to deal with threats in a way that is fair, reasonable, and predictable. For example, the State's fiber glass plants are readily subject to leakage that should entail free allowances for all three compliance periods. (NAIMA)

Response: Based on our analysis, we have categorized the fiber glass sector as medium leakage risk which provides for some free allocation for all three compliance periods.

C-133. Comment: Fiber glass insulation (mineral wool) has been given a medium level of allowances, which equates to 100 percent in 2012–2014; 75 percent in 2015–2017; and 50 percent in 2018–2020. The other two glass sectors (flat glass and glass packaging) received 100 percent allowances for all three compliance periods. CARB has justified that distinction based on its perception of the effect of foreign competition on each segment of the glass industry. CARB's effort to stop leakage is really an effort to reduce the effect on industry and employees from the implementation of the cap and trade program. Given that simple premise, the facts fully support 100 percent allowances for fiber glass insulation for each of the three-year compliance periods designated in the legislation. CARB should recognize that if the California fiber glass operations are not economically viable as a result of AB 32, some of NAIMA's members might close their plants or significantly reduce capacity. (NAIMA)

Response: Our analysis of emissions intensity and trade exposure, presented in Appendix K of the Staff Report, supports classifying fiberglass, flat glass, and container glass differently for leakage risks. Our goal is to prevent emissions leakage with the appropriate level of free allowances. We are using an approach for allocating free allowances that is equitable to all sectors. While emissions leakage and economic leakage are linked, a system for preventing emissions leakage requires different means and design than a system for preventing economic leakage; however, limiting emissions leakage will also limit economic leakage. We note that reducing production will also reduce the amount of allocation to industrial producers. This provides an incentive to continue production in California while also incentivizing reducing the emissions intensity of that production.

C-134. Comment: CARB's proposed Cap-and-Trade program, as currently written, could ultimately result in closing fiberglass plants or curtailing their operations within the State. That outcome would result in more of the California market being supplied by manufacturing facilities in other states, Canada, and Mexico. Fiber glass insulation is an important contributor to the California economy, through direct manufacturing, shipment of finished product to markets within California and other western states, and export of product to foreign markets. Fiber glass insulation promotes energy efficiency, environmental preservation, and reduces pollutants, including greenhouse gases. If fiber glass insulation would not be available, the supplies of alternative insulating materials would not be sufficient to supply the demands of the market. Raising the cost of insulation products by raising the costs of doing business for fiber glass insulation manufacturers or by artificially reducing the supply of available insulating materials will reduce the ability of the State to meet its greenhouse gas emission reduction goals. (NAIMA)

> **Response:** We disagree. We have developed a system for free allowance allocation to provide transition assistance for industry to innovate toward a low-carbon economy and prevent trade risks. As noted in Resolution 10-42, we will report to the Board annually on all shifts in business activity that may result in emissions leakage and changes in market share for covered entities and sectors. If there is a need for adjustment, we will update the allowance allocations methodology to correct unintended consequences.

Container Glass

C-135. (multiple comments)
Comment: The container glass sector as a whole has a "high risk" of leakage due to its high energy intensity and trade exposure. Add in the cost-sensitivity of the business and the already high cost of manufacturing in California, and it becomes clear that the "protections" in the proposed Cap and Trade Program intended to mitigate this "high risk" for container glass manufacturing currently fall well short of providing the necessary relief. (SMITHS)

Comment: The container glass sector's "high risk" vulnerability to leakage requires additional protections in the proposed Cap and Trade Program to avoid making California facilities uncompetitive. California's container glass sector is already more efficient in terms of limiting and controlling GHG emissions compared to facilities in other jurisdictions. (SMITHS)

Comment: California's container glass facilities are generally more expensive to operate and therefore among the most susceptible to "leakage." (SMITHS)

> **Response:** We believe our program will provide adequate protection for leakage risk and transition assistance for the container glass sector. We determine leakage risk using emissions intensity and trade exposure as two central measures. We have classified the leakage risk for the container glass sector as high for allocating free allowances. The container glass sector will be allocated allowances using an assistance factor of 100 percent for all three compliance periods. The design of our cap-and-trade program rewards early action in controlling GHGs.

C-136. Comment: Under the proposed regulation, the targeted level of stringency would be created by evaluating each industrial sector’s emissions intensity during a historical base period and targeting the benchmark to allocate 90 percent of its level per unit product. This reasoning appears to make no distinction between sectors with low and high risks of leakage and thus could create an additional 10 percent shortfall in allowances for the "high risk" glass container sector, which is already highly efficient. (SMITHS)

> **Response:** In the first year of the program the most efficient facilities in each sector—those with efficiencies at or better than the benchmark—will be receiving allowances equal to or greater than they will need for compliance. Less-efficient facilities will need to purchase additional allowances or offsets to fulfill their compliance obligations. This approach recognizes early action; minimize the potential for windfalls that could result due to excessive free allocation; and gives all industrial facilities the correct incentive to reduce GHGs. Although the benchmark stringency is not a function of leakage risk, the other components of allowance allocation, most notably the assistance factor are a function of leakage risk.

C-137. Comment: The container glass sector's cap adjustment factor should remain constant at 1.0 until at least 2020. The current cap erosion would require a 15 percent reduction in allowances for the glass container sector by 2020, despite the fact that there is no means of achieving such reduction. Even reducing glass production, the surest way to reduce net GHG emissions, will fall short of providing a sustainable reduction given the output-based allocation formula in the proposed rule that would merely result in fewer allowances going forward. At a minimum, the cap adjustment factor for container glass should not be any lower than that proposed for the cement manufacturing industry in section 95891. The container glass sector, like cement manufacturing, is a high risk sector for leakage and has the same types of GHG emissions as the cement industry. (SMITHS)

> **Response:** The cap adjustment factors for all industrial sectors other than those whose process emissions are greater than 50 percent of their GHG emissions are the same. While both container glass and cement manufacturing are both classified as high risk for emissions leakage, the cement sector's emission intensity is about eight times that of container glass manufacturing. Also, the amount of process emissions relative to the total emissions is about 60 percent in the cement sector. The glass sector's process emissions relative to total emissions are less than half of those of cement. Therefore, it is not justifiable to use the same cap adjustment factor for container glass and cement manufacturing.

C-138. Comment: Establish actual annual production in the compliance year as the basis for allowance allocation, rather than looking back three years. The three-year look-back has the effect of restricting increased output to meet market demand from wineries for bottles at a time when recovery from current national economic crisis is still on the horizon. Without a forward-looking methodology for allocating allowances to the glass container sector, the effect will be higher costs on the wine industry and other food and beverage industries which rely on California-produced glass containers and relocation of jobs to out-of-state glass producers. (SMITHS)

> **Response:** We modified the equation for calculating product-based allowance allocations. The addition of the "true-up" term ($O_{a,trueup}$), for adjusting outputs not properly accounted for in prior years' allocations, in the equation for calculating allocations under section 95891, have adequately addressed the concerns.

Natural Gas

C-139. Comment: The allowances allocated for the purposes of industry assistance in section 95870(d) should also include facilities providing the Pipeline Transportation of Natural Gas. Establishments primarily engaged in the pipeline transportation of natural gas from processing plants to local distribution systems, NAICS code 486210, should be added to Table 8-1 as these entities have some leakage potential since interstate pipelines operating compressors outside of California have some substitution capabilities for facilities inside California. This industrial sector includes both compressor stations required for pipeline transportation of natural gas and the injection and withdrawal of natural gas from storage fields.

The allowances allocated for the purposes of industry assistance in section 95870(d) only include the industrial sectors in Table 8-1. Omitted from that list are facilities providing the Pipeline Transportation of Natural Gas. Establishments primarily engaged in the pipeline transportation of natural gas from processing plants to local distribution systems, NAICS code 486210, should be added to Table 8-1. This industrial sector includes both compressor stations required for pipeline transportation of natural gas and the injection and withdrawal of natural gas from storage fields. They are covered entities under section 95811(a)(8) or (12). Companies in this sector include more than natural gas utilities (e.g., interstate pipelines, and independent storage operators), and so should be included here rather than in section 95870(c)(2). These entities do have some leakage potential since interstate pipelines operating compressors outside of California have some substitution capabilities for facilities inside California. For example, El Paso Natural Gas has compressor stations in Arizona, across the California border from stations operated by Southern California Gas Company. A recent California Energy Commission Report indicated that there is 90 BCF of storage capacity connected to California, but outside California, in competition with 219 BCF of utility-owned and independent storage in California. This sector should be added to Table 8-1 and should be evaluated by the same criteria as the industries already included in Table 8-1. (SEMPRA1)

> **Response:** In establishing the framework for leakage risk assessment, we focused on the sectors that have tradable outputs since competition occurs when multiple suppliers can supply the same (substitutable) goods or services.
> We did not include pipeline transportation of natural gas because we believe that the pipeline services have to be located between gas wells and end users; they cannot be moved to other places just to seek lower costs. We understand that

the possibility of compressing station shuffling would occur only along the border; however, the majority of compressing stations have to stay in California to serve California-based customers.

However, per Board Resolution 10-42, staff will continue evaluating the methodology for leakage risk assessment. If stakeholders provide us with additional information, staff will review them. Additional information could include excess capacity of compressing stations in neighboring states close to California border, or methodology to assess trade exposure for pipelines.

Resolution 10-42 indicates that this evaluation of leakage risk assessment will occur when we initiate a public process for determining whether allowances should be allocated directly to natural gas utilities on behalf of their customers, and we will recommend to the Board what method should be used for that allocation. This would be implemented prior to the initial allocation of allowances for the second compliance period.

Refineries / Oil & Gas

C-140. (multiple comments)
Comment: The petroleum refining and extraction sectors are categorized inappropriately as high risk. In fact, these industries face very low leakage risk; statewide extraction and refining output does not change measurably with changes in worldwide energy prices. Extraction opportunities are place-based, and refining capacity in place already within the state is not likely to relocate. (EDF1)

Comment: EDF disagrees with the categorization of petroleum extraction and refining as a high leakage risk, so CARB needs to revisit the treatment of both petroleum sectors. (EDF1)

Comment: CARB should maintain oil and gas extraction in the "high" risk category for emission leakage. (CONOCO)

Response: Petroleum extraction is classified as high leakage risk and petroleum refining is classified as medium leakage risk. These classifications are supported by available data. We determined leakage risk using emissions intensity and trade exposure as two central measures. Our analysis is detailed in Appendix K of the Staff Report. We analyzed emissions intensity data for all industrial sectors, selected natural break points in the emissions intensity spectrum, and placed industrial sectors into the high, medium, low, and very low categories of emissions intensities based on these break points. For assessing trade exposure, we considered various approaches before choosing trade share as the metric to classify industrial sectors for trade exposures.

C-141. Comment: Examination of published California Department of Oil, Gas, and Geothermal Resources data show that California domestic captive oil production is not sensitive to leakage at the carbon prices expected under the California cap & trade program ($15-$30 projected in 2020, according to CARB's staff report). As demonstrated in Figure 1, oil production has been on a steady decline over the past decade, and fuel price has had no perceptible impact on production, even with a five-fold crude oil price increase. Adding a carbon price, for example $20/ton, is likely to change the net price received for crude oil production by about one percent at recent oil prices, even if producers pay for 100 percent of their GHG allowances. (ICCT1)

> **Response:** Thank you for the comment. We believe that in the future it may be appropriate to use fuel price as a metric for leakage risk analysis. In the absence of GHG reduction regulations, variation in the price of fuel inputs may shed light on the effect that a price of carbon is likely to have on the cost of production and retail price of products. In the current categorization, we determined leakage risk using emissions intensity and trade exposure as two central measures. At the time of our analysis, this was our preferred approach for projecting potential for leakage. Our methodology is detailed in Appendix K of the Staff Report.
>
> As noted in the Staff Report, we are committing to monitoring how covered sectors, especially those who receive free allocation, address carbon costs once the program is in place. But until the program is in place, we will not have the data to substantiate or negate the concerns raised. Per Resolution 10-42, we will continue to review information concerning the emissions intensity and trade exposure of different industries in California.

C-142. Comment: We support the use of carbon allowances to reduce greenhouse gas emissions. These allowances have the potential of raising billions of dollars to help address the problem. CSS does not agree with the proposed structure to give free allowances to producers until 2015 based on the amount of petroleum they produce. If the goal is to reduce carbon emissions, we need to capture the full cost of the fuels in the price and use the fees imposed to mitigate the environmental damage and health hazards caused from their use. Giving free allowances to refineries is taking a step backwards. It would be a better plan to auction all allowances and use the proceeds to help businesses conserve fuel. The auction of these allowances could provide a source of capital for implementing efficiency measures for our small businesses which, unlike large oil companies, have no ability to set prices for their products and services. (CSS)

> **Response:** We designed a phased approach to the development of an auction system, beginning with a high percentage of free allowances allocated to program participants. We recognize that the long-term success of the program will require significant investment in emissions reductions. However, under current economic conditions, an early emphasis on auction could hamper the ability of California sources to invest in low-carbon technologies. Freely allocating allowances in the early years of the program will help prevent leakage. Allocating the allowances for free using emissions efficiency benchmarks will reward companies that have already made investments in energy efficiency and carbon reductions, and will not penalize those that produce goods in California

using energy-efficient processes. The overall allocation approach includes: creation of an Allowance Price Containment Reserve for cost-containment purposes, free allocation to the industrial sector for transition assistance and leakage prevention, free allocation to electrical distribution utilities on behalf of ratepayers, and auction of the remaining allowances.

C-143. Comment: The refining industry is highly trade exposed and we believe that the treatment of the refining sector as proposed in the draft regulation will result in significant leakage in the second and third compliance periods. This will result in a major negative impact to this value added California industry. We recommend that ARB revise its conclusion that the refining sector is medium trade exposed in the second and third compliance periods, and instead, find that this sector will be highly trade exposed. (TESORO)

Response: As noted in the Staff Report, we are committing to monitoring how covered sectors, especially those who receive free allocation, address carbon costs once the program is in place. But until the program is in place, we will not have the data to substantiate or negate the concerns raised. Per Resolution 10-42, we will continue to review information concerning the emissions intensity and trade exposure of different industries in California. We will recommend changes to the Board on leakage risk determinations, if needed, prior to the initial allocation of allowances for the first compliance period starting in 2013 for industrial sectors not identified in Table 8-1 of the cap-and-trade regulation, and prior to the initial allocation of allowances for the second compliance period starting in 2015 for industries identified in Table 8-1 of the cap-and-trade regulation. We will update the Board annually on the status of the cap-and-trade program, including, to the extent feasible, information on shifts in business activity that may result in emissions leakage and changes in market share for covered entities and sectors.

C-144. Comment: Refiners and other trade-exposed industries that purchase electric power should receive either direct rebates from utilities or allowances to compensate for trade exposure. The proposed regulation does not specifically state how Energy Intensive/Trade Exposed (EITE) entities that import electric power will be compensated for the GHG compliance costs associated with purchased power. Competitiveness of trade-exposed entities can only be maintained if allowance allocation to energy sectors is equitable. Under the proposed regulation, refineries that do not have on-site cogeneration facilities are not at parity with those that do. In the Initial Statement of Reasons, CARB appropriately contemplates direct rebates to residential electricity customers to compensate for the GHG compliance cost. However, in that same document CARB suggests that industrial customers' allowance value might be best provided through energy efficiency benefits, rather than direct cost relief. Codifying such a recommendation would create uncertainty in the extent to which refineries and other EITE entities might be adequately protected. CARB should clarify the regulations regarding importation of power by EITE entities to address the potential impact on competitiveness by adopting one of two approaches. Under the proposed framework, CARB could require the utility to share the benefits of free allowance value with trade-exposed entities through direct rebates. Alternatively, CARB could provide an EITE entity a direct allocation of free allowances for power purchased from a distribution utility. To avoid double counting, CARB should exclude these allowances from the allocation of free allowances to the entity's serving utility. (CONOCO)

> **Response:** An adjustment factor was not made for power purchased in establishing the product-based benchmarks. This is because purchased power may not create an indirect carbon cost in all California utility service territories. It is ARB's goal to see a carbon price properly embedded in all utility rates. If and when this occurs, the compensation for these indirect carbon costs could be incorporated into the product benchmarks (or reductions in these costs created in some other fashion) to help minimize leakage. We will revisit this issue once the California Public Utilities Commission Proceeding addressing utility costs and revenue issues associated with greenhouse gas emissions concludes.

C-145. Comment: Based on CARB's allocation formulas, refiners would receive the majority of industrial sector free allowances. This sector would be the biggest recipient overall behind electric utilities. The value of these allowances at $20 per GHG allowance over the years at 2012 to 2020 is estimated at $4 billion dollars. The leakage risk for refined California surface transportation fuels is low due to unique California fuel requirements and can likely be minimized further without free allocations (through mechanisms such as a border adjustment). (ICCT1)

> **Response:** We evaluated the feasibility of implementing border adjustment before choosing free allowance allocation as a means of emissions leakage prevention. However, at this point we believe that there are many technical and legal limitations, and insufficient resources to implement border adjustments. We will continue to evaluate the feasibility of border adjustments during implementation of the cap-and trade program.

C-146. (multiple comments)
Comment: We agree with CARB staff that additional analysis is warranted (Appendix K-26 and 27) regarding potential leakage risk for domestic captive producers such as oil production facilities. CARB has determined that some allocation decisions (i.e. cogeneration) require further analysis before making any final decisions, and further analysis of domestic captive producers should also precede adoption of any free allocation factors for these sources. (ICCT1)

Comment: Placing large and small refiners within the same category for leakage assistance may not be appropriate. Appendix K-Leakage Analysis specifically notes that the petroleum refining sector was aggregated for leakage analysis. WIRA requests that a separate leakage analysis be done for small refiners as they have unique circumstances. (PMTPETRO1, WIRA1)

Comment: WIRA members do all their business in California and so are more susceptible to leakage. We urge you to ask your staff to allow assessment of leakage, not only among the industries, but among segments of an industry. The presumption of through-put of cost, especially as the transportation fuels, is wrong. If cost could always be passed through, we would never lose money or sell products at a loss. (WIRA2)

Comment: The final regulation should extend full trade exposure protection for refining beyond the first compliance period. We propose that ARB either review the impacts of trade exposure looking at marginal costs and change the status of refining to highly trade exposed; or add a criterion for program monitoring of leakage potential that evaluates the competitive disadvantage of refining due to the lack of linkage or a US national cap & trade program. If neither linkage nor a US cap and trade program is in place by 2014 then ARB should extend full trade exposure protection at 100 percent free allowances for refining. It is important that this evaluation take place as early as possible and well in advance of the second compliance period to avoid the irreversible impacts of investment and jobs transferred to other states. (CHEVRON1)

Comment: The refining industry is clearly under trade pressure from fuel imports. The proposed reduction of the Assistance Factor from 100 percent in the first compliance period to 75 percent and then 50 percent in the subsequent second and third compliance periods, respectively, leaves in-state production capacity vulnerable to increased dependence on imports (and hence supply disruptions). Industry experts anticipate this import pressure to materially increase over the next several years, increasing the industry sectors leakage risk to “High”, where no reduction in the Assistance Factor would be imposed. At a minimum, CARB should re-evaluate the leakage risk preceding each subsequent compliance period and determine of the proposed reduction in the Assistance Factor is warranted. (APC)

Comment: Reassess leakage in the refining sector to consider recent imports of transportation fuels. Consider creating subsectors in the refining group that will properly identify leakage advantages that integrated and larger multi-facility refiners have over smaller, non-integrated refiners. Kern supports using a broad base in determining the sector baseline, since leakage would likely occur to less efficient refiners outside of California. Kern also suggests assigning the refining assistance factor into the high leakage risk category. It may also be necessary to create a subset in the refining sector based on integration and size, in order to prevent large entities from "shuffling carbon efficiencies" among locations to create a carbon advantage within the California Cap and Trade. (KERNOIL1)

> **Response:** We recognize limitations of the data used, but until the program is in place, we will not have the data necessary to substantiate or negate the concerns raised. We will monitor for leakage and adjust free allocation if needed during implementation. Per Board Resolution 10-42, we will continue to review information concerning the emissions intensity and trade exposure of different industries in California. We will recommend changes to the Board on leakage risk determinations, if needed, prior to the initial allocation of allowances for the

first compliance period starting in 2013 for industrial sectors not identified in Table 8-1 of the cap-and-trade regulation, and prior to the initial allocation of allowances for the second compliance period starting in 2015 for industries identified in Table 8-1 of the cap-and-trade regulation. We will update the Board annually on the status of the cap-and-trade program, including, to the extent feasible, information on shifts in business activity that may result in emissions leakage and changes in market share for covered entities and sectors.

C-147. Comment: ARB staff's determination that refining is a medium trade exposed sector is based on the ability to pass through costs and the fact that today's market is balanced with the majority of refined product consumed in California being produced in California. We believe that the analysis is flawed because it does not take into consideration the impacts on the balance of trade once the price of carbon is imposed on the market, nor does it recognize future changes in the market that are currently being signaled today.

- There is no empirical evidence established for the ability of CA refiners to partially or fully pass through carbon costs. Cost pass through will be determined by a variety of market factors as well structural factors associated with the carbon intensity of California refineries and imported products. Since long-term wholesale petroleum prices are driven by the marginal barrel costs of supply, the cost of carbon associated with the last marginal barrel of supply may be zero, if supplied by an imported barrel where no GHG regulations exist. The carbon cost associated with the last marginal barrel of supply from an in-state refiner could be small if the refiner has a low carbon intensity which is associated with simple, non-complex refineries. Therefore the less complex refiners may have more potential to pass through the costs on the marginal barrel.
- Imports and exports are currently balanced indicating a healthy market not a closed one.
- Recent worldwide increases in refining capacity and ARB's own Supplier Diversification initiatives have opened the CARBOB market to refineries worldwide.
- Because gasoline is a mixture of refinery streams, it's relatively easy for any refinery to produce 'some' CARBOB gasoline with minimal additional investment. California refineries have continued to make the more expensive investments necessary to produce a larger proportion of gasoline meeting CARBOB specifications.
- Cost of transportation from states outside California is very small – approximately 5 cents per gallon or less.
- Basing a trade exposure determination on cost pass-through does not recognize the uneven playing field created for competition from outside by the cost of AB 32 compliance imposed on California producers, particularly with rising costs of carbon (expected in 2015 due to lack of linkage). Additional issues are long-term structural disadvantages to the sector from higher costs and the spiral effect that these costs and changes have on long-term investments in the state.

- Even with high trade exposure, California refineries will have to make reductions to meet the declining cap and to pay the added cost of carbon in electricity.
- It is important to recognize that impacts of this decision to add additional burden to the refining sector in the long term is not reversible. If ARB chooses to monitor trade exposure and change the program after seeing leakage, it will be too late. Investment decisions to grow industry out of the state cannot be reversed. ARB should make the trade exposure decision based on whether there are greenhouse gas emissions control programs for refineries throughout the U.S. and whether AB 32 is linked to U.S. and worldwide programs.
- In addition to these detailed comments and recommendations, we have attached comments by the Analysis Group that substantiate that the refining sector should be considered highly trade exposed until there are widespread cap and trade programs that will equalize the costs between states and other jurisdictions. We can arrange a meeting between ARB staff and the consultants to clarify any questions regarding the comments.

We recommend a high trade exposure determination for refining. This meets the objectives of AB 32 better than medium trade exposure because it reduces economic impacts from the program without compromising the required emission reductions to 1990 levels or impacts of the cost of carbon. (CHEVRON1)

> **Response:** We recognize that we need to collect data to analyze impacts on the balance of trade once the price of carbon is imposed on the market, but we believe our analysis of available data supports classifying petroleum refining as medium trade exposure.
>
> Per Resolution 10-42, we will continue to review information concerning the emissions intensity and trade exposure of different industries in California. We will recommend changes to the Board on leakage risk determinations, if needed, prior to the initial allocation of allowances for the first compliance period starting in 2013 for industrial sectors not identified in Table 8-1 of the cap-and-trade regulation, and prior to the initial allocation of allowances for the second compliance period starting in 2015 for industries identified in Table 8-1 of the cap-and-trade regulation. We will update the Board annually on the status of the cap-and-trade program, including, to the extent feasible, information on shifts in business activity that may result in emissions leakage and changes in market share for covered entities and sectors.

C-148. Comment: Energy Independence Now (EIN) recommends that allowances for refineries and oil production require auctioning rather than CARB's proposed free allocation. This would allow a more competitive environment for emerging clean technology in the sector and potentially create an additional revenue stream for the development and adoption of these clean technologies. EIN acknowledges the fact that some free allocation in this sector is needed to prevent leakage. The Economic Allocation Advisory Committee found that only a small amount of free allowances may be needed to address leakage, but that further analysis is needed for the oil industry due to unique requirements for California fuel. Furthermore, the amount of free allowances distributed in this sector should not be based on the amount of petroleum produced or refined as currently proposed. This will act as an incentive for refineries and oil producers to increase their throughput rather than invest in efficient or clean technology. Rather, EIN recommends that allocations to the industry should be based on performance and that allowance value should be used to help transition the sector to more efficient and cleaner practices. (EIN)

> **Response:** We believe that without transition assistance, the competitiveness of industries that are both emissions intensive and trade exposed has the potential to be negatively affected relative to competitors that do not face similar GHG emission reduction requirements. An early emphasis on auction could hamper the ability of California sources to invest in low-carbon technologies. To incentivize investment and to minimize the potential for leakage, we believe a heavy emphasis on allocating free allowances in the program's early years before transitioning to heavy reliance on auctions would be more effective. As the commenter notes, allocation to industrial sectors based on the amount of annual production provides the incentive to continue in-State production. The program is specifically designed in this way to minimize emissions leakage.

C-149. Comment: We're the poster boy for leakage. We leaked two weeks ago when we shut down our refinery for economic reasons. First, we are very different from the major oil companies that most people are familiar with and who are competitors. California is already leaking capacity, and this does not include our plant. Well, where will the leakage go? China. India's capacity is growing similarly. Most people have the mistaken impression that oil refining is a lucrative industry because of the high cost at the pump. Unfortunately this price has little to do with refining profitability. What does is the difference between the price of products and the cost of raw materials. Refining profitability dropped significantly during the 2008 recession and has not returned. The high cost of crude oil has been hard on us. Now, if pass through of costs were possible for us, wouldn't we pass through these increased costs to our customers instead of shutting down? The major oil companies that are integrated do not need to make money on refining. With the high cost of crude, they can still be very profitable. Because of the recession, we urge you to consider the economic health of the industry's companies and especially the jobs affected in your rulemaking, and consider a form of hardship relief similar to what the EPA has. (PMTPETRO2, PMTPETRO3)

> **Response:** We recognize the potential risk of emissions leakage for industrial sectors that are emissions-intensive, trade-exposed with relatively limited cost pass through opportunities. And we designed a system for providing transition assistance to minimize leakage risks. As noted in the Staff Report, we are committing to monitoring how covered sectors, especially those who receive free allocation, address carbon costs once the program is in place. We have included features, such as periodic updating of leakage risks, to adjust free allocations.

C-150. (multiple comments)

Comment: Incremental emissions and employment leakage will occur from any amount of allowances auctioned to trade-exposed industry. The regulation correctly acknowledges the reality that California industry will be subjected to trade exposure as a result of the cap and trade program. California industry will be competing against global and interstate competition that are not similarly regulated, and therefore not subject to the same costs. Refiners and other industrial sectors will face a significant cost disadvantage with competing businesses outside of California. (BP)

Comment: We believe that ARB's conclusion about the refining industry as moderately trade exposed is not substantiated. Given the national, international, regional, and interstate competition for petroleum products that currently exists, it is clear that the refining sector is highly trade exposed. WSPA commissioned a study by Aspen Environmental consultants to evaluate the trade exposure of the refining sector in California. Aspen noted that ARB so far has used only national level data on value added for industries by NAICS economic sectors (refining is 3241), and only international trade data for California. However, data is available at the state level for most industries, including interstate trading activity. The interstate trade exposure (TE) index for California's entire manufacturing sector is 87 percent, well beyond the 20 percent threshold that ARB staff has proposed as "high exposure." Virtually every industrial sector exceeds the 20 percent threshold by this measure alone. Adding interstate trade to international raises the TE index for the refining sector to 26 percent. Specific to the petroleum refining sector, the national data sources used by ARB staff do not match with each other. The U.S. Census value of shipment and physical product appear to be 37 percent higher than the data reported by the U.S. Energy Information Administration and California Energy Commission. For these reasons, determining allowance allocations beyond the first cycle should be deferred until these issues can be addressed in greater detail. ARB should convene a work group in 2011 to review the most recent economic and trade information available and determine whether ARB staff's initial conclusions are supported. We recommend that ARB also incorporate interstate trade data in their analysis. ARB staff used import/export and shipment data from the U.S. Census Bureau to measure trade activity. Information on California trade from the Census Bureau is limited to the top 25 commodities imported and exported as well as the top 25 foreign trading partners. It does not track trade among states. While international competition is an important component of assessing trade exposure in various California industries, it is not sufficient. California industries also face competition from industries in other states throughout the U.S. that do not face the same stringent GHG regulations or even any GHG cap at all. (WSPA1, WSPA2)

Comment: The proposed regulation classifies petroleum refining as "medium risk" for emission leakage with significant implications for allowance allocation to the sector in the second and third compliance periods (see section 95870). We recommend classifying California refining as "high risk" for leakage due to trade exposure. The California refining sector is in direct competition with domestic and foreign refineries. These California operations would incur costs for refinery GHG emissions. Similarly, California refiners would be penalized for selecting heavy crude oils as per the LCFS program. Without appropriate protection, the fundamentals of the fuels market could force California refiners to curtail production or shut down. For instance, each 25 percent reduction in the allowance factor (high risk versus medium risk) adds approximately $150 million in annual compliance costs to the refining sector. Imports would likely increase from foreign refineries not required to hold allowances for refinery emissions. Large new refineries in India and the Middle East, with relatively low costs to operate are expected to have the capability to produce California-grade clean products for export to California as market conditions justify. Product imports to the U.S. east coast are large due to world pricing, and significant imports to the U.S. west coast are equally possible. The result would be lost jobs, reduced state revenues, and decreased fuel system security at no net benefit to the environment. CARB has appropriately classified the oil and gas sector as "high risk." CARB should classify the California refining sector as "high risk" for emission leakage through 2020, and issue allowances on this basis. Just as CARB has recognized that the State is subject to imports of crude oil cargoes, the state is also very much subject to imports of petroleum product cargoes. (CONOCO)

> **Response:** We believe our leakage risk determination for petroleum refining is supported by available data. We determine leakage risk using emissions intensity and trade exposure as two central measures. Our analysis is detailed in Appendix K of the Staff report. We analyzed emissions intensity data for all industrial sectors. We then selected natural break points in the emissions intensity spectrum. Industrial sectors are placed into the high, medium, low, and very low categories of emissions intensities based on these break points. For assessing trade exposure, we considered various approaches before choosing trade share as the metric to classify trade exposures.
>
> We recognize limitations of the data used. Per Resolution 10-42, we will continue to review information concerning the emissions intensity and trade exposure of different industries in California, and to recommend to the Board changes to the leakage risk determinations, if needed. We will update the Board annually on the status of the cap-and-trade program, including, to the extent feasible, information on shifts in business activity that may result in emissions leakage and changes in market share for covered entities and sectors.
>
> We will monitor for leakage as an integral part of cap-and-trade program implementation. Should ARB identify that leakage is occurring, we will develop appropriate responses to rectify them.

C-151. Comment: California's standalone actions on climate change will have a very negative impact on ConocoPhillips' operations in the state. The cost impacts will be significant and, depending on market reactions, may necessitate reduced operations that impact jobs and potentially increasing the State's dependence on gasoline and diesel imports. The cap-and-trade program as proposed, along with the State's LCFS program, disproportionately burdens our operations and California citizens. These combined actions will affect the viability of California refining, already trade-exposed to product imports, and adversely impact California consumers as cost of these programs become included in the price of goods and services. Transportation products should be excluded from cap-and-trade and CARB should classify California refining as "high risk" due to trade exposure. Absent the adoption of national and international climate frameworks that avoid economic dislocation and emissions “leakage”, state programs must move cautiously if at all. (CONOCO)

> **Response:** We recognize the potential impact on industrial sectors from the absence of GHG regulation outside of California. We believe the transition assistance and leakage protection feature of the cap-and-trade program is adequate to mitigate the potential impacts. Per Resolution 10-42, we will continue to review information concerning the emissions intensity and trade exposure of different industries in California, and recommend to the Board changes to the leakage risk determinations, if needed. We will update the Board annually on the status of the cap-and-trade program, including, to the extent feasible, information on shifts in business activity that may result in emissions leakage and changes in market share for covered entities and sectors. Transportation fuels are included in the program starting in 2015 after new reporting requirements have been in place for several years. We believe it is important to include transportation fuels in the program coverage in order to create a level playing field between energy types with respect to greenhouse gas emissions.

Miscellaneous

C-152. (multiple comments)
Comment: Energy-intensive industries need to have flexibility to allow incremental reductions in order to prevent leakage. (SDCHAMBER)

Comment: CARB's approach to classifying industries based on relative GHG intensity lacks an appropriate measure of proportionality and scale. The point-of-departure for CARB's leakage assessment is to identify and classify each industry's GHG emissions intensity. As noted by CARB, emissions intensity serves as a proxy for compliance costs, in which sectors with higher emissions intensities are likely to face higher compliance costs under the cap-and-trade program. As also noted by CARB, leakage risk is likely to be continuously increasing in emissions intensity. Due to “the excess administrative burden and technical difficulties,” however, CARB asserts that allowances could not be distributed as a continuous function of emissions intensity. Although CARB fails to identify the precise nature of the “excess administrative burden” and “technical difficulties,” it concludes that it is generally more convenient to establish discrete categories along the emissions intensity continuum. (CSCME2)

> **Response:** Each sector is associated with different levels of emission intensity. Assigning different assistance factors based on each sector’s emission intensity is technically difficult and administratively resource intensive. We

believe that our analysis is appropriate because it correctly captures different sectors' degree of emission intensity. Further, per Resolution 10-42, we are developing methods for implementing AB 32 that minimize administrative burden.

C-153. Comment: Aircraft maintenance service is an emission intensive and trade exposed sector with a high risk of leakage, we ask that ARB identify this sector. United Airlines San Francisco Maintenance Center is subject to California's cap and trade program primarily due to greenhouse gas (GHG) emissions generated from the production of electricity and thermal energy, and the combustion of fuels in test cells. However, the aviation maintenance services center (NAICS code 411190) was not analyzed in the leakage analysis. Many, if not all, cogeneration facilities that report based on their industrial host's NAICS code are listed in Table 8-1 and would receive free allowances to cover carbon costs associated with heat and electricity consumed on-site. Because the Maintenance Center is not identified as an industrial sector that is subject to leakage risk, no free allowances are provided to the Maintenance Center under the proposed regulation. We ask that ARB identify the aviation maintenance services sector as eligible for free allowances in Table 8-1. (UNITEDAIRLINES)

Response: We agree, and modified our leakage risk assessment accordingly.

C-154. (multiple comments)
Comment: ARB should consider making Ct in the product-based benchmark equation equal to one for industrial sectors in the "High" leakage risk category. For these sectors which are particularly sensitive to increased costs and competition from outside the jurisdiction of the cap and trade market, it will not be meaningful to offer 100 percent assistance or coverage with free allocation and yet indicate that this only applies to a fraction of the emissions that meet or exceed the industry's benchmark. These facilities should be covered completely to ensure that they are not put into a competitive disadvantage in the marketplace. (GPI)

Comment: The proposed regulation virtually guarantees that every industry, regardless of its leakage exposure, will immediately be placed at a competitive disadvantage, with the magnitude corresponding to at least 10 percent of its GHG compliance obligations. This cost disadvantage could be substantially larger depending on the extent to which indirect emissions costs are reduced through compensation from distribution utilities, as this policy mechanism remains largely undefined in the proposed regulation. CARB's proposed approach will impose costs on California cement producers that will not be faced by importers. To the extent that CARB believes that this approach is consistent with the mandate to minimize leakage, it is logical to presume that staff believes that such costs are insufficient to induce leakage. (CSCME2)

Response: In designing the system for allocating free allowances, we balanced the need for transition assistance and leakage prevention against meeting the AB 32 mandated GHG reductions. We believe our approach is balanced and is expected to be effective in achieving GHG reductions. It will provide California industries with adequate transition assistance, leakage risk protection, and incentive to innovate toward a low-carbon economy.

C-155. Comment: EDF recommends that in determining the risk of leakage (and therefore the appropriate allowance allocation), CARB take into account the amount of existing excess capacity in particular industries. (EDF1)

Response: While excess capacity is a very useful indicator to understand the relationship between supply and demand, at this point it is very difficult to obtain that information. We believe that using industrial activities as the indicator is appropriate for determining leakage risk and the calculation of allowances for allocation.

C-156. (multiple comments)
Comment: The imposition of a broader auction in the second and third periods will only increase leakage by imposing higher costs on industry. So long as California is not joined in the cap and trade program by other jurisdictions and California industry remains subject to competitive forces, this leakage risk is heightened and CARB should take every step possible to avoid it. (CMTA1, CMTA2)

Comment: Until a critical mass of states and countries adopt carbon policy that results in a similar cost of carbon, California should freely allocate 100 percent of allowances to trade exposed industry. Any less free allocation exposes California industry to incremental costs to which their competitors, both international and other states are not exposed. (BP)

Response: We are aware of the impact of the absence of cap-and-trade programs from other jurisdictions on California industrial sectors and designed a program to minimize the impact. Even though our allowance allocation system will transition into more reliance on auctions, we believe giving allowances for free in early years will provide sufficient transition assistance and incentives for industry to innovate and stay competitive against those outside of California. As noted in the Staff Report, we are committed to monitoring how covered sectors, especially those who receive free allocation, address carbon costs once the program is in place. In addition, for allocation purposes we are collecting product data from almost all sectors at risk for leakage. The data set from this collection will also serve as a key monitoring step in detecting leakage. We have included features, such as periodic updating of leakage risks, to adjust free allocations.

C-157. Comment: Small commercial and industrial customers (small business) deserve the same transition assistance as large industrial customers. ARB has indicated that in addition to providing allowance value to deter leakage of large businesses (business flight), free allowances would also be provided short-term to "provide a transition period to smooth market start-up." The same type of transition assistance should be provided to smaller commercial and industrial customers (under the 25,000 metric ton limit), so as to not discriminate against small business. Given the nature of rate regulation, allowances that are administratively allocated for this purpose can flow through to this class of customers. (SWGASCORP)

> **Response:** Free allowances are allocated to industries based on their emissions intensity and trade exposure, and this approach does not discriminate according to business size. Transition assistance is not necessary for industrial facilities emitting less than 25,000 CO_2e metric tons/year because they are not subject to a compliance obligation under the cap-and-trade program. Electrical Distribution Utilities are provided free allowances for the benefit of ratepayers in sufficient quantity to compensate ratepayers for the costs of the program. Transition assistance is not necessary for the natural gas industry because the industry will not be covered by the program until the second compliance period, which allows time for the industry to plan for inclusion. We are continuing to evaluate how to allocate allowances associated with natural gas. Furthermore, emitters that are below the threshold for inclusion in the program may opt-in to program requirements and receive free allowances based on their particular production activity.

C-158. Comment: The proposed factors to determine emissions leakage potential are largely based on US data and do not reflect Solar's business or California operations. The information presented on "Value of Shipments" and "Value added" metrics used for our classification appears to be based on broader industry data. It is not clear if ARB considered that more than 70 percent of Solar's products are sold to international customers. (SOLARTURBINES1)

> **Response:** We analyze all credible available data iteratively to classify industrial sectors for emissions intensity and trade exposure. We use the results of the classifications as two central measures for classifying leakage risks. In the absence of California data, it is necessary to use national data for the classification. The details of our analysis are presented in Appendix K of the Staff Report. A discussion of the strengths and weaknesses of the data used is included.

C-159. Comment: Currently the Draft Final Rules do not include the NAICS code 325199 (All Other Basic Organic Chemical Manufacturing) at all in the High, Medium or Low Leakage Risk category in Table 8-1. The fuel and steam use at Dow Pittsburg are largely categorized under NAICS code 325199. Dow conducted an analysis of onsite steam generation and onsite natural gas use in process heaters versus NAICS code applicability. Dow Pittsburg determined that 97 percent of our total boiler and process heater fuel use onsite in Dow equipment is classified under NAICS code 325199. Dow also determined that 98 percent of our steam consumption is classified under NAICS codes 325199 and 325188 (All Other Basic Inorganic Chemical Manufacturing). This steam is generated by Dow onsite and is also purchased steam from Calpine, also generated onsite. We also noted that one percent of Dow Pittsburg natural gas fuel use is classified under NAICS code 325320. Dow recommends that NAICS code 325199 needs to be added to ARB's Table 8-1 in the Final Regulation in the High Leakage Risk category. (DOWCHEM1, DOWCHEM2)

Response: We agree, and the regulation was modified as proposed.

Assessment of Leakage Risk

C-160. Comment: In Appendix J, the regulation states that the Industry Assistance Factor is essentially the ability an industry has to pass-on carbon costs. With low-cost competitors throughout the world, even a minimal increase in cost could displace certain market segments as demonstrated in the previously listed reports. (ACC2, ACC3)

Response: We want to clarify that the industrial assistance factor is based on the sector's leakage risk, which is derived from the sector's emissions intensity and trade exposure. The assistance factor is one of the factors used to calculate allowances for free allocation to assist industry to transition into our cap-and-trade program and prevent leakage risk. We believe our allocation strategy minimizes leakage. Per Board Resolution 10-42, we will continue to evaluate the risk of emissions leakage and make recommendations to the Board for any changes necessary to minimize the risk of leakage.

C-161. Comment: The proposed factors to determine emissions leakage potential are based on national data and are not necessarily indicative of California or local conditions. Of particular concern is that pharmaceutical and aerospace companies are identified as "low leakage risk", when in fact these two industry sectors are widely sought after by other states. (SDCHAMBER)

Response: We analyzed all credible data available iteratively in deriving emissions leakage risks for industrial sectors. In the absence of needed California data, national data was used for classifying trade exposures and emissions intensities. Per Resolution 10-42, we will continue to review information concerning the emissions intensity and trade exposure of different industries in California. We will recommend changes to the Board on leakage risk determinations, if needed, prior to the initial allocation of allowances for the first compliance period starting in 2013 for industrial sectors not identified in Table 8-1 of the cap-and-trade regulation, and prior to the initial allocation of allowances for the second compliance period starting in 2015 for industries identified in Table 8-1 of the cap-and-trade regulation. We will update the Board annually on the status of the cap-and-trade program, including, to the extent feasible, information on shifts in business activity that may result in emissions leakage and changes in market share for covered entities and sectors.

C-162. Comment: Assessing leakage risk is an inexact science at best and many CMTA members have expressed great concern about how their industries have been categorized. Because cost ramification of the determination is so high, we should be much more certain that the leakage categories and the industry members of each are valid. Moving forward with this scheme with the current level of analysis is fraught with political, legal and economic risk. (CMTA1)

> **Response:** We analyzed all credible data available in assessing emissions leakage risks for industrial sectors. We recognize that there are uncertainties in the determination. The assistance factor is 100 percent for all producers at the outset of the program, settling to a level of compensation needed to minimize leakage, based on our analysis, by 2018 in recognition of the uncertainties associated with a lack of publically available State-level trade data for all industries. Per Resolution 10-42, we will continue to review information concerning the emissions intensity and trade exposure of different industries in California. We will recommend changes to the Board on leakage risk determinations, if needed, prior to the initial allocation of allowances for the first compliance period starting in 2013 for industrial sectors not identified in Table 8-1 of the cap-and-trade regulation, and prior to the initial allocation of allowances for the second compliance period starting in 2015 for industries identified in Table 8-1 of the cap-and-trade regulation. We will update the Board annually on the status of the cap-and-trade program, including, to the extent feasible, information on shifts in business activity that may result in emissions leakage and changes in market share for covered entities and sectors.

C-163. (multiple comments)
Comment: Emissions leakage is a direct consequence of economic leakage, that is the relocation of output, jobs, investment, and other economic activity to jurisdictions that do not face comparable GHG regulations. (CSCME2)

Comment: In the absence of national and global GHG policies, California sectors will all be trade exposed. The best way to mitigate this exposure is 100 percent free allocations. The cost of carbon will be set by the direct measures adopted under AB 32 and the cost of purchasing offsets. In the absence of national and global policies, an auction of allowances will further and unnecessarily increase the costs of the program without providing additional environmental benefits, and perhaps lead to environmental degradation due to leakage of emissions and jobs to states or countries with less stringent environmental policies. To remedy this problem, CCEEB recommends that ARB establish a test to determine if an industry is trade exposed. The ARB's trade exposure test should rely on two criteria: (1) is there a federal program; and (2) is there linkage? Allocations should be evaluated every three years in relation to the trade exposure test and other market indicators, such as the reports and recommendations by an independent market monitoring committee. (CCEEB1, CCEEB2)

> **Response:** We recognized that California industrial producers compete in a global market and, in the absence of national and global GHG policies, could be competitively disadvantaged as a result of the regulation. We believe that industry assistance is necessary to provide a smooth transition into the cap-and-trade program for industrial sectors with competitiveness risks. The level of assistance provided will be high at the start of the program but decline over time

to a minimal level necessary to prevent emissions leakage as industrial sources adapt to a low carbon economy.

In designing our allowance allocation system to minimize leakage, we analyzed available data on emission intensity, trade exposure and cost pass-through ability, and approaches used by other existing and proposed greenhouse gas policies. Our leakage assessment will be updated periodically and assistance factors are already adjusted for the different compliance periods based on leakage risks. We are committed to monitor how covered sectors address carbon costs once the program is in place. We will work with covered sources and other interested parties to identify additional sources of information at the state level that could improve our ability to monitor leakage. Should we find that leakage is occurring despite the safeguards in the regulation, we will examine mechanisms to address leakage.

C-164. Comment: ARB's proposed rule includes provisions designed to address emissions leakage and avoid disadvantaging California business. The primary tool for addressing leakage is output-based allowance allocations for "Industry Assistance." The proposed rule includes formulas that determine the quantity of allowances allocated to industry participants in each year. Under these formulas, assistance will decline over time due to changes in the "assistance factor" and the "adjustment factor." In addition, ARB decisions about the "emissions efficiency benchmark" for each sector will also affect the extent to which industry assistance neutralizes the effect of the cap and trade system on firm competitiveness. Neither ARB's proposed Rule nor the ISOR indicate the criteria to be used in developing these benchmarks.

The quantity of allowances granted to firms in a given sector, as specified by these formulas, varies depending upon that sector's vulnerability to leakage. ARB faces several difficult challenges as it tries to identify sectors potentially vulnerable to leakage. A sector's vulnerability to leakage in the short- run and long-run can depend upon many factors, including market structure, industry cost structure, market trends, demand responsiveness and preferences, constraints on competition from other geographic regions, industry investment opportunities and constraints, and the magnitude of the regulatory cost or constraint. However, fully accounting for all of these factors not only requires significant data but requires analyses tailored to each industry's particular circumstances.

Faced with limited resources and data, ARB has proposed to use emissions intensity and trade share to measure vulnerability to leakage, while recognizing the limitations of these metrics. For example, the ISOR notes comments made by the Australian regulator regarding "the importance of supplemental qualitative analysis when trade share is used due to the uncertain indication of cost pass-through ability."

Because GHG and trade related metrics do not provide a perfect measure of an industry's vulnerability to leakage, some cap-and-trade programs propose that regulators may consider factors other than the formulas and conditions used to identify emissions-intensity and trade-exposure to identify vulnerable sectors. Under the EU ETS, the list of sectors “deemed to be exposed to a significant risk of carbon leakage” may be supplemented by taking into account the extent to which individual facilities can reduce GHG emissions or electricity use, future projections of market conditions, and firms’ profit margins. In Australia’s Carbon Pollution Reduction Scheme, sectors may apply for assistance by arguing that they have “a demonstrated lack of capacity to pass through costs due to the potential for international competition. Similarly, ARB has indicated that it will “continue to develop techniques to evaluate the trade exposure of various industries.

As ARB considers these alternative techniques, it may want to consider supplemental assessments reflecting both quantitative and qualitative information about a sector’s vulnerability to leakage. These assessments might better capture leakage risks for industries in unique circumstances. Use of such assessments typically requires clear and well- defined criteria and methodologies and transparent procedures for review to ensure that determinations are consistent across sectors, reflect objective, independent analysis and reflect true industry vulnerability. Ensuring adequate procedural safeguards can place an additional administrative burden on the program. Despite these complications, such assessments may be warranted given data limitations for measuring GHG or trade intensity at the state level, and may provide ARB with information on the extent to which its emissions-intensity and trade-exposure metrics have accurately captured leakage vulnerability of industries within California.

As ARB further analyzes how to most effectively address leakage, several issues are worth considering. First, prior efforts by regulators to design mechanisms to address leakage were developed within the context of national programs. However, leakage as a consequence of AB 32 may occur due to both international and interstate trade. As discussed in a prior paper, there is substantial reason to believe that trade vulnerability may be greater under these latter circumstances. Consequently, as ARB develops criteria for trade vulnerability, it might attempt to more explicitly account for these differences, particularly since it has relied largely upon metrics developed in the context of national programs addressing leakage from only international trade.

Second, as with other mechanisms used and proposed for addressing leakage, the level of assistance is insensitive to the level of allowance prices. However, the level of allowance prices is one of the primary determinants of vulnerability to emission leakage. Examining compliance costs in the petroleum refinery sector illustrates this issue. When allowance prices are $10 per MT, the additional costs on the petroleum sector refining would be roughly 1.0 cents per gallon. By contrast, when allowance prices are $85 per MT, the additional costs would be roughly 8.1 cents per gallon. By contrast, transportation costs for refined petroleum range from 3 to 12 cents per gallon depending upon the point of origination. Thus, the magnitude of the incremental costs faced by California business as a result of the cap and trade program depends closely upon actual allowance prices. In light of this sensitivity, ARB might consider mechanisms that adjust that rate at which allocations for Industry Assistance are phased out for depending upon the level of allowances prices. (ANALYSISGRP)

Response: The purpose of the initial allocation of allowances is to provide transition assistance and prevent leakage upon the start of the cap-and-trade program. We believe it is especially important, given current economic conditions, to provide regulated entities the opportunity to invest in low-carbon technologies. The commenter addresses shortcoming of data and analysis of leakage risks, and the complex interplay factors impacting the industrial economy. We agree that there are uncertainties in data and analysis, but we carefully and methodically considered all information available to develop the cap-and-trade program. We are committed to monitor throughout implementation to identify unintended consequences and take appropriate action to rectify them, if found. We believe the proposed regulation is designed to minimize leakage to the fullest extent feasible. In considering the level of allocation necessary to reduce the risk of emissions leakage moving forward, allowance price is one consideration. The example provided by the Analysis Group points to a useful point of consideration. Using the commenter's information on transportation costs of refinery products, if the petroleum refining industry is compensated at approximately 90 percent of costs when allowance prices are in the $15/ton range (1.5 cents per gallon of refined fuel), the amount of necessary pass-through to avoid leakage is less than 0.2 cents per gallon. This is well below the 3 to 12 cents per gallon required to bring these fuels in from elsewhere, according to the commenter. Therefore, no leakage is expected based on the allocation mechanism.

Assistance Factors Too High

C-165. Comment: Lower the assistance factors in the industrial sector. While we support CARB's efforts to prevent leakage by identifying industries that are at high, medium, and low risk and compensating them, we are concerned that the assistance factors are overly generous and will assign allowance value to industry profits at the expense of consumer benefits. (ENVENTREP1)

Response: We believe that the assistance factors for the industrial sector are at the appropriate level to help industry transition into the cap-and-trade program and to provide leakage protection to those sectors with high emissions and trade exposure. The allocation design will reward those who have invested in energy efficiency and GHG emissions reductions, and will encourage continued investment in clean and efficient technologies in the future.

Alternatives to Addressing Leakage through Allocation

C-166. Comment: CARB proposes to address leakage solely through allowance allocation. They have dismissed more effective approaches without sufficient cause or justification. Please consider the use of border adjustments to address leakage in the industrial sector, and provide a detailed proposal to combine allowance allocations and a border adjustment to provide maximum leakage protection. (CSCME2)

Response: We believe, at this point, there are insufficient resources to implement border adjustment. Per Resolution 10-42, we will continue to review the technical and legal issues related to implementation of a border adjustment to impose obligations on importers of cement that are equivalent to those faced by California cement manufacturers under the cap-and-trade regulation, and to implement such a provision, if it is feasible and necessary, to avoid leakage in the cement sector. We will continue working, with input from stakeholders, on the possibility of implementing border adjustment for maximizing leakage protection.

D. AUCTION

Bid Guarantee

D-1. (multiple comments)
Comment: Shell Energy believes that it is prudent for ARB to seek assurance that purchasers of allowances at auction have the financial capability to buy them. However, we believe that it is unnecessary to require investment grade credit rated companies to post bid collateral. Such guarantees are needlessly costly and time consuming.

We recommend that ARB establish credit threshold tables for investment grade companies based on their publicly reported credit ratings. These tables would provide maximum amounts that a qualified entity would be able to bid without posting additional collateral. The better the credit rating, the higher the credit threshold. If an entity wanted to bid for allowances with a value greater than its credit threshold, it would have to post collateral for any incremental exposure in the normal way. (SHELLENERGY)

Comment: Minimize unnecessary bureaucratic requirements. Investment grade credit-rated companies should not have to post bid guarantees. [pg 92 (i)] (CCEEB1)

Comment: Creditworthiness as demonstrated by a high bond rating from a rating agency should be allowed in lieu of a bid guarantee. Most municipal utilities carry bond covenants and restrictions that limit their ability to post assets as collateral plus the cost for a letter of credit is significant. For electric distribution utilities, LADWP's preferred alternative to the ARB's bid guarantee requirements is to rely on a high bond rating as the basis for creditworthiness such as "AA" or above to qualify an entity to participate in a quarterly auction. There are also creditworthiness provisions outlined in master agreements such as those available through the Western Systems Power Pool (WSPP) or Edison Electric Institute (EEI) that could be used as the basis for participation by utilities in a quarterly auction. (LADWP1)

> **Response**: We do not agree with these comments for two reasons. First, we needed a bid guarantee mechanism that would not result in very different auction participation costs for different covered entities. Second, we will be contracting with a financial services provider who must be able to access the guarantee instrument with minimal time and effort. The method proposed in the comment would require a lengthy and costly recovery effort by ARB, which might not be completed within the auction schedule.

D-2. Comment: The calculation of the bid guarantee results in excessive credit requirements for bidding. Section 95912(i)(2) places the amount of the bid guarantee at an amount that is “greater than or equal to the sum of the value of the bids submitted by the auction participant.” This can result in a bidder who places multiple bids at different price levels being required to pay a bid guarantee that exceeds the amount they would end up paying if the market cleared at the lowest price bid by the bidder (this would be the only instance where the bidder would be required to pay for all of its bids). Because the higher priced bids would actually be paid at the lower market clearing price, the bidder would never have a situation of needing to match all of the bid prices if they had bid in at different prices. We suggest a wording change to require the bid guarantee to cover the "maximum total cost for any possible settlement price of all bids submitted by the auction participant." (SMUD1)

> **Response:** We understand the use of the term “sum of the value of bids” in section 95912(i)(2) to be the maximum value as the commenter suggests, since (1) bids not awarded allowances have no value, and (2) in a single price auction the value assigned to a winning bid quantity is the auction settlement price. We do not believe a change is needed.

D-3. Comment: Compliance entities should be able to use the value of in-state physical assets and/or credit rating as bid guarantees. The requirement to provide the auction administrator with assurances in the form of bonding, cash, or a letter of credit is really unnecessary and burdensome for compliance entities with large physical assets in the state and/or who may be investment-grade, credit-rated companies. (BP)

> **Response**: We do not agree with these comments for two reasons. First, we needed a credit assurance mechanism that would not result in very different auction participation costs for different covered entities. Second, we will be contracting with a financial services provider who must be able to access the guarantee instrument with minimal time and effort. The method proposed in the comment would require a lengthy and costly recovery effort by us, which might not be completed within the auction schedule.

D-4. Comment: The Utilities are concerned that the bid guarantee election is more difficult for smaller utilities with less capital and credit. The Utilities believe that bids should be settled quickly so that any money, letter of credit, or other cash equivalent that is given for the guarantee is not tied up for extended periods of time. Furthermore, to protect these funds, guarantees should be placed in an escrow account separate from any funds of the State. In addition, the Utilities request additional guidance within the proposed regulation as to the timeline and process for settling the auction and reserve sales, including how winning bidders will be required to provide cash if they are guaranteed with a substitute, and when CARB will return the guarantee back to unsuccessful bidders. (MID1)

> **Response**: Bid guarantees will not be placed in any of the state funds. Instead, the guarantee instrument will be handled by a financial services administrator contracted by us, as described in section 95912(h). We will only require that the instruments are available until after the deadline for the auction participant to pay for the allowances. Once the auction participant has paid for the allowances it has been awarded, there will be no further need for the instrument, and it can be returned to the auction participant. We agree with the commenter’s request for guidance on the process and timeline. We will develop the procedures and

timelines for submission and return of financial assurance mechanisms with the financial services provider. We will provide guidance and training for participants prior to the auction and reserve sales.

Group Association on Purchase Limit for Opt-in Covered Entities and Voluntary Participants

D-5. (multiple comments)
Comment: CARB should impose a group limit on auction purchases for opt-in and voluntary participants. The proposed regulation creates an Auction Purchase Limit for individual entities participating in the allowance auctions. During the first compliance period, for covered entities and opt-in covered entities, the limit is set at 10 percent of the allowances; IOUs are not subject to a purchase limit; for all other auction participants, the limit is set at 4 percent. SCE strongly supports CARB's creation of these purchase limits to ensure that a few entities (particularly non-compliance entities) do not claim undue market power due to purchases at the allowance auctions. However, the possibility remains that a large group of entities can purchase enough allowances to push covered entities out of the market. Therefore, SCE recommends that CARB create an additional limit on the total number of allowances that non-covered entities, as a class, can purchase from the auction.

Based on SCE's internal analysis, it appears that the Auction Purchase Limit will always be less than the Holding Limit for voluntary and opt-in participants, and thus will likely be the limiting factor on the number of allowances these parties can purchase at auction. As noted above, voluntary and opt-in participants are limited in their individual purchases of the total allowances available at auction. However, the Auction Purchase Limit does not adequately mitigate the risk of inadequate allowances being available for compliance participants. If, for example, 5 voluntary participants and 2 opt-in participants all purchase allowances up to their auction limits, these participants could cumulatively purchase 40 percent of the available allowances in that auction, assuming the prices they bid were higher than the market clearing price. The remaining 60 percent of allowances would be substantially short of what compliance entities need to meet their obligations.

This would force compliance entities to purchase a large portion of their compliance burden in the secondary markets. Given that the markets will be aware of compliance shortfalls prices in these markets are likely to soar, which will cause an undue burden on electric customers. Thus, CARB should limit the total number of allowances that voluntary and opt-in participants can purchase in the auction as a class in order to provide adequate protection against covered entities being pushed out of the market due to market manipulation by non-covered entities. (SCE1)

Comment: The proposed regulation adopts a complicated and problematic design for the auction and sale of GHG allowances. As noted above, this auction design may lead to unintended consequences that CARB staff may not have foreseen when crafting the auction rules. For example, SCE supports the Auction Purchase Limits for individual entities, but without additional group limits on auction purchases, compliance entities may be unable to acquire sufficient allowances at auction. Entities without Cap and Trade compliance obligations could then drive up allowance prices with the knowledge that compliance entities are short. (SCE1)

> **Response:** We are allowing non-covered entities to purchase and hold compliance instruments to ensure that the market prices instruments reflect the likelihood that the price of instruments will increase over time. We expect that the covered entities will undertake the cheapest direct reductions early, undertaking more expensive reductions later. This increasing cost of direct reduction should lead to higher instrument prices over time. In an efficient market, the expectation that prices will be higher in the future should cause market participants to purchase and bank additional allowances early. This causes the prices to rise early in the program, signaling to market participants that they should be more aggressive in pursuing direct reductions.
>
> We are concerned that excluding financial participants would prevent the market from giving a price signal that reflects expected future increases in the cost of direct emission reductions. Covered entities may not have the financial ability to purchase and hold allowances for later compliance periods. If we exclude financial participants, prices may not reflect anticipated future scarcity, and covered entities will not receive the correct price signal supporting the need for additional current direct reductions. The correct price signal should lead to fewer price changes over time. If we accepted the proposed group limit for non-covered entities, it is possible that they would be unable to purchase enough allowances to generate the correct price signal.
>
> While it is true that speculative participants do not have compliance risk, they do run the risk of financial loss if they overestimate the rate of price increases.
>
> We agree with the calculations proposed by the commenter, but they apply only to a single auction. Should a covered entity be outbid at an auction, it can raise its bid price and quantity at the next auctions to make up for the shortfall.

Errata

D-6. (multiple comments)
Comment: Modify section 95911 (c)(2) as follows:
"the auction purchase limit in ~~(A)~~(1) does not apply. This subsection ~~(B)~~(2) shall not be interpreted to." (NCPA1)

Comment: Section 95911(c) discusses auction purchase limits. For purposes of clarity, SCE believes that within section 95911(c)(2), "(A)" and "(B)" should read "(1)" and "(2)." (SCE1)

Comment: Section 95911(c)(2) references the auction purchase limit in “(A).” PG&E believes that ARB intended to reference (1) instead of (A) at the end of that sentence and that ARB will amend this provision to reflect this. (PGE1)

> **Response**: We replaced all of section 95911(c), which corrected the reference error.

D-7. Comment: Modify section 95912 (j) as follows:
“At least 60 days prior to each auction the auction administrator shall publish ~~on~~ the following information.” (NCPA1)

> **Response**: We made this correction.

D-8. Comment: Section 95922 (a) and (b) refer to section 95930. However, that section does not exist. PG&E believes that ARB intended to reference section 95830 and that ARB will amend the regulation to reflect this. (PGE1)

> **Response**: We corrected the references.

Purchase Limit

D-9. Comment: CARB should seek broad participation in adjusting action purchase limits in the future. CARB has noted that it is only setting Auction Purchase Limits for the first compliance period and will set limits for subsequent periods in a later rulemaking in order to gather and learn from actual market experience. SCE strongly supports allowing CARB the opportunity to adjust the rules based on data gathered from early compliance years, as it should retain as much flexibility as possible in writing the current regulation. CARB should ensure that cap and trade market participants, particularly compliance entities, are actively involved in the next rulemaking process, as these entities will provide valuable information gained in early market experiences. Compliance entities should have adequate time and notice for comments and a thorough workshop process in order to properly inform CARB staff about their experience in the market during the first compliance period. (SCE1)

> **Response:** The comment is duly noted. We will continue our efforts to engage stakeholders in our rulemaking process in the future.

D-10. Comment: The proposed regulation sets an Auction Purchase Limit for covered entities and opt-in covered entities at 10 percent of the allowances offered for auction. Any Auction Purchase Limit must be set sufficiently high to provide reasonable access to allowances for obligated entities yet foreclose the opportunity for single entities to “corner the market.” Thus, IEP supports the concept of an auction purchase limit as a means to increase liquidity and participation in the individual quarterly auctions and mitigate against potential hoarding of allowances. What the appropriate limit should be is probably an empirical question based on reported emissions over time. We caution, however, against setting the limit at a specified percentage for the duration of the program. As obligated entities change over time, some will grow (through mergers, etc.) and an auction limit that may be correct for 2012 may be wholly misplaced in 2020. Thus, we recommend modifying the proposed regulation to allow revision of the Auction Purchase Limit over time as conditions change, subject to reasonable notice and opportunity to comment prior to adopting such changes. (IEPA)

> **Response:** We agree with the comment that the purchase limits should be set empirically over time to reflect changes in emissions resulting from merger or other factors. It is for this reason that we did not make this change apply past the first compliance period. In fact, we did change the regulation to raise the purchase limit for covered entities from 10 percent to 15 percent to reflect changes in emissions from larger entities due to changes in facilities and operating levels.
>
> Going forward, we expect that linking to WCI or to other emissions trading systems could also lead to changes in the purchase limit. Since these linking arrangements would take the form of new regulations with new purchase limits, staff concluded that setting a purchase limit now to last through 2020 would be premature.

D-11. (multiple comments)
Comment: The proposed regulation would apply the auction purchase limit to the first compliance period only, and the purchase limit for future compliance periods would be established in later rulemakings (ISOR, IX-72). CARB believes that the purchase limit is needed “to ensure that a few entities do not obtain market power through purchases at the auctions.” (ISOR, IX-72) NCPA agrees, however, NCPA believes that absent special circumstances that can be demonstrated by compliance entities, the purchase limits should apply throughout the term of the Program. The purchase limit should be set for the entire Program, and if, subject to a review of the Program it is determined that the limit should be modified, a subsequent rulemaking can be initiated to make the change at that time.

All of the reasons articulated by CARB to support sunsetting the purchase limit—developing a better understanding of the needs of larger compliance entities with additional data, more knowledge of a matured market as time passes, and greater understanding of the interactions between California’s program and the Western Climate Initiative (WCI) partners—are valid reasons to review the purchase limit amount for subsequent compliance periods. However, none of these reasons negate the need to include purchase limits as a market protection mechanism going forward. Accordingly, it would be far simpler—and safer—to include the purchase limit in the regulation for the entire duration of the Program, with the understanding that it—like any other provision that does not work when reviewed in a maturing program—will be changed for subsequent compliance periods. NCPA recommends modifications to section 95911 (c) as follows:

~~For auctions conducted from January 1, 2012, through December 31, 2014, t~~The share of allowances of any vintage year offered at any quarterly auction which may be purchased by one entity or a group of entities with a corporate association pursuant to 95914 shall be limited to less than. (NCPA1)

Comment: The Utilities agree that the purchase limit should be reviewed and appropriately adjusted for the later two compliance periods, as indicated in the ISOR (page IX-72). However, the Utilities believe that the purchase limit is a critical component of ensuring the operation of a sound allowance market and should be extended throughout the program. ARB would still have the ability to revise the limit in subsequent compliance periods to account for market adjustments and allowance distributions. (MID1)

> **Response**: We appreciate the concerns raised in the comments requesting ARB set purchase limits now for the length of the program. We understand that setting a level for the length of the program may give market participants a clear understanding of the market structure, giving them insights into future competitive conditions. Going forward, we expect that linking to WCI or to other emission trading systems could also lead to changes in the purchase limit. Since these linking arrangements would take the form of new regulations with new purchase limits, staff concluded that setting a purchase limit now to last through 2020 would be premature.

D-12. Comment: IEP is opposed to the exception to this policy as it relates to investor-owned utilities ("IOUs"). The proposed regulation would exempt the IOUs from the purchase limit because "entities do not receive a direct allocation that they can use for their own compliance needs" (Initial Statement of Reasons, p. II-38). IEP notes that IPPs, under the proposed regulation, "do not receive a direct allocation that they can use for their own compliance needs." Removing the purchase limit as it applies only to the IOUs has the effect of positioning the IOUs to acquire more allowances than they require and hoarding them for other purposes while limiting their availability to obligated entities such as IPPs. For example, it's conceivable that possession of allowances by the IOUs beyond what they need for their own compliance purposes would have value in bilateral negotiations between the IOUs and IPPs. By treating electric utilities owning electrical generation in a different manner than the treatment of other market participants such as IPPs, the proposed regulation, unless modified, would foster anti-competitive and potentially discriminatory outcomes. All parties should have equal access to allowances needed for compliance. CARB should ensure that the Allowance Purchase Limit applies equally to all parties participating in an allowance auction. CARB should delete the language in Section 95911(c)(2) that states that the auction purchase limit does not apply to IOUs. (IEPA)

> **Response:** We set the purchase limits based on data on larger emitters, taking into account direct allocations, to set a purchase limit that would allow all entities the ability to meet their compliance needs from the auction. We created the exemption from the purchase limit because (1) the IOUs must consign directly

allocated allowances, and (2) they may have to purchase allowances above the level of their direct emissions to cover emissions resulting from energy generation purchased under long term contracts. We also believe that the concerns that the exemption for IOUs will alter competitive conditions are addressed through the holding limit.

D-13. Comment: Section 95911(c)(2) (p. A-88) provides that the auction purchase limit does not apply to IOUs. The ISOR provides three reasons for this exclusion: IOUs may have large compliance obligations; IOUs must purchase the allowances they require at auction (or on the secondary market); and IOUs are regulated. These three reasons may also apply to POUs. Depending on their size, POUs may have large compliance obligations. They may have to purchase allowances they require at auction (or on the secondary market) if they do not take advantage of the section 95892(b)(2) option to have their administratively allocated allowances deposited into their compliance accounts. And they are closely regulated by their governing boards. Therefore, the exclusion from the auction purchase limit should be extended to all electrical distribution utilities, not just the IOUs. Modify section 95911(c)(2) as follows:

> For ~~investor-owned~~ electrical distribution utilities ~~receiving a direct allocation of allowances pursuant to 95892(b) and subject to the monetization requirement pursuant to 95892(c):~~ the auction purchase limit in subsection (~~A~~1) does not apply. This subsection (2~~B~~) shall not be interpreted to exempt ~~said investor owned~~ electrical distribution utilities from any other requirements of this article. (SCPPA1)

D-14. Comment: Section 95914(e)(1) (p. A-100) provides that the purchase limit applies to a group of entities with a corporate association. It should be clarified that this does not apply to a group electrical distribution utilities that are exempt from the purchase limit under section 95911(c)(2) (p. A-88) (with section 95911(c)(2) being expanded to exempt POUs as well as IOUs from the purchase limit as discussed in a previous comment). This needs to be made explicit because section 95911(c)(2) provides that the exemption "shall not be interpreted to exempt those entities from any other requirements of this article." Modify section 95914(e)(1) as follows:

> The total number of compliance instruments which may be purchased in a single auction by a group of entities (other than electrical distribution utilities) with a disclosed corporate association is limited pursuant to section 95911(c). (SCPPA1)

Response: We have not provided the POUs with the exemption, but we have addressed these concerns through modifications to the regulations. First, the purchase limit has been increased from 10 to 15 percent. Second, a revision to section 95892 gives the POUs the option to request the Executive Officer to place directly allocated allowances into the compliance accounts of facilities operated by POUs, Joint Power Agencies, or electrical cooperatives, rather than having them consigned. POUs who take advantage of this option would need to purchase fewer allowances at auction.

D-15. Comment: Section 95915(e) (p. A-103) provides for the application of the purchase limit to entities in bidding associations, but the drafting is unclear. Under section 95915(e)(1), the purchase limit will be applied to the bids submitted by the "recipient." However, if a purchaser is buying allowances on behalf of a recipient, the recipient may not enter any bids in the auction. Also, by referring to bids submitted by the recipient alone, section 95915(e)(1) would not include allowances purchased by a purchaser for a recipient in the recipient's purchase limit. According to the ISOR (at IX-102), the purpose of section 95915(e)(1) is to apply the purchase limit to the recipient and "not to the apparent purchaser." Section 95915(e)(1) needs to be revised to accomplish the stated purpose. Further, it is unclear how section 95915(e)(3) (p. A-104) is intended to operate. Section 95915(e)(3) refers to "the sum of bids submitted by the entity or entities in the bidding association designated as the 'recipient.'" However, recipients may not submit any bids themselves if the bidding function is assigned to entities designated as "purchaser" in the bidding association. (SCPPA1)

Response: This comment is no longer valid, as we have completely removed section 95915. Modifications to provisions in section 95914 governing disclosure of information on auction participation made section 95915 unnecessary.

D-16. Comment: The Utilities support the concept of applying auction purchase limits as set forth in the proposed regulation. However, the Utilities are concerned that unforeseen circumstances could result in the need for an amount of allowances exceeding a covered entity's purchase limit during the last year of a compliance period. The Utilities request that the proposed regulation include a provision authorizing the Executive Officer to grant exceptions to the purchase limit for good cause, on a case by case basis. Modify section 95911 as follows:

(c) Auction Purchase Limit. ~~For auctions conducted from January 1, 2012, through December 31, 2014, t~~<u>T</u>he share of allowances of any vintage year offered at any quarterly auction which may be purchased by one entity or a group of entities with a corporate association pursuant to 95914 shall be limited to less than:

(1) For covered entities and opt-in covered entities: ten percent of the allowances offered for auction<u>, provided, however, that upon a showing of good cause by a covered entity, the Executive Officer may grant a limited extensions of this limit during the final year of the Compliance Period where due to unforeseen circumstances beyond the entity's control the entity requires additional purchase limit to meet its surrender obligation</u>.

(2) For investor owned electrical utilities receiving a direct allocation of allowances pursuant to 95892(b) and subject to the monetization requirement pursuant to 95892(c): the auction purchase limit in (~~A~~<u>1</u>)

does not apply. This subsection (~~B~~2) shall not be interpreted. (MID1)

Response: POUs and covered entities receiving free allowances should not encounter situations where they need a number of allowances exceeding the purchase limit. In addition, IOUs do not have a purchase limit. We believe the revision raising the purchase limit to 15 percent, along with the provisions in 95892 allowing POUs to have directly allocated allowances placed in the compliance accounts of entities from whom they purchase electricity is adequate to accommodate their needs.

D-17. (multiple comments)
Comment: MSCG is not opposed to purchase limits, although we think they are better held in reserve, to be imposed if market problems are detected, and purchase limits are determined to be an appropriate solution, rather than be part of the “Day 1” auction design. (MSCG2)

Comment: Section 95911 establishes a 10 percent auction purchase limit that applies for all auction participants except Investor-owned Utilities (IOUs). WPTF appreciates that ARB is trying to prevent market manipulation. However, we challenge the premise that a purchase limit is in fact necessary. Participants in the allowance auctions will be subject to existing state and federal laws prohibiting unfair competition. Those statutes permit criminal prosecutions in some instances and provide the basis for significant civil penalties. Further, the proposed limit fails to take into consideration the fact that the other regulated entities, beyond IOUs, will also have large compliance obligation. Because independent power producers will have to purchase all their allowances through auction or the secondary market, the proposed auction limit would greatly constrain the ability of some entities to procure sufficient allowances. Under these circumstances, WPTF recommends that ARB initiate its auctions without artificial market limitations. If it later becomes apparent that existing unfair competition laws do not adequately address any perceived market irregularities, then ARB could consider a purchase limit, but at a higher level, such as the 25 percent adopted under RGGI. In any event, there should be no exemption for IOUs; such an exemption has the potential to further tilt the playing field in favor of utility-owned generation with no real benefit to the efficient operation of the market. (WPTF)

Response: We believe a purchase limit is an important instrument to ensure that a few entities do not obtain market power through purchases at the auctions. We disagree with three issues raised by the comment. First, state and federal laws prohibiting unfair competition cannot prevent the exercise of market power. They only attempt to recover damages after events occur. This is exceedingly difficult as we would have to identify how a market manipulation affected all market participants. Legal proceedings under those laws are lengthy, resource intensive, and would create greater uncertainty for the market.

Second, we have revised the purchase limit after consultation with covered entities, raising it from 10 percent to 15 percent. Data on emissions, allocations, and expected auction volumes indicate this level is sufficient. Raising the purchase limit to 25 percent is not necessary and could allow speculators to acquire enough allowances at the end of the first compliance period to give them market power.

Third, we created the exemption from the purchase limit because (1) the IOUs must consign directly allocated allowances, and (2) they may have to purchase allowances above the level of their direct emissions to cover emissions resulting from energy generation purchased under long-term contracts. We also believe that the concerns that the exemption for IOUs will alter competitive conditions are addressed through the holding limit. Finally, the speculative activities of the IOUs are subject to rules created by the CPUC.

D-18. (multiple comments)
Comment: Calpine would recommend that the auction purchase limit for covered entities during the first compliance period generally be kept at 10 percent of the total number of allowances available any given auction, but with an opportunity for any covered entity or group of covered entities with a corporate association to exceed this limit, so long as its total purchase of allowances of any vintage year does not exceed 125 percent of its average annual verified emissions during the preceding three calendar years, plus, for any entity with less than three years' reported emissions data, an additional amount that represents a reasonable estimate of the entity's anticipated emissions during that calendar year. This would allow large affiliated entities, such as Calpine, to satisfy their anticipated compliance obligation through purchases at auction, while still avoiding the potential for covered entities to engage in market manipulation by purchasing an amount of allowances grossly in excess of their anticipated compliance obligations for any calendar year. The 125 percent limitation for entities with three years' reported emissions date would provide sufficient flexibility to accommodate annual variation in a facility's dispatch, as well as some amount of increased dispatch that might be expected to occur as a result of a cap and trade program for more efficient generating units, such as Calpine's fleet. Additionally, the additional amount for entities with less than three years reported emissions is intended to provide a covered entity with the opportunity to purchase allowances for newly commissioned facilities.

Section 95911. Format for Auction of California GHG Allowances.

Auction Format.

(c) Auction Purchase Limit. For auctions conducted from January 1, 2012, through December 31, 2014, the share of allowances of any vintage year offered at any quarterly auction which may be purchased by one entity or a group of entities with a corporate association pursuant to 95914 shall be limited to less than:

(1) For covered entities and opt-in covered entities: ten percent of the allowances offered for auction~~.~~ provided, however, that the Executive Officer may authorize any covered entity or group of entities with a corporate association to purchase an amount of allowances in excess of ten percent during any auction so long as such entity's or group of entities' total purchase of allowances of any vintage year does not exceed 125 percent of the entity's or group of entities' average annual verified emissions during the preceding three calendar years, plus for any entity with less than three years reported emissions data, an additional amount that represents a reasonable estimate of entity's anticipated emissions during that calendar year.

~~For investor owned electrical utilities receiving a direct allocation of allowances pursuant to 95892(b) and subject to the monetization requirement pursuant to 95892(c): the auction purchase limit in (A) does not apply. This subsection (B) shall not be interpreted to exempt investor owned electrical utilities from any other requirements of this article~~

(A) Any covered entity or group of covered entities with a corporate association that anticipates purchasing more than ten percent of the allowances offered for auction during any quarterly auction shall submit a statement to the Executive Officer within thirty (30) days prior to the auction date identifying the covered entities for which it anticipates purchasing allowances, the total average annual emissions for such entities with three years' reported emissions data and the anticipated emissions for any entities with less than three years' of reported emissions. The statement shall be accompanied by any supporting information and the certification set forth at section 95894(b)(6). If the Executive Officer does not find that the covered entity's or group of entities' anticipated emissions for any entity with less than three years' reported emissions represents a reasonable estimate of the entity's anticipated emissions during that year, the Executive Officer shall notify the entity within seven (7) days prior to the auction date.

(2) For all other auction participants: four percent of the allowances offered for auction. (CALPINE1, CALPINE2)

Comment: The proposed regulation sets an auction purchase limit for covered entities and opt-in covered entities of ten percent (10 percent) of the allowances available in any auction conducted during the first compliance period. 17 C.C.R. section 95911(c)(1) (proposed). While Calpine understands the need to prevent market manipulation, Calpine's covered entities in California could realistically need to purchase more than 10 percent of available allowances just to cover their compliance obligations, depending upon the amount of allowances that the POUs consign for auction. By subjecting large affiliated generators such as Calpine to an auction limit that could realistically be lower than their total compliance obligation, the proposed regulation could force such large generators to obtain allowances from the secondary market or the Allowance Price Containment Reserve at a significantly higher cost than available from the general auction. As a result, the proposed auction limit could place large generators such as Calpine at a significant competitive disadvantage. (CALPINE1, CALPINE2)

> **Response**: We have addressed the issues raised in the comment through consultations with covered entities. This has led us to raise the purchase limit from 10 percent to 15 percent, which should address the problem of fluctuations in emissions level for the first compliance period. ARB will be mindful of the comment when it revises the purchase limit for the second compliance period.

D-19. Comment: The draft indicates that the purchase limit rules are to be in place through 2014. However, no indication is made of what will happen after that date. Is it accurate to assume they will be removed? Will the Executive Officer formally reassess and re-determine after a certain amount of real world experience? The rule should state what the intent is for times after 2014. (MSCG2)

> **Response**: We will set the limit for subsequent periods in a later rulemaking. We are proposing this approach for three reasons. First, we will have a better understanding of the compliance needs of larger entities when new reporting data become available for the expanded scope of the program during the second compliance period. Second, we recognize that the market will take time to develop, and it may be necessary to revise the limit based on actual market experience. Third, we intend to link with WCI jurisdictions at some point, but WCI has not arrived at a decision on purchase limits. We may have to revise the limit to account for the size distribution of covered entities in the WCI.

Corporate Association

D-20. (multiple comments)
Comment: The auction purchase limits related to direct and indirect corporate associations must be modified for regulated electric utilities. Section 95914 of the proposed regulation requires entities registered pursuant to Section 95830 to disclose direct and indirect corporate associations with other registered entities. The proposed regulation further provides that the total number of compliance instruments that may be purchased in a single auction by a group of entities with a disclosed corporate association is limited pursuant to Section 95911(c), and that entities that are a part of a corporate association may allocate shares of the purchase limit among themselves.

These provisions are entirely infeasible for California's investor-owned electricity distribution utilities. There are long-standing affiliate transaction restrictions imposed on the utilities by the CPUC and FERC. These restrictions generally limit the types of transactions that a regulated utility may enter into with its unregulated affiliate, as well as the transfer of non-public transmission and other proprietary information to affiliates that may create the opportunity for preferential treatment, unfair competitive advantage, or cross-subsidization.

Specifically, as a utility, SCE is subject to the CPUC's "Affiliate Transaction Rules for Large Energy Utilities" ("CPUC Affiliate Rules") that were most recently revised in Decision ("D.") 06-12-029. SCE is also subject to the CPUC's rules concerning non-tariffed products and services, including the CPUC-approved Gross Revenue Sharing Mechanism adopted in D.99-09-070, as well as some of the Holding Company Conditions set forth in D.88-01-063. The CPUC Affiliate Rules, as well as the CPUC's holding company decision, also require that SCE and its affiliates maintain structural separation, and ratepayer indifference to transactions, between the utility and its affiliates. In implementing these principles, the CPUC has concluded that utilities must maintain complete procurement planning independence from their affiliates. Finally, SCE is subject to the FERC Standards of Conduct and FERC affiliate restrictions. SCE has implemented the Affiliate Rules and developed comprehensive compliance plans and manuals to ensure compliance with these rules. SCE has developed an affiliate compliance website, employee training programs, affiliate expertise, personnel, and other internal infrastructure to manage its compliance. SCE has also made organizational structural decisions and changes based on the Affiliate Rules. Collectively, these Affiliate Rules require a very high level of separation of business activities between regulated utilities (such as SCE) and unregulated affiliates (such as Edison Mission Group ("EMG")), that operate in California and nationwide in unregulated wholesale electricity markets. For example, CPUC Affiliate Rules require that transactions between a utility and its affiliates shall be limited to tariffed products and services, to the provision of information made generally available by the utility to all market participants, and to Commission-approved resource procurement by the utility. Further, the rules require that the sale or purchase of goods, property, products or services be made generally available by the utility or affiliate to all market participants through an open, competitive bidding process.

Due to such regulatory firewalls, SCE will be accruing its own GHG compliance obligation without any knowledge of the corresponding compliance obligations of its unregulated affiliates. SCE may not discuss, let alone act in concert, with EMG regarding its electricity purchases and sales activities in the California wholesale markets. When the cap-and-trade program begins, SCE will not be allowed to share with EMG its forecast of emissions based on the projected emissions from its power plants and emissions related to electricity imports; nor will it be allowed to coordinate its participation in CARB's allowances auction with EMG. SCE and other EMG companies, such as Edison Mission Energy, will be expected to separately register with CARB and will be expected to separately report their emissions, to the extent their respective emissions need to be reported pursuant to CARB's mandatory reporting regulations.

Given these regulatory screens, SCE believes that it should have its own Holding, Limited Use Holding, and Compliance Accounts, which will be distinct and separate from any such similar accounts of its affiliates. SCE also believes that it should transfer compliance instruments to its own compliance account, and that any such transactions will be separate and uncoordinated with similar transactions by its affiliates. SCE and its affiliates will also separately submit verification statements.

In light of rigid and long-standing regulatory firewalls between regulated and unregulated affiliates in the electricity industry, CARB's proposed regulation to apply a single limit to the combined purchase by a group of entities who have a direct or indirect corporate association is simply not workable for such entities and must be modified. CARB needs to create an exception from this regulation that exempts regulated electric utilities from having to comply with a combined Auction Purchase Limit jointly with its unregulated affiliates.

Indeed, it seems CARB itself has acknowledged this issue and has created precisely such an exemption in its proposed regulations for Holding Limits. Section 95920(b)(6) states that "the application of the holding limit will treat holdings of entities with a corporate association pursuant to section 95914 as being held by a single entity unless existing law or regulation prohibits coordinated market activity by the associated entities, including the transfer of instruments between accounts controlled by associated entities." However, Section 95914(e)(1), in laying out the "Application of the Corporate Association Disclosure to the Holding Limit," claims that the "total number of compliance instruments which may be purchased in a single auction by a group of entities with a disclosed corporate association is limited pursuant to section 95911(c)." SCE seeks confirmation that Section 95920(b)(6) allows regulated entities such as SCE to be free from joint Holding Limits with its corporate associate(s). Additionally, SCE requests that CARB provide entities with existing regulated barriers to trade—such as investor-owned electric distribution utilities—an exemption from the joint Auction Purchase Limits as currently expressed in Section 95914(e)(1). (SCE1)

Comment: While SCE recognizes the need for disclosure of corporate affiliations to prevent market manipulation, the application of Holding Limits and Auction Purchase Limits to associated entities as if they were one entity is unworkable for regulated electric utilities like SCE that are subject to firewalls and other corporate affiliation regulations. (SCE1)

> **Response**: The comment is correct in its assessment that the purpose of the language in the original section 95920(b)(6) was intended to address the issue of state and federal restrictions on market coordination by affiliates. After consultations, we have replaced this language with new section 95833(a)(4) to ensure that existing state and federal laws and regulations are not violated. Placement in section 95833, which contains the rules determining when corporate associations exist, ensures that the exemption applies to any rule involving corporate associations.

D-21. Comment: Section 95915(a) (p. A-102) requires the disclosure of bidding associations with entities registered in GHG emissions trading systems ("ETS"), "in Canadian provinces to which California has linked," implying there is no need to disclose bidding associations with entities registered in GHG programs in other states, such as New Mexico. The ISOR does not include the limiting reference to Canada, and there does not appear to be any reason to require disclosure of bidding associations with entities registered in Canadian programs but not programs in other states. Modify this section to eliminate the reference to Canadian provinces as follows:

> Entities registering for the auction pursuant to section 95912 must disclose bidding associations with other entities also registered into the California cap and trade system or registered into one or more GHG ETS programs ~~in Canadian Provinces~~ to which California has linked. (SCPPA1)

> **Response**: This comment is moot, as we have completely removed section 95915. Modifications to provisions in section 95914 governing disclosure of information on auction participation made section 95915 unnecessary.

D-22. Comment: Section 95914 needs to be modified to recognize the CPUC's affiliate transaction rules. This section requires the identification of Direct and Indirect Corporate Associations. California public utilities can disclose names of parent and affiliated companies, but have limited knowledge of the unregulated business affiliates. Utilities subject to the jurisdiction of the CPUC must comply with rigorous affiliate compliance rules in their dealings with their unregulated affiliates. Identification of the names of the parent and affiliated companies may be provided, but information sharing or any economic transactions between the regulated and unregulated entities are subject to stringent regulations. The public policy behind these rules is to protect utility ratepayers from being negatively impacted, economically or otherwise, by any actions of a utility's unregulated affiliates. Unregulated affiliates are not to be provided any information or economic benefit from the utility that could give such unregulated affiliate any information that is non-public, or would put it in a preferential position in any transactions or dealings. Any proposed rules and regulations that would aggregate or transfer benefits, responsibility or penalties between regulated and unregulated companies would likely be in contravention of CPUC rules or regulations and need to be eliminated from any proposed ARB regulations. Add a new section 95914 (c)(4) as follows to ensure consistency with CPUC affiliate rules:
(c)(4) Any registered entity subject to affiliate compliance rules promulgated by state or federal agencies shall not be required to disclose information or take other action in contravention of such rules. (SEMPRA1)

> **Response:** We agree with the comment, and the appropriate text has been added to section 95833(a)(4).

Confidentiality

D-23. Comment: The regulation should be revised to eliminate the prohibition (section 95912(d)(2)) on an auction qualifier revealing its Qualification Status. (MSCG2)

> **Response:** We have removed the text at issue and replaced it with new section 95914 (d)(2), which gives clearer rules for disclosure of the use of an agent.

Auction Guideline

D-24. (multiple comments)
Comment: There should be more definition how an auction system would work, and auctions should be delayed until the program is well tested. (SDCHAMBER)

Comment: NCPA is concerned that despite the level of detail regarding disclosure and registration, as well as pre-and post-purchase reporting activities, there are several programmatic shortcomings that should be improved before implementation. This includes more detailed information regarding closing and accounting procedures and timelines, and transaction costs associated with the mandatory participation in the CARB administered auction. The proposed regulation needs to ensure that operations will be conducted in an expeditious and transparent manner. (NCPA1)

> **Response:** We have placed in the regulation all of the rules which auction participants must follow. The procedures for submitting the required information for certifications and for the processing of financial transactions will occur after we have contracted for the provision of auction and financial services. In addition, the contracts with the service providers will include provisions for extensive system testing before the market begins operation.

D-25. Comment: Section 95911(d)(5) (p. A-90) provides a complex process for resolving tie bids by assigning random numbers to each bundle of 1,000 allowances. A simple, familiar pro rata process should be used instead. The ISOR states that a pro rata process was rejected on the grounds that it could result in awards of allowances in bundles of less than 1,000, "which would add to the auction's complexity." However, it may be more difficult to use the complex random-number process outlined in section 95911(d)(5) than to use a pro rata process and award allowances in bundles of less than 1,000. If desired, the numbers of allowances awarded under a pro-rata approach could be rounded up or down to an appropriate round number. (SCPPA1)

> **Response**: We disagree with the assertion made in the comment that the random number process is more complicated. We adapted the procedure from the one used by RGGI. We concluded that the approach employed by RGGI has been successfully implemented, which should be an important criterion in selecting a procedure. In addition, during stakeholder meetings leading up to release of the regulation, most stakeholders considered RGGI to be a successful implementation and urged us to follow successful implementations when they are available.

Limited Use Holding Account

D-26. Comment: Allowances from the Limited Use Holding Accounts should be sold before allowances or offsets from suspended or revoked accounts. In order to ensure that Covered Entities in good standing are able to monetize their allowances, NCPA recommends that the order in which consigned allowances are used to fulfill winning bids be revised. CARB proposes to fulfill winning bids with allowances from the suspended or revoked accounts "because ARB may need to return unsold allowances to their source accounts [which is] not possible for allowances from closed, suspended, or revoked accounts." (ISOR, p. IX-69) However, rather than penalize Covered Entities that are looking to monetize their allowances by ranking allowances from limited use holding accounts second, the allowances from suspended or revoked accounts could be placed into the CARB Auction Holding Account until the next quarterly auction. Also, it is appropriate for the number of allowances that are drawn from each entity's account to be proportionate. NCPA recommends modifications to section 95911 (b)(3) as follows:

(A) The auction operator will fulfill winning bids with allowances from consignment sources in the following order:
(i) allowances consigned from limited use holding accounts pursuant to subarticle 5 ~~allowances consigned to auction pursuant to section 95910(d)(2~~);
(ii) allowances consigned to auction pursuant to section 95910(d)(2) ~~allowances consigned from limited use holding accounts pursuant to subarticle 5~~;
(iii) allowances directly allocated by ARB to auction pursuant to subarticle 8.
. . . .
(B) When there are insufficient winning bids to exhaust the allowances from a consignment source in (A) above, the auction operator will sell an equal ~~number~~ percentage of allowances from each consigning entity in that source. (NCPA1)

> **Response**: We believe it is important to exhaust the allowances consigned to auction pursuant to section 95910(d)(2) first, so that violations could be settled in a timely manner. These allowances will be sold from accounts that are suspended or closed, so if they remain unsold at auction there will be no account to which they could return. We expect that the number of allowances sold from closed accounts will be very small, especially considering that each auction in the first compliance period will have nearly 20 million allowances for sale. Therefore, giving allowances from closed accounts priority in the order of sale should have no significant effect on the number of consigned allowances sold.

Unsold Allowances

D-27. Comment: Further, the bidding process for the allowances in the Allowance Reserve is confusing and inefficient and will lead to higher costs and increased risk for compliance entities. (SCE1)

> **Response:** While we believe the original language on the bid process was clear, we do agree that it may result in an unnecessary amount of risk for bidders trying to obtain the number of allowances desired. We have revised the bidding process in section 95913, allowing bidders to specify a maximum willingness to pay for allowances and allowing bids to be fulfilled from the lowest-priced tier from which allowances are available. This should provide greater certainty that bidders will obtain the allowances they need without having to purchase more than they intended.

D-28. Comment: While SCE endorses unlimited banking of allowances, the Proposed Regulation is currently unclear as to the extent a covered entity may bank allowances when combined with Holding Limits and Auction Purchase Limits. SCE seeks clarification from CARB on this point. (SCE1)

> **Response:** We understand the term "unlimited banking" to mean that there is no time limit for holding a compliance instrument. It does not refer to holding an unlimited number of allowances. Therefore, there is no conflict between unlimited banking and a holding limit.

D-29. Comment: Section 95911(b)(4) (p. A-87) provides for allowances that are unsold at auction to be transferred to the highest-price tier in the Allowance Price Containment Reserve Account. SCPPA opposes having tiers in the Allowance Price Containment Reserve Account. However, if the allowance reserve must contain tiers, unsold allowances sent to the reserve should be added not to the highest tier but to the lowest lowest-price tier that has not yet been exhausted and closed. This will reduce the risk of allowances being transferred to a tier of the reserve that is never accessed. The ISOR states, at IX-70, that the highest tier was chosen "because it is possible that all of the allowances in the lower tiers may be sold, at which point ARB will close those tiers to further sales." This objective can be achieved by transferring unsold allowances to the lowest-price tier that remains open. (SCPPA1)

> **Response:** This comment is moot since we have revised the regulation so that allowances remaining unsold at auction will be returned to the Auction Holding Account. They will be re-auctioned after two consecutive auctions have achieved an auction settlement price above the Auction Reserve Price.

D-30. (multiple comments)
Comment: NCPA recommends that the unsold CARB held allowances not be placed directly into the highest level of the Reserve Account, as contemplated in section 95911(b)(4). Rather, those allowances should be placed back into the CARB Auction Holding Account (defined in section 95831(c)(2)), or at a minimum, the allowances should be used to repopulate the first tier of the Reserve Account. (NCPA1)

Comment: Section 95911(b)(4) states that allowances designated by ARB for an auction that remain unsold go to the highest tier in the reserve. PG&E strongly recommends that these allowances instead go back to the auction account and be made available at the next auction. Furthermore, PG&E understands that this language does not pertain to the "advance auction" allowances. Advanced auction allowances that remain unsold will go back to the auction account. PG&E requests that ARB add language to clarify this provision. (PGE1)

Comment: In addition, CARB should not require unsold, unallocated allowances to be transferred to the Allowance Reserve. (SCE1)

Comment: Finally, placing unsold allowances in the Allowance Reserve will needlessly increase long-term compliance costs. This could create an incentive for compliance entities to purchase many more allowances in early auctions than they need for compliance. If covered entities fear that unsold allowances will quadruple in price as a result of being placed in the Allowance Reserve, they will likely bid for much larger purchases in early auctions than necessary and plan to bank those allowances for later use. This behavior will create an artificial demand for allowances in early auctions with the potential to artificially inflate prices in the early allowance market overall. (SCE1)

Comment: The Allowance Reserve is intended to operate as a cost containment mechanism. The current design uses the Allowance Reserve to reduce supply in the allowance market and drive up prices. In order to provide real long-term cost containment, CARB should not reduce the supply of allowances in the auction. Sustained low allowance prices in the cap and trade should be welcomed as a signal that regulated entities are able to secure compliance at the lowest possible cost. CARB should not see this as an opportunity to arbitrarily increase allowance prices. (SCE1)

Comment: Unsold allowances should remain in the auction process and should not be transferred to the allowance reserve. The proposed regulation requires non-allocated allowances that are unsold in the auction to be transferred to the Allowance Reserve. This decision lacks a sufficient basis in economic efficiency or environmental impact. Given AB 32's mandate to reduce GHG emissions at the lowest possible cost, CARB should treat allowances designated for auction by CARB that are unsold from prior years in the same manner as non-allocated allowances from the current period by placing them in the quarterly auction, rather than the Allowance Reserve. (SCE1)

Comment: In order to avoid such an artificial price increase, CARB should roll over all unsold allowances to the next auction in the same manner as the allowances consigned to auction. (SCE1)

Comment: ARB includes several provisions aimed at achieving AB 32's 2020 GHG target that the lowest possible cost. However, other provisions inadvertently raise costs, or create the risk of higher costs. Re-consideration of these provisions could lower the cost of achieving AB 32 GHG targets. First, the proposed rule moves allowances that are not sold in the allowance auction to Tier 3 of the reserve. Instead, costs could be reduced by shifting unsold allowances to the next auction. If economic and or market circumstances change such that allowance prices rise, these allowances would be unavailable to help satisfy demand, thus raising costs until allowance prices rise to the Tier 3 price triggers. (ANALYSISGRP)

Comment: Transfers of allowances into the allowance price containment reserve holding account should be modified. Section 95831(4) establishes an allowance price containment reserve account, and states that allowances allocated by ARB that remain unsold at auction and allowances used to fulfill an entity's excess emissions obligation pursuant to section 95857(c) will be transferred to this account. SMUD suggests two modifications to these provisions.

First, allowances that remain unsold in a quarterly auction should be returned to the Auction Holding Account unless the unsold allowances are from a vintage at least one year prior to the auction in which they remain unsold. Unsold allowances in one auction do not necessarily imply that subsequent auctions will also have unsold allowances, particularly with lumpiness in allowance allocations and in investments that reduce need for allowances. Here, and in section 95991, the regulations should be modified to keep unsold allowances in the Auction Holding Account until it is reasonably clear that they are not required in current auctions. Transferring to the Allowance Price Containment Reserve Holding Account prematurely simply is a recipe for ratcheting up allowance prices unnecessarily. (SMUD1)

Comment: Allowances not sold at auction should be returned to the auction holding account rather than the highest allowance price containment reserve account. Section 95911(b)(4) states that allowances unsold at auction will be placed in the highest allowance price containment reserve account. This represents an unnecessary price escalation that appears based on the faulty assumption that if allowances remain unsold in one quarterly auction, it implies that they may not be needed for sale in the next or subsequent auctions. In fact, due to lumpiness of emission reducing investments and perhaps unequal amounts of allowances available for sale in each auction, as mentioned above, it is not clear that unsold allowances at the floor price in one auction will not be necessary in the next auction in order to keep cost-containment a priority. Forcing small amounts of allowances to be transferred from a $10 value to a $50 value during times of low demand will undoubtedly result in greater utilization of the allowance price containment reserve. ARB should aspire to make the usage of the allowance price containment reserve the exception, rather than driving the market toward its use through arbitrary rules which remove low priced allowances in favor of reselling at much higher prices when supply of allowances becomes tight.

SMUD suggests that allowances that remain unsold in a quarterly auction should be returned to the Auction Holding Account unless the unsold allowances are from a vintage at least one year prior to the auction in which they remain unsold. In short, the regulations should be modified to keep unsold allowances in the Auction Holding Account until it is reasonably clear that they are not required in current auctions. (SMUD1)

> **Response:** We agree that the allowances remaining unsold at auction should return to auction rather than be placed in the Allowance Price Containment Reserve (Reserve). We have made the change to the regulation in several places, including section 95911(b)(4) which governs the handling of unsold allowances. The allowances will be re-auctioned after two consecutive auctions have achieved an auction settlement price above the Auction Reserve Price.
>
> We resolved the concern that returning unsold allowances to auction would continue to depress auction prices by adding new section 95911(b)(4). Unsold allowances would be returned to the auction holding account. They would be

redesignated for auction after two consecutive auctions reach an auction settlement price above the Auction Reserve Price. In addition, the number of these allowances returned to auction must represent less than a 25 percent increase in the number of allowances being auctioned. These rules will ensure that whenever the market appears oversupplied allowances will be held out of the auction until the oversupply is corrected.

D-31. Comment: In justifying this treatment of unsold allowances, CARB staff claim that adding unsold allowances to the next quarterly auction will simply sustain excess supply in the auctions. That is not the case for several reasons. First, the cap consistently declines over the nine years of the program. Since the cap declines annually, supply scarcity can be expected to increase over time, and CARB does not need to create artificial scarcity by removing allowances from future auctions. Second, covered entities and voluntary participants will not be entering the market in set patterns. Auction participation patterns are inherently lumpy. While some participants may engage evenly, many will buy or sell in one auction, but not the next. Simply because an entity may be in a long position in one quarter is no reason to assume it will maintain that long position in subsequent quarters. Moreover, there is no reason to arbitrarily increase the price for those allowances from the auction settlement price to the reserve price. As a result, it is unreasonable to assume that excess supply in one auction will remain in any future auction. (SCE1)

Response: We agree that the allowances remaining unsold at auction should return to auction rather than be placed in the Allowance Price Containment Reserve (Reserve). We have made the change to the regulation in several places, including section 95911(b)(4) which governs the handling of unsold allowances. The allowances will be re-auctioned after two consecutive auctions have achieved an auction settlement price above the Auction Reserve Price. We disagree with the assertion made by this comment that there can be no systematic oversupply of allowances to a market. We note that oversupply has characterized the initial years of both RGGI and the EU ETS. This has occurred due to the uncertainty inherent in any long-term forecast of the level of economic activity, which determines the demand for allowances. Reducing the rate at which new allowances enter the market could result in a meaningful carbon price signal more quickly than a declining cap. A large over- allocation could result in an oversupply that could be drawn down very slowly if we rely solely on the declining cap. While the end result of both approaches would eventually be the same, we will have lost the benefit of a correct carbon price signal for as long as the imbalance remains uncorrected.

On the second point, many covered entities have been very clear that they intend to match the timing of allowances purchases to their emissions as much as possible. This rationale is behind many of the concerns covered entities have expressed concerning speculation and market manipulation.

Auction

D-32. Comment: All entities that have a reasonable means to recover the costs of GHG allowances ought to be required to participate in the allowance auction to obtain needed allowances for compliance. With regard to the electric sector compliance obligation, IPPs and IOUs are required to access allowances through the common auction format. IEP strongly supports this approach. On the other hand, POUs are uniquely provided the option of receiving free allowances placed automatically in their Compliance Account or in their Limited Use Holding Account for eventual auction (irrespective of the fact that they have a means of cost recovery for any allowances they are obligated to purchase). This approach unnecessarily treats the POUs differently than other obligated entities within the electric sector, in spite of the fact that the POUs have a reasonable means of cost recovery (i.e. through their rate structure). The impact of this differential treatment may be unknown, but increases the risk that the differential treatment afforded one subgroup of the electric sector advantages unavailable to others. IEP recommends modifying the Proposed Regulation to require all obligated entities that have a reasonable means of cost recovery to acquire the allowances they need for compliance purposes through a common auction format. (IEPA)

> **Response:** We understand the concern; however, POUs and IOUs operate differently with respect to electricity generation. POUs generally own and operate generation facilities that they use to provide electricity directly to their end-use customers. In order to minimize the administrative costs of the program to the POUs, and recognizing that directly allocating the allowances to the POUs does not distort their economic incentive to make cost-effective emissions reductions, we determined that it would be prudent to allow POUs to surrender directly allocated allowances without participating in the auction process. IOUs, on the other hand, have contracts with electricity generators that do not afford the IOUs the same level of control over the capital investments and operating decisions of the generation facility. We are concerned that the terms of these contracts could be adversely affected by allowing the IOUs to directly surrender allowances on behalf of their counterparties, which could lead to some foregone cost-effective emissions reductions. Instead, by requiring the IOUs to surrender the allowances at auction, the electricity generators will be sure to have a strong incentive to pass their GHG costs back to the IOUs, who will then be able to use their share of the auction revenue to reduce the ratepayer burden in a manner that is consistent with the goals of AB 32.
>
> In considering the exact amount of value to allocate to each local distribution utility, we took a cost burden approach. The framework was formed by holding a series of public meetings and with input from stakeholders. Our working consensus was laid out in the regulation. If you would like to view the presentations for these public proceedings please visit: http://www.arb.ca.gov/cc/capandtrade/meetings/meetings.htm#publicmeetings.

D-33. Comment: Section 95892(b)(2) (p. A-83) allows POUs to have the Executive Director place their allocated allowances in either their limited use holding accounts or their compliance accounts. SCPPA supports this provision for the reasons set out in the ISOR at II-32. Unlike investor-owned utilities ("IOUs"), POUs such as the SCPPA members generate a significant proportion of the electricity they sell and should not be required to submit all their allocated allowances to auction. (SCPPA1)

Response: No response is needed.

D-34. (multiple comments)
Comment: The auction system will create a bidding war between entities that will be limited in the price they can pay for allowances and utilities and other industries that can pay a significantly higher price because they have the ability to increase prices to consumers. This will lead to GHG reductions by forcing the shutdown of facilities that are unable to compete in the auction market. (AGCOALITION)

Comment: ARB should revise the proposed rule to eliminate the auction as the trading mechanism and institute a free trading platform that encourages least-cost solutions to the allocation of allowances. (HOR)

Comment: The auction process is inefficient. No regulated entity will know what the prices are, or what prices are required to successfully bid for and obtain allowances. So, they will learn in each auction. This is a very slow learning curve and leads to a limited ability to plan ahead. Moreover, as the aggregate emissions approach the cap, the prices that are bid will be wildly unpredictable, and many market participants may be unable to pay enough to obtain allowances they need for past operations. At the end of the process, in normal economic times, there will be more buyers than sellers, and the auction process will simply break down. (HOR)

Response: We believe that an auction system is the fairest and most transparent way to distribute allowances and will allow for broad participation and minimize opportunities for manipulation. Over time, our program will transition toward a greater reliance on auctioning, which will help maximize incentives for continued investment in clean and efficient technologies and provide revenue that can be reinvested for public benefit. We'll also create a market surveillance committee to ensure that market manipulation, which could create uncertainties, are detected in a timely manner. In addition, our penalty provisions contain strict penalties for market manipulation.

D-35. Comment: The proposed regulation may inadvertently prevent electric distribution utilities from selling allowances in the first quarterly auction of each year. Section 95910(d)(4) notes that allowances consigned to auction at least 60 days prior to the regular quarterly auction will be offered for sale at that auction. Section 95910(a) notes that an auction will occur on the twelfth business day of each calendar quarter, except for the very first auction, which is to be held on February 14, 2012. However, pursuant to section 95870(c)(1), the Executive Officer is not required to allocate allowances to electric distribution utilities until January 15 of each calendar year, after the deadline for consigning allowances to the first quarterly auction of each year. PG&E understands that ARB is aware of these timing issues and is working to change the dates as appropriate. (PGE1)

Response: We revised the schedule contained in the regulation for allocation, auction, and reserve sales. The new schedule should accommodate the concern expressed in the comment.

D-36. Comment: The "Advance Auction" program approach, which is beneficial to the establishment of a forward curve. The further into the future that a forward curve can be established in the market, the easier it is to hedge positions and finance project developments, whether in transformative technologies, emission reducing investments associated with existing infrastructure, or new construction of general purpose production facilities that will incur compliance obligations. (MSCG2)

Response: No response is needed.

D-37. Comment: The Utilities are unclear as to how future budget years will be distinguished for their separate auctions, and whether it will be done by year, compliance period, or otherwise. The Utilities request additional clarification of subsection 95910(c) to state what the Utilities understand to be CARB's intent that there will be separate auctions held each quarter. (MID1)

Response: Allowances from future vintage years are auctioned separately from current vintage allowances for each auction. For example, auctions in 2014 will feature separate auctions of allowances from 2014 and 2017.

D-38. Comment: ARB should make available a greater number of future-vintage allowances to help complying entities manage compliance costs. PG&E urges ARB to amend the proposed regulation to allow for auctioning of a substantial number of future-vintage allowances, so that complying entities can manage costs over time. Under section 95870(b) and 95910(c)(2), ARB will auction 2 percent of the 2015 allowance budget in 2012, 2 percent of the 2016 allowance budget in 2013, and so on. This is a step in the right direction, but a small step. No allowances of the 2013 and 2014 vintages will be auctioned in 2012, and 2 percent of the 2015 allowance budget is less than 8 million allowances. PG&E recommends that a significant quantity of future vintage allowances be made available through the auctions to effectively manage compliance costs and volatility. PG&E requests amendment of section 95870(c)(1) so that complying entities can execute approved hedging plans. The goal is to enable hedging by increasing market liquidity through orderly, gradual auctioning of substantial numbers of allowances prior to their vintage years. (PGE1)

Response: We agree and increased the advance auction amount from two percent to 10 percent.

Schedule

D-39. (multiple comments)
Comment: The Utilities recommend that the timing of reserve sales be split equally between quarterly auctions to provide covered entities with a sufficient amount of time to transfer compliance instruments into their compliance accounts and to assess needs before participating in the reserve sale. The Utilities recommend reserve sales occur 45 days following each quarterly allowance auction and modifying section 95913 as follows:

> *(c)(3)(B) Subsequent sales shall be conducted ~~three weeks~~ 45 days after each quarterly allowance auction pursuant to 95910.* (MID1)

Comment: As currently proposed, the submittal date for the various documents required to participate in the reserve sale is one week following each quarterly auction. The Utilities are concerned that this presents too little time for a covered entity to fully assess their need from the reserve and to develop the required bid guarantee documents. Thus, the Utilities propose an extra week be allowed for covered entities to submit the required documents. Please note that if CARB elects to change the timing of reserve sales to 45 days following each quarterly auction, as the Utilities propose in our comments to subsection 95913(c)(3)(B), the proposed change for subsection 95913(e) as follows, is no longer necessary.

> *(e) Submission of Bids to Purchase. At least ~~two~~ one week~~s~~ prior to the scheduled sale, a covered entity shall submit to the reserve sale administrator*:(MID1)

> **Response**: We changed the timing of the reserve sales to six weeks after each auction, as the commenter suggested.

D-40. Comment: We would also like to address frequency of auction and allowances. We believe that a more frequent auction is needed in the later years of the program to assure liquidity. We propose that you increase the auction frequency from quarterly to every two months. (CHEVRON1)

> **Response**: We are also interested in the possibility of more frequent auctions. We will consider this option as part of a future rulemaking with a full public process. During our stakeholder meetings in 2009 and 2010, we heard concerns from a number of stakeholders about the burden in time and cost to auction participants of more frequent auctions. We will explore the possibility in future rulemakings, keeping in mind the potential burden on stakeholders.

D-41. Comment: The timing of the first auction should be advanced to provide necessary allowance price discovery for electricity market in advance of January 1, 2012. Although the first surrender of allowances by capped entities is not required until May 2014, electricity generators will need to include the cost of allowances in bid prices for electricity as of January 1, 2012, when the first compliance period begins. Until a secondary market for compliance instruments develops, auctions will be the only means available for price discovery of allowances. Because the first auction is currently scheduled for February 2012, generators would have little direct information on which to base their assessment of the allowance price component of the power production for the January-February period. Given that generators need to ensure that the power price they receive is sufficient to recoup their allowance costs, earlier auctions will enhance allowance price transparency, and therefore eliminate market uncertainty that could cause prices to be higher than necessary. WPTF therefore recommends that the first auction be moved up to the last quarter of 2011. (WPTF)

> **Response**: We acknowledge the concern and have revised the first auction date to be further ahead of the compliance period start date.

Consignment Auction

D-42. Comment: CARB should clarify the role of industrial covered entities in consigning to auction. The proposed regulation requires clarification as to how allowances that are directly allocated will be treated once distributed. Section 95831(a)(3) of the proposed regulation creates a Limited Use Holding Account for entities that qualify for a direct allocation of allowances to consign their allowances to auction, but does not state how this Limited Use Holding Account will be populated. In Section 95870, it appears that the direct allocations for both public utilities and industrial covered entities will be transferred to the individual Holding Accounts of those parties. Yet a few sections later, the proposed regulation states that direct allowances to IOUs are placed directly into their Limited Use Holding Accounts, while POUs have a choice of placing their allowances in either their Compliance Account or their Limited Use Holding Account.

Section 95891 of the proposed regulation governs direct allocation of allowances to industry for “Industry Assistance.” This section lacks any discussion of which account—the Limited Use Holding Account or the Holding Account—the allocated allowances will be placed. As noted above, Section 95870 states as a general matter that allowances directly allocated will be transferred to individual Holding Accounts, which implies that industrial covered entities are not required to consign its allowances to auction, nor use them directly for compliance. This raises the question of whether industrial covered entities will have Limited Use Holding Accounts, and if so, what purpose those accounts will serve. Because of this inconsistency, SCE requests that CARB clarify the role that industrial covered entities will play in the auction and whether they will be required to consign any of their allocated allowances to auction. (SCE1)

> **Response**: Section 95921(d) states clearly that only entities with limited use holding accounts may consign allowances to auction. Section 95892 (c) further specifies that IOUs are required to consign free allowances to auctions. We believe the regulation is clear that industrial covered entities are not subject to consignment auction provisions.

Auction and Sales Procedures

D-43. Comment: Deadlines should be established for ARB decision-making processes to provide entities with a degree of certainty. Modify section 95912(l)(1) and (2) as follows:
(1) Certify whether the auction was operated pursuant to this article *within 5 days*;
(2) After certification, immediately direct the auction operator to. (CCEEB1)

> **Response:** We disagree with the comment. The rule specifies the process clearly enough to provide certainty for auction participants. The time to process auction transactions will depend on workload and the processes used by the contractors conducting the auction and financial transactions according to industry best practices.

D-44. (multiple comments)
Comment: In addition, the bidding process for the Allowance Reserve is confusing, inefficient, and will lead to higher costs and increased risk for compliance entities. A bidder in need of additional allowances from the Allowance Reserve must submit bids for a quantity of allowances from each tier, but the total must not exceed their unmet compliance need for that year. Moreover, because the bidder will not know whether that tier will be fully subscribed through bids from other covered entities, there is uncertainty about whether it will receive the bids it submitted. As a result, the bidder may choose to bid in a lower tier than the price he is willing to pay, risking that that tier will not be oversubscribed. This situation where bidders attempt to beat the system could be avoided by simplifying the Allowance Reserve. Bidders should be able to bid in their willingness to pay, and all bids should be met starting at the lowest reserve price, increasing to the next tier if bid quantities exceed the allowance quantity in the lowest tier.

An improved auction design could mitigate, if not eliminate, these uncertainties. For example, CARB could simplify the bidding process by allowing the unmet need from one tier to carry forward as a bid into the next lowest tier. Bidders should bid at their willingness to pay ($40, $45, or $50) and the market should clear at the lowest bid available. For instance, if bids are made for less than one-third of the Allowance Reserve, then all allowances from the reserve should be sold at $40. If the number of bids exceed one-third of total allowances, then all bids made at $40 should be fulfilled at $40, and those remaining bidders (at $45 or $50) should get the remaining $40 allowances pro-rated, and fill the remainder of their bids at $45. This bidding mechanism is consistent with the process used in the general auction, where bidders pay the settlement price even if their maximum bid was initially greater than the settlement price. (SCE1)

Although SCE advocates for bids to roll down into the lowest available tier, should a tier be over-subscribed, the bids should not roll up into the next tier. Market participants bid only their willingness to pay, and should not be forced to pay more than this due to a shortage. A market participant may bid into the $40 tier of the reserve, but have a reduction measure available to them at the cost of $43/ton, and therefore be unwilling to pay $45 per allowance. Therefore, when a tier is oversubscribed, a bidder should receive a pro rata reduction in allowances from its bid, 50 and the shortfall should not carry over to a higher-priced tier as the Proposed Regulation currently requires. Doing so could mitigate price uncertainty while eliminating uncertainties as to quantity (except in the case where the Allowance Reserve is completely exhausted). (SCE1)

Comment: ARB should consider the following modifications to its proposed mechanism for selling Reserve allowances:

1. Allow each buyer to submit a maximum quantity of allowances that it is willing to purchase at each Reserve sale; and
2. Automatically reduce bid quantities if a bid would lead the buyer to exceed its Holding limit.

These modifications would address problems that may arise with the proposed Reserve sale mechanism due to the potential that a buyer receives only a portion of her bid for allowances in Tiers that become exhausted in the current sale. These potential problems are best illustrated through an example. Suppose a buyer wishes to purchase 100 allowances up to the prices of the current Tier 2 price (e.g., $60 per MT). As illustrated below, each of her options for submitting bids raises problems that the first modification resolves:

Option 1: Bid for 100 allowances from the Tier 1 Reserve. If the Tier 1 Reserve becomes exhausted during the auction, she receives only a fraction this bid and purchases less than 100 allowances.

Option 2: Bid for 100 allowances from the Tier 1 Reserve (at $53 per MT) and for 100 allowances from the Tier 2 Reserve. She is guaranteed to purchase at least the 100 allowances she needs, but likely purchases more than she needs, and, moreover, may end up paying for higher priced Tier 2 allowances when Tier 1 allowances are still available.

Option 3: Bid for 100 allowances from the Tier 2 Reserve. She likely gets the 100 allowances she needs (and no more), but must unnecessarily pay for most costly Tier 2 Reserve allowances to ensure she gets the right quantity.

By contrast, with the proposed modifications, she is able to purchase exactly the quantity of allowances desired at the lowest price (i.e., her share of Tier 1 allowances and enough Tier 2 allowances to give her a total of 100 allowances).

Another problem arises if bids exceed buyer holding limits. Returning to the example, suppose the buyer’s account is 150 allowances below her holding limit, and she receives 80 allowances from her Tier 1 bid. If her Tier 2 bid is also for 100 allowances, then her entire bid will be rejected since it would exceed her holding limit. Instead, ARB should simply reduce the bid amount to 70 allowances (=150 – 80) to allow the buyer to meet their demand for allowances up to their holding limit. (ANALYSISGRP)

> **Response:** We revised the sales procedure after receiving a number of comments similar to this. In the new process, each bidder will submit a maximum willingness to pay and a quantity of allowances to be purchased. We will fill the bid from the lowest-priced tier with allowances available. This removes the need to make separate bids to each tier, which is the source of both overpaying and overbuying. This procedure also prevents the conflict between the bids and the holding limit.

D-45. Comment: In addition to the primary cost containment mechanism of using offsets, CCEEB supports an allowance reserve as an insurance policy against events such as unexpected market dynamics or difficulties obtaining ARB-approved offsets. We believe that the regulatory process may be too time consuming to respond in a timely manner and that relying on the emergency trigger creates undue disruptions and is unwarranted when it can be handled in a less draconian manner through preplanning. CCEEB recommends that ARB adopt a process to backfill the reserve before it is completely depleted. The refill mechanism should trigger once the reserve is 50 percent depleted to bring more supply into the market, recognizing that use of the reserve indicates scarcity in the market and potential liquidity problems. (CCEEB1, CCEEB2)

> **Response**: In its Resolution 10-42 of December 16, 2010, the Board directed us to monitor the depletion of the reserve and to make recommendations for corrective action. While the commenter is correct in pointing out that the regular regulation adoption process is long, we have the authority to implement regulations on an emergency basis on a shorter timescale.

D-46. Comment: We support use of an allowance reserve for cost containment but continue to be concerned that the design be objective, transparent and avoid creating a balloon payment by borrowing from the future and therefore shrinking supply. The allowance reserve, as proposed, is back loaded with the largest portion supplied by future allowances, 7 percent borrowed from the final compliance period. To balance the reduction in available allowances across the program, offsets limits for individual facilities have been raised from 4 percent to 8 percent. It's important to note that while the allowances are fully fungible instruments, the use of offsets is an option that a facility may choose not to utilize. If facilities do not use all of their allowable offsets in every year, then they are removed from the program, making it more punitive than it needs to be to meet the required emissions reductions. (CHEVRON1)

> **Response:** The use of offsets is a cost-containment method that is left to the discretion of the covered entity. It may use them or not. If they choose not to use offsets, it does not imply that the system is more punitive.

D-47. Comment: Compliance entities need transparency on the allowance allocations, reserve allowance supply, and cost cap triggers so that they can plan appropriately and develop optimal compliance strategies. (CHEVRON1)

> **Response:** The regulation contains the allowance allocation methods. The regulation specifies the prices for purchasing allowances from the reserve. There is no cost cap trigger, only the reserve. Therefore, the regulation is clear on these points.

D-48. Comment: The allowance window or allowance reserve must be designed to provide sufficient reserve liquidity. The design must include unfettered access to reserve allowances whenever market prices reach levels that make it necessary to reduce allowance prices below the collar ceiling price. Even if reserve allowances are available in sufficient supply, they cannot effectively provide a mechanism to mitigate costs if they are not accessible to entities that require them. (CHEVRON1)

> **Response:** The Reserve may be accessed quarterly, plus twice in the year after the end of the compliance period. This gives the covered entities the access they need.

D-49. Comment: We believe that the functionality of the reserve is tied to the source of the allowance supply. We cannot recommend supplying the reserve from either current or future allowances since both ultimately shrink supply and unnecessarily drive up market prices. (CHEVRON1)

> **Response:** Diverting allowances to the reserve does not automatically raise market prices, because of the simultaneous increase in the offset use limit by the amount being diverted to the reserve.

D-50. Comment: An allowance reserve funded by allowances from current or future periods with prices set artificially—and without the use of offset credits—is fundamentally flawed. (CHEVRON1)

> **Response:** The commenter does not say why it is flawed. We believe that the reserve meets the policy goal of providing a buffer supply at known prices to the market. We chose this approach because it provides more price certainty than would an auction. We have increased the offset use limit as much as possible while protecting the AB 32 goal of achieving reductions in California.

D-51. Comment: We recommend that the allowance reserve be backfilled in the third compliance period with offsets. We recommend that the reserve be available at all times and rather than artificially setting prices for the allowance reserve, ARB should develop policies that are tied to the market itself. Finally, we are concerned that unsold allowances from the quarterly auctions would be automatically placed in the allowance reserve because this will reduce liquidity and drive up costs unnecessarily. We recommend that unsold allowances be returned to the following auction. We recommend that the offsets limits be expanded to apply across the entire program rather than one year, and that facilities be allowed to sell their offset options. We are attaching separate comments on the allowance reserve provided by the Analysis Group. (CHEVRON1)

Response: The comment makes several points and we respond in the same order. Foremost, we cannot replenish the reserve with offsets because we do not have the authority to use auction or reserve sale revenue for that purpose. The approach would also complicate ARB's role as the market operator, since ARB would then become a market participant.

The reserve serves as a source of allowances between auctions. Having continuous reserve sales would increase the administrative burden of the program on both ARB and market participants, since we would have to conduct reserve sales at the same time we are conducting auctions.

We set the reserve prices at a level we expect to be above the most likely market outcomes. We did this in part to minimize the effect of the reserve on market efficiency. We also never intended the reserve to be a price ceiling or to actively manage market prices. Instead, we intended it to be a temporary buffer in case our expectations of the cost of meeting the cap were incorrect. The reserve would give staff time to modify the program to correct the problem.

We agree with the comment's proposal to send allowances remaining unsold at auction back to future auction rather than to the reserve. We changed section 95911(b)(4) to include the new procedure governing when unsold allowances would return to auction.

The depletion of the reserve in itself may not be an indicator of a potential market issue. Therefore, we did not make a change that would require an increase in the offset usage limit by backfilling the reserve with offsets in the third compliance period.

The regulation requires that offsets account for eight percent of an individual entity's emissions over a three year period. We did not allow the carryover of unused offsets within this time frame to ensure that emission reductions are being achieved by capped sources throughout the life of the program. Keeping it to the compliance period allows some flexibility by giving three years to total emissions, but still requires that emission reductions are coming from within capped sectors in all years of the program.

Allowance Reserve

D-52. Comment: Section 95913 is excessively ambiguous because it is much more complicated than it should be and requires clarification. The allowance reserve will be fairly large compared to quarterly sales of allowances in the auction since it is made up of the equivalent of 4 percent of allowances from 36 auctions. Accordingly, it would be far simpler to fill the excess need of compliance entities from the Price Containment Reserve if the price ceiling is reached in the auction and there is excess demand at the price ceiling. If compliance entities requested 10 MMT more than available at the ceiling price, the added 10 MMT would come from the Price Containment Reserve. The price ceiling would be the same as the Tier 1 level until it was exhausted, then the ceiling price in the following auction would increase to the Tier 2 level. Such a procedure would avoid a second auction and the complex rules in Sections 95913(e) and (f). (SEMPRA1)

Response: The comment about the ambiguous sales procedure is moot because we have revised the reserve sales process. We disagree with the comment on awarding allowances to auction bids above the tier prices. Entities will have adequate opportunity between auctions to purchase the allowances they need.

D-53. Comment: NextEra Energy supports ARB's use of the Allowance Price Containment Reserve defined in section 95913 of the regulation. It provides another source of procuring allowances for entities that incur a compliance obligation. (NEXTERAENERGY)

Response: No response is needed.

D-54. Comment: One of the requirements to utilize this pool of allowances however states participants "hold no compliance instruments in their holding accounts or limited use holding accounts." One reason for the inclusion of this provision is to ensure that entities using this mechanism for obtaining allowances do not profit from the sale of the allowances purchased from the reserve. This restriction is not necessary. There are other ways to ensure that any allowances purchased in this manner are used for compliance only. The emptying of accounts is not necessary and should be removed from the regulation.

NextEra Energy feels the emptying of all holding accounts in order to purchase allowances from the reserve causes more problems than it solves. For instance, will allowances with future vintages need to be retired? Also, the partial surrender of annual compliance obligation could trigger the need to go to reserve to make up any shortfall. Emptying entities holding accounts could effect the hedging positions taken for future compliance obligations. The Allowance Price Containment Reserve should be available to meet short term compliance obligations as needed by entities with a compliance obligation or to be used for long term speculation in anticipation of escalating allowance prices. In short, this requirement of emptying holding accounts does not maximize cost containment and could actually result in a cost escalation in future compliance periods.

One way to accomplish the same goal is to move the allowances purchased from the reserve directly to the retirement account of the purchaser or to tag the allowance as ineligible for transfer to another entity. Entities that have a compliance obligation need the flexibility to bank allowances obtained from various sources in order to fully realize any cost containment provided by the reserve. This flexibility benefits consumers by allowing entities with a compliance obligation to spread the risk associated compliance over time. (NEXTERAENERGY)

> **Response**: We evaluated the concern and removed the purchase requirements on the accounts' remaining allowances.

D-55. Comment: However, we are concerned that the reserve will be insufficient to contain costs if the market is short, not because of a temporary event but due to unforeseen systemic issues. Through discussions with ARB staff, we understand that the intention would be to change the cap and trade regulation should use of the cost containment reserve indicate a structural supply/demand problem. While we understand the need for market-based programs to be amended over time to reflect changes in technology/economic conditions, such changes should be rolled out in a predictable and methodical way and not as a result of market /regulatory panic over a depleting cost containment reserve.

We recommend that a process to replenish the reserve with international offsets purchased by a neutral 3rd party be added to the regulation. (SHELLENERGY)

> **Response**: We do not have the authority to use auction revenues in this manner. The activity may also make us a market participant, which could complicate our market operation and oversight role. We will have several mechanisms to monitor market performance to detect any issues that would result in unintended compliance costs.

D-56. Comment: Robust cost containment provisions are needed to address the potential for spiking ad runaway compliance costs.

Recommendation: Dow supports ARB's inclusion of a cost containment mechanism focused on allowance prices, with a ceiling price for accessing the Allowance Price Containment Reserve ("APCR") and a reserve price as part of the quarterly auction.

Rationale: Dow believes that including such a mechanism, if designed well, can reduce the volatility of allowance prices. Dow also supports ARB's proposed general usage restrictions, such as limiting the ability to purchase from the reserve to complying entities, and requiring these entities to immediately retire any allowances purchased from the allowance reserve to their compliance accounts. Dow supports ARB's design decision to increase the offset limit to account for the allowances removed from the market to fill the allowance reserve. Dow supports the removal of proposed restrictions in section 95913 (c)(1)(B) that would require entities to empty both their limited use holding accounts and general holding accounts before accessing the allowance reserve. (DOWCHEM1)

> **Response:** We made the changes to the regulation suggested in the comment.

D-57. Comment: As currently drafted, the Proposed Regulation also lacks sufficient, effective, and appropriate cost containment measures. The Allowance Reserve does not provide a true ceiling on allowance prices, and CARB should implement a hard price ceiling. (SCE1)

> **Response:** We have made clear that it will not impose a hard price ceiling, as this would prevent the market from sending a clear market price signal. The Reserve mechanism, together with the increase in the offset use limit, does provide some buffer against price increases.

D-58. Comment: IEP believes that a cap needs to be placed on the CPI escalator when determining the Reserve Tier Prices. Business certainty and investment will be undermined if the CPI remains uncapped over the 2012-2020 timeframe, particularly if the federal government's expansion of the money supply results in high inflation. IEP recommends to place a "not to exceed" five percent cap on the annual increases to the CPI factor in the methodology to determine the Reserve Tier Prices. (IEPA)

> **Response**: We do not believe that federal monetary policies require a modification of the tier prices. If federal monetary policies do result in "high inflation" as the comment suggests, they would affect the general price level. That is, while the tier prices would rise, so would the price of allowances and electricity. Failing to index the tier prices in the face of inflation would lead to premature depletion of the reserve at low real prices (i.e., adjusted for inflation).

D-59. Comment: The current structure for bidding on the allowance reserve will lead to increased risks and costs for compliance entities. As currently designed, the Allowance Reserve is inaccessible, punitive, and potentially ineffective. The Proposed Regulation creates three tiers for the Allowance Reserve, with three initial price levels of $40, $45, and $50. Assuming a modest 2 percent inflation rate, these prices could reach around $69, $77, and $86 in 2020. Given the potential impact on the State economy and on electricity customers, these prices are set too high.

To protect the integrity of the California cap and trade program and to serve as an example for regional or federal emissions trading programs, CARB must avoid burdening California consumers with excessive costs as a result of the Cap and Trade program. Pulling allowances for the Allowance Reserve from under the cap (and thereby reducing the supply of available allowances) does not provide true long-term cost containment and will do little to alleviate the cost burden on covered entities and their customers. (SCE1)

> **Response:** We disagree with the comment that the high Reserve prices will increase electricity rates. Utilities receive a direct allocation covering their exposure, which should provide them the resources they need to protect ratepayers. We also disagree with the assertion that funding the reserve reduces the supply of compliance instruments. The reserve is "funded" through an

increase in the amount of offsets covered entities are allowed to use, from four percent of their obligations to eight percent.

D-60. Comment: ARB's proposed rule includes several provisions designed to help contain costs. These provisions are important not only for California, but for broader efforts to design effective climate policies. Given the political headwinds faced by climate policy in the U.S., ARB can provide valuable leadership by demonstrating that climate policy incorporating appropriate designs and safeguards can achieve important environmental benefits without undue risk to the economy. Design of an effective California cap and trade program can also go a long way to eliminating emerging misconceptions about the value of market-based mechanisms to achieving these goals.

Along with three-year compliance periods, allowance banking and the use of allowance offsets, ARB's proposed rule includes an Allowance Reserve ("Reserve") which is designed to help moderate allowance prices. The Reserve works, in effect, by increasing the supply of allowances when allowance prices rise to the level at which they can be purchased from the reserve ("Reserve trigger prices"). Accounting for forecast inflation, Reserve trigger prices will rise to \$68, \$76, and \$85 per metric ton (MT) by 2020.

While the reserve is likely to mitigate the potential for high allowance prices, its proposed design raises several concerns. First, the reserve is stocked by increasing the cap's stringency by one percent in the first Compliance Period, four percent in the second Compliance Period, and seven percent in the third Compliance Period. These are significant increases in cap stringency, particularly in the third compliance period. While the limit on offset use has been relaxed so as to exactly equal the increased cap stringency, the proposed changes significantly increase reliance on offset markets. If offsets become a low-cost source of emission reductions, then the increased cap stringency may not raise costs appreciably. However, if offsets are either in short supply or are more costly than anticipated, then ARB's proposed changes could actually raise costs, particularly (although not exclusively) during periods when allowances are below Reserve trigger prices. A Reserve design that relies less upon increasing cap stringency would reduce the risk that the reserve raises, rather than contains, costs. (ANALYSISGRP)

Response: We agree that if there are not sufficient offsets available for covered entities to use the full eight percent limit, then the method we use to fund the reserve could be seen as tightening the cap when market prices are below the tier prices. However, the comment ignores other parts of the regulation design. The auction reserve price is designed to support consistent incentives for the investment in offset projects. We contend this feature will ensure that offset projects are viable. We will also propose additional offset protocols as part of a separate rulemaking to help increase offset supply.

D-61. (multiple comments)

Comment: Second, the proposed Reserve does not completely eliminate the risk that allowance prices rise to unacceptably high levels. If the Reserve is exhausted, then allowance prices could rise well above the trigger prices established by ARB. In fact, as the Reserve becomes depleted, uncertainty about the risk of Reserve exhaustion and subsequent high allowance prices could lead to speculation that accelerates Reserve exhaustion.

ARB has alternatives available to address these concerns, many of which have been mentioned in prior comments. First, ARB could design the Reserve to hold a (roughly) constant, but smaller, quantity of allowances. To maintain a "steady-state" quantity of allowances, the Reserve could be replenished with additional allowances as it becomes depleted. One approach to replenishing the Reserve is to use revenues from the sale of Reserve allowances to purchase emission offsets. Another alternative for replenishing the Reserve is to borrow allowances from post-2020 commitments periods. Both of these alternatives can maintain environmental integrity of the policy.

By replenishing the Reserve so that it contains a (roughly) constant quantity of allowances at all times, the Reserve does not need to be initially stocked to provide cost containment for all contingencies over the period 2012 to 2020. Thus, replenishment allows a smaller Reserve to be maintained, which reduces the quantity of allowances that is required to initially stock the Reserve. Compared to ARB's proposed Reserve, this approach provides two advantages. First, it provides a sufficient supply of allowances to address all market contingencies, and, second, it avoids the need to significantly increase the stringency of emission targets in order to stock the Reserve.

In addition to incorporating mechanisms that replenish the Reserve, ARB could also employ alternative approaches to initially stocking the Reserve. For example, ARB could initially fill the Reserve with a mix of allowances from under the cap and offsets. Allowances from under the cap could be used to initially stock a smaller Reserve than is proposed by ARB, and the Reserve could be gradually expanded through offset purchases. (ANALYSISGRP)

Comment: The Board should amend the price containment reserve to replenish the reserve with offsets, obtained from third-party approved entities, if it becomes oversubscribed so as to provide for higher-confidence cost containment and to avoid depleting future allowance pools. (CCC, MAZOWITA)

> **Response**: The Reserve is not intended to "completely eliminate the risk that allowance prices rise to unacceptably high levels" as the comment asserts. We have been clear that there is no "hard price cap" in the program. We rejected that approach as leading to interference with market price signals. We created the reserve to serve as a buffer against higher prices. The Board has directed staff to monitor depletion of the reserve and make recommendations for program revision as needed.

We did not accept the proposal for replenishment of the reserve with offsets for two reasons. First, we do not have the authority to use auction revenue to purchase offsets. Second, this would make us a market participant, complicating our role as operator of the market.

We cannot replenish the reserve with allowances without tightening the cap.

D-62. Comment: Calpine supports the proposed regulation's establishment of an initial Reserve Price of $10 per metric ton of CO_2e for 2012 vintage allowances and $11.58 for 2015 vintage allowances. See 17 C.C.R. section 95911(b)(6) (proposed). So long as the proposed regulation is revised to provide transitional relief for long-term contract generators that cannot pass-through allowance costs, as described in section A of these comments, Calpine believes that setting a strong Reserve Price will encourage covered entities both to undertake cost-effective emissions reductions within their own footprint and to support the development of real, additional emissions reductions through certified offsets projects. (CALPINE1, CALPINE2)

Response: We did not make any changes to address long-term contracts because it is up to the parties to the contracts to determine how to allocate carbon costs among themselves. ARB will not involve itself in third party contracts that were negotiated between private parties. We appreciate the support for the reserve tier prices.

D-63. (multiple comments)

Comment: We are pleased to see CARB propose a floor price of $10/tonne, escalating at 5 percent per year to reach $15/tonne by 2020. This is considerably higher than RGGI's floor price of less than $2/tonne. At these levels, the floor price will send a steady signal to the market to find innovative ways of decreasing carbon emissions. We are encouraged that CARB is proposing to auction 100 percent of allowances in the transportation fuels sector and will require the investor-owned electric utilities to sell 100 percent of their allowances into a consignment auction. This means over half of all allowances issued in the program will be auctioned from the start and will increase to roughly three-quarters of all allowances by 2020. (NRDC1)

Comment: Set a very high minimum price on carbon emissions' permits. In my view, California is prehistoric in its efforts to reduce all sorts of pollution, waste, and environmental stressors. Almost anywhere on the planet earth, you will find a better mass transit system than here, which reduces pollution, waste, and stress. By installing carbon limits that decline and carbon emissions' permit prices that have a very high minimum price, you have the opportunity to help your state remain the golden state. (COLBY)

Response: We will continue to evaluate the treatment of transportation fuels in the cap-and-trade program, including the effects of allowance distribution to different sectors within the transportation sector, and propose any necessary changes to the regulation before the start of the second compliance period in 2015. We note the importance of transparent price signals for fuel consumers in achieving reductions in this sector.

D-64. (multiple comments)
Comment: Section 95911(b)(6)(A) sets the Auction Reserve Price for auctions conducted during 2012 at $10 for allowances from the 2012 allowance budget year, and $11.58 for allowances from the 2015 allowance budget year. The proposed regulation also provides for a 5 percent plus consumer price index (CPI) annual increase in the Reserve Price (section 95911(b)(6)(B)). CARB states that the purposes of the annual increase is to "provide incentives for direct emissions reductions and the investments in offset credit projects," and that the "auction reserve prices would need to increase to reflect the increased marginal abatement cost and the inflation rate; otherwise, the reserve price would no longer support direct reductions and offset projects as intended." (ISOR, p. IX-71) NCPA does not believe that the increases are necessary to meet this objective, nor are they consistent with the purpose of a three-year compliance period.

NCPA recommends that section 95911(b)(6) be revised to strike the annual escalation of 5 percent. Aside from CPI, there should be no increase in the ongoing Auction Reserve Price. The annual increase adversely impacts the utility of the three-year compliance period as a cost-containment tool by guaranteeing that allowance prices in the later years will be 5 percent higher. Furthermore, increases are not necessary to meet the objectives articulated in the ISOR, and should not be included. (NCPA1)

Comment: The Utilities are comfortable with the need to adjust the auction reserve prices for inflation as measured by the CPI. However, we do not believe that there is justification for adding an additional 5 percent, and recommend modifying sections 95910 and 95911 as follows:

(d) Reserve Tiers.

(3) Increase in Release Prices. In calendar years subsequent to 2012, allowances from each tier shall be offered at prices equal to the offer price for each tier from the previous calendar year increased by ~~5 percent plus~~ the rate of inflation as measured by the Consumer Price Index for All Urban Consumers.

(b) Auction Reserve Price Schedule.

(6) Method for Setting the Auction Reserve Price

(B) For auctions conducted in calendar years after 2012 the Reserve Prices shall be the Auction Reserve Prices for the previous calendar year increased annually by ~~5 percent plus~~ the rate of inflation as measured by the Consumer Price Index for All Urban Consumers. (MID1)

Comment: The auction reserve price (section 95911(b)(6)) prescribes the auction reserve price set for 2012 as well as the five percent price increase plus the rate of inflation. This setting of allowance prices is inconsistent with the basic premise of the cap and trade system to reflect the pricing fluctuations inherent in a free market trading system so that GHG reductions can be obtained in an efficient, market- based process. To be consistent with this premise, CARB should set the initial price floor of the allowance and allow the market to dictate future allowance prices. (PRAXAIR)

Comment: Floor price escalation beyond inflation is not necessary. SMUD understands the desire, with a new market, to provide market certainty to those making determinations about whether to invest in a given reduction measure. We also understand that a floor price for allowances offered at auction is one way to ensure certainty, and that discounting of future payoffs implies a potential need for an escalation of that floor price beyond normal inflation. However, as markets mature, such investment signals will no longer be necessary in the market. The five percent escalator will in the proposed regulations will eventually result in excessive prices for allowances, in particular if carried beyond the 2020 timeframe. For a program with such strong complementary policies, the notion of forcing the floor price up to arbitrarily high levels seems punitive towards market participants who are trying to balance the high costs of complementary programs with the cap and trade costs. SMUD would recommend that ARB signal its intent to reflect maturing markets by tapering the 'above inflation' escalation off over time so that the escalation ends at no greater than the rate of inflation in the last year of the program. (SMUD1)

Comment: The price floor for allowances should not increase by 5 percent annually. The proposed regulation would impose a price floor of $10 that would increase annually by 5 percent plus inflation. The Initial Statement of Reasons ("ISOR") states that the intent of the 5 percent inflator mechanism is to reflect the expectation that marginal abatement costs will increase overtime as lower cost abatement measures are undertaken first. This mechanism is unnecessary because the declining nature of the cap will ensure California reaches its AB 32 goals in spite of marginal abatement cost increases. Failure to delete this mechanism could result in unnecessary rate impacts on California's customers. (PACIFICOR1)

Comment: Section 95911(b)(6)(B) (p. A-88) provides for the Auction Reserve Price to increase annually by five percent plus the rate of inflation as measured by the Consumer Price Index. The ISOR explains that this is to reflect the rate of increase in marginal abatement costs, which is assumed to be seven percent per year. However, it is not clear why the rate of increase in marginal abatement costs should be assumed to be seven percent. Lower-cost abatement measures are expected to be undertaken first. AB 32 measures may lead to the development of new abatement opportunities and increased implementation of low-cost abatement measures (such as energy efficiency) over time, renewable energy costs may decrease, and low-cost sector-based offsets may become available in later compliance periods. For these reasons, the rate of increase in marginal abatement costs may not be as high as seven percent per year. The ISOR notes that "the reserve price will rise more slowly than the expected marginal abatement cost so that the reserve price does not make the program unnecessarily more expensive." As changes in the marginal abatement cost are difficult to predict, ARB should avoid rapidly increasing the Auction Reserve Price and risking making the program unnecessarily more expensive. Instead, the Auction Reserve Price should increase by the rate of inflation only. (SCPPA1)

Comment: We have proposed other measures in the draft that will not contain costs but increase them. Automatic increases of 5 percent plus the urban consumer price index annually is unnecessary. (AGCOALITION)

Comment: Section 95913(d)(3) (p. A-96) repeats section 95911(b)(6)(B) (p. A-88) and provides for the prices of allowances in the Allowance Price Containment Reserve to increase by five percent plus inflation each year. The ISOR states that this is to take into account the assumed increase in marginal abatement costs and allowance prices over time. However, as discussed above in section IX.B, the rate of increase in marginal abatement costs is unpredictable. Without more justification for the assumed increase in marginal abatement costs, the five percent annual increase should be removed and reserve allowance prices should increase with inflation only. (SCPPA1)

> **Response**: We propose an inflator mechanism based on the expectation that marginal abatement costs and offset project costs will increase over time as lower cost-abatement measures are undertaken first, and due to inflation. Auction reserve prices would need to increase to reflect the increased marginal abatement cost and the inflation rate; otherwise, the reserve price would no longer support direct reductions and offset projects as intended. Our economic analysis assumed a rate of increase in marginal abatement costs of 7 percent, without factoring in inflation. We propose to increase the reserve price by 5 percent, plus inflation each year, so that the reserve price continues to support direct reductions and offset investment as those become more expensive. At the same time, the reserve price will rise more slowly than the expected marginal abatement cost so that the reserve price does not make the program unnecessarily more expensive.
>
> In addition, the consistent auction reserve price escalator provides certainty to offset project developers. Stakeholders have voiced concerns that uncertainty over future offset prices could reduce the supply of offsets. The reserve price reduces this uncertainty.

D-65. Comment: Set the Auction Reserve price at $1.86/allowance to be consistent with RGGI and afford easier linkage to that system over time while minimizing leakage concerns. Alternatively, set the Auction Reserve Price at $5/allowance to minimize the shock to the price of wholesale electric power in California. At a $5 floor price, a power plant with an 8000 MMBtu/kWh heat rate and gas at $4/MMBtu will still face an increase in the cost of producing wholesale electric power of 7.15 percent which is more than sufficient to send the market price signals CARB seeks for the electric sector. (IEPA)

> **Response**: We believe the carbon price imposed by RGGI does not send an adequate signal to the market to foster innovated technology and promote a change of consumer behavior.

D-66. Comment: The price floor of $10 a unit has been set too high. (INDENVASSOC)

> **Response:** We disagree that a floor price of $10 per metric ton is too high. We believe setting the reserve price at this dollar amount will ensure that allowance prices do not get too low to stimulate emissions reductions, and sends a signal to technology developers, as well as those investing in GHG offset projects.

D-67. Comment: The proposed methodology for setting an Auction Reserve Price includes an escalator of five percent per year plus the rate of inflation as measured by the Consumer Price Index ("CPI") for All Urban Consumers. A real risk exists that over the 2012-2020 timeframe, the CPI will escalate dramatically due to national expansions of the money supply to counter the ongoing recession. An unbounded CPI escalator factored into the methodology for setting the Auction Reserve Price creates a level of price risk that may undermine public support for the program goals that spur the types of investment needed to mitigate GHG emissions. IEP recommends bounding the CPI escalator component of the methodology to determine the Auction Reserve Price. (IEPA)

> **Response**: If an expansion of the money supply occurs and has the effect suggested by the comment, then it should raise the general price level. The price of allowances and offsets should increase along with the general price level. The auction reserve price should increase along with these in order to provide the same level of support for both direct reductions and offset projects.

D-68. Comment: Either a reserve price has no impact, or it artificially increases costs to society of the program. (MSCG2)

> **Response:** An auction reserve price set at the right level provides a known price floor to support investment in direct reductions and offset credit projects. We believe our auction reserve price could accommodate such goals. We will also create a market surveillance committee to closely monitor the market reaction.

D-69. (multiple comments)
Comment: CARB staff proposes a price containment mechanism with floor and ceiling prices to moderate allowance prices. The level of pricing in the allowance containment reserve is not well justified, more data is needed. The $10 floor may be far too high (particularly compared to prevailing carbon prices in other markets) and extremely damaging economic outcomes may be experienced at market prices much less than the proposed ceiling. The proposed levels are not well-justified in the regulation. (CMTA1)

Comment: The proposed floor price of $10/unit is not adequately justified. Setting the price floor at more than 5 times the known trading price in the US is not adequately justified and places California companies at an immediate competitive disadvantage. ARB should delay setting a floor price, and adopt a new floor price by regulation every three years that would better reflect the market conditions and trading partners. (SOLARTURBINES1, SDCHAMBER)

Comment: The $10 price floor for the auction of allowances is unrelated to any finding that it is necessary to spur market activity that would not also occur at $5, for example. (CALFP1)

> **Response**: The auction reserve price is one of the components of a linked regional market program for which consistency across the individual programs is especially important. For this reason, we will work closely to evaluate this issue with other WCI jurisdictions while evaluating their programs for possible linkage. We may propose an adjustment to the reserve price as part of changes made to link California's program with the programs established by WCI partner jurisdictions.
>
> We chose the $10 reserve price for two reasons. First, we are concerned that through recessionary economic conditions or forecasting error the cap-setting procedure may accidently lead to the creation of excess allowances. Throughout the regulatory process, we heard concerns from environmental groups that the cap would be unintentionally set too lax—a condition sometimes referred to as "oversupply" or "over-allocation." The over-allocation condition occurs if too many allowances are supplied to covered entities relative to expected business-as-usual emissions levels. If the cap is set too loose, prices will be lower than expected, and a weakened incentive to reduce emissions will be created. The reserve price mechanism would correct this condition by transferring excess allowances to future auctions. Second, staff is adapting the approach used in the federal Waxman-Markey proposal (HR 2454), which proposed a reserve price of $10 with an inflator mechanism of 5 percent per year plus inflation.
>
> Finally, ARB does not consider the prices observed in markets, such as RGGI, as representative of the marginal cost of abatement or production of offsets. These prices are instead the result of the over allocation problem that ARB is determined to prevent in California.

D-70. Comment: Section 95913(d) (p. A-95) provides that the allowances in the Allowance Price Containment Reserve will be divided into three tiers, each with a different price. The ISOR provides no justification for the tiering. There are a few sentences on this issue in the last paragraph of Appendix G to the ISOR: "If the first tier is exhausted quickly and purchases are made from the higher tiers, then a more significant imbalance is occurring..." However, it is not clear whether the use of tiers would provide significantly more information on supply-demand imbalances than would be provided simply by observing the percentage of allowances sold from a single-tier reserve at any point in time. Unless tiers can be shown to provide valuable information on imbalances that is not otherwise available, the tiers should be rejected as an unnecessary complication. (SCPPA1)

Response: We propose the three tiers so that in the event that covered entities purchase from the reserve, we could obtain information on entities' willingness to pay for allowances. This information would not be available if there were a single tier. In addition, we and several commenters acknowledge that once the top tier is accessed there is incentive for speculative purchases from the reserve. This could happen right away if there is only one tier.

D-71. (multiple comments)
Comment: Section 95913(d)(2) (p. A-96) sets out allowance prices for each tier of the Allowance Price Containment Reserve in 2012: $40, $45, and $50. The ISOR does not provide any detailed justification for setting the reserve prices at these levels. The reserve price should be set higher than expected allowance prices so that it does not interfere with price discovery, but lower than allowances prices in high-cost scenarios (ISOR Appendix G at G-19). As allowance prices are estimated to be approximately $15 in 2012 (according to Tables G-3 to G-5 in Appendix G of the ISOR), a reserve price that starts at $30, being double the expected 2012 allowance price. A reserve price that starts at $30 would start high enough to avoid interference with price discovery while being low enough to contain prices within tolerable levels. (SCPPA1)

Comment: The level of pricing in the allowance containment reserve is not well justified, as more data is needed. The CARB staff report finds that $30 is the estimated cost for abatement, yet the $40 level is the starting point for the high prices. (CALFP1)

Response: Staff did not propose a $30 price for the lowest tier in order to facilitate future linkage with the WCI. The $40 price for the lowest tier would be consistent with the level of the carbon tax set by the British Columbia Carbon Tax Act. When developing a single market like that being developed in the WCI, it is crucial to set up consistent price floors among future WCI partners and prevent leakage.

D-72. (multiple comments)
Comment: Thank you for including a permit price floor starting at $10/ton in the proposed Cap and Trade regulation. (SONOMAFCC)

Comment: I support a permit price floor starting at $10 per ton. (FRIEDENBERG)

Comment: We commend CARB staff for including a price floor of $10/ton into the proposed regulation. (CPC1, CPC2)

Comment: We believe that one of the program's strongest features is the $10 per allowance price floor, which escalates 5 percent plus inflation per year. This steady price signal will help businesses make long-term investments in strategies to reduce global warming pollution. (UCS1, LUDLOW, WALTERS)

Response: Thank you for the support.

D-73. Comment: If cap and trade is adopted, I would urge CARB to place some dollar value on every pollution allowance that is auctioned and to avoid any free allowances. If CARB is serious about attaining the rigorous goals of AB 32, which will be complicated by our burgeoning population, than it should ensure a reasonable price is placed on all carbon allowances from the outset. Sensitive to the current economic conditions in this state and country, I understand the possible desire to delay imposition of charging for all credits in order to minimize additional burdens to business in this state. While the goal is laudable, I think the better approach is to settle for some price that is reasonable, so as to set the proper price signal, and further propose a steady ratcheting up of the price, offset by a return of the revenues to the people of this state after a reasonable offset by CARB to pay for the cost of implementing AB 32. That way, an early signal is sent so that renewable energy gains a faster competitive edge which investors will consider to determine when and how much to invest in California's new, clean energy sectors. At the same time, a return of most of the revenues to the people of this state alleviates the impacts to the most affected people in a progressive manner. (REAVES)

> **Response**: The floor price for the auctioned allowances is 10 dollars and increases each subsequent year. We are auctioning a large number of allowances during the first compliance period, along with all of the allowances issued under the enlarged scope beginning with the second compliance period. However, at the beginning of the program we are providing some amount of free allowances to help covered entities transition into the program, but the amount of free allowances declines each year.

D-74. Comment: We support floor prices in auctions (though not in the market as a whole) and have suggested that the EU should also adopt such a policy. However, at $10 a ton, the level of the floor is currently too low to provide an adequate investment signal. We consider that this should be subject to regular review and increased as soon as possible. The use of revenues from auctions to mitigate price impacts on consumer costs is very sensible. Grants for deployment of low carbon technologies can also play a role in buying down the costs of higher cost abatement options but care should be taken not to unduly distort the abatement market by appearing to pick winners. The market would achieve this more efficiently than a government program, if changes can be made to introduce stronger ambition, long-term certainty and less offsetting. (SANDBAGCC)

> **Response**: The auction reserve price starts at $10, which is high enough to support the initial expected offset credits price. This price will continue to increase annually, which should provide an adequate price signal to encourage technology innovation. In addition, we will monitor the annual emissions level and compare that against the carbon price to see if the carbon price is at the right level to provide enough incentives for curbing carbon emissions.

D-75. Comment: The Reserve Tier Prices are set at a price four times (400 percent) the proposed initial Auction Reserve Price of $10/allowance. The purpose of establishing an Allowance Price Containment Reserve, theoretically, is to mitigate extreme volatility in the prices faced by obligated entities to acquire allowances. To achieve this outcome, the reserve price should be set high enough to allow market price signals to operate, but not so high as to be irrelevant to the goal of mitigating extreme price volatility and unintended impacts on key economic sectors such as electricity. Setting the Reserve Tier Prices at 400 percent of the initial Auction Reserve Price does not protect against extreme price volatility, particularly in the early years of AB 32 implementation. IEP recommends to set the Reserve Tier Price at 150 percent of the market-clearing price of the most recent auction capped at the proposed Reserve Tier Prices (i.e., Tier I: $40/allowance; Tier II: $45/allowance; and Tier III: $50/allowance). This approach will mitigate volatile price impacts while still creating the appropriate incentives for obligated entities to participate in the auctions (rather than seek allowances via the Reserve). (IEPA)

> **Response**: We disagree with the assertion that the reserve tier prices are too high. The Reserve is intended only to serve as a temporary buffer against extremely high prices to give staff time to make program revisions. It is not intended to keep prices in some range that stakeholders find reasonable.

D-76. Comment: The allowance price containment reserve should start at $30. The proposed regulation would prescribe allowance prices for the Allowance Reserve at $40, $45, and $50, with these prices to rise annually. PacifiCorp urges ARB to lower the reserve price, so that the reserve prices are lower than allowances prices in high-cost scenarios. Since allowance prices are estimated to be roughly $15 in 2012, the reserve price should be set high enough above that price to ensure that the reserve is not simply used as an alternative source of supply. Setting reserve prices to start at $30, $35, and $40 would strike a reasonable balance, as these prices would be high enough to avoid interference with price discovery and low enough to contain prices within reasonable levels. (PACIFICOR1)

> **Response**: Setting the reserve tier prices as suggested in the comment would interfere with operation of the market. This would eliminate a main purpose of the market, to signal the cost of carbon abatement. Again, we have always intended the reserve to serve as a last-ditch buffer against unexpectedly high prices. It is a temporary buffer intended to give us time to revise the program, not provide an absolute price guarantee.

D-77. Comment: CLFP recommends that CARB postpone determination of the reserve sale price thresholds until the regulation is more complete. The allocation benchmarks and all the monitoring tools established the ability to accurately measure leakage and anticipate other potential market failures. This will dictate the appropriate levels for the reserve pricing necessary to ensure market stability. (CALFP1)

Response: Before we set the reserve tier purchase prices we examined the results of our economic analysis to determine what were the most likely price outcomes. We set the reserve tier purchase prices above the prices from those analyses, so that the reserve tier prices would represent cases where our expectations about market outcomes were wrong. The reserve prices were not intended to "stabilize" market prices around some desirable level. Instead, they are designed to give us time to modify the program if it turns out that our understanding of the costs of meeting the cap were wrong. We believe that the reserve will buffer the program against higher prices and leakage long enough for staff to develop changes to the program. We conclude that we can go forward with the existing reserve prices, and change them later if needed.

D-78. Comment: The reserve price is set too high. CARB is proposing to sell allowances at $40 per metric ton beginning in 2012 rising to $75/metric ton in 2020. The escalating cost of the reserve over time negates the overall purpose of the reserve to serve as a cost-containment mechanism. We are concerned about the potentially high cost of allowances under this reserve system. We are also concerned that CARB has determined allowance prices before finalizing key elements of the program that could in fact influence the overall pricing outcome and will be useful in setting appropriate levels for the price reserve. Before setting price levels, CARB must first resolve important issues including benchmarking, allowances, leakage assessment, compliance and enforcement and monitoring tools. (CALCHAMBER1)

Response: We have completed the regulation and have not found any evidence that the reserve tier prices are not set correctly.

Setting the reserve tier prices lower, as suggested in the comment, would interfere with operation of the market. This would eliminate a main purpose of the market: to signal the cost of carbon abatement. Again, we have always intended the reserve to serve as a buffer against unexpectedly high prices. It is a temporary buffer intended to give staff time to revise the program, not provide an absolute price guarantee.

D-79. Comment: The proposed allowance reserve price is too high. Reserve prices similar to those used in the Northeast's Regional Greenhouse Gas Reduction Initiative (RGGI) should be applied, especially as linkage between the two would benefit both programs. The proposed $45 price containment reserve price is substantially above the current domestic and international markets. The RGGI market is currently trading at 1.85 per ton CO_2e. Given this magnitude of discrepancy, it is extremely difficult to budget power generation finances. (CONSTELLATIONENERGY)

Response: We disagree with the comment that the reserve price is set too high. See the response to Comments D-77 and D-78. Furthermore, the low prices in the RGGI market are due to chronic over-allocation, and they do not reflect a reliable estimate of the costs of abatement. The cap in RGGI did not decline in the initial years, as the cap in California will.

D-80. (multiple comments)
Comment: The Reserve Account (section 95870(a)), is a key tool toward mitigating potential adverse impacts on compliance entities due to the volatility of allowances prices. We recommend that the section 95913(d)(3) be revised to remove the annual 5 percent increase in the Reserve Account allowance prices. The annual increase, if any, should be no more than CPI, and there should be no other increase in the Reserve Price. Annual increases in the Reserve Account allowance prices adversely impacts two important cost containment tools—the Reserve Account itself, as well as the 3-year compliance period, by ensuing that the costs will be at least 5 percent higher each subsequent year. Furthermore, as with the Auction Reserve Price, annual increases in the price of allowances placed into the Reserve Account are not necessary to meet the objectives articulated in the ISOR, nor do they send additional positive market signals. Accordingly, they should be stricken. (NCPA1)

Comment: The allowance price containment reserve should not include tiers or annual adjustment beyond inflation. AB 32 workshop discussions have previously focused on an allowance reserve set using allowance prices in the range of $25 per ton to $30 per ton plus inflation only, without three separate tiers or a 5 percent annual adjustment. While the intent is to make the reserve the "last resort", extracting higher revenues from the sale of reserve allowances is not the correct policy focus and LADWP recommends that it be reconsidered. If the allowance reserve is tapped into at some point in the program, it should signal an "emergency" in the program and ARB should focus on the market factors contributing to the need to purchase allowances from the reserve. An allowance price of $50 per ton (plus 5 percent annually and inflation) for emissions will add significant costs to the price of electricity at a time when such pricing that may not be warranted or publicly supported. (LADWP1)

> **Response**: We selected a tiered structure for the reserve in order to have some warning about the increase in high prices. The Board has directed us to monitor the reserve and make recommendations for program revision. As prices rise and covered entities begin to access the reserve, we will have time to make such recommendations.
>
> Our economic analysis incorporated a rate of increase in marginal abatement costs of seven percent, without factoring in inflation. We propose to increase the reserve price by five percent, plus inflation each year, so that the reserve price continues to support direct reductions and offset investment as those become more expensive. At the same time, the reserve price will rise more slowly than the expected marginal abatement cost so that the reserve price does not make the program unnecessarily more expensive.
>
> Setting the reserve tier prices lower, as suggested in the comment, would clearly interfere with operation of the market. This would eliminate a main purpose of the market: to signal the cost of carbon abatement. Again, we have always intended the reserve to serve as a last-ditch buffer against unexpectedly high

prices. It is a temporary buffer intended to give use time to revise the program, not provide an absolute price guarantee.

D-81. Comment: PG&E supports the inclusion of the allowance price containment reserve in the Cap and Trade regulation and recommends that ARB monitor the potential for depletion of allowances. PG&E is concerned that the ability of the allowance reserve to mitigate allowance price volatility could be compromised by a shortage in the supply of offsets, faster than expected economic growth, reduced efficacy of the complementary measures, or unforeseen events such as a prolonged drought or an extended outage of one of California's nuclear units. To ensure that the allowance reserve remains adequate over time, PG&E recommends that ARB establish a formal review process that would include monitoring the allowance market for potential market failures or unsustainably high allowance prices, and develop a contingency plan that could be implemented should the allowance reserve approach low levels. PG&E supports:

- The inclusion of a cost containment mechanism focused on allowance prices, with a ceiling price for accessing the Allowance Price Containment Reserve and a reserve price as part of the quarterly auction.
- ARB's decision to establish an allowance reserve filled with allowances made available for sale at specified prices during direct quarterly sales.
- Their general usage restrictions, such as limiting the ability to purchase from the reserve to complying entities, and requiring these entities to immediately retire any allowances purchased from the allowance reserve to their compliance accounts.
- ARB's decision to increase the offset limit to account for the allowances removed from the market to fill the allowance reserve. (PGE1)

Response: The Board Resolution 10-42 instructed staff to monitor depletion of the reserve, determine the cause, and make recommendations for corrective actions. The resolution did not specifically include a contingency plan. Staff will be investigating a number of options in responding to this direction from the Board, including obtaining advice on how to monitor and modify the program with the help of a standing Market Surveillance Committee composed of academic experts.

D-82. (multiple comments)
Comment: PG&E recommends that ARB actively monitor the allowance market for the possible depletion of the reserve. PG&E recommends that ARB establish a contingency plan to address potential allowance price containment reserve depletion. PG&E recommends that ARB establish a plan that they would immediately implement in the event 50 percent of the allowances in the reserve have been purchased. PG&E's recommended plan is as follows:

- Use revenue from the sale of reserve allowances to refill the reserve with Reducing Emissions from Deforestation and Forest Degradation (REDD) offset credits; (PGE1)
- Make available additional and adequate supply to the market in a timely manner from an increase in the offset supply via an increased offset limit. To provide

adequate supply for this increased limit, ARB should adopt additional protocols and/or link to existing offset programs such as the Clean Development Mechanism (CDM), and linking with other cap and trade programs; (PGE1)

- In the event additional and adequate supply of compliance instruments is not immediately available, temporarily suspend the Cap and Trade program and the entities' associated compliance responsibility until additional and adequate supply becomes available; and (PGE1)
- If the above measures are not successful, ARB should adjust the overall allowance budget commensurate with higher than expected economic growth or electric demand, or lower-than-expected availability of offsets or lower-than-expected effectiveness of program measures. PG&E recommends the above corrective measures be taken to ensure an adequate quantity of compliance instruments is available and to avoid the potential for market failure. Additional supply may help to stabilize the cap and trade and related markets, such as the wholesale electric commodity market, and take pressure off the reserve. In the event adequate supply is not immediately available, suspension of the program and associated compliance responsibility will provide time for additional supply to be made available, and avoid price run-ups in wholesale electric commodity markets and other related markets. (PGE1)

Comment: There should be specifics on what market signals ARB will monitor in determining the amounts and timing of auctions/releases. (SOLARTURBINES1)

Comment: Accordingly, it's imperative that quarterly auctions and sales from the Allowance Price Containment Reserve Account (Reserve Account) are settled in a timely manner. The proposed regulation is also devoid of specific information regarding monitoring and tracking, which should be included. (NCPA1)

Comment: Program monitoring is incredibly important. We are encouraged by the provisions that were included in the resolution that provide for program monitoring. In particular, it's important to monitor the quantity of allowances in the reserve. The resolution directs staff to provide a report and recommendations to the Board when one of the tiers is depleted. We think ARB needs a more specific plan in place to take corrective action in a timely manner to protect the important cost containment feature of this reserve. (PGE2)

> **Response**: We believe it is important to have a comprehensive market-monitoring plan to detect fraud and prevent manipulation. We are working to create a market surveillance committee charged with such task. Monitoring, tracking, and any additional oversight are part of program implementation and are not included in this regulation.
>
> We agree that only covered entities should have access to the reserve. We disagree that the reserve should be refilled with any kind of offset credits, for two reasons. First, refilling the reserve will create a situation where all emissions reduction would come from offset projects. Second, refilling the reserve will

discourage covered entities from investing in energy improvements and technology innovation. Either scenario will incur an unfavorable result and tarnish the program's integrity.

The Board directed staff to monitor depletion of the reserve and develop recommendations to revise the cap-and-trade program if the reserve is depleted. While these recommendations could include changes to offsets use limits, changes to the cap, or other measures, the Board did not provide direction to include specific provisions, such as those recommended in the PGE comments.

Auction Requirements

D-83. (multiple comments)
Comment: Minimize unnecessary bureaucratic requirements

- Disclosure of unnecessary information will place significant unnecessary reporting burden (i.e. Time of transaction, time of settlement, price) [pg 107 (b)(3,4,5)]
- Reporting of transaction to ARB is unnecessary since it will be recorded on the registry [pg 108 (c')] (CCEEB1)

Response: Reporting transactions to the tracking system is how the market participants will report their transactions to ARB. We have revised the regulation to remove the requirement that the time of transactions is reported. We retained the requirement to report price because it is an essential element of market monitoring.

D-83.5 (multiple comments)
Comment: Finally, section 95913(c)(1)(B) provides that Covered Entities must have "no compliance instruments in their holding accounts or limited use holding accounts" in order to purchase allowances from the Reserve Account. The ISOR supports this limitation based on the notion that the Reserve Account be available to ensure "that compliance may be achieved at a reasonable cost." (ISOR, p. IX-87) We recommend that this limitation be revised to allow Covered Entities that hold offset instruments in their holding accounts to still purchase allowances from the Reserve Account due to the fact that the cost of offset projects can and should be distinguished. (NCPA1)

Comment: WPTF agrees with ARB's goal of ensuring that allowances purchased in the auction price reserve must be used for compliance. However, we believe that the requirement that covered entities must hold no compliance instruments in their holding accounts or limited use holding accounts is unnecessary and would limit the utility of the price reserve auction as a cost-containment mechanism. This requirement would require covered entities to 'pre-retire' all allowances, even those which have been purchased or banked for use in later years, to compliance accounts (or sell them off) to remove them from holding accounts. This outcome would greatly restrict the flexibility of covered entities to plan for compliance and respond to market conditions. Because allowances purchased from the reserve are placed directly into compliance accounts from which they cannot be further transferred, there is no need to additionally require that a covered entities' holding accounts are empty as a condition for participation in the auctions. Rules for access to the price reserve should not require entities to pre-retire all allowances. WPTF recommends that this requirement be removed from the regulation. (WPTF)

Comment: Covered entities should be allowed to purchase allowances from the allowance price containment reserve even if the entity has offset credits in its holding account. (OFFSETSWG1)

Comment: Modify section 95913(c)(1)(B) as follows:

> (B) Only covered entities (including opt-in covered entities) which hold no ~~compliance instruments~~ allowances in their holding accounts or limited use holding accounts may purchase allowances from the Allowance Price Containment Reserve. Covered entities may purchase allowances from the Allowance Price Containment Reserve regardless of whether they hold offset credits in their holding accounts or limited use holding accounts. (OFFSETSWG1)

Comment: The Utilities believe a covered entity should be allowed to hold offsets in their holding account and maintain access to the reserve. Modify section 95913 (Sale of Allowances from the Allowance Price Containment Reserve) as follows:

> *(c) Timing, Eligible participants, and Limitations.*
>
> *(1) Eligible participants*
>
> *(B) Only covered entities (including opt-in covered entities) which hold no allowances ~~compliance instruments~~ in their holding accounts or limited use holding accounts may purchase allowances from the Allowance Price Containment Reserve.* (MID1)

> **Response**: We agree with the comments, and the restrictions have been removed.

D-84. Comment: The proposed regulation should clarify CARB's position that Covered Entities are not subject to transaction fees for their purchases and sales in the auction, including all allowances that are consigned for auction from the Limited Use Holding Accounts. While the auction may be a revenue source for obtaining additional monies for implementation of the State's AB 32 programs, those revenues should not be raised from the mandatory participation of entities with a Compliance Obligations, but rather by third parties voluntarily participating in the auction. (NCPA1)

> **Response**: There are no transaction costs, registration fees, or consignment fees laid out in the regulation.

D-85. Comment: The Utilities are concerned that subsection 95912(e) lacks the necessary due process for allowing a bidder, after the Executive Officer has determined that they are in violation, to present information that may controvert or mitigate that determination. The Utilities suggest such a process be included in this section. (MID1)

Response: No provisions for due process were added to the regulation because ARB's process for investigating violations includes discussions with the entity where needed.

D-86. Comment: PG&E recommends that ARB include additional regulatory language detailing the design and implementation of the Cap and Trade auction to ensure efficient market functioning. The proposed regulation lacks sufficient detail concerning market systems, information systems and trading platforms for the primary auction market. ARB should provide additional details on the design and implementation of the proposed Cap and Trade auction. We recommend that ARB provide additional detail in the proposed regulation on auction design including the following: credit management process, default management process, definition of security and rating requirements, credit terms, revenue shortfall allocation, and settlements. In addition, we recommend that ARB address a number of questions, including: [NOTE: This comment refers to the following series of comments, through D-92.] (PGE1)

Response: The regulation sets out the rules that registered entities must follow, which in this case includes the bid guarantee and information submission for auction and reserve sale participation. Generally, administrative processes such as the ones listed are not included in the regulation beyond the specification of the rules themselves, and are considered part of program implementation.

D-87. Comment: a. Will ARB staff or a third party contractor administer the auctions? This issue needs to be resolved promptly to allow sufficient time to address credit requirements, default provisions, and other auction design details. (PGE1)

Response: This is part of program implementation and is also being addressed as part of WCI linkage. Regardless of the entity administering the program, the first auction is not until mid-2012. We believe there is sufficient time to resolve the questions raised by the commenter.

D-88. Comment: What specific credit, collateral and security requirements will be imposed on all parties in the quarterly auctions? (PGE1)

Response: The regulations will impose only the credit, collateral, and security requirements contained in section 95912(h).

D-89. Comment: c. How will ARB manage the credit process for each auction? How will ARB handle defaults? How will ARB perform settlements? (PGE1)

Response: The rules governing these processes are set out in sections 95912(h), 95912(k)(2), and 95912(k)(3), respectively. The exact communications needed to complete these processes are part of program operation, not the regulation, and will be published by the Executive Officer and the financial services administrator well in advance of any auction or Reserve sales.

D-90. Comment: What is the potential for market abuse or manipulation e.g. “cornering” or “squeezing,” in the quarterly auctions at the end of a three-year compliance period, when the allowance needs of covered entities are more defined? (PGE1)

Response: We consider the period around the triennial compliance deadlines as one of heightened risk of market manipulation. We have proposed several rule provisions to deal with the potential problem. Section 95921(e) prohibits specific trading practices that could be used to manipulate the market. The holding limit contained in section 95920 is designed to prevent an entity from holding sufficient allowances to be in a position to execute a “squeeze.” The purchase limit in section 95911(c) is intended to prevent an entity from concentrating its purchases at the end of a compliance period. Without this provision, an entity could potentially deprive covered entities of allowances while building up a supply of allowances to sell. A purchase limit could force speculative entities attempting to build a substantial position to spread their purchases over several auctions. This provides notice to covered entities that they must bid more competitively to secure the allowances they need in order to reduce the need to purchase on the secondary market. Finally, the regulation provides for the publication by ARB of market and auction data that will both protect the identity of those trading and provide market participants with data on price trends. This transparency will help covered entities understand the potential for market manipulation at any time.

D-91. Comment: PG&E recommends that ARB modify the proposed rule to address these and other critical auction design issues. This will ensure that the systems and resources are in place to support a fully tested and workable market. In addition, PG&E believes it is important to review how the primary auction market will interact with secondary bilateral markets. (PGE1)

Response: Many of these issues are part of program implementation and do not require regulatory text modifications. We will be closely monitoring the primary and secondary markets, along with any interactions between the two. We will be contracting with an independent market-monitoring service, as well as creating a Market Surveillance Committee of academic experts, to ensure ongoing evaluation of the efficiency of our market rules.

D-92. Comment: PG&E requests additional clarification on text related to auction design. Section 95814(a)(2)(A) would allow registration as a voluntarily associated entity to an entity that intends to purchase, hold, sell or voluntarily retire compliance instruments. However, section 95802(a)(207) defines a voluntarily associated entity more narrowly, as an entity that intends to voluntarily retire compliance instruments.

PG&E understands that ARB's intent is to use the definition in section 95814(a)(2)(A) and will correct the definition in section 95802 (a)(207) . (PGE1)

> **Response**: We agree with the comment and revised the definition of voluntarily associated entity in section 95802(a).

D-93. (multiple comments)
Comment: CARB staff proposes that free allowances in the first compliance period be followed by auctions in the second and third, with specific recommendations on percentage allowance allocations based on assigned leakage risks. An auction scheme for allowances will impose very high costs on regulated parties, which will, in turn, be passed through to the economy as a whole. Unless and until California has transitioned to a comprehensive national program with similar costs imposed on competitor states and nations an auction will fail and do untold harm to the State's economy. The regulation should be clear that auctions are not authorized until carbon trading reaches sufficient scale to reap its anticipated benefits and not decimate the state economy. When California is part of a broad national program with similar allowance allocation requirements, we can consider if an auction is appropriate and cost effective, but until that occurs, CIPA supports only free allowance distribution for all sectors for each compliance period up to 2020. (PLOTKIN)

Comment: An auction scheme for allowances will impose very high costs on the public agencies and companies subject to the program. For this and other reasons we have vigorously opposed any immediate auction for the first compliance period, and we have the same objection about later compliance periods if California has not by then transitioned to a comprehensive national program with similar costs imposed on competitor states and nations. Therefore, unless and until California is part of a broad national program with similar allowance allocation requirements, we support only free allowance distribution for all sectors for each compliance period up to 2020. (AB 32IG)

Comment: The proposed price floor is problematic without a corresponding price ceiling. The proposed regulation provides only a price floor known as the Auction Reserve Price, reasoning that the Allowance Reserve would provide a measure of cost containment and act as a price ceiling. This reasoning is faulty since allowances can be purchased over the Allowance Reserve prices. Though a rational market participant would not purchase allowances above the reserve price if allowances are available in the reserve, it is not clear that supply in the Allowance Reserve will be sufficient to meet market demand. Therefore, allowances may be sold and purchased at higher prices in quarterly auctions and secondary markets if and when the Allowance Reserve is depleted. A hard cap on GHG allowance prices would be a more effective cost containment measure. Absent such a cap and under the proposed structure, CARB cannot ensure that the legislature's concerns regarding cost containment will be addressed. (SCE1)

> **Response**: We do not consider the Allowance Price Containment Reserve to be a price ceiling. We rejected the idea of a hard price ceiling as inconsistent with a

market-based measure. We agree with the comment in that the reserve reduces upward pressures until it is exhausted, but staff also contends the effectiveness of the reserve diminishes once market participants believe it will be exhausted. We did not intend the reserve to completely eliminate price increases. Rather, the reserve provides some cost containment as the reserve was "funded" through an increase in the quantitative use limit for offsets from four percent to eight percent. We acknowledge that the reserve could be exhausted; a condition that we understand would require revision to the cap-and-trade program. The nature of these revisions would be subject to public comment and a Board consideration.

D-94. Comment: California learned the importance of a hard price ceiling from the energy markets during the California energy crisis. When buyers could benefit from higher prices, many engaged in aggressive bidding strategies, which resulted in extreme prices without actual supply shortages in the energy markets. These unreasonably high bids effectively withheld reasonably-priced supply from the markets. In that market, however, the incentive to push up prices was somewhat limited by the existence of hard price caps. Absent such price caps, California's energy crisis would have been far more severe, and economic disaster would have come much sooner. When FERC ultimately replaced these hard price caps with soft caps (similar to the even weaker price controls in CARB's cap and trade market design), it resulted in greater withholding of power, leading to shortages in the form of rolling blackouts. These shortages occurred even though the supply of power was more than adequate; it was simply withheld from the market. (SCE1)

Response: The electricity schemes described in the comment relied on the inability of the market to access reasonably priced generation due to congestion or due to withholding by the generators' operators. Since those two conditions occurred, price caps had some impact. In the carbon market, manipulators would have to find a similar way to prevent purchasers from accessing supplies of compliance instruments. The only way to do this would be to control a sufficient amount of instruments so that covered entities would have no choice but to purchase from them. These "pivotal" suppliers could then extract a higher price from covered entities that had not covered their emissions obligations.

ARB designed its holding limit to reduce the chance that any group of market participants could become pivotal suppliers. The holding limit in 2013 would limit a single entity to holding no more than about four percent of the allowances issued that year. ARB expects that this level would prevent an entity from becoming a pivotal supplier. Covered entities have a limited exemption from the limit to allow them to cover their emissions obligations. However, this exemption applies only to the allowances they place in their compliance accounts. Allowances cannot be removed from the compliance account, so these entities could not use their stockpiles of accumulated allowances to profit from a tight market. Once the covered entities cover their emissions obligations, they face the same holding limit as non-covered entities.

We believe that the holding limits will reduce the opportunity for the types of manipulation suggested in the comment. In addition, price caps are generally set very high in order to avoid distorting the price signal provided by the market. Thus, it would allow the exercise of market power until the manipulated price reaches the cap. Finally, the Allowance Price Containment Reserve is available to place a soft limit on price increases.

D-95. Comment: While allowance markets are not as vulnerable as electricity markets (since allowances can be stored more easily than electricity), the possibility for rampant abuses still remains due to the financial connection between GHG markets and electricity markets. If prices do reach intolerably high levels, then at least one of two preventable catastrophic outcomes will occur. First, the California economy could suffer undue economic harm, which is an unacceptable outcome. Second, excessive prices could undermine the very purpose of AB 32. A California-only program cannot adequately mitigate the climate change impacts of increased global GHG concentrations. What it can do is set an example of how to effectively and efficiently mitigate GHG at reasonable economic and social costs. If prices are allowed to reach excessively high levels, California's GHG regulation will be viewed as a failure and a deterrent to future GHG regulation. It has been over a decade since California's failed electricity market structure halted restructuring markets nationally, if not internationally. As discussed above, no U.S. state has restructured since that time. CARB's cap and trade design cannot allow such failure to occur. If a hard cap is not put in place, such failure may still be possible. (SCE1)

Response: We decided not to rely on hard price caps to prevent the manipulation of market prices for two reasons. First, price caps do not limit the exercise of market power until the caps are reached. Since a hard price cap could distort market price signals, the caps are generally set well above the range of expected prices. Second, the Allowance Price Containment Reserve provides a "soft" price ceiling. As long as the reserve contains sufficient allowances, it will dampen price increases below the tier prices. The Board has instructed staff to monitor depletion of the reserve and recommend corrective actions, including possible revision of the cap-and-trade program.

D-96. Comment: If no specific hard price cap is implemented, CARB must incorporate provisions in this cap and trade regulation allowing CARB to halt any quarterly auction to avoid excessively-priced GHG allowances that could cause irreversible harm to both the economy and the success of the GHG reduction program. (SCE1)

Response: We disagree with the comment. The presence of fixed-price tiers in the Allowance Price Containment Reserve will limit prices at the auction. The program will have a market monitor and market surveillance committee to identify any potential problems and recommend the specific actions the board should consider in response.

Allowance Reserve

D-97. Comment: Provide a discount for purchases of GHG allowances from the "allowance price containment reserve," which could extend to all sources identified in the "high risk" for leakage category. (SMITHS)

> **Response:** We disagree with this comment. We believe the direct allocations to covered entities are sufficient to address the leakage issue.

D-98. Comment: The proposed method of containing costs in the program is insufficient and will actually increase the prices of allowances. By moving 4 percent of allowances to the reserve at higher set prices, it will limit the supply to all and therefore increasing prices. Staff proposes to increase the offset allowances by 4 percent to 8 percent to compensate for the 4 percent being removed from the auction. It is our belief and one that we have shared at a workshop that the number of offsets available would not be expected to reach 4 percent of the allowances and therefore 8 percent would definitely not be available. So by trying to contain costs the program will remove a real 4 percent from the supply and compensate it with a 4 percent that is unlikely to be achieved because of the protocol standards. Real cost containment would be placing a cap on the price of emissions or increasing the total supply when high prices are reached. (AGCOALITION)

> **Response:** We disagree with the comment. We have expressed the concern that if market prices are too low then not enough offsets will be produced. However, the reserve only comes into play once market prices reach $40, and it continues to provide cost containment until the $50 tier is exhausted. At these market prices, we believe there will be enough offsets so that the quantitative use limit for offsets is a binding constraint. ARB estimates that there will be sufficient offset supply for the four offset protocols to meet offset needs for the first compliance period. We will also consider additional offset protocols to provide additional supply.

D-99. Comment: The ARB's proposed rule includes several provisions designed to help contain costs. These provisions are important not only for California, but for broader efforts to design effective climate policies. Given the political headwinds faced by climate policy in the U.S., ARB can provide valuable leadership by demonstrating that climate policy incorporating appropriate designs and safeguards can achieve important environmental benefits without undue risk to the economy. Design of an effective California cap and trade program can also go a long way to eliminating emerging misconceptions about the value of market-based mechanisms to achieving these goals. (ANALYSISGRP)

> **Response:** No response is needed.

D-100. Comment: Along with three-year compliance periods, allowance banking and the use of allowance offsets, ARB's proposed rule includes an Allowance Reserve

(“Reserve”) which is designed to help moderate allowance prices. The Reserve works, in effect, by increasing the supply of allowances when allowance prices rise to the level at which they can be purchased from the reserve (“Reserve trigger prices”). Accounting for forecast inflation, Reserve trigger prices will rise to $68, $76, and $85 per metric ton (MT) by 2020.

While the Reserve is likely to mitigate the potential for high allowance prices, its proposed design raises several concerns. First, the Reserve is stocked by increasing the cap’s stringency by 1 percent in the first Compliance Period, 4 percent in the second Compliance Period, and 7 percent in the third Compliance Period. These are significant increases in cap stringency, particularly in the third compliance period. While the limit on offset use has been relaxed so as to exactly equal the increased cap stringency, the proposed changes significantly increase reliance on offset markets. If offsets become a low-cost source of emission reductions, then the increased cap stringency may not raise costs appreciably. However, if offsets are either in short supply or are more costly than anticipated, then ARB’s proposed changes could actually raise costs, particularly (although not exclusively) during periods when allowances are below Reserve trigger prices. A Reserve design that relies less upon increasing cap stringency would reduce the risk that the Reserve raises, rather than contains, costs. (ANALYSISGRP)

> **Response**: We agree that the reserve will mitigate the potential for high allowance prices. However, we disagree with the comment that creating the reserve increases cap stringency, since we allow more offsets to be used for compliance approximately equal to the size of the reserve. If offsets take time to appear, or if they are more expensive than expected, then the means of funding the reserve could increase costs, but only slightly. Most of the reserve is funded through future vintage allowances. Only one percent of current vintage allowances are diverted to the reserve, but the offset use limit for the first compliance period is raised to eight percent. There would have to be a significant shortfall of offsets in the first period for the reserve to tighten the market. Even if a shortfall in offsets occurs and prices do rise, the reserve will not contribute to higher prices once the market price is high enough to cover offset project costs.

D-101. Comment: Second, the proposed Reserve does not completely eliminate the risk that allowance prices rise to unacceptably high levels. If the Reserve is exhausted, then allowance prices could rise well above the trigger prices established by ARB. In fact, as the Reserve becomes depleted, uncertainty about the risk of Reserve exhaustion and subsequent high allowance prices could lead to speculation that accelerates Reserve exhaustion. (ANALYSISGRP)

> **Response**: We agree with the comment, and the Board has directed staff to closely monitor depletion of the reserve. However, we have been clear that the reserve is not intended to serve as a hard price cap. Rather, the reserve serves to temporarily buffer unexpectedly high market prices until potential corrective actions can be taken.

D-102. (multiple comments)
Comment: ARB has alternatives available to address these concerns, many of which have been mentioned in prior comments. First, ARB could design the Reserve to hold a (roughly) constant, but smaller, quantity of allowances. To maintain a "steady-state" quantity of allowances, the Reserve could be replenished with additional allowances as it becomes depleted. One approach to replenishing the Reserve is to use revenues from the sale of Reserve allowances to purchase emission offsets. Another alternative for replenishing the Reserve is to borrow allowances from post-2020 commitments periods. Both of these alternatives can maintain environmental integrity of the policy.

By replenishing the Reserve so that it contains a (roughly) constant quantity of allowances at all times, the Reserve does not need to be initially stocked to provide cost containment for all contingencies over the period 2012 to 2020. Thus, replenishment allows a smaller Reserve to be maintained, which reduces the quantity of allowances that is required to initially stock the Reserve. Compared to ARB's proposed Reserve, this approach provides two advantages. First, it provides a sufficient supply of allowances to address all market contingencies, and, second, it avoids the need to significantly increase the stringency of emission targets in order to stock the Reserve. (ANALYSISGRP)

Comment: In addition to incorporating mechanisms that replenish the Reserve, ARB could also employ alternative approaches to initially stocking the Reserve. For example, ARB could initially fill the Reserve with a mix of allowances from under the cap and offsets. Allowances from under the cap could be used to initially stock a smaller Reserve than is proposed by ARB, and the Reserve could be gradually expanded through offset purchases. (ANALYSISGRP)

Comment: The proposed regulation will exacerbate price volatility, both by discouraging banking and by encouraging any firms that have maintained banks to sell those allowances en masse when prices are high in order to gain access to the reserve. (While such a sell-off might help bring prices down, it will do so in a much less controlled and much more volatile fashion than if banking were encouraged in the first place). EDF therefore recommends against requiring zero allowances in holding accounts before accessing the allowance reserve. (EDF1)

> **Response**: The Reserve is not intended to "completely eliminate the risk that allowance prices rise to unacceptably high levels" as the comment asserts. We have been clear that there is no "hard price cap" in the program. We rejected that approach as leading to interference with market price signals. We created the reserve to serve as a buffer against higher prices. The Board has directed staff to monitor depletion of the reserve and make recommendations for program revision as needed.
>
> We did not accept the proposal for replenishment of the reserve with offsets for two reasons. First, we do not have the authority to use auction revenue to

purchase offsets. Second, this would make us a market participant, complicating our role as operator of the market.

We cannot replenish the reserve with allowances without tightening the cap.

D-103. Comment: As a further precaution against regulated entities effectively using the reserve to build up allowance banks, the regulation could deny access to the reserve to a regulated entity within 90 days of selling an allowance. (EDF1)

First, reserve allowances should be valid only for the compliance period in which they are issued. Second regulated entities should be denied access to the reserve in any compliance period in which they increase the number of allowances in their holding accounts (i.e., add to their allowance bank). This approach will not only prevent a regulated entity from buying reserve allowances and banking them, but also from buying reserve allowances and effectively substituting them for regular allowances which it could then bank. (EDF1)

Response: We disagree with the comment. Denying access to the reserve because of a recent sale by an entity could prevent the entity from responding to changing market conditions. We also disagree with the notion that entities will sell into the market above the tier prices, then buy from the tiers. It is not clear why the purchaser in the secondary market transaction wouldn't simply wait for a reserve sale. Finally, since the reserve is funded mostly with future vintage allowances, we cannot prevent the use of the reserve allowances for current compliance and still maintain cost containment.

D-104. Comment: LADWP strongly supports policies that have been incorporated into the proposed regulation intended to help contain compliance costs, including an allowance reserve. (LADWP1)

Response: No response needed.

D-105. Comment: The prices of the allowance reserve tiers should be more closely tied to actual market allowance prices. If properly designed, the allowance reserve can play an important role in containing costs in the cap and trade system. However, the price of allowances in the various reserve tiers is far too high, especially given CARB's estimate of allowances prices of $10 in 2012 and $20 in 2020. (BP)

Response: We agree that the reserve tier prices are above the prices staff expects to prevail in the market through 2020. However, the purpose of the reserve is to reduce price increases outside of the expected range of prices and not to dampen the price signal that is a main objective of the cap-and-trade program. The Reserve is intended to serve as both a last resort source of allowances and as an indicator that the cap-and-trade system has not potentially functioned as intended. We chose a fixed-price purchase format as opposed to a reserve auction in order to ensure the reserve allowances would be available at a known price. Behind this approach is the assumption that a drawdown of the reserve would be an indication that we may have underestimated the cost of cap-and-trade.

Miscellaneous

D-106. Comment: We agree with CARB's proposal to auction allowances required for the carbon content of transportation fuels delivered to end-users when they are brought into the cap in 2015. (ICCT1, ICCT2)

Response: No response is needed.

D-107. Comment: Section 95912(d)(1)(A) (p. A-91) prohibits entities from publicly releasing their "qualification status." This term is not defined. In order to avoid inadvertent breaches of this requirement due to entities not being aware of what information not to release, "qualification status" should be defined in the Cap and Trade Regulation. (SCPPA1)

Response: The text is in a section that discusses the requirements for participation in the auction, which includes approval by the Executive Officer of an auction registration application pursuant to section 95912. In this context the meaning of the term is clear.

D-108. Comment: SCE suggests that CARB seek out an independent, professional evaluation of its auction design to limit the potential for what could be drastic, unforeseen consequences. (SCE1)

Response: We have received comments from academic experts who have provided staff with numerous suggestions for improvements, such as more frequent auctions and double-sided auctions in which participants can bid to buy or sell. We are considering these options for future modifications.

E. COMPLIANCE OBLIGATION/COMPLIANCE CYCLE

This section includes comments and responses about applicability of the regulation (sections 95810–95814 of the regulation), details about compliance instruments (i.e., allowances and offset credits; sections 95820 and 95821), and compliance requirements for covered entities (sections 95850–95856). Major sub-topics include point of regulation, surrender and retirement of compliance instruments, compliance periods, recordkeeping and reporting, the treatment of municipal solid waste, and waste-water. We also discuss compliance obligations related to military facilities in this section.

Applicability

E-1. Comment: Anrafi Associates recommends that CARB revise its proposal of imposing charges for omissions or requiring offset use, to apply such appropriate provisions only to those designated major greenhouse gas business emitters who have not installed reasonable available control technology on their existing operations or best available control technology on their new operations. In other words, no charges for emissions or requirements for offset use should be imposed on businesses that are implementing cost effective reasonable and best CARB-controlled technologies. The advantage of this approach is that it would not penalize such designated businesses with added cost burdens if they have timely installed the appropriate technologies established by CARB. (ANRAFIASSOC)

> **Response:** We are implementing the cap-and-trade regulation to impose an economy-wide limit on GHG emissions, which no other regulation currently does. The requirement to use best available control technologies would not ensure that the 2020 GHG emissions level required by AB 32 is met. Under the regulation, a covered facility must surrender compliance instruments to cover its on-site emissions. If a facility has advanced control technology, it may benefit by reducing its compliance obligation or by receiving free allocations if it is an industrial facility eligible for industry assistance.

E-2. Comment: No provisions in the Draft Final Rule are made for existing facilities who are new program participants due to recent emission increases that occurred since 2009. With operating changes in 2010, Dow Pittsburg will be reporting for emissions to the ARB in 2011 for the first time and will be a new participant in the cap and trade program. ARB should provide definition and clarification for existing facilities that are now subject to the proposed program. (DOWCHEM1, DOWCHEM2, DOWCHEM3)

> **Response:** We will notify facilities that are required to report under the Mandatory Reporting Regulation (MRR) before the reporting deadline. Subsequently, the emissions that facilities report will be used to determine whether the cap-and-trade program covers that entity, and whether that entity has a compliance obligation. Section 95812 now includes mandatory reporting

data in 2011 as part of the information used to determine a facility's inclusion in cap-and-trade.

Military

E-3. (multiple comments)
Comment: Given the unique nature of the military mission, the potential disruption of military operations, the fiscal law restraints on federal agency purchases of Compliance Instruments, the limited availability of offsets, and the failure to analyze the impact on federal funding, DoD requests that the proposed regulations be modified to add the following exception:

New Section 95815. Military Facilities:
Military facilities that qualify as a "covered entity" pursuant to Section 95811 and that generate greater than 25,000 $MTCO_2e$ per year are exempt from this regulation until such time as the U.S. Congress authorizes federal expenditures to participate in a state greenhouse gas cap and trade program. (USDOD1)

Comment: In case of conflict or national security operations, DoD installations may experience rapid changes in activity levels, including increased energy and fuel use. These changes in activity level would be beyond the control of the individual installations or groups and may be sustained for significant periods of time. We would like to discuss options for special consideration for these periods, including linking surge with DoD's ability to reach back before 31 December, 2006, for military-generated offsets, as discussed above. Another option is providing a temporary exemption for these surge periods from compliance with the cap and trade program. Our goal is to avoid a situation where the cap and trade mandates conflict with mission requirements. (USDOD1)

Comment: Federal government must comply with acquisition requirements. The FAR provides an expansive set of controls governing the federal government's purchase of goods and service in the open market. There are mandates on ensuring open and fair competition. These regulations may limit the federal government's ability to participate in the auction to purchase Compliance Instruments. Since this is the primary mechanism to comply with a mandatory GHG emissions cap, federal agencies may be significantly disadvantaged in their compliance efforts. In the absence of specific Congressional authorization federal agencies may be barred from participating in the program outside of the FAR mandates. The timing and likelihood of Congressional approval is currently unknown. (USDOD1)

Comment: Supreme Court Justice Steven Breyer has noted, "The concerns that led to the development of this case law, such as fears of unjustified raids on the federal treasury by states or attempts by states to discourage federal activity within their borders, would seem applicable in the present context." Maine v. Navy, 973 F.2d 1007, (1st Cir. 1992)(Breyer, C.J.)(citing McCulloch v. Maryland, 17 U.S. (4 Wheat.) 316, 426-27, 4 L.Ed. 579 (1819); Public Util. Comm'n v. United States, 355 U.S. 534, 543-44, 78

S.Ct. 446, 452-53, 2 L.Ed.2d 470 (1958). The DoD applauds the portions of the proposed C&T rulemaking that require the use of revenues generated by the program to be used in ways similar in purpose to the program's goals. However, we would be remiss if we did not take note of anecdotes of similar programs where funds have been spent in ways inconsistent with the general welfare of the federal taxpayer.

For example, "In just over two years, the (Regional Greenhouse Gas Initiative (RGGI)) has generated more than $729 million for the 10 states that have participated. Each state is supposed to use its share of the money raised to invest in renewable energy and to promote energy efficiency and consumer benefits, like programs that help low-income electricity customers pay their utility bills. But the money is proving too much of a temptation for states not to use [as] a convenient pool of money that can be drawn on to help balance state budgets. Critics say that diverting money from the fund for general spending, instead of using it on emissions control and energy savings, makes the initiative little more than a hidden tax on electricity." Mireya Navvaro, States Diverting Money From Climate Initiative, N.Y. Times, November 28, 2010 (USDOD1)

Comment: The DoD concerns reflect the discussions around AB 1405 (2010), which would have earmarked a substantial portion of cap and trade revenues to fund a wide range of social-based programs provided by non-governmental organizations (NGOs). Although Governor Schwarzenegger vetoed this bill, a public discussion of the ARB 2010 Legislative Report revealed that both NGOs and ARB Board members thought that despite the fate of the legislation, ARB had the authority and willingness to implement these social programs. While these publicly funded NGO programs may not be a part of the current proposal, DoD must view this proposal through that history. If revenues from the auction of Compliance Instrument are earmarked for these social programs, then federal agencies may be barred on constitutional grounds from participating in a primary method of compliance. (USDOD1, USDOD2)

Comment: There is yet another fiscal law issue in that to the extent the military is put in a position of selling instruments on the open market, and receives a surplus from the sale of that trading allowance, the military may be illegally augmenting its federal budget. The DoD may not accept allowances from the ARB as that term is defined in the proposed regulation due to the augmentation rule. "The (augmentation) rule is that a government agency may not accept for its own use (i.e., for retention by the agency or credit to its own appropriations) gifts of money or other property in the absence of specific statutory authority. 16 Comp. Gen. 911 (1937)." U.S. Government Accountability Office, Office of General Counsel, Principles of Federal Appropriations Law, (The Red Book) 3d ed., Vol. II, p. 6-222. "As the Comptroller General (has) said, '[w]hen the Congress has considered desirable the receipt of donations...it has generally made specific provision therefore ....' Id. at 6-223 (citing 16 Comp. Gen. 911, 912; See also B-286182, Jan. 11, 2001; B-289903, Mar. 4, 2002 (nondecision letter)). Thus, acceptance of a gift of money or other property by an agency lacking statutory authority to do so is an improper augmentation.

The following discussion from the Comptroller General summarizes the illegal augmentation theory:

Although there is no express statutory prohibition against augmentation of appropriated funds, the theory, propounded by the accounting officers of the Government since the earliest days of our Nation, is designed to implement the Constitutional prerogative of the Congress to exercise the power of the purse; that is, to restrict executive spending to the amounts appropriated by the Congress. See e.g. 9 COMP.DEC. 174(1902).

Several implementing statutes further assure that agencies do not accept additional monies from sources other than the Congress itself. For example,18 U.S.C. 209 prohibits acceptance of any salary payment or other compensation for a Government employee from any source outside the Government. Funds may not even be transferred between separate Government appropriations without specific statutory authority. 31 U.S.C. 1532. Contributions or donations from outside sources are made to Government agencies, in the absence of statutory authority to retain them, they must be deposited promptly in the general fund of the Treasury. 31 U.S.C. 3302. Violations of any of the above statutes constitute an illegal "augmentation of the agency's appropriation and the funds must be disgorged and returned to the Treasury so that they can be appropriated as the Congress sees fit.

Matter of: FCC Acceptance of Rent Free Space and Services at Expositions and Trade Shows, June 28, 1984, B-210620, 63 COMP.GEN. 459.

Determining whether C&T revenues make the program subject to the illegal augmentation rule requires consideration of several factors. Among those factors include the purpose of the appropriation, the amount of discretion in the uses of the funds and the nature of the augmentation itself, whether cash or value in-kind.

Applying those factors to the proposed C&T rulemaking, ARB Staff Report: ISOR PROPOSED REGULATION TO IMPLEMENT THE CALIFORNIA CAP- AND-TRADE PROGRAM, Volume II, Appendix D, states: "The value of the allowances is represented by the money paid to the State, which would then have the opportunity to use the revenue for public benefit."(D-20) "Allowance value can be used in many ways, including use for the public benefit or to ease the cost of regulation."(D-22) "Regulating greenhouse gas emissions will probably stimulate economic growth in some sectors and may slow growth in others. Worker training programs funded with allowance value can help Californians shift jobs if necessary."(D-22) The allowances were clearly designed in consideration of both economic value to the position holder and accomplishment of the regulatory goal, GHG reduction. The economics of the program distinguish C&T from a traditional air pollution control or abatement program. Considered in tandem with the legislative histories of AB 1405, Proposition 26 and the 3 parts of the Massachusetts test outlined above, the problems of DoD participation are evident. (USDOD1, USDOD2)

Comment: California Government Code section11346.5(6) requires the notice of proposed adoption to include "an estimate [of] the cost or savings to any state agency, [other] nondiscretionary costs imposed on local agencies, and the cost or savings in federal funding to the state." The term 'federal funding' is interpreted broadly and it includes the addition or subtraction of federal programs within the state. According to California Government Code section 11349.1, "The (Office of Administrative Law) shall return any regulation (where) the adopting agency has not prepared the estimate required by (section 11346.5(6)) and has not included the data used and calculations made and the summary report of the estimate in the file of the rulemaking." (For rules governing the preparation of this statement, see California Code sections13000 et seq. (Department of Finance)). There is no analysis in the Initial Statement of Reasons on the economic impact of this regulation upon the agencies of the federal government. Absent this analysis, OAL must return this regulation to ARB under state law. (USDOD1)

Comment: We have had meaningful discussion regarding the unique, world-wide reach of California's DoD installations, as well as the breadth of the services provided to the service members on base, analogous to municipal jurisdictions. Consistent with this viewpoint, ARB discussed an exception for military base operations in the preamble to the California mandatory GHG reporting regulation:

> “Another exception to the traditional facility definition is military bases. Some military bases are spread over many thousands of acres and encompass a wide variety of activities such as employee housing, medical facilities, airfield operations, aircraft repair, ship construction and repair, and other operations. Each of these operations could also be under the operational control of different branches of the military or military contractors within the confines of a base. ARB staff has thus provided the option for a military base to subdivide the base for reporting purposes into independent functional groupings, based on the types of operations performed on the bases. Through this mechanism, each base would not necessarily have to report as a single facility, but could subdivide based on “operational control"' (defined in the regulation), and on major functional groupings such as aircraft repair and overhaul or ship construction and repair operations. As with traditional "facilities," only those GHG sources specified within the proposed regulation would be reported, while unspecified sources such as residential heating and cooling would not be included.”

Based on this rationale, ARB's mandatory reporting regulation definition of "facility" states that operators of military installations may classify such installations as more than a single facility based on distinct and independent functional groupings within contiguous military properties. We would therefore request consistent treatment of DoD's military installations in the California cap and trade regulation. This avoids a scenario where a single power plant on a city-sized military installation results in the entire operations of the installation being subject to cap and trade requirements. We do not believe such an outcome would be consistent with how municipalities are being treated under ARB's final GHG reporting rule and under the preliminary draft cap and trade rule, and as such may be outside of the federal waiver of sovereign immunity. (USDOD1)

Comment: We are concerned that routine movement of fuel from a ship to shore, or from shore to ship or one of our island facilities could trigger cap and trade requirements. Our interpretation of this preliminary draft regulation is that the proper application is when fuel is purchased within California from a supplier who would be subject to compliance. Other movement of fuels, as part of the military mission function, should not be subject to regulation that could impact our mission needs and flexibility. Therefore, we would ask that fuel movements on behalf of the United States military or for military purposes be exempted from these requirements. (USDOD1)

Comment: The inclusion of a major new sector of Fuel Suppliers in 2015 requires additional analysis that we have not completed. It goes without saying that the ability to supply fuel to our major installations in CA, much of which is transported and combusted outside of CA, is an instrumental part of DoD's world-wide operational mission. We ask that you work with us to ensure that this aspect of our mission is not covered by this regulation. (USDOD1, USDOD2)

Comment: Other specialized fuels, which are moved on behalf of the United States military or for military purposes, are not part of the transportation sector. We request that the regulation provide a exemption to avoid ambiguity. We note that addressing the DoD fuel movements in this manner would be consistent with the EPA's Mandatory Greenhouse Gas Reporting Rule (MRR) in Title 40 of the Code of Federal Regulations Part 98 at section 98.6. (USDOD1)

Comment: The treatment of transportation fuels raises an issue for DoD in California. While the current proposal onIy includes gasoline and diesel, placeholders exist for other transportation fuels. At least one DoD installation has a production facility creating biodiesel fuel from waste cooking oil and others are being considered. DoD would like to know if/how such production would be treated. DoD would not believe it appropriate to '"penalize"' a facility that produces biofuel from non-foodstocks. (USDOD1)

Comment: We wish to express our support for the three-year compliance periods to enhance compliance options and flexibility with this very new program. Facilities will need to develop complex compliance strategies to comply with this regulation and the three-year window in which to implement the strategy will provide facilities the flexibility needed to do so while still meeting national security demands. As pointed out earlier, DoD's mission requirements can quickly change in response to world events. It is imperative that we retain the maximum flexibility for compliance. (USDOD1)

Comment: A significant means to comply with mandatory GHG emissions is to participate in the "trading" portion of the C&T program, and to obtain Compliance Instruments at auction or in the anticipated market. These innovative and precedential compliance mandates raise issues not previously addressed. An initial analysis, based on the information provided to date, indicates that federal fiscal law constraints may prohibit federal agencies from obtaining the Instruments in those ways. (USDOD1, USDOD2)

Comment: The Supremacy Clause of the U.S. Constitution also prohibits states taxing the federal government. Further, the federal agencies can only pay a state "fee," if the charge is in accord with well-established U.S. Supreme Court precedent (see U.S. v Massachusetts, 435 US 444 (1978)), and U.S. Government Accountability Office (GAO) opinions. Federal agency acquisition of goods and services must also comply with the Federal Acquisition Regulation (FAR). The application of these authorities to the purchase of Compliance Instruments in the GHG cap and trade program presents a number of concerns. DoD will require additional time to review the proposed program, especially since the ARB staff report states that additional modifications are anticipated. (USDOD1)

Comment: State revenues generated must approximate costs of the GHG program. The ARB Staff Report discusses that Compliance Instrument auctions may result in revenues to the state and that revenues may be expended by providing rebates to electricity rate payers or by investing in the "green" economy to stimulate research and jobs. If revenues in excess of program costs are generated, federal agencies may be barred by federal law from participation in the purchase of Compliance Instruments at auction. (USDOD1)

Comment: Federal government must receive benefits commensurate with the amounts paid. The revenue generated in an auction also may be reinvested for the "public benefit." The benefits to the public at large are usually paid for by taxes, and the State cannot tax the federal government. If the distribution of the amounts paid by federal agencies for Compliance Instruments does not result in commensurate benefits, then they may be barred from participation in the auctions. (USDOD1)

Comment: The Cap and Trade Program will initially apply to one facility in the Marine Corps at 29 Palms. If the draft program were implemented, the facility might have to choose to reduce its electricity generation in order to avoid compliance obligation. And that puts us in the path of the legal problem my colleague mentioned about not being able to purchase allocations. Based on these concerns as well as those stated by the DoD representative, we hope that you recognize the unique role of the federal military and support our request for an exemption from the program. (MCIW)

Comment: Many of the DoD's energy reduction initiatives emanating from the federal requirements referenced above will meet the formal "offsets" criteria and will be an important part of the DoD compliance strategy. Consider, for example, the Navy installation of San Clemente Island, which is not on the power grid; therefore, all power generated comes from liquid fossil fuels barged from the mainland. There is no other way to access "green power." In recognition of the impacts from this energy transfer. the Navy implemented an alternative energy project on San Clemente Island in 1998 comprising 675 KW of wind power, which supplies up to 15 percent of the island's power. We have asked for recognition of these efforts throughout the AB 32 implementation process and continue to do so today. Given the variability of the DoD mission and changing national security needs, we are particularly concerned about requirements for offsets should a "surge" occur due to training/mission needs. For this reason, we seek to ensure recognition of our past efforts. (USDOD1)

Comment: DoD has facilities through the country and the world and must manage these in a constantly changing environment. For this reason, we request that CA 's cap and trade offsets include the widest geographic coverage. For example, if we seek to bring a new mission to California that would increase a cap we would want to have the opportunity to use reductions from elsewhere, e.g. the facility where the mission is coming from or other offset projects. (USDOD1)

Comment: Currently the offset market is narrowly limited to the four following protocols: 1. Urban Forest Projects, 2. Ozone Depleting Substances Projects, 3. Livestock Manure (Digester) Projects, and 4. U.S. Forest Projects. The military is concerned that its inability to purchase Compliance Instruments requires us to generate our own offsets to comply with this regulation. As explained above, the federal government has for years taken actions to reduce its energy use and GHG footprint. These reductions are regularly monitored with executive level oversight at CEQ and OMB, both agencies independent of DoD, charged with implementing these initiatives. To the extent that the military is subject to the Cap-and- trade program, we recommend that the Executive Officer, in his authority within Sub article 13, Sections 95970-95973, approve federally mandated protocols for offsets. These federal reductions will meet regulatory criteria for offsets outlined in Section 95972 for protocols, i.e., accurate accounting, data collection and monitoring, project baseline, and ensuring the reductions are permanent. The proposed capture of offsets is overly restrictive in this current draft, and should be expanded to recognize federal reduction offset protocols. (USDOD1)

Comment: In accordance with ARB's approved "Policy Statement on Voluntary Early Actions to Reduce Greenhouse Gas Emissions," we recommend that ARB consider moving the date for Offset Project Eligibility (page 64 of the PDR) from 31 December, 2006 back in time, to allow for recognition of significant projects such as the Navy's 1998 installation of wind turbines on San Clemente Island. As we understand ARB's rationale for the 31 December 2006 cut off, it corresponds to the date of implementation of AB 32. DoD installations in California have implemented many high quality projects that could be considered as offset credits in the California Cap and Trade market. Setting a date at 3I December 1997 will allow some of these projects to be eligible for offset credit generation and will reward the early actors in accordance with ARB's policy. An earlier offset project eligibility date is more in line with the legislatively mandated baseline year of 1990 and will allow consideration of renewable energy projects which take many years to implement. (USDOD1)

Comment: As we have discussed in our comments on the mandatory reporting rule, DoD is subject to unique requirements that pose issues for verification through third parties. We appreciate the inclusion of local air districts in the verification and support continued utilization of local air districts in the verification process of offsets. (USDOD1)

> **Response:** After further consideration of military concerns, we agreed to exempt military facilities from this regulation for one year while other regulatory options are further explored. The military exemption was part of the second 15-day changes to the regulation. We will coordinate with the military to better understand their written concerns and implications for national security. Any alternative direct regulations will be designed to ensure the military also reduces its GHGs as other facilities are required to do under the cap-and-trade program.
>
> In addition, Board Resolution 11-32 directed the Executive Officer to partner with the air quality management districts and air pollution control districts in the implementation of the cap-and-trade regulation, including, but not limited to, an evaluation of the impacts of the cap-and-trade program on industrial source greenhouse gas permitting and implementation of the Adaptive Management Plan. The Board further directed the Executive Officer to report back periodically to the Board on the nature and extent of this partnership, with the first report due in the first quarter of calendar year 2012.

CO_2 Suppliers

E-4. (multiple comments)
Comment: Only CO_2 producers, not CO_2 suppliers, should be covered entities. At its carbon dioxide plants, Praxair obtains certain refinery gas streams rich in CO_2 and purifies them into carbon dioxide which can be used in many processes like food freezing and beer carbonation. Praxair does not produce the carbon dioxide it processes. If Praxair did not take and purify the refinery gas streams, they would be emitted at the refinery as a waste gas.

Section 95811(g) provides that suppliers of carbon dioxide are covered entities. A "supplier" is defined in section 95802 as "a producer, importer, or exporter of a fossil fuel or an industrial greenhouse gas." As a result of this proposed definition it appears that CARB would subject a number of entities along the supply chain to a compliance obligation, including not only Praxair as a purifier and distributor of CO_2 to its customers (but not as a producer of CO_2) but also its customers. Carbon dioxide producers alone, as the generators of the raw CO_2, should bear sole responsibility for CO_2 controls, and not those entities recycling and distributing the CO_2. Subjecting multiple entities in the same supply chain is simply unfair and economically onerous on CO_2 recyclers, distributors, and their customers. Imposition of additional compliance obligations for distribution-related activities may threaten Praxair's continued CO_2 supplier operations within the state. Carbon dioxide suppliers do not create the raw CO_2 that they purify and render into usable products for consumer and commercial use the producers do; therefore, producers should solely bear the costs of such production and subsequent users of the raw CO_2 should be exempted from this Proposed Rule.

CARB has acknowledged that raw/waste gas CO_2 purchased, purified, and sold by CO_2 suppliers is produced primarily by petroleum refineries. Application of compliance obligations solely on the producers of this CO_2 is entirely consistent with CARB's identification of other covered entities in section 95811, e.g., lime manufacturers, cement manufacturers, petroleum refineries, iron and steel mills, and many others that produce CO_2 as waste emissions from their manufacturing operations. Moreover, imposition of compliance obligations on CO_2 suppliers is inconsistent with the U.S. Environmental Protection Agency's (EPA) comprehensive regulatory scheme requiring both the mandatory reporting of GHG emissions and, separately, controls of such GHG emissions. EPA's rules fairly and appropriately provide that the producers or manufacturers of raw/waste gas CO_2 bear the sole responsibility and liability for monitoring and controlling such CO_2 emissions. Even CARB's Mandatory Reporting Regulation is consistent with the federal reporting scheme, providing that only suppliers of carbon dioxide that are included in 40 CFR Sec. 98.2 are required to report under the Mandatory Reporting Rule (section 95101(a)(1)(B)).

Imposition of these proposed compliance obligations will encourage substantial leakage as well, encouraging out-of-state CO_2 suppliers to import into California just enough quantities of CO_2 to fall below the 25,000 metric ton/year threshold and avoid the burdensome costs imposed on in-state suppliers to acquire allowances, potentially undercutting in-state businesses such as Praxair's. CARB staff recognized, in our recent meeting, the distinction between production and the suppliers' role in distribution, and conceptually agreed that only one entity in the supply chain should be subject to the compliance obligation. Praxair looks forward to continuing discussions with Staff to improve the Proposed Rule in this regard.

However, should CARB determine not to exempt such CO_2 suppliers, then CARB should allocate free allowances to such suppliers in recognition of leakage risk and to avoid substantial adverse economic harm to CO_2 suppliers. Moreover, such industry assistance might enhance innovative use of CO_2 for positive environmental and sustainability purposes (e.g., use of CO_2 as a refrigerant versus environmental damaging alternatives such as ammonia, ozone depleting substances, or other chemicals with higher GHG warming potentials and longer atmospheric persistence). (PRAXAIR)

Comment: CARB should not impose a compliance obligation on CO_2 suppliers unless there are net imports greater than 25,000 metric tons of CO_2e annually. Section 95852(g) provides that "[A]n entity that supplies carbon dioxide covered under section 95811(g) has an aggregated compliance obligation based on the sum of imported and exported quantities of CO_2."

Praxair transports CO_2 product in and out of California, mostly by CO_2 trailers and railcars as a normal course of business. This movement across state borders allows for the most efficient utilization of our capital and resources, enabling lower costs to supply and lower prices to customers. For example, it may be more efficient and cost-effective to import CO_2 from Oregon to supply northern California customers while exporting CO_2 from southern California to supply Arizona customers.

As written, the proposed regulation would penalize a company for making these types of cross border shipments by requiring the purchase of allowances for both the imports and the exports. This would have the unintended impact of increasing CO_2 trailer delivery miles to avoid cross-border movement, resulting in higher costs to Praxair and other CO_2 suppliers as well as higher overall carbon footprint due to incremental transportation activities.

Praxair has two CO_2 production plants in California. At both of these plants, the raw/waste gas CO_2 purchased is produced as an off-gas by a neighboring petroleum refinery and sold to Praxair for recycling and purification prior to resale of the CO_2 to wholesale and retail customers. These producers have compliance obligations for this CO_2 as covered entities. If Praxair exports the CO_2 outside of California, however, Praxair would then have a compliance obligation because this material is being exported. The effect of this export is a double counting of the CO_2 molecules and thus a double compliance obligation—the first obligation falling on the producer and the second obligation falling on the supplier. Imposing such additional costs is arbitrary and unreasonable.

This also places Praxair at a competitive economic disadvantage, with respect to product CO_2 being produced in California, with CO_2 that is sourced from other states' markets, resulting in leakage.

Another real life example of leakage that can occur if exports are required to have allowances is as follows. A few years ago Praxair was involved with a promising CO_2 reduction project in which CO_2 recycled from a refinery was shipped out-of-state to a customer that previously generated their own CO_2 from an on-site lime kiln operation. By changing from CO_2 production to purchase of recycled and purified refinery off-gas, this project resulted in a "net" CO_2 emissions reduction. If under the Proposed Rule this exported CO_2 would now be subject to a compliance burden, there is a strong likelihood that the economics of this transaction will erode, and the customer will revert to producing their own CO_2.

We encourage CARB to provide in the final regulation that exported CO_2 that has already been subject to regulatory coverage as produced CO_2 (e.g., petroleum refining as a CO_2 producer) should be excluded from a CO_2 supplier's determination of its aggregated compliance obligation. This approach is consistent with the concept that only one entity in the chain of custody should be subject to the compliance obligation. Should a supplier's net imports exceed the threshold for reporting—and the CO_2 was not already subject to an upstream compliance obligation—only then should such a supplier be subject to a compliance obligation for such imported CO_2. (PRAXAIR)

Response: We modified the compliance obligation for CO_2 suppliers to include only in-state production or extraction of CO_2 for supply to commercial applications or for geological sequestration. The threshold remains 25,000 metric tons CO_2 per year. We modified the regulation to exclude exported CO_2 from a CO_2 supplier's compliance obligation unless it is being exported for use in geologic sequestration, as we do not want to incentivize out-of-state geologic sequestration without rigorous assurance that the CO_2 will remain permanently stored underground. We further modified the regulation to exclude CO_2 imports from a compliance obligation, as we assume that imports are relatively small, and those imports would need free allocations to ensure similar treatment as in-state production of supplied CO_2. Instead of providing free allocation of allowances for a relatively small amount of CO_2, we chose to monitor imports; if CO_2 imports increase, ARB will reassess its treatment of imported CO_2.

Fuels

E-5. Comment: We believe that the treatment of fuels under the cap in 2015 will place an unreasonable burden on producers and/or consumers of those fuels in California. We encourage CARB to reconsider placing fuels under the Cap as they are already covered by a host of other regulations (Federal RFSII, LCFS, Pavely, etc). (TESORO)

Response: The cap-and-trade regulation establishes a declining limit (cap) on 85 percent of statewide GHG emissions, including fuels. The declining cap established in the regulation ensures that all necessary reductions occur to meet the 2020 target. We believe an economy-wide cap with a broad market is the best way to help meet that target.

E-6. Comment: ATA supports ARB's decision to maintain a phase-in approach for the incorporation of transportation fuels during the second compliance period in 2015 as opposed to requiring compliance for all sources beginning in 2012. The phase-in approach allows for the smoother implementation of a complex regulation, while also allowing additional time for harmonization with regulations in other jurisdictions, especially given the interstate nature of transportation fuel consumption and associated emissions. (ATAA)

Response: No response necessary.

E-7. Comment: The BMW Group supports the implementation of a Cap and Trade system for transportation fuels in order to reflect the growing use and availability of alternative fuels such as biofuels, electricity, and hydrogen. (BMWGROUP)

Comment: We support the inclusion of the carbon content of transportation fuels within cap and trade as a complimentary measure to vehicle standards, the LCFS, and policies to reduce vehicle miles traveled. (ICCT1)

Response: We appreciate the support.

E-8. Comment: Do not aggregate oil and natural gas systems' GHG emissions for defining a regulated source. The proposed regulations tie the definition of an oil and natural gas system compliance entity to CARE GHG reporting requirements which aggregate small oil and gas production emission sources at the basin level oil and natural gas system (section 95802(a)(138)). Oil and natural gas operations at a company are seldom organized at a basin level. Aggregating the reporting obligations at a basin level for oil and natural gas operations poses particular issues that are being discussed in the context of EPA's reporting rule. They raise similar and more relevant issues for the purpose of compliance. Historically, EPA has relied on a different definition of a facility that does not include the concept of aggregation at basin level for the purpose of compliance pursuant to the Clean Air Act. We believe that the inclusion of a basin level concept creates an artificial organizational layer that does not typically have a parallel in the organization structure of an oil and gas company. This would make it difficult to implement and demonstrate compliance obligations associated with the proposed regulations. In fact the reporting rule does state that the definition of a facility (that includes the concept of a basin) is for the purpose of that rule only. We agree and do not believe that it is logical to expand the definition of a facility beyond the reporting rule.

CARB should limit the definition of an oil and natural gas system compliance entity to single point sources emitting greater than 25,000 TCO_2e per year. (CONOCO)

> **Response:** Under the MRR and cap-and-trade regulation, oil and gas systems are reported and covered in a manner that is modeled after the U.S. Environmental Protection Agency (EPA) rule. We have tried to remain consistent in our reporting requirements in order to harmonize with the Federal Rule. We believe it is appropriate to require reporting at a basin level for this sector to include these sources of emissions under the cap if at that level of reporting the emissions exceed 25,000 metric tons of CO_2e.

E-9. Comment: The cap and trade program should not be extended to transportation consumer emissions as provisions of other federal and State programs address these. Additionally, fuel providers should not be responsible for these emissions that are directly consumer related. Transportation emissions should be considered only if a formal review determines that this action is necessary and implementation would be more cost-effective than other policy approaches. The proposed regulations include GHG emissions from consumer use of transportation fuels under the State emission cap starting in 2015 (section 95812(d)(1)). This results in a clear overlay to the existing federal Renewable Fuels Standard, the California Low Carbon Fuel Standard (LCFS), and State/federal vehicle GHG performance standards. Inclusion of transportation fuel emissions within the cap and trade program will add a volatile carbon cost to the price consumers already pay for GHG control measures such as LCFS and vehicle efficiency standards. In addition, fuels under the cap will increase administrative complexity and the market price of emission allowances for all the other capped sectors. Specifically, a carbon cost of $20 per ton would add a fuel cost burden in excess of $3 billion per year to the California economy. In addition to individual consumers, much of this cost will fall to businesses and municipalities impacting small business owners, truck drivers, city bus and trash services, construction companies, rail services, and others. This carbon cost, along with the cost of compliance for LCFS and federal programs, will be embedded into the costs of all goods and services that rely on transportation. CARB should not extend the cap and trade program to consumer emissions from use of transportation fuels. Instead, CARB should allow existing federal/state programs to address GHG emissions in this sector. This is consistent with the approach adopted in the European Union. Any inclusion of consumer use of transportation fuels under the state emission cap in 2015 should be contingent on a formal review and a conclusion that such a measure is necessary and cost-effective for achieving the State's GHG reduction goals. We seek the Board's resolution that would require staff to review inclusion of transportation consumer emissions in the cap. This review should be completed well before the proposed 2015 start date. (CONOCO)

Response: We believe that cap-and-trade’s market-based approach is the most cost-effective and practical approach to lower emissions throughout most of California’s economy. There are numerous sectors that are covered by direct regulation and the cap-and-trade regulation. For example, the electricity sector is subject to the Renewable Portfolio Standard as well as the cap-and-trade regulation. We believe that the cap-and-trade-program is complementary to existing renewable and LCFS standards and to other State or federal laws.

The LCFS regulates fuel producers by requiring them to reduce the carbon intensity of their fuels 10 percent by 2020. This is accomplished by creating various “fuel pathways” for fuels based on their lifecycle emissions, accounting for feedstocks, production processes, transporting fuels, and other factors. While the LCFS will incentivize the use of lower carbon, non-petroleum fuels, it does not address emissions from petroleum refineries. The cap-and-trade program addresses both facility emissions that occur from fuel production (beginning in the first compliance period) and accounts for combustion emissions from the fuel that is produced and sold in California (beginning in the second compliance period).

Placing a price signal on transportation fuels will reduce the consumption of transportation fuel; driving investment in newer, more fuel-efficient vehicles. Any GHG reductions resulting from federal regulations or the LCFS at covered entities would be counted as emission reductions under the cap-and-trade program.

We agree that cap-and-trade is not well-suited to address emissions from millions of distributed point sources such as automobiles. However, our approach is not to apply cap-and-trade to the end user (vehicle drivers), but to the fuel suppliers, who will be responsible for fuel that is combusted. By taking this “upstream” approach in the regulation, we avoid the challenges of applying it to millions of “downstream” users.

E-10. Comment: CARB's projected baseline emissions inventories do not appear to account for the expected shift from petroleum transportation fuels to biofuels in the future. This shift would set back CARB's efforts to achieve 2020 GHG goals unless transportation biofuels are included in cap and trade or the overall level of the cap and trade is reduced to account for leakage due to expected increasing levels of transportation biofuels. We strongly recommend that emissions from all transportation liquid fuels be treated equally and fuel providers should be held accountable under the cap for the carbon emissions of all biofuels. (KUSTIN03)

> **Response:** The cap-and-trade regulation will help transition California away from carbon-intensive fossil fuels to cleaner and more-efficient fuels. The fossil fuel portions of biofuels and bioenergy are under the cap. Transportation fuels and fuel suppliers will have a compliance obligation. However, biomass-derived fuels are exempt from a compliance obligation since CO_2 emissions resulting from the combustion of biomass are considered biogenic. Emissions from biomass-derived fuels must be reported and verified pursuant to the MRR. Source categories that are not listed under section 95852.2 (Emissions without a Compliance Obligation) or that have not received a qualified positive or positive verification statement must be reported as "other biomass CO_2." Other biomass emissions that cannot be verified pursuant to the MRR are not considered biomass-derived, and will hold a compliance obligation.

Natural Gas

E-11. Comment: The proposed regulation should be modified with respect to treatment of natural gas local distribution companies (LDC) to reflect that natural gas LDCs are already at the 1990 greenhouse gas emissions levels that AB 32 requires. The natural gas sector has already achieved the AB 32 target of being below 1990 greenhouse gas (GHG) emissions levels. The proposed regulation offers no credit for energy efficiency measures implemented over the past two decades that have led to significant and sustainable emissions reductions in the natural gas sector. The proposed regulation improperly includes natural gas LDCs under the Cap and Trade Program for the actions of end users that they do not control.

Accordingly, this sector has already carried out its responsibilities under AB 32. The sector is continuing to pursue programmatic measures through the CPUC that are anticipated to achieve further reductions to maintain GHG emissions at 1990 levels even with economic growth. It serves no purpose to subject the small natural gas customers to the added costs of the Cap and Trade Program when it has already done its share by incurring costs already for energy efficiency measures over the past two decades as well as implementing an inverted rate structure that provides incentives for conservation and energy efficiency. (SEMPRA1)

> **Response:** We believe that returning to the 1990 GHG emission level is a statewide goal that does not apply to each individual industry or facility level. To

achieve the mandates of AB 32, it will be essential for continued reductions in all sectors.

E-12. Comment: We consider inclusion of the commercial and residential natural gas customers an unproductive action by ARB. Including these customers with no allocation of allowance value seems entirely at odds with AB 32's direction that ARB "Ensure that entities that have voluntarily reduced their greenhouse gas emissions prior to the implementation of this section receive appropriate credit for early voluntary reductions." (SEMPRA1)

> **Response:** We disagree. The carbon price signal created by the coverage of natural gas used by commercial and residential customers will create an incentive for conservation of this fuel. Reduced natural gas usage will lead to reduced greenhouse gas emissions.

E-13. Comment: Natural Gas Liquids used as feedstocks for petrochemicals are non-emissive and should be exempt from regulation. Compliance obligations for odorized propane should be delayed until 2015 to match the phase in date for local distribution companies (LDC) and transportation fuels, since propane competes directly with natural gas in these markets. (WSPA1)

> **Response:** While the program covers suppliers of liquefied natural gas (LNG), which is derived by fractionating natural gas liquid, it does not cover suppliers of natural gas liquid. The emissions associated with producing natural gas liquid may be covered if a facility exceeds the applicability threshold. Therefore, natural gas liquids used as feedstock are not covered. Section 95851(b) states that suppliers of LNG will have a compliance obligation starting 2015.

E-14. Comment: Only odorized propane needs to have an allowance obligation and the entity with title to the propane at the point of odorization should be responsible. The Propane Education and Research Council (PERC) fee currently applies in this fashion. Owners of propane at the point of odorization are known and are already paying a fee. Moving the point of regulation to large emitters, the point of odorization, and transportation fuel blenders simplifies efforts to track and cap emissions and provides transparency for the allowance market. (WSPA1)

> **Response:** We believe that the point of regulation should be the LPG producer and importer, rather than owners of propane at the point of odorization. This is consistent with Federal reporting requirements; it also allows ARB to provide a level playing field for propane odorized in-state and propane odorized outside jurisdiction and imported to California.

E-15. Comment: The point of regulation for Natural Gas Liquids (NGL) should be at the point of combustion for large emitters or at the point of odorization for non-industrial use to avoid the potential for double counting or over-regulation. Any NGLs which are blended into transportation fuel should be treated in the same manner as petroleum transportation fuel. (WSPA1)

> **Response:** We disagree. For program simplicity and efficiency, the point of regulation for Natural Gas Liquids is at the supplier.

Biomass

E-16. Comment: Suppliers of biofuels should be able to apply for credits for certain fuels using an emission crediting system consistent with adopted emission factors, the best science, and verifiable methodologies. CARB's Low Carbon Fuel Standard is a good example of how credits for low-carbon fuels could be accounted for. (KUSTIN03, KUSTIN08)

> **Response:** Suppliers of biofuels that are identified by the source of fuel, as described in section 95852.2 of the cap-and-trade regulation, will be able to avoid a compliance obligation. Receiving any credits in addition to this would be considered double-counting, as they would be used to replace fossil fuel, thus being "credited" under a capped sector and credited for being a biofuel.

E-17. Comment: We strongly recommend that ARB require fuel providers to hold CO_2 emission allowances to cover the GHG emissions released into the atmosphere as a consequence of the use of transportation biofuels. (KUSTIN08)

> **Response:** Suppliers of biofuels will be held accountable for the fossil fuel portion of their emissions. Biomass-derived fuel emissions must be identified by the source of fuel as described in section 95852.2 of the cap-and-trade regulation. A biomass-derived fuel not listed in that section will be required to hold a compliance obligation under section 95852.1.

E-18. (multiple comments)
Comment: Ethanol made from cellulosic materials, corn starch, or sugar cane are all treated as "zero" emissions even though it is well understood that ethanol from these different sources result in dramatically different impacts on GHG emissions. The same is true for biodiesel derived from virgin oils, tallow, or waste oils. According to ARB's own analysis, ethanol made from corn starch can actually increase the amount of carbon dioxide released into the atmosphere. While ARB's analysis shows that both biodiesel and renewable diesel derived from soybeans provide small reductions in emissions, biomass-based diesel alternatives derived from sources such as palm oil grown on former tropical forest or peatland could substantially increase emissions. As a consequence, exempting all ethanol and biodiesel from carbon allowance obligations could have the perverse effect of incentivizing the greater use of ethanol and biodiesel, regardless of whether they can contribute to reduced GHG emissions or not. (KUSTIN08)

Comment: The policy exempting biofuels used for transportation from compliance obligations under certain conditions is not consistent with the goals of AB 32 because it would incentivize use of some fuels that are more carbon intensive on a life cycle basis or have other types of negative sustainability impacts. This would lead to an increase of emissions instead of incenting only those fuels that are less carbon intensive and result in lower emissions. The development of some rules for fuels under the cap and not others—particularly the treatment of biofuels—is handled unevenly, with specific regulations outlining the accounting process for biofuels used for transportation but no corresponding detail for the rest of the program. Because the other elements of the policy are not included we cannot evaluate the full impact of this language in context with the impacts of the full rule. We further recommend that ARB delete the policy on biofuels because it is not consistent with the goals of AB 32 and it is premature and inappropriate to add this biofuel regulatory language into the rule without providing the context for the other elements of the rule addressing transportation fuels. (CHEVRON1)

Comment: Regarding the exemption for fuel ethanol from a compliance obligation (section 95952.2(c)), no justification can be provided since ethanol introduction has many environmental impacts in California, the rest of the U.S., and internationally, since it greatly increases smog, water pollution, and causes displacement of better land uses. Emissions from fuel ethanol source categories as identified in sections 95100 through 95199 of the Mandatory Reporting Regulation count toward applicable reporting thresholds but do not count toward a covered entity's compliance obligation set forth in this regulation. (CBE1)

> **Response:** ARB's cap-and-trade requires all emissions from biomass combustion to be reported. California's Low Carbon Fuel Standard (LCFS) goes one step further in its GHG assessment for transportation fuels by addressing all lifecycle emissions (not just fossil fuel) in its regulation. The LCFS is expected to reduce the carbon intensity of transportation fuels 10 percent by 2020. Since GHG lifecycle emissions from transportation fuels are already regulated through the LCFS, biofuels do not need to be directly addressed in the cap-and-trade program. California's LCFS comes from Executive Order S-01-07, which mandates the establishment of a statewide goal to reduce the carbon intensity of California's transportation fuels by at least 10 percent by 2020. This standard applies to all transportation fuels unless otherwise noted in the regulation. Specifically with regard to transportation fuels, ethanol from biomass (Agriculture, Municipal, and Forestry) is covered under the LCFS, while biomass electricity is excluded from the regulation. This program is complementary to LCFS, as it provides incentives to develop less carbon-intense fuels by applying a compliance obligation to fossil fuels.

E-19. Comment: All technologies and land use choices must be evaluated on a level playing field, using rigorously developed and consistent scientific methodology that is uniformly applied. The PRO does not address the potential for the substantial expansion of the production of biofuels using single as well as multi-purpose crops that will likely enhance land productivity and further reduce lifecycle GHG emissions. (ERICKSON)

> **Response:** The cap-and-trade regulation only looks at direct reductions of fossil-fuel emissions at covered facilities from the increased use of biofuels, as this is the point at which there is a compliance obligation. All other benefits are considered, but not directly related to the scope of the regulation to address direct emissions at covered entities.

E-20. (multiple comments)
Comment: Treat emissions from all transportation liquid fuels equally and hold fuel providers accountable under the cap for the GHG emissions of all biofuels. The proposed regulations currently exempt emissions from all “biodiesel” and “fuel ethanol” and do not address any other type of biofuels. CARB’s own analysis points out that ethanol made from corn starch and biodiesel derived from soybeans can actually increase GHG emissions. If ethanol and biodiesel are exempted from compliance obligations this could actually incentivize their use despite their higher GHG content. We strongly recommend that CARB close the current biofuels loophole by accounting for emissions associated with biomass production and combustion. Without accurately accounting for the GHG impacts of biomass energy CARB runs the risk of creating a loophole of significant, uncounted increases in GHG emissions. We strongly recommend that CARB develop reporting requirements for biomass facilities and address the resulting emissions as they do for other generation sources. (ENVENTREP1, ENVENTREP2)

Comment: We strongly recommend that CARB treat emissions from all transportation liquid fuels equally and hold fuel providers accountable under the cap for the GHG emissions of all biofuels. The proposed regulations currently exempt emissions from all “biodiesel” and “fuel ethanol” and do not address any other type of biofuel. It is well understood, however, that GHG emissions resulting from the use of transportation biofuels varies dramatically depending on how the biofuel is produced. According to CARB’s own analysis, ethanol made from corn starch and biodiesel derived from soybeans can actually increase GHG emissions. As a result, exempting all ethanol and biodiesel from compliance obligations could have the perverse effect of incentivizing the greater use of all ethanol and biodiesel, regardless of whether it can contribute to reduced GHG emissions. We therefore urge CARB to require fuel providers to hold compliance instruments to cover the GHG emissions from transportation biofuels. It is critical to the integrity of the AB 32 program that CARB not create an emissions loophole by treating all transportation biofuels as “zero emissions.” (NRDC1)

Comment: ARB must close the biofuels loophole by requiring fuel providers to hold allowances to cover the greenhouse gas emissions released as a consequence of the use of transportation biofuels. The cap-and-trade rule should include GHG emissions from the combustion of transportation biofuels under the cap and require covered entities to obtain allowances for the emissions associated with the production and combustion of this material. It is well understood that CO_2 emissions as a result of using ethanol varies dramatically depending on how the ethanol is produced. This is also the case for other types of biofuels. Exempting all ethanol and biodiesel from carbon allowance obligations could have the perverse effect of incentivizing the greater use of ethanol and biodiesel, regardless of whether they can contribute to reduced GHG emissions or not. Consequently emissions from all transportation liquid fuels should be treated equally. Fuel providers should be held accountable under the cap for the carbon emissions of all biofuels. Suppliers of biofuels should be able to apply for credits for certain fuels, if at all, only by using a comprehensive and scientifically defensible emission crediting system that accurately captures the fuel's specific carbon footprint. (CBD1)

Comment: Emissions from biomass-derived fuels should have a compliance obligation under the cap that should reflect net emissions after both upstream and downstream emissions associated with the production and combustion of the fuel source have been taken into account. PFT recommends that ARB amend section 95852.2(a)(4)(A) of the Cap and Trade regulations and section 95852.2 et al. of the Mandatory Reporting Regulation (MRR) to include upstream biological emissions associated with land use impacts and the management of biomass feedstocks. The accounting and reporting guidance should be developed in 2011 prior to the regulations taking effect in 2012, and should require biomass fuel suppliers to report biological emissions associated with the feedstock. In the near term, CARB should require fuel users to report the origins of biomass for fuel. ARB staff should immediately begin the development of a clear reporting methodology that allows the forest biomass combusted for energy to be tracked back to a specific forest project. Section 95852.2(a)(4) of the Cap and Trade regulation should be amended to include this new reporting requirement. Section 958452.2 of the Mandatory Reporting Regulation should also be amended to reflect this reporting requirement, and in the period until this guidance is developed, the MMR should require facilities to report the source and volume of any forest biomass combusted. There should also be monitoring of where the source materials are coming from so you could distinguish between biomass material that is a benefit versus that which is creating a greater carbon debt. If ARB decides they don't want to put biomass into the cap we would urge you to at the very least make sure that you're getting good monitoring and reporting of where the material is coming from so you could monitor whether the lack of a compliance obligation creates an incentive for mining the forests for exact carbon to create that energy and so you can keep track and potentially use adaptive management if you do need to take steps to bring biomass under the cap. (PFT1, PFT2)

Comment: The proposed rules potentially create a double "freebie" for biomass combustion: an exemption from compliance obligations, coupled with a program for distributing free allowances for that same combustion that may be sold into the market and used to justify emissions at other facilities. This double "freebie" not only incentivizes biomass and biofuels use, but also risks a form of allowance double-counting that could ultimately increase GHG emissions overall. (CBD1)

Comment: Emissions from bioenergy, whether from combustion to generate electricity or from liquid transportation fuels, should be under the cap and should not be exempted from compliance obligations. As ARB has recognized in its Low Carbon Fuel Standard, biofuels vary widely in their life-cycle greenhouse gas emissions. The cap and trade rule should provide incentives for the lowest-carbon fuels, rather than blanketly exempting all bioenergy. The biomass exemption provides a perverse incentive to cut down forests, with all of their sequestered carbon, for energy purposes, which would actually make global warming worse. (SIERRACLUBCA4)

Comment: While we support the development of biomass energy and fuels from forests, careful consideration should be given to the GHG and environmental impacts that could result upstream from the production of the feedstock. The final proposed cap and trade regulations exempt forest biomass energy and fuels from the cap and only require the reporting of GHG emissions associated with the combustion of biomass without inclusion of upstream impacts. Yet, biomass energy and fuels, depending on the land use and management impacts upstream, can result in increased biological GHG emissions from the landscape as well as additional indirect emissions from energy use. The potential upstream land use impacts of biomass energy and fuels for a cap and trade program are comparable to those associated with the production of biofuels for California's Low Carbon Fuel Standard (LCFS). CARB has been and continues to invest considerable time and effort to account for indirect land use impacts, GHG emissions and sustainability for forest biofuels in its LCFS. Given the similarity in upstream accounting issues and potential environmental impacts with respect to biomass energy and fuels in the cap and trade program, the GHG treatment and sustainability considerations should be consistent across programs. TNC recommends that ARB amend section 95852.2 (a)(4)(A) of the cap and trade regulations and section 95121 et al. of the Mandatory Reporting Regulation to include upstream biological emissions associated with the land use impacts and management of feedstock. The accounting and reporting guidance should be developed in 2011 prior to the regulations taking effect in 2012 and should require biomass fuel suppliers to report biological emissions associated with the feedstock. In the near term, CARB should require fuel users to report the origins of biomass for fuel. The sustainability standard developed pursuant to the LCFS should also apply to the biomass used for energy within the cap and trade program. Also, TNC recommends the inclusion of biomass energy and fuels in the cap. The combustion of biomass results in greenhouse gas emissions and may not be offset by regrowth or maintenance of feedstock (e.g., forests) upstream. To maintain an incentive for biomass energy and fuels, compliance obligations may be freely allocated. However, this free allocation should be contingent upon proper evaluation and accounting of upstream biological emissions and sustainability criteria, as well as benchmarking based on best practices for the industry, as discussed earlier in our recommendations. (NC1)

Comment: ARB should begin work, including collaboration with EPA and other stakeholders and experts, to develop scientifically defensible quantitative assessments and reporting requirements by 2015 to evaluate the net carbon flux from the harvest and combustion of biomass-derived fuels. CARB should consider easing the reporting and tracking requirements to allow landowners and biomass users to easily certify the source of their biofuel, thus streamlining the program and creating stronger incentives to utilize the best biomass available. (EDF1)

Comment: Emissions from bioenergy produced through use biomass derived fuels, including especially forest biomass, and "wood and wood wastes" identified in section 95852.2(a)(4), should, as a default matter, be included under the cap and generate compliance obligations. Entities combusting these fuels should be excused from compliance obligations only to the extent that they can demonstrate that the production and use of the biomass fuel resulted in reduced or avoided greenhouse gas emissions over a timeframe relevant to AB 32, that is, by 2020. To this end, ARB should begin work, including collaboration with relevant stakeholders and experts, to develop scientifically defensible quantitative assessments reporting requirements to evaluate the net carbon flux associated with harvest and combustion of different biomass-derived fuels. Exemptions from compliance obligations should be based on the use of agency approved models and reporting requirements and should be limited to fuel sources that result in zero or negative total GHG emissions, such as food waste digesters.

Developing a transparent carbon accounting framework based on geographic and operational origin of forest biomass materials is critical if ARB and covered entities are to develop a scientifically defensible methodology for bioenergy under the cap and trade regulation. Such a program should include information associated with the production of biomass material (i.e. allowing for tracking from the point of combustion back to the point of production). However, in order to ensure the program is of reasonable size and scope, and doesn't create a costly disincentive to utilize biomass overall, CARB should consider easing the reporting and tracking requirements for certain sources of bioenergy where there is clarity on atmospheric carbon flux values. In such circumstances, CARB could allow landowners or biomass users to certify the source of their bioenergy and utilize lookup tables with default emissions factors and carbon flux values. (KUSTIN05)

Comment: The proposed regulations provide a significant incentive to produce energy from forest materials by exempting biomass facilities from compliance obligations. Exempting these categories from compliance obligations is equivalent to assigning a net carbon impact of zero to the growth, harvest, production, and NRDC Letter to CARB re Cap and Trade combustion of these fuel sources. In effect, the rule assumes, without justification, the "carbon neutrality" of all biomass fuels. Failure to accurately account for the GHG impacts of biomass energy incurs the risk of significant, uncounted increases in GHG emissions. We strongly recommend that CARB commit to both developing reporting requirements for biomass facilities and to addressing the resulting emissions, if any, in a manner consistent with other generation sources in the AB 32 regulatory framework. (NRDC1)

Comment: California's cap and trade program would create an incentive to use biomass and biofuels whether or not they do in fact produce fewer emissions than the fossil fuels they would replace. The implicit subsidy such a program would create would effectively result in a form of emissions leakage from capped to uncapped energy sources and significantly erode the emission reductions that CARB intends the program to achieve. (EDF1)

Comment: CARB should seek input from a broad range of stakeholders and develop a program that allows for the accurate quantification of net carbon fluxes into and out of the atmosphere from the use of biofuels. (EDF1)

Comment: It is inappropriate to only measure the GHG emissions at the smokestack and ignore landscape implications of biomass utilization. This option fails to account for the potentially lower emissions profile of some biomass sources compared to fossil fuels, while also ignoring the very real potential for higher total net emissions from biomass relative to fossil fuels depending on the source and production practices and time frame of analysis. (EDF1)

Comment: We support the inclusion of carbon flux calculations into the rule; we also realize that CARB currently does not have the accounting and reporting framework in place to make that inclusion possible. We encourage CARB to develop an appropriate framework and to seek input from a broad array of stakeholders. (EDF1)

Comment: Different forest biomass feedstocks and their management can incur very different "carbon debts" over different time scales. As currently written, the cap and trade rule provides a significant incentive to produce biomass energy from forest materials through the exemption, but does not provide the accounting infrastructure to require or ensure that the emissions from the combustion of these materials are carbon neutral within the timeframe relevant to AB 32. Of course, in some instances the use of biomass to make energy will result in "de minimus" or net carbon negative emissions (i.e. biomass fired power plants that burn only agricultural wastes which otherwise would be burned in the open or anaerobic digesters that handle food waste). Other examples may include use of harvest or mill residue for bioenergy. However, in other cases, such as conversion of standing forests to bioenergy without forest replacement, the production of biomass based energy could cause an increase in overall GHG emissions in the atmosphere. The cap and trade regulation currently before the board represents an opportunity to promote and reward the use of fuels that provide the most emissions reductions while moving away from biomass that can increase overall greenhouse gas emissions, such an opportunity should not be missed. (KUSTIN05)

Comment: Close the biomass biofuels loopholes. Emissions from bioenergy, whether from combustion to generate electricity or from liquid transportation fuels, should be under the cap and should not be exempted from compliance obligations. As ARB has recognized in its Low Carbon Fuel Standard, biofuels vary widely in their life-cycle greenhouse gas emissions. The cap-and-trade rule should provide incentives for the lowest-carbon fuels, rather than blanketly exempting all bioenergy. The biomass exemption provides a perverse incentive to cut down forests, with all of their sequestered carbon, for energy purposes, which would actually make global warming worse. (SIERRACLUBCA4)

Comment: We understand that ARB may be assuming that future carbon sequestration associated with overall statewide forest growth will offset any emissions from combustion of woody biomass fuels. Such an assumption does not support a wholesale exemption from compliance obligation as currently proposed, but rather, supports the development of a quantitative framework to measure and verify this phenomenon. To the extent that harvesting biomass affects overall carbon stocks and the overall rate of sequestration, all bioenergy should not be considered inherently "carbon neutral," but rather, should generate a carbon debt that must be considered. Thus, the timeframe over which a particular harvested area can re-sequester the carbon associated with biomass removal is essential to understanding the carbon implications of the particular fuels. It is important to note that any re-sequestration must be equal to the sequestration that would occur under a business-as-usual scenario for a net carbon value of zero.

Developing a transparent carbon accounting framework based on geographic and operational origin of forest biomass materials is critical if ARB and covered entities are to develop a scientifically defensible methodology for bioenergy under the cap and trade regulation. Such a program should include information associated with the production of biomass material (i.e., allowing for tracking from the point of combustion back to the point of production). (KUSTIN06)

Comment: We request that ARB adjust the treatment of energy produced from biomass (in particular—forest biomass) in the Cap and Trade rule to include this source under the cap and account for greenhouse gas emissions associated with the production and combustion of this material. (KUSTIN06)

Comment: Under the Clean Air Act, U.S. EPA correctly determined that biogenic emissions should be considered when evaluating whether facilities are subject to the Prevention of Significant Deterioration and Title V Programs. Once facilities are subject to these federal provisions they trigger additional control requirements and regulatory oversight. If California were to accurately incorporate biomass emissions into the cap and base compliance requirements based on those emissions, the program would complement EPA's effort to accurately account for emissions, and would create an incentive to identify and reward use of the lowest carbon biomass available. (KUSTIN06)

Comment: ARB has not explicitly made a determination regarding the overall carbon impacts of these fuel sources and does not provide explicit explanation for the exemption. However, exempting these categories from compliance obligations is equivalent to assuming an identical flux of carbon into and out of the atmosphere associated with all biomass growth, harvest, production, and combustion. In effect, by exempting bioenergy, the rule assumes "carbon neutrality" for all biomass fuels, which is not scientifically accurate. Rather, different forest biomass feedstocks and their management can incur very different "carbon debts" over different time scales. As currently written, the Cap and Trade rule provides a significant incentive to produce biomass energy from forest materials through the exemption, but does not provide the accounting infrastructure to require or ensure that the emissions from the combustion of these materials are carbon neutral within the timeframe relevant to AB 32. Of course, in some instances the use of biomass to make energy will result in "de minimus" or net carbon negative emissions (i.e. Biomass fired power plants that burn only agricultural wastes which otherwise would be burned in the open or anaerobic digesters that handle food waste). Other examples may include use of harvest or mill residue for bioenergy. However, in other cases, such as conversion of standing forests to bioenergy without forest replacement, the production of biomass based energy could cause an increase in overall GHG emissions in the atmosphere. The cap and trade regulation currently before the board represents an opportunity to promote and reward the use of fuels that provide the most emissions reductions while moving away from biomass that can increase overall greenhouse gas emissions—such an opportunity should not be missed. Accordingly, emissions from bioenergy produced through use biomass derived fuels—including especially forest biomass, and "wood and wood wastes" identified in section 95852.2(a)(4)—should, as a default matter, be included under the cap and generate compliance obligations. Entities combusting these fuels should be excused from compliance obligations only to the extent that they can demonstrate that the production and use of the biomass fuel resulted in reduced or avoided greenhouse gas emissions over a timeframe relevant to AB 32, that is, by 2020. To this end, ARB should begin work, including collaboration with relevant stakeholders and experts, to develop scientifically defensible quantitative assessments reporting requirements to evaluate the net carbon flux associated with harvest and combustion of different biomass-derived fuels. Exemptions from compliance obligations should be based on the use of agency approved models and reporting requirements and should be limited to fuel sources that result in zero or negative total GHG emissions, such as food waste digesters. (KUSTIN06)

Comment: With respect to biomass energy and fuels, we do support biomass for these purposes. However, we do also believe that the combustion of biomass and the associated greenhouse emissions should have compliance associated with it. While the combustion may be offset by forest regrowth upstream, there is not a guarantee you could have emissions that increase upstream to produce the materials for combustion downstream. (NC6)

Comment: The proposed exemption for biogenic emissions must be eliminated. The ISOR fails to explain the exemption for biogenic emissions. Among other things, an ISOR must include a "statement of the specific purpose" of each proposed regulation and "the rationale for the determination by the agency that [each proposed regulation] is reasonably necessary to carry out the purpose for which it is proposed." (Gov. Code section 11346.2(b)(1)) The ISOR also must identify "each technical, theoretical, and empirical study, report, or similar document" on which ARB relies in proposing the regulation. (Gov. Code section 11346.2(b)(2)). Furthermore, the ISOR must describe "reasonable alternatives to the regulation and the agency's reasons for rejecting those alternatives." (Gov. Code section 11346.2(b)(3)). The ISOR fails to comply with these requirements of law. Nowhere does the ISOR explain why the proposed regulation, at section 95852.2, exempts virtually all combustion emissions from biogenic sources from compliance obligations. Nor does the ISOR identify any technical, theoretical, or empirical support for the exemption. By the same token, the ISOR fails to describe any alternative approaches to the exemption or ARB's reasons for rejecting them. Without an understanding of ARB staff's rationale for the exemption, neither the public nor decision-makers can assess whether it is consistent with the purpose of AB 32 or participate meaningfully in the public process surrounding adoption of the regulation. Accordingly, staff's failure to explain the reasoning behind the exemption constitutes a substantial failure to comply with the Administrative Procedure Act. *See* Gov. Code section 11350. (CBD1)

Comment: The proposed exemption for biogenic emissions must be eliminated. Biomass and biofuels emissions do not necessarily displace fossil fuel emissions. Another common assumption of carbon neutrality proponents is that biomass and biofuels combustion by definition displaces fossil-fuel combustion. In other words, this carbon neutrality theory hinges on the belief that for each ton of biomass burned, an equivalent amount of fossil fuel is not burned, and any resulting fossil GHG emissions are therefore completely avoided. Like other assumptions underlying the carbon neutrality argument, this assumption lacks a sound basis in fact. First, the assumption of one-to-one displacement does not account for growth in demand for energy or other products, but rather seems to assume a flat demand curve. Population and economic growth, however, will generally cause increases in demand, even as energy use and manufacturing become more efficient. As a result, biomass may simply be adding capacity rather than displacing capacity currently satisfied by fossil fuels. Second, in the energy sector, it cannot be assumed that future demand will automatically be satisfied by fossil-fired, carbon-intensive generation. Rightly or wrongly, biomass energy is widely considered to be renewable energy, and thus competes with other renewables for subsidies, incentives, and market share within renewable portfolio standards and renewable electricity standards. Accordingly, to the extent that biomass generation adds capacity to serve future demand in the context of a renewable energy standard, it may well displace other renewables (such as wind and solar, which tend to be more expensive per unit of energy generated) rather than fossil fuels, resulting in dramatically increased carbon emissions per megawatt of energy produced. Determining whether and to what extent biomass generation replaces fossil-fired generation thus requires a facility-specific analysis of energy market characteristics and conditions. It cannot simply be assumed that every ton of biogenic carbon replaces a ton of fossil carbon that would otherwise enter the atmosphere. (CBD1)

Comment: The proposed exemption for biogenic emissions must be eliminated—renewability and sustainability standards do not necessarily provide good proxies for climate analysis. For the most part, existing sustainability and renewability standards exist primarily to incentivize particular forms of energy generation, and are not good proxies for analysis of the carbon footprint of a particular biomass-burning facility. These standards thus typically reflect political and economic rather than primarily scientific or technology-based considerations. Such standards also may create perverse incentives that lead to other unacceptable environmental effects; as discussed in the Manomet Report and elsewhere, increased demand for biomass fuels can result in vastly increased levels of whole-tree harvest and even large-scale conversion of natural forests to energy crops. Moreover, existing sustainability standards tend to ignore critically relevant time-scale and carbon debt questions; as previously discussed, a biomass harvesting regime that is technically "sustainable" or "renewable" on a scale of decades or centuries will still contribute significantly to climate impacts.

Limitations on "wood and wood waste" within the proposed cap and trade regulation, which appear to have been modeled on previous definitions of "renewable" biomass under California law, provide an excellent illustration of this problem. Combustion of wood harvested in accordance with a "timber management plan" or other "locally or nationally approved plan," for the purpose of "forest fire fuel reduction or forest stand improvement," would be eligible for the exemption from compliance obligations. Yet these standards say absolutely nothing about the relative carbon intensity of the fuels or the relative carbon debts associated with their removal, and thus do not provide an adequate proxy for analysis of "carbon neutrality."

Furthermore, even to the extent that removal of "hazardous fuels" or insect-infested stands might be intended to prevent emissions associated with wildfire or widespread forest decay, it is not accurate to assume that removal and combustion of these fuels simply avoids identical emissions that would have occurred anyway. It is true that combustion of trees, brush, and litter in forest fires releases carbon emissions. Yet the emissions from fires may be far lower (and far fewer live trees may be killed) than previously believed, depending upon forest type and fire intensity. Indeed, significant amounts of carbon remain sequestered in forest pools following even high-intensity wildfires. Carbon lost in fires also may rapidly be resequestered by early successional species following disturbance.

In fact, recent scientific studies call into question the entire enterprise of removing (and burning) biomass in order to avoid carbon emissions associated with wildfire:

> [F]uel removal almost always reduces carbon storage more than the additional carbon that a stand is able to store when made more resistant to wildfire. Leaves and leaf litter can and do have the majority of their biomass consumed in a high-severity wildfire, but most of the carbon stored in forest biomass (stem wood, branches, coarse woody debris) remains unconsumed even by high-severity wildfires. For this reason, it is inefficient to remove large amounts of biomass to reduce the fraction by which other biomass components are consumed via combustion.

Accordingly, it is not accurate to assume that the carbon emissions associated with biomass energy production would have occurred in the forest anyway, on the same time scales and to the same degree, as a result of fire. In reality, biomass combustion ensures that forest biomass is converted into carbon dioxide on a very short time scale, whether or not similar emissions would have occurred as a result of fire, and regardless of whether logging is as effective as natural succession in facilitating sequestration of those emissions. Current scientific work also indicates that fire, even the high-intensity variety, is a natural event that we should accept and encourage, not attempt to forestall through speculative, intensive, and destructive logging projects aimed at “forest cleaning” or “fuel reduction.” The dead trees left standing after a high-intensity fire provide critical wildlife habitat as well as soil nutrients that encourage rapid growth of early successional species. Moreover, unlike emissions produced in biomass energy facilities, carbon in standing dead trees and forest floor pools may remain sequestered for a long time following even a high-intensity fire, and decays slowly into the atmosphere even as new plant growth recolonizes a burned area. (CBD1)

Comment: The proposed exemption for biogenic emissions must be eliminated. ARB must close the biomass loophole by including bioenergy emissions under the cap and accounting for the greenhouse gas emissions associated with biomass production and combustion.

The cap and trade rule should include the GHG emissions from the combustion of biomass (in particular, forest biomass) under the cap and require covered entities to obtain allowances for the emissions associated with the production and combustion of this material.

Section 95852.2 exempts a number of fuel source categories from compliance obligations. Exempted categories include direct combustion of several sources of cellulosic biomass, including solid waste, construction and manufacturing debris, mill residues, range land maintenance residues, all agricultural crops or waste, and wood or wood waste. Covered entities must report emissions from the combustion of these fuels but are not required to obtain allowances for those emissions. Furthermore, neither users nor suppliers of biomass for energy are required to identify the sources of biomass material or report the biological greenhouse gas impacts associated with the removal of biomass for energy or fuel.

As explained in the preceding section, ARB has not explicitly made a determination regarding the overall carbon impacts of these fuel sources and does not provide any explicit explanation for the exemption. However, exempting these categories from compliance obligations is equivalent to assuming an identical flux of carbon into and out of the atmosphere associated with all biomass growth, harvest, production, and combustion.

Accordingly, emissions from bioenergy produced through combustion of biomass, derived fuels, including especially forest biomass, and “wood and wood wastes” identified in section 95852.2(a)(4), should, as a default matter, be included under the cap and generate compliance obligations. Entities combusting these fuels should be excused from compliance obligations only to the extent that they can demonstrate that the production and use of the biomass fuel resulted in reduced or avoided greenhouse gas emissions over a timeframe relevant to AB 32, that is, by 2020. (CBD1)

Comment: The proposed exemption for biogenic emissions must be eliminated. Biomass combustion is not “carbon neutral.” The unchecked expansion of biomass energy, particularly the use of woody biomass to generate electricity, represents a double threat to the climate and to California’s forests. Although scientists and policy-makers have now thoroughly debunked the long-standing myth that biomass combustion is “carbon neutral,” industry proponents continue to seek special treatment for biomass projects based on the dangerously false contention that biogenic GHG emissions do not affect the climate. Public incentives for biomass, embodied in renewable energy standards and other policies, are both threatening to exacerbate greenhouse pollution and putting increased pressure on the nation’s forests by increasing the demand for woody fuel. The proposed cap and trade regulation, with its blanket exemption for biomass and biofuels, would create another powerful incentive for biomass development in California.

Biomass combustion causes GHG emissions, particularly of CO_2. Indeed, CO_2 emissions from electrical generating units burning woody biomass rival or exceed those of coal-burning facilities, and are nearly double those of facilities burning natural gas. CO2 from fossil sources shares the same physical characteristics and same climate-forcing properties as CO_2 from biogenic sources. There is no physical, chemical, or climate-forcing difference between fossil CO_2 and biogenic CO_2. Put simply, CO_2 is CO_2. Infrared radiation does not and cannot discriminate among the identical molecules of CO_2 circulating in the atmosphere.

There is thus no basis in law, science, or sound policy for exempting sources of biogenic GHG emissions from compliance obligations. These emissions affect California’s ability to achieve AB 32’s objectives just as much as emissions from other sources. Moreover, the climate impacts of any particular biomass facility will vary greatly, depending on fuel characteristics and sources, secondary emissions associated with harvesting and processing, land use impacts, and effects on future sequestration. In effect, the degree to which a particular biomass project might plausibly claim to be “carbon neutral,” and the time it might take to achieve neutrality, cannot be known absent a complete lifecycle analysis considering all of these factors and variables. It is this type of analysis, not an unexplained and unsupportable blanket exemption for biomass emissions, which ARB should be developing as part of this regulation.

Neither the ISOR nor the FED offers any insight into why the proposed regulation exempts biomass emissions from compliance obligations. The obvious implication from this silence is that ARB staff views biomass combustion as “carbon neutral,” although neither document explains the theory behind this belief. Whatever the theory, this view is not supported by the facts. (CBD1)

Comment: The proposed exemption for biogenic emissions must be eliminated—biogenic emissions are not automatically carbon-neutral. Some biomass proponents claim that all biogenic GHG emissions are part of a “natural” carbon cycle that by definition cannot have any effect on the climate. Under this theory, burning biomass releases carbon that was removed from the atmosphere by the fuels as they were growing, and thus completes a “natural” cycle by returning that carbon to the atmosphere.

This theory is facially and dangerously incorrect. Taken to its logical conclusion, this theory would hold that deforestation has no effect on climate change. Indeed, under a literal application of this theory, every single tree, shrub, and blade of grass on earth could be burned tomorrow and converted into CO_2 with no discernible effect on the climate.

Scientists and policy-makers agree, however, that deforestation—which necessarily entails conversion of sequestered biogenic carbon into atmospheric CO_2 does contribute to climate change. Ten to 15 percent of global carbon emissions result from deforestation and forest degradation, primarily in the tropics. These emissions are estimated at between 1,400 and 2,000 Tg per year. Although U.S. forests are generally considered a net carbon sink, this may be true only due to significant global leakage related to domestic demand for wood and agricultural products. GHG emissions associated with these losses are significant contributors to climate change notwithstanding their “biogenic” character.

The “natural carbon cycle” theory also ignores the fact that a tremendous amount of primary forest, representing a huge proportion of historic biogenic carbon stores, has been lost during the last few centuries. According to recent maps compiled by the World Resources Institute, only 21 percent of the world’s forests are “intact,” and 47 percent have been lost entirely. Between 1850 and 2000, global land use change caused emissions of 156,000 Tg of carbon, mostly from deforestation. Recent studies indicate that the density of remaining forest cover may be lower and far more variable than previously thought. The United States has also experienced the greatest loss of forest cover, as a proportion of forest cover in the year 2000, of any country with more than one million square kilometers of forest. This historic and continuing loss of forest biomass, much of which has been burned or otherwise converted into atmospheric carbon pollution, represents a tremendous existing carbon debt, one that further emissions of biogenic carbon can only increase. To extend the metaphor, continuing to burn trees for energy isn’t like balancing a checkbook. It’s like taking out another mortgage on a house that’s already far underwater.

Furthermore, it makes no sense to assume that all currently existing trees and other plants are composed solely of “biogenic” carbon. More than two centuries of increasing fossil GHG emissions have accumulated in the atmosphere. Given these pollutants’ atmospheric lifetimes, and considering the lifespan of many trees and plants, it is safe to assume that some considerable portion of this fossil carbon has been resequestered in currently existing biomass. Technically, therefore, burning that biomass may be returning fossil carbon to the atmosphere, again increasing the overall planetary carbon imbalance relative to pre-industrial conditions. Above all, this example demonstrates that it makes little scientific sense to divide carbon into theoretical “fossil” and “biogenic” pools for the purpose of assuming simplistically that biogenic carbon is part of some natural cycle that cannot affect the climate. Whatever natural biogenic carbon cycle existed prior to the industrial revolution has been radically altered by deforestation, land use change, and fossil carbon emissions.

The extent and duration of the effects of global warming will be determined largely by the degree to which anthropogenic sources of GHGs, particularly CO_2, continue to exceed the capacity of the Earth's carbon sinks for reabsorption—in other words, by the cumulative total of anthropogenic greenhouse pollutants in the atmosphere. Every ton of CO_2 counts toward this total, regardless of what was burned to produce it. Every ton of CO_2 similarly counts toward California's effort to meet the statutory goals of AB 32. Broad exemptions from compliance obligations for large categories of emissions facilitate near-term GHG pollution and interfere with these goals. (CBD1)

Comment: The proposed exemption for biogenic emissions must be eliminated. Biomass combustion creates a "carbon debt" that can last for decades or even centuries. Under another common theory advanced by proponents of biomass energy, biomass burning should be considered carbon neutral because any GHG emissions will be reabsorbed by future plant growth that replaces the harvested fuel. Yet carbon emitted during biomass combustion may remain in the atmosphere for decades or centuries before being resequestered.

Another version of this theory assumes that the emissions from present combustion and future decomposition are roughly the same, and thus concludes that combustion has a "net zero" emissions profile. ARB staff articulated this theory, albeit in a conclusory and unsupported fashion, in the ISOR for the Renewable Electricity Standard.

Both versions of the theory ignore the critical temporal relationships between present carbon emissions and the future effects of global warming and climate change. In other words, because meeting (or exceeding) atmospheric CO_2 targets has a strong temporal element, the time that it takes for CO_2 released into the atmosphere today to be reabsorbed is of critical importance in assessing the climate impacts of carbon emissions. By the same token, the carbon in living and dead biomass will remain sequestered in various pools (including forest soils) for a significant amount of time, whereas combustion immediately converts all of that carbon to atmospheric GHGs. This time lag has been identified in several recent studies as the source of a "carbon debt" that varies by fuel source, technology, and comparison to the fossil fuels assumed to be displaced by bioenergy generation.

The biomass carbon debt is especially pronounced when trees are burned for energy. Scientists agree that "[t]he amount of carbon sequestered by forest ecosystems plays an important role in regulating atmospheric levels of carbon dioxide." The removal and processing of forest biomass reduces storage in forest carbon pools and results in short-term emissions of greenhouse gases, even when some of that biomass remains sequestered for a period of time in commercial forest products. According to recent studies, "[t]ypically 30–50 percent of the harvested C is lost in manufacturing and initial use, a loss that is larger than could be expected from even the most extreme forest fire." Where harvested biomass is combusted for energy, rather than processed into wood products, short-term emissions are necessarily far greater, and long-term sequestration in forest products is eliminated altogether.

In addition to converting woody biomass into CO_2, thinning and post-fire salvage operations for bioenergy production also reduce the future carbon sequestration potential of the affected forest stand by removing trees that otherwise would have continued to draw CO_2 from the atmosphere. Surveys of the world's most carbon-dense forests, including the moist temperate conifer forests of North America, have confirmed that the greatest accumulations of biological carbon occur in the absence of human land-use disturbance.

Removal of forest biomass also affects long-term carbon storage in forest soils. Thinning and harvesting operations can reduce carbon inputs to soils and stimulate soil respiration, resulting in both reduced soil sequestration and near-term emissions. A recent meta-analysis of logging impacts in temperate forests showed that harvesting reduced soil carbon by an average of eight percent; depending on soil type, forest composition, and harvest method, some losses were as high as 36 percent. Other studies have shown that forests remain net sources of carbon emissions for more than a decade after logging operations, primarily due to increased soil respiration. Fuel treatments that change the amount and composition of decomposing forest biomass can influence long-term below-ground carbon storage.

The time between harvest and complete reabsorption of all this lost carbon by a forest stand, the duration of the "carbon debt", can span decades or even centuries. For example, one recent study concluded that even assuming perfect conversion of biomass to energy and a one-to-one displacement of fossil-fired generation, it still took from 34 to 228 years for forests in the western U.S. to reach carbon neutrality for biomass used directly for energy generation, and between 201 and 459 years if the biomass was converted to biofuels (the ranges depending upon the characteristics of the trees, forests and fire return intervals). Accordingly, because forest biomass utilization is not carbon neutral in the near term, the near-term effects of carbon emissions associated with biomass combustion must be considered.

This is especially important here because the primary goal of AB 32, reducing California's GHG emissions to 1990 levels by 2020, is a near-term goal. Accordingly, excessive near-term emissions will likely impede achievement of this goal. Moreover, at a global level, near-term GHG emissions exacerbate the risk of increasing atmospheric concentrations of greenhouse pollutants to the point where severe impacts are unavoidable, the so-called climate "tipping point." It is well established as a matter of science and policy that in order to avoid the worst impacts of global warming and climate change, global temperatures must not be allowed to exceed 2°C over pre-industrial levels. Whether we exceed the 2°C threshold depends on the level at which atmospheric CO_2 levels are eventually stabilized, which in turn depends on total cumulative anthropogenic GHG emissions. The greater the CO_2 levels, the greater the risk of exceeding this threshold and triggering likely catastrophic climate changes. The probability of overshooting 2°C is as follows according to Hare and Meinshausen (2006):

85 percent (68-99 percent) at 550 ppm CO_2 eq (= 475 ppm CO_2)
47 percent (26-76 percent) at 450 ppm CO_2 eq (=400 ppm CO_2)
27 percent (2-57 percent) at 400 ppm CO_2 eq (= 350 ppm CO_2)
8 percent (0-31 percent) at 350 ppm CO_2 eq

According to these scientists, "[o]nly scenarios that aim at stabilization levels at or below 400 ppm CO_2 equivalence (~350 ppm CO_2) can limit the probability of exceeding 2°C to reasonable levels." But in order to achieve stabilization levels that avert the worst impacts of climate change, emissions must peak by about 2015, and must decline very rapidly thereafter.

In short, minimizing CO_2 emissions in the next few years is critically important to meeting both AB 32's goals and global climate targets, even if some of all of that CO_2 might in theory be reabsorbed from the atmosphere in the decades or centuries to come. The science makes clear that the time frame for resequestration of CO_2 emitted from forest biomass combustion is on the order of decades or centuries, not years. Indeed, in evaluating carbon emissions from other biofuels, independent scientists have begun to develop strategies for evaluating the carbon impacts of biofuels in relation to the high social and environmental cost of short-term emissions. Even EPA has begun to recognize the importance of this temporal analysis in other contexts. Short-term CO_2 emissions from woody biomass combustion are thus significant, not "neutral", in the context of efforts to avoid the worst impacts of climate change, and should be treated as such for purposes of AB 32 as well.

Even if regeneration of a biomass fuel may one day repay the carbon debt incurred when it was first burned, the greenhouse pollution emitted upon combustion will act to warm the atmosphere for years, decades, or centuries in the meantime. Put another way, even if a particular biomass fuel may one day arguably become carbon neutral, its emissions are not climate neutral in the interim. Rather, they exert a warming effect on the climate and contribute to the total cumulative accumulation of GHGs in the atmosphere that will determine not only California's success or failure in meeting the goals of AB 32, but also humanity's success or failure in heading off the worst impacts of climate change. (CBD1)

Comment: The proposed exemption for biogenic emissions must be eliminated. National-level reporting and inventory programs provide no basis for exemptions at the facility scale. Industry proponents also often claim that counting and regulating biomass emissions at the facility level would contradict GHG reporting and inventory methodologies adopted by the Intergovernmental Panel on Climate Change (IPCC) and Environmental Protection Agency, both of which treat biomass emissions as carbon neutral. Scientists, however, have called into question whether biomass emissions should be considered carbon neutral even at the national inventory scale. The "accounting error" that assumes carbon neutrality for biomass power is based on a misreading of internationally accepted carbon accounting standards promulgated by the Intergovernmental Panel on Climate Change (IPCC). These rules count any harvesting of wood as a direct and immediate emission of carbon dioxide to the atmosphere at the time of harvesting. These emissions are only considered to be re-sequestered following the slow, often multi-decade regrowth of cut forests. Emissions released when biomass power plants actually burn this fuel are not counted under IPCC rules in order to avoid double counting. The U.S. EPA and other institutions that track carbon emissions have misinterpreted this accounting rule. The EPA does not count stack emissions when biomass is burned for power generation, but it also does not account for emissions at the time of harvesting. The result is that emissions from biomass power are never counted. The better solution is to focus first on carbon emissions from the smokestack, and then to factor in emissions and reductions associated with land use change and other relevant considerations. Compliance obligations for biomass emissions under the cap and trade program, which measure emissions first and foremost at the stack, are consistent with this good accounting practice. (CBD1)

Comment: The proposed rules potentially create a double “freebie” for biomass combustion: an exemption from compliance obligations, coupled with a program for distributing free allowances for that same combustion that may be sold into the market and used to justify emissions at other facilities. This double “freebie” not only incentivizes biomass and biofuels use, but also risks a form of allowance double-counting that could ultimately increase GHG emissions overall. (CBD1)

Comment: Forest biomass energy and fuels should be included within the cap and mandatory reporting should include upstream impacts to the land base. While TNC supports the development of biomass energy and fuels from forests, careful consideration should be given to the GHG and environmental impacts that could result upstream from the production of the feedstock. Biomass energy and fuels, depending on the land use and management impacts upstream, can result in increased biological GHG emissions from the landscape as well as additional indirect emissions from energy use. The potential upstream land use impacts of biomass energy and fuels for a cap and trade program are comparable to those associated with the production of biofuels for California’s Low Carbon Fuel Standard (LCFS). CARB has been and continues to invest considerable time and effort to account for indirect land use impacts, GHG emissions and sustainability for forest biofuels in its LCFS. Given the similarity in upstream accounting issues and potential environmental impacts with respect to biomass energy and fuels in the cap and trade program, the GHG treatment and sustainability considerations should be consistent across programs. TNC recommends that ARB amend section 95852.2(a)(4)(A) of the cap and trade regulations and section 95852.2 et al. of the Mandatory Reporting Regulation to include upstream biological emissions associated with the land use impacts and management of feedstock. The accounting and reporting guidance should be developed in 2011 prior to the regulations taking effect in 2012 and should require biomass fuel suppliers to report biological emissions associated with the feedstock. In the near term, CARB should require fuel users to report the origins of biomass for fuel. The sustainability standard developed pursuant to the LCFS should also apply to the biomass used for energy within the cap and trade program. Also, TNC recommends the inclusion of biomass energy and fuels in the cap. The combustion of biomass results in GHG emissions and may not be offset by regrowth or maintenance of feedstock (e.g., forests) upstream. To maintain an incentive for biomass energy and fuels, compliance obligations may be freely allocated. However, this free allocation should be contingent upon proper evaluation and accounting of upstream biological emissions and sustainability criteria, as well as benchmarking based on best practices for the industry, as discussed earlier in our recommendations. (NC2)

> **Response:** ARB wants to correctly identify and separately treat biomass-derived fuels from fossil fuels. Section 95103(j) of the MRR states that the operator or supplier must separately identify, calculate, and report all direct CO_2 emissions resulting from the combustion of biomass-derived fuels as specified in section 95115 for facilities, and sections 95121-95122 for suppliers. Biomass-derived fuel emissions must be identified by the source of fuel, as described in section 95852.2 of the cap-and-trade regulation. A biomass derived fuel not listed in that section will be required to hold a compliance obligation under section 95852.1. For a fuel listed under section 95852.2, reporting entities must also meet the verification requirements in section 95131(i) of this article, or the fuel must be identified as an Other Biomass-Derived Fuel and be subject to a compliance obligation under section 95852.1. By not including biomass-derived fuels under the cap, we are recognizing that the use of a biomass-derived fuel is preferred over the use of fossil fuels at capped sources for the purposes of achieving the AB 32 emissions target.
>
> The scope of this regulation is to apply a compliance obligation on direct emissions from capped entities. Any lifecycle analysis of biomass-derived fuel and its potential emissions or impacts beyond the emissions at the capped entities is not within the scope of this regulation. The program will include transportation fuels under the cap starting in 2015. Therefore, GHG emissions associated with the transport of biomass material will be covered under the cap. We are developing an adaptive management plan to monitor and adjust the program for any unanticipated adverse impacts to stocks of woody biomass as a result of offset projects. We do not believe that exempting emissions from combustion of woody biomass will result in the harmful removal of woody biomass from forests as there are existing environmental protection laws that serve to protect against the denuding of the forests. The data collected under the MRR will help ARB monitor increases in biomass-derived fuels, types of specific fuels, and source location to monitor for any changes to the use of biomass-derived fuels as a potential result of this program. The reporting requirements in the MRR have been subject to a public review and comment process as part of that rulemaking.

E-21. Comment: LADWP supports the use of biomass-derived fuels for meeting compliance with the 33 percent RES as they play a critical role in the ability of utilities to meet the standard at the lowest cost. Use of digester gas or other biogas that is upgraded to pipeline quality, in lieu of natural gas to generate electricity, is a beneficial use of waste gas and should be encouraged and supported by ARB. LADWP recommends that ARB recognize the displacement of fossil fuels and treat biomass-derived fuels that are RES-compliant as having zero GHG emissions compliance obligation under the cap-and-trade program when used in the generation of electricity. LADWP recommends that ARB reassess how it addresses contract shuffling to make sure that it does not hinder the beneficial displacement of fossil fuels for generating electricity.

The cross reference to the MRR in section 95131(i)(2)(A)(2) unnecessarily restricts biomass-derived fuel to contracts in effect prior to January 1, 2010 and that remain in effect; or fuel provided under a contract dated after January 1, 2010 only for the amount of fuel that is associated with an increase in the biomass-based fuel producer's capacity. The MRR ISOR indicates that this provision is to prevent contract shuffling. Undue restrictions to address contract shuffling will result in increased costs for compliance with the RES regulation and the cap and trade regulation. (LADWP1)

> **Response:** We agree that the use of biogas to generate electricity is beneficial, but we believe that the regulation must prevent leakage by ensuring that biogas is not merely redirected to California while being replaced with fossil fuel outside of California. The second paragraph addresses primarily the MRR, not this regulation. But the text in that section of the MRR was subsequently moved to this regulation. New section 95852.1.1 makes it clear that emissions from biogas and biomethane under contract prior to January 1, 2012, do not have a compliance obligation. This new section also clarifies that there is no compliance obligation for emissions from these fuels provided under contracts dated after January 1, 2012, if the contracts are for fuel associated with an increase in the producer's capacity, or new production, or recovery of fuel that was previously destroyed. This provision for new contracts is necessary to prevent leakage.

E-22. Comment: In order to ensure the program is of reasonable size and scope, and doesn't create a costly disincentive to utilize biomass overall, CARB should consider easing the reporting and tracking requirements for certain sources of bioenergy where there is clarity on atmospheric carbon flux values. In such circumstances, CARB could allow landowners or biomass users to certify the source of their bioenergy and utilize lookup tables with default emissions factors and carbon flux values. (KUSTIN06)

> **Response:** We believe the current reporting and verification requirements in the MRR for biomass-derived fuels strike a good balance between cost-effectiveness and credible reporting to support the cap-and-trade program. The same level of accounting is necessary for emissions with a compliance obligation and those that are exempt, to ensure the environmental integrity of the cap-and-trade program.

E-23. Comment: California's proposed Cap and Trade program should recognize the carbon neutrality of biomass. The only reasonable option for treatment of emissions from biomass-derived fuels is to exempt them from having a compliance obligation. We believe the agency's approach to combustion emissions from ethanol and other biomass-derived fuels outlined in section 95852.2 of the proposed regulation is appropriate and scientifically justified. The approach of exempting emissions from biomass-derived energy from counting toward a covered entity's compliance obligation is consistent with the treatment of biomass emissions in other established regulatory frameworks, policy proposals, and accounting protocols. We encourage CARB to resist requests to require a compliance obligation for emissions from bioenergy, as well as any other appeals to otherwise include bioenergy emissions under the cap. CARB should continue to avoid attempting to capture emissions from changes in carbon stocks due to land use changes under the cap, since those emissions are outside the scope of the cap and trade program. Further, speculative emissions related to land use change are already being dealt with separately through the LCFS (although there is significant controversy and disagreement surrounding the methods used by CARB to estimate such emissions). Potential changes in land-based carbon stocks should not obfuscate or interfere with the carbon neutrality of biomass under the cap and trade program. Indeed, land use change emissions and the biomass carbon cycle are two distinctly separate issues and should continue to be treated as such. (RFA)

Comment: A letter to Chairman Mary Nichols and members of the board by a group of environmental organizations on December 9, 2010, urges the Board to, in effect, remove section 95852.2 from the proposed regulation. Their rationale for requesting this adjustment to the proposed regulation is thoroughly flawed, and the adjustment they request should be rejected.

The letter argues that the adjustments they are requesting are consistent with the approach taken by US EPA. This is simply not correct. The latest EPA Guidance on Greenhouse Gas Permitting recommends that permitting authorities continue to treat biomass as carbon-neutral while it determines whether to exclude some designated forms of biomass from the carbon neutral category.

The letter asserts that the rule assumes carbon neutrality for all biomass fuels. This is incorrect. The rule in section 95852.2 lists the specific categories of biomass that can be used for energy production without incurring a compliance obligation. All of the biomass materials listed in the rule have been shown to have reduced greenhouse gas emissions when used for energy production, rather than meeting an alternative fate such as landfill disposal, open burning, and enhanced risk of destructive wildfires for the state's forests.

The letter does admit that in some instances the use of biomass to make energy will result in de minimus or net carbon negative emissions. In fact, of the fuel that is used by the California biomass industry, all of it results in de minimus or net carbon negative emissions. The positive greenhouse-gas performance of the industry has been well documented.

The principal concern expressed in the letter concerns the use of fuels derived from forest biomass. Indeed, in presenting an example of a biomass fuel category that could cause an increase in the atmospheric burden of greenhouse gases, the letter cites: "conversion of standing forests to bioenergy without forest replacement." In fact, that category of biomass fuel has a compliance obligation in section 95852.2 of the rule and, therefore, would be subject to regulation without any modification of the rule. Section 95852.2 (a) (4) requires that forest-derived fuels be harvested according to the State forestry practices act, and be harvested specifically for purposes of fire risk reduction or other forest improvement goals.

The letter implies that the greenhouse gas implications of using forest derived fuels have not been sufficiently studied to justify exempting fuels consistent with section 95852.2 (a) (4) from a compliance obligation. In fact, in addition to the Pacific Institute report, which analyzed the issues, the U.S. Forest Service performed a comprehensive life-cycle analysis of the greenhouse gas implications of forest fuels use over a defined landscape in Northern California for the CEC's PIER program. Both studies demonstrate that the use of forest fuels that are consistent with section 95852.2 (a) (4) of the rule will reduce the burden of greenhouse gases in the atmosphere over the long term, fully consistent with AB 32.

California today has 33 biomass electric generating facilities, distributed across 19 counties, with a combined generating capacity of over 600 MW of reliable, baseload, renewable power that can be counted on and scheduled. Biomass power is approximately two percent of the overall power generated in the State, and about 18 percent of all the renewable power generated in the State. The industry employs approximately 750 workers directly at the power plants, and supports approximately 1,500 additional jobs in fuels production and transportation. Most of these jobs are in rural areas of the State. These are some of the "green jobs" promised by the State's moves to reduce greenhouse gas emissions. Biomass power production in California is a critical component of the State's renewable energy needs, solid-waste disposal infrastructure, and air quality improvement goals. (CBEA1)

Response: Thank you for the support.

E-24. Comment: Treatment of biofuels and biomass should be consistent for the transportation, electricity, and industrial sectors. ARB’s Cap and Trade should reward only biofuels that have lower GHG emissions than conventional fuels. (EDF1)

Response: We believe the regulation promotes these objectives.

E-25. (multiple comments)
Comment: EDF encourages the inclusion of biomass combustion to generate bioenergy in the cap starting in 2015. (CEERT, EDF1, EDF2)

Comment: We urge CARB to fully account for emissions from biofuel combustion in the cap and trade program starting in Phase II (year 2015) with adjustments or other mechanisms to account on a performance basis for both the combustion emissions and the landscape carbon effects associated with waste utilization and biomass production and harvest. (EDF1)

> **Response:** We will continue to evaluate this proposal as part of future amendments to the rule.

E-26. (multiple comments)
Comment: Combustion emissions from biogas resources should be properly accounted for. Section 95852.2 describes emissions for which there is no compliance obligation. These are generally emissions from combustion of biogenic fuels, which are reasonably excluded from a compliance obligation because their combustion offsets fossil fuel combustion while also eventually or even simultaneously reducing the release of methane gas to the atmosphere. However, this section inexplicably appears to exclude biogas from digesters from this reasonable treatment. The regulation should clearly exempt all eligible biomass and biogas combustion from a compliance obligation. (SMUD1)

Comment: Since ARB has imposed a quantitative limit on the number of offsets (lowering their value relative to an allowance), being required to surrender allowances from combustion emissions and receiving additional upstream offsets are not equivalent. In this circumstance, receiving a compliance obligation and earning fewer upstream offsets would be a better alternative. American Biogas Council does not advocate an approach whereby fewer offsets are awarded. Bio-methane economics often require revenue streams from both offsets as well as the ability to sell the biogas. Reducing the number of offsets received would limit the number of projects undertaken, further inhibiting offset supply and preventing meaningful GHG reductions from taking place. However, this approach is the preferred alternative to requiring compliance obligations for combusting biogas. (ABC)

> **Response:** We have made clarifications to address this concern. Combustion emissions from a digester are exempt from a compliance obligation as long as any credits for methane destruction from the digester do not receive more credit than calculated using the Global Warming Potential from the IPCC, Second Assessment.

Geothermal

E-27. (multiple comments)
Comment: We ask that ARB consider clarifying in sections 95852 and 95852.2 that emissions from geothermal facilities do not have a compliance obligation. We believe the following proposed amendments by the geothermal industry in California merely clarifies ARB's existing intent while not creating any additional confusion about what is a "fugitive" versus "process" emissions. Modify sections 95852(h) and 95852.2(f) and (g) as follows:

(h) The compliance obligation is calculated based on the sum of [(i)-(iv) unchanged]; and (v) all process and vented emissions of CO_2, CH_4, and N_2O as specified in the Mandatory Reporting Rule except for those listed in section 958522(g) below.

Modify section 95852.2. as follows:

(f) Emissions from geothermal generating units and geothermal facilities;
(g) Fugitive and process emissions from:

(1) CO_2 emissions from hydrogen fuel cells;
(2) At petroleum refineries; asphalt blowing operations, equipment leaks, storage tanks and loading operations; or
(3) At the facility types listed in section 95101(e) of the Mandatory Reporting Regulation, Petroleum and Natural Gas Systems; leak detection and leaker emission factors, and stationary fugitive and "stationary vented" sources on offshore oil platforms. (ORMAT)

Comment: The proposed regulation needs to be revised to clarify that GHG emissions resulting from geothermal power sources are not subject to a compliance obligation. California is fortunate to have some of the largest geothermal reservoirs in the world. Unlike intermittent renewable generating sources, such as wind and solar, geothermal power represents a continuous, baseload supply of clean energy, without requiring any combustion of fossil fuels. As such, geothermal resources represent a significant and important component of California's renewable generating portfolio. However, GHG emissions from geothermal power plants can, in most cases, reasonably pass through a stack, vent or other functionally equivalent opening. Acknowledging this fact, the proposed revisions to the MRR would no longer categorize emissions from geothermal generating sources as "fugitive" in nature. See 17 CCCR 95112(f) (proposed) ("Operators of geothermal generating facilities must calculate annual emissions of CO_2 and CH_4 from geothermal energy sources using source specific emission factors derived from a measurement plan approved by ARB"). In light of these changes to the MRR and in recognition of the fact that GHG emissions from geothermal generating sources are not truly fugitive in nature, Calpine would recommend that CARB revise the proposed regulation so that the exemption for GHG emissions associated with geothermal power generation no longer depends upon their classification as either "fugitive emissions" or "process emissions," but is instead separately enumerated within the proposed regulation. Modify sections 95852(h) and 95852.2(f) as follows:

> (h) The compliance obligation is calculated based on the sum of (i) emissions of CO_2, CH_4, and N_2O resulted from combustion of fossil fuel; (ii) emissions of CH_4 and N_2O resulted from combustion of all biomass-based fuel; (iii) emissions of CO_2 resulted from combustion of unverifiable biomass-derived fuels, as specified in section 95852.2; (iv) emissions of CO_2 resulted from combustion of biomass-derived fuels not listed in section 95852.2; and (v) all process and vented emissions of CO_2, CH_4, and N_2O as specified in the Mandatory Reporting Rule except for those listed in section 95852.2(~~a)(6~~g) below.

(f) ~~Fugitive and process emissions from: (1) CO_2 emissions from~~ Geothermal generating units~~; (2) CO_2~~ and ~~CH_4 emissions from~~ geothermal facilities~~;~~

(~~3~~g) Fugitive and process emissions from:

(1) CO_2 emissions from hydrogen fuel cells;

(~~4~~2) At petroleum refineries: asphalt blowing operations, equipment leaks, storage tanks, and loading operations; or

(~~5~~3) At the facility types listed in section 95101(e) of the Mandatory Reporting Regulation, Petroleum and Natural Gas Systems: leak detection and leaker emission factors, and stationary fugitive and "stationary vented" sources on offshore oil platforms. (CALPINE1, CALPINE2)

Comment: The geothermal energy industry is a leading provider of renewable energy in California, and reported data from California's geothermal facilities has clearly demonstrated that any GHG emissions associated with the generation of this electricity is de minimus. NCPA recommends proposed revisions to section 95852 (Emissions Categories Used to Calculate Compliance Obligations) and section 95852.2 (Emissions without a Compliance Obligation) that would clarify the intent of the proposed regulation that emissions from geothermal generation not be subject to a compliance obligation in the Program. Modify sections 95852(h) and (v) and 95852.2(f) and (g) as follows:

(h) The compliance obligation is calculated based on the sum… and
(v) all process and vented emissions of CO_2, CH_4, and N_2O as specified in the Mandatory Reporting Rule except for those listed in section 95852.2(a)(6)(g) below.

(f) Emissions from geothermal generating units and geothermal facilities, ~~Fugitive and process emissions from:~~
(g) Fugitive and process emissions from:

~~(1) CO_2 emissions from geothermal generating units;~~

~~(2) CO_2 and CH_4 emissions from geothermal facilities;~~

(1) CO_2 emissions from hydrogen fuel cells;

(2) At petroleum refineries: asphalt blowing operations, equipment leaks, storage tanks, and loading operations; or

(3) At the facility types listed in section 95101(e) of the Mandatory Reporting Regulation, Petroleum and Natural Gas Systems: leak detection and leaker emission factors, and stationary fugitive and "stationary vented" sources on offshore oil platforms. (NCPA1)

Comment: CARB has chosen to characterize geothermal facility GHG emissions as either "fugitive" or "process" emissions for mandatory reporting purposes. These terms are essentially a proxy category for the types of GHG emissions that can be measured at geothermal facilities but are not completely accurate given that naturally occurring GHG emissions from geothermal facilities can pass through cooling stacks. Given the factors mentioned above, and given that the proposed regulation does not propose a compliance obligation for geothermal facilities, we would ask that ARB consider the following amendment to sections 95852 and 95852.2 to clarify that emissions from geothermal facilities do not have a compliance obligation. We believe that GEA's proposed amendment merely clarifies ARB's existing intent, while not creating any additional confusion about what is a "fugitive" versus "process" emission. Modify sections 95852(v) and 95852.2(f) and (g) as follows:

(v) all process and vented emissions of CO_2, CH_4, and N_2O as specified in the Mandatory Reporting Rule except for those listed in section 95852.2(g)

(f) Emissions from geothermal generating units and geothermal facilities.
(g) Fugitive and process emissions from:

(1) CO_2 emissions from hydrogen fuel cells;
(2) At petroleum refineries: asphalt blowing operations, equipment leaks, storage tanks, and loading operations; or
(3) At the facility types listed in section 95101(e) of the Mandatory Reporting Regulation, Petroleum and Natural Gas Systems: leak detection and leaker emission factors, and stationary fugitive and "stationary vented" sources on offshore oil platforms. (GEA)

Comment: CalEnergy requests that ARB clarify in sections 95852 and 95852.2 that greenhouse gas emissions from geothermal facilities do not have a compliance obligation under the cap and trade program by adding a new section under section 95852.2 to specifically address emissions from geothermal generating units and facilities (designed as subparagraph (f)), and separating out exempt fugitive and process emissions. Modify sections 95852(h) and 95852.2(f) and (g) as follows:

(h) The compliance obligation is calculated based on the sum of

(i) emissions of CO_2, CH_4 and N_2O result~~ed~~ing from the combustion of fossil fuel;
(ii) emissions of CH_4 and N_2O result~~ed~~ing from combustion of all biomass-based fuel;
(iii) emissions of CO_2 result~~ed~~ing from combustion of unverifiable biomass-derived fuels, as specified in section 95852.2;
(iv) emissions of CO_2 result~~ed~~ing from combustion of biomass-derived fuels not listed in section 95852.2; and
(v) all process and vented emissions of CO_2, CH_4, and N_2O as specified in the Mandatory Reporting Rule except for those emissions from sources listed in section 95852.2~~(a)(6)~~(g) below.

(f) all greenhouse gas emissions from geothermal generating units and geothermal facilities.
~~(f)~~(g) Fugitive and process emissions from:

~~(1) CO2 emissions from geothermal generating units;~~
~~(2) CO2 and CH4 emissions from geothernal facilities;~~
~~(3)~~(1) CO_2 emissions from hydrogen fuel cells;

~~(4)~~<u>(2)</u> At petroleum refineries: asphalt blowing operations, equipment leaks, storage tanks, and loading operations; or
~~(5)~~<u>(3)</u> At the facility types listed in section 9510l(e) of the Mandatory Reporting Regulation, Petroleum and Natural Gas Systems; leak detection and leaker emission factors, and stationary fugitive and "stationary vented" sources on offshore oil platforms. (CALENERGY)

Response: We agree and modified section 95852.2(b) to clarify that emissions from geothermal generating units and geothermal facilities do not hold a compliance obligation. Based on stakeholder comments, staff concluded that although geothermal facilities must report under the Mandatory Reporting Regulation, they will not hold a compliance obligation. ARB will monitor their activities via the CEC Renewables Portfolio Standards program. We also fixed the reference previously in item (v) of section 95852(h).

E-28. Comment: Include a process to add to the list of fuels without a compliance obligation. Modify section 95852.2 as follows:

Emissions from the following source categories as identified in sections 95100 through 95199 of the Mandatory Reporting Regulation count toward applicable reporting thresholds but does not count toward a covered entity's compliance obligation set forth in this regulation. <u>The Executive Officer may add additional source categories meeting similar criteria</u>. These source categories include Municipal Solid Waste. (CCEEB1)

Response: Combustion emissions from the biomass derived portion of biomass derived fuels such as municipal solid waste count toward applicable reporting thresholds but do not count toward a covered entity's compliance obligation unless those emissions are reported as other biomass CO_2 under MRR. Additional changes to this requirement will be considered in any future amendments to the MRR and cap-and-trade regulation. The Municipal Solid Waste sector is not excluded from this program.

E-29. Comment: List biofuel plants as a covered stationary source. The proposed regulation includes a list of specific industrial processes (e.g. petroleum refining) in the definition of entities covered by the emission cap (see section 95811). This list does not specifically include biofuel production facilities but appears to capture such facilities under the more general category of "stationary combustion." All transportation fuels must be treated equitably within the regulatory framework. While it is appropriate that CO_2 emissions from the combustion of biofuels are not included under the state emission cap, fossil carbon emissions from stationary source production of biofuels should be included in the cap if individual biofuel production facilities exceed the 25,000 TPY emission threshold. CARB should clarify that biofuel plants with emissions greater than 25,000 TPY qualify as covered sources by specifically including them in the list of covered facilities in section 95811. (CONOCO)

Response: Only biomass-derived fuels as listed in section 95852.2, Emissions without a Compliance Obligation, are exempt from holding a compliance obligation. Those that are not verified as meeting the requirements in this section will be reported as other biomass CO_2 and will hold a compliance obligation. We believe the regulation is written to include biofuel plants if they meet the applicability threshold of 25,000 metric tons of CO_2e per year.

E-30. Comment: We wish to compliment ARB on your treatment of biomass under section 95852 of the proposed Cap and Trade regulation. Section 95852.2 provides a well-reasoned listing of biomass sources that have been shown to have lower emissions levels of greenhouse gases when used for energy production than when disposed of using conventional means, such as landfill disposal and open burning. We urge the ARB board to implement the Cap and Trade rules without modification of the sections pertinent to biomass energy production and protect this important green jobs industry. (CBEA1, CBEA2)

Response: Thank you for the support.

E-31. Comment: Neither a justification, nor an evaluation of impacts was provided, nor could we imagine any possible justification for the exemptions section 95852.2 (c)(1), (2), and (3) and (f)(4) and (5). Exemptions, such as this, are entirely inconsistent with requirements for maximizing reductions and should be struck. (CBE1)

Response: Combustion emissions from the biomass-derived portion of fuel ethanol do not hold a compliance obligation. However, emissions that are not verified as being biomass-derived will be reported as other biomass, and will hold a compliance obligation. Fugitive and process emissions from asphalt blowing operations, equipment leaks, storage tanks, and loading operations at petroleum refineries; or leak detection and leaker emission factors, and stationary fugitive and “stationary vented” sources on offshore oil platforms do not hold a compliance obligation. One important criterion for inclusion under the cap is an accurate quantification methodology for emissions sources. We don’t believe we have sufficient methods to accurately quantify these types of emissions for inclusion under the cap and apply a carbon cost. We will continue to evaluate new information and technology related to the quantification of these emissions.

E-32. Comment: Section 95852.2 (p. A-64) identifies emissions that do not trigger a compliance obligation. The section contains some problematic provisions. The opening sentence refers to “Emissions” without qualification, although it appears from section 95852(h) (p. A-63) that only CO_2 emissions from combustion of biomass-derived fuel are exempt. CH_4 and N_2O emissions will carry liability. (SCPPA1)

Response: We modified this section. The compliance obligation for covered sources is calculated based on the sum of emissions of CO_2, CH_4, and N_2O that resulted from combustion of fossil fuel; emissions of CH_4 and N_2O that resulted from combustion of all biomass-derived fuel; emissions of CO_2 that resulted from combustion of biomass-derived fuels that do not meet the requirements in section 95852.2 (Emissions without a Compliance Obligation); emissions of CO_2 that resulted from combustion of biomass-derived fuels pursuant to section 95852.1; and all process and vented emissions of CO_2, CH_4, and N_2O as specified in the MRR, except for those listed in section 95852.2(b), Fugitive and Process Emissions. Finally, CH_4 and N_2O are covered greenhouse gases under this regulation.

E-33. Comment: In section 95852.2(a) there is a reference to combustion emissions from biomass-derived fuels, but in subsections (b), (c), (e), and (f) there is no reference to combustion of the fuels. SCPPA understands from discussions with ARB staff that this was an unintended consequence of a formatting error and that subsections (b), (c), (e), and (f) should instead be subsections (5) to (8) in section 95852.2(a). (SCPPA1)

Response: We corrected the formatting error in section 95852.2.

E-34. (multiple comments)
Comment: Section 95852.2(a) inappropriately excludes emissions from “biogas from digesters” from the category of emissions that do not trigger a compliance obligation. It appears that biogas from digesters is excluded from being considered zero-CO_2-emissions because such gas may be from projects that earn offsets under ARB’s Compliance Offset Protocol for Livestock Manure (Digester) Projects (Protocol). However, the protocol only applies to livestock manure digester projects. Digester gas can be collected from other sources that would not be covered by this Protocol. More importantly, the protocol awards offsets for avoiding methane emissions from livestock manure, not for avoiding fossil fuel emissions. The protocol (p. 6) makes a clear distinction between the two types of emission reductions. This protocol does not account for carbon dioxide emission reductions associated with displacing grid-delivered electricity or fossil fuel use. The staff report for the protocol echoes this (on page 6 of the report). (SCPPA1, SCPPA5, SMUD2)

Comment: The use of biogas for producing power for the electricity grid or electricity for on-site use, thereby displacing fossil-fueled power plant GHG emissions, is considered a complementary and separate GHG project activity and is not included within the offset protocol accounting framework.

Insofar as the emission reductions from displacing fossil fuel with biogas are not covered by the protocol, no offsets are awarded under the protocol for those emission reductions. Offsets are only awarded for avoiding methane emissions. The Cap and Trade regulation should recognize emission reductions from displacing fossil fuel with biogas by allowing biogas combustion to be treated as zero-CO_2-emissions, regardless of whether offsets have been, or could be, issued for avoiding methane emissions. Modify section 95852.2 as follows:

<u>CO_2</u> ~~E~~<u>e</u>missions from the following source categories as identified in sections 95100 through 951<u>58</u>~~99~~ of the Mandatory Reporting Regulation …

(a) Combustion emissions from biomass-derived fuels ~~(except biogas from digesters)~~ from the following sources: …

(~~e~~8) Biogas~~methane~~ from the following sources:

(A~~1~~) All animal and other organic waste; or
(B~~2~~) Landfill, ~~gas and~~ wastewater, and digester gas. (SCPPA1)

Comment: PG&E recommends that ARB clarify the treatment of biogas and biomass as described in section 95852.2(a) exempts combustion emissions from biomass-derived fuels from a covered entity's compliance obligation, except for biogas from digesters, while section 95852.2(e) exempts biomethane from all animal and other organic waste, landfill gas and wastewater. This section therefore appears to state that if biogas from digesters were combusted, those emissions would not be exempt, but if biomethane were released into the atmosphere, those emissions would be exempt. Modify section 95852.2(e) as follows:

(e) Combustion and fugitive ~~B~~biomethane emissions from the following sources: (PGE1).

Response: We agree and revised the regulation accordingly.

E-35. (multiple comments)
Comment: Modify section 95852.2 to include the following source categories:
(e) Biomethane or biogas from the following sources:
(2) Landfillgas and wastewater treatment plants
(f)(6) CH_4 from landfills.
(f)(7) CH4 and N_2O from POTWs. (LASD1)

Comment: We are greatly concerned that the language proposed in the draft is confusing and not consistent with staff's intent to exclude emissions of biogas, including digester gas from wastewater treatment, from compliance obligations. Modify section 95852.2 as follows:

(a) Combustion emissions from biomass-derived fuels (except biogas from digesters) from the following sources:
(e) Biomethane and biogas from the following sources:
(1) All animal and other organic waste; or
(2) Landfills gas and wastewater treatment.
(f) Fugitive and process emissions from:
(1) CO_2 emissions from geothermal generating units;
(2) CO_2 and CH_4 emissions from geothermal facilities;
(3) CO_2 emissions from hydrogen fuel cells;
(4) At petroleum refineries: asphalt blowing operations, equipment leaks, storage tanks, and loading operations;

(5) At the facility types listed in section 95101(e) of the Mandatory Reporting Regulation, Petroleum and Natural Gas Systems: leak detection and leaker emission factors, and stationary fugitive and “stationary vented” sources on offshore oil platforms; or
<u>(6) Methane from landfills.</u>
<u>(7) Methane and N_2O from municipal wastewater treatment plants.</u>
(BACWAAC)

Response: We agree and modified this section.

E-36. (multiple comments)
Comment: It is critical to potential wastewater credit generation that the wording "except biogas from digesters" is removed from section 95852.2. We believe this was unintended and only confuses this subsection with manure digesters. The wastewater industry in California has many digesters that would be very negatively impacted by this provision. (LASD1)

Comment: I understand that the phrase "(except biogas from digesters)" in the first line of 95852.2(a) is meant to exclude offset credits, and not biogas or biomethane in general. It would be very helpful that this change keeps clear that it is not meant to exclude biomethane as provided in 95852.2(e)/(a)(8). (WEINSTEIN)

Response: We agree and removed this term from section 95852.2(a).

Wastewater

E-37. Comment: Biogas emissions from digesters should not hold a compliance obligation, (page A-64 subparagraph (a)). Subparagraph (a) indicates emissions from biomass-derived fuels (except biogas from digesters) count toward applicable reporting thresholds, but do not count toward a covered entity's compliance obligation. The exclusion of digester biogas from this provision suggests that it is counted toward a covered entity's compliance obligation. This appears to be inconsistent with subparagraph (e) on page A-66 that indicates biomethane from all animal and other organic waste, or landfill gas and wastewater are categories without a compliance obligation under the cap and trade program. Subarticle 3 (Applicability) correctly does not include publicly owned treatment works (POTW) or sewage treatment plants as a category of covered entities. However, it appears that if that digester gas, whether from municipal sewage or livestock, is captured and flared it does not create a surrender obligation. If that same digester gas is combusted to generate electricity instead of being flared, the same gas will have GHG emissions that would then count toward an allowance surrender obligation for a covered entity, such as an electric utility. (LADWP1)

Response: We modified section 95852.2(a) to exempt the following from a compliance obligation: combustion emissions from biomethane; biogas from all animal and other organic waste or landfill and wastewater treatment plants; and fugitive, process, and vented emissions from CH_4 and N_2O from municipal wastewater treatment plants.

E-38. (multiple comments)
Comment: We believe that local government agencies such as wastewater treatment facilities should be exempted from compliance obligations under the cap and trade program. (BACWAAC, CAWWCCG1)

Comment: We suggest that following adoption of this regulation, ARB direct staff to continue to work with local government stakeholders including the wastewater treatment community regarding full exemption from the regulation. While wastewater facilities currently fall under the compliance threshold due to the exclusion of biomass emissions (assuming the changes recommended above are made), we are concerned that changes to plant operations, calculation methodologies, covered sectors under EPA's mandatory reporting rule (which ARB is aligning with in its mandatory reporting rule), thresholds, or other unforeseen conditions have the potential to bring wastewater treatment agencies into the cap in the future. Rather than waiting for these changes to occur, we request that staff continue to work with us to consider solutions including an exemption. Wastewater treatment is a necessary service, and emissions associated with wastewater would happen whether or not our facilities are present. We cannot control the quantity or quality of our inflow nor the water quality requirements placed on our effluent, which drive the treatment methods selected. Therefore, we cannot control our emissions, and because we cannot move, we do not present any leakage risk. As public agencies, we have very specific procurement rules and lengthy budgeting processes, and we cannot adapt to market conditions sufficiently to ensure compliance at a reasonable cost in a market-based system. Finally, we cannot pass compliance costs on to customers due to the public processes associated with our rate-setting. For these reasons, we believe an exemption from compliance obligations is appropriate and we would like to continue to work with staff toward this end. (EMWD, ACWA, BACWAAC, CAWWCCG1)

Comment: We urge the Board to direct staff to work with the wastewater community to consider an exemption from the cap for wastewater facilities. Similar to the Marines plea, we think we're different. And though our mission is different, we think enabling you all to flush every day is a pretty critical activity as well. So our agencies can't control what comes into our facilities or the effluent requirements we need to meet, and those drive our emissions. So we request that you consider working with us going forward to consider an exemption. (CAWWCCG2)

> **Response:** We modified section 95852.2(a) to exempt the following from a compliance obligation: combustion emissions from biomethane; biogas from all animal and other organic waste or landfill and wastewater treatment plants; and fugitive, process, and vented emissions from CH_4 and N_2O from municipal wastewater treatment plants.

If in the future, any covered sources at these facilities trigger the threshold for a compliance obligation, we will evaluate the concerns related to cost pass through.

E-39. (multiple comments)
Comment: WIRA supports the staff position that GHG emissions associated with biodiesel not be subject to an allowance obligation. This policy will continue to promote the development of non-fossil fuel based alternative fuels. (WIRA1, PMTPETRO1)

Comment: We strongly support the changes to the language regarding emissions without a compliance obligation that are presented in Attachment B to today's resolution. These changes clarify staff's intent to exclude biogas emissions from cap and trade. And we support that as a way to beneficially use a digester gas that's produced around the state. (CAWWCCG2)

Comment: ATA supports the consistent treatment of biomass-derived fuels under the regulation with a reporting requirement, but no compliance obligation. This approach makes sense from both the perspective of encouraging development of alternative fuels and the perspective of addressing biomass-derived fuel emissions consistently across all sources. (ATAA)

Comment: We support modifications to the language in section 95852.2 that clarify staff's intent with respect to biomass sources without a compliance obligation. (EMWD, ACWA, CAWWCCG1)

Response: Thank you for the support.

E-40. Comment: Fugitive and vented emissions from natural gas systems are already being captured under the compliance obligation of Natural Gas Suppliers, since these entities will report using an “upstream approach,” meaning that the compliance obligation will be based on the volume of gas received at the State border or city gate minus volume of gas delivered to storage or entities directly regulated. Therefore, fugitives and vented emissions should be exempt from a direct cap and trade compliance obligation (in section 95852.2(f)) because they are already being captured under the compliance obligation of Natural Gas Suppliers. Because of the imprecise methodologies used in calculating natural gas system fugitive and vented emissions, and because these emissions are already being captured under the compliance obligation of Natural Gas Suppliers, they should be exempt from a direct cap and trade compliance obligation. PG&E recommends that section 95811 also be revised to reflect this change. Modify section 95852.2(f)(5) as follows:

(5) ~~At t~~The facility types listed in section 95101(e) of the Mandatory Reporting Regulation, Petroleum and Natural Gas Systems.~~: leak detection and leaker emission factors, stationary fugitive and “stationary vented” sources on offshore oil platforms~~ (PGE1)

Response: We have clarified section 95858.2 to exempt vented and fugitive emissions from several types of activities associated with Petroleum and Natural Gas systems.

E-41. Comment: Section 95852(h)(v) references exemptions listed in section 95852.2(a)(6). However, that section does not exist. It is PG&E's understanding that the list of exemptions in part (v) is supposed to reference section 95852.2(f). (PGE1)

Response: We modified this section, which is now included as section 95852(i).

E-42. Comment: ATA appreciates that the regulation more clearly excludes aircraft fuel from coverage under the regulation and no longer includes a placeholder for the inclusion of additional fuels in the future. The exclusion of aircraft fuel is necessary and appropriate in light of federal preemption of State regulation in this area. (ATAA)

Response: No response necessary.

E-43. Comment: CO_2e emissions from biomass plants will not be subject to the compliance obligation if certain verifiable criteria are met. Clarify section 95131(i), which states that if the fuel is not certified by an accredited certifier of biomass-derived fuels, the verification team shall examine the fuel contracts to determine if the fuel being provided under a contract dated after January 1, 2010, is only for the amount of fuel that is associated with an increase in the biomass-based fuel producer's capacity. This seems to state that a biomass purchaser cannot purchase additional fuel from a supplier unless the supplier has increased their fuel output. It would be allowed to purchase additional fuel from a supplier if a previous purchaser is no longer purchasing biomass fuel from that supplier. (CONSTELLATIONENERGY)

Response: We modified section 95131(i) of the MRR to clarify the verification requirements of biogas and biomethane; urban, agricultural, and forest wood waste; biodiesel and fuel ethanol; municipal solid waste; and tires. These modifications will assist verifiers with the assessment of these fuels. To avoid emissions leakage, only increased or new production of biomass-derived fuels is exempt from holding a compliance obligation. The contract date has been changed from January 1, 2010, to January 1, 2011.

E-44. Comment: We ask that the Board, when you move forward with the implementation of these cap and trade regulations, continue to recognize the greenhouse gas reduction benefits associated with waste-derived energy and resources. We urge you to continue to recognize biogas and biomass derived fuels as carbon neutral, particularly those biomass and biogas fuels that are derived from waste materials. (WM2)

Response: No response necessary.

Municipal Solid Waste

E-45. (multiple comments)
Comment: Waste-to-energy facilities have no ability to control the incoming MSW, so there would be no opportunity to reduce fossil-based CO_2 emissions, leaving the purchasing of allowances, or CARB compliance obligations, as the only option. Additionally, these facilities cannot pass these allowance costs through to their customers since the customers would instead choose the cheaper option of landfilling, resulting in a greater amount of greenhouse gas emissions, as described previously; an "internal to California leakage." CCEEB believes that these waste-to-energy facilities should receive a full exclusion from compliance obligations rather than the partial exclusion outlined in section 95852.2(d). This is consistent with other widely recognized International cap and trade frameworks, proposed federal climate legislation and the regional program, RGGI, which is an important consideration for future linkage. Finally, existing state law, H&S Code section 41516 recognizes the important nature of these facilities, and "that such projects should therefore be encouraged as a matter of state policy." A huge financial burden placed on local governments to purchase allowances, with a strong potential to actually increase greenhouse gases if these facilities were forced to close down, is not consistent with this state policy. (CCEEB)

Comment: The proposed regulation imposes great hardship on existing and potential future Waste-to-Energy facilities. ARB is taking the unprecedented step of requiring that waste-to-energy facilities be subject to a GHG emissions cap. Throughout the world, these facilities are treated as sources of renewable energy rather that sources of GHG emissions. The bulk of overall GHG emissions from waste-to-energy emissions (approximately 65 percent) are from biogenic waste sources (green waste, paper, etc.) internationally recognized as being part of the "near-term" carbon cycle that are not counted as part of a GHG Cap and Trade program. The remaining approximately 35 percent of emissions are from anthropogenic (fossil) sources, but these are waste sources that would be generated in any event as a waste (i.e., non-recyclable plastics). These are waste materials that are destined for disposal and, without waste-to-energy, would require disposal in a landfill. Even so, the fossil emissions of a typical waste-to-energy plant are lower than coal or oil-fired emissions and are only slightly higher than that of a combined cycled natural gas generating facility. Avoided emissions associated with waste-to-energy facilities, including:

- Avoided fossil fuel emissions from other energy sources,
- Avoided landfill methane emissions, and
- Avoided emissions associated with recycling and recovery of ferrous and non-ferrous metals that is achieved in a waste-to-energy plant.

These are avoided emissions that are unique to waste-to-energy and that cannot be achieved by any of the other fossil fuel (or renewable energy) sources. Indeed, if an overall life-cycle assessment of the fossil fuel energy source were used to include energy production and transportation emissions, the emissions associated with the other fossil energy sources would be even higher.

WM firmly believes that it is inappropriate to include waste-to-energy under California's proposed Cap and Trade program given the significant GHG reductions achieved by waste-to-energy, at least not without full recognition of the life-cycle benefits associated with WTE operations. Regulation of stack carbon dioxide emissions as a point source ignores the energy and environmental benefits of waste-to-energy facilities that are more fully defined through a life cycle assessment. The significant savings in greenhouse gas emissions resulting from waste-to-energy is not theoretical, but proven by substantiated, peer-reviewed analysis of site-specific data.

The recognition of waste-to-energy as a GHG reduction technology is not without significant precedent. Other greenhouse gas regulatory programs, such as the European Union Emission Trading Scheme (EU-ETS), the Regional Greenhouse Gas Initiative (RGGI), and Congressional climate change legislation (sponsored by California's Congressman Waxman And Senator Boxer) under consideration should be viewed as potential models upon which to base a new California Cap and Trade program, at least with respect to waste-to-energy.

Under the EU-ETS, by far the largest mandatory GHG Cap and Trade program, waste-to-energy facilities are specifically excluded due to their ability to reduce GHG emissions from waste management (just as CARB has already recognized for mandatory commercial recycling). In fact, the European Environment Agency (EEA) attributes considerable reductions in waste management GHG emissions to increased levels of recycling and waste-to-energy.

Under RGGI, which regulates fossil fuel-fired utilities only, waste-to-energy facilities are specifically excluded because they burn municipal solid waste.

Further, the U.S. House-passed Waxman-Markey federal cap and trade bill (H.R. 2454), while capping fossil-fuel fired utilities, among other sources, specifically excludes waste-to-energy plants which burn five percent or less of supplemental fossil fuel (e.g., natural gas or fuel oil as a supplemental fuel). The U.S. Senate Environment and Public Works Committee approved the same exclusion in the Boxer-Kerry (S. 1733) bill. The House bill and the Senate Energy and Natural Resources Committee's approved American Clean Energy and Leadership Act (S. 1462) also establish a federal Renewable Portfolio Standard that recognizes waste-to-energy as a renewable energy source.

Finally, the net reductions achieved by waste-to-energy have been recognized internationally under the Clean Development Mechanism, as part of the Kyoto Protocol. Waste-to-energy projects can generate credits through the approved methodology AM0025, "Avoided emissions from organic waste through alternative waste treatment processes."

The goal of each of these programs is promotion of technologies and practices that lower the release of greenhouse gases into the atmosphere. Waste-to-energy helps to achieve that goal and therefore has been appropriately excluded from all other cap and trade regimes.

Any cap and trade program established by ARB should embrace the same goal as the international programs: to support technologies and methods that lower greenhouse gas emissions into our atmosphere. To some extent, CARB is heading in the correct direction with regard to solid waste management. ARB has recognized that the Climate Action Reserve (CAR) as a possible entity through which tradable GHG reduction credits may be generated. CAR has already adopted a GHG offset protocol for waste conversion technologies that recognizes the benefits of diverting organic waste from landfills to reduce methane emissions. Indeed, the GHG reduction credits derived by the CAR protocol for conversion technologies is based on reduced landfill emissions, very similar to what is achieved by a waste-to-energy facility. However, to evaluate waste-to-energy facilities accurately, ARB should also recognize the additional GHG reductions achievable by waste-to-energy through metals recycling and the recovery of energy resulting from this alternative to fossil sources.

California is only beginning to embrace the benefits of waste-to-energy in managing solid waste and producing renewable electricity, although three such facilities already exist in California. California's AB 939 (Sher, 1989) recognizes the benefits of these three facilities by allowing landfill waste diversion credit for these operations. Additionally, CalRecycle recently completed a solid waste GHG lifecycle analysis that documents the greatest future reductions in solid waste GHG emissions involve a framework that heavily emphasizes the recovery of energy from waste, including the increased use of waste-to-energy.

Subjecting waste-to-energy facilities to a California GHG Cap and Trade system without recognizing their overall lifecycle benefits will be inconsistent with other California integrated waste management policies and will jeopardize the continuing economic viability of these operations. Any program that places waste-to-energy under the cap would have the unintended consequence of increasing the release of greenhouse gases since communities may choose to close facilities or cease pursuing new capacity rather than pay the cost of compliance with a cap-and-trade program. The potential closure or reduced operation by these facilities could easily result in more waste being disposed of in California landfills and reduced metal recycling and recovery, effectively a form of emissions "leakage" that ARB is aggressively attempting to minimize. By recognizing the net reductions in greenhouse gases achieved by waste-to-energy and not regulating it under a cap, ARB can insure that waste-to-energy continues as a viable means to reduce landfill disposal and increase metal recycling and recovery, along with associated GHG emission reductions.

CalRecycle recently completed a comprehensive life-cycle assessment of GHG reductions associated with waste management practices, by employing a life cycle assessment. The initial conclusions of the CalRecycle life-cycle assessment is that the greatest degree of GHG reductions from the waste and recycling sector is achieved by maximizing energy recovery from waste.

WM strongly requests that waste-to-energy facilities be recognized for their avoided GHG emission benefits that are unique to this energy source, consistent with other state, regional, national and international programs for the reduction of GHG emissions. Rather than include waste-to-energy in the proposed cap and trade regulations based solely on the fossil fraction of the waste-derived fuel WM recommends that ARB simply recognize the additional GHG reduction benefits associated with waste-to-energy by allowing waste-to-energy plants to be evaluated on a life-cycle basis rather than purely on fossil-based emissions. (WM1)

Comment: There are three waste-to-energy facilities plants in California. We urge the Board to take a look at a broader view of waste to energy and the multiple benefits, life-cycle benefits that waste to energy provides by diverting waste from landfills, providing additional metal recovery, and providing a useful energy source. Not only can the three facilitates continue to operate, but future waste-to-energy facilitates can hopefully go forward. (WM2)

Comment: CARB is proposing only a partial exclusion of waste-to-energy from compliance obligations of the cap and trade program based upon their biogenic portion of the waste stream. The fossil- based components of municipal solid waste (MSW), such as plastics, is treated very differently. It is this fossil-based portion of the waste stream that ultimately causes the CO_2 threshold to be triggered placing waste-to-energy facilities into the proposed program. We believe this conclusion is inappropriate for the following reasons: 1) U.S. EPA, under its Mandatory Greenhouse Gas Reporting Program, has recently changed the definition of "fossil fuel" by eliminating the language, "consumer products that are derived from such materials and are combusted." EPA did not intend to indicate that MSW combustion was not a renewable energy, taken as a whole. 2) Consumer products that were originally derived from fossil materials and cannot be further recycled should not be considered a traditional, discretionary fossil fuel. They are waste products that must be managed. The primary purpose of waste-to-energy facilities is the management of MSW. They should not be treated as traditional fossil fuel-fired electricity generators who can pick and choose their fuel supply. 3) Components of post-recycled MSW, such as contaminated plastics, do not currently have recycle markets and must be managed either in a waste-to-energy facility or landfill. Life cycle analyses, using methods developed by EPA and approved by CARB, demonstrate that if one counts the avoided methane from not landfilling this waste, the anthropogenic CO_2 generated from the waste-to-energy facilities that now count towards the cap and trade threshold would instead become negative (i.e., there would be a net greenhouse gas benefit). We believe CARB should fully exclude waste-to-energy facilities from any compliance obligations under the proposed program recognizing three factors:

- Not doing so will have a severe financial impact on the facilities and the local governments they serve, potentially forcing them to shut down and making them stranded infrastructure, unable to continue because of their inability to meet their bond payments;

- It has been shown, and verified by CARB, that operating these facilities avoids methane emissions at the local landfill, resulting in a net benefit (reduction) in greenhouse gases; and
- State law clearly states that these renewable energy facilities should be encouraged "as a matter of state policy." (LASD1, LASD2)

Comment: During the 1980's when three waste-to-energy facilities were built and operated in California, several state laws were enacted to support these facilities, the most important of which is contained in section 41516 of the Health and Safety Code. We believe that CARB's proposal is not consistent with this provision of state law and the intent of the Legislature to encourage operation of these three waste-to-energy facilities. Specifically, inclusion in the cap-and-trade program could cause the shutdown of these facilities causing greater amounts of greenhouse gas emissions in California given the likelihood that the waste stream would instead be discarded in landfills. We see no logic in this endpoint and, in fact, no other cap-and-trade program in the United States or the world includes waste-to-energy facilities. (LASD1, LASD2)

Comment: We believe that CARB's proposal is not consistent with this state law and the intent of the Legislature to encourage operation of these three waste-to-energy facilities. Namely, inclusion in the cap-and-trade rule could cause the shutdown of these facilities, which would have the opposite of the intended result by creating greater amounts of greenhouse gas emissions in California due to the fact that the waste would likely have to be disposed of via landfills. In fact, no other cap-and-trade program in the United States, or internationally, includes waste-to-energy facilities in a cap and trade program. State law clearly states that these renewable energy facilities should be encouraged "as a matter of state policy." (CREA)

Comment: Severe inequity of including renewable energy facilities and in particular the Commerce Refuse-to-Energy Facility (CREF), in CARB's cap and trade program could force these waste-to-energy facilities to shut down. We are requesting that these facilities be treated like the electric, gas and oil utilities, as well as other industries in the program, and receive free allowances. Not doing so places a severe financial burden on these facilities and the local governments under which they operate. Under the current CARB cap and trade proposal, waste-to-energy facilities will not enjoy the benefits of free allocations that are being offered to electric, gas and oil utilities, as well as other industries. No options are available except purchasing allowances to cover CREF's emissions compliance obligations. As the price of allowances inevitably increases, in time this amount could easily exceed one million dollars per year. We are requesting that CARB provide free allowances for the three California waste-to-energy facilities. (CREA)

Comment: The Board should modify the proposed regulations to remove the CO_2e allowance requirement for WTE facilities. Alternatively, the Board should provide free CO_2e allowances for California's WTE facilities pending further investigation by the Board of the considerable environmental benefits of WTE, including GHG mitigation benefits. That would be followed by additional rulemaking to rescind the counterproductive CO_2e allowance requirement for WTE facilities. (LGCRE)

Response: We did not modify section 95852.2 to provide a full exclusion from compliance obligations for waste-to-energy facilities. However, we continued excluding the biogenic fraction of MSW in section 95852.2(a)(7). We also modified this section to remove restrictions on the exclusion when the biogenic fraction of MSW is converted to a clean-burning fuel.

By including these facilities under the cap-and-trade program, the facilities will have an incentive to reduce fossil fuel emissions either through new technology or increased use of biomass-derived fuels. The commenters have been unsuccessful in demonstrating that GHG emissions from waste-to-energy facilities are lower than GHG emissions from diversion of the waste to landfills. Also, from an equity standpoint, we include all electricity generation sources in the cap-and-trade regulation.

E-46. Comment: Biomass-derived fuels should not be subject to a compliance obligation in the Cap and Trade Program. The "Greenhouse Gas Verification Requirements" section of ARB's Staff Report on Mandatory Reporting states that "Any biomass-derived fuels cannot also receive an offset credit in another voluntary or mandatory program and still be an eligible biomass-derived fuel for reporting as biomass CO_2 that would not be subject to an obligation in the cap and trade program." PG&E interprets this to mean that, for example, a livestock manure digester project (e.g. a dairy) that generated and sold offsets and combusted the biogas from that project either as a flare (i.e. stationary combustion) or as a self-generator of electricity would have a cap and trade compliance obligation for those combustion emissions if they were equal to or greater than 25,000 MT CO_2e. PG&E contends that biomass-derived fuel should not be subject to a cap and trade compliance obligation if it comes from a project that also receives offset credits, for the following reasons:

- It is inconsistent with ARB's Compliance Offset Livestock Manure (Digester) Project Protocol. Offsets from livestock manure digester projects, such as those that comply with the ARB Compliance Offset Livestock Manure (Digester) Project Protocol, are from the net change in emissions associated with installing a biogas control system (BCS) at the project's facility. As noted on page 6 and reiterated in Table 4.1 on page 9 of the Protocol, the CO_2 emissions associated with the generation and destruction of biogas (such as through flaring, electricity generation, or combustion as pipeline gas or CNG/LNG) are considered biogenic and are not included in a project's GHG Assessment Boundary. The protocol specifically notes that the CO_2 emissions from combustion of the biogas through flaring, during electric generation, or by an end user of pipeline or CNG/LNG, are excluded from the project's emissions.

- It is inconsistent with approaches taken by the Intergovernmental Panel on Climate Change (IPCC), U.S. EPA, and Department of Energy (DOE). Both the IPCC guidelines for CO_2 emissions from BCS21/ and the EPA in its Mandatory

Reporting of GHG Rule agree that the CO_2 emission are biogenic (as opposed to anthropogenic) and should not be counted towards a facility's GHG emissions, and, are therefore not subject to a compliance obligation. The IPCC Guidelines for National Greenhouse Gas Inventories states that "only fossil CO_2 should be included in national emissions under Energy Sector while biogenic CO_2 should be reported as an information item also in the Energy Sector." IPCC reasons that "CO_2 emissions from livestock are not estimated because annual net CO_2 emissions are assumed to be zero—the CO_2 photosynthesized by plants is returned to the atmosphere as respired CO_2." EPA's Inventory of U.S. GHG Emissions and Sinks specifically states that biomass combustion emissions of "biogenic origin" are excluded because "Fuels with biogenic origins are assumed to result in no net CO_2 emissions, and must be subtracted from fuel consumption estimates." Finally, DOE's voluntary GHG reporting program, 1605(b), states that "carbon dioxide emissions of biogenic fuels do not "count" as anthropogenic emissions under the Framework Convention on Climate Change because the carbon embedded in biogenic fuels is presumed to form part of the natural carbon cycle."

- Without the benefit of both energy and carbon offsets livestock manure digester projects are not cost effective. Even with full credit for carbon offsets and use of the project's biogas for self-generation or sold electricity, Livestock Manure Digester Projects are financially challenging. Although, ARB currently lists nineteen digester projects as operational, there are only eleven digester projects currently in operation in California. Many digesters have shut down for economic and/or operational reasons. In order for these projects to contribute to the State's GHG reduction goals, they need revenue from both the energy value of the biogas and carbon offsets. Finally, if these projects don't get built, there will be an increase in greenhouse gas emissions. (PGE1)

Response: We clarified that combustion emissions from digester biogas will not have a compliance obligation as long as any offset credits earned for methane capture in the digester project do not exceed those calculated using the Global Warming Potentials listed in the IPCC, Second Assessment.

E-47. Comment: I encourage you not to change the biomass provisions that you have proposed in your cap and trade. The treatment of biomass that you have in the law today is fully consistent with the treatment that EPA is developing in the tailoring rule. The tailoring rule progression to date has moved closer to California's treatment of biomass, and we're hoping it will continue to do that. Also, the rule does not assume carbon neutrality for all biomass. It only asserts carbon neutrality for biomass types for which actual carbon neutrality has been demonstrated in scientific studies. The use of the fuels that are listed in section 95852.2 does lead to demonstrable reductions in greenhouse gases when those fuels are used for energy production rather than disposed of in conventional means. (MORRISG)

Response: Thank you for the comment.

E-48. Comment: Kern is a small independent family-owned refiner with no upstream crude oil or downstream retail operations. I'd like to add one item to our written comments. That would be we would like to see renewable diesel added to the source categories for emissions without a compliance obligation. (KERNOIL2)

> **Response:** Section 95852.2 includes the fuel types that are exempted from holding a compliance obligation. The provision for biodiesel exemption does cover renewable biodiesel.

E-49. Comment: Include full life-cycle accounting of biofuel emissions. The proposed regulation excludes emissions from the combustion of biomass-derived fuels; biodiesel, fuel ethanol, municipal solid waste and biomethane from compliance (see section 95852.2). Life-cycle GHG emissions from the production and use of biofuels includes emissions from land-use change, fuel production and fuel consumption. The exclusion of biofuel combustion emissions is appropriate for the organic carbon in the fuel. Other provisions in the regulation account for stationary and transportation emission sources associated with biofuel production. However, the regulations do not account for the GHG emissions resulting from land-use change when crops are grown for fuel. CARB regulations should ensure that the full GHG impacts of biofuel production (e.g. land-use change) are accounted for in the cap and trade program. (CONOCO)

> **Response:** The point of regulation is to address emissions at the capped entities. Land-use emissions are beyond the scope of this regulation. The LCFS does take into account the full lifecycle emissions for biofuels and is a complimentary measure under the cap-and-trade program.

E-50. Comment: The Cap and Trade program will profoundly affect the San Joaquin Valley. Special consideration should be given to the health effects in this region. We share the concern of many public health and environmental justice organizations that the Cap and Trade program currently does not require biomass, solid waste, agricultural crops and waste, woody waste, and dairy and cattle operations to obtain emission allowances for their operations. These processes contribute to greenhouse gas emissions and other forms of air pollution as well. ARB should require these industries to comply fully with all reporting and allowance obligations in AB 32. (CATHCHAR1)

> **Response:** The cap-and-trade program does not allow any covered entity to avoid the existing requirements at the local, state, and federal level to address air emissions that may be harmful to public health. The cap-and-trade program is designed to reduce GHGs and include co-benefits for other air emissions. ARB and local air districts have specific programs designed to control local air emissions. The sources exempt from a compliance obligation are still subject to all other environmental protection regulations.

E-51. (multiple comments)
Comment: I am writing to urge you to amend the proposed cap and trade rule to eliminate the exemption from compliance obligations for forest biomass emissions. (FORMLETTER08)

Comment: Eliminate the exemption from compliance obligations for forest biomass emissions. (LISH)

> **Response:** We do not agree. All forest biomass must be reported and verified to be exempt from a compliance obligation.

E-52. Comment: The apparent intended use of the word "biomass-derived fuel" in the proposed regulations to mean anything that was ever living that is not now fossilized is confusing, since "biomass" has a pre-existing, and different, meaning in the energy industry, as generally referring to the items listed in 95852.2(a)(1), (2), (3) and (4). Biomethane from digesters is generally not considered biomass in the energy industry. See, e.g., California Energy Commission Renewable Energy Facilities Eligibility Guidebook 3rd ed., p. 3 ("biomass or biogas"), page 10 ("biogas" and "biomass" are two separate items on the table), pp.11 and 20, discussing biomass and biogas as completely separate resource categories, and Form CEC-RPS- I A/B (listing biomass and biogas as completely separate resource categories). (WEINSTEIN)

> **Response:** For the purposes of this regulation, we do consider biomethane to be a biomass-derived fuel for all intended purposes.

E-53. Comment: Since most people in the energy industry distinguish "biomass" from the other items in the broad list of fuel sources listed in 95852.2(a), in order to avoid confusion, it may be useful for the proposed regulations to use the word "organic" or "organically derived" rather than "biomass-derived" for the broad, all-inclusive concept for which "biomass-derived" is now used, and redefine and limit the defined term "biomass" to fuels in the nature of 95852.2(a)(1), (2), (3) and (4), to keep "biomass" as used in the regulations within the confines of traditional meaning of the word "biomass" in the energy industry. (WEINSTEIN)

> **Response:** We do not agree. The cap-and-trade regulation applies to more than just the energy industry. We have defined the term biomass for this specific program to include a reference to organic materials.

E-54. Comment: The proposed regulation prescribes, “An entity that has emissions from biomass-derived fuels is required to report and verity its emissions pursuant to the Mandatory Reporting Regulations section 95130 and has a compliance obligation for every metric ton of CO_2e emissions from biomass-derived fuels that would result from full combustion or oxidation of all fuel for emissions identified below.” The proposed regulation then proceeds to specify that source categories for which a compliance obligation ensues, including emissions from source categories not listed under section 95852.2 or emissions from source categories listed under section 95852.2

without the requisite documentation to establish the validity of biomass-derived fuels. The proposed language is unclear. IEP understands the proposed regulation to appropriately exempt from a compliance obligation those fuels that fall within section 95852.2 (assuming proper reporting, etc.). Furthermore, IEP understands that to the extent a biomass facility has a compliance obligation, that obligation will be associated only with the fuel consumed by the facility for which a compliance obligation actually exists, i.e. the calculation will be net of any emissions associated with the fuels indicated in section 95852.2. Modify section 95852.1 as follows:

(a) Emissions from source categories listed under section 95852.2 below are not subject to a compliance obligation;
(b) Emissions from source categories that are not listed under section 95852.2 below are subject to a compliance obligation; or
(c) Emissions, from source categories listed in 95852.2, without information and documentation necessary to establish the validity of biomass-derived fuels which are considered unverifiable pursuant to MRR section 95131(i) and are subject to a compliance obligation. (IEPA)

Response: We modified this section to further clarify our intent.

E-55. Comment: Section 95852.1 (p. A-63) regarding the compliance obligations for biomass-derived fuels contains some wording that appears to be unnecessary and should be removed for clarity. (The summary of and rationale for this section in the ISOR, at IX-39 to 40, is also unclear and should be reviewed). Section 95852.1(b) refers to the biomass verification requirements in section 95131(i) of the Revised MRR. Section 95131(i)(2)(A) of the revised MRR sets out very important (and detrimental) restrictions on the ability to treat emissions from biomass-derived fuels as zero-CO_2-emissions. Biomass-derived fuel purchased under contracts entered into after January 1, 2010, other than contracts for expanded production only, will not count as zero-CO_2-emissions. SCPPA strongly opposes the restriction in section 95131(i)(2)(A) of the revised MRR and will discuss the restriction in its comments on the revised MRR. However, if such a restriction is imposed, given its importance, it should be clearly set out in the Cap and Trade regulation, for example, in the definition of biomass-derived fuel or in section 95852.1 (directly rather than by cross-reference) rather than being included towards the end of a long and technical section headed "Requirements for Verification Services" in the revised MRR. Modify section 95852.1 as follows:

An entity that has emissions from biomass-derived fuels is required to report and verify its emissions pursuant to Mandatory Reporting Regulation section 95131~~0~~ and has a compliance obligation for every metric ton of CO_2e emissions from ~~biomass- derived fuels that would result from full~~ combustion ~~or oxidation~~ of all biomass-derived fuel from the categories ~~for emissions~~ identified below:

(a) ~~Emissions from s~~Source categories that are not listed under section 95852.2 below; or

(b) ~~Emissions, from s~~Source categories listed in 95852.2, without information and documentation necessary to establish the validity of the fuel as a biomass-derived fuel~~s~~ and which are therefore considered unverifiable pursuant to MRR section 95131(i). (SCPPA1, SCPPA5, SMUD2)

Response: The text in the MRR related to the exemption of biomass-derived fuels has been moved into section 95852.1. Restrictions regarding the exemption eligibility for biomass-derived fuels are required to prohibit emissions leakage. AB 32 explicitly requires us to limit emissions leakage in the design of the market program.

E-56. Comment: If ARB must make an adjustment to account for the emissions from combustion of biomass derived fuel, it is preferable that this adjustment be made in the manure offset protocol. The ARB could take into account the project emissions from combusting CO_2 and award a smaller number to offsets, such that the downstream compliance obligation exemption is preserved. This approach is preferable to having a compliance obligation on the gas, which would make it more difficult to market and thereby limit the number of projects undertaken, and the benefits to the State. (ABC)

Response: We have no restrictions on the exemption for combustion emissions from biogas from a manure offset project, other than the offset credits for captured or destroyed methane must not be greater than those calculated using the Global Warming Potentials in the IPCC, Second Assessment.

E-57. Comment: We urge ARB to clarify that a facility which was previously flaring its biogas and now re-directs that gas into productive use (or increases efficiency in its use of biogas) would also qualify for the compliance obligation exemption. (ABC)

Response: We clarified the regulation to exempt from a compliance obligation previously flared biogas now used for useful energy.

E-58. Comment: The proposed regulation language requires that fuel producers that have sold biomass-derived fuel to a California operator before 2010 to continue selling to the same operator in order to retain the compliance exemption. This holds the biomass derived fuel production facility captive to one buyer and gives that buyer an inordinate amount of market power. It unnecessarily restricts biomass derived production capacity that has historically supplied the state from being able to sell to another California buyer, when doing so would have no net impact on emissions or the cap. As long as a verifier can verify that a contract existed with a California buyer, there should be no requirement for the biomass derived fuel facility to continue to sell to the same entity in order to be eligible for the compliance obligation exemption. (ABC)

Response: We clarified the text to allow for exempt biogas that is sold to a capped entity in California to sell to a different capped entity in the state and still be exempt from a compliance obligation.

E-59. Comment: Under section 95852.1 and 95852.2 of the proposed regulations and section 95131(i) of the proposed revised Mandatory Reporting Rule (MRR), the compliance exemption for biomass-derived fuels is limited to: (1) fuel production that was obligated under contract to a California operator prior to January 1, 2010; and (2) fuel that is "associated with an increase in the biomass-based fuel producer's capacity." This restriction does not account for facilities which transport gas to California, but are not specifically under a contract. If an operator can provide concrete evidence (and a verifier can verify) that the output from a biomass-derived fuel was historically flowing to California, then that fuel is equally deserving of the compliance obligation exemption. (ABC)

> **Response:** We modified the text to allow such transferred biogas to be exempt if the fuel can be shown and verified to be combusted in California prior to January1, 2012, or was biogas not previously used to produce useful energy.

E-60. Comment: The American Biogas Council is concerned that some of the restrictions ARB has placed on the ability of biomass derived fuels to qualify for the compliance obligation exemption will have the unintended effect of limiting the nascent growth of the biogas industry. (ABC)

> **Response:** The eligibility requirements are to prohibit emissions leakage as required under AB 32.

E-61. Comment: The American Biogas Council strongly recommends that ARB allow facilities earning offsets under a digester protocol to claim a compliance obligation exemption. The American Biogas Council believes that biogas from manure digester offset projects is carbon neutral, and should qualify for the same compliance obligation exemption provided for other biogenic sources. In an offset project, an upstream offset is awarded for the conversion of methane to carbon dioxide (CO_2). The compliance obligation exemption, on the other hand, is awarded on the basis that the emissions from biomass derived fuel are biogenic. These are two distinct attributes and should be treated as such. (ABC)

Comment: Biogas from manure digester offset projects is carbon neutral, and should qualify for the same compliance obligation exemption provided for other biogenic sources. The emissions generated from biogas combustion are carbon neutral whether the biogas originated from a manure digester, a landfill, a wastewater treatment plant, or any other biogenic source. The fact that the manure digester is also receiving offset credits is no bar to the gas being recognized as carbon neutral. Offset credits are awarded for emission reductions or sequestration beyond a business as usual baseline. The digester will receive the same quantity of offset credits whether it flares the methane or puts it to productive use in generating electricity because the offset credits are awarded solely for the conversion of methane to CO_2. If the regulations do not provide a compliance exemption, the program runs the risk of encouraging livestock manure digester operators simply to flare methane instead of putting the gas to productive use through electricity generation. If ARB is concerned that the CO_2 emissions that result from methane digester biogas combustion are not being taken into account if a digester project receives offset credits for the full CO_2e value of the methane combusted and the use of the biogas receives a downstream compliance exemption, then CERP urges ARB to change the methane digester protocol rather than withhold the compliance exemption. The quantity of credits earned by a livestock manure digester project should be the difference between the baseline CO_2e and the actual CO_2 that is emitted due to the combustion of captured methane. If the protocol was so changed, there would be no justification for imposing a compliance obligation on livestock manure digester biogas downstream. The biogas is carbon neutral, and is as deserving of the compliance exemption as the other exempted sources. Imposing a downstream compliance obligation on methane digester biogas projects is highly problematic. These problems could be avoided by reducing the quantity of offset credits awarded upstream to account for the CO_2 emissions generated by the methane combustion and applying the biogas compliance exemption to biogas from methane digester offset projects. (CERP2)

> **Response:** We clarified the text to allow for biogas from a digester offset project to be exempt from a compliance obligation for its combustion emissions. The offset project only credits the capture and destruction of methane. The exemption applies to the combustion CO_2.

E-62. Comment: The American Biogas Council strongly recommends that ARB apply the biogas compliance exemption in a uniform manner, such that any facilities which have historically been providing biogas to a California entity remain eligible for the compliance obligation exemption. (ABC)

> **Response:** The compliance obligations are assessed at the covered entity, not at the fuel supplier, until 2015. In 2015, the fuel suppliers in California are subject to the cap, and biomass-derived fuels are exempt if they meet specific criteria in the regulation.

E-63. Comment: CARB's Low Carbon Fuel Standard (LCFS) establishes a global best practice for accounting for the GHG intensity of fuels. Through the development of the LCFS, the world has learned that biofuels can have greatly varying lifecycle carbon emissions, including important impacts related to land-use changes. Linking the cap & trade system to the LCFS to account for the carbon content of transportation fuels would support the goals and successful outcomes of both policies. Certain investigations within the LCFS are still on going, such as the Expert Workgroup on food versus fuel issues, and should be reviewed before any such exemptions are finalized.

We recommend allowing fuel providers the flexibility to choose between two options: 1) require allowances to cover the carbon content of the fuel, as proposed for other liquid transportation fuels; or 2) allow use LCFS accounting tools to determine the GHG burden of the fuel in order to adjust the compliance obligation.

The currently proposed exemption provides an implicit subsidy for surface transportation biofuels, regardless of their GHG profile. For example, a $20/ton GHG allowance price translates into a price advantage for conventional ethanol (on top of existing federal subsidies) equivalent to about $0.16-$0.20 per gallon of gasoline-equivalent. Conventional ethanol would also receive a competitive advantage over lower carbon alternatives, such as advanced biofuels that are a focus of in-state research and development investments and electricity and hydrogen meeting the 33 percent renewable portfolio standard. (ICCT1, ICCT2)

> **Response:** Lifecycle emissions are beyond the scope of this regulation. Any direct GHG reductions from covered entities as a result of LCFS would be appropriately recognized under the cap-and-trade program by a decrease in the compliance obligation for the emissions associated with the combustion of that fuel type. While that relationship is not a direct relationship, as one is carbon intensity and the other is actual emissions, we believe the current design of the cap-and-trade program to reduce overall GHG emissions is not in conflict with the LCFS.

E-64. Comment: In support of the ambitious goal of AB 32 to reduce California's GHG emissions to 1990 levels by 2020, CARB has estimated that ethanol emissions, as currently exempted from the cap and trade proposal, would hold steady at about 5 million metric tons per year from 2008 to 2020. There are many reasons why sales from ethanol and other transportation biofuels (not covered by the proposed cap) will likely grow in coming years: 1) ethanol blend levels in typical gasoline are increasing, currently to E10 (i.e., 10 percent ethanol from just under 6 percent) and potentially to E15 in the future; 2) the national Renewable Fuels Standard will more than double the amount of biofuels nationally; and 3) California is investing heavily in E85 infrastructure. While the effect of increasing sales volumes on GHG emissions depends in part on how these biofuels are produced, well-aligned regulatory programs are needed to ensure that the sales mix includes a rapidly increasing share of the lowest GHG biofuels. CARB's ambitious plan to meet AB 32 goals leaves no room for growth in emissions outside the cap, as might be expected from expansion in biofuels. (ICCT1, ICCT2)

> **Response:** The emissions cap from this program includes GHG emissions from fossil fuels. By allowing alternatives to fossil fuels that are not under the cap, we believe there is room for a growth in emissions from non-fossil sources outside the cap. Biomass-derived fuels that can be verified are exempt from a compliance obligation. There is no limit to how many emissions a covered entity may report and verify as emissions from biomass-derived fuels.

E-65. Comment: CAL FIRE supports sections 95852.1 and 9582.2 addressing biomass-derived fuel emissions. These sections require reporting of all biomass derived fuel emissions but exempt certain activities and conditions from allowance obligations, including wood and wood wastes generated from timber harvests permitted under the FPA, fuel reduction purposes, and stand improvement activities, so long as the emissions are documented and verified. CAL FIRE supports the sustainable utilization of forest wood waste for bioenergy production as a means of encouraging forest health treatments and contributing to California's renewable energy goals to reduce fossil fuel consumption through biomass energy generation. (DFFP1, DFFP2)

Response: Thank you for the support.

E-66. Comment: Support activities that encourage the recovery, recycling and reuse of waste materials. Do not allow CO_2 emissions from biomass energy and fuels to be considered carbon neutral. Landfill methane or emissions from burning waste should not be considered "carbon neutral", especially in light of the preferable environmental alternatives of composting and AD that will provide greater overall emissions reductions. Require waste-to-energy facilities to be subject to a GHG emissions cap. Do not consider waste-to-energy biogenic. Develop offset protocols that can create credits for the use of recycled materials. (SFMAYOR1)

Response: The regulation does include waste-to-energy facilities under the cap. ARB continues to work closely with its sister boards to evaluate alternatives to landfilling. Offset protocols must address direct reductions of GHG's at a project site for emissions that are not under the cap.

E-67. Comment: Section 95852(b) (p. A-62) establishes the compliance obligation for first delivers of electricity. This is a key provision for first delivers of electricity, so it is important that it is clear and correct. However, as currently drafted, this provision suffers from several defects:

- Section 95852(b) states that there is a compliance obligation for every metric ton of CO_2e for which a positive or qualified positive verification statement is issued. However, the report that a first deliverer of electricity is required to prepare and have verified under the revised MRR contains information about more sources of emissions than those for which the reporting entity has a compliance obligation. (See for example the information required to be reported under sections 95111(a)(7), (c)(1), (c)(5) and (g)(5) of the revised MRR). The subset of verified emissions that form the compliance obligation should be clearly identified.

- Section 95852(b) states that in addition to the emissions in the verification statement, the compliance obligation includes emissions from stationary combustion or from imported electricity. This incorrectly implies that there are emissions from stationary combustion or from imported electricity that are not included in the verification statement and do not need to be verified.

- Section 95852(b) should exclude from the compliance obligation emissions associated with facilities with emissions below 25,000 metric tons of CO_2e per year, as those emissions are not covered under section 95812(b)(2) (p. A-40). The reference to the first deliverer of electricity being covered under section 95812(b)(2) is not sufficient, as a first deliverer may have one facility that exceeds the threshold and one that does not.

- Section 95852(b) should exclude from the compliance obligation CO_2 emissions from the combustion of biomass-derived fuels listed in section 95852.2 and verified in accordance with section 95131(i) of the revised MRR.

Modify section 95852(b) as follows:

(b) First Deliverers of Electricity. A first deliverer of electricity covered under sections 95811(b) ~~and 95812(b)(2)~~ has a compliance obligation ~~for every metric ton of CO2e emissions for which a positive verification statement or qualified positive verification statement is issued, and~~ for every metric ton of CO_2e ~~of stationary combustion~~ emissions (subject to section 95852(h)) from electricity generating facilities in California, and ~~or~~ emissions associated with electricity imported into California from a source in a jurisdiction where a GHG emissions trading system has not been approved for linkage by the Board pursuant to subarticle 12, in each case where the thresholds set out in section 95812(b)(2) have been exceeded and for which a positive or qualified positive verification statement is issued. (SCPPA1)

> **Response**: We modified this section and added section 95852(b)(7), which contains an equation summing emissions with a compliance obligation. Staff has clarified the emissions that result in compliance obligation. This clarification includes clearly stating that the obligation is for the emissions that have a positive or qualified positive verification statement and where set thresholds have been exceeded.

E-68. Comment: Comments submitted to CARB by CBE in May of 2008 on the Scoping Plan identified, based on CARB data, methane emissions that are exempt from regulation. For example, three categories of Stationary Sources listed (Fuel Combustion, Petroleum Production and Marketing, and Industrial Processes) emitted about 466 tons per day (about 170,000 tons methane per year) of exempt compounds, which is likely to be mostly methane. This is about 4 million tons CO_2e per year. There is no reason to continue exempting these emissions, either for smog, or for GHG impacts. It is now known that methane is a considerable contributor to smog, as also discussed in this earlier comment. AB 32 requires the maximum technologically feasible GHG reductions of carbon dioxide, methane, nitrous oxide, hydrofluorocarbons, perfluorocarbons, and sulfur hexafluoride. Carbon is only one GHG. Furthermore, CARB should remove entirely the methane exemptions for all sources in the state, including transportation sources. CBE proposed this, and CARB found it to be a feasible reduction measure, but never implemented it. Now CARB should evaluate adding this measure as a complementary reduction, as an alternative to the current Cap and Trade proposal, in order to achieve the maximum technologically feasible reductions. (CBE1)

> **Response:** Methane emissions from combustion are covered under the program. Methane emissions from fugitive and vented sources are not covered because of the difficulties to accurately quantify them. Where we believe we

have accurate accounting and measurement methods for fugitive and vented sources, those are included under the cap. However, some fugitive and vented emissions may be covered under direct regulations by ARB in the future.

E-69. (multiple comments)
Comment: Only a fraction of oil and gas facilities are utilizing best practices to minimize fugitive emissions. By excluding these sources from the program, CARB is failing to encourage covered facilities to reduce fugitive emissions, and preventing the opportunity for large operators to take advantage of low-cost emissions reduction opportunities. (EDF1)

Comment: EDF recommends CARB remove the blanket exemption for fugitive emissions from the oil and gas sector and develop a framework to hold operators of oil and gas extraction sites accountable. With regard to the justification for the exemption in the ISOR document, (page IX-41), the reasoning given is that "entities whose aggregate emissions include fugitive emissions from the activities described will not count those emissions toward their total compliance obligation when reporting." [Refers to Section 95852(f)] Such an explanation is not reasoning, but rather a re-description of the exemption itself. EDF requests the agency provide a more detailed explanation of its reasoning for this exemption in the Final Statement of Reasons (FSOR) to be published when the rule is presented as a final agency action to the Office of Administrative Law. (EDF1)

Response: Fugitive, process, and vented emissions from sources as specified in section 95852.2(b) are exempt from holding a compliance obligation under the cap-and-trade regulation. This exemption harmonizes our regulation with the Federal EPA Mandatory Reporting Requirements. Accurate quantification of fugitive emissions at a level of accuracy sufficient for cap-and-trade would be technically difficult, very costly and time intensive. A large oil and gas producer may have thousands of components spread across a large geographic area. While labor-intensive methods are available to quantify fugitive emissions, determining the time period over which the leak has been occurring would require repeated measurements at a frequency that would not be practical given the large number and geographic distribution of these fugitive sources. If quantification methods are developed to provide accurate accounting of these emissions, they would potentially be included in the cap as part of a future rule amendment.

Point of Regulation

E-70. Comment: We support the transportation fuels sector's upstream point of regulation. (CPC1, CPC2, SONOMAFCC, FRIEDENBERG, FORMLETTER01, HANSON)

Response: Thank you for the support.

E-71. Comment: The CO_2 content of fuels should be regulated at the level of the fuel producers, in order to increase the efficiency of the regulation and provide incentives for CO_2 reductions. (BMWGROUP)

> **Response:** The cap-and-trade regulation imposes a compliance obligation for fuels at a so-called "upstream" point. Thank you for the support.

Opt-In Entities

E-72. (multiple comments)
Comment: We are concerned about the provision that would allow opt-in or voluntary associated facilities from purchasing allowances at ARB auctions. Further restrictions are needed to insure that opt-in or voluntary associated entities will not purchase and retire allowances thereby limiting the market and driving up costs of the limited pool of allowances. (ACC1)

Comment: The proposed rule includes two concepts that erode the cap. The first is the ability of certain entities to "opt in" to the program if they are among the classes of entities covered by the proposed rule but which do not emit CO_2e in excess of the applicable thresholds for the first compliance period. These "opt in" entities would consume part of the cap (no additional allowances would be available to cover the opt in entities), and would compete for allowances with entities that are required to submit compliance instruments. The second concept is the ability of non-covered entities to purchase allowances (or offsets) and retire them voluntarily, even though they are not required to submit allowances. Each of these options erodes the available pool of allowances and effectively reduces the cap available to covered entities that require allowances in order to survive economically. (HOR)

Comment: Prohibit entities that are not in the original compliance group from purchasing allowances and submitting them for retirement. Regulated entities should be able to purchase allowances for their own compliance purposes without being unnecessarily held up by unregulated entities. The purpose of the allowance market is to make the process more efficient and not to give third parties the ability to shut down existing businesses. (HOR)

> **Response:** We disagree. We do not think that it is appropriate to place further restrictions on non-covered entities participating in the cap-and-trade program. We have developed market rules associated with purchase and holding limits to address some of these concerns. We expect that the market effect from small opt-in and non-covered entities will be negligible in the context of the entire market.

Voluntary Retirement of Compliance Instruments

E-73. (multiple comments)
Comment: The Utilities strongly encourage CARB to restrict the voluntary retirement of compliance instruments to offsets only. The voluntary retirement of allowances by non-covered entities results in a reduction of the overall cap level for covered entities. A restriction on voluntary retirement to offsets only would provide a direct GHG reduction opportunity through the creation and retirement of CARB qualified and approved offsets while not increasing the cost burden to covered entities. Modify section 95922(d) as follows:

(d) Voluntary Retirement of Compliance Instruments.

(1) An entity registered pursuant to section 95930 may voluntarily submit offsets ~~any compliance instrument~~ for retirement.

(2) To voluntarily retire an offset ~~compliance instrument~~, the registered entity submits a transaction report to the accounts administrator listing its account number, the serial numbers of the [offsets] ~~instruments~~ to be retired, and the ARB Retirement Account as the destination account. (MID1)

Comment: The voluntarily retirement of compliance instruments must be done in an open and transparent way as this action directly impacts those covered entities that have a compliance obligation. Since the retirement of allowances by VAEs results in a reduction of the overall cap level and increases the cost burden for covered entities, the Utilities strongly support a provision whereby VAEs would only be allowed to retire offsets. This adjustment would provide VAEs with a direct GHG reduction opportunity through the creation and retirement of CARB qualified and approved offsets. In addition, such an approach would protect consumers from an unjustified price escalation due to an unduly constrained allowance market. (MID1)

Comment: NCPA is concerned that voluntarily associated entities (VAE) could have a detrimental impact on the ability of Covered Entities to obtain the allowances they need at costs less than the Reserve Account price. The proposed regulation needs to ensure that VAE participation in the market is designed so that entities with a compliance obligation are not adversely impacted. Such participation creates significant market power and market manipulation potential, and could have unintended consequences for compliance entities. While the ISOR advocates the inclusion of these entities as a means to allow entities without a compliance obligation to “voluntarily retire compliance instruments for the benefit of the environment” and believe that “allowing additional participants also increases market liquidity and creates a larger market,” (ISOR, p. IX-15), this can still cause adverse consequences for Covered Entities. The general economic theory is that more market players will lower costs; however, that may not necessarily be the case in practice. For example, even those with the most altruistic intent and the financial means to affect their intent to simply retire emissions could wreak havoc on the price of available allowances for those that need them for a compliance obligation.

NCPA appreciates the limitations that have been placed on the number of allowances that can be purchased by the VAE and restrictions on their ability to purchase from the Reserve Account, but believe that these limitations fall short of adequately addressing the potential adverse impacts. NCPA recommends that participation by VAEs be further restricted to surrender of offset allowances only, and that all of the transactions conducted through section 95831(c)(3) be publicly noticed and transparent. In the alternative, NCPA recommends that VAEs be able to only voluntarily surrender no more than 1 percent of California GHG allowances annually. (NCPA1)

> **Response:** We believe the market rules have been structured in a way to address these concerns. This includes provisions for purchase and holding limits. We believe the impact of voluntary participants will be negligible on the market and on the ability of covered entities to comply with the regulation.

E-74. Comment: NCPA recommends that section 95830(d)(3) be revised to require a registration deadline for VAEs, as all other auction participants must register with CARB a certain number of days prior to the auction. (NCPA1)

> **Response:** Section 95912(c) provides that any entity, whether a VAE or an entity with a compliance obligation, that is intending to participate in an auction must complete an auction registration 30 days in advance of the auction. Therefore, no change is needed.

Threshold for Compliance Obligation

E-75. Comment: The Utilities request clarification of subsection 95812(b) and how the entity and facility thresholds operate together. Clarify how facilities that do not exceed the facility threshold are factored in determining an entity's threshold and compliance obligation. The confusion occurs given the use of the word "aggregated." The language is circular, but seems to indicate that only facilities that exceed the facility threshold are to be counted in the aggregation. This reading makes the concept of aggregation redundant since one facility would tip the entity over the threshold. (MID1)

> **Response:** We removed the term "aggregated" from section 95812(b).

E-76. Comment: The last sentence of section 95812(b)(2)(B) (p. A-41) refers to specified sources that emit 25,000 metric tons of CO_2e per year. This provision is incomplete, as the treatment of facilities with emissions higher or lower than this level is not specified. This section should be corrected by adding the words "or more" as follows:

> (B) The threshold for an electricity importer from a specified source which emits 25,000 <u>or more</u> metric tons of CO_2e per year is zero. (SCPPA1)

> **Response:** We agree and modified this section accordingly.

Surrender of Compliance Instruments

E-77. (multiple comments)
Comment: To clarify draws from compliance account, modify section 95856(f)(3) as follows:

> (3) The Triennial Surrender obligation shall equal the Triennial Compliance Obligation calculated pursuant to section 95853 less allowances and offset credits <u>already surrendered</u>. (NCPA1)

Comment: SMUD requests clarification of the aforementioned missing words in section 95856(f)(3). If we are correct in our interpretation, the section should read as shown below, but if incorrect, ARB should clarify what the actual intent is of this section. Modify section 95856(f)(3) as follows:

> (3) The Triennial Surrender obligation shall equal the Triennial Compliance Obligation calculated pursuant to section 95853 minus less <u>compliance instruments</u> ~~allowances and offset credits~~ <u>previously surrendered for the compliance period via Annual Surrender obligations.</u> (SMUD1)

Comment: Section 95856(f)(3) (p. A-71) states that the triennial surrender obligation equals the triennial compliance obligation "less allowances and offset credits." This appears to be incomplete. The ISOR states (at IX-49) that "the triennial surrender obligation will account for compliance instruments already surrendered pursuant to the annual compliance obligation." Modify section 95856(f)(3) as follows:

> (3) The Triennial Surrender Obligation shall equal the Triennial Compliance Obligation calculated pursuant to section 95853 less allowances and offset credits<u> that have been surrendered to meet annual compliance obligations in the relevant compliance period pursuant to sections 95855 and 95856</u>. (SCPPA1)

Comment: The Utilities request clarification in subsection 95856(f)(3) regarding the proper calculation of the triennial surrender obligation. To be clear on what allowances and offsets are being factored, modify section 95856(f)(3) as follows:

> (3) The Triennial Surrender obligation shall equal the Triennial Compliance Obligation calculated pursuant to section 95853 less allowances and offset credits <u>already transferred to the covered entity's compliance account for the Compliance Period.</u> (MID1)

> **Response:** We agree and modified this section to clarify that compliance instruments already surrendered to fulfill the annual compliance obligation for years in the compliance period will count toward a covered entity's triennial compliance obligation.

E-78. (multiple comments)
Comment: Section 95856(g)(1) (p. A-71) states that the Executive Officer will retire the compliance instruments surrendered. "Surrender" is not defined. It should be clarified that the Executive Officer will only retire the number of compliance instruments equal to the compliance obligation, leaving any excess compliance instruments in the holder's compliance account for use against future compliance obligations. Modify section 95856(g)(1) as follows:

> (1) Retire the <u>number of</u> compliance instruments <u>equal to the triennial compliance obligation</u>~~surrendered~~. (SCPPA1)

Comment: To clarify draws from compliance account, modify section 95856(g) as follows:

(g) When the Executive Officer has determined the covered entity has met its surrender obligations, the Executive officer shall:

> (1) Retire <u>only</u> the <u>number</u> of compliance instruments <u>necessary to meet the Triennial Surrender Obligation of the covered entity pursuant to subsection (f) above</u> ~~surrendered~~; and . . . (NCPA1)
>
> **Response:** We do not agree that the suggested change is necessary because surrender is adequately described in section 95856.

E-79. Comment: Deadlines should be established for ARB decision-making processes to provide entities with a degree of certainty. Modify section 95856(e)(3) as follows:

> (3) When the data review and reconciliation process, as stated in section 95104 of the Mandatory Reporting Regulation, for a covered entity has concluded, the Executive Officer shall issue a final determination of the covered entity's triennial compliance obligation <u>within 30 days</u>. (CCEEB1)
>
> **Response:** We removed this section from the regulation as it was unnecessary, so the comment is no longer relevant. Data reported under MRR is subject to any reviews and appeals between the reporter and verifier. As this data feeds directly into the cap-and-trade program, another review process would be redundant.

E-80. Comment: There should not be an annual compliance obligation in the same year as the triennial compliance obligation. Although the cap and trade regulation is structured around three-year compliance periods, sections 95853, 95855, and 95856 establish annual and triennial compliance obligations and lay out when these obligations must be met through surrender of sufficient allowances. In the case of annual compliance obligations, the partial surrender required is 30 percent of verified emissions from the previous year, and this amount is due by July 15 of the following year for electric utilities. In the case of the triennial compliance obligation, occurring at the end of the compliance periods established in the regulations, the surrender required is generally 100 percent of the verified emissions from the three-year compliance period, due on November 1 of the following year. Section 95856(f)(3) is intended to suggest, in SMUD's opinion, that the amount of compliance instruments that should be surrendered is the amount needed for triennial compliance minus the amount already surrendered via annual compliance surrender, but missing words obscure the meaning of this section. SMUD believes that there should not be an annual surrender in the same year as the triennial surrender, as the two surrender obligations in the same year increase transaction costs unnecessarily. Modify section 95855 as follows:

<u>(c) there is no annual compliance obligation in the same year in which there is a triennial compliance obligation.</u> (SMUD1)

> **Response:** We agree and added section 95856(d)(3) to clarify that there is no annual compliance obligation in years 2015, 2018, and 2021.

E-81. Comment: After initially determining an entity's compliance obligation, the Executive Director should provide an opportunity for the entity to query the determination. Section 95856(e)(3) (p. A-71) appears to provide for such a process by referring to a "data review and reconciliation process, as stated in section 95104 of the Mandatory Reporting Regulation." However, section 95104 of the revised MRR does not contain any provisions relating to data review and reconciliation. Provisions for such a process, incorporating an opportunity for covered entities to query determinations and present further evidence, should be drafted and included in the revised MRR or the Cap and Trade regulation, and there should be a correct cross-reference in section 95856(e)(3) to that new provision. (SCPPA1)

> **Response:** We removed section 95856(e)(3) from the regulation, so a cross-listing with the corresponding MRR section is no longer necessary. The GHG data report will be verified through an interactive process between a third-party verifier and the covered entity. Any discrepancies should be found and corrected as part of this process. The compliance obligation will be based on the verified emissions. We do not believe another review of the reported data is necessary once the verification opinion is submitted.

E-82. Comment: The Utilities would like clarification as to how the annual compliance obligation is calculated in the event of a "non-qualified verification" per CARB's Mandatory Reporting Regulations (MRR) for the previous year's emissions report. (MID1)

> **Response:** We modified the cap-and-trade regulation to clarify that emissions will be assigned pursuant to section 95131 of the Mandatory Reporting Regulation. We also modified the MRR regulation to describe how emissions would be assigned.

E-83. Comment: Modify section 95852(h) as follows:

(h) The compliance obligation is calculated based on the <u>CO_2e</u> ~~sum of~~ emissions <u>determined from (i) emissions</u> ~~of CO_2, CH_4, and N_2O resulted from combustion of fossil fue.~~ (CAPCOA1, CAPCOA2)

Response: We removed this section of the regulation, so the suggested edit is no longer relevant. We added new section 95852(i), which describes the calculation of the compliance obligation.

E-84. Comment: Section 95855 (p. A-69) provides that an entity has an annual compliance obligation for any year when it is a covered entity, unless it first becomes a covered entity in the third year of a compliance period. This exemption does not seem sufficient. There is only a short period between when an entity may first discover that it has become covered and when the first annual compliance obligation becomes due. It may be difficult for a newly-covered entity to obtain compliance instruments in this period. The exemption from the annual compliance obligation should be for the first year in which an entity becomes a covered entity, regardless of whether that year is the first, second, or third year of a compliance period. (SCPPA1)

Response: We do not believe that an exemption is warranted and that entities should conduct due diligence in monitoring their emissions levels as reporting is already required for entities that exceed 10,000 $MTCO_2e$.

E-85. Comment: Section 95855(b) refers to "positive or qualified positive GHG emissions reported from the previous data year." This appears to be a reference to positive or qualified positive verification statements, which are separate from emissions reports. This should be clarified. Modify section 95855 as follows:

(a) An entity has an annual compliance obligation for any year when the entity is a covered entity except for the <u>year in which the entity initially exceeds the relevant threshold in section 95812.</u> ~~condition specified in section 95853(d); and~~

(b) The annual compliance obligation for a covered entity equals thirty percent of <u>covered emissions reported in a</u> positive or qualified positive <u>verification statement for</u> ~~GHG emissions reported from~~ the previous data year. (SCPPA1)

Response: We agree and modified section 95855(b) with a change similar to that suggested by the commenter.

E-86. (multiple comments)
Comment: The Utilities have developed a timeline showing the various proposed deadlines for electric utilities that are covered entities. The timeline is included as Attachment A to these comments. The Utilities have submitted a request to CARB staff working on the changes to the MRR that the verification deadlines be consolidated to October 1 each year for both operators and suppliers of electric power entities. Similarly, the Utilities are requesting here that the annual and triennial surrender deadline be consolidated to November 1 in an effort to increase administrative simplicity

and harmonization for the covered entity, especially given that these deadlines are subject to enforcement action. The Utilities believe that the annual surrender dates must follow verification, further justifying a November 1 date. Modify section 95856(d) as follows:

(d) Deadline for Annual Surrender. For any year in which a covered entity has an annual compliance obligation pursuant to section 95855, it must fulfill that obligation by November 1 of the calendar year following the filing of an entity's reports pursuant to section 95103 of the MRR.

~~(1) By May 15 of the calendar year following the year for which the obligation is calculated if the entity reports by April 1 pursuant to section 95103 of the MRR.~~
~~(2) By July 15 of the calendar year following the year for which the obligation is calculated if the entity reports by June 1 pursuant to section 95103 of the MRR.~~
(MID1)

Comment: The deadline for annual surrender should be aligned with the three-year compliance period surrender deadline, page A-70. Subparagraph (b) on page A-69 indicates the annual compliance obligation equals 30 percent of a positive verification statement or qualified positive verification statement from the previous year. LADWP supports this annual surrender obligation as a reasonable balance between providing needed flexibility and identifying entities at risk of default. LADWP recommends further streamlining of the surrender deadline to a single date of November 1 of the following calendar year, rather than two separate dates of May 15 and July 15. Vertically integrated electric utilities have two reporting deadlines, one for facility-level reporting, and another for entity-level reporting. A single annual surrender deadline that occurs after these two dates provides for less complexity. Modify section 95856 as follows:

"Compliance Period 1 Annual Surrender Deadlines:
1) Thirty percent of 2012 emissions are due November 1, 2013
2) Thirty percent of 2013 emissions are due November 1, 2014
3) Remaining emissions for 2012-2014 are due November 1, 2015

Compliance Period 2 Annual Surrender Deadlines:
4) Thirty percent of 2015 emissions are due November 1, 2016
5) Thirty percent of 2016 emissions are due November 1, 2017
6) Remaining emissions for 2015-2017 are due November 1, 2018

Compliance Period 3 Annual Surrender Deadlines:
7) Thirty percent of 2018 emissions are due November 1, 2019
8) Thirty percent of 2019 emissions are due November 1, 2020
9) Remaining emissions for 2018-2020 are due November 1, 2021." (LADWP1)

Comment: Section 95856(d) (p. A-70) sets surrender deadlines of May 15 or July 15 for the annual compliance obligation. However, the annual compliance obligation is calculated based on "positive or qualified positive GHG emissions." Qualified or positive qualified verification statements are not due until September 1 or October 1. The surrender deadline for the annual compliance obligation should be changed to occur after the due date for verification statements. To align with the surrender deadline for the triennial compliance obligation, the due date for the annual compliance obligation should be November 1. For the third year of each compliance period, the annual compliance obligation and the triennial compliance obligation would be due together. Modify section 95856(d) as follows:

(d) Deadline for Annual Surrender. For any year in which a covered entity has an annual compliance obligation pursuant to section 95855, it must fulfill that obligation by November 1 of the following calendar year. For any year in which the covered entity's annual compliance obligation and triennial compliance obligation coincide, the obligations shall be satisfied coincidentally.~~:~~

> ~~(1) By May 15 of the calendar year following the year for which the obligation is calculated if the entity reports by April 1 pursuant to section 95103 of the MR;~~
> ~~(2) By July 15 of the calendar year following the year for which the obligation is calculated if the entity reports by June 1 pursuant to section 95103 of the MRR.~~
> (SCPPA1)

Comment: WSPA recommends ARB change the deadline for annual surrender from May 15 to November 1. Section 95855(b) requires that covered entities surrender 30 percent of their obligations by May 15, based on the previous year's emissions report. As verified reports are not available until September 1, the surrender obligation would be via an unverified report. If the unverified report contains errors that are subsequently corrected, the covered entity could be liable for penalties. (WSPA1)

Comment: Amend annual surrender deadline to date when verified emission reports are available. November was selected to coincide with triennial surrender date. Modify section 95856(d) as follows:

(d) Deadline for Annual Surrender. For any year in which a covered entity has an annual compliance obligation pursuant to section 95855, it must fulfill that obligation

> (1) By ~~May 15~~ November 1 of the calendar year following the year for which the obligation is calculated if entity reports by April 1 pursuant to section 95103 of MRR;
> (2) By July 15 of the calendar year following the year for which the obligation is calculated if... (CCEEB1)
>
> **Response:** We agree and changed the surrender deadline to November 1. We have also modified the text so that in the year after the compliance period ends there is only a triennial surrender obligation, not an additional annual surrender obligation.

E-87. Comment: Section 95856(d)(2) requires the annual surrender of allowances within 45 days of when the facility has reported the previous year's GHG emissions but prior to having the emission reports verified. Praxair recommends that CARB amend this provision and allow covered entities until 45 days after the GHG emissions report has been reviewed and passed the required verification process. (PRAXAIR)

Response: We agree and extended the deadline until November 1.

E-88. Comment: Section 95856(e)(3) provides for the Executive Officer to issue a final determination of a covered entity's triennial compliance obligation after a data review and reconciliation process. No timeframe for the Executive Office to issue these final determinations is specified. An entity should not be required to fulfill its triennial compliance obligation until after it has received the final determination. Modify section 95856(f)(1) (p. A-71) as follows:

The covered entity must transfer sufficient valid compliance instruments to its compliance account to fulfill its triennial surrender obligation by the later of November 1 of the year following the third year of the compliance period, or 15 days after the covered entity receives the Executive Officer's final determination under section 95856(e)(3). (SCPPA1)

Response: Since section 95856(e)(3) has been removed from the regulation, the suggested change is no longer relevant. This section was removed as the data used to establish the compliance obligation is already subject to review and appeal under the MRR.

E-89. Comment: Section 95853 (p. A-67) states that triennial compliance obligations are calculated based on total verified emissions. However, several categories of emissions that are reported by a first deliverer of electricity and verified in a verification statement are not used to calculate that entity's compliance obligations. Thus, the term "total verified emissions" should not be used as a basis for computing an entity's compliance obligations. A different term such as "total verified covered emissions" should be defined with reference to section 95852 and then used throughout section 95853 in place of every reference to "total verified emissions." Modify section 95853(a) as follows:

(a) The covered entity's triennial compliance obligation in this situation is calculated as the total verified emissions specified in section 95852 as constituting a covered entity's compliance obligation ("covered emissions") from all three data years of the compliance period. (SCPPA1)

Response: We agree and modified the regulation with similar text.

E-90. (multiple comments)
Comment: The proposed regulation should provide greater flexibility in meeting the compliance obligations by removing some temporal restrictions on the purchase of allowances. The proposed regulation would not allow a regulated entity to procure emissions allowances corresponding to a year later than when the emissions actually occurred. This restriction could create a compliance hurdle in meeting the triennial

compliance obligation, which is due in November of the first year following the end of the triennial period. If a regulated entity discovers it does not have enough emissions allowances at the end of the triennial period (e.g., after 2014), the regulated entity would only be able to procure emissions allowances in auctions that have a previous year's vintage (e.g., allowances from 2012-2014, but not 2015). While it is understandable that ARB would seek to limit unnecessary delays in compliance, there are legitimate reasons that a covered entity may need to secure some allowances in a subsequent annual period. Accordingly, ARB should not extend its temporal restrictions to the triennial compliance period. (PACIFICOR1)

Comment: The proposed regulation would not allow a covered entity to procure emissions allowances from a year later than the year the emissions were actually emitted (section 95856(b)(2), p. A-70). This restriction could create a compliance hurdle in meeting the triennial compliance obligation, which is due in November following the end of the triennial period. If a regulated entity discovers it does not have enough emissions allowances at the end of the triennial period (i.e., after 2014), the regulated entity would only be able to procure emissions allowances in auctions that have a previous year's vintage (i.e., allowances from 2012-2014, but not 2015). While it is understandable that CARB would seek to limit compliance procrastination, there are legitimate reasons related to variance in consumer demand for product or advantageous market conditions for product manufacture that may result in a covered entity needing to secure some allowances in a subsequent annual period, particularly where its operations are not easily forecasted or are subject to demand drivers outside of its control. Accordingly, CARB should relax its temporal restrictions to the triennial compliance period to provide some flexibility in meeting obligations that arise from market conditions or operations late in the compliance period. (PRAXAIR)

> **Response**: The regulation does not hinder an entity's ability to procure allowances for the current compliance period. However, the regulation does not allow allowances from the current year to meet past triennial compliance obligations. We believe this requirement is necessary to ensure the environmental integrity of the cap. We believe that borrowing should be limited to the purchase of allowances from the Allowance Price Containment Reserve. We anticipate a secondary market in which allowances from past vintages will be available for procurement. The program is also designed to promote due diligence on the part of the entity to monitor and acquire compliance instruments in a timely manner.

E-91. Comment: CARB should clarify which allowances can be used for compliance in a given year. Section 95856(b)(2) states that with limited exceptions, a compliance entity may only use a compliance instrument "issued from an allowance budget year within or before the year during which the compliance obligation is calculated." SCE requests that CARB clarify whether this "compliance obligation" is calculated in the year on which the payment comes due (e.g., 2015 for the first compliance period) or in the year in which the emissions were released (e.g., through 2014 for the first compliance period). This clarification will assist compliance entities in planning a reasonable and achievable schedule for attaining precisely enough compliance instruments to meet its needs for each compliance period. (SCE1)

Response: We have provided the requested clarification by changing "the year during which" to "the year for which."

E-92. Comment: The regulation should include an appeal process to address technical reporting issues affecting the timely surrender of compliance instruments. Section 95856 outlines the provisions for the surrender of compliance instruments, including data review and determination of a covered entity's triennial obligation and final retirement of the compliance instruments by the ARB Executive Officer. It is unclear if and when a covered entity may appeal the Executive Officer's final determination of a compliance obligation. It is possible that there may be technical differences of opinion between the covered entity and the verifier as to the calculation of emissions that are subject to a compliance obligation. LADWP recommends that an additional subparagraph be added to this section. Modify section 95856 as follows:

<u>(h) Appeal Process.</u>

<u>(1) The covered entity may appeal its triennial compliance obligation within 15 days of receiving the final determination.</u>

<u>(2) An appeal must be submitted in writing to the Executive Officer and must include a detailed explanation of what is being contested. Additional new information may be submitted in support of the appeal.</u>

<u>(3) The covered entity must surrender compliance instruments equivalent to the emissions not subject to the appeal, and hold the balance of compliance instruments in its compliance account to cover the remaining emissions as identified in the Executive Officer's final determination while the appeal is reviewed.</u>

<u>(4) Upon final review and resolution, a written notification shall be sent to the covered entity that includes any findings of the Executive Officer in response to the appeal as well as any necessary adjustments to the covered entity's final triennial compliance obligation.</u>

<u>(5) The Executive Officer shall retire the compliance instruments in the compliance account equivalent to the emissions identified in the written notification. Any remaining allowances deemed not subject to a surrender obligation shall remain in the compliance account for future surrender obligations.</u> (LADWP1)

Response: We have considered whether to include an appeals process for the cap-and-trade regulation. We have concluded that it is not appropriate to specify such a process in the regulation. The MRR contains a provision for a dispute resolution between reporting entities and their verifiers. The results of the verified emissions data reports support the calculation of the compliance obligation. The cap-and-trade rule will rely on the data collected from MRR to determine the compliance obligations for entities.

E-93. (multiple comments)
Comment: The Utilities are unclear as to the process where, accidentally or due to circumstances varying from forecasts, a compliance entity transfers more compliance instruments into its compliance account than are required to meet a compliance obligation (as opposed to the process for "excess emissions" which is clearly defined in section 95857). Subsection 95831(a)(4) states that once a compliance instrument is transferred into the compliance account it may not be removed by the covered entity, and section 95856 states that compliance instruments transferred into the compliance account will automatically be retired at the appropriate surrender date. The Utilities request clarifying language to be included in section 95856 articulating a process for truing up excess compliance instruments. Compliance instruments in excess of the surrender obligation could be transferred by an account administrator back into the covered entity's holding account, or alternatively, held in the covered entity's compliance account until the next surrender deadline. The Utilities request clarification that CARB would not retire any compliance instruments in excess of the surrender obligation unless specifically requested by the covered entity. (MID1)

Comment: The Utilities are seeking clarification regarding treatment of excess compliance instruments in a compliance account that exceed the entity's surrender obligation. Modify section 95856(g) as follows:

(g) When the Executive Officer has determined the covered entity has met its surrender obligations, the Executive Officer shall:

> (1) Retire the compliance instruments surrendered, provided, however, in the event the number of compliance instruments contained in a compliance account at the end of the compliance period exceeds the entity's surrender obligation, the Executive Officer shall retain the excess instruments in the compliance account unless the entity requests the excess instruments be retired or returned to the entity's holding account; and (MID1)
>
> **Response:** We do not believe the recommended changes are necessary. The compliance obligation is based on the reported and verified emissions for which there is a compliance obligation. To meet a surrender obligation, an entity must provide enough compliance instruments to equal its compliance obligation into its compliance account. The Executive Officer will not retire any compliance instruments in excess of the compliance obligation from the compliance account of an entity. It is necessary to restrict the movement of compliance instruments from the compliance account to appropriately apply the market rules designed for the program.

E-94. Comment: As written, a significant percentage of allowances will be unavailable for trading in closing months of a compliance period due to the compliance accounts, holding limits and annual surrender. In the months preceding final true-up, compliance entities will be aware of the fact that they must hold enough of the proper vintage allowances in order to meet their final true-up (for this first compliance period, this will mean vintages 2012, 2013 and 2014). This will cause many compliance entities to conservatively bank the proper vintages, leading to little allowance availability, greatly reduced liquidity and a potential crisis in market confidence during the 2015 true-up period. These problems could be exacerbated by non-compliance entities that bank and carry-over allowances. During this time, compliance entities will have in hand 2015 vintage allowances, allocated early in 2015. Unfortunately, the regulation as written prohibits use of these allowances for use in 2015 true-up for the 2012-2014 compliance period. In order to increase allowance availability, liquidity and market confidence, the regulation should prohibit non-compliance entities from carrying allowances across compliance periods and should allow use of vintages that correspond to the year in which the surrender must be made, as well as earlier vintages. Modify section 95856(b)(2) as follows:

(2) To fulfill any compliance obligation, a compliance instrument must be issued from an allowance budget year within or before the year during which the compliance obligation is <u>to be surrendered</u> ~~calculated~~. (BP)

> **Response:** We disagree with this specific suggestion, which would effectively allow borrowing. We believe borrowing should not be allowed, except for any allowances purchased from the Allowance Price Containment Reserve. We further disagree that we should allow compliance entities to carry forward allowances from one compliance period to the next but prohibit non-compliance entities from doing so. This would run counter to our stated goals to promote a broad and liquid market for compliance instruments.

E-95. Comment: ARB should amend its rules to be consistent with the three-year compliance period. PG&E supports ARB's choice of a three-year compliance period, and requests that ARB clarify the proposed regulation as necessary to ensure that ARB's intention is achieved. As currently written, section 95856(b)(2) appears to require that each ton of emissions be covered by an allowance from the same or a prior budget year, so that higher emissions during a dry 2012 could not be covered by 2013-vintage allowances. Modify section 95856(b)(2) as follows:

(b)(2) To fulfill any compliance obligation, a compliance instrument must be issued from an allowance budget year within or before the ~~year~~ <u>three-year compliance period</u> for which the compliance obligation is calculated." (PGE1)

> **Response:** We disagree. The suggested change would allow entities to meet their annual compliance obligations with allowances from a future vintage year. For example, this comment's suggestion would allow 2014 vintage allowances to meet a 2013 annual compliance obligation. We want to prevent this form of borrowing and ensure the environmental integrity of the program in later years.

Untimely Surrender Obligation

E-96. Comment: Section 95857(d)(2)(A) states that when the covered entity meets its obligations pursuant to subsection (c) "Recovery of Untimely Surrender Obligations", the Executive Officer shall transfer three-fourths of the allowances to the highest-priced tier of the Allowance Price Containment Reserve Account. As discussed earlier in these comments transferring allowances into the Price Containment Reserve Account will remove those allowances from the first market the auction and may inadvertently and unnecessarily tighten the cap. Modify section 95857(d)(2)(A) as follows:

> (A) Three fourths to the highest-priced tier of the Allowance Auction Holding Account ~~Price Containment Reserve Account~~; and
> (B) One fourth to the Retirement Account." (SEMPRA1)

Response: We agree and modified the regulation as suggested.

E-97. Comment: In sections 95820 and 95821, there are references to the "quantitative usage limit set forth in section 95995." SMUD believes that there is a technical error in this reference and that the text should refer to" the quantitative usage limit set forth in section ~~95995~~95854." (SMUD1)

Response: We agree and corrected both sections.

E-98. (multiple comments)
Comment: Covered entities should be allowed to use offsets to cover the standard obligation portion of their excess emissions obligation. Section 95857 lays out the requirements for surrendering additional allowances upon a shortfall in meeting an Annual or Triennial Compliance obligation**.** SMUD understands that the untimely surrender obligation is essentially four times the timely surrender obligation, and that the regulation states as written that the untimely surrender obligation must be met with allowances, not offset credits. SMUD believes that this is unfair, and suggests that the portion of that untimely surrender obligation that would be required for timely surrender be allowed to be met with offsets. Modify section 95857(b)(3) as follows:

(b)(3) Three quarters of a~~A~~ covered entity's compliance obligation for untimely surrender may only be filled with CA GHG allowances or allowances issued pursuant to subarticle 12. One quarter of a covered entity's compliance obligation for untimely surrender may be filled with any compliance instruments eligible under subarticle 4, subject to the quantitative usage limit established in section 95854. (SMUD1)

Comment: Section 95857(b)(3) (p. A-72) provides that a covered entity may surrender allowances but not offsets to fulfill an untimely surrender obligation. The ISOR states (p. IX-51) that this is to ensure the obligation "results in further environmental improvement." However, the strict criteria for offsets will ensure that offsets, being "additional," also lead to environmental improvement. Thus, there should be no prohibition on using offsets to satisfy the untimely surrender compliance obligation, and section 95857(b)(3) should be deleted. (SCPPA1)

Comment: Offsets should be eligible for use in paying a penalty. Under the proposed regulations, offsets cannot be turned in as part of the compliance instrument penalty paid by a covered entity that misses a compliance deadline. The entity must turn in four allowances for each compliance instrument outstanding. The ineligibility of offsets in this context will further devalue offsets relative to allowances. CERP asks ARB to consider allowing covered entities to turn in offsets for at least some portion of a penalty obligation. (CERP1)

> **Response:** We agree with this comment and modified the regulation accordingly.

E-99. Comment: The Sanitation Districts recommend that offsets be allowed to cover an entity's compliance obligations in situations of excess emission, in addition to allowances. Such a restriction on the use of offsets is extremely punitive for the entity with a compliance obligation and is another barrier against creating offsets. (LASD1)

> **Response:** We believe we have removed the perceived “extremely punitive” restriction against offsets by other means. We modified the regulation to allow the use of offsets if that can be done without violating the offset usage limit. Allowances surrendered to meet three-quarters of the obligation will now be placed into the Allowance Holding Account instead of in the Price Containment Reserve Account.

E-100. Comment: Section 95857(c)(4) (p. A-73) provides that an entity has 30 days to secure allowances needed to cover its untimely surrender obligation. This period may or may not include an allowance auction. If there were no allowance auction in this period, the entity may find it difficult to obtain enough compliance instruments. We request that ARB modify this section to give the entity 30 days or, if later, five business days after the next allowance auction to obtain the needed compliance instruments. Modify section 95857(c)(4) as follows:

(4) If the Executive Officer is unable to retrieve sufficient allowances using the above process, the Executive Officer shall provide the deficient covered entity 30 days <u>or, if later, five business days after the next auction to</u> secure the <u>compliance instruments</u>~~allowances~~ needed to cover its untimely surrender obligation; (SCPPA1)

> **Response:** We agree and made changes similar to those suggested by the commenter. The entity now has five days past the next auction or reserve sale, whichever is later.

E-101. Comment: Section 95857(c)(5) (p. A-73) provides that if an entity does not fulfill its compliance obligation for untimely surrender, the Executive Officer will take allowances from the holding accounts of affiliates to which the defaulting entity has transferred allowances. The ISOR states (at IX-52) that this provision is intended to address situations in which an entity takes steps to shield compliance instruments from retirement. However, under the current drafting this provision may have adverse consequences for innocent “affiliates” who purchased allowances from the defaulting entity in good faith. This provision should be carefully limited to avoid harming such entities. Various limitations should be considered, such as restricting the provision to transfers of allowances made without reasonable compensation and transfers to entities that have reason to believe the transferring entity may default on its compliance obligations. Section 95857(c)(5) is especially onerous insofar as “affiliates” is not defined. The Executive Director could construe the term to reach as broadly as “direct and indirect corporate associations.” A definition of “affiliates” is required. The definition should not be too broad, given the possibility of adverse consequences for innocent entities. (SCPPA1)

> **Response:** This suggested definition is no longer necessary because section 95857(c)(5) has been removed from the regulation.

E-102. (multiple comments)
Comment: Section 95857(d)(2)(A) (p. A-74) provides that three-quarters of the allowances used to fulfill an untimely surrender obligation will be transferred to the highest-priced tier of the Allowance Price Containment Reserve Account (Reserve). The ISOR states (at IX-54) that this provision is to ensure that fulfilling the untimely surrender compliance obligation does not overly reduce the supply of compliance instruments and consequently raise their price. However, there is no specific rationale for putting the allowances in the highest tier of the reserve. If allowances are placed in the highest tier, they will be withdrawn from the market at market prices and will only be available at a price that is calculated to be significantly higher price that may never be reached. SCPPA opposes having tiers in the Allowance Price Containment Reserve Account. However, if the allowance reserve must contain tiers, instruments added to the reserve should be added not to the highest tier but to the lowest-priced tier that has not yet been exhausted and closed. (SCPPA1)

Comment: The Utilities request that allowances surrendered for excess emissions destined for the allowance price containment reserve be allocated to the lowest tier within the reserve. Focusing the allowance on the highest tier only serves to penalize the other covered entities that must purchase from the reserve, the majority of which have not had an excess emissions occurrence. Alternatively, putting these allowances into the lowest tier provides covered entities with an ability to purchase these allowances without unduly increasing the cost burden and the covered entity’s avoided costs are more likely to be spent on AB 32 reduction activities. In contrast, the revenue from allowances bought at the reserve is directed to the State’s General Fund, and there is no guarantee that these monies will be spent on AB 32 reducing activities. Modify section 95857(d)(2)(A) as follows:

(A) Three fourths to the ~~highest~~ lowest priced tier of the Allowance Price Containment Reserve Account. (MID1)

Comment: Similarly, excess emissions penalty allowances that are surrendered pursuant to 95857(c) should not be automatically transferred to the Allowance Price Containment Reserve Holding Account. That portion of the allowances required to be surrendered pursuant to 95857 (c), that are in excess of the actual emissions obligation of the covered entity, specifically the three penalty allowances required to be turned over as a penalty should be deposited into the Auction Holding Account rather than the Allowance Price Containment Reserve Account as specified in 95831 (c)(4)(C) and 95857 (d)(2)(A). The placement of these allowances in the reserve account unfairly penalizes the rest of the market, by requiring the three allowances to be removed from circulation and placed at a minimum price level of $50 per ton. There is no other purpose to place these allowances at the highest allowance price containment reserve account other than to penalize other market participants. To do otherwise acts to arbitrarily and unreasonably force the overall market price to a higher level. (SMUD)

> **Response:** We modified the regulation such that three-quarters of allowances used to fulfill an untimely surrender obligation will be transferred to the Auction Holding Account. Therefore, these comments regarding which tier to place allowances are no longer relevant.

E-103. Comment: Section 95857(a)(2) states that the compliance obligation for untimely surrender ("excess emissions") will not apply if the instruments transferred to meet the obligation were rendered invalid because of the reversal of an offset credit. In that case, the entity is given 30 days after the notice of reversal is received to make up the excess emissions. This, in effect, allows a facility to purchase dubious offsets or even those known to be likely found to be invalid, in order to delay or avoid the penalty for untimely surrender of compliance instruments. This provision also compromises the point at which the penalty provisions, which state that each day after a required instrument is not timely submitted is a separate day of violation, are triggered. Is it when the instrument was originally due? When it is determined to be invalid? When any rights to appeal that determination are exhausted? (CAPCOA1)

> **Response:** Section 95857 has been modified to only apply in the case of invalidation, not a reversal, and the entity is given 90 days to replace the invalidated offset with another compliance instrument. We believe the risk of invalidation is small, as the offset program has been designed with a system of checks and balances and will be under our direct oversight. All provisions related to invalidation determinations and notifications are in section 95985. The additional time is provided to allow the entity access to an auction or Reserve sale to acquire “replacement” compliance instruments. We do not believe an entity will buy suspect offsets to gain additional time, only to go back out to the market to buy additional compliance instruments to cover the same compliance obligation.

E-104. Comment: Section 95857(c)(1) states that the obligation to surrender allowances for excess emissions is "immediately due." But, there is no mention of the triggering date. Is it the date the report for that compliance period is submitted? Is it as of the date that an audit is complete? Is it the date that CARB issues its final determination? For penalty purposes, this date is critical. (CAPCOA1, CAPCOA2)

> **Response:** This comment is no longer relevant because section 95857(c) was modified, and the requirements for when the "excess emissions" are due was clarified in section 95857(b)(6).

E-105. Comment: The Utilities greatly appreciate CARB's inclusion of a time period within which covered entities may resolve excess emissions issues. However, there is no opportunity for a covered entity to purchase the required allowances to fulfill the excess emissions requirement at either auction or the reserve following the November 1 surrender deadline. The same argument applies to the proposed annual surrender deadline of May 15 for facilities (please note that the Utilities recommend changing the annual surrender deadlines to November 1 for both operators and suppliers and electric power entities above). Thus, the Utilities would recommend the cure period be extended to 100 days to provide an opportunity for covered entities to access the auction. Modify section 95857 as follows:

(c) Allocation to Public Utilities.

(4) If the Executive Officer is unable to retrieve sufficient allowances using the above process, the Executive Officer shall provide the deficient covered entity ~~30~~ 100 days to secure the allowances needed to cover its untimely surrender obligation. (MID1)

> **Response:** Section 95857(b)(4) was modified to state that "the untimely surrender obligation is due within five days of the first auction or reserve sale conducted by ARB following the applicable surrender date, whichever is the latter, and for which the registration deadline has not passed when the untimely surrender obligation is assessed."

E-106. Comment: The Utilities continue to have concerns regarding the effect of imposing a penalty that would require the submission of multiple allowances for each excess emission. This approach appears to be counterproductive, setting the covered entities and the AB 32 cap and trade program up for failure. While the Utilities appreciate that the additional allowances will be available to covered entities through the reserve if needed for compliance obligations, the exclusion of using offsets to meet this penalty will essentially have the effect of penalizing the covered entities by constraining the future of the market. Modify section 95857(b) as follows:

(b)(2) The covered entity's compliance obligation for untimely surrender is calculated as ~~four~~ two times the entity's excess emissions; and.

(b)(3) The covered entity's compliance obligation for untimely surrender may only be fulfilled with CA GHG allowances of allowances issued pursuant to subarticle 12.

Offsets shall be allowed to cover excess emissions by deduction from the covered source's compliance account equal to three times the number of the source's emissions (3x the allowances shortage). (MID1)

> **Response:** We disagree with this comment. We modified the regulation to make three-fourths of compliance instruments available through auction. After careful internal deliberation and consultation with outside experts and our WCI Partner jurisdictions, we remain convinced that the calculation for an entity's compliance obligation is appropriate and should be met with allowances and offsets for one-fourth if using the offsets does not violate the quantitative usage limit. We believe that our chosen multiplier of four achieves a balance between providing a strong incentive for timely compliance and not imposing unduly harsh obligations for lack of timely compliance.

Three-Year Compliance Period

E-107. Comment: LADWP strongly supports policies that have been incorporated into the proposed regulation intended to help contain compliance costs, including three year compliance periods. (LADWP1)

> **Response:** Thank you for the support.

E-108. Comment: We would have preferred annual compliance periods but the fact that annual reporting is still required of all participants helps to mitigate these concerns. (SANDBAGCC)

> **Response:** No response necessary.

Recordkeeping and Reporting

E-109. (multiple comments)
Comment: Section 95850(b) requires records associated with this proposed regulation be retained for 10 years. The corresponding requirement in the California GHG reporting rule (section 95105(a)) is five years. Since this rule is significantly linked to the California GHG Mandatory Reporting Regulation the record retention periods should be consistent. We recommend only a five-year records retention period, since this should provide ample time period for CARB to review, if needed, a covered entity's records. (PRAXAIR)

Comment: Section 95850(b) (p. A-60) requires covered entities to retain records for at least 10 years. This period is unreasonably long. By contrast, section 98.3(g) of the US Environmental Protection Agency's Mandatory Reporting of Greenhouse Gases Rule, 40 CFR Part 98 (EPA Rule), only requires records to be kept for three years. As ARB is aiming to harmonize with as many of the provisions of the EPA Rule as possible, as discussed in the ISOR for the revised MRR, a record retention period similar to that of the EPA Rule should be considered. Records should be retained until the end of the compliance period following the compliance period in which the record was generated.

As a result, records would be held from three to six years, depending upon the point in a compliance period at which a record was developed. Modify section 95850(b) as follows:

(b) Record Retention Requirements. Each covered entity must retain all of the following records <u>until the end of the compliance period following the compliance period in which the records were generated</u> ~~for at least 10 consecutive years~~ and must provide such records within 20 calendar days of receiving a written request from the Executive Office. (SCPPA1)

Comment: In light of what appears to be a de facto standard of five years among Federal Regulatory agencies with similar responsibilities, the ten year standard proposed by CARB would be an outlier. Therefore, in order to minimize unnecessary compliance costs for market participants, CARB should adopt a five-year record retention standard, rather than the proposed ten. (MSCG2)

> **Response:** We modified both rules to require record retention for 10 years. This allows records to be retained over at least two compliance periods, to support several program design elements, such as under-reporting in section 95857.

E-110. Comment: The Utilities believe it is important to allow flexibility for circumstances whereby the covered entity may require more than 20 calendar days to compile all of the records being requested. Such flexibility is provided under similar requirements in the California Public Records Act (Government Code section 6250 et seq.). We suggest giving the Executive Officer the ability to extend the time for providing documents in appropriate circumstances. Modify section 95850 as follows:

(c) <u>In unusual circumstances, the time limit for providing records prescribed in this section may be extended by the Executive Officer, upon written request by the covered entity setting forth the reasons for the extension and the date on which the documents are expected to be dispatched. As used in this section, "unusual circumstances" means the following, but only to the extent reasonably necessary to the proper processing of the particular request:</u>

> <u>(1) The need to search for and collect the requested records from field facilities or other establishments that are separate from the office processing the request.</u>
> <u>(2) The need to search for, collect, and appropriately examine a voluminous amount of separate and distinct records that are demanded in a single request.</u>
> <u>(3) The need for consultation, which shall be conducted with all practicable speed, with another agency having substantial interest in the determination of the request or among two or more components of the agency having substantial subject matter interest therein.</u>
> <u>(4) The need to compile data, to write programming language or a computer program, or to construct a computer report to extract data.</u> (MID1)

> **Response:** We do not agree. This type of time provision for responses to data and information requests is standard practice for ARB regulations. It is clear in

the regulation which types of data are to be retained under this provision. It would not be unreasonable for entities to have a central repository of this specified information for ease of access.

Increase Transparency

E-111. (multiple comments)
Comment: The public should have access to the type and amount of compliance instruments surrendered by each entity each time the entity surrenders compliance instruments for compliance. There should be sufficient information that is publically available in a timely fashion to allow the public to review and check compliance, while keeping price and trade secrets confidential. (LUDLOW, UCS1)

Comment: As enforcement progresses, increase transparency. (UCS2, CADMANS)

Response: We recognize the need for transparency, and plan to enable the public to readily review and check compliance while ensuring proper confidentiality of business information. However, we believe that this is an implementation issue and details will be developed during the implementation process.

E-112. Comment: The public should have access to the type and amount of compliance instruments surrendered by each entity each time the entity surrenders compliance instruments for compliance. There should be sufficient information that is publically available in a timely fashion to allow the public to review and check compliance, while keeping price and trade secrets confidential. (WALTERS)

Response: The proposed regulation provides that the serial numbers of retired compliance instruments will be recorded to a publicly available Permanent Retirement Registry (section 95831(b)(3)(C)). Additional details about which types of information will be made publicly available will be part of program implementation.

E-113. Comment: It is essential that emissions data is made publicly available on an annual basis as soon as possible to enable timely scrutiny of the participants' behavior in the scheme. (SANDBAGCC)

Response: Thank you for your comment. ARB currently makes reported GHG emissions data reports publicly available each year once the reports have been received and verified.

E-114. Comment: While the proposed transportation fuels applicability in section 95852(d) could be read to include domestic production, we suggest making this more explicit, similar to language for natural gas in sections 95852(c) and (e). The following revision would help avoid any potential misunderstanding or attempt to avoid compliance. Modify section 95852(d) as follows:

(d) Suppliers of RBOB and Distillate Fuel Oils. A supplier of petroleum products covered under section 95811(d) or 95812(d) has a compliance obligation ~~from~~ for every metric ton CO_2e of GHG emissions that would result from full combustion or oxidation of the quantities of the following fuels that are imported and/or delivered to California, produced in California, or otherwise delivered to end users in California. (ICCT1)

Response: The applicable coverage of fuels is intended to include fuel produced in California. The new language in 95852(d) clarifies this point.

E-115. Comment: Most of the detail of the approach for attributing emissions to imported power is laid out in the proposed "Amendments to the Regulation for the Mandatory Reporting of Greenhouse Gas Emissions" rather than the cap and trade regulation. WPTF has provided ARB its specific concerns and recommendations in a separate submission on the proposed reporting regulation, where we have also requested technical modifications to the regulation regarding the attribution of imports. We therefore recommend in this proceeding that ARB incorporate the technical changes to the reporting regulation that WPTF has recommended, and that once completed, the definition of "Specified Source of electricity" in the cap and trade regulation should be modified so that it is consistent with the final technical regulation. (WPTF)

Response: The definition of "specified source of electricity" was modified in both the first and second 15-day changes to the regulation. We have coordinated changes between the MRR and the cap-and-trade regulation.

E-116. Comment: We support the proposed 15-day changes to ensure that emissions from livestock and manure are not in the mandatory reporting or in the program as well as the portable engines, the diesel pump engines. We certainly encourage you to ensure that those 15-day changes are included. (CCASSOC)

Response: Thank you for the support.

F. CO-POLLUTANTS

This section includes comments and responses about the Co-Pollutant Emissions Assessment (Appendix P of the Staff Report). Major sub-topics include concerns about potential increases in criteria air pollutants and toxic air contaminants, the potential effects on communities already affected by co-pollutants and the need to develop a methodology to identify these communities, the fulfillment of AB 32 requirements concerning co-pollutants and affected communities, the need for a health impact assessment, the scenarios used in evaluating the potential effects on California communities, and monitoring of the program's impact on co-pollutant emissions.

F-1. (multiple comments)
Comment: Fresno suffers from both extremely high poverty rates and extremely bad air, and severe health problems, such as high asthma rates, due to these problems. We are concerned that pollution trading could result in increased local pollution of criteria pollutants. The communities we work with, the disadvantaged and most vulnerable populations, are very concerned with increasing pollution and the cumulative impacts of multiple sources in their small communities. (FRESNOMINISTRY)

Comment: We are asking you to consider the localized impacts so that we are not just blending all other kinds of sources of emissions with the emissions that are impacting low income communities. (CANAACP)

Comment: The current project allows harms to California, for instance, by allowing increasing industrial pollution in heavily industrialized California communities, and by causing evictions of indigenous people through fake forest offset projects. (CBE1)

Comment: Cap and trade schemes also exacerbate environmental injustice by increasing hotspots, creating price volatility, and leading to oppression through high risk and fraudulent offset projects that too often also result in displacement. The proposed regulation does nothing to avoid the known pitfalls inherent to cap and trade. Instead, the regulations bend over backwards to accommodate polluters' desire for zero cost compliance, ease and flexibility at the expense of true significant reductions, health protection (avoiding increases in other pollution), and environmental justice. (CBE1)

Comment: Under the proposed regulation, emitters could just as easily choose not to reduce any GHG emissions at all by simply buying credits and offsets. This would result in the equally disproportionate outcome that low income communities of color around the entities would see absolutely no direct or co-benefits from this cap and trade regulation. Industrial polluters in California are predominantly located and tend to cluster in low income neighborhoods and communities of color. A demographic analysis of the communities nearest industrial facilities in California reveals that people of color comprise 58 percent of the population living within one mile of a facility, and 62 percent of the population living between one to six miles from a facility. The area within six miles of a facility is densely populated, reaching over 5,000 people per square mile. The demography of populations over six miles away from a facility changes dramatically. People of color comprise only 46 percent of the population and the density drops to 125 people per square mile. Children of color comprise between 71-74 percent of children living within 6 miles of a facility and 57 percent of those living more than six miles away. Allowing offsets and credits for these entities means these communities will see no benefits from this regulation. ARB should not allow trading, especially in overburdened communities. The unrestricted trading, reserve credits, and large percentage of offsets allowed in this regulation seriously threatens to further overburden such communities, in violation of AB 32. (CRPE1)

Comment: ARB should make good on the commitment made to disadvantaged communities in AB 32, namely to ensure that activities undertaken to comply with the regulation do not disproportionately impact low-income communities. (CIPAL)

Comment: We have an overall concern about the staff proposal for the program which we believe leans heavily towards benefiting pollution sources economically, while leaning minimally towards either economic or health benefits for the most impacted and disadvantaged communities. For example, the staff proposal to move the offsets limits from four percent of emissions (as proposed in the Scoping Plan, December 2008) to now proposing eight percent of emissions allows polluting sources to achieve the majority of their respective share of emission reductions by purchasing offsets (nearly 100 percent). Clearly, this level of offsets will have a negative health impact on the ability to maximize localized pollution reductions that should benefit California residents. This will be true of the program as it is implemented within the State, and particularly acute once California begins linking our program with other states and nations, as is anticipated. (CCA1, CCA3)

Comment: A scheme that is flexible for polluters tends to dilute the environmental goal, and exacerbate social injustices. Although the proposed regulation states that CARB will monitor the consequences of the cap and trade program in relation to co-pollutants, the provisions offered are inadequate. This is a fundamental problem: the basis of the system is that the market chases after the cheapest abatements, and under such a scheme there is no recourse to adjust for the concentration of pollutants in “hot spots”, potentially exacerbating environmental racism. “We note with particular concern the treatment of biofuels, which appear at the cheaper end of the carbon abatement curve for California.” (CTW)

Comment: Needed co-pollutant reductions do not address Environmental Justice issues. Any area with one refinery in it is impacted by a major pollution source. One example of extreme Environmental Injustice impacts due to the oil industry, with the very highest concentration of oil refineries in the state, is the Wilmington/Carson area in Southern California which contains about a third the state’s refining capacity. This area includes about half of Los Angeles’ refining capacity (five refineries and about 650,000 bpd). In the Los Angeles region overall, refineries dominate the top 15 VOC emitters, out of many hundreds of Stationary Sources listed by SCAQMD in the 2007 Air Quality Management Plan. The Wilmington Area includes about half the refinery VOCs emissions (about 1,600 out of 3,200 tons per year) in the LA region. A plume map provided by SCAQMD graphically displays that Wilmington receives the air pollution from five overlapping refining plumes (isopleths) generated over this area (two ConocoPhillips refineries, Valero, BP, and Tesoro).

Wilmington has demographics that demonstrate that people of color and low income people are bearing the brunt of the heavy industry concentration in this area.

As if this extreme concentration of oil refineries was not enough to warrant local cleanup efforts, this area also includes oil drilling operations (Wilmington is the third largest oil field in the U.S.), extreme heavy diesel truck traffic (as a major goods movement corridor), the biggest Ports in the Country (Ports of LA and Long Beach which are the biggest single pollution sources in the area), and hundreds of other industrial sources. Clearly, refining areas are in need of direct, local pollution controls, not the potential for further concentration and expansions that the Cap and Trade proposal makes likely, through allowing refineries to buy their way out of local pollution control. (CBE1)

Response: The commenters are concerned that a greenhouse gas emission cap-and-trade program would (1) lead to localized increases in criteria and toxic air pollutant emissions, otherwise known as co-pollutants, and (2) that these increases could exacerbate existing inequities in impacted and disadvantaged communities; particularly low-income and minority communities. The commenters attribute this to a facility's ability to purchase allowances or a limited number of offset credits in lieu of reducing greenhouse gas emissions on site.

As stated in the Emissions Assessment, we believe that overall co-pollutant emissions in California would likely decrease as a result a cap-and-trade program. Nevertheless, during the regulatory development process, we evaluated the potential for localized increases in co-pollutant emissions in affected communities due to a cap-and-trade program to the best of our ability. The findings of this analysis can be found in the Staff Report and its Appendix P: Co-Pollutant Emissions Assessment. Since the distribution of changes in co-pollutant emissions resulting from the cap-and-trade program are dependent on how individual facilities choose to comply with the program, we evaluated how co-pollutant emissions could change in three hypothetical scenarios within four environmental justice communities—Wilmington, Oildale/Bakersfield, Richmond, and Apple Valley/Oro Grande. Under the three hypothetical scenarios, we found that co-pollutant emissions could increase or decrease a very small amount. However, most compliance approaches are expected to result in a reduction in co-pollutants through increased efficiency and decreased combustion of fossil fuel.

It is important to note that the mere presence of a cap-and-trade program for greenhouse gas emissions will not weaken or reduce facility-specific requirements or permits for co-pollutants. All facilities will continue to be subject to existing State, federal, and local ordinances and rules. A brief discussion of key existing air quality laws that minimize potential adverse impacts is presented below.

The federal Clean Air Act (CAA) of 1970, as amended in 1977 and 1990 (42 USC section 7506(c)), establishes National Ambient Air Quality Standards (NAAQS) for air pollutants that pose a threat to human health and welfare. California has adopted more stringent air quality standards for most of the federal criteria pollutants under the California Clean Air Act (CCAA) of 1988. Similar to the federal standards, the California standards have been designed to protect the health of the most sensitive persons with a margin of safety.

Under the federal Clean Air Act, all states, including California, are required to develop State Implementation Plans (SIPs) that provide for attaining the national ambient air quality standards. The most recent comprehensive SIP was completed in 2007, and a new SIP will be finalized in 2012. The SIP is focused on areas with pollution levels that exceed national air quality standards for ozone and PM2.5. However, most of the control measures adopted pursuant to the SIP will reduce emissions and improve air quality throughout the State.

New Source Review (NSR) is a title applied to programs regulating the new construction of, and/or modifications to, industrial sources that emit, or will emit, air pollutants. NSR requirements under State law are codified in Division 26 of the California Health and Safety Code. Specific to NSR, each local air district is to include in its attainment plan a stationary source control program designed to achieve no net increase in emissions of nonattainment pollutants or their precursors for all new or modified sources that exceed particular emission thresholds. Each of the 35 air districts in California has its own NSR program and issues permits to construct and operate. The permit requirements are dependent on the California AAQS or NAAQS designation (attainment, nonattainment, and unclassifiable areas), and the amount and type of pollutants that the source will emit. In addition, most new and modified stationary sources are required to use Best Available Control Technology (BACT). Furthermore, all the air districts have either a policy or regulation that addresses toxic air pollutants for new and modified sources.

The CEQA review of local projects may identify and require mitigation for mobile and other emission sources. CEQA requires that where a project will have significant impacts, the lead agencies (in this context, cities, counties, and air districts) must consider alternatives (including, where appropriate, alternative locations that would have fewer impacts) and require feasible mitigation to reduce those impacts to less-than-significant levels. Mitigation for a given project could include additional pollution control technologies, off-site measures, and mobile source mitigation that would reduce cumulative pollution in the area affected. Further analysis of what may be appropriate for specific, future energy-related projects must be analyzed in response to a specific proposal.

Facilities whose toxic air contaminant emissions and risk potential exceed a certain threshold must prepare a Health Risk Assessment (HRA) under the “Hot Spots” Information and Assessment Act. More information about the hotspots program is available in the Appendix O. This and other regulations will continue to result in significant reductions in co-pollutant emissions, exposure, and health-based risk.

Moreover, through the Energy Efficiency and Co-benefits Assessment Regulation for Large Stationary Sources, we are currently collecting information on opportunities for further GHG and co-pollutant emission reductions. We are scheduled to receive these data by the end of 2011. We will initiate a process to ensure that large industrial sources subject to the regulation be required to take cost-effective actions to reduce emissions identified under those audits. The audit results, due to ARB by the end of 2011, will inform the development of regulatory requirements that staff intends to propose to the Board in 2012. We plan to initiate a separate public process in fall 2011 to discuss metrics and actions to implement this commitment.

Although we anticipate that co-pollutant emissions would decrease as a result of the implementation of the cap-and-trade regulation, ARB is committed to monitoring the regulation’s implementation to identify and address any situations where the program has caused an increase in criteria air pollutants or toxic emissions. To assist staff in its assessment, we developed an Adaptive Management Plan that was posted for public review on October 10, 2011, and considered and approved by the Board at its October 20, 2011, public hearing. The Board’s approval of the Adaptive Management Plan is reflected in Attachment C of Board Resolution 11-32.

Adaptive management is a process of information gathering, review and analysis, and response that promotes flexible agency decision-making. It is particularly appropriate where complex systems are involved, where the effects of an agency’s decisions and actions play out over an extended period of time, and where the agency must meet multiple objectives—as in the case of the cap-and-trade regulation, which was adopted by the Board at its October 20, 2011, public hearing.

The adaptive management approach will allow us to collect and review applicable data sources (e.g., the MRR data, market tracking system, economic data, emission inventory, air monitoring data, and energy efficiency and co-benefits audits) and develop the appropriate tools to determine if there are impacts due to compliance with the cap-and-trade regulation as information becomes available. We will work with other State agencies and local air districts during this process. If it is determined that an adverse impact has been identified as result of the regulation, ARB will conduct a public process and report to the Board on appropriate responses.

Adaptive management is consistent with ARB's long-standing approach to program implementation, which incorporates ongoing evaluation of how programs and regulations are implemented on the ground, regular updates to the Board, and adjustments to program implementation and regulatory requirements, as necessary.

A separate but related concern raised by several commenters is that a greenhouse gas emission trading program could increase existing inequities related to the burden of air pollution exposure; that is, that low-income and minority communities would bear a disproportionate share of the impact of unforeseen increases in air pollution, and/or would experience less of the benefits from a cap-and-trade program.

Data and research clearly indicate that a disproportionate share of facilities with high GHG emissions are located in low-income communities with a high percentage of minorities, and that the annual co-pollutant emissions burden from large GHG-emitting facilities is larger for minorities. However, this is entirely different than finding that facilities located in minority neighborhoods are more likely to buy allowances or offsets instead of reducing greenhouse gas emissions on site.

Counter to the commenters' contentions, numerous studies have evaluated the potential for inequitable impacts from emissions trading programs on minorities and found that trading did not have a disproportionate impact.

As noted by the Market Advisory Committee:

> "U.S. Environmental Protection Agency staff analysis found that under the SO_2 emission trading program, the largest reductions occurred in areas with the highest emission levels. This finding was true both regionally and at individual plants."[1]

Thus, it is possible that the areas with highest emissions could experience relatively greater benefits from a cap-and-trade program.

The most effective way to reduce the impacts of co-pollution emissions in low-income and disadvantaged communities is to implement programs that target reductions in co-pollutant emissions directly. While a GHG-focused program would likely reduce co-pollutant emissions along with GHG emissions, it is not the most effective mechanism for decreasing exposure to co-pollutants.

---

[1] See Market Advisory Committee to the California Air Resources Board, Recommendations for Designing a Greenhouse Gas Cap and Trade System for California (hereafter "MAC Recommendations") at 10 (2007) [citing The Acid Rain Program and Environmental Justice: Staff Analysis" (September 2005) U.S. Environmental Protection Agency, Office of Air and Radiation, Clean Air Markets Program].

A separate commenter referred to the potential inclusion of REDD forest credits when they referred to "fake forest offset projects." The regulation does not allow any REDD credits into the cap-and-trade program. If the Board were to include REDD offsets at a future date, it would only occur through an amendment to the cap-and-trade regulation. This would trigger a required CEQA analysis and full public process before the Board would take action. As these credits are not part of the current rule, this concern is not applicable.

Another commenter raised concerns about the use of treatment of biofuel. The regulation exempts certain types of biofuels from a compliance obligation if they meet the requirements for reporting, verification, and eligibility under the MRR and cap-and-trade regulation. The intent of the cap-and-trade regulation is to reduce GHGs associated with fossil fuels. In that context, the use of biofuels is a preferred path. There are several constraints related to location, collection, and transportation of biofuels that limit their opportunity for use by the types of facilities under the cap. Every capped facility will have to decide for itself the most cost-effective way to reduce its emissions. Within each facility, there may be opportunities for retrofits or upgrades that could reduce emissions much more cost-effectively over the life of the program than just switching from fossil fuels to biofuels. We believe the program is designed to achieve its objective of reducing GHG emissions from the use of fossil fuels in a cost-effective manner.

F-2. (multiple comments)
Comment: ARB has not adopted a method to identify environmental justice communities. ARB has not adopted a methodology for identifying disproportionately impacted, low-income communities throughout the state. For the co-pollutant assessment, ARB chose four communities after consulting with the Environmental Justice Advisory Committee and other environmental stakeholders. While we agree these communities are environmental justice communities that should be assessed, ARB can't stop there. Each environmental justice community is unique and ARB needs to have a method to identify and analyze these communities. Without a screening method, it is impossible for ARB to evaluate whether this regulation, or any other under AB 32, will have localized impacts in communities already adversely impacted by pollution. ARB needs a screening method to ensure a complete evaluation of the most vulnerable communities, the communities the Legislature sought to protect when it adopted Health & Safety Code section 38652(b)(1). A host of factors, such as race, linguistic isolation, and the number of polluting sources pre-existing in an area, along with income should be used to paint a more complete picture. The Board should adopt the mapping tool created by Manuel Pastor, James Sadd, and Rachel Morello-Frosch which was part of the ARB-funded project to develop methodological approaches to address environmental justice concerns and apply the Environmental Justice Screening Method statewide before making decisions on market-based mechanisms, including this cap and trade regulation. (CRPE1)

Comment: I wanted to touch on two issues, both having to do with the proposed 15-day modifications—or the resolution with the proposed 15-day modifications.

First deals with the finding that the cap and trade regulation is consistent with ARB's environmental justice policies and will equally benefit residents of any race, culture, or income level. That's contradicted a little bit later on in the resolution where it finds that because of the flexibility imbedded in the cap and trade program, it's difficult to pinpoint where reductions will happen and where there might be increases in criteria pollutants or toxic contaminants. And because of the siting of many of the industries under the cap, they are disproportionately sited in low income communities and communities of color.

So one of the things that the Environmental Justice Advisory Committee and several environmental justice groups have been talking about for a long time has been being clear about where localized pollution increases are happening and being sophisticated with that analysis.

And I think one of the issues that has been raised several times is where health impacts are happening due to the cap and trade regulation. And the health impact assessment came out just two days before the public comment period was over. And I think that was the opposite of what had been hoped for, were that the health impact assessment would help guide the crafting of the regulation.

I would also add that the way the cap and trade system is structured in terms of localized pollutions is that it will be monitored as the program evolves. And there's some language in here that says that if unanticipated adverse environmental impacts are identified that are substantial enough to interfere with or undermine the achievement of the objectives for the cap and trade program as defined by AB 32, that's a little vague in terms of what will actually trigger changes especially as the program is implemented in the long term because of the need for certainty. So the chances of adjustment down the course without some criteria of what that will be are going to be less likely. (CRPE2)

Comment: CARB should direct staff to work with community stakeholders to develop a process for modifying the methodology for identifying the most impacted communities that utilizes GIS mapping looking at cumulative air emissions combined with multiple socioeconomic factors (including those included in AB 1405). (KUSTIN02, KUSTIN11, KUSTIN12)

Comment: Catholic Charities urges ARB to develop a more robust methodology than it currently has to identify the most impacted communities. ARB should use GIS mapping to look at cumulative air emissions combined with multiple socioeconomic factors. We recommend ARB use the methodology developed specifically for the ARB by Doctors Manuel Pastor, Rachel Morello-French, and James Sadd. (CATHCHAR1)

Comment: We urge ARB to develop a more robust methodology than it currently has to identify the most impacted communities. ARB should use GIS mapping to look at cumulative air emissions combined with multiple socioeconomic factors. In its August 25, 2010 letter, ARB's Environmental Justice Advisory Committee gave specific recommendations on what belongs in a screening method for low-income communities that are highly impacted by air pollution. (CIPAL)

ARB should adopt and utilize the Environmental Justice Screening Method (EJSM) to identify and monitor communities highly impacted by the cumulative emissions. The report states that this is not available on a statewide level, but the academic researcher team stated otherwise to the Environmental Justice Advisory Committee (EJAC) at their June 9, 2010, meeting. The EJAC strongly recommended that CARB utilize the tool to screen for impacted communities throughout the state to meet the requirements and the intent of AB 32. The EJSM may also be used to screen for other categories of impacted communities, whether they are highly impacted or not in order to ensure pollution reductions in communities highly impacted and that no new hot spots are being created, especially in a "medium" impacted community. (CBE1)

Comment: CARB should evaluate communities based on exposure to pollution as well as socioeconomic vulnerability that exacerbate the impacts of pollution. We recommend that ARB use the EJSM in the development of the CBF to adequately screen for eligible communities, but also include the communities that may not be included in the screening due to non-incorporated status. The EJSM should also be updated on a frequent and regular basis to accommodate new and developing research and statewide databases. (CBE1)

> **Response:** The commenters advocate the use of a geographic information system (GIS) mapping tool, specifically the Environmental Justice Screening Method developed by Dr. Manuel Pastor, to identify low-income communities impacted by air pollution for determining impacts from market-based compliance mechanisms.
>
> When selecting the communities (Wilmington, Oildale/Bakersfield, Richmond, and Apple Valley/Oro Grande) for the Cap-and-Trade Emissions Assessment, we used the Environmental Justice (EJ) Screening Method developed by Dr. Pastor, recommendations from the Environmental Justice Advisory Committee (EJAC), and other information. A subset of these communities was also used by the California Department of Public Health (CDPH) in the Health Impact Assessment (HIA). However, when the Emissions Assessment and the HIA were written, the EJ Screening Method was limited to the South Coast, and it could only be used as part of the process of identifying a comprehensive list of affected communities for all of California. Since then, Cal/EPA has financed additional research to expand the EJ Screening Method to the Bay Area and the Central Valley. The research summary will be available in fall 2011. ARB will review this report to determine how best to incorporate it into the overall evaluation of the cap-and-trade program as it is implemented.
>
> It is important to note that even if these findings were currently available, the EJ Screening Method cannot be used to determine the future impacts of a cap-and-trade program or any alternatives. It is composed of retrospective data on air

pollution and socioeconomic indicators, and does not have the capability to evaluate prospective impacts or the underlying causes of air pollution.

Although we anticipate that co-pollutant emissions would decrease as a result of the implementation of the cap-and-trade regulation, ARB is committed to monitoring the regulation's implementation to identify and address any situations where the program has caused an increase in criteria air pollutants or toxic emissions. To assist staff in its assessment, we developed an Adaptive Management Plan that was posted for public review on October 10, 2011, and considered and approved by the Board at its October 20, 2011, public hearing. The Board's approval of the Adaptive Management Plan is reflected in Attachment C of Board Resolution 11-32.

Adaptive management is a process of information gathering, review and analysis, and response that promotes flexible agency decision-making. It is particularly appropriate where complex systems are involved, where the effects of an agency's decisions and actions play out over an extended period of time, and where the agency must meet multiple objectives—as in the case of the cap-and-trade regulation, which was adopted by the Board at its October 20, 2011, public hearing.

The adaptive management approach will allow us to collect and review applicable data sources (e.g., the MRR data, market tracking system, economic data, emission inventory, air monitoring data, and energy efficiency and co-benefits audits) and develop the appropriate tools to determine if there are impacts due to compliance with the cap-and-trade regulation as information becomes available. We will work with other State agencies and local air districts during this process. If it is determined that an adverse impact has been identified as result of the regulation, ARB will conduct a public process and report to the Board on appropriate responses.

Adaptive management is consistent with ARB's long-standing approach to program implementation which incorporates ongoing evaluation of how programs and regulations are implemented on the ground, regular updates to the Board, and adjustments to program implementation and regulatory requirements, as necessary.

F-3. (multiple comments)
Comment: The Board should not make a decision on this cap and trade regulation before a Health Impact Assessment (HIA) is completed. The staff report refers to the HIA being conducted by the California Department of Public Health but does not indicate when it will be completed. According to the report, the HIA will evaluate potential health impacts, health disparities among communities, and potential uses of any revenue generated by this proposed regulation. This is all valuable information to have before the Board makes a decision on the cap and trade regulation. Waiting to examine "community health status, air pollution exposures, and vulnerable populations"

as part of the "public decision-making process on the use of revenues generated by the program" is unacceptable and violates the mandates of AB 32. (CRPE1)

Comment: CARB needs to complete and include a health analysis before taking action on the proposed regulation. This assessment would include the existing localized health burdens, the impacts of free allowances, trading, out-of-state offsets, economic impacts and directing investments into the most impacted communities. This analysis is crucial to evaluating the proposed regulation. (CBE1)

Comment: We are very concerned that a comprehensive health impacts assessment (HIA) will not be completed before your Board considers this rule. According to the report, the HIA will evaluate potential health impacts, health disparities among communities, and potential uses of any revenue generated by this proposed regulation. This is all valuable information to have before the Board makes a decision on the Cap and Trade regulation. Waiting to examine community health status, air pollution exposures, and vulnerable populations as part of the public decision-making process on the use of revenues generated by the program is unacceptable and violates the mandates of AB 32. A more complete and independent analysis needs to be done on how the Cap and Trade program will impact disadvantaged and cumulatively impacted communities. We would like to see a safeguard in place to protect sensitive areas like cumulatively impacted and/or highly populated urban areas and Class I Air Sheds (including National Parks). It is also important to have protections in place so that emitters in these areas cannot increase pollution by purchasing offsets. (CVAQC, FRESNOMINISTRY)

> **Response:** The commenters were concerned that the HIA would not be finalized before the cap-and-trade regulation was adopted, and emphasized the importance of evaluating the effects of the regulation in impacted and vulnerable populations, particularly the use of auction revenue.
>
> Both the California Department of Public Health (CDPH)'s *Health Impact Assessment of a Cap-and-Trade Framework* (HIA) and ARBs *Co-Pollutant Emission Assessment* (Emissions Assessment) were finalized prior to the Board's initial consideration of the cap-and-trade regulation. In fact, Michael Lipsett, M.D., Chief of the Environmental Health Investigations Branch at CDPH, presented a summary of the HIA findings to Board members at the December 16, 2010, Board hearing. Both the HIA and the Emissions Assessment considered the impacts of a cap-and-trade program on cumulatively impacted communities.
>
> CDPH's HIA discussed the potential impact of a cap-and-trade program on health inequities. However, as the HIA states "there is a limited ability to predict these local impacts because of scarce local level data and an inadequate ability to accurately predict or model local impacts related to cap-and-trade." Nevertheless, the document evaluates health disparities in three areas—Wilmington, Richmond, and the San Joaquin Valley. The HIA found that a cap-and-trade program with offsets would have more health benefits than a

program without offsets, specifically with regard to economic health determinants. The HIA also included recommendations on how to use the auction revenue.

Although we anticipate that co-pollutant emissions would decrease as a result of the implementation of the cap-and-trade regulation, ARB is committed to monitoring the regulation's implementation to identify and address any situations where the program has caused an increase in criteria air pollutants or toxic emissions. To assist staff in its assessment, we developed an Adaptive Management Plan that was posted for public review on October 10, 2011, and considered and approved by the Board at its October 20, 2011, public hearing. The Board's approval of the Adaptive Management Plan is reflected in Attachment C of Board Resolution 11-32.

Adaptive management is a process of information gathering, review and analysis, and response that promotes flexible agency decision-making. It is particularly appropriate where complex systems are involved, where the effects of an agency's decisions and actions play out over an extended period of time, and where the agency must meet multiple objectives—as in the case of the cap-and-trade regulation, which was adopted by the Board at its October 20, 2011, public hearing.

The adaptive management approach will allow us to collect and review applicable data sources (e.g., the MRR data, market tracking system, economic data, emission inventory, air monitoring data, and energy efficiency and co-benefits audits) and develop the appropriate tools to determine if there are impacts due to compliance with the cap-and-trade regulation as information becomes available. We will work with other State agencies and local air districts during this process. If it is determined that an adverse impact has been identified as result of the regulation, ARB will conduct a public process and report to the Board on appropriate responses.

F-4. (multiple comments)
Comment: The Cap and Trade regulation can cause Co-Pollutant hotspots, especially due to foregoing reductions of more toxic emitters for more benign ones. If a facility located in an overburdened community "buys" carbon from other facilities so that it can increase its GHG emissions, it is also increasing its emissions of toxic compounds. In addition, by mixing many different sources together into one big Cap and Trade program, the differences in co-pollutants emitted by different facilities and equipment is lost, and left unaddressed. Consequently an oil refinery CO_2 source that happens to have high benzene or high mercury, or high PM2.5 co-pollutants emissions, is treated the same as a food industry source CO_2 that burns natural gas, but has low co-pollutant emissions.

The proposed regulation does nothing to avoid hotspots or co-pollutant emissions. Yet AB 32 requires that, "*Prior to the inclusion of any market-based compliance mechanism in the regulations . . . the state board shall . . . (1) Consider the potential for direct, indirect, and cumulative emission impacts from these mechanisms, including localized impacts in communities that are already adversely impacted by air pollution; (2) Design any market-based compliance mechanism to prevent any increase in the emissions of toxic air contaminants or criteria air pollutants."*

This failure must be corrected. In fact, ARB failed to take the first step necessary to do the analysis to determine cumulative impacts. (CBE1)

Comment: AB 32 specifically requires that ARB "ensure that activities undertaken to comply with the regulations do not disproportionately impact low-income communities." The regulations may not "interfere with efforts to achieve and maintain federal and state ambient air quality standards to reduce toxic air contaminants," must minimize leakage, "consider overall societal benefits, including reductions in other air pollutants, diversification of energy sources, and other benefits to the economy, the environment and public health", and "consider the significance of the contribution of each source or category of sources to statewide emissions of greenhouse gases." But if ARB adopts a cap and trade program, AB 32 additionally requires ARB to affirmatively "design" the program "to prevent any increase in emissions of toxic air contaminants or criteria pollutants," consider direct, indirect and cumulative emission impacts from the program, and direct private and public funds to disadvantaged communities. The proposed regulation overwhelmingly ignores these requirements, and ARB's failure to analyze reasonable alternatives makes adoption of the draft regulations even more irrational.

The cap and trade regulation as currently proposed allows significant flexibility and benefits to polluters, but it impermissibly creates environmental justice problems. For example, because the regulation allows off-site reductions, we lose the potential for localized benefits and ARB creates a hard-to-track system that defeats the purpose of public vigilance and accountability. In highly impacted communities, there should be restrictions to trading to ensure meeting the requirements to not exacerbate hot spots of pollutions. If trading is restricted to within these communities, reducing local emissions of criteria and air toxics will benefit the health of these same communities that are already overburdened by pollution. Furthermore, including direct emission reduction measures will ensure real, placed-based reductions, reduce cumulative impacts, and ensure meeting the maximum feasible reductions requirement of AB 32. (CBE1)

Comment: The regulation fails to meet AB 32 criteria for market-based compliance mechanisms. The Legislature included specific protections for communities already burdened by air pollution, sought to prevent an increase in toxic exposure, and wanted to maximize benefits for California. Accordingly, the Legislature commanded the Board, before adopting a market-based compliance mechanism, to (1) consider the potential for direct, indirect and cumulative emission impacts from these mechanisms, including localized impacts in communities that are already adversely affected by air pollution;

(2) design any market-based compliance mechanism to prevent any increase in the emissions of toxic air contaminants or criteria air pollutants; and (3) maximize additional environmental and economic benefits for California, as appropriate. The proposed cap and trade regulation violates the Legislature's unambiguous commands, threatens communities with more air pollution, and fails to seize the opportunity to benefit California both economically and environmentally. The Board, if it adopts this free market hypothesis, will forgo the opportunity to generate well-paying green jobs and stimulate a California-based clean energy economy. Pollution trading creates environmentally unjust outcomes and does not work to reduce greenhouse gas emissions.

The regulation does not prevent localized or disproportionate impacts.
Because the cap and trade program offers emitters flexibility in how they reduce greenhouse gases to comply with the program, there is a substantial risk of undesirable side effects. ARB cannot anticipate where emissions reductions will occur. Because ARB cannot predict where emissions reductions and criteria pollutant co-benefits will occur, the regulation is not designed to prevent localized impacts. Nothing in the regulation actually prohibits an increase in criteria or toxic emissions. Emitters could choose to adopt a measure that reduces GHGs but increases air pollution. Reliance on other, unspecified air pollution regulations to prevent increases in co-pollutants is inappropriate and speculative. AB 32 requires the Board to "design any market-based compliance mechanism to prevent any increase in the emissions of toxic air contaminants or criteria air pollutants."

ARB admits that this threat is real. The staff report analysis states "the regulation affords entities flexibility to choose the most cost-effective strategies to reduce emissions, so the potential for some compliance actions to result in increased co-pollutant emissions at some facilities cannot be entirely discounted." ARB will only monitor the situation and take steps as necessary to address increases in criteria pollutants and toxics as they occur. The report goes on to state that pre-existing mechanisms would address the increases, such as stationary source controls, permitting programs, and air monitoring for ozone, PM2.5, and toxics. The report evidences that the cap and trade regulation is not a program designed to prevent increases—it is a program that freely acknowledges that increases are a real possibility but expects other regulations to deal with, and clean-up, cap and trade's mess. Not only does this violate the Legislature's clear command, but it is an unrealistic expectation. Many of the regulations and programs cap and trade relies on to deal with the increased pollutants are not currently meeting their attainment deadlines or were designed to reduce a specific amount of pollution that was calculated without the increased emissions from this program. The Board cannot expect these regulations to deal with the increased emissions from cap and trade. AB 32 does not allow the Board to adopt a market-based mechanism that may increase pollutants, and then provides no solution. (CRPE1)

Comment: The Staff Report analyzes potential co-pollutant increases under the cap-and-trade program in relation to the significant decreases in co-pollutants that existing regulations are expected to achieve by 2020. The state's initiatives to decrease co-pollutants are laudable. And the staff's implicit point is well-taken: if those decreases are realized, there is less of a need to use AB 32 to indirectly accomplish co-pollutant reductions. Nonetheless, AB 32 states that the state's GHG policies should be designed to complement its efforts to attain air quality standards. The cap-and-trade program, as currently designed, does not take that step.

These comments do not dispute that changes in co-pollutant levels as a consequence of GHG trading reflect the relative stringency of associated co-pollutant regulation. If a GHG trade leads to increases in co-pollutants, it is because the co-pollutant regulatory program did not prevent those increases. CARB may resist the effort to impose co-pollutant goals on its GHG regulatory program. But, as noted above, AB 32 explicitly links GHG and co-pollutant emissions by specifying that the flexibility of a market-based GHG program not lead to increases in associated co-pollutants, even if those increases would be permissible under existing co-pollutant regulations.

The Staff Report argues that existing programs are already doing enough to address pollution in California, and that trading restrictions on stationary sources would add only a marginal benefit. Ultimately, whether CARB thinks it is necessary or not, AB 32 states that California should use its GHG policies, including its market mechanisms, to further co-pollutant reduction goals. (USFLAW)

Comment: The Staff Report argues that existing air pollution regulations would keep any co-pollutant increases to a minimum. This is not the place to pick apart California's air pollution regulations, but it is not clear that they would fully address an impacted community's concerns. For example, even if NSR were triggered and the facility had to purchase criteria pollutant offsets to compensate for the increase in criteria pollutants, it is not clear that the emission reduction credits would come from the same location as the increases, potentially leading to a net increase in impacted communities notwithstanding the offset requirement. Moreover, offset requirements apply only to criteria pollutants, not air toxics. While California's "Hot Spots" program provides more attention to local emissions than occurs in most states, it does not directly prevent increases. (USFLAW)

Comment: The Staff Report suggests that co-pollutant increases are extremely unlikely to occur because the burden of New Source Review requirements and the cost of GHG allowances themselves will discourage increased emissions. At the same time, however, the Staff Report acknowledges that the state's refineries are likely to continue to supply areas outside California even if demand for fossil fuels in California drops. The Staff Report also acknowledges that new biorefineries and biomass facilities could be incentivized by AB 32 implementation measures. Thus, emissions increases are a real possibility. (USFLAW)

Comment: The California legislature expressed its concern about the distributional implications of a cap-and-trade program by explicitly stating that market mechanisms must, to the extent feasible, be designed "to prevent any increase in the emissions of toxic air contaminants or criteria air pollutants." Based on the language in the Staff Report, the staff appear to construe the language "prevent any increase" too narrowly. The staff appear to be interpreting this language to mean that the cap-and-trade program itself must not "cause" increases in co-pollutant emissions, stating that "not all emissions increases at facilities covered by the cap-and-trade program will result from the program itself. Staff believes that only in very limited circumstances would a localized emissions increase be the actual result of the incentives created by the cap-and-trade program." Under this approach, the Staff Report acknowledges that the cap-and-trade program could, in some instances, create incentives that could result in co-pollutant increases. For example, if a utility relies upon several different generation facilities, the price signal generated by the cap-and-trade program could induce the utility to increase production at more energy efficient facilities. Co-pollutant emissions could therefore increase at the more efficient facilities. Incentivizing more efficient energy generation is, of course, a positive development. Nonetheless, AB 32 requires CARB to take the co-pollutant consequences into account.

The language states that the agency is required to "prevent" increases in co-pollutant emissions, without limiting that obligation to increases caused by the cap-and-trade program itself. As the Staff Report acknowledges, facilities could choose to increase emissions in order to increase production or expand into a new type of production. New facilities could also be built. To the extent a cap-and-trade program allows facilities to increase emissions by buying GHG allowances, the GHG control program would not constrain co-pollutant increases and could be inconsistent with AB 32's requirements. (USFLAW)

Comment: AB 32 requires that ARB ensure that the regulations do not disproportionately impacted low income communities and also consider benefits to the economy, the environment, and public health. If ARB adopts the cap and trade rule, AB 32 requires ARB to design the program to prevent an increase in emissions, consider cumulative impacts, and direct public and private funds to disadvantaged communities. However, if implemented, this cap and trade rule does none of these. (CAEJA)

Comment: The regulation does not deliver emissions reductions. To meet the requirements of AB 32, this regulation must prevent any increase in the emissions of toxic air contaminants or criteria air pollutants. Cap and trade models are not successful prophylactic measures and have proven to be ineffective tools for phasing out carbon use and pollution trading is an ineffective air quality policy with the arguable exception of the Acid Trading Program. Due to over allocation of allowances, low carbon prices, fraudulent transactions and banking (which may result in short term reductions followed by a spike in emissions when banked credits are utilized), pollution trading programs do not significantly reduce air pollution. AB 32 requires ARB to "design" the cap and trade program to "prevent" any increases and to prevent localized impacts. Even if specific facilities do not increase their emissions, and continue to emit business as usual, this does not maximize co-benefits or prevent localized impacts, and as explained above, relying on other regulations to reduce emissions is inappropriate. (CRPE1)

Comment: I'm concerned that AB 32 will contain legislation that allows big polluters to continue to ruin California's air quality. Keep them responsible. One of California's major attractions is its livability. (THOMSON)

Comment: The Cap and Trade regulation can cause Co-Pollutant hotspots, especially due to foregoing reductions of more toxic emitters for more benign ones. Pollution hotspots are areas where pollution concentrates locally rather than dispersing. (Greg Karras, *Flaring hot spots: Assessment of episodic local air pollution associated with oil refinery flaring using sulfur as a tracer* CBE Report (July 2005)). Hotspots can have dire health and other quality of life consequences. For instance, modeling has shown that RECLAIM actually increased NOx concentrations in Wilmington, a low income community of color in Los Angeles, beyond what would have resulted without RECLAIM.

Hotspots are an issue in the carbon trading context because carbon dioxide is almost always released with other pollutants, or "co-pollutants. These co-pollutants can include particulate matter including heavy metals, VOCs such as benzene, sulfur compounds, and hundreds of other toxic compounds. If a facility located in an overburdened community "buys" carbon from other facilities so that it can increase its GHG emissions, it is also increasing its emissions of toxic compounds. Said another way, by taking pollution that occurs across a large area and concentrating that pollution in an environmental justice community, the toxic load in that community increases.

In addition, by mixing many different sources together into one big Cap and Trade program, the differences in co-pollutants emitted by different facilities and equipment is lost, and left unaddressed. Consequently an oil refinery CO_2 source that happens to have high benzene or high mercury, or high PM2.5 co-pollutants emissions, is treated the same as a food industry source CO_2 that burns natural gas, but has low co-pollutant emissions. This allows an oil refinery source to avoid regulation, or even expand, by buying its way out through clean-up of a facility with less toxic co-pollutants. If the oil refinery uses forest credit offsets, it definitely means that a more toxic source (an oil refinery) is offset by a less toxic source.

The proposed regulation does nothing to avoid hotspots or co-pollutant emissions. Yet AB 32 requires that,

> "Prior to the inclusion of any market-based compliance mechanism in the regulations . . . the state board shall . . . (1) Consider the potential for direct, indirect, and cumulative emission impacts from these mechanisms, including localized impacts in communities that are already adversely impacted by air pollution; (2) Design any market-based compliance mechanism to prevent any increase in the emissions of toxic air contaminants or criteria air pollutants." (CBE1)

Comment: Despite the volume and toxicity of industrial co-pollutants (especially oil industry), there are zero tons of direct controls required for this source—all are allowed to be completed through buying pollution credits from outside any particular industry, and carried out outside California or the U.S. (CBE1)

Comment: Given the acknowledged link between GHGs and co-pollutants, the state would benefit from integrating its GHG and co-pollutant reduction strategies and creating a more unified approach to regulating industrial emissions. AB 32 recognizes the connection between GHGs and co-pollutants, and instructs CARB to develop GHG reduction policies that would not only reduce GHGs, but do so in a way that "maximizes additional environmental and economic co-benefits for California, and complements the state's efforts to improve air quality." Overall, the scoping plan in general and the cap-and-trade program in particular will likely lead to improvements in air quality. That said, the cap-and-trade program does not include measures to prevent increases in co-pollutants or optimize the location of GHG and corresponding co-pollutant reductions.

The State's commitment to reduce GHGs is likely to improve co-pollutant levels and redound to the benefit of most, if not all, Californians. The state could, however, take greater initiative in fulfilling AB 32's invitation to link GHG and co-pollutant reduction benefits. (USFLAW)

Comment: I request that you very carefully consider evidence that cap and trade does not offer a solution to the air pollution problem. When the polluters are rewarded for polluting, they will not be encouraged to stop polluting. There are many people suffering physically from pollution, and these people are not the one causing it. There is a need to insert justice as a required element in the rules you make. AB 32 cannot be effective if the rules continue to permit pollution and the polluters are rewarded for it. Remember also that the entire planet needs better air. (DONOVAN)

> **Response:** The commenters claim that the cap-and-trade regulation does not fulfill the requirements outlined in AB 32; specifically the following three provisions:
>
> To the extent feasible and in furtherance of achieving the statewide greenhouse gas emissions limit, the state shall do the following:
>
> 1. Consider the potential for direct, indirect, and cumulative emission impacts from these mechanisms, including localized impacts in communities that are already adversely impacted by air pollution (Section 38570(b)(1);
>
> 2. Design any market-based compliance mechanism to prevent any increase in the emissions of toxic air contaminants or criteria air pollutants (Section 38570(b)(2);

3. Maximize additional environmental and economic benefits for California, as appropriate (Section 38570 (b)(3).

We disagree and believe that the proposed cap-and-trade regulation meets the requirements of AB 32.

Requirement 1
As noted earlier in this section, ARB evaluated the potential for localized increases in direct, indirect, and cumulative emissions in impacted communities due to a cap-and-trade program to the best of our ability during the regulatory development process. The findings of this analysis can be found in the Staff Report, in *Appendix P. Co-Pollutant Emissions Assessment*. In addition, the CDPH also investigated the potential impacts of a cap-and-trade program on health inequities, as documented in the *Health Impact Assessment of a Cap-and-Trade Framework* (HIA). We considered the results of both documents in the regulatory development process before endorsing the program.

Requirement 2
As the Emissions Assessment indicates, co-pollutant emissions in California would likely decrease as a result of a cap-and-trade program. This would mainly be attributed to an increase in efficiency and a decrease in the combustion of fossil fuels. In addition, as stated in a previous response, numerous studies have evaluated the potential for inequitable co-pollutant impacts from emissions trading programs on impacted communities and determined that either there were no impacts or that an emissions trading program could lead to co-pollutant benefits in impacted communities.

The State of California has the most stringent and successful air quality programs in the country. As described in the Emissions Assessment, our program has substantially improved the air quality in California. The cap-and-trade program will complement our existing air quality program and not impede or in any way alter existing requirements for criteria and toxic air pollutants.

Some of the commenters note specific concerns with aspects of federal, State, and district air quality regulations, and claim that they have not and would not stop air quality from worsening in their community. We acknowledge these concerns. However, the cap-and-trade regulation is not the proper venue or mechanism for addressing enforcement issues with existing regulations.

One commenter specifically states that cap-and-trade programs lead to hotspots. The commenter's evidence of this is that modeling has shown that RECLAIM increases NOx emissions in Wilmington. This is incorrect. According to the South Coast Air Quality Management District, RECLAIM has resulted in significant reductions in both NOx and SOx emissions at refineries in Wilmington. Regardless, the cap-and-trade program would overlay all source-specific rules, unlike RECLAIM, which allows facilities that participate in the trading program to opt out of certain district rules.

Although we anticipate that co-pollutant emissions would decrease as a result of the implementation of the cap-and-trade regulation, ARB is committed to monitoring the regulation's implementation to identify and address any situations where the program has caused an increase in criteria air pollutants or toxic emissions. To assist staff in its assessment, we developed an Adaptive Management Plan that was posted for public review on October 10, 2011, and considered and approved by the Board at its October 20, 2011, public hearing. The Board's approval of the Adaptive Management Plan is reflected in Attachment C of Board Resolution 11-32.

Adaptive management is a process of information gathering, review and analysis, and response that promotes flexible agency decision-making. It is particularly appropriate where complex systems are involved, where the effects of an agency's decisions and actions play out over an extended period of time, and where the agency must meet multiple objectives—as in the case of the cap-and-trade regulation, which was adopted by the Board at its October 20, 2011, public hearing.

The adaptive management approach will allow us to collect and review applicable data sources (e.g., the MRR data, market tracking system, economic data, emission inventory, air monitoring data, and energy efficiency and co-benefits audits) and develop the appropriate tools to determine if there are impacts due to compliance with the cap-and-trade regulation as information becomes available. We will work with other State agencies and local air districts during this process. If it is determined that an adverse impact has been identified as result of the regulation, ARB will conduct a public process and report to the Board on appropriate responses.

Requirement 3
The cap-and-trade program was designed to maximize a number of additional environmental and economic benefits. For example, the forest offset protocol is expected to lead to immeasurable wildlife and ecological benefits in California. The cap-and-trade program as a whole will incentivize investment in green technology.

In summary, we believe that the cap-and-trade program appropriately meets a balance for all the program objectives, including the three identified. Nevertheless, we are committed to monitoring the regulation's implementation to identify and address any situations where the program has caused an increase in criteria air pollutant or toxic emissions through a proposed adaptive management component of the cap-and-trade program.

See also response to Comment B-13.

F-5. (multiple comments)
Comment: Living in a region with high levels of air pollution due to the same stacks that are emitting GHGs, I want all of that pollution cut. It does not make sense to keep polluting or spewing out GHG emissions anywhere and especially in communities that have felt the impact of pollution for decades if not generations. Cut GHG emissions at the source for the full benefit of all Californians! (MASARENHAS)

Comment: CARB should evaluate other co-pollutants including PM2.5 and toxics which feasible direct controls would achieve. AB 32 requires addressing the co-pollutants issues, but the proposed Cap and Trade regulation and Scoping Plan do not. Large California NOx, CO, and other co-pollutant reductions can be achieved if an alternative is adopted requiring direct control measures using methods known by CARB (e.g., for boilers and heaters). These co-pollutants otherwise cause large cumulative impacts in communities of color.

Project alternatives such as requiring direct control measures would create California jobs, California health improvements, and the best model for regions outside California to replicate. They were not considered. Cost effectiveness calculation of such controls should include the benefits of reducing GHGs, reducing smog and toxics, and reducing health impacts. (CBE1)

Comment: Boiler and Heater NOx and CO Co-pollutant emissions are large and if directly controlled would yield large local health benefits. AB 32 requires ARB to design the program to prevent any increase in emissions of toxic air contaminants or criteria pollutants. It also requires it to consider the overall societal benefits of reducing other air pollutants and benefits to the environment and public health. Yet the draft regulation demonstrates that reductions could have been achieved to substantially reduce co-pollutant emissions but was rejected. If these controls were implemented locally instead of traded, they would not only result in the CO_2 emissions reductions identified by CARB, but would also result in very substantial co-pollutant reductions. CARB should have considered such an alternative project to address co-pollutant impacts. (CBE1)

Comment: Pollution trading often does not result in emissions reductions because of increased difficulty monitoring and enforcing emission reductions. Instead of relying on trading, ARB should focus on direct emission reductions, “a greenhouse gas emission reduction action made by a greenhouse gas emission source at that source.” By requiring emissions reductions at the source, ARB will provide certainty that emissions reductions will occur and can determine where the reductions will occur. Thus, ensuring that environmental justice communities will get an equitable share of the co-benefits of reducing greenhouse gas emissions. In addition, direct emission reduction measures can provide targeted co-benefits and ensure an appropriate level of GHG and co-pollutant reductions. (CRPE1)

Comment: Refining areas are in need of direct, local pollution controls, not the potential for further concentration and expansions that the Cap and Trade proposal makes likely, through allowing refineries to buy their way out of local pollution control. (CBE1)

Response: Several of the commenters suggested that ARB should directly regulate greenhouse gas emissions from stationary sources instead of pursuing a cap-and-trade program.

The cap-and-trade program creates a limit on the emissions from sources responsible for 85 percent of California's GHG emissions, establishes the price signal needed to drive long-term investment in cleaner fuels and more efficient use of energy, and affords covered entities flexibility to seek out and implement the lowest-cost options to reduce emissions. The cap-and-trade program is designed to work in concert with other measures, such as standards for cleaner vehicles, low-carbon fuels, renewable electricity, and energy efficiency. The program will also complement and support California's existing efforts to reduce criteria and toxic air pollutants.

When developing the Scoping Plan in 2008, and in the Staff Report for the cap-and-trade regulation, we evaluated the air quality impacts of a direct regulatory approach compared to a cap-and-trade program.

A cap-and-trade program has the distinct advantage of imposing an enforceable cap on emissions—making it the most likely method to successfully meet the AB 32 goal of capping emissions at 1990 levels by 2020. As described on pg. IV-3 of the Staff Report, direct regulations for emission sources do not provide the same assurance of reductions as those offered by a cap-and-trade program.

Emissions reductions from command-and-control regulations are estimates based on assumptions about the specific regulation, and they typically result from reducing the emissions intensity of the regulated activity. These assumptions may include forecasts of technology development and penetration estimates. Although these estimates would be based on the best data available, actual results may be different because regulations may fail to achieve expected reductions, or programs may not be funded at adequate levels or may be less effective than projected. In addition, increases in the regulated activity (e.g., an increase in throughput) could mean that the regulation has the effect of reducing emissions intensity but the absolute level of emissions could actually increase over time. A cap-and-trade program, on the other hand, would establish the maximum level of total GHG emissions allowed to be emitted collectively by all covered sources. Because the cap-and-trade program sets a cap on the GHG emissions from the majority of California's GHG emissions, it helps ensure that the State will meet the AB 32 statewide emissions limit.

Source-specific regulations are also unlikely to be as cost-effective at reducing GHG emissions as the proposed cap-and-trade program. The cap-and-trade program is designed to allow broad flexibility for the covered entities to find the most cost-effective GHG emissions reductions by reducing their GHG emissions, buying allowances from an entity that does not need them for compliance, or purchasing offset credits. With source-specific regulations, entities have limited flexibility and must comply with the regulation, no matter what it costs. Even though each source-specific regulation must undergo cost-effectiveness analyses, it may not necessarily be the most cost-effective for the industry and economy as a whole because cost-effective reductions are not necessarily evenly distributed through all industrial sectors.

In addition to lacking emissions-reductions certainty, and having the potential to be less cost-effective at reducing emissions, industry-wide command-and-control regulations would be time consuming to develop and challenging to draft and implement. To develop these regulations, ARB would need to identify and target specific processes and equipment and formulate regulations for each. Due to the diverse nature of many industrial processes and a lack of data, it is not practical for ARB to craft and implement such regulations at this time. However, ARB will use information collected through the mandatory reporting regulation, the cap-and-trade regulation, the industrial efficiency audit, and other sources to evaluate how facilities are complying with the cap-and-trade regulation, and to evaluate additional opportunities for cost-effective emission reductions at large stationary sources subject to the program.

F-6. (multiple comments)
Comment: We have concerns about the approach CARB staff used to conduct the emissions assessment. We believe the approach should ensure we are analyzing the specific impacts (both emissions and corresponding health impacts) of the cap and trade regulation exclusively, utilizing a smaller/neighborhood-level analysis to assess localized impacts, and including an analysis of the impacts from the use of offsets. In addition, we urge CARB to commit to specific benchmarked ongoing monitoring. (CCA1)

Comment: AB 32 directs CARB to develop policies that “complement the state’s efforts to improve air quality.” It is not enough to prevent co-pollutant increases. Ideally, the cap-and-trade program should help achieve air quality standards by targeting GHG, and associated co-pollutant, reductions in the state’s most polluted areas. Not surprisingly, CARB’s Co-Pollutant Emissions Assessment reveals that greater co-pollutant reductions benefits would be achieved if all facilities had to reduce their proportionate share than will be achieved by letting facilities trade GHG allowances in ways that could maintain or increase emissions. For example, in the Wilmington case study, if facilities reduced their GHG emissions by their proportionate share rather than increasing emissions, co-pollutant reductions would be enhanced by 2 percent for NOx, 3 percent for PM2.5, and 1 percent for ROG. While the percentage difference in emissions reductions is small, the data indicates that the cap-and-trade program has not been designed to enhance the achievement of air quality objectives.

In addition, the emissions assessment does not evaluate what could have been achieved if the program were designed to require or incentivize greater GHG reductions in the state's most polluted areas. The first scenario in all of the report's case studies assumes that all facilities in the state reduce by the same amount. The report does not analyze the co-pollutant consequences of achieving greater-than-average GHG reductions in the state's most polluted areas. (USFLAW)

Comment: The case studies in the emissions assessment do include emissions increase scenarios, evaluating both the possibility that facilities would increase GHG emissions by 4 percent and the possibility of a new source in each study area. The Staff Report reveals that these GHG emissions increases would lead to small increases in co-pollutants relative to the baseline scenario. For example, in the Wilmington case study, if GHG emissions increased by 4 percent, then, in comparison with the baseline scenario resulting from current criteria pollutant controls, there would be 1 percent less NOx reduction, 2 percent less PM2.5 reduction, and 1 percent less ROG reduction. Achieving less reduction is tantamount to increasing emissions relative to the baseline; co-pollutant emissions would be higher than they would have been had the facilities reduced instead of increasing GHG emissions. Moreover, it is possible that major facility expansions could lead to increases above 4 percent and that more than one new facility could choose to locate in certain areas, possibilities not considered by the assessment. (USFLAW)

Comment: The co-pollutant emissions assessment conducted has many limitations and does not include major source categories coming into the program in 2015. Historical data and similar previous hypothetical analyses have consistently shown that such model-based predictions (such as the 1990's SIPs which expected attainment of ozone standard by 2010) have often proved to be wrong.

According to the Scoping Plan, 169 MMT of CO_2E reduction per year is associated with a co-benefit of reducing $PM_{2.5}$ by 15 tons/day. Applying the same ratio in a cumulative context, the proposed amount of offsets equates to losing the co-benefit of reducing $PM_{2.5}$ by 2.3 tons/day—this could translate to about 100-120 deaths. The emission reduction programs funded by the CBF will reduce this burden significantly and maximize the co-benefits as required by AB 32. (CCA2)

Comment: ARB conducted a "Co-Pollutant Emissions Assessment" in four areas of the state and concludes that the cap-and-trade regulation is expected to have a beneficial effect on emissions. This conclusion is arguably justifiable because of the approach taken to compare the emission changes in the context of background levels and the size of the area considered for evaluation. We believe that the assessment should have included evaluation scenarios of emission impact changes expected in the vicinity of emission sources (for example, at the fence line and 0.5 mile radius) as opposed to comparing it to the total emissions from all sources in a large area. The historical data and previous assessments have consistently shown that predictions from similar macro scale modeling based on emission inventories have often proved to be misleading and have very limited accuracy in their predicting value. In almost all of the previous regulatory development processes, the tonnage reduction or potential increase of emissions was estimated for that particular (specific) regulation and was estimated along with associated health benefits. Staff argues that due to lack of information on the concentration, location, duration of air pollutant exposures, unique surrogate for the large industrial sources and data to conduct air quality modeling prevented them to conduct a health assessment. However, with similar limitations many previous regulations and reports (goods movement, diesel emission reduction plan) including the Scoping Plan have estimates of health benefits. Furthermore, by incorporating other existing regulations into the assessment, CARB is not providing the focused evaluation of the cap-and-trade program we anticipate is envisioned in AB 32. The assessment also neglects to consider the cumulative impact of offsets proposed in the cap-and-trade program. The total offsets limit proposed is about 232 MMT CO_2E or an average of 26 MMT per year (lower in early years and higher in later years). According to the Scoping Plan, 169 MMT of CO_2E reductions per year is associated with a co-benefit of reducing PM2.5 by 15 tons/day. Applying the same ratio in a cumulative context, the proposed amount of offsets equates to losing the co-benefit of reducing PM 2.5 by 2.3 tons per day. This could be translating to about 100-120 deaths annually. The above scenario is neither acknowledged in the proposed regulation nor has any real and viable solution to initiate or augment co-pollutant emission reduction efforts recommended in the proposal. (CCA1)

Comment: Framework for the Co-Pollutant Emissions Scenarios is flawed. CARB did not properly assess the co-pollutant risk. Co-Pollutant Emissions Assessment is limiting in that it only identifies four “impacted communities” for the purposes of demonstrating the hypothetical bounding exercise and has a problematic boundaries for the communities. ARB should reduce the scale of this assessment to magnify the local communities that are experiencing high exposures to pollution. It is unclear why CARB chose to exclude the West Oakland community and the Port of Oakland and yet, include predominately white, upper class and upper middle class cities such as Piedmont, Orinda and Regional Parks areas in East Contra Costa County. If the intent was to give a regional assessment, CARB should have included the East Bay communities where local PM 2.5 daily concentrations are exceeding federal standards. Low-income communities of color such as in East Oakland are overburdened by exposure to fine particulates and other pollutants and are vulnerable to cumulative impacts. (CBE1)

Comment: ARB includes three scenarios for Community Case Studies (Appendix P-50). We find Scenario 1—where all covered facilities reduce within the community and use offsets within the community—highly unlikely in the regulation’s proposed form in Richmond and Wilmington, due to expected trends in increasing refinery capacities and the unlimited geographic boundaries of the offset program. There are no requirements or incentives to do this; in fact the whole regulation is stated to be designed for trading across state and international lines. However, this scenario could be more likely if the regulation is amended to geographically restrict trading and offsets. Scenario 2—where all covered facilities increase their emissions—seems very likely, especially for sources like refineries, which are attempting to expand and will have to purchase offsets or additional allowances. Scenario 3—where a new combined heat and power unit at an existing refinery is built in the community—there is a major deficiency in the analysis because it does not account for the possibility that refineries will utilize this increased efficiency in one area of the refinery to allow increased capacity to refine heavier, dirtier crude, resulting in a net increased emissions and exacerbating localized impacts. For example, CARB and the Air Quality Management Districts are well aware that this is the standard approach used in air permitting, and routinely carried out during expansions. Furthermore, due to the flexibility of the proposed regulation, we find the equally apportioned 4 percent greenhouse gas reduction at every cap-and-trade industrial and electricity generation facility in the community region extremely unrealistic. (CBE1)

> **Response:** The commenters suggested that the Co-Pollutant Emissions Assessment should have evaluated additional scenarios, the scenarios selected are unrealistic, and ARB should have analyzed the change in co-pollutant emissions in the State's most polluted areas.
>
> We evaluated the potential for localized increases in co-pollutant emissions in impacted communities due to a cap-and-trade program to the best of our ability, given resources and data availability (see the response earlier in the section for details). Due to the variety of compliance options available, it was not feasible to analyze the impacts of every potential hypothetical change in greenhouse gas emissions in every community. Instead, we selected scenarios to bound the potential range of co-pollutant emission changes that could occur in a community. We then analyzed the change in co-pollutant emissions in four communities that are adversely impacted by air pollution—Wilmington, Oildale/Bakersfield, Richmond, and Apple Valley/Oro Grande—which have a significant concentration of industrial sources. As stated below, these four communities were selected using a variety of methods and through consultation with the Environmental Justice Advisory Committee (EJAC).
>
> A few of the commenters estimated the quantity of premature deaths that are not avoided by including offsets in the cap-and-trade program using estimates from the Scoping Plan. It is not appropriate to apply the ratio used in the Scoping Plan to the co-pollutant emissions that would be reduced under a cap-and-trade program to estimate the impacts. Instead please refer to the Co-Pollutant Emissions Assessment in the Staff Report.
>
> The methodology used in the Scoping Plan report for estimating premature deaths associated with particulate matter less than 2.5 microns in diameter (PM2.5) is outdated. We routinely prepare cost-benefit analyses as part of promulgation of regulations designed to reduce air pollution. These cost-benefit analyses include estimates of the health benefits, and the dollar value associated with a proposed regulation. We quantify some of the health impacts associated with exposure to current and future levels of ambient particulate matter. The methodology used in these analyses is periodically updated as new scientific literature is published.

In 2010, we updated the methodology for estimating premature mortality related to long-term exposure to PM2.5 in response to a new review of the National Ambient Air Quality Standards for Particulate Matter by the U.S. Environmental Protection Agency (U.S. EPA). That review included the most recent peer-reviewed scientific literature on the health effects of PM2.5, and one of its findings is that there is a causal relationship between PM2.5 exposure and premature death. We adopted the U.S. EPA's PM2.5 risk assessment methodology because it represents the most scientifically defensible basis for making estimates of the health benefits of PM2.5 regulations.

In addition, the HIA found that a cap-and-trade program with offsets would have more health benefits than a program without offsets, specifically with regard to economic health determinants. As previously indicted, staff anticipate that co-pollutant emissions would decrease as a result of the implementation of the cap-and-trade regulation. However, ARB is committed to monitoring the regulation's implementation to identify and address any situations where the program has caused an increase in criteria air pollutants or toxic emissions. To assist staff in its assessment, we developed an Adaptive Management Plan that was posted for public review on October 10, 2011, and considered and approved by the Board at its October 20, 2011, public hearing. The Board's approval of the Adaptive Management Plan is reflected in Attachment C of Board Resolution 11-32.

Adaptive management is a process of information gathering, review and analysis, and response that promotes flexible agency decision-making. It is particularly appropriate where complex systems are involved, where the effects of an agency's decisions and actions play out over an extended period of time, and where the agency must meet multiple objectives—as in the case of the cap-and-trade regulation, which was adopted by the Board at its October 20, 2011, public hearing.

The adaptive management approach will allow us to collect and review applicable data sources (e.g., the MRR data, market tracking system, economic data, emission inventory, air monitoring data, and energy efficiency and co-benefits audits) and develop the appropriate tools to determine if there are impacts due to compliance with the cap-and-trade regulation as information becomes available. We will work with other State agencies and local air districts during this process. If it is determined that an adverse impact has been identified as result of the regulation, ARB will conduct a public process and report to the Board on appropriate responses.

Adaptive management is consistent with ARB's long-standing approach to program implementation which incorporates ongoing evaluation of how programs and regulations are implemented on the ground, regular updates to the Board, and adjustments to program implementation and regulatory requirements, as necessary.

F-7. (multiple comments)
Comment: All of California will benefit from the improved health and lower pollution levels that will result from CARB's implementation of California's landmark legislation. We believe these policies can improve our energy security, create new business opportunities and more jobs, and provide incentives for innovation. (UCS3)

Comment: CIPL joins with other public health and environmental justice organizations in supporting the public health assessments of the cap and trade scenarios by the Department of Public Health and the Air Resources Board. (CIPAL)

Comment: Catholic Charities supports the efforts by the ARB and the Department of Public Health to conduct public health assessments. (CATHCHAR1)

Response: Thank you for the comments. We appreciate the support.

F-8. (multiple comments)
Comment: In order to make sure that public health at the community level is safeguarded, ARB should require an ongoing review and update of the co-pollutant emissions assessment included in the Initial Statement of Reasons, and should continue to work with the Department of Public Health in ongoing review and evaluation of the impacts of the Cap-and-Trade program. (SIERRACLUBCA4)

Comment: We urge CARB to require an ongoing review and update of the Co-Pollutant Emissions Assessment (Assessment) included in the Initial Statement of Reasons once the Cap and Trade Program is enacted. As mentioned earlier, we believe the community emissions assessment is important to the regulatory development and review process. We appreciate that multiple cap and trade scenarios that were analyzed for Wilmington, Oildale/Bakersfield, Richmond, and Apple Valley/Oro Grande including several different compliance choices by facilities (facility upgrades to reduce emissions, the purchase of allowances or reliance on offset purchases). This analysis provides a helpful step forward in understanding the range of potential communitywide air quality and emission impacts based on assumptions of future facility actions. As your analysis notes, however, it is difficult to know what facility-specific changes will actually occur under cap and trade and how this will impact emissions. Therefore, as the program is implemented, it is important to specifically require an ongoing, updated assessment of emissions in order to get a clearer picture of how the cap and trade program is actually impacting pollution emissions in communities and to capture any localized impacts not included in the initial analysis. While the Assessment indicates that staff will evaluate how the facilities are complying with the regulation at least once every compliance period, we believe more specific direction is needed in the regulation. (KUSTIN02, KUSTIN11, KUSTIN12)

Comment: The proposed regulation states that CARB will monitor the co-pollutant consequences of the trading program and take further action as appropriate. Such monitoring will provide an important opportunity to assess the program. However, the report indicates that such an assessment will occur only once a compliance period—once every three years. That appears to be too infrequent to properly monitor the program's co-pollutant consequences. (USFLAW)

Comment: As AB 32 and the Cap and Trade program go forward, we request that ARB conduct ongoing reviews and updates of the co-pollutant emissions assessment. We hope the Department of Public Health and ARB will continue working with each other to conduct broader assessments of the impacts to public health. (CATHCHAR1, CIPAL)

Comment: We wanted to reinforce the importance of ongoing assessment of emission impacts and health surveillance in local communities. And we want to work with you to get this built into the periodic review discussed in the periodic regulation review that's discussed in the 15-day changes in Attachment B. (ALA)

Comment: We urge CARB to continue to work with the Department of Public Health (DPH) in ongoing review and evaluation of public health aspects of the Cap and Trade program. Similar to the emissions assessment, we believe CARB should continue to work with DPH to conduct broader assessments of public health impacts as the program is implemented. (KUSTIN11, KUSTIN12)

> **Response:** Although we anticipate that co-pollutant emissions would decrease as a result of the implementation of the cap-and-trade regulation, ARB is committed to monitoring the regulation's implementation to identify and address any situations where the program has caused an increase in criteria air pollutants or toxic emissions. To assist staff in its assessment, we developed an Adaptive Management Plan that was posted for public review on October 10, 2011, and considered and approved by the Board at its October 20, 2011, public hearing. The Board's approval of the Adaptive Management Plan is reflected in Attachment C of Board Resolution 11-32.
>
> Adaptive management is a process of information gathering, review and analysis, and response that promotes flexible agency decision-making. It is particularly appropriate where complex systems are involved, where the effects of an agency's decisions and actions play out over an extended period of time, and where the agency must meet multiple objectives—as in the case of the cap-and-trade regulation, which was adopted by the Board at its October 20, 2011, public hearing.
>
> The adaptive management approach will allow us to collect and review applicable data sources (i.e., the MRR data, market tracking system, economic data, emission inventory, air monitoring data, and energy efficiency and co-benefits audits) and develop the appropriate tools to determine if there are impacts due to compliance with the cap-and-trade regulation as information

becomes available. We will work with other State agencies and local air districts during this process. If it is determined that an adverse impact has been identified as result of the regulation, ARB will conduct a public process and report to the Board on appropriate responses. We will report to the Board at least annually on the implementation of the Adaptive Management Plan.

Adaptive management is consistent with ARB's long-standing approach to program implementation which incorporates ongoing evaluation of how programs and regulations are implemented on the ground, regular updates to the Board, and adjustments to program implementation and regulatory requirements, as necessary.

F-9. Comment: The cap and trade program should have a more direct linkage between specific industrial and utility sector allowance allocations to specific actions that benefit historically disadvantaged communities and low-income ratepayers. Concurrently, CARB should err on the side of under allocation when doling emissions allowances to major sources in disadvantaged and historically impacted communities. (EDF1)

Response: Utilities must use the value of their allowances on behalf of rate-payers. Our intent is to provide free allowances solely to transition to a program that relies on auction and prevents leakage. As stated in Board Resolution 10-42, the Board agreed with the recommendations of the Economic and Allocation Advisory Committee, including financing economic opportunities and environmental improvements in disadvantaged communities. We are currently developing recommendations on the use of auction proceeds and will examine potential applications in disadvantaged communities.

G. DEFINITIONS

This section includes specific comments and associated responses about definitions, and primarily concerns section 95802 of the regulation.

G-1. (multiple comments)
Comment: The first deliverer of electricity is currently defined either as the "owner or operator" of an electricity generating facility in California or an electricity importer. Because the point of regulation for the electricity sector is the first deliverer, it is critical that the definition be certain and unambiguous. In the majority of cases, the operator is also the owner, but there are cases where the owner may include multiple parties and the operator may be one of those owners acting on behalf of all the owners. LADWP recommends that this be corrected for consistency with subarticle 3, section 95811, such that for an in-state electricity generating facility only the operator is the first deliverer, and not the owner of the facility. (LADWP1)

Comment: The definition of “First deliverer of electricity” should be clarified. “First deliverer of electricity” is defined in section 95802(a)(71) (p. A-17) as “either the owner or operator of an electricity generating facility in California or an electricity importer.” However, in section 95811(b)(1) (p. A-40), the operator, not the owner or operator, of an electricity generating facility in California is specified as being the covered entity for electricity generating facilities. The definition of “first deliverer of electricity” in section 95802(a)(71) implies that there is a choice about whether the owner or the operator of a facility will be the covered entity for an electricity generating facility, but allowing a choice may cause problems, given that the operator, not the owner, is required to report under the revised MRR, given that the owner and the operator of a facility are different entities in many cases, and given that many generating facilities are jointly owned. ISOR for the revised MRR notes (p. 135) the importance of avoiding ambiguity as to the entity with reporting obligations. It is even more important to avoid ambiguity as to the entity with cap and trade compliance obligations. The simplest approach would be to follow section 95811(b)(1) and revise section 95802(a)(71) to refer to the operator only rather than to “either the owner or operator” of an electricity generating facility. (SCPPA1)

> **Response:** We agree and modified the definition of "First Deliverer of Electricity" to only include the operator of the facility and not the owner.

G-2. Comment: The definition of greenhouse gases within Section 95802 does not include fluorinated compounds listed within 40 CFR Part 82, subpart A. This definition is inconsistent with the compounds listed within the ODS protocol in this regulation; all of which are listed within 40 CFR Part 82, subpart A. (CAPCOA1, CAPCOA2)

> **Response:** The definition of “Greenhouse Gas” was modified to make it consistent with terminology in AB 32, and includes only the six greenhouse gases listed therein. Nothing in AB 32 limits ARB from identifying additional GHGs that may be included in Compliance Offset Protocols. The ODS protocol

compounds are defined in the ODS protocol which is incorporated by reference into the regulation.

G-3. Comment: The reference to "hydrocarbons" within the definition of Greenhouse Gases in section 95802(a)(84) needs to be removed. (PMTPETRO1, CCEEB1, WIRA1)

Response: We agree and modified the definition of "Greenhouse Gas" to not include hydrocarbons, consistent with terminology in AB 32.

G-4. Comment: ATA recommends a change to the definition of "Kerosene" to address a typographical error. We are fully supportive of ARB's proposal to exclude jet fuel from the definition of kerosene. To fully effectuate this, ATA recommends that the word "include" be inserted into the last sentence of the definition of "Kerosene," (section 95802(a)(104)), in order to address an apparent typographical omission. With this insertion, the sentence should read, "Kerosene does not include kerosene-type jet fuel." (ATAA)

Response: We corrected the typographical error.

G-5. Comment: Section 95985 makes extensive reference to the concept of replacing credits in the event of a reversal, but the term is not defined. "Replace" should be a defined term, perhaps defined as transferring a compliance instrument into the Retirement Account established pursuant to section 95831(3). (SHILLINGLAW1)

Response: We modified section 95985 and believe the revisions clarify what is meant by replacing an offset credit. Specifically, an entity "must replace each metric ton of CO_2e with a valid ARB offset credit or another approved compliance instrument."

G-6. Comment: "Solid waste materials" should be defined in Section 95852.2(a)(1). (LASD1)

Response: For consistency, we replaced the undefined term "solid waste materials" with the term "Municipal Solid Waste," where applicable. In addition, we modified the definition of "Municipal Solid Waste" to clarify the types of material that would fall under this category.

G-7. (multiple comments)
Comment: Section 95802(a)(207) defines "Voluntarily Associated Entity" as "any entity which does not meet the requirements of section 95811 in this article that intends to voluntarily retire compliance instruments in the cap-and-trade program," while section 95814(a)(2)(A) more broadly defines the role of a Voluntarily Associated Entity as "an entity that does not meet the requirements of sections 95811 and 95813 that intends to purchase, hold, sell, or voluntarily retire compliance instruments." NCPA recommends that these definitions be reconciled so that they are consistent. (NCPA1)

Comment: The definition of voluntarily associated entity needs to be corrected. CERP strongly supports ARB's creation of an open market for trading in compliance instruments. CERP believes that allowing a wide variety of entities to participate in the market will ensure a liquid market and reduce the potential for any one entity to exercise market power. However, the definition of "voluntarily associated entity" in the proposed regulations provides that such an entity must have an intent to voluntarily retire compliance instruments. This appears to be an error because other provisions make clear that a "voluntarily associated entity" can be a broker or other liquidity provider. (CERP1)

> **Response:** We agree and modified the definition for consistency.

G-8. Comment: Section 95857(c)(5) gives CARB's Executive Officer the power to identify holding accounts controlled by "affiliates" of the deficient covered entity to which the covered entity has transferred compliance instruments and prevent transfers from the holding accounts and retrieve allowances from them to address the deficient surrender by the covered entity. However, "affiliate" is not defined. (CAPCOA1, CAPCOA2)

> **Response**: We modified section 95857(c) to outline the consequences of not meeting the untimely surrender obligation. As a result, the term "Affiliate" was deleted from subsection (c)(5).

G-9. (multiple comments)
Comment: We believe the definition of what constitutes a "beneficial ownership" relationship needs to be brought into sharper focus. A Beneficial Ownership designation should be limited to a party that has an arrangement with the account owner that allows it to direct the account owners management and disposition of the allowances held beneficially for it. (MSCG2)

Comment: Section 95915(b) (p. A-102) sets out a very broad definition of "bidding association." An entity would be in a "bidding association" if the entity had "any form of agreement with another entity" or "has agreed to provide assistance to the other entity in any way" except for investment or auction advisory services. The definition of "bidding association" should be narrowed to include only agreements relating to the allowance auctions. Modify this section as follows:

> An entity has a disclosable "bidding association" with another entity if it:
> (a) Has any form of agreement with another entity <u>relating to the allowance auctions; or</u>
> (b) Is partnered with another entity for bidding purposes; <u>or</u>
> (c) Has agreed to provide assistance <u>in relation to the allowance auctions to the other entity</u> in any other way, with the exception of investment or auction advisory services ~~with the other entity~~. (SCPPA1)

G-10. Comment: The Utilities request further explanation of subsection 95915(b) as to the description of what a disclosable bidding association is. As currently written in the proposed regulation, the definition of a "bidding association" is vague and further clarification of the types of agreements and assistance being referred to is needed. For example, the ISOR (page IX-101) appears to indicate coverage only for entities that provide advisory services (presumably although not explicitly stated) related to allowance auction bids. However, subsection 95915(b)(3) refers very broadly to any "assistance." The Utilities request that subsection 95915(b) be revised to define the realm of agreements and assistance that would create "bidding associations." (MID1)

> **Response**: We agree that "Beneficial Ownership" and "Bidding Association" needed clarification. We modified the regulation by deleting section 95915, along with the term "Bidding Association." In addition, new sections 95833 (Disclosure of Direct and Indirect Corporate Associations) and 95834 (Disclosure of Beneficial Holding) were added to clarify language in the appropriate context within the regulation. New section 95833 is composed generally of modified text that originally appeared as sections 95914(a) through (d). This section additionally requires all registered entities to identify if they share specific types of relationships with other registered entities. This information is needed to monitor for suspicious activity in the market program and ensure market rules are not circumvented. New section 95833(a)(2) was modified from original text to clarify an existing requirement that an entity holding compliance instruments on behalf of another entity in a beneficial holding relationship is considered to have a direct corporate association with the other entity.
>
> New section 95834 provides detailed provisions for an existing requirement that any entity holding compliance instruments on behalf of another entity disclose the relationship to ARB. New section 95834(a)(1) defines when a beneficial holding relationship exists. It also defines an agent as an entity holding allowances owned by a second entity, which is defined as the principal. New section 95834(a)(2) creates a type of beneficial holding relationship for electric distribution utilities that may need to hold compliance instruments on behalf of entities with whom they have long-term electricity delivery contracts, which may not explicitly determine which party to the contract has the responsibility to surrender compliance instruments. Section 95834(a)(3) allows entities that have disclosed a corporate association pursuant to section 95833 to utilize the beneficial holding arrangements.

G-11. Comment: Section 95852.2(a) references emissions from sources which do not have a compliance obligation specifically excepting biogas from digesters. However the term "Biogas" is not defined. A definition should be added. Modify section 95802 as follows:

> <u>Biogas - gas from the anaerobic digestion of organic wastes.</u>

Also Section 95852(e) specifically lists emissions of Biomethane from animal and other organic waste and landfill gas and wastewater as specifically exempted from creating a compliance obligation and yet "Biomethane" is likewise not defined. A definition for "Biomethane" should be added. Modify section 95802 as follows:

> Biomethane - is biogas that has been upgraded or otherwise conditioned to meet CPUC natural gas specifications and is suitable for injection into natural gas pipeline systems operated by public and private utilities. (SEMPRA1)

> **Response**: We agree, and added definitions for biogas and biomethane to section 95802. The definition of biomethane does not reference biomass, but rather, is defined as biogas that meets pipeline-quality natural gas standards.

G-12. Comment: I understand that staff plans to add a defined term "biomethane" as "pipeline-quality biomass-derived fuel." If staff does adopt use of "organic" or "organically derived" in place of the current use of "biomass" to mean anything once living that is not now a fossil, the current use of "biomass" in the proposed regulation that is something very much broader than the meaning of the word "biomass" this definition would instead read something akin to "pipeline-quality organically derived fuel." (WEINSTEIN)

> **Response**: We agree, and added definitions for biogas and biomethane to section 95802. The definition of biomethane does not reference biomass, but rather, is defined as biogas that meets pipeline-quality natural gas standards.

G-13. Comment: The definition of electricity generating unit should be corrected. The definition of electricity generating unit listed at 95802(a)(58) incorrectly excludes some major facilities that are primarily electrical generation assets wholly owned by SMUD (and controlled to provide a critical component in SMUD's bulk transmission grid) but are also cogenerators supplying steam to nearby facilities not owned by SMUD. The definition should be changed as follows:

> (58) "Electricity generating facility" means a facility whose primary ~~sole~~ purpose is to generate electricity for the grid rather than on-site use and which includes one or more electricity generating units at the same location. ~~"Electricity generating facility" does not include a cogeneration facility or self-generation~~. (SMUD1)

> **Response:** We agree that an "electricity generating facility" should not exclude cogeneration facilities and modified the definition accordingly.

G-14. Comment: The definition of "intentional reversal" in section 95802(99) is overbroad to the extent that it attempts to penalize landowners for "negligent" loss of carbon stocks. This standard is extremely subjective and difficult to define. For instance, if a landowner maintains a highly stocked stand in order to maximize carbon and this increases fire risk which causes a reversal, is this negligence? Or if a landowner chooses not to preemptively thin a stand which is vulnerable to disease in order to maximize carbon and the entire stand is affected by disease causing a reversal, is this negligence? We recommend the definition be amended to reflect the current CAR Forest Carbon Protocol language that an intentional reversal is a result of "intentional or grossly negligent acts of the forest owner." (FCC, BLUESOURCE)

> **Response**: If a well-stocked forest that is managed in accordance with applicable forestry regulations and project objectives suffers from an unintended wildfire, this would not constitute negligence. A fire attributable to a forest owner's failure to follow laws and regulations or approved harvest and management plans would be negligence. Whether or not a reversal is intentional or not has a direct bearing on how the invalidated forest offset credit is replaced and by whom. We believe it is important to have the current language to ensure a comprehensive evaluation is allowed in determining how to replace the invalidated forest offset credit.

G-15. (multiple comments)
Comment: SCE requests clarification on the definition of a "California greenhouse gas emissions allowance" found in section 95802 of the proposed regulation. This definition states that allowances issued by CARB will be "equal to up to one metric ton of CO_2 equivalent." All allowances should be worth the same amount: exactly one metric ton of CO_2 equivalent. SCE requests that CARB confirm this interpretation, as there can be no functioning market for allowances without precise standards and measurements. (SCE1)

Comment: Section 95802(a)(27) (p. A-10) defines "California greenhouse gas emissions allowance" as "an allowance issued by ARB and equal to up to one metric ton of CO_2 equivalent." However, "allowance" is separately defined in section 95802(a)(5) (p. A-7) as a "limited tradable authorization to emit up to one metric ton of carbon dioxide equivalent." Given the definition of "allowance," the definition of "California greenhouse gas emissions allowance" should be "an allowance issued by ARB under this Article" if not eliminated altogether as redundant. Modify this section as follows:

"California greenhouse gas emissions allowance" or "CA GHG Allowance" means an allowance issued by ARB <u>under this Article</u>~~ and equal to up to one metric ton of CO2 equivalent~~. (SCPPA1)

> **Response**: The smallest accounting unit for emissions or compliance instruments is a metric ton. That is, if a covered entity was responsible for a compliance obligation that was some fraction of a ton, that entity would turn in an allowance for a whole ton. Therefore, we did not change this definition.

G-16. (multiple comments)
Comment: Recognize Carbon Capture and Storage by including its definition in section 95802. Including a definition of CCS in the rule will facilitate its further consideration during development of the implementing regulations. (APC)

Comment: Recognize Carbon Capture and Storage explicitly within the Regulation by including a definition of CCS in Section 95802. A definition of CCS within the regulation is clearly necessary so that as the cap and trade program develops, there is an accepted standard that stakeholders can reference. It also provides acknowledgement by the Board that CCS is an accepted strategy in achieving the short and long-term goals of the program. Hydrogen Energy suggests the following definition as used by the California CCS Review Panel: "Carbon capture and storage (CCS) refers to the capture, or removal, of carbon dioxide (CO_2) at large industrial sources and its subsequent compression, transport, and injection into the subsurface for long term or permanent storage." (HECA)

> **Response**: The terms "Carbon Dioxide Supplier" ("facilities…that capture the CO_2 stream in order to utilize it for geologic sequestration") and "Geologic Sequestration" included in section 95802 (definitions) acknowledge that CCS may have potential in the program.

G-17. Comment: Clarify forest owner definition with respect to conservation easement holders. The revised definition of forest owner needs to be clarified with respect to easement holders. The definition asserts that easement holders are not considered a forest owner, but proceeds to define forest owner to include entities that may hold timber rights. However, easement holders may hold timber rights as part of a conservation easement, which creates an inconsistency in the definition. Therefore, the definition does not need to include an explicit exclusion of easement holders. If there are particular sections of the Protocols that should exclude easement holders from obligations of forest owners, those sections should make this explicit. (NC1, NC2)

> **Response:** We changed the definition of "Forest Owner" to remove the exemption of conservation easement holders, and will continue to work with stakeholders to evaluate the merits of the suggested edits.

G-18. (multiple comments)
Comment: "Forest owner" should be defined to exclude the fee owner when all timber rights are held in perpetuity by another entity. If one entity holds timber rights in perpetuity on a property and the fee holder has no control over the management of the timber, it would not seem reasonable to define both the fee holder and the timber rights holder as the "forest owner" collectively as currently drafted. Modify section 95802(a)(75) as follows:

In some cases, one entity may be the owner in fee while another entity may have an interest in the trees or the timber on the property, in which case all entities or individuals with interest in the property are collectively considered the forest owners, unless the

<u>owner of the interest in the trees or the timber on the property owns that right in perpetuity and may manage said timber in its sole discretion</u>. (SHILLINGLAW1)

Comment: The definition of "forest owner" in the proposed regulation (section 95802(75)) states that both the holder of timber rights and the landowner are accountable for project reversals. See also Forest Protocol at 6 (stating that "all Forest Owner(s) are ultimately responsible for all forest project commitments"). Land ownership is composed of a "bundle of sticks" and each stick can be separated from the bundle and held by a different person or entity. Accordingly, not all fee title owners of forest land or woodlots will own the timber and/or carbon rights. Since timber rights and carbon rights can be held as a separate property right from fee title to land, the landowner without timber or carbon rights has no legal ability to control forest project activities, and therefore should not be held accountable for forest project commitments associated with timber or carbon rights. This is consistent with ARB's decision, which we support, to forgo landowner agreements such as the Project Implementation Agreement required under the CAR protocol. However, ARB does not address these issues in its rulemaking materials (see, e.g., ISOR IX-1). Any contractual relationship with ARB should be with the party that owns the carbon and/or timber rights. Similarly, liability for reversals should lie clearly with the holder of the carbon and/or timber rights and not extend to a fee owner without such rights. Accordingly we recommend that the definition of forest owner be amended so that the entity holding carbon rights can be defined as a forest owner where ownership is separated. (FCC, BLUESOURCE)

Comment: The definition of forest owner states that both the holder of timber rights and the landowner are accountable for reversals. Since timber rights are a wholly separate property right from the land, the landowner should not be held accountable for reversal associated with timber rights. A landowner does not have any management control over timber rights, nor does he share in any income associated with the harvest of timber or the sequestration of carbon. We recommend the definition be amended so that a perpetuity timber rights owner with 100 percent of managerial control and ownership of the timber assets can be defined as a "forest owner." (NISSENBAUM)

> **Response**: We clarified the definition of "Forest Owner" to designate owners of "real" property in the forest as forest owners. In some cases, this could be the fee holder or timber rights holder. When designating one forest owner for purposes of the offset project operator, the parties may specify in external contracts who has liability for certain parts of the project implementation. We are leaving the specific designation of roles and responsibilities up to the private parties with interests in the forest project, land, or rights. We believe that it is important for the definition of a forest owner to be as broad and inclusive as possible, to capture any entity with an interest in the property involved in the forest project. Aspects of a Forest Project such as soil carbon which is included as a required pool in the case of intensive site preparation, may extend beyond the scope of timber rights. Entities that have ownership of non-timber rights within the project area likely will have some control over activities that may affect forest management or carbon sequestration. Currently, there is no legal

framework to specifically address carbon rights, although we are aware that this question is actively being researched. Given all the potential variables and entities that may share ownership or an interest in the property, we believe the most reasonable and comprehensive approach is to have a single forest owner designated as the Offset Project Operator, that will have the primary responsibility for managing the forest project in conformance with the protocol and the regulation, while all forest owner(s) will still share responsibility for all commitments associated with the forest offset project. The forest owner(s) may define in private contracts any specific roles and responsibilities for implementing a forest offset project.

G-19. Comment: A "first deliverer of electricity" is defined in the proposed regulation as a generator or an "electricity importer" and the "electricity importer" is defined as the entity that takes receipt at a point located outside the state of California. However, these definitions do not account for a situation in which an importer takes title to power at the California border, which is a common practice in the wholesale marketplace. PacifiCorp recommends that ARB specifically account for this situation by defining the "electricity importer" as the entity purchasing the power and delivering it into California. (PACIFICOR1)

Response: Reading of section 95802(b)(84) shows that the commenter is in error regarding the definition of "Electricity Importer." If the transfer of electricity occurs between balancing authorities, the importer is the purchasing-selling entity (PSE) that is identified on the segment of the e-tag that has the first Point of Delivery in California. Otherwise, the importer is simply "the marketer or retail provider that holds title to the electricity," per the definition.

G-20. (multiple comments)
Comment: The definition of "imported electricity" should be amended. The final sentence of the definition of "imported electricity" in section 95802(a)(97) (p. A-20) excludes electricity that is wheeled through California. Section 95802(a)(97) defines "electricity wheeled through California" as being "electricity that is delivered into California with final point of delivery outside of California." "Electricity wheeled through California" is also defined in section 95102(a)(104) of the revised MRR. SCPPA's comments on the revised MRR will propose a change to that definition to include simultaneous electricity exchanges. For consistency, the Cap and Trade Regulation should refer to the definition in the revised MRR rather than including a slightly different definition of the same term. In addition, electricity that is imported into California from a linked jurisdiction should be excluded from the definition of "imported electricity." Insofar as the emissions associated with electricity that is imported into California from a linked jurisdiction would not be included in a California covered entity's compliance obligation, that electricity should not be considered to be imported electricity.

Modify section 95802(a)(97) as follows:

> “Imported electricity” means electricity generated outside the state of California and delivered to serve load inside California. ... Imported electricity does not include electricity wheeled through California, as defined in MRR section 95102(a)(104)~~which is electricity that is delivered into California with final point of delivery outside California~~. Imported electricity also excludes electricity imported into California from a jurisdiction in which a GHG emissions trading system has been approved for linkage by the Board pursuant to subarticle 12. (SCPPA1)

Comment: The definition of imported electricity does not address potential linkages to other external emissions trading systems (ETS). LADWP understands that next year will commence a separate proceeding to address such linkages. The emissions attributed to another linked jurisdiction are already regulated by the other jurisdiction and therefore should be netted out from any compliance obligation that results from the reporting of emissions under AB 32. To avoid double-counting emissions, modify the definition of imported electricity as follows:

> “Imported electricity” means electricity generated outside the state of California and delivered to serve load inside California. Imported electricity includes electricity delivered from a point of receipt located outside the state of California, to the first point of delivery inside the state of California, having a final point of delivery in California. Imported electricity includes electricity imported into California over a multi-jurisdictional retail provider's transmission and distribution system, or electricity imported into California over a balancing authority's transmission and distribution system. Imported electricity includes electricity that is a result of cogeneration outside of California. Imported electricity does not include electricity wheeled through California, which is electricity that is delivered into California with final point of delivery outside California. Imported electricity does not include electricity that is imported from a source in an approved external ETS where emissions associated with that electricity are attributed to and regulated by the other linked external emissions trading system. (LADWP1)

Comment: The definition of imported electricity excludes electricity wheeled through California, which is electricity that is delivered into California with final point of delivery outside California. To remain consistent with treatment of simultaneous energy exchanges under the AB 32 fee regulation, modify the definition of imported electricity as follows:

> "Imported electricity” means electricity generated outside the state of California and delivered to serve load inside California. Imported electricity includes electricity delivered from a point of receipt located outside the state of California, to the first point of delivery inside the state of California, having a final point of delivery in California. Imported electricity includes electricity imported into California over a multi-jurisdictional retail provider's transmission and distribution system, or electricity imported into California over a balancing authority's transmission and distribution system. Imported electricity includes electricity that is a result of cogeneration outside of California. Imported electricity does not

include electricity wheeled through California, <u>including simultaneous exchanges</u>, which is electricity that is delivered into California with final point of delivery outside California, <u>including simultaneous energy exchanges in which the point of receipt and point of delivery are outside California.</u> (LADWP1)

Response: While we did not modify the definition of “Imported Electricity” as requested, we did include language in section 95852(b) that defines the compliance obligation for first deliverers of electricity and excludes qualified exports from the compliance obligation. We also added a new definition for qualified exports in section 95802(225). Allowing the exclusion of qualified exports has the same effect as excluding simultaneous exchanges. Also, the regulation clearly states that a first deliverer’s compliance obligation is for “emissions in California or in a jurisdiction where a GHG emissions trading system has not been approved for linkage by the Board pursuant to subarticle 12.” Furthermore, we modified section 95852(b) to also include a description of the calculation of the compliance obligation ($CO_2e_{covered}$). Finally, the cap-and-trade and the MRR definitions remain consistent on this subject.

G-21. Comment: Metropolitan acknowledges that the definition of electricity importer covers both marketers and retail providers, and that the current proposed definition of marketers covers Metropolitan. However, Metropolitan is not a true marketer of electricity, as the term is typically used. Metropolitan only imports energy for the purpose of serving its own load on the CRA and not to "market" or resell this energy. Modify Section 95802(a)(113) as follows:

(113) "Marketer means a purchasing-selling entity that takes title to wholesale electricity <u>for the purpose of resale</u> and is not a retail provider.”

This change would clarify that Metropolitan is not intended to be included in the Cap-and-Trade Program. However, this modification would not affect the inclusion of the other entities that we have identified for coverage under the regulation, nor would it impact the requirements that apply to these covered entities. (MWDSC1, MWDSC2)

Response: We do not agree with the proposed change Metropolitan suggests. It is our intent to include all emissions from electricity imported into the State of California. This would include the electricity that Metropolitan imports to operate their pumps to move Colorado River Aqueduct (CRA) water.

G-22. Comment: The definitions for “Electricity Importers” and “Purchasing-Selling Entity” should be clarified to distinguish the purchaser-seller from the source/sink, and to account for deliveries at the California border.

E-tags and e-tag data simply do not offer the tracing mechanisms and delivery information that the proposed regulations would use to define “Electricity Importers.” Defining electricity imports has been a challenging issue in multiple proceedings before the CPUC, the California Energy Commission (“CEC”) and other agencies. Here, as in other proceedings, care is needed to ensure that ARB obtains the necessary level of specificity in its regulatory definitions to allow for distinctions among different commercial circumstances in the power markets, and not rely on e-tags for sufficient data. The definitions for “Electricity Importers” and “Purchasing-Selling Entity” do not distinguish the purchaser/seller entity as that term is used on e-tags from the source or sink of the electricity, or from the purchaser and seller, or importer and exporter, of the electricity. Often times, a North American Electric Reliability Corporation (“NERC”) e-tag identifies an out-of-state balancing authority, but not the resource or resource type that is the source of the generation, even though that balancing authority (or owner of the resource that is the source of generation) is not the entity selling or importing the power. (PACIFICOR1)

> **Response:** We have relied upon the resources and references provided by NERC, and have coordinated terms used in the regulation with NERC terms and tagging requirements. NERC is the entity responsible for managing the e-tag system and setting rules and procedures for the use of e-tags. The California Independent System Operator Corporation (CAISO) sets tariffs, rules, and policies for how e-tags are used specifically within the CAISO market and system under the NERC umbrella. We use the NERC-approved definition of PSE, but add that the PSE is identified on a NERC e-Tag for each physical path segment, which is an additional requirement for e-Tags. The terms “sources” and “sinks” are not precisely defined, but in general they correspond to points of delivery, not entities that deliver electricity. PSEs are entities (electricity importers) that schedule and deliver electricity. We use e-Tags to establish the identity of the first deliverer for imported electricity when the electricity is required to be scheduled with an e-Tag. E-Tags are required for electricity transfers between balancing authorities. For other types of deliveries of electricity to California, we use other data to establish the identity of the first deliverer.
>
> We modified section 95852, and we require other information related to ownership or contracts for electricity, in addition to e-Tag data. The additional information assists in identifying the first deliverer and ensuring that specified imports are properly identified. We agree that often e-tags identify the balancing authority as a source rather than a generator. That is why we do not rely solely on e-tags in the new requirements (section 95852(b)(2)) for electricity importers to calculate compliance obligations based on a facility-specific emission factor. We note that “Electricity Importers” are defined as marketers and retail providers that hold title to imported electricity. We continue to work with stakeholders to clarify how electricity importers are identified in the regulation.

G-23. Comment: While e-tags may in some cases provide reliable evidence regarding imports, e-tag data should not be relied upon in isolation for tracking imported power. Therefore, PacifiCorp suggests that ARB revise the definitions in the proposed regulation to use the actual act of electricity import into California as the primary basis for identifying the “first deliverer of electricity.” Given that e-tags cannot automatically provide the data being sought in the proposed regulation, self-reporting by the importer will be required. (PACIFICOR1)

> **Response:** We agree that e-tags cannot be solely relied upon for tracking imported electricity. We added a definition of "Direct Delivery of Electricity" (section 95802(b)(68) that lists other ways of importing electricity. This definition is also explained in the MRR, and the use of these ways in determining first deliveries for specified power is in MRR section 95811.

G-24. Comment: Calpine proposes the following revisions, which are largely based upon the provisions concerning long-term contract generators appearing within proposed federal climate change legislation and regulations implementing RGGI. Modify section 95802(a) as follows:

<u>(111) "Long Term Contract" means a sales or tolling agreement governing the sale of electricity and/or useful thermal energy from an electric generating facility or cogeneration facility at a price (whether a fixed price or price formula) that does not allow for recovery of the costs of compliance with this regulation and that is at least five (5) years in duration, provided that such agreements are not between entities that were affiliates of one another at the time at which the agreement(s) were entered into.</u>

<u>(112) "Long-Term Contract Generator" means a covered entity which is not an electric distribution utility and which operates an electric generating facility or cogeneration facility pursuant to one or more long-term contracts.</u>
(CALPINE1, CALPINE2

> **Response:** We appreciate the comments and input from Calpine regarding the definition of "Long Term Contract." At this time, we do not want to interfere in the potential renegotiation of these contracts that are based on a fixed price. We hope that parties will continue the negotiation process, or that parties continue to investigate alternative fuel options, which emit fewer GHGs when combusted.

G-25. (multiple comments)
Comment: In the proposed regulation "Electrical distribution utility(ies)" means an Investor Owned Utility (IOU) as defined in the Public Utilities Code section and 218, or a local publicly owned electric utility (POU) as defined in Public Utilities Code section 224.3, that provides electricity to retail end users in California." This definition does not include a category of electric providers that are similarly situated to IOUs and POUs; Electrical Cooperatives. Electrical Cooperatives are defined in Public Utilities Code section 2776 as "any private corporation or association organized for the purposes of transmitting or distributing electricity exclusively to its stockholders or members at cost." As such, Electrical Cooperatives are a "hybrid" between a POU and IOU, in that they are owned by their members, but operate as a non-profit public service for end use members. Electrical Cooperatives in California are small utilities located in rural areas, facing high infrastructure costs and other obstacles as they strive to provide affordable and reliable electric service to their members. As non-profit, member-owned utilities

governed by their locally-elected boards of directors, they must adhere to federal Rural Utility Service (RUS) guidelines, but are also subject to many of the same AB 32 mandates as IOUs and POUs.

NCPA recommends that the proposed regulation be revised to provide that Electrical Cooperatives be included in the definition of “Electrical distribution utility(ies)”, and that those Electrical Cooperatives that serve retail customers be eligible to receive electric sector free allowances. Including this small group of utilities within the definition of “Electrical distribution utility(ies)” would not change the scope of the program, nor have an impact on the recent discussions regarding allocation of allowances to the electricity sector, and data from the Electrical Cooperatives should already be part of 89 million allowances available for allocation to electrical distribution utilities. In section 95892, the proposed regulation specifically addresses the need to allocate allowances to Electrical Distribution Utilities “for the protection of electricity ratepayers.” Electrical Cooperatives have electricity ratepayers, the same as all other Electrical Distribution Companies. However, unlike energy service providers, electrical cooperatives provide more than just the electricity transaction to their customers, therefore making them analogous to IOUs and POUs for the purposes of the proposed regulation. If the definition of “Electrical distribution utility(ies)” is not changed as described above to include the Electrical Cooperatives, the ratepayers of these entities will bear the total cost of the cap-and-trade regulation. Accordingly, modify section 95802 (a)(57) as follows:

“Electrical distribution utility(ies)” means an Investor Owned Utility (IOU) as defined in the Public Utilities Code section and 218, or a local publicly owned electric utility (POU) as defined in Public Utilities Code section 224.3, <u>or an Electrical Cooperative as defined in Public Utilities Code section 2776</u>, that provides electricity to retail end users in California. (NCPA1)

Comment: In the proposed regulation, “Electrical distribution utility(ies)” means an Investor Owned Utility (IOU) as defined in the Public Utilities Code section 218, or a local publicly owned electric utility (POU) as defined in Public Utilities Code section 224.3, that provides electricity to retail end users in California." (section 95802(a)(57)). The title "California retail end users" is synonymous with "California ratepayers." The proposed definition incorrectly fails to include Electrical Cooperatives. Electrical Cooperatives are a category of electricity providers that are similarly situated to IOUs and POUs, in that Electrical Cooperatives also provide electricity to California ratepayers. The only difference is that in an electrical cooperative system, the ratepayers are the ultimate consumer of the electricity provided by the cooperative distribution entity (such as Anza), which distributes the electricity at cost to its rural service area. AEPCO recommends that the proposed regulation be revised to include Electrical Cooperatives in the definition of section 95802(a)(57) and like POUs and IOUs, be eligible to receive electric sector free allowances. If the definition in section 95802(a)(57) is not changed to include the Electrical Cooperatives, the ratepayers of these entities will bear the total cost of the cap-and-trade regulation. Modify section 95802 (a)(57) as follows:

"Electrical distribution utility(ies)" means an Investor Owned Utility (IOU) as defined in the Public Utilities Code section 218; a local publicly owned electric utility (POU) as defined in Public Utilities Code section 224.3; <u>or an Electrical Cooperative as defined in Public Utilities Code section 2776</u> that provides electricity to retail end users in California. (AEPC)

> **Response:** We agree, and modified the definition to include electrical cooperatives as defined in Public Utilities Code section 2776.

H. ECONOMIC IMPACTS

This section includes comments and responses about both the Economic Analysis (Appendix N) contained within the Staff Report and general concerns about the potential impact of the regulation on California's economy and businesses. Major sub-topics include effects on small businesses and agriculture, timing of the start of the program relative to the economic recession, ability of covered entities to pass-through the price of allowances to their customers, and support for and opposition to the program.

General Concerns: Cost, Price Increase, and Economy

H-1. (multiple comments)
Comment: I do not want implementation of a CA cap and trade system. There is no environmental benefit for such localized action, and the program will increase food and energy costs. This is a waste of taxpayer money. (MCCARTHYV)

Comment: Cap and trade will raise our gas prices, destroy jobs and shut down California farms. Please note that myself, my friends, and family are against any representative or organization attempting to implement cap and trade, and you will not receive our support. (ATP)

Comment: This proposed regulation will drastically raise costs on a myriad of products. The improvement to weather and air quality brought about by this measure is miniscule. It would, however, "even the business playing field" with products that are made in countries like France that already have this policy. So I wonder if it is a political method of lowering our productivity in the global marketplace. All in all, it is a bad idea for America. (COCLRAN)

Comment: If you want California to keep sliding into the financial abyss, Cap and Trade is the way to do it. (WOODWARD)

Comment: Please do not vote for or pass the cap and trade bill. We will be watching and keeping track of who is responsible for raising our utility bills and will respond on election day if not before. (SCHLICHTER)

Comment: I do not support CARB's wish to impose Cap and Trade in this state. We do not need any further cost burden placed on the people of this state. (CROULET)

Comment: Do not implement AB 32 and or cap and trade. California's economy is devastated from over taxation and regulation. (WESSELS)

Comment: The proposed adoption of a California cap on Greenhouse Gas Emissions and Market-Based Compliance Mechanisms Regulations will further jeopardize the already failing California's agricultural and business economy. The people of this state do not want this regulation. Please do not adopt it. (LUCE)

Comment: Please do not implement these caps. Our State's economy is already hurting enough. (RANDALL)

Comment: I do not support this move to legislate a proposed California cap on Greenhouse Gas Emissions. I believe it is misguided and will cause unintended financial consequences to the fiscal health of the state. (HARRISS)

Comment: In one of the worst economic periods in our history, this is an inappropriate time to implement any regulations. Please slow down and take cap and trade regulations off the table. (FRENCH)

Comment: We cannot afford Cap and Trade. I am very worried about the direction this state and country are going. (CAMPRINI)

Comment: I wanted to post my objection to the pending regulations. Californians are going to be outraged should these measures be enforced. I don't know anyone who is not suffering financially due to the economic conditions. (BROWNE)

Comment: At a time when our state is billions in the red, now is not the time for any cap on greenhouse gases or any regulation such as those. (LUEKENS)

Comment: Gas prices now are higher than ever, and raising gas prices will only hurt everyone who drives to and from work, buys food for family, and I guess you can forget vacations. (JAMES)

Comment: Your cap and trade energy tax proposal scheme will increase gas prices, cost jobs, shut down family farms, and make food more expensive. (PINKSTON2)

Comment: I hope you will be reasonable, that is come up with a balance which advances the environment but doesn't stifle enterprise in California. (AVW)

Comment: Estimated costs for this proposed trading scheme before you, according to a report compiled by free market proponent Calwatchdog.org, the potential cost per household ranges from $570 to $6,500 annually, and the price of gasoline would increase 61 cents per gallon by January. Some of the unintended consequences likely to result from this rule could be massive increase in harvesting of lumber in sensitive sites and selling back credits to California resulting in a double fee for commodity lumber, still more transfer of wealth from an already impoverished California citizenry and the devastation of precious habitat to countless endangered species of plants and animals. (HASSEBROCK1)

Comment: Cap and trade means cap and tax. The Federal Government and many States have "backed off" on cap and trade. California should not proceed with this job killer. (HILLG3)

Comment: Cap and trade will utterly destroy the economy of California, worse than it is now. (BLAKEMORE)

Comment: California is flat broke. Our State economy is in complete shambles and we have the worst business climate of any state in the union. Companies are leaving the State in droves and new startups are scarcer than ice cream cones in the Sahara. A costly cap and trade program may push us beyond any hope of significant recovery. (MYERSG1)

Comment: I am strongly opposed to the passage of this program. The cost of this program to our economic wellbeing far exceeds any benefits we may reap from it. If so many other states have pulled out, why should we continue down the road to economic disaster? Please do not vote to adopt the Cap and Trade program. (SIEBERN)

Comment: This will not only affect the farmers in our state, but the cost of foods for everyone. Are you trying to move agriculture out of the country? You have the power to extensively damage lives of many people, forever changing our ability to compete and produce food, all because you are still drinking the cool-aid professional illusionist Al Gore gave you. Wake up; get real; be a hero; do not let this happen! (STEWARTM2)

Comment: It should be clear by now that California is teetering on the edge financially, that people are moving away in droves, costs of everything are going up and we are driving away the job producers. To be kind I am calling these "cap and tax" ideas misguided, but my heart tells me that there are people who want to see our State and our country fail and collapse. (AGEE)

Comment: By issuing mandates, the Board is not relying on the market, but creating ways to destroy the free market and create totalitarian economic controls over the energy sector of our economy. Any attempt to implement caps on greenhouse gas emissions is in direct opposition to capitalism and the economic structure that creates wealth in this country. It will cause massive budget deficits, high taxes, and complete economic depression. (NARITELLI)

Comment: The American Chronicle article entitled “Cap-and-Trade Energy Tax will Cause Redistribution of Wealth Among States and Working Families” cites the Congressional Budget Office as stating that cap and trade would cost the average American household an extra $1,600 per year. It would increase the price for a gallon of gasoline between $0.61–$2.53, and would increase electricity costs anywhere from 44–129 percent. You guys must have dollar signs in your eyes or someone else does and they are using you as a front! (LAFOLLETTE)

Comment: The economic analysis that was conducted for the Cap-and-Trade program was completed only at a macroeconomic level and failed to analyze the costs of the individual facilities costs in complying with the program. The proposed program will lead to hundreds of thousands of increased annual cost just to continue operating in

California. Statewide allowance cost will be anywhere from $3 billion to $73 billion annually in increased cost to affected entities. (AGCOALITION)

Comment: Please disregard the Cap and Trade rulings. This will add even more burden on the weak economy and working people. We cannot afford more taxes to support this legislation, which is based on questionable research data. (RITCHIEC)

Comment: Environmental regulation needs to be throttled back primarily because it has crippled private enterprise throughout the state. Business has vacated at an alarming rate which equates to job loss which equates to loss of state revenue which will multiply the state deficit. Your "Cap on Greenhouse Gas Emissions and Market-Based Compliance Mechanisms Regulation, Including Compliance Offset Protocols" will serve to vacate more revenue. When will you understand this will bankrupt California for an incomplete science that limits and punishes prosperity? (ARTENO)

Comment: I'm particularly worried about cap and trade because it's clear there will be much higher energy prices and that businesses will be passing those prices on to their customers. The Legislative Analyst has reported that unless other states adopt climate change laws as strict as California's our state will lose businesses, jobs and economic activity. I'm in a green business and I'm a green supporter. But I may turn out to be one of those businesses the Legislative Analyst was talking about. One of the sad ironies of cap and trade and other AB 32 policies is that it will cost so much it will drive a lot of folks who want to engage in the green economy to other states. I haven't seen anything in this proposal that convinces me this will not be the case. Even with a phased-in approach to selling allowances, with the economy the way it is and with the recession predicted to continue for several years, I'm hoping you will direct your staff to do some more research into how the costs and benefits are likely to line up in real time, and to come up with a realistic plan on how to control those costs. (AWSINC)

Comment: What good can come out of this at a time when people are struggling to keep or maybe find employment and then this law makes it three times harder for employers to hire, or employees trying to get to a job? (STEELER)

Comment: The current proposals for cap and trade will raise the costs for average working families here in California. This is the most trying time for us financially, to add to that burden will put many over the poverty line. Increases on heating and cooling bills, gas, food, etc. are avoidable. There must be an alternative, such as giving tax breaks to companies that choose to cut their carbon emissions. Please consider the many struggling families before imposing further taxes upon us. (HAMMOND)

Comment: Your proposed action would result in widespread misery to the poor. (POLLOCK)

Comment: We can't afford the kind of compliance regulations that you want to impose. Out of state companies will simply cease doing business with us. (SAMARDICH)

Comment: I do not want cap and trade. It would be a bad law, and discourage and harm businesses, and is wrong! Do not consider the adoption of a cap on greenhouse gas emissions and market-based compliance mechanisms! It will kill what is left of California business, and hurt taxpayers. (KYLBERG)

Comment: Cap and Trade will basically add costs of operation to businesses in California and restrict industrial growth. This will increase costs of all goods and services that require energy to produce. This is an added burden that Californians can ill afford especially when the unemployment rate is at 12.5 percent. The increased cost of Cap and Trade will disrupt the state economy and stop recovery from the current recession. The Cap and Trade plan is being pushed by financial interests that see a new market place for them to buy and sell commodities. This will generate huge windfall profits for the commodity traders. There has been inadequate consideration given to the impact this new added cost will have on the economy of the state. (JEPSON)

Comment: California's businesses are already overtaxed and overregulated. They are fighting for survival now. Who will be left to pay the taxes if they close their doors? (SELLERS)

Comment: I'm having a hard time understanding how rising energy is not going to affect the economy and other individuals who are having a hard time. Most people are living paycheck to paycheck and in some instances they're living off of unemployment benefits. These folks can't afford higher utility bills. And they can't afford to make investments in new cars, refrigerators, or solar roofs, even though that there's rebates associated to this. From what I see, the staff answer to just about every concern about the cost is saving energy efficiency. It seems to me that California's economy is going to get better but not yet. This is something else that I'm having a hard time understanding, the timing of this proposition. (RAMIREZJ)

Comment: We're very concerned that the higher energy costs predicted as a result of cap and trade will create severe hardships for California families and for veterans in particular. Higher energy costs translate to lost jobs, a scenario that we can't afford to risk. The challenges facing our veterans are even greater than those that face our civilians. The U.S. Bureau of Labor Statistics reports that about 21 percent of Gulf War veterans serving after August 2001 reported having a service-connected disability and 21.6 percent of 18 to 24-year-old male veterans for that period were unemployed as of 2009. With so few jobs to go around, it's getting harder and harder for veterans like these to find work. We must not make it even harder than it already is. I understand the concept of higher energy costs potentially being offset by energy savings. But we're talking about people who can't afford to pay their utility bills as it is and who can't afford to buy new energy efficient cars and refrigerators. The staff's conclusion that the cap and trade program will not negatively impact jobs and the economy is frankly not realistic. We hope you will take this into account before pulling the switch on a plan that has the potential to hurt those least able to afford it. (AGIF2)

Comment: We're concerned with the increased costs of the program. We are going to be the ones that are going to pay the high cost of the energy, fertilizer, and higher water cost delivery. We are the end users, and are going to be the ones heavily burdened. So we ask that cost implications be recognized and also for a panel to be set up to monitor these kinds of costs and ag have a seat at the table because we're the ones paying the bill. So hopefully we can be a part of the panel. (CCGG)

Comment: While we applaud the goals of your cap and trade proposal, we're concerned that this policy may indeed put jobs and family projects budget at risk. All indications are that this cap and trade program will drive energy costs up for businesses for families. When businesses have to pay higher energy costs, they have less money available for payroll; and that means a reduction in jobs and in the critically important benefits like health care that go with them. This is very, very serious for all Californians but especially for our veterans, who already suffer from disproportionately high unemployment. They face special challenges in civilian market. Their military skills do not always translate directly to civilian jobs. And while the government, the VA, does all it can, there are not enough resources to give our veterans the support and training they need to transition to civilian life. In California, those resources will become even more strained as local governments and nonprofits alike suffer from cap and trade higher energy costs and the reduced tax revenues that will result as the economic activity is reduced. The staff's assumption that cap and trade would not cost anything is not supported by credible facts. Therefore, proceeding further, more work is necessary to ensure we avoid unintended consequences that can make it even harder for our veterans and families and other Californians. Please consider this when deliberating your next step in this case. (AGIF1)

Comment: I've heard a lot of different sections of industry speak today. One thing that ties us all together is that we are all consumers. If we just take into account that we shop at, let's say, five businesses apiece, if each one of those businesses costs do go up, they have no choice in order to continue to operate but to pass those costs on to you and myself. Multiply that times however many businesses we frequent, and you can see that it becomes quite an issue for families that are living paycheck to paycheck, single family incomes with children that are trying to save for college, that are trying to live a traditional wholesome and productive lifestyle. (RAMIREZA)

Comment: I'm extremely worried that the action you're about to take on cap and trade will have direct and detrimental impact on my business. The stated purpose of this cap and trade program is to impose costs that induce people to invest in newer, more energy efficient devices. When cap and trade forces the cost of fuels and vehicles to go up, the value of most vehicles will go down. That means that cars and trucks in California, currently own and drive will be worth a lot less. My inventory will be worth less as well. In my neighborhood and many others like it people can't afford new cars. They can't afford higher gas prices. Many of them can't even afford to take the bus nowadays. With the economy as bad as it is, people are already holding on to their old cars longer. Under cap and trade, they are likely to keep them even longer, which means no reduction in emissions and a lot less business for most car lots. We will all suffer. So it's somewhat naive to say that it's okay for energy prices to go up because people will make smart investments in new cars and other things and save on energy in the long run. We're in a major recession and unemployment is sky high, especially in California. The people who can't afford those decisions far outnumber the people who can. What I'd like to know is, what are you going to do when these assumed investments in energy efficient cars and other things don't happen and when you're not meeting your carbon reduction goals? Are you going to make the energy we use and need every day even more expensive? Frankly, this plan seems more like punishment than inducement. (DELACRUZ)

Comment: I am skeptical of the ARB's economic analysis of the Cap-and-Trade program, which suggests that there will be very little cost to the overwhelming benefits. However, the authors of the analysis do reluctantly acknowledge that the program will create an adverse economic impact: the gross state product will be reduced; the costs of business will rise; and the economy's recovery will remain stagnant. In order to operate well, our state relies on a thriving business climate. Given California's $26 billion deficit and the 12.4 percent unemployment, our state's economy is not stable enough to implement AB 32's policies that we know will further burden business. (LAMALFA)

Comment: ARB makes a number of seemingly contradictory economic claims. The ARB states that its cap-and-trade regulations will reduce the growth rate of the California economy from 2.4 percent to 2.3 percent. At the same time, the ARB claims that the regulations under consideration will "not have a significant statewide adverse economic impact directly affecting businesses, and little or no impact on the ability of California businesses to compete with businesses in other states." And that, "impacts on long-term projected growth rates in personal income and employment are similarly small." And that, "Regulated businesses may face additional indirect costs due to increased energy and input prices, and some businesses might be impacted based on the compliance path they choose to meet their obligations under the proposed regulation." And that, the "proposed regulatory action would not eliminate existing businesses within the State of California, but would affect the creation of new businesses or the expansion of existing businesses currently doing business in California. The proposed regulatory action would not eliminate jobs within the State of California, but would affect the creation of jobs within California." It strains credulity to believe that California can act to completely reorder the energy sector and only slightly reduce economic growth, slightly increase prices and end up with more jobs, not less. Assuming this to be the case, does that mean that the ARB projects more lower paying jobs and relatively less higher paying jobs as the result of its actions? How else can a reduction of economic growth be explained as part of the ARB analysis? Lastly, ARB, in its economic analysis states that the analysis did "not consider the avoided costs of inaction. The potential effects of climate change that are expected to occur in California, such as increased water scarcity, reduced crop yield, sea level rise, and increased incidence of wildfires, could cause severe economic impacts." Given that California's cap-and-trade efforts, when viewed in the global context of a developing China and India, is likely to provide, at most, a day or two's reduction in greenhouse gas

(GHG) emissions (and this is assuming that leakage doesn't accelerate, as more economic activity that once occurred in California is off-shored to coal-fired China), how can this statement even be seriously countenanced when, in fact, there will be no significant global GHG emissions reduction as a result of the ARB's actions? Lastly, over the past 150 years, California has experienced "increased water scarcity, reduced crop yield, sea level rise, and increased incidence of wildfires" with three of the four directly attributable to environmental policies that have limited water storage and conveyance (increased water scarcity), cut flows of water to farms (reduced crop yield), and reduced timber harvesting and forest fuel management (increased incidence of wildfires) – the one foot rise in sea level over the past 150 years being the sole impact not caused by environmental policy, and certainly not an impact anyone in California has seen as particularly difficult in which to adapt. (ASMMANDEVORE4)

Comment: We're extremely disappointed with the economic analysis of the proposal. It's only 20 pages long and certainly not very robust and not at the level that we're used to when we look at rate making and impacts that we look at the Commission. We're also very skeptical that the impacts on the price of electricity to consumers is anywhere near as modest as the economic analysis, as bare as it is, proposes. Energy prices for the farming community have risen approximately 40 percent in the last decade. Largely that was due to poor policymaking through the deregulation debacle back of the 1990's. And so you can understand our concern and our hesitancy a little bit about this potential cost impacts that a proposal just like this will have without having a robust understanding behind it. Since deregulation, the cost of the actual commodity of electricity, where this proposal will have its main impacts for our members, is a pass-through cost for the utilities. And at this point we see that the utilities have a little bit of exposure in terms of the pass-through costs that they're going to pass on to the customers. A lot of the risk of this is coming down on the ratepayers - our family farms, our agri-businesses. And that's going to come out in the form of higher energy costs. We're concerned about that, because in the 1980's when we had a lot of high energy cost and it started going up, a lot of those agricultural customers moved to diesel and moved off of electricity, which I think is the opposite direction that we would like to see in the movement in the spirit of what this proposal offers. We look forward to continue to work with the Board on this proposal as it moves forward, and assist as we can to help make this economic analysis more robust. (AGECASSOC)

Comment: The proposed rule fails to implement the key elements of successful cap-and-trade programs, and imposes unnecessary costs upon the California economy that could be truly debilitating. The economic analysis performed with respect to the Proposed Program does not seem to appreciate the likely market responses to the Proposed Rule, and seems to make unsupported and optimistic assumptions about market responses to cap and trade regulation. Moreover, key aspects of the existing market for CO_2e emitting industries and businesses are not accurately assessed or incorporated into the analysis. (HOR)

Comment: Please do not go forward with your push on cap and trade. California cannot afford the loss of jobs and tax base that this would affect. (ROBERTSK)

Comment: Cap and trade means cap and tax. The Federal Government and many states have backed off on cap and trade. California should not want to proceed with this devastating job killer. (HILLG2)

Comment: CARB should stop this unethical, cost-raising, and job killing attempt immediately. (BABIGIAN)

Comment: I am strongly opposed to a cap on greenhouse gas emissions. It's a job killer. (PAPPANO)

Comment: ConocoPhillips supports the development of federal climate change policy in the United States that is economically efficient, environmentally effective and that ensures the availability of secure, affordable and reliable energy. We oppose development of a patchwork of state-level programs. California's stand-alone actions on climate change will have a very negative impact on ConocoPhillips' operations in the State. The cost impacts will be significant and, depending on market reactions, may necessitate reduced operations that impact jobs and potentially increase the State's dependence on gasoline and diesel imports. (CONOCO)

Comment: Enough with the stifling effects of California government on business. We don't need a cap on greenhouse gas laws now too. Please consider this a big vote against instituting another law to kill business in my home state over the theory of global warming. (BEAVER)

Comment: The proposed California Cap on Greenhouse Gas Emissions and Market-Based Compliance Mechanisms Regulation, if adopted, will introduce a crippling and devastating dismantling of California's agricultural and business economy. If your goal is to drive California backward to the economic and social status of a third world country, you could not choose a more effective means than the adoption of this regulation. With functional unemployment in California hovering just below 20 percent, business owners, the greatest jobs generating engine in the state, ask you not to adopt this regulation. (BROESAMLE)

Comment: These costly measures will have absolutely no impact on global warming and will result in even more California job losses which we can ill afford. (STARNES)

Comment: No to cap and trade. We cannot afford to lose any more businesses in California. If we don't have jobs, we won't have anything to tax. (HILLG1)

Comment: The proposed rule radically skews the economic burdens on different segments of the California economy. (HOR)

Comment: The "cap and trade" scheme you will be proposing will put California at a huge disadvantage commercially with competitors, further driving business and agriculture from the State. (BROWNT)

Comment: I adamantly oppose the statewide cap and trade scheme that will raise our gas prices, kill jobs and shut down farms. (BRUEGEMAN)

Comment: Cap and Trade will further hurt California's economy, driving business and industry out of California and into states and countries that do not have California's regulations, China having virtually no environmental regulation at all. Considering California gets 25 percent of our pollution from China, how exactly does California benefit from Cap and Trade? (JENKINS)

Comment: This action is a job killer and with only California in the game it is a total waste of capital. More jobs will go out of state. More businesses will go out of state. Look what this will do to making the California budget harder to close. (GATES)

Comment: Extra cost imposed by this program here in California will have a series of implications for California businesses. We won't be part of a broader program. Thus, any pain that could potentially come down will put us at a competitive disadvantage to other companies throughout the country. (CALCHAMBER2)

Comment: Just the government oversight of this policy is a mind boggling cost of tax dollars and human resources. For every green job 'created' how many other jobs will be lost by the extra burden on other businesses? How many businesses will move out of California due to this policy. It is already one of the least business friendly states in the union. (PEABODY)

Comment: The proposed cap and tax scheme under consideration is an added burden to the federal proposed greenhouse gas rules (40 CFR Part 98, subpart W) placing California based companies at extreme hardship and a competitive disadvantage. Promulgation of this rule as proposed without assurance from the federal EPA that it would be “treated as equivalents or substitutes” signals to California based companies that investments should be made outside of California. Further, the Western Climate Initiative (WCI), which might provide cover for California’s scheme is falling apart. New Mexico’s political change is ahead of our own and while they have recently passed a rule on the same day that the state elected a Governor that rejects Anthropogenic Global Warming (AGW) and is supported with electoral support that will result in the only state in the WCI that could be counted on to follow us as sure bets to call it off. The other states are all recalcitrant to support their obligations and are now poised to join in a new club with a different motive, to entice those companies that are considering leaving the Golden State to relocate to their own state. (HASSEBROCK1)

> **Response:** We recognize that there will be price increases from the proposed cap-and-trade program. However, we do not believe that these price changes will result in large negative impacts to the state economy. Table N-3 and Table N-7 of the staff report highlight estimated changes in energy prices and resulting economy wide estimates of impact. The estimated impacts show relatively small changes in economic growth and employment when compared to growth

otherwise expected over 2007 to 2020. Please see Chapter VIII and Appendix N of the Staff Report for additional information about our economic analysis of the cap-and-trade regulation.

The cap-and-trade program does not specify how or where emissions reductions will be made. Reductions will be made by covered sources if the cost of making reductions is less than the cost of acquiring allowances, thereby minimizing price increases. Further, free allocation to some covered entities at the beginning of the program will assist with transition and reduce the potential for economic leakage. The regulation is also designed with cost-containment mechanisms such as banking, limited use of offsets, and an allowance price containment reserve.

For non-covered sectors of the economy, individual households and businesses are not expected to make rapid or extreme changes in their purchase decisions of energy-consuming devices (e.g., appliances or automobiles). Devices have useful lifetimes and have to be replaced at some point. The responses to cap-and-trade will be to slightly shorten the useful lifetime of the devices. Therefore, individuals may replace the devices sooner and may choose devices with higher efficiencies than they would have otherwise chosen.

Our economic analysis evaluated the impacts of the regulation on both small businesses and individual consumers. Based on analysis of data from Dun and Bradstreet, we found that the small business sectors with the greatest percentage of their revenues spent on electricity and natural gas were primarily service-related and serve local markets. Out-of-state businesses cannot serve these markets. As a result, most California small businesses are not likely to face competitiveness issues relative to out-of-state businesses. Under the likely range of allowances prices, most small business sectors experience less than a 2 percent change in the share of revenue spent on energy.

There are existing programs that will help households and business identify energy-saving opportunities and provide assistance in making efficiency improvements. Finally, auction revenue could be used to reduce or eliminate negative impacts to most individual households.[2]

Effects on Small Business

H-2. (multiple comments)
Comment: We're very concerned that the cap and trade program you are considering will make it much more difficult for small business and entrepreneurs who are striving to build and maintain businesses here in California to be successful. Regardless of staff's assertion that cap and trade's higher energy costs will be a wash, all indications are that the costs will rise much higher and faster than will any potential future energy efficiency

---

[2] http://www.climatechange.ca.gov/eaac/documents/eaac_reports/2010-03-22_EAAC_Allocation_Report_Final.pdf

savings. We've been following the AB 32 process for several years now and have observed the common thread that staff consistently says it's not going to cost anything. Yet experts like the California Legislative Analysts have concluded that there will be costs, especially in the near term, and that those costs are going to have negative impacts. For example, the LAO found that some businesses may not be able to afford AB 32's transition costs and therefore will not be around to enjoy energy savings that might occur later. In another report earlier this year, the LAO determined that California-only policies will have an adverse effect on our state's economy, resulting in lower business profits; higher prices; and reduced production, income, and jobs. Cap and trade is one of the largest policy elements of AB 32. So it stands to reason these findings would apply. There is a reason most other states and the federal government have put cap and trade on hold. There's is reason all but one other state in the Western Climate Initiative have declined to move forward with the cap and trade. (LIFCI)

Comment: I implore you, please do not pass cap and trade regulations. Other states have already abandoned these outlandish measures and for Good reasons. Do likewise. The last thing Californians need is taxes that will result in the loss of millions of jobs. This is not in our best interest! Please listen to the small business owners and those who would like to remain employed - do not pass the cap and trade regulations. Make California business friendly so we can grow our economy. (MURGUIA)

Comment: I would ask that you consider minority and Hispanic small businesses and the impacts of the cap and trade to our communities. We have many trucking companies that will be directly impacted at a time when they as well as all of our small minority businesses are struggling to keep their doors open. I want to remind you that as small business grows, so grows our great state. (SJCHISPCHMBR)

Comment: As a regulated entity, our utility, under cap and trade, LADWP is facing enormous cuts for emission allowances. Now, it sounded like earlier today that you may have come to some type of an agreement with them. We've not privy to that. However, as of yesterday, based on consumption of coal as a source of energy, we were able to realize that the economic analysis ranged in increases from 54 to 269 percent. Between this and the renewable portfolio standard, to say that L.A. ratepayers will be hard hit is a significant understatement. The premise of the allowance fee is that it will allow inducements to cause major emitters to switch to lower Carbon usage and more efficient energy sources. Your staff report also observed that rising energy prices drives purchases of more expensive but more efficient devices. Staff's assumption assumes that this is okay and that there are public initiatives programs available for small businesses will drive small businesses to go for these types of investments. However, we would like to say that small businesses right now are operating in such a narrow margin that they basically don't have the access to capital or the resources that many other industries do have. And so we encourage that a further study be done on the impact of small businesses. (LAHISPCHMBR)

Comment: Care must be taken to ensure that any cap and trade program you adopt does not have a price tag that will put California in a dire economic situation and ultimately doom the policy to failure. As you know, the federal government has decided to postpone action on a national cap and trade policy because the cost to businesses and consumers would be too high. There seems to be a significant disconnect between this conclusion and that of your staff, who project that there will be essentially very little cost. With all due respect, we question this conclusion since the staff's economic analysis projects double digit increases in the cost of the most commonly used energy sources and fuels as a result of cap and trade fees. This doesn't even take into account the investments the providers of that energy will have to make in order to comply with a cap, a cost they will have to pass along to their customers. It struck me that the economic analysis assumes that small businesses are likely to respond to the higher energy prices by investing in energy efficient technologies to achieve those energy savings. This seems to be an unrealistic assumption considering that most small businesses and households are already doing everything possible to save on energy costs and don't have the resources to invest in new vehicles or other purchases that might save them a few dollars a month over a long period of time. As I said earlier, I wear two hats: the U.S. Hispanic Chamber and the business nonprofit of TELACU. In both situations I represent a segment of the community that suffers from disproportionately high unemployment and faces unique economic challenges. With the state budget deficit growing by the hour, there is more pressure for higher taxes, while at the same time there are fewer and fewer resources available in the social safety net, which is increasingly strained. This is not the time to impose drastically higher energy costs based on an over-optimistic assumption that it will all work out over time. (TELACU)

Comment: CARB has always maintained that in order to be effective, the cap and trade program must be part of a regional multi-state effort. Yet the regulation before you does not propose linking to any specific programs outside California at this time. If widespread equitable linkage cannot be accomplished, serious consideration should be given to postponing a cap and trade regulation. The LAO earlier this year observed that California's economy will be adversely affected by adopting climate change policies that are not adopted elsewhere, largely because of higher energy prices which will occur here. The LAO warned of rising costs for goods and service due to leakage of economic activity to locations outside of California where regulatory costs are lower. Your staff's economic analysis suggests that small businesses are not likely to face competitive issues with out-of-state businesses since out-of-state businesses cannot provide local services like those provided by hair salons and bakeries. This is incredibly shortsighted and reveals a lack of understanding of basic economics. While it is true that out-of-state taco shops, for example, are unlikely to compete with neighborhood taco shops, those local taco shops will suffer from increased energy costs that will be difficult to pass along to their customers. And they will lose customers whose own businesses have been competitively damaged by California-only cap and trade program. That means not only the owners of those small businesses, which make up the majority of our membership, will suffer. It also means that they are likely to have to lay off workers, who in turn will lost the wages and benefits upon which their families depend. While the proposed regulation and supporting documentation are voluminous, it appears there is yet much work to be done to identify the true costs of the program and its impact on small and minority-owned businesses, consumers, and the state's economy. The California Hispanic Chambers of Commerce urges you to address these issues before finalizing a cap and trade policy. (CAHISPCHMBR)

Comment: We're very concerned about the cap and trade and its impact on small business. And the assumption that it will have little impact on small business is just not the case. As energy costs increase, our small businesses are going to get hit in two areas: One is the direct cost to them for those energy increases in their businesses. And secondly is the cost of goods and services that they have to purchase in order to do business. And these small businesses are operating on such small margins, barely in the black right now. And any increases in cost can quickly send them into the red. And so it's really critical that we consider this. A lot of attention has been given to the costs of cap and trade. But the offsetting savings are vague and don't seem to be commensurate with the increased costs. (SACHISPCHMBR)

Comment: Very little has been done in the way of analyzing the real world impact to the end-users and those entities' products and services. This is of critical interest to small and minority-owned businesses and communities of color since they spend a higher percentage of their budgets on energy and can least afford even small increases in the cost of utilities and fuels. They will be hard hit when the cost of food, transportation, clothing, and other necessities goes up as can and trade costs are passed along to them as the end-users. While there is a discussion to provide assistance to small businesses and families who can't afford the utility rate increases, it's unclear how that would work and who would be eligible, how much help would be available, et cetera. And there is a strong possibility that ratepayer assistance won't begin to cover the other costs of everyday living and doing business outside of electricity and gas bills. Our small businesses are worried that in order to pay the bills under cap and trade, they'll have to lay off workers. Families are worried about losing paychecks and health care benefits at the same time the cost of living will be going up under cap and trade. Small businesses and families alike are worried about the cost of higher education, as some state universities subject to the cap were forced to raise tuition even higher and to cover those costs. (LOMBARD)

Comment: I'm representing the Coalition of Energy Users. We are thousands of taxpayers and small businesses who are concerned about this. I talk to small business owners every day that are concerned that these regulations could put businesses out of work, people out of work.
(COEU2)

Comment: Please do not attempt to enact or enforce this. Stacking this onerous load on the top of the already burdensome AB 32 will ring in the death knell for all too many of California's already struggling small businesses. (MGD)

> **Response:** Most small businesses will not be directly regulated under the California cap-and-trade program. The program will affect most small businesses only indirectly, through increases in energy costs. Under a contract

with ARB, Dun and Bradstreet provided us with data from a statistical data model that estimates the portion of revenue that businesses spend on energy. The vast majority of small businesses in California are not energy-intensive; that is, energy-related costs represent only a small fraction of their total revenue. So, increases in the price of energy will have only a modest financial impact. Under the likely range of allowances prices, most small business sectors experience less than a 2 percent change in the share of revenue spent on electricity and natural gas.

Higher energy prices may affect the price of intermediate goods and services that small businesses use; however, the increase in these costs is likely to be modest. We believe that the likely effects of the cap-and-trade program will be minor for small businesses and will be absorbed into the existing range of cost variation that they already face.

Please also see Chapter VIII and Appendix N of the Staff Report for additional information about our analysis of the impacts of the cap-and-trade regulation on small business.

Effects on Agriculture

H-3. (multiple comments)
Comment: The cap and trade rules being considered are not a practical solution to emissions. These rules would just add to the burdens on California's small businesses, in particular farmers who are the backbone of local economies. (CREW)

Comment: It is difficult enough these days for farmers to keep on producing crops because of all the costs and regulations. Do not pass this legislation. (MELL)

Comment: California farmers do not need, nor does the State of California need a Cap and Trade program. Please stop this attempt to further bankrupt our state. (RAADIK)

Comment: Farming is our number one income producer and you will effectively shut them down. Vote no on cap and trade. (GARDNER)

Comment: This proposed legislation will severely hurt our central valley farmers and economy in general. Please vote against this legislation. No to cap and trade. (PALOCSAY)

Comment: Please do not make it harder and more expensive on our food producers by passing more regulations. (WRIGHT)

Comment: Increased gas prices and increased costs to farmers and other productive parts of our economy are unconscionable at this time with the economy still extremely unsteady. Hang back and leave cap and trade greenhouse gas emissions to another decade, if ever. (SCHULTE)

Comment: As a Californian, I am adamantly against cap and trade. It will put small farmers out of business and raise gas prices and unemployment. (POWELL)

Comment: Even without this cap and trade adoption, we have a 12 percent unemployment rate. The cost of food, gas, and utilities are all continuing to increase, while the value of our dollar is shrinking. The intent to adopt the cap and trade proposal in this economic time is beyond ludicrous. I vote no. (MCADAMS)

Comment: We are cold all winter as we cannot afford propane and electricity as it is. A cap and trade bill will doom us. Please think how it will affect heating homes, farms, employment, etc. (CAMPO)

Comment: I am against crippling our State with Cap and Trade and higher taxes for farmers, on gas, etc. (IMPROTA)

Comment: I do not support CARB's energy tax proposal. This ill-conceived scheme will increase gas prices, cost jobs, shut down family farms, and make food more expensive. AB 32 is not about the environment it is about redistribution of wealth. In other words, it is meant to drive businesses, jobs and people out of California. If AB 32 is not suspended, you will see more and more businesses leave California and unemployment get worse. (BALL)

Comment: We do not support CARB's plans to raise gas prices, kill jobs and put the family farmer out of business. California cannot afford to pay higher prices for food and other things in our lives. If this continues you will drive business out of California. So please do not do this to our great State. (BOGGS)

Comment: Please review the state of business and farming in California before you implement draconian environmental regulations. The very idea that Man's activities today will cause the climate to change irreversibly in 100 years or so, is ridiculous on its face. The climate will continue to change whether AB 32 is implemented or not. California changing standards will affect the lives of the people living in California today. The immediate and known effects will be to further damage our failing economy. It is completely irresponsible to implement legislation which guarantees current injury with no reliable expectation of any future benefit. (STONE)

Comment: California is in the worst economic condition in decades. Family farms are on the verge of collapse. Unemployment is at record levels. Prices are rapidly increasing. People, companies, and jobs are streaming out of the State, to other, more business-friendly areas. Now is not the time to heap more regulations, more costs, and more taxes on the people of California. Please do not impose all these new regulations on us. (MCCARTHYJ)

Comment: CARB claims to want to boost consumption of locally grown food, but this will have the opposite effect by putting farmers out of business. Cap and trade is in collapse elsewhere, so why should we hurt our economy even more when other states and Washington all recognize how harmful this will be? (DURKEE)

Comment: Farmers will be hurt, the consumer will be picking up the tab. Jobs will be lost. (HENDRICKS)

Comment: It would be highly difficult for our family and many others to pay more for gasoline. It has cost the dairy farmers and other farmers' untold grief already. (DANIELE)

Comment: I cannot believe that in this poor economy, and with businesses leaving this State every day, you would dare to put through this terrible bill. We farm 22 acres and have a company that employs 90 people. I guess we will have to move out of this State so we can make a little profit to stay aboveboard and not have to lay people off. (BROOKS)

> **Response:** We recognize the importance of agriculture to the California economy and recognize that the agricultural sector is a large consumer of energy. Table 27 of the Updated Economic Evaluation of California's Climate Change Scoping Plan demonstrates that the impacts to agriculture from the AB 32 climate policies are relatively small and are roughly comparable to the impacts to other sectors of the economy.[3]
>
> Like other energy users, agriculture will face changes in electricity, natural gas and transportation fuel prices. ARB analyzed how significant the contribution of energy prices was to food processors and found that compared to other agencies, the contribution was low. Please see Appendix K of the Initial Statement of Reasons for additional information about our leakage analysis. ARB believes that these small additional costs can be passed through to consumers.

Need to Postpone Because of the Economy

H-4. (multiple comments)

Comment: It's an effort to show leadership, but I'm concerned that other states have not wanted to participate in this program. Right now we have only New Mexico. Congress as a whole now is a majority that is opposed to cap and trade. Please look at the hundreds of online comments from regular citizens and business owners who are urging you to postpone this plan. I know some have posted that with Proposition 23, it's a mandate to go full speed ahead. However, please also realize that three million Californians voted yes on 23 and believe that there are very serious concerns that should be addressed. This is not something we can afford right now with record high unemployment, a $20 billion budget deficit, and at a time when the nation as a whole does not wish to go forward with this plan. I hope you will at least consider postponement for economic reasons. (COEU2)

[3] http://www.arb.ca.gov/cc/scopingplan/economics-sp/updated-analysis/updated_sp_analysis.pdf

Comment: Implementing Cap and Trade during a recession in a state (California) with very high unemployment and one foot in bankruptcy is insane. (HOYT)

Comment: Although California, due to its topography and population, is challenged by greenhouse gases, it is definitely not time to enact this legislature with the state of the economy in California and the U.S. Please put this on hold until California is well on its way to economic recovery. Enactment of this legislature will only hurt California more in the long run than help. (HEYN)

Comment: California proceeds alone at its economic peril. California will begin its cap and trade system without the commensurate participation it had hoped to stimulate from neighboring political subdivisions and the federal government, which in turn will have major consequences likely resulting in a range of negative economic impacts on California businesses. (PLOTKIN)

Comment: No more regulations. We are the most environmentally regulated country (and state) on earth. The cap and trade legislation is little about the environment and more about control. Our economy has the potential to affect the entire nation. California is so vulnerable. This legislation will no doubt encourage inflation as the commodities we depend on most increase in price. The legislation will destroy jobs, businesses, lives, and families. (PHILLIPSE)

Comment: The economy is still in the tank and you want to impose additional costs that will hurt the economy. I believe we should move forward continuing to help clean up the environment but we should start approaching it during a financially promising time; not now. This will not do a thing to help us rebound from this economic crisis. (AYERS)

Comment: Doing this at this time would be bad for business. The economy is just starting to turn around. Why risk scaring away potential businesses that might want to come to California? Why make it more difficult for current businesses to grow? Stop this. Wait until unemployment is below 5 percent and then work on emissions. (BRAXTON)

Comment: Stop adding additional burdens. Give the economy time to recover. (LYNES)

Comment: Implementation of any sort of cap and trade regulation in California promises to increase our already-nation's-worst unemployment, raise our already-high gasoline and electric utility costs, and increase the rate at which businesses choose to leave (or simply not come to) our fair State. While the issue of global climate change is important and should be given due attention, we in California simply cannot afford a Quixotic attempt to halt carbon emissions at our borders. I suppose CARB has the administrative power to make this regulation happen. The sad fact is that if you choose to do so, you will find yourself exercising more and more control over fewer and fewer people, with a smaller and smaller budget due to ever-declining tax revenues. (MCGLASSON)

Comment: Ask yourself before voting yes on this legislation is this really the time and place to over burden the people of this once great State with such a damaging piece of work. This will hurt all families who purchase anything, it will drive cost up of nearly everything we need to survive we do not need this now or later. (PACKER)

Comment: I respectfully request that you slow the pace of implementing this new legislation. Our State cannot afford to continue letting special interest radical groups to develop and push legislation that continues to place us at a disadvantage to the rest of the nation and world. This Cap and Trade legislation will do nothing more than hurt employment in the State while lining the pockets of a few investors. And it will make no change in the rate of "global warming." The law of unforeseen consequences continues to be proven time and time again by legislation such as this. I urge you to carefully read all of the proposed regulations and then present them to the public for comment. (MORTIMER)

Comment: This proposal is utter madness in the current economic climate. The State can NOT afford this right now (if ever). Cap and Trade simply will not work and will cause much harm to the entities that have the ability to do something about the environment in the future. (JEMISON)

Comment: In California's current fiscal and economic environment, we need to maintain a focus on implementing a program that will not undermine the state's nascent economic recovery. (CHEVRON1)

Comment: While everybody cares about the environment, please postpone your cap and trade plan and take into account the costs this will impose on our already weak economy, the failure of cap and trade to gain traction elsewhere and the deep opposition of millions of California taxpayers and business owners. Even your own analysis estimates the cap and trade proposal will result in a loss of GDP, and many other researchers have estimated much greater costs. The cap and trade proposal discusses business owners having the choice of paying cap and trade taxes or alternatively investing in new equipment. The writers of the proposal may think this is a generous proposition by giving the carbon-emitter the choice of what type of additional costs they would like to incur, but the fact is many small businesses are already operating in the red and cannot afford either option. Regular citizens are currently struggling and cannot afford these additional costs. (COEU1)

Comment: This and other pseudo-environmental regulations will only hinder our state's economic recovery, and will impose even more draconian measures on our families, farms and businesses. This is hardly the time to discourage jobs and employment prospects. The notion of a "green" economy is based on assumptions that do not stand up to objective analysis. (PHTA)

Comment: In this time of high unemployment and poor job creation, you want to implement this costly program? You will drive the prices of everything up in a down-turned economy. As a business owner, I can undoubtedly say that I will raise prices to accommodate the increased costs. The rules and regulations in this state are driving businesses and private job creators away. (HERR)

Comment: Why now at a time of high unemployment, a not too rapidly recovering economy, would we risk killing jobs? If indeed we're not trying to redistribute the wealth from those of us that have it, whether it's through attention to their medical needs or attention to their energy needs through the state. That makes no sense to me. (FORD)

Comment: It doesn't take a genius to realize this is not the time to be placing additional strain on businesses in CA. The PM2.5 diesel regulations have forced many truckers out of business already. How many deaths do you think will be a direct result of 25-50,000 families losing the breadwinner of the household? In case you weren't aware. Poverty kills. (MILLERJEF)

Comment: In any circumstances I would not support this proposed cap on greenhouse emissions because of its impact on agriculture. Every Californian will be affected by this new regulation because of its impact on the farming community. The people that pass this will be responsible for every California farmer who goes out of business and loses his home and farm. Compassion and common sense can prevail and this part of AB 32 can be put on hold for at least another year if not two. (PALM)

> **Response:** The cap-and-trade regulation is designed to be a cost-effective means of achieving the statutory requirement in AB 32 of reducing 2020 greenhouse gas emissions to 1990 levels. ARB found that cap-and-trade is likely to be the most cost-effective means of achieving these reductions. See Chapter IV of the Staff Report for additional information about alternatives to the cap-and-trade regulation that we considered.
>
> In addition, we designed the program to gradually phase in the auction of allowances and with cost containment mechanisms such as banking, offsets, and an allowance price containment reserve to protect against high prices and price volatility.
>
> It should also be noted that a policy such as cap-and-trade provides relief in slow economic times because the emission cap is largely met from the reduced production and consumption that accompany the economic downturn. As the economy recovers and incomes increase, produces and consumers will have the means to make the necessary investments to help them make permanent emissions reductions.
>
> We are also providing an additional year for covered entities to better prepare and plan for when ARB will enforce the cap by designing the program to have a compliance obligation in 2013 instead of 2012.

Market Price of Allowances

H-5. (multiple comments)
Comment: Expectations about the Federal market after 2020 have significant influence on banking behavior and thus on the equilibrium allowance price in the California market during the period 2012-2020. If unlimited banking is allowed, and a Federal program comes on line after 2020, the allowance price in the AB 32 market will be determined in part by the expected federal price. The strength of this effect depends on the stringency of the AB 32 cap relative to the BAU baseline (taking into account offsets and complementary measures). The less abatement is required by AB 32, the more the California price will be driven by the expected federal price. The importance of the federal price also means that assumptions about the design of a federal cap-and-trade system—for example, the trigger price for a federal allowance reserve—are key drivers of predicted outcomes in the AB 32 market. (EDF1)

Comment: The effectiveness of complementary policies also plays a central role in the market price of allowances and in the performance of the reserve. The base-case assumptions provided by CARB include an estimate of reductions from complementary policies, such as energy efficiency measures, the renewable electricity standard, and the low-carbon fuel standard. These complementary policies (along with the projected supply of offsets) will likely be more than sufficient to achieve the reductions required by AB 32. In this case, if the program is modeled without banking after 2020 (i.e., we consider the AB 32 market from 2012-2020 as "self-contained"), the allowance price is likely to be set by the marginal cost of offsets. If post-2020 banking is allowed, the only economic reason for abatement (beyond offsets and complementary policies) prior to 2020 is to bank in anticipation of post-2020 price. In this case, the price distribution will be dominated by expectations of the future federal allowance price. (EDF1)

> **Response**: We agree with these comments. In a post-2020 market, the allowance price will be influenced by what happens in both California and at the Federal level. However, what a post-2020 market will look like is still very much an unknown.

H-6. Comment: For the system to succeed, carbon must be priced high and priced ever higher during the years following. (BEAZLIE)

> **Response:** By design, as the number of available permits decline, the price of allowance will increase, providing for higher allowance prices in the future.

General Opposition to the Program

H-7. (multiple comments)
Comment: How is this extra tax going to be justified? (STEELER)

Comment: Just where is this ill-gotten gain going to go? Who made this agency and this ideology so important that they can control the citizens of this state through these unfair and unnecessary penalties? (STEELER)

> **Response**: The California Global Warming Solutions Act of 2006 (AB 32, Nuñez, Chapter 488, Statutes of 2006) mandates that GHG emissions be reduced to 1990 levels by 2020. In addition, AB 32 assigns ARB the authority and responsibility to implement measures that reduce greenhouse gas emissions. The cap-and-trade program is one of those measures chosen to meet the reduction requirements.

Fiscal Impact Statement-Form 399

H-8. Comment: The fiscal impact statement associated with the regulation incorrectly assumes that Reid Gardner electricity will be imported only until December 31, 2013. However, the termination date is July 25, 2013, six days short of 19 months. The fiscal impact statement should be revised accordingly. (DWR)

> **Response:** The Form 399 has been changed to reflect the correct termination date of the contract with Reid Gardner.

H-9. Comment: The fiscal impact does not account for delays in billing and collecting charges built in to the long-term SWP water supply contracts and resulting mismatch in costs of purchasing allowances and incurring surrender obligations which could have a fiscal impact to DWR. (DWR)

> **Response**: Most regulated entitles will face the same issue and will have to adjust billing schedules or find other sources of revenue that will allow them to secure allowances.

AB 32 Not Specific to Cap-and-Trade

H-10. (multiple comments)
Comment: I oppose the implementation of AB 32. This will hurt CA business and will force more unemployment in CA. (FARLY)

Comment: I am against AB 32 and what it will do to the cost of living. All services and goods in California will become much more expensive. Electricity, gas, diesel, natural gas, groceries will shoot through the roof. (GIANNINI)

Comment: California needs to be more citizen- friendly. AB 32 will cause the economy to get worse. California needs jobs, jobs and more jobs. No new taxes, no more added regulations and work with private businesses to get things moving again. (RAY)

Comment: AB 32 is a job killer, no way around it. It will raise prices, drive jobs out and the green jobs won't begin to replace the lost ones. Quit killing CA, we are already bankrupt. (MYERSH)

Comment: I am opposed to the implementation of regulations associated with AB 32. To continue to tax the salaries of those few who can still find a job in this Once Golden but Not Anymore State is to kill the golden goose. Honey, the electorate are your golden geese and we are DYING. Enough taxation. (KINNARE)

Comment: California is experiencing its worse economic downturn since the 1930s; and part of the problem is due to government actions that kill economic activity. Companies will vote with their feet and move to other more business friendly states and will take their economic generating businesses with them. AB 32 is a recipe for economic disaster. (MANGAI)

Comment: Small refiners are clearly being disproportionally and negatively impacted economically by the AB 32 regulations and should be recognized as a distinctive subset of the California refining industry. (KERNOIL1)

Comment: I urge this committee not to implement this provision of AB 32. Californian's are being taxed to death. The economy in California is on the verge of bankruptcy and if you implement any portion of AB 32 this state may not survive. Please don't strap the people of this great state with more taxes. (YOUNGHARLAN)

> **Response:** The California Global Warming Solutions Act of 2006 (AB 32, Nuñez, Chapter 488, Statutes of 2006) mandates that GHG emissions be reduced to 1990 levels by 2020. In addition, AB 32 assigns ARB the authority and responsibility to implement measures that reduce greenhouse gas emissions.
>
> In 2010, we conducted a joint economic analysis of the AB 32 Climate Change Scoping Plan with Charles River Associates and Professor David Roland-Holst of the University of California Berkeley. The estimated price of CO_2 in these three analyses ranged from about \$20/MTCO_2e to \$100/MTCO_2e in 2020. The range of prices in those analyses depended on assumptions about the success of other AB 32 policies and whether offsets were allowed for compliance. Changes to the state economy and employment were found to range from small positive changes to small negative changes, indicating that AB 32 policies will not result in large negative impacts to the state economy.[4]
>
> Economic analysis performed for the cap-and-trade regulation showed that the regulation would not have large negative impacts to the state economy. Table N-3 and Table N-7 of the staff report highlight estimated changes in energy prices and resulting economy wide estimates of impact. The estimated impacts show relatively small changes in economic growth and employment when

[4] http://www.arb.ca.gov/cc/scopingplan/economics-sp/meetings/042110/outline.pdf

compared to growth otherwise expected over 2007 to 2020. Please see Chapter VIII and Appendix N of the Staff Report for additional information about our economic analysis of the cap-and-trade regulation.

The cap-and-trade program does not specify how or where emissions reductions will be made. Reductions will be made by covered sources if the cost of making reductions is less than the cost of acquiring allowances, thereby minimizing price increases. Further, free allocation to some covered entities at the beginning of the program will assist with transition and reduce the potential for economic leakage. The regulation is also designed with cost-containment mechanisms such as banking, limited of use of offsets, and an allowance price containment reserve.

For non-covered sectors of the economy, individual households and businesses are not expected to make rapid or extreme changes in their purchase decisions of energy consuming devices (e.g., appliances or automobiles). Devices have useful lifetimes and have to be replaced at some point. The responses to the cap-and-trade program will be to slightly shorten the useful lifetime of the devices. Therefore, individuals may replace the devices sooner and may choose devices with higher efficiencies than they would have otherwise chosen.

Our economic analysis evaluated the impacts of the regulation on both small businesses and individual consumers. Based on analysis of data from Dun and Bradstreet, we found that the small business sectors with the greatest percentage of their revenues spent on electricity and natural gas were primarily service-related and serve local markets. Out-of-state businesses cannot serve these markets. As a result, most California small businesses are not likely to face competitiveness issues relative to out-of-state businesses. Under the likely range of allowances prices, most small business sectors experience less than a 2 percent change in the share of revenue spent on energy.

There are existing programs that will help households and business identify energy-saving opportunities and provide assistance in making efficiency improvements. Finally, auction revenue could be used to reduce or eliminate negative impacts to most individual households.[5]

H-11. Comment: DWR is concerned that in the early years of cap and trade, when its surrender obligation will come due, there will be too few allowances available. It is not clear that by the time DWR must surrender its compliance instruments there will have been adequate opportunity to purchase allowances at a reasonable price. Without a price cap on the allowances, large price spikes are possible. DWR would be competing against independent power producers, who will be able to pass the cost of allowances on to their customers (one of whom is DWR). Against the background of public budgeting and revenue collection, which are conducted in pre-established time periods,

---

[5] http://www.climatechange.ca.gov/eaac/documents/eaac_reports/2010-03-22_EAAC_Allocation_Report_Final.pdf

DWR may face fiscal difficulties and cash flow problems in making purchases of high-value allowances. DWR requests that the ARB consider excluding DWR from the regulation to avoid these adverse impacts, or structuring the auctions in a way that this threat is reduced (perhaps with a set-aside of allowances for public agency use or a price cap). (DWR)

> **Response**: We believe that between allowances made available at auctions, allowance price containment reserve sales, the secondary market, and the option to use offset credits, covered entities will be able to obtain a sufficient number of compliance instruments to meet their obligations.

H-12. (multiple comments)
Comment: AB 32 requires regulations to be cost effective and to minimize costs and maximize total benefits to California (section 38562). In addition, the mandated reduction must be in addition to any other greenhouse gas emission reduction that otherwise would occur (section 38562). DWR's surrender obligation and associated costs will be attributable only to the emissions related to the importation of energy from the Reid Gardner power plant for the period January 2012 through July 2013. This contract is already scheduled for termination, effective July 2013. Imposition of surrender obligations on DWR due to Reid Gardner will not induce the contract's termination; that has already been decided. Procurement of alternative energy to replace Reid Gardner will need to meet the performance standard mandated by Water Code section 142. The only consequence of naming DWR as a "covered entity" under the proposed regulation is to impose on DWR the cost of allowances necessary to surrender the compliance obligation. The reduction in GHG is one that would "otherwise occur" and accordingly cannot be considered an appropriate reduction under AB 32's section 38562. In addition, it cannot be considered cost-effective. "Cost-effectiveness" means "the cost per unit of reduced emissions of GHG adjusted for its global warming potential" (section 38505(d)). The regulation does not reduce these emissions because they are already planned for reduction independent of the regulation. The regulation merely imposes a cost without reducing GHG, and accordingly is not cost-effective. It would be more cost effective to allow DWR to use its resources to fund other GHG reduction or mitigation strategies. (DWR)

Comment: The regulation is not cost-effective because the expenditure of money on allowances will do nothing to further AB 32 goals. As noted above, the linkage between DWR's purchase of allowances and individual consumers' water use is very attenuated; there is no connection with retail electricity use. There should be a more direct link to justify the expense of purchasing allowances. (DWR)

> **Response**: There are important policy reasons to include DWR in the cap. The cap-and-trade program is designed to both place an enforceable and declining cap on greenhouse gas emissions, and to send a price signal to encourage more efficient use of energy. As part of this program, it is important to create a level playing field in order to send a consistent price signal. If ARB were to remove

DWR from the cap, it would inappropriately incentivize electricity imported by DWR since they would not be subject to the price signal.

First deliverers of electricity, like DWR, are not eligible for free allocation of emissions allowances because we believe that the cost of allowances can be passed on to the consumers of the electricity. Free allocation of emissions allowances is only for sectors at risk for emission leakage. Most regulated entitles will face the same problem and will have to adjust billing schedules or find other sources of revenue that will allow them to secure allowances at the beginning of the program.

H-13. (multiple comments)
Comment: Local governments that are already severely impacted financially by the economic downturn cannot afford to absorb the cost of emissions allowances or their administrative costs. Under the current CARB proposed program, waste-to-energy facilities will not enjoy the benefits of free allocations that are being offered to electric, gas and oil utilities, as well as other industries. CREF, like other waste-to-energy facilities that operate in California, receive post-recycled waste, and have no control over the incoming waste stream or practicable means to reduce the fossil-based components of the MSW (largely plastics). Thus, no options are available to meet the facilities compliance obligations except via purchasing allowances. As the price of allowances inevitably increases, in time this amount could easily exceed a million dollars per year. CREF, like other waste-to-energy facilities, has no ability to pass this allowance cost through, contrary to a critical but incorrect assumption that CARB has made about these facilities. Two main reasons exist that prevent passing costs through to haulers. First, CREF has fixed-rate electrical contracts that do not allow for any cost recovery of allowances. Second, if CREF raises its tipping fees, haulers using the facility would simply take the waste to local, cheaper landfills, resulting in an increase in greenhouse gas emissions due to increase methane emissions at the landfill. The overall impact to the City of Commerce, as well as its operating partner, the Sanitation Districts, would be the need to absorb the allowance cost, a cost which would recur each compliance period at an ever-increasing dollar amount, every year into the foreseeable future. (LASD1)

Comment: CREF, like other waste-to-energy facilities, has no ability to pass this allowance cost through, contrary to the critical but incorrect assumption that CARB has made about these facilities and the economic impacts of the cap-and-trade regulation. Two main reasons exist that prevent passing costs through to haulers. First, CREF has fixed-rate electrical contracts that do not allow for any cost recovery of allowances. Second, if CREF raises its tipping fees, haulers using the facility would simply take the waste to local, cheaper landfills, resulting in an increase in greenhouse gas emissions due to increase methane emissions at the landfill. The overall impact to the City of Commerce, as well as its operating partner, the Sanitation Districts, would be the need to absorb the allowance cost, a cost which would recur each compliance period at an ever-increasing amount, every year into the foreseeable future. Local governments that are already severely impacted financially by the economic downturn cannot afford to absorb the cost of emissions allowances. Not doing so will have a severe financial impact on the facilities and the local governments that own them and that they serve. (CREA)

Comment: The Sanitation Districts waste management facilities emit largely biogenic CO_2 because of the combustion of biogases (landfill and digester gas). One of our facilities however, the Commerce Refuse-to-Energy Facility (CREF), also emits anthropogenic CO_2 due to the combustion of fossil-derived consumer end products in the waste stream, consisting largely of plastics. CREF is one of three waste-to-energy facilities in California, all built in the 1980's with the support of the California legislature that established laws to encourage these renewable energy facilities. Even though the biogenic fraction makes up the majority of the emissions (approximately 60 percent), the anthropogenic CO_2 emissions are sufficiently large to trigger the cap and trade threshold. For the reasons that follow in greater detail, we request that these facilities be removed from the proposed program because of the severe financial burden that would be placed on them, and on the local governments under which they operate. (LASD1)

> **Response**: There are important policy reasons to include waste-to-energy facilities in the cap. The cap-and-trade regulation is designed to both place an enforceable and declining cap on greenhouse gas emissions, and to send a price signal to encourage more efficient use of energy. As part of this program, it is important to create a level playing field in order to send a consistent price signal. If ARB were to remove waste-to-energy facilities from the cap, it would inappropriately incentivize electricity generated by these facilities, since they would not be subject to the price signal.
>
> Generators of electricity are not eligible for free allocation of emissions allowances because we believe that the cost of allowances can be passed on to the consumers of the electricity. Free allocation of emissions allowances is only for sectors at risk for emission leakage. We do not believe, and data has not been provided that shows that the three waste-to-energy facilities are at risk for emissions leakage.

H-14. (multiple comments)
Comment: The proposed regulation will have a significant impact upon the university. We have five cogeneration plants and one large heat thermal plant that will be captured by the cap and trade regulations. We estimate that the cost of purchasing allowances on the auction will range between 7 million and 30 million per year, depending upon the actual cost of the allowances on the auction. The university and higher education and education in general is under significant financial pressure. The amount of state funding of the university has declined dramatically since 1990, by 51 percent of the cost of funding of each student. We've had to increase tuition and fees by roughly 40 percent over the last two years. And the cost to comply with the program by purchasing allowances would of course come out of general funds and would have to either come

out of tuition and fees or state funding, which is unlikely given the dire strait of budget situation. So we ask for transition assistance. (UC2)

Comment: The University supports the creation of a greenhouse gas Cap and Trade program, but is concerned that it is being disproportionately impacted by the proposed Cap and Trade rule and that its compliance costs will ultimately be borne by students, researchers, and patients to the detriment of teaching, research, and healthcare activities. In light of these concerns, the University submits comments to facilitate creation of a Cap and Trade program that treats public higher education in a manner that is consistent with the treatment of other entities that are regulated under the proposed Cap and Trade rule. (UC1)

> **Response**: Free allocation of emissions allowances is only for sectors at risk for emission leakage. We do not believe that the University of California is at risk for emission leakage. Our analysis shows that even if all compliance costs were passed on to the students, the increase in student fees would be minimal because of the compliance obligation. It should be noted that the University of California also has additional options to reduce their compliance costs (by making their facilities more efficient) and for passing through the compliance cost (to research or other university activities).

Fuels Under Cap: Compliance Obligation

H-15. (multiple comments)
Comment: The idea of full and automatic pass through of allowance costs to consumers is not valid: Under the proposed regulation, there is no certainty that these costs will be passed through to the final consumer. Any costs that are not passed through will provide a particular disadvantage to the small, less integrated refiner. Kern suggests that staff be directed to establish a mechanism to assure that these costs be fully passed through as a separate and distinct invoice line item. This mechanism shall be in the form of a linked allowance utilizing a uniform rate per gallon based on tailpipe carbon emissions, and known in advance. (KERNOIL1)

Comment: Assumed cost pass through for allowance costs of transportation fuels is incorrect. The Regulation and staff report assert that the costs associated with allowance value of transportation fuels will be passed along to the consumer, and thereby relieving the obligated party from bearing the burden of those costs. This assertion is incorrect for the independent, non-vertically integrated refiners. Costs will be passed through with a degree of certainty only if a mandated mechanism is in place specifically for this purpose. For consumers to see the additional carbon cost of the program and to adjust their behavior accordingly, a mechanism needs to be in place for those costs to be passed along directly. Relying on general market forces to adjust for the price of carbon is not sufficient when the marketplace includes such diverse players as importers, small refiners, large integrated exploration, refining and retail operations, speculators and others who have the ability to establish product price independent of actual production costs. We recommend allowing for the cost of allowances to be specifically invoiced nearer the final point of sale. (WIRA1, PMTPETRO1)

Comment: Placing fuels under the cap represents a significant cost to the state on top of many other regulatory schemes that are already adopted. The cost impacts to consumers in California as we emerge from a recession cannot be underestimated. At a minimum, placing fuels under the cap must be avoided at least until there are widespread cap and trade programs that include fuels across the US and around the world. None of the cap and trade programs throughout the world include fuels in the cap and trade programs, except New Zealand. If we do not fully review the economic impacts prior to adopting this policy, we risk unfairly punishing our residents and our state's economy unfairly. Chevron recommends that fuels not be placed under the cap until additional study of the impacts and alternatives are completed and should not be considered until there are widespread cap and trade programs that include fuels across the US and around the world. (CHEVRON1)

Comment: Placing diesel fuel under a declining cap as part of the Cap and Trade Program in 2015 will cause warehousing in California irreparable harm. Leakage of cargo and the associated value added services that California warehouse and supply chain partners provide to other ports, specifically Seattle, Houston, Panama and Canada do not improve overall carbon emissions.

Continuing on the current path and placing diesel fuel under a declining cap in California will do the following to the businesses left in a state:

1. Create volatile carbon prices that are recognized only in the California supply chain and require 3PLs to redesign shipping lanes and warehouse locations. California will be left with the trucks and the pollution from other states but none of jobs.
2. Repeat the State fuel crisis of 1993 and 1996, defined by a price shock in the beginning of the second compliance period negatively impacting overall allowance prices for the entire program.
3. Decrease actual volumes of low carbon fuel sold and burned in the State while increasing the sales of diesel fuel from other states created by the redesign of shipping lanes. The leakage in interstate fuel burned in the State will increase the criteria pollutants that have actual health impacts rather than symbolic carbon reductions from California.
4. Become a marketing campaign for the 2014 Panama Canal Opening creating speculative movement of freight out of California before the 2015 introduction.
5. Make diesel transportation users the highest cost sector for compliance under the scoping plan while ignoring the low cost method of engine efficiency standards. Fuel reformulation is not cost effective either through the low carbon fuel standard or the placement of fuels under the cap. Adopting them both in the same year is punitive to the transportation sector.
6. Drive up the allowance price for utilities and refineries leading to increased fuel prices and electricity prices. Commercial electricity users left behind in allocation of residential free allowances will shoulder increased rates caused by renewable energy mandates for utilities. Every commercial business in the State, including local warehousing, will be faced with increased electricity costs. (IWLA1, IWLA2)

Comment: The proposed California only "Cap and Trade" regulation creates significant cost increases in diesel fuel for companies that are forced to fuel in California. CTA is opposed to placing diesel fuel under the cap for the following reasons and requests that CARB remove diesel fuel from the Cap and Trade Program in the interest of California jobs and a level playing field. The following issues can only be addressed by taking diesel fuel outside the Cap and Trade Program's declining cap as it will:

1) Create a California-only 30 cent per gallon fuel tax based an allowances market price of $30 per metric ton CO_2 equivalent.
2) Double regulate the trucking industry with two punitive measures impacting fuel costs. First, the low carbon fuel standard and second, diesel fuel under the cap significantly impacting the price of in state diesel fuel.
3) Displace fuel purchases from interstate carriers to outside the state and increasing the use of out of state diesel fuels in California in violation of the State Implementation Plan.
4) Disadvantage California diesel users who compete with interstate carriers for California freight transferring freight accounts outside the state.

5) Creates a diesel fuel price signal needed to drive investment in cleaner fuels but that leaves California's trucking industry in peril and the state in a financial crisis.
6) Creates price shock in 2015 by adding fuels under the cap when allowances are scarce. (CTA)

Comment: The Cap and Trade program should not be extended to transportation consumer emissions as provisions of other federal and state programs address these. Additionally, fuel providers should not be responsible for these emissions that are directly consumer related. Transportation emissions should be considered only if a formal review determines that this action is necessary and implementation would be more cost-effective than other policy approaches. The proposed regulations include GHG emissions from consumer use of transportation fuels under the state emission cap starting in 2015 (section 95812(d)(l)). This results in a clear overlay to the existing federal Renewable Fuels Standard, the California Low Carbon Fuel Standard (LCFS), and state/federal vehicle GHG performance standards. Transportation GHG emissions are being substantially addressed through current federal and state programs (i.e. federal fuel economy programs, federal renewables programs and state LCFS programs). Cap and Trade is not well-suited to address emissions from millions of distributed point sources such as automobiles. Inclusion of transportation fuel emissions within the Cap and Trade program will add a volatile carbon cost to the price consumers already pay for GHG control measure such as LCFS and vehicle efficiency standards. In addition, fuels under the cap will increase administrative complexity and the market price of emission allowances for all the other capped sectors. Specifically, a carbon cost of $20 per ton would add a fuel cost burden in excess of $3 billion per year to the California economy. In addition to individual consumers, much of this cost will fall to businesses and municipalities impacting small business owners, truck drivers, city bus and trash services, construction companies, rail services, and others. This carbon cost, along with the cost of compliance for LCFS and federal programs, will be embedded into the costs of all goods and services that rely on transportation. CARB should not extend the Cap and Trade program to consumer emissions from use of transportation fuels. Instead, CARB should allow existing federal/state programs to address GHG emissions in this sector. This is consistent with the approach adopted in the European Union. Any inclusion of consumer use of transportation fuels under the state emission cap in 2015 should be contingent on a formal review and a conclusion that such a measure is necessary and cost-effective for achieving the State's GHG reduction goals. We seek the Board's resolution that would require staff to review inclusion of transportation consumer emissions in the cap. This review should be completed well before the proposed 2015 start date. (CONOCO)

> **Response:** As noted in the regulation’s Staff Report, we chose to include transportation fuels in the program starting in 2015 because together it is the largest source of GHG emission in California. We believe that cap-and-trade’s market-based approach is the most cost-effective and practical approach to lower emissions throughout most of California’s economy. There are numerous sectors that are covered by direct regulation and the cap-and-trade regulation.

For example, the electricity sector is subject to the Renewable Portfolio Standard as well as the cap-and-trade regulation. We believe that the cap-and-trade-program is complementary to existing renewable and LCFS standards and to other State or federal laws.

The LCFS regulates fuel producers by requiring them to reduce the carbon intensity of their fuels 10 percent by 2020. This is accomplished by creating various “fuel pathways” for fuels based on their lifecycle emissions, accounting for feedstocks, production processes, transporting fuels, and other factors. While the LCFS will incentivize the use of lower carbon, non-petroleum fuels, it does not address emissions from petroleum refineries. The cap-and-trade program addresses both facility emissions that occur from fuel production (beginning in the first compliance period) and accounts for combustion emissions from the fuel that is produced and sold in California (beginning in the second compliance period).

Placing a price signal on transportation fuels will reduce the consumption of transportation fuel; driving investment in newer, more fuel-efficient vehicles. Any GHG reductions resulting from federal regulations or the LCFS at covered entities would be counted as emission reductions under the cap-and-trade program.

We agree that cap-and-trade is not well-suited to address emissions from millions of distributed point sources such as automobiles. However, our approach is not to apply cap-and-trade to the end user (vehicle drivers), but to the fuel suppliers, who will be responsible for fuel that is combusted. By taking this “upstream” approach in the regulation, we avoid the challenges of applying it to millions of “downstream” users.

Compliance Pathways

H-16. (multiple comments)
Comment: CLFP recommends ARB recalculate pay-back periods to reflect actual industry practices. (CLFP1)

Comment: Assumptions on pay-back periods are faulty because CARB assumes pay-back periods on an annual basis. In Appendix F, staff proposes emissions reduction strategies asserting in the regulation that pay-back periods on capital costs are under three years. As food processors only operate a few months out of the year, this pay-back period on technology adaptation is unworkable for the food processing industry. Any pay-back for capital investments would be significantly lengthened due to seasonal operation norms. (CALFP1)

Comment: PG&E reviewed the offset price estimates presented in Appendix F and offers the following feedback. On page F-42, the price of forestry offset credits is estimated at $4 per metric ton. Based on experience through PG&E’s ClimateSmart™

program, forestry offset projects are currently being sold for between $7 and $10 per metric ton. Ozone-depleting substance and livestock methane capture projects go for between $5 and $7 per metric ton. This is consistent with an annual report on the voluntary market which shows an average price of forest management projects at $7.3 per metric ton and livestock methane capture projects at $5.7 per metric ton. (PGE1)

> **Response:** The compliance pathway analysis was designed to show different means for regulated entities to comply with the regulation. It relies on many assumptions, including technology costs and availability, payback period, offset availability and cost, and the rates at which technology can be applied to California facilities. We believe that the assumptions in the pathway's analysis are reasonable. Currently, we are not planning on updating the Compliance Pathways analysis, but we will take these comments into consideration should we update it in the future.

Offsets

H-17. Comment: If the Board adopts the cap and trade regulation, instead of direct emissions reductions, then the unbridled use of offsets from out-of-state will mean that the jobs and economic benefit resulting from those reductions will not benefit California. The Legislature surely did not intend that offsets from planting trees in Canada would be an appropriate market-based mechanism. (CRPE1)

> **Response:** In designing the cap-and-trade regulation, we had to balance many objectives. The use of offsets provides an important cost-containment mechanism, while also encouraging the deployment of greenhouse gas-reduction technologies in uncapped sectors. Table 26 of the Updated Economic Evaluation of California's Climate Change Scoping Plan demonstrates that the impacts to the state economy of a cap-and-trade program that does not allow for the use of offsets are substantially greater than in a program that allows for the use of offsets. It should also be noted that the cap-and-trade regulation limits the use of offsets to eight percent of each entity's compliance obligation in each compliance period.

H-18. Comment: ARB's forecast estimates provided in Table G-1 of Appendix G overlook two important items. First, the forecast assumes that offset volume is only dependent on price and second, that a sufficient volume of offsets will be developed if the price is high enough. This forecast does not consider the limits based on the current approved protocols and the "feedstocks" needed to develop GHG emission reductions. For example, at the ARB's June 22, 2010 workshop, ARB Staff estimated the volume of GHG emission reductions from ozone-depleting substances at 30 million metric tons between 2012 and 2014. This estimate was based on existing ODS banks calculated by the U.S. Environmental Protection Agency ("EPA"). When estimating supply, any analysis needs to consider that once these ODS are destroyed, there is no additional volume. For livestock manure capture projects, the number of projects is limited by the number of cows. It is estimated that there are 1.4 million dairy cows in California. The average cow generates about 5 metric tons of carbon dioxide equivalent per year. Therefore if the methane was captured from every dairy cow in California, you would only generate 7 million metric tons of GHG emissions per year. In order to meet the demand for the first compliance period, every dairy and every ozone-depletion substance bank would need to be in the process of developing their projects. Because offsets are limited by the feedstocks (refrigerants, cows, trees), it is not possible to meet the theoretical potential in this analysis even at high offset prices. (PGE1)

> **Response**: We estimate that if every entity used their allowable eight percent offsets, approximately 26 million metric tons of offsets would be needed in the first compliance period. At this time, based on the four approved protocols, we will be close to the supply demand for the first compliance period. In addition to the four approved protocols, we intend to review and recommend for Board approval additional offset protocols in the future. On August 24, 2011, we announced that ARB will investigate three additional protocols for possible consideration by the Board in 2012. These include pneumatic valves and two potential agricultural protocols. We expect that these protocols could provide 15 to 20 million metric tons of reductions. Protocols developed by third parties may be reviewed and, if applicable, be considered for adoption by ARB. In addition, we will coordinate closely with the WCI partner jurisdictions on offset protocol development.

Linkage

H-19. Comment: Until further details develop for both additional entities to develop a viable carbon market by 2012, and ARB delineates specific details regarding the linkage of these programs, we view the California Cap-and Trade regulation as a state-only program that will have significant economic impacts due to its limited markets and place California businesses in a competitive disadvantage. (VALERO)

> **Response**: ARB evaluated the potential economic impacts of the cap-and-trade regulation and found that the program would have a very small impact on economic growth. Table N-3 and Table N-7 of the staff report highlight estimated changes in energy prices and resulting economy-wide estimates of impact. The estimated impacts show relatively small changes in economic growth and employment when compared to growth otherwise expected over 2007 to 2020. See Chapter VIII and Appendix N of the Staff Report for additional information about our economic analysis.
>
> The California cap-and-trade program has been designed to be part of a regional trading system. The program design allows linkage with programs established by partner jurisdictions in the Western Climate Initiative (WCI) to create a regional market system. The goal of the regional program is to enhance individual jurisdictions' actions through collective action to reduce GHG emissions.

Support for Cap-and-Trade

H-20. (multiple comments)
Comment: As Education Director for West Coast Green I work with officials from the CPUC, CEC, Bay Area Air District, Bay Area governments, and many businesses and organizations dedicated to creating a clean economy for California. We thank you for your work crafting and implementing AB 32, and strongly believe that implementing a Cap-and-Trade program for California is the right step to take for our economy, our environment, and our communities. This policy could be strengthened by holding polluters accountable, auctioning pollution allowances, and creating a robust fund to help ratepayers in CA offset the costs of transitioning to a low-carbon economy. As I wrote for Climate Biz.com (http://www.greenbiz.com/blog/2010/09/01/why-were-asking-wrong-questions-cap-and-trade):

Cap and Trade Boosts Economy and Saves Money:
The most recent economic analysis released by the Western Climate Initiative in July, the proposed cap-and-trade program would provide net savings across the region of $100 billion by 2020 and spur long-term job growth. These cost savings are in addition to other benefits, such as improved public health, and economic development across a wide range of industries from investing in a cleaner, greener economy.

A host of recent reports has concluded that the costs of capping carbon would have a minimal impact on small businesses and S&P 500 companies alike, and would not compromise economic competitiveness or force jobs overseas. Likewise, the most recent EPA analysis of the American Power Bill found it would cost American families somewhere in the range of $100 a year, while California's new cap-and-trade program could actually provide net savings of $100 a year to the average family.

In fact, WCI calculates that enacting a cap-and-trade program could provide net savings to the whole region of $12 billion a year. While significant, this is still less than 1 percent of total economic activity in the region. This means the net impact to most businesses and consumers—in either cost or savings—will be largely negligible.

We urge you to continue your work implementing a robust Cap-and-Trade program for California by auctioning permits in a way that raises money for California businesses, families, and communities. (MANNLE)

Comment: Air Products encourages all measures that will mitigate the potential cost of allowances. Controls such as the three-year compliance period, modest compliance account balance requirements (vis-à-vis the incurred compliance obligation), flexibility in the amount and source of offsets, the ability to bank allowances and the use of the Strategic Allowance Reserve will all be necessary and the maximum flexibility in their application should be allowed. (APC)

Comment: Because of the state's revenue shortfalls, and both federal and private investor reluctance, I think it would be wise to put a price on carbon pollution as soon as possible, by increasing the share of permits that are auctioned. That may sound counterintuitive to opponents of fast implementation, but the undeniable facts are that the cost of implementation is at a historic low, and new opportunities are more greatly needed now than at any time since the 1930's. (POWERSD)

Comment: The benefits of regulation have vastly outweighed the costs. American business has always responded in the end by innovating and finding low-cost strategies to comply with environmental regulation. Don't set the bar so low that Californians lose out on the health and economic security benefits we could achieve by pressing industry to innovate. (TURNER)

Comment: There are a number of lifecycle-cost effective energy efficiency measures that could be implemented. There's no reason, economically, let alone climate change-wise, to delay implementing reductions in emissions by requiring upgrades in efficiency. Keep our energy money here in efficiency improvements versus exporting them for buying energy supplies. (MILLERKEN1)

Comment: There may be a dip in businesses wanting to come to California when the cap and trade is first implemented, however within a short time all the other benefits of setting up business in California will outweigh any draw backs originally focused on. (BUSSE)

Comment: Businesses based in or that do business in California should be held responsible for the damage they cause. Just as we pay recycling fees for the television sets and monitors we buy, the companies that produce environmental damage should be taxed as well. (LEVINSON)

Comment: We think this regulation supports the continuing building of a sustainable business economy, clean business economy within the state. There have been reports on the job. Our organization has actually done more of an anecdotal approach where we put together examples of our individual companies that have grown substantially. We did a survey. We found last year in the heart of the recession our membership grew the employee count by 20 percent, and are expecting more this coming year and the same next year. This is a direct result of policies like this. (CAEEIC)

Comment: Greenhouse emissions cause economic and environmental damage that already is in the trillions. Strong measures to prevent greenhouse emissions are needed to prevent the damage from escalating into extinction. (YEAGER)

Comment: Please put caps on greenhouse gas emissions. The oil companies should be investing in renewables. What standards we set will be followed by other states. We the people of CA need to show America what real leaders are made up of. Just say no to oil! (ZELICHOWSKI)

Comment: My main concern is that a full-fledged cap-and-trade system as earlier proposed would have significant utility rate impacts on top of the costs of implementing increased renewable resources and reducing greenhouse gas emissions. While my client's proposed projects show very faint indicators that we may be pulling out of the recession, I'm really worried that significant electric rate increases might push those projects out of California and prolong the recession. I'm thankful that CARB has proposed regulations implementing the goals of AB 32 that are very sensitive to reducing rate impacts to our business customers in this still fragile economic environment. Rate increases are unavoidable to meet our emission goals, but with the proposed implementation they are small and phased in over the next decade. I believe we all can work with the small annual rate increases that are required in order for California to continue to be a leader in environmental stewardship. (REC)

> **Response:** We concur that the cap-and-trade program and the broader Scoping Plan effort provide a model for action that can be taken at the Federal level and by other states individually and through regional action. By moving forward, California is both positioning our economy to benefit as climate action is taken internationally and promoting action throughout the country and the world.

Miscellaneous

H-21. (multiple comments)
Comment: Did CARB conduct any analysis on the impact of the regulation on different classes of water users (e.g. urban, agricultural, and environmental)? (DWR2)

Comment: Did CARB conduct an analysis identifying the economic and environmental impacts of this regulation, specifically based on impacts to water uses? More specifically, did CARB analyze the impacts on agricultural water users, who may have a disproportionately high level of water use compared to their electricity use? (DWR2)

Comment: Did CARB consider the economic and environmental impacts such as land use changes and crop-shifting that could result from this regulation’s possibly larger impact on agriculture, particularly in light of the assertion by federal power providers that they are not obligated to comply with this regulation, and the resulting incentives which would encourage additional water use on lands entitled to receive federal water deliveries? (DWR2)

> **Response:** Federal power providers are not exempt from this regulation for the electricity they delivery to the California grid. We analyzed the water ratepayer impacts from the regulation and found that, since the emissions associated with water distribution are included in the share of value returned to end-use customers through the electric distribution utilities, the impact on ratepayers is insignificant. We considered the average ratepayer in this analysis and acknowledge that different classes of ratepayers could face different impacts. We do not have information to determine how DWR will set rates for water customers once the regulation takes effect. Nevertheless, in Resolution 11-32,

the Board directed the Executive Officer to continue discussions with stakeholders to identify and propose, as necessary, during the initial implementation of the cap-and-trade program, potential amendments to the regulation, including distribution of allowance value associated with cap-and-trade compliance costs from using electricity to supply water and the expected ability of allowance allocation and other measures to adequately address the incidence of these costs equitably across regions of the State. Our responses to comments on environmental impacts are included in the responses to the Functional Equivalent Document.

H-22. Comment: DWR references comments from their earlier comment letters, and asserts that the environmental and economic impacts on DWR and water users have not been addressed.

Response: Our response to comments submitted by DWR is included as part of this Final Statement of Reasons and in the responses to the Functional Equivalent Document.

I. ELECTRICITY

This section includes comments and responses about the treatment of the electricity sector in the regulation. Major topics concern allocation to the electrical distribution utilities, treatment of imported electricity, renewable energy, combined heating and power facilities and other facilities with long-term contracts, and the electricity consignment auction. Comments concerning the use of consignment auction proceeds are found in the section entitled "Use of Auction Proceeds."

Allocation

General

<u>*Allocation to UCs*</u>

I-1. Comment: We're extremely disappointed that, while industry is given free allowances, the university and higher education in general and hospitals do not receive free allowances or any financial assistance or transition assistance under the proposed regulation. The proposed regulation will have a significant impact upon the university. We have five cogeneration plants and one large heat thermal plant that will be captured by the cap and trade regulations. We estimate that the cost of purchasing allowances on the auction will range between 7 million and 30 million per year, depending upon the actual cost of the allowances on the auction. We ask for transition assistance. (UC2)

> **Response:** While we understand the concerns of the UCs, we expect that the universities will be able to fully pass through the cost of carbon as fee increases or other options meant to pay for administrative overhead such as indirect costs in contracts and grants. Because there is not risk of leakage, the university does not require transition assistance. However, the university should expect to receive some remuneration for the increased cost of procuring electricity from the local distribution utilities that service the campuses. We are working closely with the CPUC and the POU governing boards to determine the appropriate level of remuneration. That said, at the October 20, 2011 meeting, the Board directed staff in Resolution 11-32 to coordinate with State universities and stakeholders to evaluate options for compliance, with amendments to the regulation as appropriate, including options for the use of auction revenue and to report back to the Board in summer 2012.

<u>*Allocation to Utilities NOT Efficient*</u>

I-2. Comment: Based on the HDPP situation, the auction mechanism as currently proposed in the Cap and Trade Rule conflicts from the outset of the program with AB 32's requirement that any ARB regulations be designed "in a manner that is equitable, seeks to minimize costs and maximizes the benefits to California" (H&S Code section 38562(b)(1)). For the outset in 2012, the proposed Cap and Trade program would distribute most GHG allowances for free, while requiring other entities like HDPP to purchase GHG allowances through the auction. It now appears that most electrical generators that purchase GHG allowances either had contracts that allowed them to pass the costs of GHG allowances through to the markets in 2012—or benefitted from subsequent government decisions allowing utilities to pay such costs in 2012, unlike HDPP and similar generators. Requiring HDPP or similar generators to purchase GHG allowances without the ability to pass through GHG allowance costs would place an inequitable burden on certain sectors and certain industries during 2012, in conflict with AB 32 and the principles underlying the proposed Cap and Trade program as approved by the Board. (HDPP2)

> **Response**: For the High Desert Power Project (HDPP) plants, the contract terms of concern are only an issue through 2012. ARB will be starting the first compliance period of the emissions trading program in 2013; therefore, HDD does not have to obtain allowances for their 2012 emissions. For 2013, HDPP has a mechanism in the contract structure to pass costs down.

Energy-Intensive Trade- Exposed

I-3. Comment: An issue related to third-party energy supply is the requirement to be a covered entity in order to receive an allowance allocation. Table J-75 states that facilities will receive a direct allocation of allowances for thermal energy imported from off-site. But, in order to be eligible for any allocation of allowances, a facility must be a covered entity or an opt-in covered entity. This means the facility must report at least 10,000 metric tons of CO_2e to qualify to opt-in. Consequently, a facility that purchases the majority of its thermal energy from a third-party will have very high indirect emissions, but no direct emissions, and may have an incentive to increase direct emissions in order to become a covered entity and be eligible for an allowance allocation related to off-site thermal supply. (CACC)

> **Response:** We disagree with this speculative assertion. A facility choosing to increase direct emissions in order to receive an allowance allocation would typically need to install new equipment to provide thermal energy to substitute for imported thermal energy. Furthermore, by becoming a covered entity, such a facility would have a compliance obligation for all direct emissions while receiving allowances for only part of the emissions. We believe, absent data to the contrary, that such a choice is unlikely to make economic sense.

GHG Cost Pass-Through, Verification

I-4. (multiple comments)
Comment: To provide a balanced implementation of its proposed Cap and Trade Regulations and avoid increasing global GHG and criteria air pollutant emissions, ARB should allocate allowances in a manner that recognizes the disproportionate and enterprise threatening burden that GWF faces relative to most other power producers. GWF's burden is the direct result of its efforts to comply with federal and state policies and the associated contractual obligations that GWF entered into. ARB could

accomplish this goal by amending the proposed Cap and Trade Regulations such that GWF receives allowances for its GHG emissions associated with its pre-AB 32 PPAs, declining throughout the 2012-2020 period at the same rate provided for the cement manufacturing industry. See proposed Cap and Trade Regulations, Table 9-2. Proposed amendments to the proposed Cap and Trade Regulations to achieve this goal are provided in Attachment A.

One of AB 32's core concepts concerns GHG "leakage", defined as "a reduction in emissions of greenhouse gases within the state that is offset by an increase in emissions of greenhouse gases outside the state." (Health & Safety Code sec. 385050). Section 38562(b)(8) requires ARB to minimize leakage in the way it crafts any market-based compliance mechanism, such as the proposed Cap and Trade Regulations. Additionally, section 38570(b)(2) directs ARB to design any market-based compliance mechanism to prevent any increase in the emissions of criteria air pollutants or toxic air contaminants. An alternative destination for California-produced petroleum coke (not otherwise consumed in California) is Asia (in fact, almost all California produced petcoke is exported). Petroleum coke that is exported to Asia instead of being consumed in California increases GHG emissions by the amount required to transport it to the end-user. In addition, criteria air pollutant emissions resulting from the consumption of additional tonnage of exported petroleum coke are almost certain to rise, since the emissions standards in Asia (particularly in China and India, two likely destinations of California petroleum coke) are not nearly as stringent as California's criteria pollutant standards.

By granting allowances (on a declining basis) directly to GWF for GWF's historical GHG emissions, ARB would fulfill its mandate to give leakage, criteria pollutant, energy/GHG intensity, and economic issues due consideration when designing the proposed Cap and Trade Regulations. ARB would treat GWF in a manner akin to other similarly situated entities that consume similar fuel. In addition, ARB would greatly reduce the economic impact of the proposed Cap and Trade Regulations to allow GWF to comply with its Pre-AB 32 PPAs, thereby recognizing that GWF's PPAs are a product of both federal and state law to promote domestic energy independence through the consumption of by-product fuels, like petroleum coke. Modify section 95870 as follows:

(a) Allowance Price Containment Reserve. On December 15, 2011, the Executive Officer shall transfer allowances to the Allowance Price Containment Reserve, as follows:

(1) One percent of the allowances from budget years 2012-2014,

(2) Four percent of the allowances from budget years 2015-2017, and

(3) Seven percent of the allowances from budget years 2018-2020.

(b) Advance Auction. On December 15, 2011, the Executive Officer shall transfer two percent of the allowances from budget years 2015-2020 to the Auction Holding Account.

(1) These allowances shall be auctioned pursuant to section 95910.

(2) The proceeds from the sale of these allowances will be deposited into the Air Pollution Control Fund and will be available upon appropriation by the Legislature

for the purposes designated in California Health & Safety Code sections 38500 et seq.

(c) Allocation to Public Utilities.

(1) Electrical Distribution Utilities. The Executive Officer will place an annual individual allocation in the holding account of each eligible distribution utility on or before January 15 of each calendar year from 2012-2020 pursuant to section 95892. Allowances available for allocation to electrical distribution utilities shall be 89 million multiplied by the cap adjustment factor in Table 9.2 for each budget year 2012-2020.

(2) Reserved for Natural Gas Distribution Utilities.

<u>(3) Owners and/or Operators of Electrical Generating Facilities not otherwise defined as Electrical Distribution Utilities. The Executive Officer will place an annual individual allocation in the compliance account of each eligible owner and/or operator of an electrical generating facility operating under a Pre-AB 32 Power Purchase Agreement on or before January 15 of each calendar year from 2012-2020 pursuant to section 95892. Allowances available for allocation to owners and/or operators of electrical generating facilities operating under Pre-AB 32 Power Purchase Agreements shall be drawn from the pool defined in section 95870(c)(1), and multiplied by the cap adjustment factor in Table 9.2 for each budget year 2012-2020, except for Pre-AB 32 Power Purchase Agreements for petroleum coke fueled generation, which shall be multiplied by the cap adjustment factor for Cement Manufacturing in Table 9-2.</u>

Modify section 95890 as follows:

(a) Eligibility Requirements for Industrial Facilities. A covered entity or opt-in covered entity from the industrial sectors listed in Table 8-1shall be eligible for direct allocations of California GHG allowances if it has complied with the requirements of the MRR and has obtained a positive or qualified positive verification statement for the prior year pursuant to the MRR.

(b) Eligibility Requirements for Electrical Distribution Utilities. An electrical distribution utility shall be eligible for direct allocation of California if it has complied with the requirements of the MRR and has obtained a positive or qualified positive verification statement on its sales number for the prior year pursuant to the MRR.

(c) Reserved for Natural Gas Distribution Utilities.

<u>(d) Eligibility Requirements for Owners and/or Operators of Electrical Generating Facilities not otherwise defined as Electrical Distribution Utilities. An owner and/or operator of an electrical generating facility shall be eligible for free, direct allocation of California GHG allowances if it has complied with the requirements of the MRR, has obtained a positive or qualified positive verification statement on its sales number for the prior year pursuant to the MRR, and is operating under a Pre-AB 32 Power Purchase Agreement</u>.

Modify section 95892 as follows:

(a) Reserved for allocation to electrical distribution utilities.

(b) Transfer to Utility Accounts.

(1) Investor owned utilities. The Executive Officer will place allowances in the limited use holding account created for each electrical corporation.

(2) Publicly owned Electric Utilities. At least 90 days prior to receiving a direct allocation of allowances, publicly owned electric utilities will inform the Executive Officer of the share of their allowances that is to be placed:

(A) In the publicly owned electric utility's compliance account, or

(B) In the publicly owned electric utility's limited use holding account.

<u>(3) Owners and/or Operators of Electrical Generating Facilities not otherwise defined as Electrical Distribution Utilities. The Executive Officer will place allowances in the compliance account of any covered entity from which an investor owned utility purchased electricity pursuant to a Pre-AB 32 Power Purchase Agreement, as defined by section 95802(a)(153)</u>. (GWFPS1)

Comment: Some electric utilities and independent power producers entered into contracts in the past that are still effective and that did not anticipate the proposed rule. The situation is similar (but opposite) for independent power producers who agreed to sell electricity to utilities under contracts that do not allow them to pass through the costs of allowances or offsets. In order to continue operating, these independent power producers are required to purchase allowances and offsets, but may not be able to pay for them within the pricing structure under existing contracts…The Proposed Rule does not take into account these contractual issues, or provide adequate remedies for the unintended costs borne disproportionately by parties to existing contracts. Some form of phase in, or relief from allowance requirements, is required in order to avoid significant, unintended consequences. (HOR)

Response: We realize that a portion of generators and industrial steam producers have reported that some existing contracts do not include provisions that would allow full pass-through of carbon costs associated with cap-and-trade. We have closely examined this issue, but do not believe it is the role of the regulator to negotiate contracts for parties engaged in an agreement, nor will we treat entities differently who have negotiated contracts. In several cases, we are aware of and are encouraged by knowledge of parties that are in the process of negotiations, or already have negotiated new contracts, to resolve this issue. Staff believes that bilateral contract negotiations provide the best resolution of this issue.

New Entry

I-5. (multiple comments)

Comment: The Utilities request additional clarification of how subsection 95853(e) applies to new entrants from the electric sector. While section 95812 includes the threshold for covered entities, which specifically includes electric generation facilities as well as the first deliverers of electricity, the amount of free allowances a new entity is eligible to receive is calculated based on section 95891 in the proposed regulation which outlines a calculation for allowance allocation only for the industrial sector. (MID1)

Comment: Section 95853(e) addresses the calculation of the triennial compliance obligation for new entrants, and notes that new entrants are eligible to receive allowances pursuant to both subarticles 8 and 9, which address allocation to both the Electrical Distribution Utilities and Industrial Facilities. However, this section also notes that allowances will be calculated pursuant to the provisions of section 95891, which deals only with the industrial sector. In order to clarify exactly how new entrants will be treated, and how their treatment will impact other Covered Entities and the overall allowance Budget, NCPA recommends that this provision be clarified. (NCPA1)

> **Response:** To clarify, 95853(e) only applies to new entrants in the industrial sector. Electricity generation facilities do not receive free allocations; thus, they would not apply to this section. There are no provisions in the regulation for new entrant utilities. A set number of allowances are allocated to utilities, and those allowances are divided up between the entities based on cost burden, energy efficiency, and early action. If a new utility were to enter the program, the division of allowances for all entities must be recalculated, requiring changes to all utility allocation. We believe this situation is unlikely, but are prepared to make the necessary changes if needed.

POU vs. IOU

I-6. Comment: While the Council does not offer an opinion on the option that the proposed California regulations proffer for publicly owned utilities that would allow these entities to simply use the allowances provided for compliance, the Council is concerned that the option could lead to reduced investment in AB 32 related activities by these entities, which could increase allowance prices for all in the long run. (BCFSE)

> **Response:** We share your concern, and made changes to section 95892 to ensure that allowances allocated to the distribution utilities must be used exclusively for the benefit of retail ratepayers and in a manner that is consistent with the goals of AB 32.

I-7. Comment: LADWP strongly supports the provision that allows a publicly owned electric distribution utility (POU) to deposit administratively allocated allowances directly into its compliance account. All entities should have a reasonable means to comply with the Cap and trade regulation in a manner that accommodates their respective business models and compliance strategies. By including this provision, ARB has correctly acknowledged that the electric sector remains only partially deregulated after AB 1890, Chapter 854, Statutes of 1996, which was originally intended to introduce competition to California's electricity sector. (LADWP1)

> **Response:** We agree. Thank you for your support.

I-8. Comment: ARB has been sensitive to the diversity of the electric distribution utilities, many of which are publicly owned utilities that operate for the exclusive benefit of their retail ratepayers, provide the sole source of electric service within their service territories, own their generation assets on behalf of their retail ratepayers, and finance their investments in a manner entirely different from investor-owned utilities. As such, imposing auction design features on vertically integrated POUs is an unnecessary additional step that does not provide any value to POU electric ratepayers, nor to California overall. Many utilities, such as LADWP, own and operate generation to meet all of the load requirements. It does not make sense for LADWP to receive administratively allocated allowances, sell them in an auction, only to turn around and buy them back again. This is not, in LADWP's view, a "carve out" or "exemption" for POUs. Instead, it is a fundamental and critical need, due to the business structure. The Cap and trade program must be designed to work for all participants, including POUs, even if that means the regulation includes provisions like this one that efficiently accommodate different business models and compliance strategies. (LADWP1)

Response: We agree. Thank you for your support.

I-9. (multiple comments)
Comment: As proposed in the Proposed Rule, customers of IOUs have to pay for their allowances through higher electricity prices, while POUs do not. ARB does not explain this apparently arbitrary distinction between types of utilities. Is there are rationale for this disparate treatment? Does it have a purpose? AB 32 provides no basis or support for this distinction. (HOR)

Comment: CARB asserts that the allowance allocation system is fair within and across sectors. If so, fairness dictates that IOUs should be subject to the same rules as POUs with respect to the mandatory consignment of allocated allowances, which is not the case under the Proposed Regulation. Because of these unequal rules, any adverse impacts of the auction process will fall far more heavily on IOU customers than POU customers. (SCE1)

Comment: Publicly-owned utilities (POU) must not be allowed to reserve directly allocated allowances to meet the emission reduction obligations of their generation. Section 95982 exempts POUs from a requirement to make all allowances that it has received through direct allocation available for sale at auction. This exemption permits POUs to use directly allocated allowances to cover emissions by their own generation, while other generation resources will have to purchase compliance instruments. The staff report asserts that this exemption is warranted on the grounds that POUs have a different business model than IOUs, and no not compete with independent power producers. However, those statements are not categorically true, as POUs do frequently participate in wholesale power markets to sell surplus power. To allow POUs to reserve directly allocated allowances to cover emission reduction compliance of their own generation would give them an unacceptable advantage over independent power producers in these wholesale markets. WPTF therefore urges that the regulation be modified to require POUs to monetize all allowances received through direct allocation and to acquire allowances for their own generation and imports through auction. (WPTF)

Comment: Fairness dictates that CARB treat IOUs and POUs equally in the allowance auction. CARB staff states that "the allowance allocation system is equitable within and across sectors of the California economy." However, by requiring the IOUs to consign their allowances to auction without requiring the same of POUs, the proposed regulation is inconsistent in its treatment of IOUs and POUs. POUs have the choice to consign their allocated allowances to auction or place the allocated allowances directly in their Compliance Accounts. SCE believes POUs and IOUs should be subject to the same rules under this regulation. Both IOUs and POUs are freely allocated allowances, some of which will be used for direct compliance and some of which will be used for compliance with regard to purchased power. Thus, SCE and other IOUs should be afforded the same flexibility in auction participation as POUs, and be permitted to either consign allowances to auction, or transfer allowances to their compliance accounts. Alternatively, SCE suggests that POUs should be subject to the same rules as IOUs with regard to their freely allocated allowances. If 100 percent of the direct allocation for IOUs must go to their Limited Use Holding Accounts for consignment in auction, then the same should apply for POUs. This is true for several reasons.

First, CARB's primary reason for requiring IOUs to consign allocated allowances to auction is to ensure that the "amount of value given to distribution utilities is transparent to the public, and that this value is used on behalf of utility ratepayers." This reasoning applies just as strongly to POUs and their customers.

Second, SCE believes that the rate impact of the cap and trade program should be felt equally by both IOU customers and POU customers to avoid perception issues and cross-customer class distortion. SCE supports the process of monetizing its direct allowance allocation; a rise in rates will increase energy consumption sensitivity, while periodic rebates can serve to minimize customer hardship. However, POUs should be required to similarly adjust their rates in order to maintain relative parity between IOU and POU rates. Otherwise, customer confusion or dissatisfaction may result. IOU rates will likely be much higher in dollars per kilowatt hour than POU rates, and while the periodic refunds from IOUs should offset the rate increase, it is unlikely that customers will see their separate refunds as directly related to their rate increases. Moreover, IOU customers will be doubly disadvantaged as the IOUs are forced to establish and implement what will likely be a costly mechanism for returning this allowance value to their customers, while POU customers are spared this additional cost.

Third, CARB's unequal treatment of IOUs and POUs will negatively affect the availability of allowances during the crucial early days of the auction. If POUs can withhold allowances from the auction, IOUs will be placed at a competitive disadvantage. Without the consignment of allowances by industry and all utilities, the total available allowances in each auction in the first compliance period could be limited to those consigned by IOUs and a minimal amount placed in the auction by CARB. IOUs will be forced to compete for these allowances with other covered entities, voluntary participants, and opt-in participants. This could crowd IOUs out of the market in the auction while POUs need not enter the auction in the first place, creating an unfair advantage for POUs. Additionally, if the market is aware that IOUs are forced into the secondary market to purchase allowances, prices will likely soar, causing an undue burden on electricity customers. Especially during the first compliance period, requiring POUs to consign their allowances to the auction will increase the likelihood that the markets are broad enough to prevent this burden.

To address this inequality, CARB should provide the same rules for IOUs and POUs. CARB can modify the IOU rules to parallel those for the POUs and allow IOUs to retire some allocations directly into their compliance accounts. Alternatively, CARB can modify the rules for POUs such that they too must auction off and then re-purchase their allowances. (SCE1)

Comment: The proposed regulation should treat publicly owned utilities similar to other electricity market participants and other load serving entities. The proposed regulation has arbitrarily set up different rules for publicly-owned electric utilities (POU) than for investor-owned electric utilities (IOU), giving POUs unfair market advantages, and giving POU customers different GHG price signals than are required to be given to IOU customers. The cost of all electricity consumed in California should equally reflect the real cost of carbon. The proposed regulation requires first-deliverers of out-of-state electricity and investor owned utility generation to purchase allowances through the auction or purchase offsets. If POUs are given free allowances directly that they can apply to their generation, while other generators must purchase allowances in wholesale markets, there is clearly a mismatch in the treatment of similarly situated generators with potentially uncertain effects on the electricity market. If it is important that IOUs must auction off allowances to avoid interfering with competitive markets, it would seem equally important for POUs to do the same. It is odd that the regulation requires IOUs, who are already subject to State regulation through the CPUC, to document how the allowance value is used, but does not require POUs, whose actions have no State oversight, to do the same. POUs have no oversight from the State regarding the use of allowance value except through ARB regulations. These provisions, applicable only to POUs, are arbitrary, discriminatory, and have no basis in law or fact to support them. There is no provision in AB 32 that justifies it, and the ISOR offers no compelling justification. The proposed regulation should be corrected to require publicly owned utilities to purchase allowances through the auction or other means for their out-of-state electricity purchases and owned generation in the same manner as for other generators. Modify section 95892(b) "Transfer to Utility Accounts" as follows:

> (1) Electric Distribution Utilities. The Executive Officer will place allowances in the limited use holding account created for each electrical distribution utility.
> ~~(1) Investor-owned utilities. The Executive Officer will place allowances in the limited use holding account created for each electrical corporation.~~

~~(2) Publicly owned Electric Utilities. At least 90 days prior to receiving a direct allocation of allowances, publicly owned electric utilities will inform the Executive Officer of the share of their allowances that is to be placed:~~
~~(A) In the publicly owned electric utility's compliance account, or~~
~~(B) In the publicly owned electric utility's limited use holding account.~~
(SEMPRA1)

We also would ask the Board to eliminate the dichotomy in the allocation of allowances for the state's electric utilities. The cost of electricity consumed in the state should equally reflect the real cost of carbon. Unfortunately, the proposed regulation on the use of allowance revenues for IOUs and POUs would put IOU customers at a disadvantage. (SEMPRA1, SEMPRA2)

Comment: The proposed regulation should provide multi-jurisdictional retail providers with the same compliance flexibility that is granted to POUs. The proposed regulation currently requires all IOUs (including MJRPs) to place all of their allowances directly into the auction. In contrast, POUs would be able to directly use their allowances to meet their own compliance obligation and place the remainder into the auction. For the purposes of these regulations, MJRPs are more akin to POUs insofar as the MJRPs are vertically-integrated entities operating their own balancing authority areas. Furthermore, MJRPs are subject to regulatory jurisdiction by entities other than the California Public Utility Commission (CPUC), and are therefore subject to a different set of resource planning requirements than are the other California IOUs. Accordingly, to accommodate these structural distinctions and avoid direct conflict with its regulatory mandates under other jurisdictions, MJRPs should be granted the same compliance flexibility as are the POUs. We suggest that ARB revise that distinction to be not about investor-owned versus publicly-owned, but one of vertical integration. (PACIFICOR1, PACIFICOR2)

Response: We understand the concerns; however, POUs and IOUs operate differently with respect to electricity generation. POUs generally own and operate generation facilities which they use to provide electricity directly to their end-use customers. In order to minimize the administrative costs of the program to the POUs, and recognizing that directly allocating the allowances to the POUs does not distort their economic incentive to make cost-effective emissions reductions, we determined that it would be prudent to allow POUs to surrender directly allocated allowances without participating in the auction process. IOUs, on the other hand, have contracts with electricity generators that do not afford the IOUs the same level of control over the capital investments and operating decisions of the generation facility. We are concerned that the terms of these contracts could be adversely affected by allowing the IOUs to directly surrender allowances on behalf of their counterparties, which could lead to some foregone cost-effective emissions reductions. Instead, by requiring the IOUs to consign the allowances at auction, the electricity generators will be sure to have a strong incentive to pass their GHG costs back to the IOUs who will then be able to use their share of the auction revenue to reduce the ratepayer burden in a manner that is consistent with the goals of AB 32.

In considering the exact amount of value to allocate to each local distribution utility, we took a cost burden approach. The framework was formed by holding a series of public meetings and obtaining input from stakeholders. Our working consensus was laid out in the regulation. If you would like to view the presentations for these public proceedings please visit: http://www.arb.ca.gov/cc/capandtrade/meetings/meetings.htm#publicmeetings.

Sectoral Allocation and Interaction

I-10. Comment: LADWP appreciates the ARB's proposal to administratively allocate allowances to the electric sector as a whole in an amount that is expected to cover the sector's native load compliance burden while the electric distribution companies expand their renewable energy portfolios and pursue aggressive energy efficiency standards. It is important for the electric sector's emissions budget to be set at the start of the program in order to provide regulatory certainty. However, should there be major shifts in emissions that result from an earlier than expected economic recovery, increase in load associated with electric transportation or multi-year droughts, LADWP supports an overall reevaluation of the electric sector's allowance budget and upward adjustments as appropriate to ensure that the electric ratepayers are protected from undue economic harm. (LADWP1)

Response: We will continue to evaluate the appropriateness of allowance allocation and make recommendations to adjust if necessary. Any adjustment would require a regulatory amendment.

I-11. (multiple comments)
Comment: Utility sector allowance allocation should include cogenerated electricity that is sold to the grid. Subarticle 8 of the proposed regulation states that allowances will be administratively provided to electric distribution utilities in the electricity sector, in an amount equal to 89 million metric tons multiplied by the cap adjustment factor in Table 9.2 in each budget year. This is equivalent to 89 million metric tons of allowances in 2012, declining each year thereafter to contribute to meeting the AB 32 target of achieving 1990 emission levels in 2020. SMUD strongly supports the proposed administrative allocation of allowances to electric distribution utilities on behalf of their customers, but the amount of allowances so provided is key. It is our understanding that the allowances for the electricity sector so allocated are intended to be set at 90 percent of the sector’s 2008 emissions, including emissions from cogeneration electricity sold to the grid. However, the 89 million metric ton number does not yet include the emissions associated with cogeneration electricity sold to the grid. SMUD believes that this addition is essential in order to reduce impacts on electricity customers. (SMUD1)

Comment: PG&E recommends that the quantity of allowances allocated to the electric sector via utilities be increased by 8.7 MMT for an electric sector total of 97.7 MMT/yr in 2012 and requests that section 95870 (c) be revised to reflect this. The increase reflects utilities' purchases of electricity from combined heat and power (CHP) facilities. PG&E's proposed 8.7 MMT adjustment associated with CHP generation delivered to the grid was quantified by estimating electric local distribution company (LDC) purchases from CHP and multiplying them by a "payment" heat rate derived from the recent settlement proposed by key QF trade organizations and the IOUs. For a heat rate, PG&E proposes an 8125 Btu/kWh rate, which is on the low end of a number of "payment" heat rates included this settlement. Assuming natural gas as a marginal fuel and current estimates of CHP grid deliveries, this translates to an additional allocation of allowances to the electric sector of 8.7 MMT per year. (PGE1)

Comment: "Allowances available for allocation to electrical distribution utilities shall be 89 million multiplied by the cap adjustment factor in Table 9.2 for each budget year 2012-2020" (section 95870(c)(1)). NCPA believes that this number should be revised to include an additional 8.7 MMT from combined heat and power (CHP), for a total sector allocation of 97.7MMT. NCPA supports the use of 97.7 MMT as the minimum number allowances to be freely allocated to the Electrical Distribution Utilities.
NCPA recommends that section 95870(c)(1) be modified to also include 8.7 MMT of additional allowances that are attributable to CHP generation that is purchased by utilities (as opposed to used for industrial purposes). The 8.7 MMT is derived by taking a reported 2,562 MW of statewide CHP purchases by electric utilities, and using a 8125 Btu/kWh heat rate, which translates into 9.7 million metric tons of emissions, multiplied by 90 percent, which results in 8.7 million metric tons of additional allowances to address utility purchases of electricity from CHPs. The cost of CHP generation purchased by utilities is properly allocated to the electrical distribution utilities on behalf of their customers. (NCPA1)

> **Response:** We agreed and changed the regulation accordingly. We explained the new allocation to the electricity sector in "Appendix A: Staff Proposal for Allocating Allowances to the Electric Sector," which was posted to the rulemaking website on July 27, 2011.

I-12. Comment: Make the following change in Table 9-2 within section 95891 to clarify that despite the heading, the factors in this category apply to the electricity sector, too: "Cap Adjustment Factor (c) for <u>Electric Sector and </u>All Other Industries." (NCPA1)

> **Response:** We modified the table to be more general and include the electricity sector as follows: Table 9-2: Cap Adjustment Factors for <u>Allowance Allocation.</u>

I-13. Comment: The reason ARB gives for its decision to allocate all allowances to utilities is that they are in the best position to monetize the value of the allowances and return that value to their ratepayers. Stated differently, the utilities are in the best position to obtain revenues for allowances from other industrial sectors and use those revenues to reduce electricity users' costs. This represents a policy decision to exact revenues from regulated parties, and direct those revenues to the reduction of electricity rates for electric utility ratepayers. This concept is bizarre, and has no foundation in AB 32. On what legal or policy basis should utilities be allocated allowances that they essentially sell to other industries in order to reduce ratepayers' electric bills? A system that allocates a limited resource to one segment of the economy at the expense of other sectors is a recipe for disaster. The other segments of the industry will not be able to compete with utilities for allowances. In addition, the costs of the program will be artificially skewed toward non-utilities. (HOR)

> **Response:** Allocation to electricity utilities was chosen as the preferred method to return the allowance value to those affected by this program. Because most industrial facilities and Californians use electricity, returning allowance value via electricity utilities is the best alternative to reduce the cost burden of this program. We modified the regulation to include 95892 that demands electric utilities use allocation value to benefit ratepayers, which includes both industry and Californians. Additionally, industrial facilities receive allowances corresponding to production or energy use, see section 95891.

I-14. Comment: There is another reason that this allocation is inequitable. Utilities are uniquely positioned to purchase (and in fact are required to purchase) renewable energy. The purchase of renewable energy is the only option (other than reducing operations) for continuing to operate at historical levels while complying with a greenhouse gas emissions limit. Other entities have limited abilities to avail themselves of renewable energy, because such energy is usually built to order for utilities. Nearly all of such sources are supported by, and sell their power exclusively to, utilities. So, utilities are among the only entities able to offset their constrained greenhouse gas emissions limits with alternative sources. And yet, the Proposed Rule places the allowances in the hands of the utilities, at the expense of all other market sectors. Utilities will be able to supplement their generation sources to mitigate the costs of allowances, while their competitors and other market segments will have only a limited ability to do so. (HOR)

> **Response:** We disagree with this comment and believe that all facilities have strategies to reduce greenhouse gas emissions. The compliance pathway analysis of the Staff Report details reduction opportunities for the various industrial sectors of California. Additionally, industrial facilities will also receive allowances to assist in the transition to a lower carbon economy and to minimize leakage consistent with the mandates of AB 32.

I-15. Comment: Lest you think that consumers are the beneficiaries of this inequitable arrangement, consider the second compliance period. In the second compliance period, all fossil fuels will be subject to greenhouse gas emissions limits and to the allowance program. Beginning on January 1, 2015, gasoline, propane, and all commercial and industrial products will reflect a price for greenhouse gas emission allowances that are generated by competition with electric utilities. When consumers use too much electricity, the cost (or shortages) will show up in the gasoline prices paid by other consumers. At that point, all California citizens will be paying extra costs in goods and services in order to subsidize electricity rates. There is nothing about such a system that is equitable. (HOR)

> **Response:** A central aspect of the cap-and-trade program is the existence of a price signal to drive reductions in greenhouse gas emissions. Reductions will come from all covered sectors, and we expect that consumers will respond to carbon prices by choosing the bundle of goods and services that provides them with the greatest affordable benefit. To assist consumers in the transition to a lower-carbon economy, we determined that it is appropriate to return a fraction of the total allowance value to consumers. Because most industrial facilities and Californians use electricity, returning allowance value via electricity utilities is the best alternative to reduce the cost burden of this program. We modified the regulation to include section 95892 that directs electric distribution utilities to use allocation value to benefit ratepayers, which includes both industry and Californians.

I-16. Comment: Increase the percentage of allowances auctioned to emitters and utilities. The California Public Utilities Commission (CPUC) and the California Energy Commission (CEC) recommended to CARB a transition to 100 percent auction for the electricity sector by 2016. It is not entirely clear from CARB's Proposed Rule section 95870(c)(1) and Table 9.2 what percentage is being freely allocated versus auctioned, but it appears to be a far cry from 100 percent by 2016. (CONSUMERSUNION)

> **Response:** We disagree with this comment and believe the current method of increased free allocation is the best approach. See Section H of the Staff Report.

Transportation Electrification

I-17. (multiple comments)
Comment: The proposed regulation must account for shifts in achieving GHG emissions reductions from the transportation sector to the electricity sector.

Transportation electrification is widely recognized as an important means for achieving net societal GHG emissions benefits, even though coal-fueled power plants provide some portion of the energy supply. However, a lower-carbon economy with greater reliance on electric vehicles will result in a commensurate increase in the demand for electricity as a transportation fuel.

Moreover, the burden created by this beneficial fuel switching will be borne disproportionately among different utilities. Increases in electricity demand driven by transportation electrification will not produce any greater compliance costs or obligations for deregulated utilities that have largely divested their fossil generation and primarily offer distribution services. In contrast, vertically-integrated utilities that still fall under traditional regulation will continue to operate and build new generating units to meet increases in electricity demand. The resultant electricity demand from such beneficial activities as transportation electrification will compound the existing GHG compliance obligations of these utilities.

PacifiCorp recommends that ARB include in its proposed regulation a robust, flexible mechanism for adjusting a utility's overall compliance obligation as the burden for achieving GHG emissions reductions from the transportation sector shifts to the electricity sector. (PACIFICOR1)

Comment: The Utilities request that CARB address the potential for increased use of plug-in electric vehicles and the impact of this on all aspects of the cap and trade program. The Utilities believe additional allowances should be made available to electric distribution utilities commensurate with the covered entity's growth in emissions due to infiltration from the vehicles, as further identified by the California Public Utilities Commission in a recent white paper. (CPUC, Policy and Planning Division, Staff White Paper: "Light-Duty Vehicle Electrification in California: Potential Barriers and Opportunities" May 22, 2009). (MID1)

Comment: Growth resulting from vehicle electrification should be accompanied by a commensurate allocation to protect utility customers from increased compliance costs. PG&E is concerned about the interaction of the Cap and trade program with other policies that encourage vehicle, port, off road equipment, and goods movement electrification. Electric fuel will increase statewide electricity consumption, and associated GHG emissions. While society will experience lower overall emissions, increased electric sector emissions will result in higher electricity costs, which utility customers will bear through increased rates. PG&E is concerned that this circumstance may create disincentives for utilities and their ratepayers to support transportation technologies that use electricity, reducing the potential to achieve the benefits associated with transportation sector electrification. PG&E agrees with the CPUC's assessment that "failure to make available additional allowances to the electricity sector due to electrification risks overburdening ratepayers with the cost of transportation sector emissions." To ensure that electric fuel is encouraged, consistent with the goals of AB 32, PG&E recommends that ARB address increased costs to the electric sector through allocation of allowances in the Cap and Trade program. PG&E believes that allowances associated with electric fuel should be returned to electric ratepayers, under the guidance of the CPUC and municipal utility boards, so that the value of allowances flow directly to the customers who bear the carbon costs associated with electric fuel. (PGE1)

Comment: Cross-sector shifts of emissions should be accounted for in the allowance allocation policies. Perhaps the largest potential for emissions reductions in the State in the long-term lies in electrification of the transportation sector. However, these reductions are by no means assured given the high costs of infrastructure investment that the electricity sector and customers will need to make, as well as the costs of the vehicles themselves. Given these up-front cost-barriers, significant incentives will likely be needed for consumers to be willing to adopt electric vehicles en-masse. While the

ARB has stated it intends to leave the allowance value associated with the transportation sector to the legislature to determine how best to appropriate that value, SMUD strongly encourages the ARB to consider how the allowance value associated with those transportation emissions that are shifted to the electric sector could be used to defray infrastructure cost upgrades and incent electric vehicle uptake. Just as distribution utilities are looked to for delivering effective incentive mechanisms for energy efficiency and rooftop solar in this state, so too will the distribution utilities play a central role in encouraging electric vehicles. As regulated entities, distribution utilities can be required to spend any allowance value associated with transportation electrification on programs, rate incentives, and infrastructure upgrades which support this electrification, thereby encouraging more rapid adoption of the technology.

In addition to providing some incentive, a shift of allowance value will assure that increased emissions obligations that result from increasing electric transportation loads do not create an undue cost burden on the utility's other consumers. If electric transportation loads drive increased compliance obligation, electric utilities will be forced to pass these costs on to our customers on top of the infrastructure costs we must come up with to enable these vehicles in the first place. The amount of allowances that should be transferred from the transportation sector should, at a minimum, cover this increased compliance obligation, but ideally should cover both this as well as an amount up to the allowance value that is avoided in the transportation sector as a result of the electrification activity. (SMUD1)

Comment: Electrification of public transportation (ISOR, p. II-33), ports, and personal vehicles could have a net positive impact on the State's overall emissions reductions. However, this same impact is likely to result in an increase in the emissions associated with the electricity sector that are not accounted for in any of the current emissions accounting methods under consideration. Electrification and the development of a more robust, secure, and reliable electric vehicle infrastructure are not simple matters. However, they are a real part of meeting the goals of AB 32 and will present real impacts for electric utilities' compliance with the Cap and Trade Program. Accordingly, NCPA urges the Board to direct staff to work with stakeholders to further review and address this issue, and provide 15-day proposed revisions for the public's consideration during the first quarter of 2011 for inclusion in the final regulation. (NCPA1)

> **Response:** We are aware of the increased interest in the electrification of commercial and personal vehicle fleets. However, we do not expect that the growth in this electric load will significantly impact utility costs by 2020. We will monitor the electrification of transportation and will address this concern if it arises in the future.

Allocation Structure

I-18. (multiple comments)
Comment: Recognize the historically low emissions of SFPUC's electric system in allocating allowances to the electric sector. SFPUC has the lowest GHG emissions per

megawatt hour (MWh) of any large California electric utility. The current proposal fails to properly recognize the City's low GHG footprint and potentially loads the City's municipal utility operations with a greater cost burden than emissions-intensive utilities. The initial ARB staff proposal has not benefited from public discussion on the issue of how to allocate allowances to the electric sector. Subsequent to the release of the staff proposal, the SFPUC became aware that ARB staff, working with a selected group of electric utilities (the Joint Utilities Group or JUG), is now proposing an entirely new allocation mechanism that has yet to be made publicly available for comment or review.

After a review of the JUG proposal, it is clear that it unfairly rewards those utilities which have historically had high GHG emissions at the expense of utilities such as SFPUC. Paradoxically, SFPUC, despite having amongst the lowest GHG emissions rate of any public utility in California, could find itself in the position of needing to buy allowances to meet its demand during times of drought conditions and to meet future load growth. This represents a significant departure from ARB's original proposal to allocate allowances based on a combination of utility sales and historical emissions, an allocation method much more consistent with rewarding past actions to reduce GHG emissions. Under the JUG proposal, SFPUC would forego potential revenue from allocations it should receive. Requiring SFPUC to buy allowances while high emission utilities are relieved of that cost would not be equitable, and in effect would create a situation in which SFPUC would subsidize energy efficiency and renewable energy investments by electric utilities which use much higher GHG-producing fuel sources. We therefore recommend that ARB:

A. Refrain from endorsing the JUG proposal at this time until interested parties have had time to review and analyze its methodology and proposed allocation. These detailed proposals represent a fundamental change from the guiding principles outlined in the Initial Statement of Reasons (ISOR), and therefore warrant proper public process. The JUG proposal also grants allowances, in contravention of the requirements of AB 32, for "early action" that is already required by State law.

B. The Board should direct ARB staff to focus on the stated goals of any allocation proposal and the requirement that it; "provide proper incentives, (be) affordable for all utilities, and (be) considered equitable."

C. The City encourages ARB to include as the stated goals of the JUG to:

- Ensure that utilities with lower GHG emissions have sufficient allowances to provide reliable service and meet their needs.
- Ensure that utilities with lower GHG emissions do not see increased rates as a result of Cap and Trade implementation (The Allocation-Cost Burden).
- Afford utilities with lower GHG emissions a proportionately greater net benefit (i.e., a larger Allocation-Cost Burden) from the allocation process than utilities with higher GHG emissions.

D. In order to recognize and reward electric distribution utilities with demonstrated low GHG emissions, and to provide an incentive for other utilities to continue to reduce their GHG emissions, the City encourages ARB to establish a minimum allocation for all electric utilities. A minimum allocation that is below

the 2020 target for the electric sector (specifically, 200 metric tons per gigawatt-hour) will ensure that low GHG utilities will be rewarded for their past and current efforts and provided with a revenue source to support growth, fund further renewable and energy efficiency programs and investments and mitigate rate impacts on their customers.
E. ARB should give staff the necessary discretion to craft appropriate modifications to any proposed allocation mechanism finally adopted.
(SFMAYOR1, SFPUC1, SFPUC2, SFPUC3)

Comment: Allocation of allowances among electric distribution companies should strongly and visibly reflect early action, and there should be consideration of transitioning toward a replicable, sales-based allocation structure. The proposed regulation is at present, silent about how the allowances administratively provided to the electric sector are to be distributed among the various electric distribution utilities in the state. In May of this year, ARB staff indicated that the thought at that time was to distribute such allowances primarily based on sales, similar to the output-based approaches proposed for many individual industrial sectors. SMUD has consistently stated a preference for an allowance structure that reflects early action to reduce GHG emissions, as many utilities that have taken these actions have already incurred and passed on to their ratepayers the costs of these early emission reductions. In addition, SMUD has supported allowance structures that transition toward greater reliance on sales over time, to provide a more powerful incentive to reduce use of higher GHG resources. Specifically, SMUD has supported a structure that was based initially 75 percent on historic emissions and 25 percent on sales, transitioning by 2020 to a structure that is based 25 percent on historic emissions and 75 percent on sales. This is similar in structure to that recommended to the ARB by the California Energy Commission and the California Public Utilities Commission, the two energy agencies with the greatest experience with the electricity sector.

However, SMUD understands that staff is currently considering basing the allocation of allowances among utilities on projected emissions resulting from utility resource plans and state-required investments in renewables and efficiency. While we can support this approach, SMUD believes that this structure is not easily replicable beyond 2020 or nationally because the development of resource plans from now on will be altered if those doing the planning understand that their allocation of cap and trade allowances will be affected by how they do these plans. This implies potential risks to California if a similar structure is adopted nationally, as it would likely leave California entities with lower than expected allowances in a national market, and it is unclear whether California’s general early action to reduce GHG emissions would be recognized. Strong advocacy of national complementary policies may help to reduce these risks, but will not mitigate them entirely. To address these issues, SMUD believes that the final structure must include a strong, visible, ‘early action’ component, not just to recognize such actions within the currently proposed cap and trade in California, but also so that if the approach is adopted nationally, there will be precedent to recognize California’s early action. In addition, SMUD believes that there should be further consideration of a transition to an approach based more on sales, similar to that proposed for the industrial sectors. (SMUD1)

Comment: The allocation of allowances among utilities, as laid out in Appendix 1. In that discussion, we believe that we should shoot for a structure that is replicable beyond 2020 and nationally, and one that includes a strong visible early action component to reduce risks to California in a national situation. We also believe there should be further consideration of a transition to a sales-based approach, similar to the output-based approach that's being used in the industrial sector. (SMUD2)

Comment: The allocation of emissions allowances to electrical distribution utilities should be based on the distribution utilities' projected costs of compliance. The proposed regulation does not specify how allowances would be allocated among the Electrical Distribution Utilities that are eligible for direct allocation from the Air Resources Board (ARB). Assuming an allowance trading regime is included in the Cap and Trade Program, PacifiCorp supports ARB's separately-proposed methodology to allocate allowances based on the distribution utilities' projected compliance burden. Under this approach, a utility will receive allowances based on its forward-looking compliance obligation, which is primarily a function of the overall expected emissions attributable to serving the utility's customers, net of partial credit for greenhouse gas reductions due to early action with renewable resources and energy efficiency.

Though PacifiCorp continues to have significant reservations regarding the use of state- and/or regional-based allowance trading regimes as the principal means of reducing carbon emissions, the Company strongly supports ARB's adherence to an emissions-based allowance allocation methodology, as opposed to a sales-based approach. An emissions-based methodology will help mitigate increases in electricity costs attributable to the Cap and Trade Program for customers of utilities with higher emissions profiles, as they transition to a lower-carbon portfolio. Under ARB's proposal, these utilities would be allocated allowances to either (1) cover emissions from utility-owned generation or (2) be sold by the utility at auction, with proceeds used to offset the higher costs of energy purchased at market. This proposal also helps utilities like PacifiCorp with a significant share of customers under the CARE program manage the disproportionately-high rate impacts of the Cap and Trade Program to its low-income demographic.

PacifiCorp continues to advocate that if an allowance trading regime is to be implemented within a greenhouse gas compliance program, allowances should be allocated based purely on emissions, and the Company remains firmly opposed to a sales-based allowance allocation approach. A sales-based approach awards windfall profits to low- and zero-emitting utilities in the form of a wealth transfer from utilities like PacifiCorp with higher emissions profiles; this scheme would only further exacerbate the rate impact on PacifiCorp's low-income customers in California. In addition, PacifiCorp's preference is that ARB does not allocate allowances according to either early action with renewable resources or energy efficiency gains, as ARB currently proposes. However, PacifiCorp feels that ARB's proposed allocation method reflects a reasonable compromise among the California utilities. (PACIFICOR1, PACIFICOR2)

Comment: The Council notes that the Air Resources Board may adopt an allowance allocation structure in the utility sector that is based on current, static, utility procurement plans. The Council does not believe that such an approach is replicable at a national level, or after 2020 in California, as the development of procurement plans from the point of adoption onward—whether at a state level or nationally—will be altered if those doing the planning understand that their allocation of cap and trade allowances will be affected by how they do these plans. (BCFSE)

Comment: LADWP generally supports a forecasted emissions-based methodology to allocate allowances in a manner that reflects the forecasted emissions cost burden for each load serving utility, and incorporates the expected benefits of energy efficiency investments, so that energy efficiency accomplishments are rewarded. LADWP supports an allocation methodology that does not leave any electric utility "short" of emission allowances so long as that utility continues to make emission reductions in alignment with the State's renewable energy and energy efficiency requirements. (LADWP1)

Comment: LADWP firmly rejects any methodology that would incorporate a retail sales-based allocation, in that such allocation fails to acknowledge the cost burden associated with the Cap and trade program and introduces disparate and discriminatory treatment between electric distribution utilities. LADWP does not support updating of the intra-sector allocation between electric utilities between 2012 and 2020, since this is a fairly short period and any shifting of allowances between utilities could cause unnecessary disruptions to investments. If any reassessment of the sector's allowance budget results in an increase to the sector's overall allocation, such increase should be equitably applied to all electric distribution utilities. (LADWP1)

Comment: The administrative allocation of allowances to the electric sector must balance the desire to reward early actions to reduce emissions without penalizing electric utilities for geographic or historical circumstances that dictate the emissions of their current generation portfolio. (LADWP1)

> **Response:** We modified the electric utilities allocation and provided a description and rationale for the approach in Appendix A: Staff Proposal for Allocating Allowances to the Electric Sector with the 15-day changes to the regulation. We modified sections 95870 and 95892 and inserted table 9-3. The allocation methodology is non-updating and based on cost burden, energy efficiency, and early action—as defined by investment in renewables during the period 2007-2011. We believe that this approach fairly apportions value to the electric distribution utilities in a way that compensates retail customers for their cost, providing transition assistance, while maintaining a strong incentive for distribution utilities to make investments toward lowering their emissions profile. We believe that this approach is replicable for the beyond 2020 horizon and at

the regional or national level. The key for such future work, as was the case with the current electric sector allocation, will be to identify data sources that are not subject to manipulation.

Allocation to Electricity Utilities

I-19. Comment: The renewable energy program and GHG reduction program complement each other in that they both will reduce GHG emissions. And, both could place a substantial financial burden on ratepayers. A GHG Program that would require utilities to purchase GHG allowances while at the same time the utilities are committing substantial resources to procure renewable energy will take its toll on the financial stability of the utilities. The reality is that the ratepayer will pay for the utilities efforts to reduce GHG. To also pay for the allowances would be asking the ratepayer to pay twice and not be assured that they would see the financial benefits returned in their electric bills. We believe that the distribution of the allowances will be critical to the success of the program. There have been several proposals that very well could shift the compliance burden from one utility to another (or one region of California to another). For example, this could happen by using data from programs such as conservation, energy efficiency and renewable energy. Then, using this information to estimate the GHG reductions that were accomplished, and then using this information as the bases to provide additional allowances to a utility. These extra allowances would then be removed from another utility to maintain the established allowance cap. The utility with the reduced allowance would be placed at a disadvantage in achieving compliance with the Program goals. If ARB is considering this method, then we recommend that ARB increase the initial sector allocation to allow for the adjustments with a goal that no electric utility will have a short fall and receive less than its original allocation. However, any program that has to rely on estimates or projections for crediting GHG emission reductions is suspect. Therefore, we recommend and support a program that utilizes a utility's GHG emissions, as reported to ARB, as the bases for determining the allocation of allowances. The resultant allocation program would be fair, straight forward, understandable and provide regulatory certainty. (WPA)

Response: We are committed to reducing the burden of these programs on the ratepayer. We modified the regulation to include 95892, to ensure that allowance value distributed to utilities is used to benefit the ratepayer. Additionally, we developed an electric utility allocation methodology based on cost burden, energy efficiency, and early action that we believe is equitable. We disagree that ratepayers will pay twice due to the renewable energy program and cap-and-trade program because investment in renewable energy will reduce the utilities' compliance burden.

Support

I-20. Comment: We think your guiding principles have been maintained, and we support specifically the administrative allocation of the allowance to the electric sector, the benefit of consumers, in particular support of the proposal of approximately 97.7

MMT. We support the policy guidance that the resolution gives the staff and how to allocate the allowances among the utilities. We support giving the staff authority to deal with the remaining implementation details. And Californians at this point I think can be just as proud of the continuing leadership in the greenhouse reduction measures. We will continue to support and implement the complementary measures in AB 32, energy efficiency and renewables so they will go a long way to ensuring our compliance. We will implement whatever procedures you adopt. However, we must ensure we maintain good custodians of rate payer dollars and keep rate increases to a minimum. (SCPPA4)

Response: Thank you for your support.

I-21. Comment: LADWP strongly supports policies that have been incorporated into the proposed regulation intended to help contain compliance costs, including administrative allocation of allowances to electric distribution utilities on behalf of their retail customers. (LADWP1)

Response: Thank you for your support.

I-22. Comment: DRA supports ARB's proposal to allocate allowances to the electric distribution utilities for the benefit of their customers. Free allocation of allowances to the electricity sector is essential for the California cap and trade program. This should provide the utilities with more time to reduce their emissions in a cost-effective manner, limit unnecessary short-term costs, and enable the utilities to transition to a low-carbon economy at the right pace. While it is clear that California can be a model for regional, national and international cap and trade programs, California consumers should not pay for the greater part of these efforts. (DRA)

Response: We agree. Thank you for your support.

I-23. Comment: We're supportive of the 97.7 million metric tons as an allocation to the electricity sector. It's that number set forth in Appendix 1 of the resolution. (NCPA2)

Response: Thank you for your support.

I-24. Comment: We're also pleased that the resolution addresses the need to further review allocation issues that may arise from electrification of the transportation sector. (NCPA2)

Response: Thank you for your support.

I-25. Comment: On the appropriate allocation of allowances to the electrical distribution utilities, NCPA believes that the distribution utilities are the best situated to deliver allowance values directly to retail customers throughout the state. (NCPA2)

Response: We agree.

I-26. Comment: NCPA supports the proposed regulation's free allocation of allowances to Electrical Distribution Utilities. Electrical Distribution Utilities are best situated to deliver the benefits of any allowance value directly to the State's retail customers and meet the stated objective of free allocation; that is "to ensure that electricity ratepayers do not experience sudden increases in their electricity bills associated with the cap and trade regulation" (ISOR, p. II-28). NCPA has long supported an allowance allocation methodology that recognizes electric utility investments in zero- and low-GHG emitting resources, including wind, solar, and hydro-electric, as well as investments in state-of-the art natural gas-fired electric generation facilities that emit far fewer harmful GHG emissions than their predecessor facilities. NCPA believes that any allowance allocation mechanism must recognize these investments, and should also create a program design that moves the entire state away from higher emitting resources. Clearly the move towards higher and higher renewable energy mandate one such tool, but others must also be employed. (NCPA1)

Response: We agree. Thank you for your support.

I-27. Comment: NCPA continues to work with the other members of the Joint Utility Group, as well as representatives from the California Environmental Protection Agency (Cal EPA) and CARB staff and other stakeholders in the interest of developing an allowance allocation compromise that can meet the objectives of the State's environmental and economic goals. NCPA generally supports the direction of the allocation compromise that has been discussed with the utility stakeholders and Cal EPA during the last six weeks. This compromise is based on three important principles:

(1) Covering each Electrical Distribution Utilities' cost burden associated with the Cap and Trade program,
(2) Recognizing Electrical Distribution Utilities' early actions and investments in renewable electricity generation, and
(3) Recognizing the cumulative energy efficiency reductions of each Electrical Distribution Utilities'.

NCPA believes that it is appropriate for an allocation method that includes these three factors to provide lower-emitting utilities with more free allowances at the start of the program, as this demonstrates that it is possible for an allocation method to cover a utilities' cap and trade related costs, as well as acknowledge the early investments in low-GHG emitting resources. The final consensus position that clearly meets each of the three discussed criteria must do so while still maintaining a total minimum allowance carve-out for the electric sector of 97.7 MMT (89 MMT referenced in section 95870(c)(1), plus an additional 8.7 MMT for CHP), and allocate those allowances freely to the Electrical Distribution Utilities as currently contemplated in the Proposed Regulation, including the right of the Electrical Distribution Utilities to retain the ability to utilize the value of the allowances for the benefit of retail ratepayers consistent with the goals of AB 32, and as directed by their governing bodies (local governing boards for the POUs or the California Public Utilities Commission for IOU). (NCPA1)

Response: We agree. Thank you for your support.

I-28. Comment: The Utilities strongly support CARB's decision to allocate free allowances to the electrical distribution utilities. The electrical distribution utilities are in the best position to assist California's ratepayers with the cost burdens associated with the Cap and trade program. The Utilities recommend the following changes to section 95870:

(c)(1) Electrical Distribution Utilities. The Executive Officer will place an annual individual allocation in the limited use *holding account of each eligible distribution utility on or before January 15 if each calendar year from 2012-2020 pursuant to Section 95892. Allowances available for allocation to electrical distribution utilities shall be 89 million multiplies by the cap adjustment factor in Table 9.2 for each budget year 2012-2020.* (MID1)

Response: Thank you for your support. We do not believe the modification you suggested is necessary, as the allocation mechanism is now specified in the regulation.

I-29. Comment: The Utilities support the intra-utility allocation recommendation developed by the JUG and CARB. The Utilities believe this recommendation adequately accounts for the cost burden of each electrical distribution utility, incorporates an appropriate amount of energy efficiency as well as early action. The Utilities believe it is important to have a set allowance allocation methodology in place and active prior to the start of the Cap and trade program as this will assist with the Utilities' long-term planning and budgeting in order to make the clean investments necessary to achieve the AB 32 reduction strategies. The intra-utility allowance allocation recommendation brought forward by CARB is a compromise that the Utilities are supporting because of the fairness and balance it creates for all the electric distribution utilities in California. The recommendation appropriately recognizes the cost burden that will incur on every electric ratepayer from the entire AB 32 program while effectively rewarding early action toward renewable energy and energy efficiency investments. The Utilities appreciate all of the work CARB has done to develop this recommendation and looking forward to working with staff over the next year on refinement of the data. (MID1, MID2)

Response: We agree. Thank you for your support.

I-30. Comment: The Utilities support the provision that will provide publicly owned utilities (POU) with the flexibility of either consigning their freely allocated allowances for sale at general auctions or applying them directly to meet cap and trade compliance obligations. As electric distribution utilities are diverse, this provision provides an important recognition in that covered entities should have a reasonable means to comply with the Cap and trade program in a manner that accommodates their respective business models and compliance strategies. The Utilities agree with CARB's rationale for this provision in that POUs are largely vertically integrated, and in addition points out that some POUs may be disproportionately impacted if required to participate in quarterly auctions due to significant capital needed, and the transaction costs expected to participate. (MID1)

Response: We agree. Thank you for your support.

I-31. Comment: REU is a member of the joint utility group and is supportive of the electric utility allowance allocation method that was presented here today. We believe this method is a fair and balanced approach that appropriately recognizes the cost burden that electric distribution utilities pass on to the residents of California. Even though REU's resource portfolio is 63 percent carbon free, a few years ago, we anticipated that this Cap and Trade Program could increase REU's electric rates by as much as 21 percent. So I'm very pleased to be standing here today supporting an allowance allocation methodology that will not create an immediate rate impact to REU customers. (RELECTRIC)

Response: We agree. Thank you for your support.

I-32. Comment: Section 95892(b)(2) allows publicly owned utilities to make an annual designation to place their freely allocated allowances either into their Limited Use Holding Account or into their Compliance Account. NCPA supports this provision as a sound means by which to avoid needless transactions. As noted in the ISOR, this distinction is warranted due to the fact that "most POUs own and operate their own generation and do not compete with independent generators in the way IOUs do." (ISOR, p. II-32) Because of this, allowances directly allocated to POUs may either be consigned for sale at the general quarterly auctions or used directly to meet their compliance obligations. If a POU decides to auction some of its allowances at the general auction, the same auction rules apply to the POUs as those described above for the IOUs. While there may be some concerns that this "option" limits the amount of revenue that a POU has to spend "exclusively for the benefit of retail ratepayers… consistent with the goals of AB 32," as mandated by section 95892(d)(3) for the use of auction proceeds, this concern is unfounded. Like all electric utilities, POUs are required to meet any number of programmatic measures under the Scoping Plan. The fact that a POU may not have to purchase allowances in the market and receive the corresponding revenue does nothing to change the total amount of revenue available to the POU for AB 32 related programs since the POU would most likely be both the original allowance seller and the most likely purchaser. As a practical matter, revenues not used to purchase allowances in the auction will be freed up for other AB 32 related expenditures, including savings from needless transactions costs, to be used for the benefit of the POU's retail customers consistent with the goals of AB 32. (NCPA1)

Response: We agree. Thank you for your support.

I-33. Comment: We commend CARB for adopting a cautious approach to the use of auctions in the early years of the program. We are keenly aware of the current political environment surrounding greenhouse gas legislation and "cap and tax" branding in particular in the United States, and thus believe CARB has been extremely wise in its decision to distribute allowances largely through direct allocation in the early years. This will help deflate political criticism of cap and trade as a tax: cap and trade systems do not inherently have to become implicit carbon taxes on end-use consumers if direct allocation is combined with regulatory control over consumer pricing in the utility sector.

A well designed and strictly enforced cap and trade system with direct allocation to power distributors and regulated consumer pricing by a watchful public utilities commission will largely contain the carbon price signal within the wholesale and generation market. This will have the desired effect of shifting the merit order away from the most fossil intensive sources of generation, while restraining the impact on end-use customers. This does require a disciplined and watchful utilities regulator, which California has, although we grant that this is not a universal truth in other parts of the country or the world. We note that most of the concerns about windfall profits resulting from free allocation to large emitters as witnessed e.g. in Germany and other nations under the European Union Emissions Trading Scheme (EU ETS) will not likely be replicated in California given the regulatory structure here, as generators and utilities will not be able to freely pass on the carbon price to consumers in the State. The price signal needed to affect consumer behavioral shifts to reducing energy consumption will admittedly be damped in this structure, but we note that California has a long and successful history in achieving the objectives around energy efficiency and demand side management through other regulatory tools including efficiency standards and utility incentive schemes.

We thus strongly endorse CARB's prudent allocation policy and hope that it helps defeat the cap-and-tax political argument at the federal level. We are confident that California's cap and trade system if designed and implemented correctly will demonstrate that carbon can be priced meaningfully and in a manner which places any cost burden predominantly on the fossil generation sources as opposed to the consumers. (CLIMATEWEDGE)

Response: Thank you for your support.

I-34. Comment: Under the allocation to electrical distribution utilities for protection of electricity ratepayers, section 95892(b)(2), POUs are allowed, after informing the Executive Officer, to divide their share of freely allocated allowances into portions designated for either:
(A) The publicly owned electric utility’s compliance account, or
(B) The publicly owned electric utility’s limited use holding account.
By including this provision, ARB has correctly acknowledged that the electric sector remains only partially deregulated and as a result the electric distribution utilities remain very diverse. This provision is an important recognition by ARB that all entities should have a reasonable means to comply with the cap and trade rule in a manner that accommodates their respective business models and compliance strategies. CMUA agrees with the rationale for the provision that POUs are largely vertically integrated,

and in addition points out that some POUs may be disproportionately impacted if required to participate in quarterly auctions due to significant capital needed, and transaction costs expected to participate. (CMUA1)

Comment: We agree with the baseline allocation of allowances for the electricity sector, and support the regulation, as it reflects the expected cost burden to distribution utilities, incorporates the expected benefits of energy efficiency investments, and recognizes early action. It also recognizes that there are very large emission reductions that are coming from direct regulations in the electricity sector. (CMUA2)

Response: We agree. Thank you for your support.

Water

I-35. (multiple comments)
Comment: Allocation of free allowances should be made to Metropolitan, analogous to the allocation that will be provided to the electric POUs and IOUs, if CARB determines that Metropolitan is to be included in the cap. Free allocation solely to electric utilities with retail customers and to specific manufacturing facilities is inequitable, unfair, and penalizes Metropolitan who buys energy at wholesale and consumes it for its own use for critical water deliveries into southern California. (MWDSC1, MWDSC2)

Comment: There is no rational justification for treating DWR as an independent, for-profit wholesale power producer. DWR owns no power plants; DWR only enters into wholesale power sales when its load unexpectedly drops, resulting in surplus power. All DWR power transactions are dedicated to acquiring energy necessary to make water deliveries. DWR does not compete with independent power producers for customers because it dedicates all the power it generates to move water, and acquires more power as needed. The SWP is a net buyer of power; its operations result in net pumpload demand for energy that must be procured in the electricity market. Indeed, having issued tax-exempt revenue bonds, DWR is prohibited from undertaking profit-making activities which would jeopardize the tax-exempt status of its bonds. It would be equitable to treat DWR the same way POUs are treated. Like a POU, DWR is a governmental entity providing a public service. All revenues are required to go to costs associated with providing that service. Many POUs engage in activities identical to DWR: they have hydropower generation, make market purchases of energy, use power to pump water, and deliver water to water users. While DWR provides no retail service of either water or electricity, this distinction does not justify disparate treatment. DWR understands that one component of the cap and trade regulation is the mitigation of economic impact on electricity consumers, and the granting of free allowances to IOUs and POUs is an effort to achieve that mitigation. However, DWR's ratepayers are also entitled to mitigation of the economic impacts of this regulation. As a wholesale water deliverer, DWR lacks the flexibility other electricity users might have to modify its practices. As noted above, DWR's priority is water deliveries and carbon price mitigation is subordinate to those water deliveries. In addition, the trail of costs from DWR's incurred expenses to the ultimate water user is so tangled and time-delayed that it cannot be assumed that a water user will recognize a power price signal and react by consuming less water, and that lower water consumption would consequently reduce GHG. Without proof of that connection, imposing a surrender obligation on DWR does not reasonably lead to an expectation that AB 32 goals will be achieved. The obligation is merely a financial penalty. The money that would be spent on allowances to meet the surrender obligation could be better spent on achieving the Department's GHG reduction goals already underway. If DWR is not excluded from the regulation, it should receive free allowances. AB 32 mandates that entities that have voluntarily reduced their greenhouse gas emissions receive appropriate credit for early voluntary reductions. DWR is voluntarily terminating its contract for energy from the Reid Gardner power plant in Nevada. The Climate Action Team cited this as a discrete early action (see "Climate Action Team Proposed Early Actions to Mitigate Climate Change in California, at page 6), and that was referenced in the Air Resources Board's report on early actions. AB 32 requires that DWR be awarded some form of credit for this early action. An appropriate credit would be a grant of free allowances to permit DWR to meet its surrender obligation for the remainder of the contract's term, to July of 2013. This would be a sensible, cost-neutral remedy which would protect DWR's reasonable expectations of credit and mitigate in part the financial impact DWR will suffer due to early termination action and alternative procurement. The proposed amendment to the regulation, above, would be an appropriate method to recognize the early action credit for DWR. DWR is open to discussing other forms of appropriate credit if the Board feels another methodology merits consideration. Modify section 95890(c) and 95892(f) as follows:

> <u>(c) Eligibility Requirements for the Department of Water Resources. Pursuant to Section 95892(f), the Department of Water Resources shall be eligible for direct allocation of allowances if it has complied with the requirements of the MRR and has obtained a positive or qualified positive verification statement for the prior year pursuant to the MRR.</u>
>
> <u>(f) On January 1 of each year during the first compliance period, the Executive Officer shall deposit in the Department of Water Resources' compliance account allowances in an amount equal to DWR's $MTCO_2e$ emissions reported pursuant to the MRR in the preceding year.</u> (DWR)

Comment: Like Metropolitan, the electric distribution utilities (EDU) buy wholesale energy to serve load. The major difference is that these utilities serve electric customers at retail while Metropolitan consumes the energy it purchases, and passes the costs along to its member agencies, the downstream water customers. In order to address costs, CARB is providing free allowances to utilities that buy energy at wholesale and have a retail customer base. This penalizes utilities that buy energy at wholesale and consume it. These utilities then must pass the cost on to downstream customers. (MWDSC1)

Comment: It is inequitable, ineffective, duplicative, and improper to burden water ratepayers with additional costs and pass the resulting revenues on to electric ratepayers DWR uses electricity to produce a "product," water, much the same as a manufacturer uses electricity. Like a manufacturer, DWR will pay a higher price for market energy once this regulation is in place. Similar to a manufacturer whose product reflects the higher price of electricity, DWR will pass those costs on, first to water contractors who will then pass the costs on to the end users of water. There is no justification for imposing an additional cost on DWR through a separate compliance obligation which DWR will necessarily pass on to its water contractors, and ultimately to the consumers of water. No such surcharge will be imposed on the end user of manufactured products. The regulation and accompanying ISOR contain no justification for this duplicative cost and disparate treatment. No AB 32 goals are furthered by making this distinction. The consequence of imposing a surrender obligation on DWR will be to transfer funds from water ratepayers to electricity ratepayers. DWR will need to purchase allowances, and the vast amount of allowances available at auction will belong to IOUs or POUs. The IOUs and POUs are required to utilize the auction proceeds for the benefit of their ratepayers. The regulation and accompanying ISOR contain no justification for this transfer. DWR is implementing ambitious programs to achieve a 20 percent reduction in water use by 2020. The additional expense of this market mechanism incurred by water ratepayers will reduce funds available for important water conservation efforts. (DWR)

Comment: DWR plays a unique role in California as a state agency that generates and purchases power at a wholesale level. It does not make retail sales, and is not an independent private power producer an investor-owned utility, or a local publicly owned utility. The focus of the ARB's regulatory efforts, naturally, has been on the primary players in California's energy market. Attempts to place DWR in a category with other entities are misguided. DWR deserves to be considered accurately, and in its proper role. Viewing AB 32 in light of DWR's status as a state agency, it is clear that no regulatory authority over DWR was contemplated under Parts 4 and 5 of AB 32. Indeed, AB 32 frequently calls out the special roles of state agencies in greenhouse gas reduction efforts, and AB 32 contains many references to state agency responsibilities and collaboration. Regulations promulgated under AB 32 need to reflect this distinctive role for state agencies such as DWR. Significantly, AB 32 prohibits the ARB from altering any programs administered by other state agencies for the reduction of greenhouse gas emissions: “Nothing in this part or Part 4 (commencing with section 38560) confers any authority on the state board to alter any programs administered by other state agencies for the reduction of greenhouse gas emissions” (section 38574). Excluding DWR from this regulation would be consistent with AB 32's directive to "consider the significance of the contribution of each source or category of sources to statewide emissions" (Health & Safety Code section 38562(b)(9)) and to "take into account the relative contribution of each source of GHG" (see section 38561). The emissions attributable to DWR's final 19 months of deliveries from Reid Gardner are not a significant contribution to statewide emissions, and no other DWR activity would make it a "covered entity" under the regulation. Modify section 95811 as follows:

(h) <u>This article does not apply to the California Department of Water Resources.</u>
(DWR)

Modify section 95802(a)(59) as follows:

(a)(59) "Electricity Importers" are marketers and retail providers that hold title to imported electricity. For electricity delivered between balancing authority areas, the entity that holds title to delivered electricity is identified on the NERC E-tag as the purchasing-selling entity (PSE) on the tag's physical path, with the point of receipt located outside the state of California, and the point of delivery located inside the state of California. Federal ~~and state~~ agencies are subject to the regulatory authority of ARB under this article, and include Western Area Power Administration (WAPA)~~,~~ and Bonneville Power Administration (BPA). ~~and California Department of Water Resources (DWR)~~ When PSEs are not subject to the regulation authority of ARB, including tribal nations and state agencies, the electricity importer is the immediate downstream purchaser or recipient, if any, that is subject to the regulatory authority of ARB. (DWR)

Comment: Metropolitan is a public water utility that purchases energy at wholesale and consumes that energy rather than reselling it. Entities covered in the Cap and Trade program are specific industrial facilities that directly emit greenhouse gases, and electric investor owned utilities (IOU) and electric publicly owned utilities (POU) with retail customers. The Cap and Trade program that CARB has laid out is not applicable to a public water utility such as Metropolitan. (MWDSC1)

Comment: DWR is considered a Covered Entity by virtue of its activities in the electricity sector. DWR is more comparable to an EDU than a generator or marketer, since the costs of the allowances it will be required to surrender will ultimately be passed to end-use consumers. Therefore, DWR should receive a direct allocation of allowances pursuant to regulations that are applicable to the electricity sector. Alternately, DWR should not be considered a Covered Entity under the regulations.

The Mandatory Reporting Regulations required DWR to report its GHG emissions according to the same rules that applied to retail electricity providers. Pursuant to a conversation with ARB GHG Inventory staff, the SWC understands that the emissions associated with DWR's imported electricity were included by ARB staff when the starting allowance budget level of 97.7 MMT was set. DWR will be responsible for incurring abatement costs tied to its emissions without the benefit of receiving that allowance value. The allowances to which DWR would otherwise be entitled will be distributed to EDUs who will not be responsible for any abatement costs associated with these emissions. Therefore, in order to ensure equitable treatment, DWR should be included in the list of Covered Entities that receive direct allowance allocations.

DWR will be required to pay the total allowance costs for its emissions if it does not receive a direct allocation of allowances. Under the proposed regulations, water wholesalers such as DWR are the only utilities whose downstream customers receive no relief from increased rates associated with AB 32 compliance. Water is an important commodity no less essential than electricity and water ratepayers cannot forego its consumption. ARB should be as mindful of the impacts on water ratepayers as they are of electricity ratepayers. Therefore, DWR should receive a direct allocation of allowances for the same purposes as EDUs, i.e., the protection of water customers.

DWR passes through all SWP power costs to the SWC agencies and, ultimately, to end-use water consumers. Thus, water ratepayers are in precisely the same situation as the retail electricity ratepayers as the incidence of the Cap and Trade program falls directly on them. Therefore, DWR should receive a direct allocation of allowances for the same reason that allowances are being given to EDUs.

In sum, if DWR does not receive free allowances for imported energy purchased to power the SWP, no other entity will be able to mitigate allowance-related costs to water consumers, defeating ARB's intent to protect end-use utility customers from exorbitant price increases. If ARB determines that providing free allowances directly to DWR is inconsistent with the requirements and goals of AB 32, it should work with the SWC to fashion a methodology to ensure that retail water utilities are treated in the same manner as retail electric utilities with respect to the mitigation of cost increases. Add section 95890(d) as follows:

Section 95890. General Provisions for Direct Allocations

(d) All provisions of this Article applicable to a publicly-owned Electric Distribution Utility shall be applicable to the California Department of Water Resources for the State Water Project pumping load reported under article 2, section 95111(e), title 17, Greenhouse Gas Emissions Data Report. (SWC1, SWC2)

Comment: The Sustainability Plan represents an AB 32-consistent emission reduction plan in which DWR can invest its allowance value, and DWR should receive free allowances on the same basis as a publicly-owned electric distribution utility. DWR's commitment to reducing GHG emissions is well-established by its current and prior actions. (SWC1)

> **Response:** We believe that it is important to capture the emissions associated with water distribution. There are opportunities for reductions in the emissions associated with this activity, and the emissions are not insignificant. The role of water distribution entities (DWR and MWD) in the economic value chain between producers of electricity and end-use consumers of water services is most closely associated with electricity marketers, and their treatment under the regulation is consistent. We believe that it would be inappropriate to provide direct allocations to the water distribution utilities for the benefit of end-use customers, because they do not have a direct relationship that would facilitate the return of value in a way that would maintain the marginal incentive of end-use customers to reduce emissions. Further, the emissions associated with water distribution are included in the share of value returned to end-use customers through the electric distribution utilities. We performed an analysis of the distortion created by returning value through electric distribution utilities, as opposed to water distribution utilities, and found the effect to be insignificant.

I-36. Comment: Metropolitan acknowledges that the definition of electricity importer covers both marketers and retail providers, and that the current proposed definition of marketers covers Metropolitan. However, Metropolitan is not a true marketer of electricity, as the term is typically used. Metropolitan only imports energy for the purpose of serving its own load on the CRA and not to "market" or resell this energy. Modify section 95802(a)(113) as follows:

> (113) "Marketer means a purchasing-selling entity that takes title to wholesale electricity <u>for the purpose of resale</u> and is not a retail provider."

This change would clarify that Metropolitan is not intended to be included in the Cap-and-Trade Program. However, this modification would not affect the inclusion of the other entities that CARB staff has identified for coverage under the regulation, nor would it impact the requirements that apply to these covered entities. (MWDSC1, MWDSC2)

> **Response:** We disagree. The definition is intended to capture all imported electricity delivered by entities other than retail providers, including the commenter.

Errors and Simple Section References

I-37. Comment: Section 95870(c)(1) (p. A-74) provides that allowances allocated to electrical distribution utilities are to be placed in the holding accounts of those entities. However, section 95892(b)(2) (p. A-74-75) provides that allowances to publicly owned electrical distribution utilities ("POUs") are to be placed in either limited use holding accounts or compliance accounts as designated by the utilities. Section 95870(c)(1) should be amended to refer to the option that will be available to POUs under section 95892(b)(2). (SCPPA1)

> **Response:** We made the suggested modification.

I-38. Comment: Section 95870(c)(1) provides that allowances allocated to electrical distribution utilities will start at 89 million. However, an additional amount of allowances will be allocated to utilities to reflect the utility share of cogeneration or "combined heat and power" ("CHP") emissions. The number of CHP-related allowances that are to be allocated to electrical distribution utilities should be specified in section 95870(c)(1). (SCPPA1)

> **Response:** We made the suggested modification.

I-39. Comment: Section 95890(b) (p. A-77) states that an electrical distribution utility will be eligible for a direct allocation of "California" in specified circumstances. Presumably the intended reference was to "California GHG Allowances." The missing words should be inserted. Section 95890(b) also refers to an entity's "positive or qualified positive verification statement on its sales number." The term "sales number" is not defined. This term should not be used because a verification statement relates primarily to emissions, and liability is not determined by reference to electricity sales. Modify section 95890(b) as follows:

> An electrical distribution utility shall be eligible for direct allocation of California <u>GHG Allowances</u> if it has complied with the requirements of the MRR and has obtained a positive or qualified positive verification statement ~~on its sales number~~ for the prior year pursuant to the MRR. (SCPPA1)

Response: We made the suggested modification.

I-40. Comment: The eligibility requirements for electric distribution utilities in subparagraph (b) reflects an omission of the word "allowances" and an error that incorrectly makes reference to a "positive or qualified positive verification statement on *its sales number* for the prior year pursuant to the MRR." LADWP recommends that this subparagraph be revised to read as follows:

"(b) Eligibility Requirements for Electrical Distribution Utilities. An electrical distribution utility shall be eligible for direct allocation of California <u>allowances</u> *if it has complied with the requirements of the MRR and has obtained a positive or qualified positive verification statement* ~~on its sales number~~ <u>of emissions</u> *for the prior year pursuant to the MRR*." (LADWP1)

Response: We made the suggested modification.

I-41. Comment: Correct subsection reference on page 85.

> (2) For investor owned electrical utilities receiving a direct allocation of allowances pursuant to 95892(b) and subject to the monetization requirement pursuant to 95892(c): the auction purchase limit in (A) does not apply. This subsection (B) shall not be interpreted to exempt said investor owned electrical utilities from any other requirements of this article; and... (CCEEB)

Response: We made the suggested modification.

I-42. Comment: Modify section 95890(b) as follows:

> "Eligibility Requirements for Electrical Distribution Utilities. An electrical distribution utility shall be eligible for direct allocation of California <u>GHG allowances</u> if it has complied with the requirements of the MRR and has obtained a positive or qualified positive verification statements on its sales number for the prior year pursuant to the MRR." (NCPA1)

Response: We made the suggested modification.

Electrical Cooperatives Allocation

I-43. (multiple comments)
Comment: CARB notes that “free allocation of allowances to public utilities on behalf of their customers is designed to help offset the cost impacts of AB 32 policies” (ISOR, p. IX-55). For purposes of this program, Electrical Cooperatives have many of the same characteristics as POUs and IOUs, and further meet the requirements of section 95802(a)(57) for providing “electricity to retail end users” in California. Similarly, Electrical Cooperatives will be impacted by many of the same AB 32 obligations associated with mandatory programs established to meet the policies set forth in AB 32, as well as compliance costs associated with the Program. Accordingly, it is appropriate for them to also be eligible for the receipt of free allowances on behalf of their customers.

CARB notes that “electrical distribution utilities provide electricity to residential and small commercial customers” and proposes to allocate free allowances to them “because electrical distribution utilities are best situated to utilize the value of allowances for ratepayer benefit” (ISOR, p. II-32). Because Electrical Cooperatives also provide these same services with many of the same responsibilities and obligations as POUs and IOUs, and are also similarly situated to maximize the value of the allowances to deliver benefits to their ratepayers, Electrical Cooperatives are properly included within this definition. (NCPA1, AEPC)

Comment: Because Arizona Electric Power Cooperative is a non-profit, 100 percent debt-financed, member owned entity, all its costs, including rate increases, flow directly to AEPCO's member-owners, who in turn pass it on to the ultimate consumer in the distribution cooperatives' service areas. AEPCO's member base is much smaller than investor owned utilities' customer bases; therefore, the rate increases that will inevitably result from the cost of compliance without receiving the allowances will be much greater for AEPCO's members than it will be to investor-owned utilities where the costs are balanced between the shareholders and customers. In the absence of allowances, the cost of compliance will go directly to AEPCO, which will be passed on to its ratepayers, which are the ultimate consumers of AEPCO's cooperative distribution entities, including Anza Electric Cooperative. (AEPC)

Comment: Electrical Cooperatives have all of the same characteristics as POUs and IOUs, and further meet the requirements of section 95802(a)(57) for providing "electricity to retail end users in California. Electrical Cooperatives will be impacted by many of the same AB 32 obligations associated with mandatory programs established to meet the policies set forth in AB 32, as well as compliance costs associated with the Program. Accordingly, it is appropriate for Electrical Utilities be eligible for the receipt of free allowances on behalf of their customers; and as a non-profit organization, Electrical Cooperatives should have the option to sell its allowances at auction or use them directly for meeting compliance obligations as the POUs do. (AEPC)

Comment: In the proposed regulation "Electrical distribution utility(ies)" means an Investor Owned Utility (IOU) as defined in the Public Utilities Code section and 218, or a local publicly owned electric utility (POU) as defined in Public Utilities Code section 224.3, that provides electricity to retail end users in California." This definition does not include a category of electric providers that are similarly situated to IOUs and POUs; Electrical Cooperatives. Electrical Cooperatives are defined in Public Utilities Code section 2776 as "any private corporation or association organized for the purposes of transmitting or distributing electricity exclusively to its stockholders or members at cost." As such, Electrical Cooperatives are a "hybrid" between a POU and IOU, in that they are owned by their members, but operate as a non-profit public service for end use members. Electrical Cooperatives in California are small utilities located in rural areas, facing high infrastructure costs and other obstacles as they strive to provide affordable and reliable electric service to their members. As non-profit, member-owned utilities governed by their locally-elected boards of directors, they must adhere to federal Rural Utility Service (RUS) guidelines, but are also subject to many of the same AB 32 mandates as IOUs and POUs.

NCPA recommends that the proposed regulation be revised to provide that Electrical Cooperatives be included in the definition of "Electrical distribution utility(ies)", and that those Electrical Cooperatives that serve retail customers be eligible to receive electric sector free allowances. Including this small group of utilities within the definition of "Electrical distribution utility(ies)" would not change the scope of the program, nor have an impact on the recent discussions regarding allocation of allowances to the electricity sector, and data from the Electrical Cooperatives should already be part of 89 million allowances available for allocation to electrical distribution utilities. (NCPA1)

Comment: In section 95892, the proposed regulation specifically addresses the need to allocate allowances to Electrical Distribution Utilities "for the protection of electricity ratepayers." Electrical Cooperatives have electricity ratepayers, the same as all other Electrical Distribution Companies. However, unlike energy service providers, electrical cooperatives provide more than just the electricity transaction to their customers, therefore making them analogous to IOUs and POUs for the purposes of the proposed regulation. If the definition of "Electrical distribution utility(ies)" is not changed as described above to include the Electrical Cooperatives, the ratepayers of these entities will bear the total cost of the cap-and-trade regulation. Accordingly, modify section 95802 (a)(57) as follows:
"Electrical distribution utility(ies)" means an Investor Owned Utility (IOU) as defined in the Public Utilities Code section and 218, or a local publicly owned electric utility (POU) as defined in Public Utilities Code section 224.3, <u>or an Electrical Cooperative as defined in Public Utilities Code section 2776</u>, that provides electricity to retail end users in California. (NCPA1)

Comment: In the proposed regulation, "Electrical distribution utility(ies)" means an Investor Owned Utility (IOU) as defined in the Public Utilities Code section 218, or a local publicly owned electric utility (POU) as defined in Public Utilities Code section 224.3, that provides electricity to retail end users in California." (section

95802(a)(57)). The title "California retail end users" is synonymous with "California ratepayers." The proposed definition incorrectly fails to include Electrical Cooperatives. Electrical Cooperatives are a category of electricity providers that are similarly situated to IOUs and POUs, in that Electrical Cooperatives also provide electricity to California ratepayers. The only difference is that in an electrical cooperative system, the ratepayers are the ultimate consumer of the electricity provided by the cooperative distribution entity (such as Anza), which distributes the electricity at cost to its rural service area. AEPCO recommends that the proposed regulation be revised to include Electrical Cooperatives in the definition of section 95802(a)(57) and like POUs and IOUs, be eligible to receive electric sector free allowances. (AEPC)

Comment: If the definition in section 95802(a)(57) is not changed to include the Electrical Cooperatives, the ratepayers of these entities will bear the total cost of the cap-and-trade regulation. Modify section 95802 (a)(57) as follows:
"Electrical distribution utility(ies)" means an Investor Owned Utility (IOU) as defined in the Public Utilities Code section 218; a local publicly owned electric utility (POU) as defined in Public Utilities Code section 224.3; <u>or an Electrical Cooperative as defined in Public Utilities Code section 2776</u> that provides electricity to retail end users in California. (AEPC)

> **Response:** We agree. We modified section 95892(b)(2) to make electrical cooperatives eligible for allowances, and we modified 95802 (a)(57) (now 95802 (a)(82)) as requested. Table 9-3 shows an allocation to Anza Electric Cooperative.

Other

I-44. Comment: Occidental Petroleum Corporation (Oxy) has four significant interests in California oil and gas extraction operations. Each operation purchases significant amounts of electricity from an investor-owned utility to support their operations. ARB proposes to provide free allowance allocations to energy-intensive trade-exposed (EITE) to *"avoid imparting undue initial economic gain or loss"* in the early program years and to prevent leakage. The method of determining how many free allowances must be provided to achieve this objective does not meet the agency's own objective of ensuring that trade-exposed entities receive coverage of the emissions costs associated with their electricity use. ARB should rectify this inconsistency to avoid competitive impact in one of two ways: (1) require the utility to share the benefits of free allowance value with trade-exposed entities through *direct rebates* or (2) provide to an EITE entity a direct allocation of free allowances for power purchased from a distribution utility and exclude that entity's usage from the allocation of free allowance value to its serving utility. (OOGC)

> **Response:** We modified section 95892 to ensure that allowance value distributed to utilities is used to benefit the ratepayers, including industrial customers. The CPUC and the POU governing boards will determine the most equal and fair way to redistribute the auction value back to its customers. ARB

will continue to work with the CPUC, POU governing boards, and other regulating entities as directed in Board Resolution 10-42 to ensure that the auction value distribution is fair, avoids emissions leakage, and follows the guidelines laid out in section 95892.

I-45. Comment: Two elements of the proposed program may not be obvious to the casual observer. First, the rebates will be made "per capita," meaning that each ratepayer will receive an equal share of the rebate. But the costs in higher rates will be paid disproportionately by larger users of electricity. The price of electricity will go up for large users (and the usage will presumably decline), while the price for small users will go down (and the usage will presumably increase). The program therefore redistributes the right to use electricity and redistributes the income earned on allowances from the larger (richer) users and allocates it to the smaller (less wealthy) users. If the usage of electricity is based on demand, and demand is based on price, it is entirely possible that the shift of rebates from larger users to smaller users will simply change usage patterns, and not change overall demand. (HOR)

Response: The CPUC and the POU governing boards will determine the most equitable way to redistribute the auction value back to its customers. ARB will continue to work with CPUC, POU governing boards, and other regulating entities as directed in Board Resolution 10-42 to ensure that the auction value distribution is both fair and follows the guidelines laid out in section 95892.

I-46. Comment: Add section 95892(c)(3) as follows:
<u>The electrical distribution utility shall set aside allowances for each calendar year in an amount sufficient to satisfy the compliance obligation of any covered entity attributable to generation of electricity purchased by the electrical distribution utility pursuant to a Pre-AB 32 Power Purchase Agreement, as defined in Subarticle 2. These allowances shall be set aside prior to each auction that the electrical distribution utility offers allowances for sale. If the verified emissions attributable to the Pre-AB 32 Power Purchase Agreements exceed the amount of allowances set aside by the electrical distribution utility, the electrical distribution utility shall obtain the remaining amount of allowances from the next quarterly auction, or through the Allowance Price Containment Reserve. The electrical distribution utility shall transfer the required amount of allowances to the covered entity from which it purchases electricity under the Pre-AB 32 Power Purchase Agreement no later than 30 days before the covered entity's annual and triennial compliance obligation.</u> (WEC)

Response: We disagree. We believe that these matters are best resolved through bilateral negotiations between the contracting parties, and that any intervention on our part would be inappropriate at this time.

I-47. Comment: The first issue is that [some] regulated parties that are required to obtain allowances do not receive allocations of them. These entities include independent electricity generation facilities and electricity importers. These regulated entities must purchase allowances at auction or directly from utilities. This method of allocation means that no entity other than a utility can be assured of being able to purchase allowances. In the absence of reasonable certainty regarding the cap, any entity with allowances will seek to hoard them until the regulatory environmental is clearer and the adequacy of the cap and allocation methods is determined. Without allowances, those entities cannot operate, so these are life-and-death issues. There is nothing in the program that ensures that allowances will be made available to non-utilities at reasonable prices. (HOR)

> **Response:** The consignment mechanism, quarterly auctions and reserve sales, and proposed purchasing limits guarantee that all compliance entities will have a regular opportunity to acquire allowances at auction.

I-48. Comment: This allocation method does not recognize the fundamental advantage enjoyed by utilities in the marketplace. Electric utilities can recover their expenses for buying allowances through increased rates approved by the California Public Utilities Commission. No other market participants have this power. Accordingly, in a head-to-head competition for allowances, the utilities necessarily win. They can bid whatever is required in order to obtain the allowances required to operate, and rates will be increased accordingly. (HOR)

> **Response**: We disagree and believe the system is set up to be fair and equitable. We allocate allowances to utilities on behalf of ratepayers and modified section 95892 to ensure that allowance value distributed to utilities is used to benefit the ratepayer.

I-49. Comment: Allowances will be distributed "for free" to all utilities, but IOUs then have to submit their allowances back to ARB for auction. Publicly-owned utilities (POU) do not have to submit their allowances for auction, but may keep them for their compliance purposes. The minimum auction price is \$10/CO_2e, and ARB expresses the view that a price of \$30/CO_2e is somehow reasonable or appropriate. Moreover, there is no ability for utilities to constrain demand. They cannot impose a direct price signal to consumers to reduce their consumption of electricity. The utilities are required by law to keep serving the demand, and there is no direct method of limiting that demand. The result is that electric utilities must obtain the allowances necessary for their operations, and can pass through the costs. All other regulated entities, whether they be industrial concerns, independent power generators or industrial generators of electricity, will be at a disadvantage to the regulated utilities in connection with obtaining allowances. (HOR)

> **Response**: We disagree that utilities cannot reduce demand. Energy-efficiency programs and tiered rate pricing are two mechanisms that utilities have successfully employed to reduce demand in California. A primary goal of the program is to create a price signal to reduce greenhouse gas emissions. The allocation mechanism requires that allowance value provided to utilities be used to benefit ratepayers; see section 95892(a). The cost of compliance also drives greenhouse gas reductions in other industries. In the case of energy-intensive,

trade-exposed industries that cannot pass along costs to consumers, potentially creating a risk of emissions leakage, free allocation is provided to mitigate this risk. We expect that generators will be able to pass along the cost of compliance to the utilities that purchase their electricity to serve retail load, and to industrial consumers that purchase directly. Because the majority of allowances provided to utilities will be consigned to auction, generators, be they utility or independently owned, will have equal opportunity to compete for allowances at quarterly auctions.

I-50. (multiple comments)
Comment: Section 95890(b) states that an electric distribution utility is only eligible for direct allocation of allowances if it has complied with the mandatory reporting regulations and obtained a positive or qualified positive verification statement on its sales number for the prior year. SMUD requests clarification of this provision, as it appears to be missing the word 'allowances' in the second sentence, and refers to verification of a utility's "sales number", which has an unclear relationship to the allowance allocation structure. This language may be a holdover from a draft of the regulations when the ARB was considering allocation utility sector allowances based on sales, but regardless of genesis, it should be clarified. SMUD does not believe, as implied by the text, that an electric utility's allowances should be wholly taken away in one year based on a previous year's verification issue, this is an onerous penalty for a verification misstep. However, if that is ARB's intent, some thought and language should eventually address what happens to the allowances that may be withheld, for whatever reason, from an electric utility or other obligated entity. (SMUD1)

Comment: In some instances, a covered entity may be in the process of correcting a verification issue up until the deadline for direct allocation disbursements (which is on or before January 15 of each calendar year). If such is the case, the Utilities propose that the said entity be allowed to petition the Executive Officer to receive their allotted allowance allocation, should the verification issue be resolved to a positive verification. We request modifying section 95890 as follows:

> *(b) Eligibility Requirements for Electrical Distribution Utilities. An electrical distribution utility shall be eligible for direct allocation of California* <u>allowances</u> *if it has complied with the requirements of the MRR and has obtained a positive or qualified positive verification statement on its sales number for the prior year pursuant to the MRR.* <u>An entity that has not obtained a positive or qualified positive verification pursuant to the MRR may petition the Executive Officer for a direct allocation of California allowances if the entity is in the process of correcting the verification issues.</u> (MID1, NCPA1)

Comment: In order to be eligible for free allocation of allowances, Electrical Distribution Utilities must have a positive or qualified positive verification statement based on their Mandatory Reporting Regulation obligations (section 95890(b)). NCPA supports the proposed revisions suggested by MID/REU/TID,7 that would allow an entity to petition for eligibility pending correction of a verification statement.
Modify section 95890(b) as follows:

(b) Eligibility Requirements for Electrical Distribution Utilities. An electrical distribution utility shall be eligible for direct allocation of California GHG Allowances if it has complied with the requirements of the MRR and has obtained a positive or qualified positive verification statement on its sales number for the prior year pursuant to the MRR. An entity that has not obtained a positive or qualified positive verification pursuant to the MRR may petition the Executive Officer for a direct allocation of California GHG Allowances if the entity is in the process of correcting the issues raised in the verification statement. (NCPA1)

Response: Thank you for the note. We made the typographical edit to incorporate the word "allowances." We did not include the language pertaining to the opportunity to petition the Executive Officer. We believe that it is important for the integrity of the program that any free allocation of allowances be withheld, to ensure that the entity provides a verified emissions statement and product data statement, where a product data statement is applicable.

Revenues Instead of Auction Rights

I-51. Comment: Simply assign the distribution utilities, at least the investor-owned ones, Auction Revenue Rights (ARRs) than go through the ritual of formally allocating the allowances to the utilities, then having them formally consign them back for auction. Similarly, we believe it would be better to assign ARRs to trade-exposed businesses, rather than actually give them allowances. (MSCG2)

Response: We disagree. We prefer to directly allocate allowances and have individual entities offer them at auction. This ensures similar treatment for IOUs, POUs, and industry.

Auction

I-52. (multiple comments)
Comment: Reconsider the allocation of allowances to utilities and the rebate of auctioned proceeds from other buyers of allowances back to utility rate based customers. This is a significant issue because utilities will be in a position to essentially bid up the price of allowances and rate base the proceeds or rate base the cost, and then rebate the proceeds of the auction back to their customers. That process of auction and rebate to the ratepayers does not make a lot of sense to me. Other participants who don't get allowances, industries and importers of electricity and independent power generators, will be bidding for those allowances as well, while the proceeds of those auctions will be going back to the rate payers. These cross industry subsidies have not been properly considered in the staff's review of the economic impacts. I think this is going to end up creating cross sectorial competition for allowances, which is a game that the utilities will be in a better position to play than anybody else. Regulated parties who are obligated to submit allowances to continue their operations should be allocated allowances from the state. (LAWRENCER)

Comment: The first issue I think needs to have a harder look taken at is the allocation of allowances to utilities and the rebate of auctioned proceeds from other buyers of allowances back to utility rate based customers. The reason I think this is a significant issue is that utilities will be in a position where they can essentially bid up the price of allowances and rate base the proceeds or rate base the cost and then will in the end be rebating the proceeds of the auction back to their customers. That process of auction and rebate to the rate payers does not make a lot of sense to me, but it's more difficult it seems to me because other participants who don't get allowances, industries and importers of electricity and independent power generators, will be bidding for those allowances as well. And the proceeds of those auctions will be going back to the rate payers. So you have cross industry subsidies which I think have not been properly considered in the staff's review of the economic impacts here. I think what this is going to end up creating is cross sectorial competition for allowances, which is a game that the utilities will be in a better position to play than anybody else. Regulated parties who are obligated to submit allowances to continue their operations should be allocated allowances from the rate. (LAWRENCER)

> **Response:** We do not agree that utilities will bid up the price of allowances. The IOUs were required to divest almost all fossil-fuel power plants and now purchase electricity from independent power plants that emit GHGs. If they bid up allowance prices, their costs for purchased power from fossil-fuel power plants will increase proportionally to the increase in auction settlement prices.
>
> We modified section 95892 to ensure that allowances allocated to utilities are used exclusively for the benefit of retail ratepayers. Retail ratepayers include essentially all households, and the vast majority of commercial and industrial electricity users. Although the revenue goes through the utilities, its use is subject to the limitations of their governing bodies (POUs) or the CPUC (IOUs). We have worked with, and continue to work with, the CPUC and POU governing bodies to ensure that all ratepayers, including industry and independent generators, benefit from allowance revenue to the extent that they face carbon costs. We believe that importers of electricity and independent power generators will pass carbon costs through to the utilities.
>
> Finally, we modified section 95920 to clarify holding limits that apply to all entities, including utilities. Section 95912(j) requires the auction administrator to determine that bids and bid quantities conform with the holding limits. The consignment mechanism, auction requirements, and holding limits together limit the utilities ability to manipulate the market.

I-53. Comment: The regulations should clarify that EITE entities receiving free allowances may place those allowances in the auction or retain them for future compliance. (EPUC)

> **Response:** Auction consignment at ARB auctions is only available for the utilities and for ARB to dispose of allowances. Consignment of allowances at

ARB auction is not available to EITE covered entities. We expect EITEs will need the allowances allocated to them to meet their compliance obligation. If they have surplus allowances, they can sell them on the secondary market. Nothing prevents an EITE from retaining allowances for future compliance or sale in the secondary auction, except that they may not exceed the holding limit.

I-54. Comment: It is imperative that the auction rules that place restrictions on the transfer of allowances and Holding Accounts not adversely impact the legitimate ownership interests of government entities such as NCPA and its members. Accordingly, freely allocated allowances designated to Electrical Distribution Utilities whose generation resources are owned as part of a JPA arrangement in which the Electrical Distribution Utility is a member should properly be designated to either the Electrical Distribution Utilities' Compliance Account, as currently authorized under section 95892(b)(2), or into a Compliance Account held by the JPA. (NCPA1)

Response: We modified section 95892(b)(2) to allow Electrical Distribution Utilities that are publicly owned electric utilities or electrical cooperatives to designate the placement of their allocated allowances, either to their own compliance account, or into the account of a JPA of which the utility is a member, and with which the utility has a power purchase agreement.

Compliance Account

I-55. Comment: NCPA believes that requiring the designation [of allowances to compliance accounts or a limited use holding account] with regard to the next year's allowances during the timeframe contemplated by the proposed regulation is problematic. The "90 days prior" deadline falls on or about October 1, a month prior to the true-up for submittal of compliance instruments for the Triennial Compliance Obligation (section 96856(f)). It also precludes entities from being able to utilize all of the gathered data from the previous year upon which to make a determination regarding the election. NCPA recommends that publicly owned utilities be required to make this election by no later than 30 days prior to the start of the allocation year (i.e., December 1). Modify section 95892(b)(2) as follows:
(b)(2): Publicly Owned Electric Utilities. By no later than December 1 of each year, ~~At least 90 days prior to receiving a direct allocation of allowances~~, publicly owned electric utilities will inform the Executive Officer of the share of their allowances for the following calendar year that is to be placed....
(A) In the publicly owned electric utility's compliance account or compliance account of a Joint Powers Agency in which the Electrical Distribution Utility is a member and with which it has a power purchase agreement, or (B) In the publicly owned electric utility's limited use holding account. (NCPA1)

Response: Although we made the modification requested in 95892(b)(2)(A), we did not make the other modifications requested by NCPA1. As long as entities keep accurate records, the earlier deadline should provide ample time for entities to make their elections.

I-56. Comment: Modify section 95831(a)(4) as follows:
(a)(4)(A) A covered entity or opt-in covered entity may transfer compliance instruments to its compliance account at any time, <u>or compliance account of a Joint Powers Agency in which the Electrical Distribution Utility is a member and with which it has a power purchase agreement.</u>
(a)(4)(B) <u>Except as noted in subsection (A) above, a</u> ~~A~~ compliance instrument transferred into a compliance account may not be removed by the covered entity. (NCPA1)

> **Response:** This change is not necessary, as the changes in 95892(b)(2) resolve the commenter's concern.

I-57. Comment: LADWP appreciates that ARB proposes an administrative allocation to electrical distribution utilities for the protection of electricity ratepayers that recognizes the different business models of the utilities. As a direct result of AB 1890, the investor owned utilities (IOU), for the most part, divested of their fossil generation assets, and today have an indirect compliance obligation that is based primarily on power purchased from other generators. On the other hand, publicly owned utilities follow a different business model in which they continue to remain mostly vertically integrated utilities owning the majority of their generation assets on behalf of their customers. As a result, POUs maintain a direct compliance obligation for the electricity that they directly generate to serve native load. This is a fundamental difference that makes it imperative that the ARB maintain a Cap and trade program that accommodates these different business models in a way that maintains the environmental integrity of the program, while giving the utilities the flexibility they need to continue to make the necessary emission reduction investments in renewables and energy efficiency that will help transform the electric sector to low- and non-emitting generation resources. There are circumstances in which allowances should be allowed to be transferred directly from a compliance account of one entity to the compliance account of another covered entity. These include the following:

1. Energy purchases to make up for emergency outages affecting owned generation (fire, earthquake, equipment failure);
2. Energy purchases to make up for planned outages affecting owned generation (maintenance, upgrades, repowering);
3. Energy purchases to make up for under-production from intermittent renewables (renewable energy project is not delivering projected output for native load); and
4. Energy received from a jointly owned facility for retail sales where allowances are held by the joint owners in their capacity as electric distribution utilities, and the operator of the facility may be a joint owner operating the facility on behalf of the owners overall.

LADWP recommends that ARB revise the regulation to allow for these direct transfers of allowances from one compliance account to another compliance account. (LADWP1)

> **Response:** We disagree. However, we believe that the modifications made to section 95892(b)(2) provides sufficient flexibility for utilities that are members of JPAs to cover their obligations.

Consignment Auction

I-58. (multiple comments)
Comment: The Proposed Rule is made more perplexing by the rebate to ratepayers of the revenues earned from sales of allowances. Under the proposed rule, IOUs will bid on allowances in order to be able to maintain generation levels at those required to serve the demand. IOUs will pay whatever is required to obtain the allowances, because they can recover the costs of allowances in their rates. Rates will be raised to cover the costs of allowances. Then, the proceeds of the allowances will be rebated to the customers of the IOUs. The auction of allowances therefore raises rates to pay for allowances and rebates the proceeds to the ratepayers. It should be apparent that this system, in the aggregate, is a loop in which the original payment of the costs of allowances ends up back in the hands of those who made the payment in the first place. This system is the economic equivalent of allocating the allowances for free, except that it involves significant additional administrative expense. (HOR)

Comment: Reconsider the allocation of allowances to utilities and the rebate of auctioned proceeds from other buyers of allowances back to utility rate based customers. This is a significant issue because utilities will be in a position to essentially bid up the price of allowances and rate base the proceeds or rate base the cost, and then rebate the proceeds of the auction back to their customers. That process of auction and rebate to the rate payers does not make a lot of sense to me. Other participants who don't get allowances, industries and importers of electricity and independent power generators, will be bidding for those allowances as well, while the proceeds of those auctions will be going back to the rate payers. These cross industry subsidies have not been properly considered in the staff's review of the economic impacts. I think his is going to end up creating cross sectorial competition for allowances, which is a game that the utilities will be in a better position to play than anybody else. Regulated parties who are obligated to submit allowances to continue their operations should be allocated allowances from the rate. (LAWRENCER)

> **Response:** While the guarantee of revenue to consigners does mitigate the accounting cost of bidding in the auction, it does not put the consigners at an economic advantage, or give them an incentive to bid more than they otherwise would. To understand this, note that if a consigner can make a direct emissions reduction at a cost lower than the auction-clearing price, it is in the consigner’s best economic interest to make the reduction, rather than purchasing the allowance.

Auction and Holding Account

I-59. Comment: Auction infrastructure and the cost of allowances, as described in the Cap and Trade Regulation, is overly complicated, administratively burdensome, and does not guarantee cost containment for allowances. If Metropolitan is covered under the Cap and trade Regulation, as a public entity, it should not have to compete against private sector companies or IOUs to purchase allowances annually or for each compliance cycle. (MWDSC1)

> **Response:** We disagree. All participants at auction will have equal access to allowances in order to comply with the program. The auction rules are intended to limit market power by any one entity through purchase limits for most entities. Auction rules require certain reporting requirements and a financial guarantee. These rules are no more burdensome than the energy markets with which the commenter is familiar. We developed the program to allow a reasonable amount of offsets to be used for compliance and have included an allowance reserve to help contain allowance prices that is only available to entities with a compliance obligation.

I-60. Comment: It is imperative that the auction rules that place restrictions on the transfer of allowances and Holding Accounts not adversely impact the legitimate ownership interests of government entities such as NCPA and its members. Accordingly, freely allocated allowances designated to Electrical Distribution Utilities whose generation resources are owned as part of a JPA arrangement in which the Electrical Distribution Utility is a member should properly be designated to either the Electrical Distribution Utilities' Compliance Account, as currently authorized under section 95892(b)(2), or into a Compliance Account held by the JPA. (NCPA1)

> **Response:** We modified section 95892(b)(2) to allow Electrical Distribution Utilities that are publicly owned electric utilities or electrical cooperatives to designate the placement of their allocated allowances, either to their own compliance account, or into the account of a JPA of which the utility is a member, and with which the utility has a power purchase agreement.

Compliance Account

I-61. Comment: Modify section 95831(a)(4) as follows:
(a)(4)(A) A covered entity or opt-in covered entity may transfer compliance instruments to its compliance account at any time, <u>or compliance account of a Joint Powers Agency in which the Electrical Distribution Utility is a member and with which it has a power purchase agreement.</u>
(a)(4)(B) <u>Except as noted in subsection (A) above, a</u> ~~A~~ compliance instrument transferred into a compliance account may not be removed by the covered entity. (NCPA1)

Response: This change is not necessary, as the changes in 95892(b)(2) resolve the commenter's concern.

Imported Electricity

General

I-62. Comment: Covering imports of electricity from out of state is essential to maintain competitiveness in California and again is another improvement on the EU system where imports from neighboring countries are not addressed giving rise to opposition in certain trade exposed Member States. (SANDBAGCC)

Response: We agree and appreciate the support.

I-63. Comment: The compliance obligation for first deliverers of electricity should not include electricity that is generated out-of-state and sold outside California. As currently drafted, it appears that the Cap and trade regulation may inadvertently place a compliance burden on electricity that is generated out-of-state that does not enter California. The regulation must clarify this issue to ensure that electricity that is generated outside of California by a California load serving entity that is not imported into California is not a California greenhouse gas emission. The legislation did not provide ARB jurisdiction under AB 32 to consider external generation not imported, and therefore not subject to emissions reporting under section 38530 of the mandatory reporting regulation. The language proposed in section 95111(g)(5) of the mandatory reporting regulation should be deleted to ensure that such electricity is not treated as having an emissions compliance burden under section 95852 of the Cap and trade regulation. (LADWP1)

Response: The regulation specifically identifies the compliance obligation for first deliverers, including those that import electricity. The revisions to the mandatory reporting regulation are part of a separate rulemaking. However, section 9511(g)(5) of the MRR has been deleted, which we believe should satisfy the commenter's concern.

I-64. Comment: Two-way border adjustment is needed to prevent leakage in the electricity sector. LADWP supports ARB's efforts to address emissions leakage, which negatively affects California's economy and erodes the environmental integrity of the cap and trade program. While the first deliverer approach addresses the competitive advantage of importers of power into California, an additional mechanism is needed to address the competitive disadvantage faced by exporters of power generated in California. The proposed Cap and trade regulation requires California power generators to acquire compliance instruments to cover their greenhouse gas emissions, whether that power is consumed within California or exported.

If the exporter is not the generator, the exporter will nonetheless be liable for the costs of the compliance instruments as the generator will incorporate the cost into the price of the power. To remain whole, the exporter would need to pass the cost of the compliance instruments through to the out-of-state buyer, putting California exporters at a competitive disadvantage compared to out-of-state generators that serve load in jurisdictions where there is no cap and trade program. This may lead to emissions leakage, as power that was formerly generated within California becomes uncompetitive and is replaced with power generated outside California.

From an operational standpoint, not reimbursing exporters for the compliance cost of California power could have a negative impact on reliability of the electrical grid, especially as utilities must comply with pending regulations being promulgated by the Federal Energy Regulatory Commission (FERC) to provide regulation services every fifteen minutes for interconnected intermittent renewable resources like wind and solar. This regulation service is critical with regard to overall reliability of the WECC-wide (Western Electricity Coordinating Council) grid. If one utility is getting less output than expected from an interconnected intermittent renewable resource like wind, then other utilities may be required to provide energy to help meet that load, regardless of whether that need is in California or somewhere else within the WECC region. If electricity generated in California is exported to support load elsewhere within the WECC, the exporting entity should receive credit for the compliance obligation associated with the California power. If not, the higher cost of California power would be a disincentive to exporting power when it is needed to support reliability of the grid and the regulation conflicts with the comprehensive regulatory structure established by FERC. (LADWP1)

Response: AB 32 includes in its definition of Statewide greenhouse gas emissions (section 38505(m)) all emissions of CO_2e within California and emissions associated with imported electricity. It requires ARB to set a cap on these emissions. This regulation is a critical part of meeting that cap. It would be contrary to the requirements and intent of AB 32 if California added GHG-emitting generation, or increased the operation of existing GHG-emitting generation, in order to export electricity.

While it is possible that California electricity exported will be less competitive than other electricity that might be sold from other jurisdictions during the same time periods, it is not clear from the data that this is the case. This would depend on the availability of other resources at times when California utilities are exporting electricity. Nonetheless, the requirements of AB 32 preclude ARB from creating a policy that would increase GHG emissions within the state, as would a payment of allowances to exporters of fossil electricity.

It is highly unlikely, and no evidence has been presented, that reliability would be threatened if exported California electricity was more expensive. First, if transmission paths were available, other cheaper electricity could conceivably take its place. More likely, electricity purchasers in other jurisdictions would continue to trade for or purchase electricity from clean California natural gas power plants whenever needed for electricity system reliability.

Requirements for Specified Sources of Electricity

I-65. Comment: The proposed regulation sets the default emission rate for unspecified power based on a methodology that imputes an emission rate for the "average" emissions of all units that contribute to the pool of energy derived from unspecified resources. IEP is concerned that this methodology will frustrate CARB's GHG emissions reductions goals regionally and will promote contract shuffling. When the emissions rate of imported power from a known resource exceeds the rate imputed to unspecified resources, the First Delivers of the imported power will have an incentive to shield the true emissions associated with their power deliveries behind the marginal emissions associated with unspecified power deliveries. However, this incentive will evaporate if the imputed emissions rate for unspecified power is based on a measure of the marginal emissions rate of the units comprising the subset of unspecified power resources, rather than the average. Thus, the emissions rate for unspecified power should be based either on the marginal emissions rate of the class of electric generators used to calculate the emissions rate of unspecified power at a point in time; or, assuming the marginal unit varies over time, then the average emissions rate for the highest emitting quartile of the class of electric generators used to calculate the emissions rate of unspecified power.

In addition to supporting the tracking and accounting of imported power more closely on a regional, WECC basis (e.g., through the auspices of the WREGIS), IEP also recommends that the Initial Statement of Reasons be modified as follows:

5. Calculating Compliance Requirements
   b. First Deliverers of Electricity
      ….For this type of electricity (Electricity generated outside of California and imported into the State from an unknown source), there is no threshold for the compliance obligation, because it is not possible to trace it back to the generator. Since ARB does not know the source of electricity, staff does not know the amount of GHG emissions to assign to it. Therefore, staff proposes to use a default emissions factor for unspecified power. Staff recommends the emissions factor be based on <u>a measure of the marginal</u> emissions associated with the available electricity generation that could be sold on the spot market and brought into California. The GHG emissions will be calculated by multiplying this emission factor by the MWh delivered. (IEPA)

Response: We do not agree that the methodology used to assess the emission rate for unspecified power will compromise our emission-reduction goals. This comment applies more to the MRR revisions and we note that the MRR Staff Report explained that the default emission factor for electricity from unspecified sources is calculated using the Final WCI Default Emission Factor Calculator created by CPUC staff, vetted through the WCI Electricity Team, and adopted by the WCI Partners. The default emission factor is equal to the average marginal emission factor for years 2006, 2007, and 2008. It is based on marginal facilities likely to be dispatched in the WECC. Marginal facilities are defined as facilities with capacity factors lower than 60 percent. Two percent transmission line losses are included. The default emission factor is not based on the average of WECC units. Regarding the potential for contract shuffling, we included a prohibition against resource shuffling (another term for contract shuffling) in section 95852(b)(1), and a definition of resource shuffling in section 95802(a)(251).

The commenter's intent is not clear. It appears that the commenter would like the default emission factor to be calculated based on the marginal emissions rate of the same set of units for which the average rate was calculated by ARB. However, the marginal rate of this set of units is likely to vary significantly by season and by hour of the day as load varies. The commenter seems to prefer that a distinct default emission be calculated for "each point in time." Because the marginal emission rate varies continuously, and it cannot be calculated for a time interval smaller than one hour, it is not feasible to require stakeholders to use a default emission factor for each point in time, or for each hour. Since it is infeasible to calculate a default emission factor for "each point in time," it appears that the commenter recommends, as second best, that ARB use the average emissions rate for the highest-emitting 25 percent of the group of generators used in our methodology. However, this approach would not account for seasons and hours when generators in the group with lower emissions than the highest emitting quartile are on the margin. The commenter has not provided sufficient analysis of which generators are on the margin during which hours of the year to convince us that IEPs suggested methodology is more accurate the methodology we used. Finally, the regulatory process does not include modifications to the initial Staff Report; instead, this final Statement of Reasons provides the rationale for the final regulation.

I-66. Comment: The proposed amendments to the MRR would set forth a procedure for calculating the default emission rate for unspecified power based on the average emissions rate derived using calculation tools developed by the Western Climate Initiative and announced by CARB along with the proposed MRR amendments. This default emissions rate will then be used to calculate the allowance compliance obligation for unspecified power under the Proposed Regulation's cap and trade program. Calpine is concerned that, by relying upon a low default emissions rate for unspecified power, the Proposed Regulation will have the effect of allowing first delivers to classify their higher emitting imports as unspecified power so that they will be treated more favorably, in comparison to lower-emitting specified sources of imported power and in-state generating sources. This would have a perverse consequence of encouraging increased dispatch of higher-emitting sources, to the detriment of both lower-emitting specified imports and in-state generating sources. To address this problem, Calpine recommends that the default emission rate for purposes of both the proposed amendments to the MRR and the proposed regulation should be set at 1,100 lbs (0.55 tons) CO_2e per MWh, which is equivalent to the State's Emissions

Performance Standard and therefore represents the emission rate of the higher heat-rate existing combined-cycle gas-fired power plants likely to determine market-clearing prices in California. (CALPINE1, CALPINE2)

> **Response:** We agree that the default emissions rate is lower than some high-emitting sources of imports, and that absent other measures, there could, in some cases, be an incentive to dispatch higher-emitting resources. However, a new definition of resource shuffling (section 95802(a)) and a prohibition against contract shuffling have been added in section 95852(b). In addition, the MRR requires reporting that will help to track situations in which first deliverers attempt to classify higher-emitting imports as unspecified. We believe that these changes address the commenter's concerns.

I-67. Comment: In our view, creating complex rules for identifying emissions from individual sources may very well exacerbate "contract shuffling", not prevent it. The proposed "specified/unspecified" system will not inhibit contract shuffling, and in light of the potential risk it poses of significant disruption to efficient markets and power system operations, we believe that the impacts upon implementation merit close scrutiny. If adverse impacts on liquidity, reliability or price are observed, then it may be appropriate to revisit the specified/unspecified system. (MSCG2)

> **Response:** We agree that the regulation sections that explain the requirements for claiming a specified source alone may not prevent contract shuffling, and we modified the regulation to add a prohibition against resource shuffling (another term for contract shuffling) in section 95852(b)(1) and a definition of resource shuffling in section 95802(a)(251).
>
> We have also worked very closely with the California Independent System Operator (CAISO), the operator of California's main electricity market, to design compliance requirements for the cap-and-trade program that will not impede a smooth-functioning electricity market. As the program is implemented, ARB and our market surveillance committee will monitor both the emissions-trading market and the power market, and recommend changes to our program as appropriate. We believe that changes to the requirements for first deliverers of electricity are not needed at this time.

I-68. Comment: The details of how "specified" versus "unspecified" is determined should be part of the proposed regulation. At a minimum, there should be a cross-reference in the Regulation Order that explains where to find the necessary administrative details in the MRR. It is not clear from the draft regulations what is required for a First Jurisdictional Deliverer to treat imported power as from a "specified" resource under the Regulation. (MSCG2)

> **Response:** We have made modifications to the regulation that should provide clarity on this issue. Section 95892((b)(2) has been added to provide details on what is required in order to make a claim that electricity is from a specified

source. This section contains a cross-reference to section 95111 of the MRR, which provides additional details on specified versus unspecified sources. Section 95802(264) and (279) provide definitions of a specified source and unspecified sources. All other electricity is unspecified.

I-69. Comment: Section 95812(d)(2), says that “The threshold for an electricity importer of specified or unspecified source of electricity is zero as of January 1, 2015.” We would appreciate clarification of the meaning of this section. Modify the section to make the intent clear. (MSCG2)

Response: We agree and modified sections 95812(d)(2) to clarify that as of January 1, 2015, the applicability threshold for electricity importers is zero metric tons of CO_2e per year for specified sources and zero MWhs per year for unspecified sources.

e-Tags

I-70. Comment: Fourth, there is a potential ambiguity with regard to whether certain transactions occur within or outside California, and thus constitute “imports” or “first deliveries” of power under the electricity importing rules. Specifically, there are trading hubs along the California border where the exact physical location is undefined or ambiguous. The most potentially problematic are “COB” and “NOB.” Others that may raise questions include Mead and Palo Verde. At some point, the ARB will need to decide if transactions at these various “hubs” are in fact taking place “in California” for purposes of reporting and compliance. When those decisions are made, they need to be made part of the Regulation Order so parties have a reference source. One simple way would be to create a listing of all such hubs and indicate their “in-state” status for reporting purposes. Alternatively, it may be decided to make this list part of the MRR instead. In either case, the existence of the list should be cross-referenced in the other document. (MSCG2)

Response: We disagree that there is ambiguity with regard to transactions at the trading hubs. We have worked closely with CAISO, which operates the CAISO market in which these hubs are part of the path of electricity delivered into California. The PSE or Scheduling Coordinator that delivers to these hubs is required to deliver the electricity to a “hub” or “node” or, more precisely, Point of Receipt, in California. If such delivery does not take place, no sale of electricity takes place. CAISO is aware that some entities have not been using NERC e-tags and other system tools in full compliance with its requirements and tariffs that apply to participants in CAISO markets. We continue to work with CAISO to ensure that electricity importers understand and conform to requirements.

I-71. Comment: When considering the 2020 emission limit of 427 million metric tons of carbon dioxide equivalent ($MMTCO_2E$) of greenhouse gases in conjunction with the Western Climate Initiative (WCI), will emissions leakage be considered? How will the ARB attempt to account for multiple sources of power generation within the Western

Interconnection? Specifically, BC Power, the government-owned utility in British Columbia, has been in power deficit for 10 of the past 11 years. It makes up that deficit by importing coal-fired power from Washington state and the province of Alberta. BC Power then sells California "green" hydropower after backfilling their grid deficit with coal power. Will ARB account for this form of electron laundering by looking at the full life cycle emissions of the sources of power imported into California? Has ARB considered the cost impact of electricity to California consumers if BC Power, or other providers of electricity, are forced to purchase emissions allowances to fully account for their electron laundering? (ASMMANDEVORE1)

Response: We have done extensive work to consider, and eliminate to the extent possible, emissions leakage and economic leakage. For example, Appendices L and M of the Staff Report both devote many pages to leakage in the context of electricity. Furthermore, in section 95852(b) we distinguish between specified and unspecified sources of imported electricity and have added a specific prohibition against resource shuffling to address the potential for leakage when out-of-state sources of electricity are allocated compliance obligations under the regulation.

We agree that BC Power imports coal-fired power to meet part of its load. Furthermore, BC Power has exported power from various hydroelectric resources for many years. The regulation is not designed to undo existing or historical arrangements in which power is traded between jurisdictions. Instead, the regulation is designed to achieve real GHG emissions reductions going forward. For example, if BC Power increases exports to California from hydropower and simultaneously imports more coal power in order to provide low-emission factor power to California, we would consider that a form of resource shuffling.

In addition, British Columbia is, along with California, a member of WCI. We expect British Columbia to adopt regulations that conform to WCI guidelines in order to participate in a cap-and-trade program along with California, which will also help to eliminate the potential for leakage in BC Power operations.

I-72. Comment: Some studies have suggested that hydropower, depending on where it is sited, can be a net negative for GHG emissions because it can drown carbon-impounding forests while the rotting plant matter releases large amounts of methane. Given this, will hydropower from BC Power have a higher imputed GHG load than hydropower from the Hoover Dam, which did not drown forests as it was built in a desert? (ASMMANDEVORE2)

Response: Currently neither ARB nor the WCI take a full lifecycle approach to the emissions from electricity generation. This means, for example, that the GHG emissions created during the extraction of natural gas and coal is not considered in the attributions of GHG emissions to power generated at natural gas or coal power plants. In similar fashion, the emissions associated with the construction of wind and hydroelectric generators or the production of photovoltaic panels is not included. Therefore, a hydropower resource in BC and electricity from the Hoover Dam would both avoid a compliance obligation if specified according to the requirements of the regulation. We note that as California and other jurisdictions intensify efforts to mitigate climate change through policies and programs, the need for a full lifecycle approach to electricity generation is reduced, since more direct emissions in that lifecycle would be covered in these programs.

Unclassified

I-73. Comment: Constellation Energy is in favor of the “border adjustments” on power purchased from out of state generators as an equitable means of preventing “leakage” in the power sector. CARB’s economic analysis used several different models that generated a large range in allowance costs, from $15 to $160 per ton, depending on the year and the effectiveness of the program. At $45 per ton CO_2E, coal plants with existing PPAs are likely to become uneconomic. In addition to allowances, CARB is requiring facilities to pay an annual GHG program fee, and some facilities over 100 MW will also have to perform an energy efficiency evaluation. Constellation Energy is concerned that California plants will become uneconomic in competition with plants in other states prior to regulation under a federal program. Constellation Energy is concerned that CARB is underestimating the potential for leakage with respect to the IPPs. (CONSTELLATIONENERGY)

Response: The point of the regulation is to put a price on GHG emissions that ultimately will result in lower GHG emissions. Long-term, we expect that coal plants to become uneconomic, partly in response to this regulation, unless they can produce electricity with much lower emissions per MWh. We do not believe leakage is likely to occur as high-emission California power plants are dispatched less frequently, because the electricity they generate could not be replaced by other high-emission electricity given the requirements of section 95852(b) as modified and the California emissions performance standard under Senate Bill 1368 (Perata, Chapter 598, Statutes of 2006).

I-74. Comment: Wellhead is concerned that the proposed regulations do not adequately account for some of the intricacies in how the CAISO administers the market. The proposed regulation and ISOR assume that generators selling power to the wholesale markets will be able to recoup GHG compliance costs by including such costs in their bid prices. In general, CAISO market participants receive compensation at a rate no less than the price bid into the applicable market. However, there are certain exceptions where payments from the CAISO for energy dispatched by the CAISO do not include any consideration of GHG costs. This occurs when the CAISO dispatches a resource at minimum load or out of economic order (normally for reliability reasons). In these cases, the market rules assure the generator of receiving compensation that covers their cost of providing the generation dispatched by the CAISO. However, the current CAISO process does not include consideration of any GHG costs incurred by the generator in responding to these CAISO dispatch instructions. If the CAISO does not modify its market compensation process to account for a generator's actual GHG costs in these situations, the proposed regulations will create yet another class of generators without appropriate GHG cost recovery. (WEC)

> **Response:** We have worked closely with CAISO to develop requirements for first jurisdictional deliverers of electricity that dovetail with the existing electricity market structure. CAISO is working on how bids for electricity will incorporate GHG costs in the market. We will continue to work with CAISO to ensure that the sort of disadvantage to generators identified by the commenter does not occur.

Electricity: Renewable Energy

Renewable Electricity Credits (RECs)

I-75. (multiple comments)
Comment: Ensure equal treatment of all renewables that qualify for RES or RPS. The Mandatory Reporting Requirement rule raises an additional issue that is intimately related to the rules proposed under the Cap and Trade program. The proposed regulation should assign a zero GHG attribute to all renewable energy that meets RPS or RES requirements. In general, all renewable energy that meets State standards to qualify for the RPS or RES should be GHG-reducing to comply with California law and to maintain benefits that parties expected when complying with the RPS statute. The discussion points of this recommendation are detailed in our comments on the proposed amendments to the regulation for the Mandatory Reporting of Greenhouse Gas Emissions and are not discussed further in these comments. (SEMPRA1)

Comment: In order to ensure that the State's environmental objectives are consistently addressed, and to be consistent with the counting methodologies used in allowance allocation discussions, the proposed regulation must treat all renewable resources from existing California renewable energy programs as zero-emitting resources. Out-of-state renewable energy contracts that are currently valid renewable contracts for purposes of meeting the requirements of an existing renewable portfolio standard (RPS) program or are compliant with the recently adopted Renewable Electricity Standard (RES) regulation also contribute to the overall reduction of GHG emissions, and towards meeting the mandates of AB 32. Accordingly, they should be recognized as such in the context of the Cap and Trade Program, where appropriate. (NCPA1)

Comment: The compliance obligation for first deliverers of electricity under the Cap and trade regulation should be amended to account for emission reductions associated with the retirement of renewable energy certificates under the California Renewable Electricity Standard Regulation, page A-62 subparagraph (b). The draft regulation states that a deliverer of electricity covered under sections 95811(b) and 95812(b)(2) has a compliance obligation for "every metric ton of CO_2e emissions for which a positive verification statement or qualified positive verification statement is issued" and every metric ton of CO_2e of stationary source combustion emissions, or emissions associated with electricity imported into California from a source in a jurisdiction where a GHG emissions trading system has not been approved for linkage by the Board pursuant to Subarticle 12. The Cap and Trade regulation is not a stand-alone regulation; rather it is one piece of a larger program to achieve the state's emission reduction goal, and needs to dovetail with the other complementary emission reduction measures identified in the AB 32 Scoping Plan. As such, the Cap and trade regulation should recognize emission reductions achieved under other AB 32 regulations such as the Renewable Electricity Standard (RES). The RES environmental analysis suggests that increasing renewable energy from 20 percent to 33 percent will result in 11-12 MMT in GHG emission benefits ($MMTCO_2$e/yr) by 2020. The RES also acknowledges that emission benefits are "WECC-wide" insofar as compliance can be achieved through the purchase and retirement of renewable energy certificates (REC) generated within the WECC without actual delivery of the green energy to California.

This reduction in WECC-wide emissions due to the RES should be recognized under the Cap and trade regulation, and a first deliverer's compliance obligation under the cap and trade regulation should be adjusted to reflect the emission reduction associated with the RECs that entity has retired to comply with the RES. However, as currently drafted, the compliance obligation under the Cap and trade regulation will be calculated based on emissions reported and verified under the mandatory reporting regulation (MRR). Except to the extent that delivered renewable energy reduces emissions by displacing fossil generation, the MRR does not quantify emissions reduced as a result of purchasing and retiring unbundled RECs.

LADWP recommends that ARB fully acknowledge the WECC-wide emission reductions that will result from the RES. Without alignment between the RES, MRR, and Cap and trade regulations, entities will only be credited with renewable energy that is physically imported into California. Any RES compliance using unbundled RECs would result in a double-burden insofar as entities would pay the cost of purchasing the RECs as well as the cost of emission allowances for energy used to serve load in California. It would be inconsistent to count the emission reductions from the RES toward the AB 32 emission reduction target without also attributing those emission reduction benefits to the entities that are purchasing and retiring the RECs.

LADWP recommends the following be included in this section under section (b):

"First Deliverers of Electricity." A deliverer of electricity covered under sections 95811(b) and 95812(b)(2) has a compliance obligation for every metric ton of CO_2e emissions for which a positive verification statement or qualified positive verification statement is issued, and every metric ton of CO_2e of stationary combustion emissions, or emissions associated with electricity imported into California from a source in a jurisdiction where a GHG emissions trading system has not been approved for linkage by the Board pursuant to Subarticle 12. <u>This compliance obligation shall be adjusted for implementation of the Renewable Electricity Standard for the purchase and retirement</u>

of unbundled or tradable renewable energy certificates purchased and retired by the entity to comply with the Renewable Electricity Standard. (LADWP1)

Comment: PG&E requests clarification of the role of out-of-state renewable energy purchases in California's Cap and trade program. PG&E recommends ARB provide that resources eligible under the RES or RPS are credited as zero GHG to ensure that the RES, RPS, Cap and Trade, and Mandatory Reporting Regulations are consistent and achieve GHG reductions in the most cost effective manner. As such, the Mandatory Reporting Regulation should be revised to provide that imported Renewable Energy Credits (REC) include the renewable-GHG attribute of the out-of-state renewable facility from which it was generated. This approach ensures that California receives the full GHG reduction benefits of the State's renewable programs by providing consistency with the statutory and CPUC definitions of a REC and the numerous CPUC-approved RPS contracts that have been entered into on behalf of utility customers. (PGE1)

> **Response:** These commenters wish to use RECs to reduce their compliance obligation for electricity delivered to California in place of electricity from renewable resources that qualify under the RPS. They also request that all renewable energy that qualifies for the RPS be allowed to reduce their compliance obligation. We do not agree that RECs should reduce compliance obligation unless they meet the requirements that were in place for the RPS for investor-owned utilities prior to the passage of SBX1 2 (Simitian, 2011), and prior to the CPUC's decision to allow IOUs to use tradable RECs for RPS compliance.[6] Unlike the RPS, this regulation puts a compliance obligation on electricity delivered to California based on GHG emissions that occur in the generation of electricity. If the electricity delivered to California was generated in a facility that produces GHG emissions, and it was imported in place of electricity from a renewable resource, the regulation puts a compliance obligation on the electricity based on its actual emissions. However, we agreed with commenters that RPS electricity should reduce the compliance obligation of a first deliverer under the conditions laid out in new section 95852(b)(4).
>
> In this response, we first discuss the modification we made to the regulation, then discuss concepts pertinent to the comments and our treatment of imported RPS eligible electricity. Finally, we respond to some specific points to further illustrate our approach.
>
> As described more fully in our responses to the first 15-day changes to the regulation, we modified section 95852(b) to allow for an "RPS adjustment." With this approach, a first deliverer's compliance obligation may be reduced by the product of the default emission factor multiplied by the quantity of eligible

[6] Although the CPUC released the Decision in March 2010, it was stayed due to petitions for modification, so the IOUs could not use tradable *renewable* energy credits (TRECs) to comply with the RPS until the CPUC lifted the stay on January 13, 2011.

renewable electricity purchased by the electricity importer, or imported to California on behalf of an entity that owns or has contract rights to the eligible renewable electricity. With this approach, a compliance obligation may be reduced whether or not the RECs are “bundled” with the electricity or sold separately. This approach is consistent with our overall approach to require reporting and compliance obligation based on actual emissions from imported electricity that is delivered in real time to serve California load.

We note that under the RPS currently in effect, POUs, unlike IOUs, are allowed to choose certain options in their own RPS programs that are not available to IOUs. Of relevance here is that some POUs may have purchased “tradable” or “unbundled” RECs to count within their own programs, prior to the CPUC’s recent decision. We do not allow tradable RECs to be used in the calculation of any electricity importer’s RPS adjustment, unless the electricity that resulted in the creation of the RECs meets the requirements of new section 95852(b)(4).

Were we to recognize all RECs and RPS energy as “negating” the emissions from other electricity delivered to replace renewable generation, there would be significant opportunities for leakage. Allowing RECs to be used to help meet a compliance obligation would likely facilitate “double-counting” of an “avoided emissions” attribute, and would be incompatible with the WCI partners’ approach to renewable electricity.

A California cap-and-trade program that imposes a compliance requirement to obtain and submit allowances to emit greenhouse gases is fundamentally different than the compliance requirements for an RPS or RES program, which requires utilities to obtain a set percentage of their electricity sales from renewable resources. This regulation uses a metric of CO_2e emissions, while the RPS uses MWhs of electricity generated from renewable resources. Since these comments were submitted in December, 2010, the RES program has been discontinued, and the proposed regulation is no longer being considered by ARB. Instead, SBX1 2 was passed and signed, implementing a California 33 percent RPS requirement, obviating the need for RES. The proceedings to develop and implement the requirements of this bill are currently ongoing and will continue beyond the date of the finalized cap-and-trade regulation.

We note that tradable RECs that are eligible for use in the RPS program need not be associated with the actual disposition or delivery of the electricity generated at a renewable facility. We believe that electricity delivered from a zero GHG-emitting renewable resource for use outside of California is in fact electricity without GHG emissions, even if a REC associated with that electricity has been sold for use in the California RPS. Therefore, if a REC issued for a single MWh is used to reduce the compliance obligation of another MWh of GHG-emitting electricity imported to California, there would be two MWh of electricity with zero actual or deemed emissions, a form of double-counting.

Notwithstanding the analysis above, we added section 95852(b)(4), which should allow most electricity generated outside of California at eligible renewable energy resources to reduce an entity's compliance obligation. We also expect, that at least in some cases, entities that have purchased tradable RECs can enter into new contracts, or renegotiate contracts, to purchase electricity associated with the tradable RECs. This can make it possible to use the RECs and electricity together to reduce compliance obligation.

Before responding to additional specific points made in the comments above, we note that all of these comments were made prior to any regulatory language that considered a potential value for any renewable electricity that was not directly delivered to California. This means that the above comments generally are moot, and do not address the regulation. Nonetheless we respond here to certain comments.

First, despite NCPA1's contention, not all RPS electricity reduces GHG emissions. When hydroelectric power is abundant in the Northwest, sometimes there is an oversupply of electricity. Under such conditions, if a biomass facility that also uses natural gas but meets RPS requirements continues to generate, it will increase GHG emissions. To the extent that the biomass facility generates power, GHG emission-free hydroelectric would be replaced by generation with emissions.

With respect for PGE1's comment, we are not aware of any "renewable-GHG attribute" that has any regulatory meaning. As discussed in our responses to the 15-day changes to the regulation, the CPUC has made it clear that while RECs may have an "avoided emissions" attribute, the value of avoided emissions for some renewable electricity is zero.

I-76. Comment: The cap and trade program must harmonize with the renewable energy standard. SMUD understands that the WCI has recommended abandoning the renewable energy tracking system WREGIS for the purposes of tracking purchases of renewable energy under a First Jurisdictional Deliverer framework. SMUD, and other stakeholders in the electricity sector, have pushed back against this arbitrary decision given the harm that it does to the existing RECs market, to the harmony of the cap and trade program with the ARB's own Renewable Electricity Standard, to existing voluntary renewable energy programs, and to those responsible for tracking and reporting emissions at jurisdictions subject to the regulation. While SMUD is providing similar comments to the Mandatory Reporting regulation, we feel strongly enough about this issue that we raise it here again as an example of where the ARB could improve the harmonization of its cap and trade rule with the complementary policies. The decision made at the WCI was made with very little public process, and further adopted by ARB without a public workshop on the topic. Although the decision has been shared with a subset of utility stakeholders, there is little in the administrative record of this rulemaking, either in the ARB's record of workshops or in the background staff papers. As the ARB and CPUC seek to harmonize decisions around the use of RECs as a tracking mechanism for the RES, this issue will inevitably be brought into full public light. However, SMUD is concerned that the resolution of this issue may come only after the ARB reporting and cap and trade regulations have closed the door on this topic. (SMUD1)

Response: The commenter claims that WREGIS tracks renewable energy. The WREGIS system does not track electricity from generation to where it is consumed. The WREGIS system does not track electricity or emissions, but instead allows for the creation, registration, and tracking of RECs. There is no regional system for tracking the disposition of electricity, from renewable, fossil fuel, or any other kind of electricity generator. If the generator produces electricity with GHG emissions, then there is no regulatory system that gives legitimacy to a claim that the electricity generation did not produce GHG emissions, notwithstanding the fact that in the RPS program, imported non-renewable electricity is allowed to substitute for renewable to some degree. Renewable electricity produced at a generator that meets RPS eligibility requirements generally has low, or no, emissions, but there is no regulatory system for “null power.” Such a system, if it existed, would cause electricity to be deemed to have associated GHG emissions if the electricity is from a zero or low emission renewable source but the RECs have been separated (“unbundled”) from the electricity. The lack of a “null power” regulatory system means that double-counting of a zero-emission attribute of electricity can easily occur.

We believe the regulation harmonizes with the new approaches to RECs included in the 33 percent RPS requirement (SBX1 2), which replaced the Renewable Electricity Standard mentioned by the commenter. The new RPS mandate allows some use of ”unbundled renewable energy credits,” which we believe are essentially the same as “tradable RECs.” However, a utility is limited to using these unbundled RECs to meet 25 percent of its RPS requirement through 2013, 15 percent for the compliance period ending in 2016, and 10 percent thereafter.[7] A modified WREGIS could conceivably track renewable electricity, and we are considering whether WREGIS could be modified to do so, or another system created to track electricity deliveries.

Within WCI, there were stakeholder discussions regarding the use of RECs in reporting emissions from out-of-state electricity imports. Stakeholders were requested to submit their proposed option in the potential role for RECs within a cap-and-trade system. The WCI Electricity Team evaluated all of the discussion and stakeholder responses, and the implications of the three options posed. The Electricity Team made their recommendation to WCI Partners, who subsequently announced the decision, which we support. We continue to work with stakeholders on the issues described by the commenter.

I-77. (multiple comments)

[7] Public Utilities Code section 399.16(b)

Comment: SMUD strongly encourages the ARB to fully vet this topic before making a final decision. The WCI decision reverses legal definitions of RECs set forth in the Public Utilities Code, and relied on in energy contracts by dozens of covered entities. It throws into question the underlying value of the RECs tracked by WREGIS, effectively voiding the WREGIS definition, thereby creating further confusion about legal claims that can be made regarding contracts involving this commodity. The reasoning offered by the WCI decision is primarily that the administrative burden of tracking REC ownership and claims made by purchasers of null power ignore the new administrative burden that is created for the reporters of these transactions, who now have the very tool that was created to track renewable energy claims taken away, leaving them in a predicament of relying on vague language in a reporting regulation to base long term contracts on. Finally, the decision calls into question the claims that are made in the voluntary renewable energy markets around the benefits that are embedded in REC's, thereby undermining the value of this market perhaps in a bigger way than the decision of whether or not to create a set-aside.

In addition to fully capturing stakeholder input on this important topic, the ARB should consider the cost implications of adopting this policy on REC's. The use of REC's for RPS and RES compliance was intended to help reduce the high cost of building renewable energy. By requiring entities to purchase both the energy and the REC, the ARB is effectively eliminating, or greatly limiting the viability of REC's for use in the RES and RPS compliance. This policy will either increase costs under the RES or it will increase costs under the cap and trade as entities opt to purchase REC's and are required to come up with additional allowances. Considering the RES is one of the most expensive policies under the full set of AB 32 policies, and was expected to result in substantial reductions in the scoping plan, the ARB should give strong consideration to policy decisions which either inflate its cost or reduce its effectiveness in contributing to statewide emissions reductions.

Specific changes to the cap and trade regulation would be to recognize that all state-recognized renewable energy resources procured for either the Renewable Portfolio Standard (RPS) or Renewable Electricity Standard (RES) should not be required to have any compliance burden associated with their purchase. SMUD recommends adding a subsection (g) to Section 95852.2 (emissions without a compliance obligation), as follows:

<u>95852(g) Reserved for future consideration of treatment of combustion emissions associated with power delivered along with RECs.</u>

In the reporting regulation, language would explicitly be needed recognizing the use of WREGIS for tracking these renewable energy purchases. (SMUD1)

Comment: The regulation should be altered to treat RECs and out-of-state renewable resources as having zero GHG emissions commensurate with the underlying renewable resources that they represent, in order to harmonize with the renewable energy standard, eliminate potential duplication and tracking systems, and provide support for the voluntary market. We think that the current treatment of RECs in the reporting regulations could lead to hundreds of millions of dollars in additional costs and threaten the ability of the RES to deliver GHG reductions as expected. We do not believe this issue has been fully vetted with stakeholders and urge future consideration as requested in the joint utility letter that you've received. We'd like to see this issue added to the list of issues staff plans to workshop in 2011 or otherwise explicitly address some direction to staff for further resolution. (SMUD2)

Comment: SCE, PG&E, SDG&E, SMUD and NCPA are very concerned that the ARB's draft Cap-and-Trade and proposed amendments to the Mandatory Reporting Regulations do not recognize the greenhouse gas (GHG) reduction benefits of certain renewables contracts entered into to meet the State's renewables goals. The current version of the draft reporting regulations provide no mechanism to account for the zero GHG attributes of many out of-state renewable contracts and, as a result, would result in regulated parties having to retire allowances for these renewables resources. If this deficiency is not resolved, our customers and California will face the following:

- Hundreds of millions of dollars in increased costs to retire allowances for imported energy from contracts with renewable resources that are otherwise counted as renewable by State law.
- Inability of the State's 20 percent and 33 percent renewables programs to achieve the GHG reductions estimated by ARB since certain renewable contracts would be treated as GHG emitting.
- Upward pressure on allowance prices given increased demand for allowances needed to cover these renewable contracts.

The State's renewable programs are already identified by ARB as the highest cost GHG reduction measure and these costs should not be unnecessarily increased. California utility customers should receive credit for the GHG attributes that they have already purchased through their renewable contracts and should not be required to pay twice for their GHG benefits.

Fortunately, there is a workable solution to this problem-the use of the State's statutorily required system using WREGIS and renewable energy credits to count out-of-state purchases as RPS-eligible within the ARB's Mandatory Reporting Regulation. WREGIS has a deep foundation within the CPUC's decisions and California's renewables program. Accordingly, we urge the ARB to use this system to ensure that all renewable purchases eligible under the RES and RPS are credited as zero GHG. (PUBLICUTILITIES)

> **Response:** As recommended by SMUD, we held a workshop to consider RECs, renewable energy, and other topics associated with imported electricity on August 26, 2011. We do not agree that the regulation reversed legal definitions of RECs. SBX1 2 changed the definition of a renewable energy credit to:
>
> > (h)(1) "Renewable energy credit" means a certificate of proof associated with the generation of electricity from an eligible renewable energy

resource, issued through the accounting system established by the Energy Commission pursuant to Section 399.25, that one unit of electricity was generated and delivered by an eligible renewable energy resource.

(2) "Renewable energy credit" includes all renewable and environmental attributes associated with the production of electricity from the eligible renewable energy resource, except for an emissions reduction credit issued pursuant to Section 40709 of the Health and Safety Code and any credits or payments associated with the reduction of solid waste and treatment benefits created by the utilization of biomass or biogas fuels.

This definition does not state under what circumstances a REC has value in California, nor does it say where the electricity would be delivered. WREGIS tracks RECs for many states, but California law and regulation determines their use in California. The CPUC has put forth that avoided emissions do not necessarily have any value in a GHG regulatory program. Even though they are included in a WREGIS Certificate, this does not mean that avoided emissions can be used in a GHG regulatory program.

Regardless of the WCI process, California's energy agencies have made it clear that RECs may have no value in a GHG regulatory program.

Furthermore, we agree that REC-only transactions may reduce the cost of renewable energy for RPS compliance. Requiring allowances for electricity from GHG-emitting power plants does nothing to limit the viability of RECs for use in RPS compliance. GHG regulation does not increase costs for RPS compliance; it merely imposes a compliance obligation on GHG-emitting power when that power is delivered into California.

The new RPS law over time reduces the amount of RECs that can used to meet a utility's RPS compliance requirements, with an exception for certain grandfathered use of RECs. In the first set of 15-day changes to the regulation, we added section 95802(a)(237) to recognize this transition by defining "replacement electricity" as electricity from GHG-emitting sources that, in limited circumstances described in new section 95852.2(b)(3), can be deemed to have the emissions of a variable renewable resource. We made this change because currently it is very difficult to deliver renewable electricity from variable renewable resources between balancing authority areas, and because there is a tradition of "firming" variable renewable power by substituting other electricity when, for example, wind dies down or clouds block the sun. Because renewable resources are using various strategies to deliver firm power, and because transmission system operations are evolving to enable delivery of variable renewable resources between balancing authority areas, we believe these changes are appropriate for variable resources which in their nature are not fully deliverable at this point. In the second set of 15-day changes to the regulation, we removed the "replacement electricity" definition and included provisions for an RPS adjustment, which we believe addresses the commenters' concerns.

I-78. Comment: Please make sure that RPS requirements and penalties are maintained or strengthened. Anything that creates incentives for utilities to invest in renewable generation is better in the long-run for the environment and our economy. And with increasing competition from emerging economies for natural gas, we must invest in energy independence. (BROWNRI)

Response: RPS requirements and penalties are established within the California Energy Commission and the Public Utilities Commission, and are not the subject of this regulation.

I-79. Comment: An approach that does not recognize the GHG attributes from RPS contracts is contrary to the RPS legislation and would arbitrarily increase costs for California customers. It also calls into question ARB's use of AB 32 as statutory authority to require 33 percent renewables as a GHG-reduction measure and could result in the State not achieving ARB's forecast GHG reductions from both the 20 percent and 33 percent renewable programs. (PGE1)

Response: Our approach is not contrary to the RPS legislation. We agree that electricity from RPS eligible generation has low or no GHG emissions in most cases. However, we believe that this regulation must account for the emissions of electricity imported into electricity, even if that electricity substitutes for RPS electricity. While we disagree that ARB does not have authority to require a 33 percent renewable electricity standard, it is not necessary for ARB to require such a standard because legislation requiring a 33 percent RPS has become law. ARB discontinued its efforts to complete its rulemaking process to establish a 33 percent Renewable Electricity Standard.

I-80. Comment: Please clarify the assignment of the emission level that goes with renewable energy credits. The emission level should be that of the underlying electricity generating resource that gave rise to the renewable energy credit. For example if a California utility purchases a renewable energy credit from a biomass project, the emission level that goes with that REC should be the emission level of the biomass project, not the system average. (NESCO)

Response: ARB does not assign emission levels to RECs. For delivered electricity, we use reported actual emissions to determine compliance obligations for delivered electricity.

I-81. Comment: Water agencies are in a unique position to offer additional opportunities for reducing greenhouse gas emissions associated with electricity use in California. In particular, the strategic deployment of renewable energy projects on water agency properties could provide significant early reductions in greenhouse gas emissions, along with other benefits such as improving the reliability of the state's energy supplies during peak use periods and reducing the load on the state's transmission lines. However, increasing the number of renewable energy projects within the water sector will depend on addressing current administrative and legislative obstacles that prevent these projects from going forward. Consideration should be given to making in-conduit hydropower an eligible technology for the self-generation incentive program. Large hydropower generation (more than 30 MW) should be recognized as a renewable energy source. (ACWA)

> **Response:** This comment is beyond the scope of the regulation. The California Energy Commission is the agency responsible for determining whether a technology or generator is RPS eligible.

Voluntary Renewables

I-82. (multiple comments)
Comment: We support the inclusion of the current placeholder language indicating that a voluntary renewable energy set-aside will be a part of California's emission trading program. Such a mechanism will provide crucial support for the continued growth in voluntary purchases of renewable energy in California in the years ahead. (UCS1, LUDLOW, WALTERS)

Comment: The provision to set aside/cancel permits to protect voluntary uptake of renewable electricity tariffs is welcome, continuing the principle set out in the Regional Green House Gas Initiative. The EU has failed to address the question of how to ensure caps do not prevent voluntary reductions, made beneath the cap, from delivering additional emissions savings. We will continue to point to developments in the US in our calls for similar measures to be introduced in Europe. (SANDBAGCC)

Comment: We believe including a set-aside for California's growing voluntary renewable energy market will help to further stimulate innovation in renewable energy, thus promoting new businesses and job growth, as well as reducing pollution. (SIERRACLUBCA4).

Comment: I want to express my appreciation on behalf of CEERT, the Global Warming Advocates Coalition and a number of clean energy companies and advocacy organizations for the inclusion of placeholder language for a set-aside of allowances on behalf of voluntary purchases of renewable energy. This provision, coupled with other policies, will provide crucial support to the continued growth of California's renewable energy industry and will bring a number of public health and environmental co-benefits as well as much needed jobs to the state of California. (CEERT)

Comment: The Council supports the allocation for a voluntary renewable energy allowance set-aside. (BCFSE)

Comment: We write to you in support of including a provision in the Cap and Trade Regulation to establish a Voluntary Renewable Energy Set-Aside. We believe including such a provision will help to further stimulate innovation in renewable energy, thus promoting new businesses and job growth, as well as reducing pollution. The proposed cap and trade program currently contains placeholder language indicating that a voluntary renewable energy set-aside will be part of California's emission trading program; specifically, placeholder language that would establish a voluntary renewable set-aside account (p. A-52) and the allocation to voluntary renewable energy allowance set-asides (p. A-77). Such a mechanism will provide crucial support for the continued growth in voluntary purchases of renewable energy in California in the years ahead. Clean energy development provides a host of co-benefits, not least putting California in a better position to meet the State's post-2020 goals. (KUSTIN09)

Comment: The proposed Cap and trade program currently contains placeholder language indicating that a voluntary renewable energy set-aside will be part of California's emission trading program; specifically, placeholder language that would establish a voluntary renewable set-aside account (p. A-52) and the allocation to voluntary renewable energy allowance set-asides (p. A-77). Such a mechanism will provide crucial support for the continued growth in voluntary purchases of renewable energy in California in the years ahead. Following the WCI recommendations, renewable energy generated within California and sold into the voluntary market should be eligible for the set-aside. (KUSTIN01)

Comment: SMUD supports consideration of a voluntary renewable energy allowance set-aside account. Section 95831(b)(6) reserves an account under the control of the Executive Director for the future creation of a portion of allowances set aside to support voluntary renewable activities. SMUD has consistently advocated for support for a voluntary renewable accommodation under the cap and trade program, and looks forward to working with ARB staff to establish the account in 2011. Failure to do so, in SMUD's opinion, will act to undermine our successful Greenergy Program and similar voluntary renewable purchasing efforts. (SMUD1)

> **Response:** We appreciate the commenters' support of the voluntary renewable energy set-aside. We modified section 95831(b)(6) and what was called a set-aside account is now the Voluntary Renewable Energy (VRE) Reserve Account.

I-83. Comment: There should be no cap on the budget adjustment for voluntary renewable energy. The ex-post true-up description in ARB's December 2009 Preliminary Review Draft (PDR) suggested that there would be a fixed cap ("predetermined percent") of the total allowances that could be used for the budget adjustment for VRE demand. 3Degrees urges ARB not to adopt a pre-determined cap and to allow the budget adjustment to be determined solely by the ex-ante estimate of need based on demonstrated demand.

It should not be the case that only some voluntary demand reduces emissions. Every emission-free megawatt hour (MWh) of renewable energy supported by voluntary demand offers the same greenhouse benefits and should be recognized by eligibility to retire allowances. A pre-determined cap would introduce risk and uncertainty regarding environmental claims. It is important that purchasers know that they will receive what they purchase.

The rationale for a cap on the administrative adjustment is usually to protect emitters from having to acquire scarcer (and possibly more expensive) allowances. But every renewable MWh generated to the grid reduces the number of MWh (and emissions) generated from other sources, thereby reducing the need for allowances. When both supply of and demand for allowances are reduced by an equal amount, the price of allowances should be unaffected. If there must be a cap on the number of allowances that can be placed in the holding account as an administrative adjustment, then there is no need to do the ex-ante estimate of budget adjustment for the voluntary market for renewable energy.

If ARB implements a cap on the Voluntary Renewable Electricity (VRE) set-aside, the fixed number or percent of allowances should simply be placed into the holding account. RGGI provides an example. Although the RGGI model rule envisioned that each state would conduct an ex-ante estimate of demand, most RGGI states (the exception being Massachusetts) opted to place a fixed number or percent of allowances in their administrator's accounts, rendering the ex-ante estimate administratively superfluous.

Should ARB decide to pursue a cap on the number of allowances that can be placed in the holding account, 3Degrees strongly recommends that the cap be subject to annual review and adjustment rather than at the start of each three-year compliance period, or that an automatic review be triggered whenever demand exceeds the cap for two years in succession. Several RGGI states have adopted a similar provision. (3DEGREES)

There should be no predetermined time limit on the VRE set-aside. ARB should bear in mind that it is through the addition of more renewables that the state will actually reduce carbon emissions in the electricity sector. A healthy and reliable voluntary market provides renewable energy developers with a clear market signal that additional long-term revenue is present to support new projects. This, in turn, leads to more investment and growth of renewables in California. The growth of demand for renewables, both voluntary and mandatory, provides evidence that the overall emissions cap can be lowered. 3Degrees sees no logical reason to curtail this positive trend by limiting the amount of time the VRE mechanism can contribute to reducing emissions.

The increased demand for renewables, both voluntary and mandatory, will lead to increased supply, which reduces greenhouse gas emissions and reduces the need for allowances overall. Term limiting a VRE set-aside threatens the investment in, and scaling of, renewable generation.

If ARB feels that it may be desirable to end the VRE set-aside at some point, it should not choose an arbitrary sunset date now when we have no evidence to support that move. Instead, it should undertake a general market review in the future to examine the evidence and determine, through a multiparty stakeholder process, that a sunset on the set-aside is merited. If ARB decides to end the VRE set-aside, it should be careful to base the sunset on the date of project installation, not on the date of the RECs or output. Renewable developers make investment decisions based on a set of assumptions about market support. If developers do not have the regulatory certainty to make informed decisions around future projects, then risk is increased and, subsequently, fewer projects are likely to be built. (3DEGREES)

> **Response:** We believe that allowing voluntary renewable electricity to retire allowances is a transitional strategy. In general, this regulation imposes costs on GHG-emitting activities under the cap and does not in any way give credit for any kind of activities within the capped sectors that do not emit GHGs. We make a temporary exception for voluntary renewable electricity so that during the early years of the cap-and-trade program, the voluntary market can continue to sell its product as something that reduces GHG emissions. We expect voluntary use of renewables to continue to increase as electricity users seek ways to produce their own, emission-free electricity, regardless of whether it reduces the cap. As allowance prices rise, and assuming that the cost of renewable electricity will continue to fall, electricity end-users will have increasing economic incentives to purchase electricity that is not subject to a carbon price, including voluntary renewables. We added section 95870.1(c) that provides for transfer of allowances to the VRE reserve account through the budget year 2020, which covers the entire period of the cap instituted with this regulation. New section 95870(c) provides for the transfer of allowances to the VRE Reserve Account. For 2013 and 2014, 0.5 percent of the allowances will be transferred, and for 2015-2020, 0.25 percent of the allowances will be transferred each year. Our internal analysis of VRE demand led to the conclusion that the amount transferred during the first two years will likely be sufficient to meet the full demand for VRE allowance retirement. Because this is a transitional program, we cut the annual VRE reserve account allocation by 50 percent for 2015-2020.

I-84. (multiple comments)
Comment: The proposed regulation includes two separate sections that carve-out special treatment for allowances to address voluntary renewable energy projects. In section 95831(c)(6) the regulation would create an Allowance Set Aside Account for Voluntary Renewable Energy Credits and in section 95870(e) the regulation would address the means by which that account would be funded. CARB must ensure that the reduction in available allowances does not result in increased compliance costs for utilities and other compliance entities. (NCPA1)

Comment: PG&E's overarching policy principles, with respect to AB 32 implementation, are to preserve the environmental integrity of the program, while managing customer costs. PG&E believes that any proposal that removes allowances from the market must align with these principles. Therefore, any proposal to remove or retire allowances to reflect voluntary renewables should preserve the environmental integrity of AB 32 and not increase the compliance costs for utility customers and other participants. To accomplish this, we believe that it is important that any allowances removed for voluntary renewables be linked to actual generation rather than potential generation, and be based on a rigorous emissions reduction methodology associated with this renewable generation. (PGE1)

Comment: The Utilities appreciate that CARB has deferred action on the Voluntary Renewable Energy Allowance Set-Aside (VRE) and agree that it is important to allow the market to develop fully before this program element is considered. The Utilities continue to have concerns with the inclusion of a set-aside account. If this set-aside is eventually added to the cap and trade program it will, by design, remove compliance instruments from the market leaving fewer allowances available for covered entities, which in effect reduces the cap below the goal set by AB 32. This would also increase the overall costs of compliance and the compliance burden for covered entities. The Utilities recommend revisiting this issue after the end of the first compliance period so as to have a sufficient base case for analysis, and at that time determine whether this type of option can be viably integrated into the cap and trade program without unintended consequences. (MID1)

> **Response:** We modified section 95831(c)(6) and added section 95841.1 to clarify the use of the VRE set-aside account, and the requirements for retirement of allowances based on VRE. This is a transitional program or strategy, to encourage continued voluntary investment in renewable electricity during the early years of the cap, by ensuring that real GHG reductions can be claimed for VRE that meets the regulation's requirements. We do not believe that the VRE program will reduce available allowances. Because VRE must be grid-connected, it will reduce the demand for electricity from utilities, including the demand for GHG-emitting electricity. Utilities can therefore reduce purchases of GHG-emitting electricity, thus reducing demand for allowances proportionally to the amount of VRE for which allowances are retired. Although CARB need not ensure that reducing available allowances does not increase compliance costs, we do not believe this is likely. Furthermore, the VRE requirement in new section 95841.1 ensures that allowances would only be retired for actual generation rather than potential generation.

I-85. Comment: VRE set-aside should be based on the location of the eligible generators, not on the location of the purchasers. 3Degrees fully supports a generator-based approach in which allowances are retired whenever RECs from a facility in ARB's territory are purchased and retired by a customer in the VRE market with no limitation on the customer's location. WCI recently recommended this approach to guide its VRE set-aside. However, it should be noted that RGGI has based its retirement of allowances for voluntary renewable energy on the location of the buyer. We believe this would be a mistake. It should not matter where the buyer is located, but rather on where the generator is located, for two reasons:

First, if a consumer located outside California purchases RECs from a renewable generator located within California, that purchaser would have the same effect on emissions in California as an in-state purchaser. Both would reduce emissions in California.

Second, in addition to lowering emissions in California, focusing on the location of the generator is good for the California economy by encouraging out-of-state demand and offering wider markets to California-based generators.

Whether the purchaser is located inside or outside California, RECs from eligible California generators should be retired. REC retirement will generally occur in WREGIS, but if the RECs are exported to another tracking system that serves the purchaser, these too should be accepted as long as they include the necessary information to tie them back to a California generator whose RECs were originally issued by WREGIS.

The problem with basing the adjustment on the location of the renewable energy customer (i.e., limiting it to California purchasers) is that it would unnecessarily restrict the benefits to California—the economic benefits to California generators noted above, and the emission reduction benefits to California, because out-of state purchasers would be reluctant to buy from California generators if they cannot claim emission reductions. This would lead to smaller and balkanized markets for renewable energy as other states would follow California's lead. Limiting markets in this way would reduce competition and could lead to higher REC prices. (3DEGREES)

> **Response:** We agree and new section 95841.1, by requiring direct delivery of VRE electricity, bases the set-aside on the location of the generator, and not the purchaser.

I-86. Comment: 3Degrees would like to emphasize that the creation of a VRE set-aside to support renewable energy is most effective when other geographic partners create reciprocal arrangements. ARB has signaled that it intends to integrate its climate efforts with other cap and trade programs, and that it may also fashion its VRE set-aside on WCI's structure. 3Degrees encourages ARB to press for similar treatment of voluntary renewable energy among WCI's partners. Just as renewable energy generated in California and sold to voluntary buyers in New Mexico should result in retirement of California allowances, so should renewable energy generated in New Mexico and sold to voluntary buyers in California result in the retirement of a New Mexico allowance.

Further, when integrating ARB's design with WCI, there should be no state- or province-specific restrictions that balkanize the VRE market. Despite WCI's reluctance to require harmonizing its jurisdictional rules on a VRE set-aside and defining renewable generator eligibility requirements, such a uniform definition of eligible resources could account for an administrative adjustment to each partner's base budget. (3DEGREES)

Response: Although no response is required because this comment does not address the regulation, we agree that harmonization of the VRE approach throughout WCI is desirable.

I-87. Comment: The administrative adjustment to the budget should be done annually rather than for a three-year compliance period. The previously published Discussion of Concept contemplates an adjustment to the base budget for each compliance period, which is three calendar years. We recommend that the administrative adjustment for voluntary renewable energy demand be made annually so that voluntary buyers and sellers do not have to wait for three years or longer to be certain of the effect of their purchases. Annual reporting, verification and adjustments would also ensure that participants remain familiar with the administrative actions necessary to support environmental claims, and submit timely reports.

Another reason for making the administrative adjustment annually is that it would be more accurate to do a one-year projection of voluntary demand than a three-year projection. Voluntary demand may be more sensitive to annual fluctuations in general economic conditions as well as to price fluctuations based on year-to-year variations in supply and demand. A one-year ex-ante estimate of the budget adjustment needed would be more likely to reflect current conditions. An annual adjustment and retirement of allowances would also be consistent with the Green-e Energy standard for annual verification of purchases and retirements. This is important because Green-e Energy certifies the vast majority of voluntary renewable energy products.

The ex-post true-up of budget adjustments should true-up in both directions. The PDR also addressed the ex-post true-up of budget adjustments. The Discussion of Concept states, “Any earmarked allowances that resulted from the overestimation of expected reductions vs. claimed reductions could be released in the subsequent compliance period.” That is a true-up in one direction, when voluntary demand is less than the ex-ante adjustment, but there is no equivalent true-up in the other direction, when voluntary demand exceeds the ex-ante adjustment. In fact, the PDR states, “In no event could the size of this adjustment exceed a predetermined percent of the total allowances from the compliance period in question.” This is not a real true-up if it only goes in one direction. 3Degrees recommends that any shortage for a given year be remedied by increasing the succeeding year’s ex-ante adjustment by the amount of the shortage, and immediately (in the new year) retiring allowances commensurate with the shortage.

If this cannot be done, then ARB should adopt a policy of not releasing any excess allowances in the holding account, and instead carrying them forward to be used in any year when voluntary demand exceeds the ex-ante adjustment for that year. This issue is critical because it will be impossible to ensure that a purchase is meaningful if it is uncertain that it will result in the retirement of equivalent allowances. Purchasers have to know that they are going to get what they think they are buying.

The ex-ante estimate of budget adjustment needed should be based on WREGIS data. The PDR suggests that the National Renewable Energy Laboratory (NREL) provide an estimate of voluntary renewable energy demand for the ex-ante budget adjustment. NREL is an outstanding institution, and is the source of a great many useful reports and analyses, but it has limited access to data on the location of the renewable generators that produce the electricity and renewable energy certificates (REC). Generator location data is critical for ARB's purpose because any adjustment that is made to the emissions budget should be based only on generation located in California or in WCI states whose emissions are similarly capped.

To create the ex-ante estimate, ARB should first establish the most recent annual demand (we will call it the baseline), then update that using recent growth in demand to estimate the necessary adjustment to the upcoming budget year. The best source for baseline data—based on accuracy, comprehensiveness and administrative convenience—is the Western Renewable Energy Generation Information System (WREGIS). Each certificate issued by WREGIS contains vital information about the energy source, generator location, date the generator began commercial operation, and other attributes of the MWh generated. WREGIS also assigns each certificate a unique serial number, a fact which is essential to verification of no double counting. WCI has already recommended its partners use an established REC tracking system like WREGIS as the basis for allowance retirements from a VRE set-aside.

WREGIS is also ideal to this task because it is comprehensive. It includes all RECs issued to California generators registered in WREGIS, regardless of whether those RECs are sold as an unbundled product, bundled with electricity and sold as green power, or generated by distributed generation and consumed onsite.

Retail sellers of renewable electricity or RECs should have to indicate in their WREGIS accounts the number and serial numbers of the certificates sold to (and retired for) voluntary purchasers. Again, the certificates will indicate whether they were issued to California generators or to generators in other capped states. After the end of a calendar year, WREGIS could then produce a report showing the sum total of voluntary sales from eligible California (or WCI partner) generators.

For the second step in the ex-ante estimate, ARB (or the California Energy Commission, or NREL for that matter) would project the baseline ahead to the upcoming budget year using the percentage change in voluntary renewable energy sales between the two most recent years with full data. To illustrate, let us assume that we are in 2011 and that we need to estimate the adjustment to the 2012 base budget. ARB would obtain a report from WREGIS on voluntary sales from eligible generators for calendar year 2010. The 2010 baseline would be adjusted two years to 2012 by using the annual growth rate in voluntary sales, also shown by WREGIS reports, from 2009-2010. This approach is not complicated, uses highly reliable data, and could be done and reported out by ARB staff showing all data and calculations for transparency.

The final step in the ex-ante adjustment would be as described in the PDR's Discussion of Concept. Using the projection of voluntary demand in MWh, ARB would calculate, using a California-appropriate emissions factor, a commensurate number of allowances representing reduced emissions due to this expected level of voluntary demand for eligible renewable energy. This number of allowances would then be withheld from the base budget, and earmarked and held in ARB's holding account. (3DEGREES)

> **Response:** Although these comments were submitted during the 45-day comment period, they do not address the regulation, but instead address the preliminary draft regulation (PDR) which was released before the beginning of the regulatory process. When the regulation was released, section 95831(b)(6) created the VRE Reserve Account, but staff continued to work with stakeholders to craft the language regarding the allowance budget for the account, the yearly allocations, and the rules for retirement of allowances. We took into account the comments of 3DEGREES and many other stakeholders and modified section 95831(b)(6) and added sections 95841.1 and 95870(c) to provide for retirement of allowances from the VRE Reserve Account to encourage VRE. We believe our regulatory approach to the allowance budget provides the best certainty for the market, and will encourage rapid development of voluntary renewable electricity in the early years when most needed. This is a transitional program and reduces the VRE allocation in the later years of this regulation, because we expect the price effect of the regulation to continue to encourage VRE even if though the set-aside percentage will be reduced after 2014.

I-88. (multiple comments)
Comment: ARB's December 2009 Preliminary Review Draft (PDR) suggested that there would be a fixed cap ("predetermined percent") of the total allowances that could be used for the budget adjustment for VRE demand. REMA urges ARB not to adopt a pre-determined cap and to allow the budget adjustment to be determined solely by the ex-ante estimate of need based on demonstrated demand.

It should not be the case that only some voluntary demand reduces emissions; every emission-free mega-watt hour (MWh) of renewable energy supported by voluntary demand offers the same greenhouse benefits and should be recognized by eligibility to retire allowances. A pre-determined cap would introduce risk and uncertainty regarding environmental claims. Again, it is important that purchasers know that they will get what they think they are purchasing. The rationale for a cap on the administrative adjustment is usually to protect emitters from having to acquire scarcer (and possibly more expensive) allowances. But every renewable MWh generated to the grid reduces the number of MWh (and emissions) generated from other sources, thereby reducing the need for allowances. When both supply of and demand for allowances are reduced by an equal amount, the price of allowances should be unaffected. If there must be a cap on the number of allowances that can be placed in the Holding Account as an administrative adjustment, then there is no need to do the ex-ante estimate of budget adjustment for the voluntary market for renewable energy. Should ARB implement a cap on the VRE set-aside, the fixed number or percent of allowances should simply be placed into the Holding Account. RGGI provides an example. Should ARB instead to pursue a cap on the number of allowances that can be placed in the Holding Account, REMA strongly recommends that the cap be subject to periodic review and adjustment prior to the start of each three-year compliance period, or that an automatic review be triggered whenever demand exceeds the cap for two years in succession.

Prohibit a time limit on the VRE set-aside. If renewable technology costs become competitive, and there is sufficient supply relative to demand that REC prices are low, we can put more renewables on the grid, reduce greenhouse gas emissions, and thereby reduce the need for allowances. While RGGI has not incorporated such as limit, and no RGGI members have embraced it, WCI has recommended that its partner jurisdictions choose "whatever time limit" (if any) that is found appropriate for that jurisdiction." If ARB nevertheless feels that it may be desirable to end the VRE set-aside at some point, it should not choose an arbitrary sunset date now when we have no evidence to support that move. Instead, it should undertake a general market review in the future to examine the evidence and determine, through a multiparty stakeholder process, that a sunset on the set-aside is merited. Finally, if ARB decides to end the VRE set-aside, it should be careful to base the sunset on the date of project installation, not on the date of the RECs or output. Term limiting a VRE set-aside threatens the investment in and scaling up of renewable energy generation.

REMA fully supports a generator-based approach in which allowances are retired whenever RECs from a facility in ARB's territory are purchased and retired by a customer in the VRE market with no limitation on the customer's location. It should not matter where the buyer is located, but rather on where the generator is located, for two reasons:

- If a consumer located outside California purchases RECs from a renewable generator located within California, that purchaser would have the same effect on emissions in California as an in-state purchaser. Both would reduce emissions in California.
- In addition to lowering emissions in California, focusing on the location of the generator is good for the California economy by encouraging out-of-state demand and offering wider markets to California-based generators.

REC retirement will generally occur in WREGIS, but if the RECs are exported to another tracking system that serves the purchaser, these too should be accepted as long as they include the necessary information to tie them back to a California generator whose RECs were originally issued by WREGIS. The problem with basing the adjustment on the location of the renewable energy customer (i.e., limiting it to California purchasers) is that it would unnecessarily restrict the benefits to California. Limiting markets in this way would reduce competition and could lead to higher REC prices.

REMA would like to emphasize that the creation of a VRE set-aside to support renewable energy is most effective when other geographic partners create reciprocal arrangements. ARB has signaled that it intends to integrate its climate efforts with existing programs like WCI, and that it may also fashion its VRE set-aside on WCI's structure. REMA encourages ARB to press for similar treatment of voluntary renewable energy among WCI's partners. Just as renewable energy generated in California and sold to voluntary buyers in Oregon should result in retirement of California allowances, so should renewable energy generated in Oregon and sold to voluntary buyers in California result in the retirement of an Oregon WCI allowance. Further, when integrating ARB's design with WCI, there should be no state or province-specific restrictions that balkanize the VRE market. Despite WCI's reluctance to require harmonizing its jurisdictional rules on a VRE set-aside and defining renewable generator eligibility requirements, such a uniform definition of eligible resources could account for an administrative adjustment to each partner's base budget.

The previously published ARB Discussion of Concept contemplates an adjustment to the base budget for each compliance period, which is three calendar years. We recommend that the administrative adjustment for voluntary renewable energy demand be made annually so that voluntary buyers and sellers do not have to wait for three years or longer to be certain of the effect of their purchases. Annual reporting, verification and adjustments would also ensure that participants remain familiar with the administrative actions necessary to support environmental claims, and submit timely reports. Another reason for making the administrative adjustment annually is that it would be more accurate to do a one-year projection of voluntary demand than a three-year projection. Voluntary demand may be more sensitive to annual fluctuations in general economic conditions as well as to price fluctuations based on year-to-year variations in supply and demand. A one-year ex-ante estimate of the budget adjustment needed would be more likely to reflect current conditions. An annual adjustment and retirement of allowances would also be consistent with the Green-e standard for annual verification of purchases and retirements. This is important because Green-e certifies the vast majority of voluntary renewable energy products.

The PDR also addressed the ex-post true-up of budget adjustments. The Discussion of Concept states, "Any earmarked allowances that resulted from the overestimation of expected reductions vs. claimed reductions could be released in the subsequent compliance period." That is a true-up in one direction, when voluntary demand is less than the ex-ante adjustment, but there is no equivalent true-up in the other direction, when voluntary demand exceeds the ex-ante adjustment. In fact, the PDR states, "In no event could the size of this adjustment exceed a predetermined percent of the total allowances from the compliance period in question." This is not a real true-up if it only goes in one direction. REMA recommends that any shortage for a given year be remedied by increasing the succeeding year's ex-ante adjustment by the amount of the shortage, and immediately (in the new year) retiring allowances commensurate with the shortage. If this cannot be done, then ARB should adopt a policy of not releasing any excess allowances in the Holding Account, and instead carrying them forward to be used in any year when voluntary demand exceeds the ex-ante adjustment for that year. This issue is critical because it will be impossible to ensure that a purchase is meaningful if it is uncertain that it will result in the retirement of equivalent allowances. Purchasers have to know that they are going to get what they think they are buying.

The PDR suggests that the National Renewable Energy Laboratory (NREL) provide an estimate of voluntary renewable energy demand for the ex-ante budget adjustment.

NREL is an outstanding institution, and is the source of a great many useful reports and analyses, but it has no data on the location of the renewable generators that produce the electricity and renewable energy certificates (REC). Generator location data is critical for ARB's purpose because any adjustment that is made to the emissions budget should be based only on generation located in California or in WCI states whose emissions are similarly capped. To create the ex-ante estimate, ARB should first establish the most recent annual demand (we will call it the baseline), then update that using recent growth in demand to estimate the necessary adjustment to the upcoming budget year. The best source for baseline data—based on accuracy, comprehensiveness and administrative convenience—is the Western Renewable Energy Generation Information System (WREGIS). Each certificate issued by WREGIS contains vital information about the energy source, generator location, date the generator began commercial operation, and other attributes of the MWh generated. WREGIS also assigns each certificate a unique serial number, a fact which is essential to verification of no double counting. WCI has already recommended its partners use an established REC tracking system like WREGIS as the basis for allowance retirements from a VRE set-aside. WREGIS is also ideal to this task because it is comprehensive. It includes all RECs issued to California generators registered in WREGIS, regardless of whether those RECs are sold as an unbundled product, bundled with electricity and sold as green power, or generated by distributed generation and consumed onsite. Retail sellers of renewable electricity or RECs should have to indicate in their WREGIS accounts the number and serial numbers of the certificates sold to (and retired for) voluntary purchasers. Again, the certificates will indicate whether they were issued to California generators or to generators in other capped states. After the end of a calendar year, WREGIS could then produce a report showing the sum total of voluntary sales from eligible California (or WCI partner) generators. For the second step in the ex-ante estimate, ARB (or the California Energy Commission, or NREL for that matter) would project the baseline ahead to the upcoming budget year using the percentage change in voluntary renewable energy sales between the two most recent years with full data. The final step in the ex-ante adjustment would be as described in the PDR's Discussion of Concept. (REMA)

Comment: We are concerned about the WCI recommendation that RECs have no role in cap and trade accounting. In the spring of 2010, the Western Climate Initiative (WCI) announced a recommendation to Partner states and provinces that, in a nutshell, unbundled REC purchases by regulated entities in the electricity sector should not reduce their compliance obligation. On May 27, 2010, CRS submitted a comment letter explaining the reasons why we believe this approach is misguided. Not least, this counters accepted best practice that null power should be assigned a system power profile. The approach would undermine the commonly accepted definition of RECs as containing the environmental benefits of the renewable energy generation that produced the REC. This hard-won and now commonly accepted definition has been enshrined in existing contracts and has facilitated impressive growth in the voluntary market over the past five years.

In response to concerns such as these, we understand that WCI's final recommendations for a VRE set aside were changed to explicitly suggest that specified null power be made be eligible for the set aside. From page 3: "WCI Partner jurisdictions should also consider requiring that renewable energy produced by VRE-eligible facilities in a non-WCI Partner jurisdictions and sold on a specified basis to the WCI Partner jurisdiction be counted as if those facilities were located in the WCI Partner jurisdiction."

We appreciate that perspectives such as those we have been offering appear to have been heard and responded to with this adjustment to the operation of the VRE Set Aside. Though we would prefer a more direct approach, whereby RECs do affect carbon accounting and null power carries associated emissions, in the absence of this first best outcome, we would support the inclusion of specified null power under the VRE Set Aside.

We do not believe that the draft Cap and Trade rule directly addresses this issue of REC accounting; however, we understand CARB is planning to follow the WCI recommended approach. That approach did not include a participatory process, not even the more limited participation usually offered as part of WCI policy development. A whitepaper discussing options was released, but there was no proposed recommendation with an opportunity to comment.

Though we see no indication that CARB is on the cusp of committing to a policy that constructs an artificial wall between RECs and carbon accounting, we reiterate that we think this would be a bad idea even with the inclusion of null power in the VRE set aside. Such a policy would create new accounting challenges and complications for existing contracts.

The VRE set aside will support the continued growth of voluntary purchases of renewable energy from both distributed generation and utility-scale facilities based within the state. These purchases are private funds going to expand clean energy generation in California. Given that this has been one of the bright spots in the California economy, policy choices to support continued growth only makes sense. As CARB has recognized, without such a VRE Set Aside, California clean energy producers wishing to sell into the voluntary market would be hampered by the fact they would no longer be able to correctly say that such purchases would lead to net emission reductions. There is demonstrated appetite amongst Californians for investment in voluntary action to reduce greenhouse gas emissions. The inclusion of a VRE Set Aside ensures that an in-state clean energy option continues to exist for these funds. (CRS)

Comment: NextEra Energy was pleased to see ARB recognize the importance of the voluntary renewable energy market. We look forward to working with ARB in developing sections 95870(e) and 95831 (c)(6) in 2011. An accounting mechanism for voluntary renewable energy purchases needs to be established to allow renewable energy projects located within California to participate in the voluntary renewable energy market. This can be accomplished most effectively through an off the top set-aside pool of allowances. Similar programs have been established in 9 of 10 RGGI states. The contribution from the voluntary purchase renewable energy credits to the development of new clean energy projects should not be ignored. The clean energy development that the off-the-top approach provides will put California in a better position to meet its long term goals (i.e. post-2020). The additional early (i.e. pre-2020) clean energy development will mean less reductions will have to be found in the long term, which will potentially reduce future allowance prices. Again, there are many other environmental and economic benefits beyond these reduced allowance prices.

The voluntary renewable energy set-aside should be estimated in advance of each compliance period and then the appropriate volume of allowances removed from total pool of allowances created under the cap. Information from the National Renewable Energy Laboratory, the Western Region Electricity Generation Information System, and other public data sources should serve as the basis for determining the quantity of allowances to be set-aside under the cap in advance of each compliance period. At the end of a compliance period, program administrators should reconcile voluntary demand estimates with actual generation. The difference between estimated and actual demand can be accounted for by adding to or subtracting from the set aside for the next compliance period.

ARB should consider the location of the renewable energy generator for eligibility. The RGGI program provides useful insight into how an off-the-top system can work. (NEXTERAENERGY)

> **Response:** The comments do not address the regulation. They address the PDR, the WCI process, and other documents prepared for discussion prior to the start of the formal rulemaking process for the cap-and-trade regulation. These comments, however, shaped the regulation submitted for formal rulemaking.
>
> Because of the transitional nature of this program, we have set the percentage of allowances allocated each year to the VRE Reserve Account. Setting a percentage of allowances, reducing the amount in later years, and sunsetting the program are all part of our transitional approach. Therefore we did not follow the recommendations of REMA and others that would prefer a permanent, demand-based approach. We reiterate that, in the future, the price effect is expected to provide an incentive to produce electricity that is GHG-emission free. Thus, in the future, a set-aside of allowances for VRE should not be necessary to support the VRE market.

I-89. (multiple comments)
Comment: We request the implementation of the proposed rule provision that provides for "Voluntary Renewable Energy Allowance Set-asides" under Sub Article 8, Disposition of Allowances, section 95870 (e), as soon as the cap is implemented. The set-aside allowance pool needs be maintained of sufficient size to encourage and stimulate renewable energy projects. These set-aside allowances should be preferably

limited and made available only to renewable energy projects that are determined to be "additional" and surplus, similar to that which must be demonstrated for an "offset" or emission reduction credit project. Projects eligible for the set-asides need to be those that would not have taken place under baseline "business as usual" market conditions. This requires a demonstration that without the value of the set-aside allowance, the renewable energy project economics would not be favorable. Specifically this should include projects which utilize biomass wastes that would have otherwise been open burned. We further recommend the GHG value of the set-aside allowance be determined using the average statewide GHG electricity emissions factor from the previous year (tons GHG per MWh electric). (PCAPCD)

Comment: Following the WCI recommendations, renewable energy generated within California and sold into the voluntary market should be eligible for the set-aside. (KUSTIN09)

> **Response:** We modified section 95831(b)(6) and added sections 95841.1 and 95870(c) which will implement the Voluntary Renewable Energy “set-aside” program allowing retirement of allowances from the VRE Reserve Account pursuant to section 95841.1. We believe our approach provides an incentive for VRE projects that will be additional, and that those projects would not take place without this incentive. Section 95841.1 makes renewable energy generated in California and sold into the voluntary market eligible for the “set-aside,” provided the participants meet the requirements of that section.

I-90. Comment: ARB should enable linkage of voluntary renewable energy set-asides with WREGIS. The proposed regulation provides for a Voluntary Renewable Energy Allowance Set-Aside Account. PacifiCorp believes that additional provisions towards preventing adverse impacts on the voluntary renewable energy (VRE) market would improve the proposed regulation. If ARB does include provisions for VRE allowance set-aside, the accounts to track VRE should be closely coordinated with the existing tracking mechanisms in WREGIS.

PacifiCorp also believes that if ARB removes allowances from the cap and trade market to reflect voluntary renewables, it should also preserve the environmental integrity of AB 32 and not increase compliance costs for utility customers and other participants. Any allowances removed for VRE should be linked to actual generation, not potential generation, and be based on a rigorous emissions reduction methodology associated with this renewable generation. (PACIFICOR1)

> **Response:** We added additional provisions sections 95841.1 and 95870(c), in part to prevent adverse impacts on the Voluntary Renewable Energy market, and we require reporting of RECs, which are issued through WREGIS, in section 95841.1(b)(2 and 3). Retirement of allowances requires actual, not potential, generation.

I-91. Comment: CIPL supports the Voluntary Renewable Energy Set-Aside. We understand that "voluntary associated entities" such as non-profit groups will be able to participate fully in the secondary markets and auctions. As legal non-profit organizations, many religious congregations are installing solar panels and undertaking other carbon-reducing measures at their facilities. With the implementation of an off-the-top voluntary renewable energy set-aside program, congregations would be assured that their actions are resulting in net emissions reductions. CIPL looks forward to working with the Air Resources Board as it develops the specific mechanisms to encourage voluntary purchases of renewable energy. (CIPAL)

> **Response:** We appreciate the support. Congregations will be able to participate in the VRE set-aside program pursuant to new section 95841.1.

Other

I-92. Comment: The renewable energy program and the GHG reduction program complement each other in that they both will reduce GHG emissions. And, both could place a substantial financial burden on ratepayers. A GHG Program that would require utilities to purchase GHG allowances while at the same time the utilities are committing substantial resources to procure renewable energy will take its toll on the financial stability of the utilities. The reality is that the ratepayer will pay for the utilities efforts to reduce GHG. To also pay for the allowances would be asking the ratepayer to pay twice and not be assured that they would see the financial benefits returned in their electric bills. We believe that the distribution of the allowances will be critical to the success of the program. There have been several proposals that very well could shift the compliance burden from one utility to another (or one region of California to another). For example, this could happen by using data from programs such as conservation, energy efficiency and renewable energy. Then, using this information to estimate the GHG reductions that were accomplished, and then using this information as the basis to provide additional allowances to a utility. These extra allowances would then be removed from another utility to maintain the established allowance cap. The utility with the reduced allowance would be placed at a disadvantage in achieving compliance with the Program goals. If ARB is considering this method, then we recommend that ARB increase the initial sector allocation to allow for the adjustments with a goal that no electric utility will have a shortfall and receive less than its original allocation. However, any program that has to rely on estimates or projections for crediting GHG emission reductions is suspect. Therefore, we recommend and support a program that utilizes a utility's GHG emissions, as reported to ARB, as the bases for determining the allocation of allowances. The resultant allocation program would be fair, straightforward, understandable and provide regulatory certainty. (WPA)

> **Response:** The allocation of allowances to utilities is based on consideration of the cost burden and early investment in emission reductions of each utility. We determined the cost burden by using utilities' plans for generation to supply their load through 2020, including the effect of policies such as the RPS and energy efficiency programs. The utilities as a group support the allocation method. We

believe that the allocation to utilities does not place any utility at a disadvantage. Furthermore, we modified section 95892(a) to clearly state that “Any allowance allocated to electrical distribution utilities must be used exclusively for the benefit of retail ratepayers.” We believe the number of allowances allocated to utilities coupled with this provision will create a good balance between allowing the pass through of carbon cost through utility rates to incentivize reduced GHG emissions, and protecting ratepayers from the full impact of both the renewable energy requirements (e.g., the RPS) and carbon costs utilities face in generating or procuring electricity.

I-93. Comment: 3Degrees would like to emphasize that the creation of a VRE set-aside to support renewable energy is most effective when other geographic partners create reciprocal arrangements. ARB has signaled that it intends to integrate its climate efforts with other cap and trade programs, and that it may also fashion its VRE set-aside on WCI’s structure. 3Degrees encourages ARB to press for similar treatment of voluntary renewable energy among WCI’s partners. Just as renewable energy generated in California and sold to voluntary buyers in New Mexico should result in retirement of California allowances, so should renewable energy generated in New Mexico and sold to voluntary buyers in California result in the retirement of a New Mexico allowance. (3DEGREES)

Response: This comment does not address the regulation. However, we added section 95841.1, which requires direct delivery of renewable VRE electricity among other conditions for the retirement of allowances in the VRE set-aside program. This provision helps ensure that VRE energy cannot be double-counted.

Combined Heat and Power (CHP)

Organizing Comments

I-94. (multiple comments)
Comment: Electric distribution utilities as a group will receive an allowance allocation roughly equivalent to 90 percent of their historical emissions for 2012. Facilities that produce electricity on-site (owned by the industrial entity, as opposed to a third-party facility physically on-site but considered off-site in the proposed regulation) and that qualify for Industry Assistance and are classified as High Leakage Risk will also likely receive a high percentage of their required allowances in a free allocation. All other CHP facilities that supply electricity to industrial hosts will be required to purchase a higher percentage or all of their required allowances. The proposed allowance allocation strategy does not create a level playing field for all electricity suppliers and may provide a disincentive to operate or install CHP. The potential for a level playing field is slim, unless the auction proceeds used for ratepayer protection are thoughtfully and equitably directed. Third-party electricity suppliers to industrial hosts eligible for assistance should receive allowance allocations comparable to those received by the

distribution utilities. No such protection is envisaged in the proposed regulation for CHP installed at sites not considered a leakage risk. (CACC)

Comment: The ISOR makes clear ARB's intent to cover the carbon costs of EITE entities' energy use to ensure they remain competitive and to avoid leakage. Depending on the mechanics of allocation, the proposed regulation could miss the mark. EITE entities have four primary options to procure electricity, and the proposed regulation provides certainty for emissions cost recovery for only one of those options. If an EITE entity produces and consumes power "on-site", its carbon costs will be covered. (2) If an entity procures power from its interconnected utility, through (3) self-generation that may not be located "on-site", or under a PUC Code section 218(b) over-the-fence transaction, the regulation is unclear about the level of coverage. To achieve CARB's stated objective, the proposed regulation should be revised to provide for carbon cost recovery by an EITE entity regardless of the entity's source of electricity. Specifically, if relying on the existing framework, CARB should provide that:

- An IOU or POU must convey free allowance value to an EITE entity through a rebate or bill credit, rather than through potential access to energy efficiency programs; alternatively, CARB should allocate free allowances to cover EITE entities' costs of carbon embedded in utility purchased power and deduct those allowances from the utility allocation.

- An EITE entity importing power from a non-utility generator through non-utility facilities should receive a free allowance allocation to cover the cost of carbon emissions associated with these imports.

- Any form of "self-generation" should be covered by a free allowance allocation provided the delivery of the power does not rely on utility delivery.

With these changes, CARB can be assured that the carbon costs associated with electricity consumed by all EITE entities will be covered in a competitively neutral way without risk of double recovery.

Market recovery of carbon costs: CARB should state its intent that CHP delivering power to the grid has a sufficient opportunity to recover carbon costs in the market price and provide for periodic review of market prices to assure that coverage.

Based on the existing regulatory framework, if an entity imports its power from a utility, the utility should be required to provide a direct rebate to cover those costs. (Alternatively, to ensure that all EITE entities importing power are treated equally, CARB could provide a direct allocation of allowances to these entities to cover carbon costs associated with imports). If an entity self-generates or purchases power over private wires from a non-utility, the carbon costs associated with the power should be recoverable through a direct allowance allocation. (EPUC)

Comment: For Combined Heat and Power (CHP), the regulation bases allocation for exported power from CHP on an assumption of carbon price recovery. The regulation must put in place provisions to monitor and ensure cost recovery. There needs to be assurance that third party CHP's serving the industrial sector receive free allocations for emissions related to the energy provided to the industrial sector on the same basis as if they were included in the sector. (WSPA1, WSPA2)

Comment: The Scoping Plan identifies 4000 MWs of new CHP by 2020. A key emission reduction measure is the proposed cap and trade program. Its effect on combined heat and power (CHP) is of significant concern to the CCDC1. California Clean DG Coalition (CCDC) represents "Onsite CHP" where the system, typically less than 20 MW, is sized to the electric and thermal needs of the commercial and industrial customer. We confirmed with staff that several issues will need to be addressed after Board action on December 16. These issues deal with the flow-through of free allocations from the utilities to CHP owners, what constitutes the marginal plant for purposes of calculating GHG reductions, and education and outreach. We ask for Board direction to the staff to work with CCDC so that the ARB can achieve its goals for this technology sector. (CACDGC)

> **Response:** We agree that the carbon costs energy-intensive, trade-exposed industrial emitters (EITEs) incur from purchased electricity is an important issue. We are working to ensure a level playing field for all sources of purchased electricity. The overall approach for the cap-and-trade regulation is based on the need to internalize the cost of GHG emissions and create a price signal that will encourage investment in the most cost-effective emission-reduction projects.
>
> Electricity utilities are allocated allowances to cover part of the total cost burden on utilities. These costs include the costs of the 33 percent renewable portfolio standard, costs utilities will face to purchase allowances for their own emissions to the extent that they own emitting power plants, and costs passed through from merchant power plants and cogeneration plants that must purchase allowances. Furthermore, section 95892(a), as modified, requires that any allowances allocated to utilities be used exclusively for the benefit of retail ratepayers.
>
> The approach for allocating allowances outside of the electricity industry is to compensate EITEs for the portion of carbon costs needed to ensure that California industry can remain competitive. Most EITE facilities are allocated allowances based on the Product Output-Based Allocation methodology pursuant to section 95891(b).
>
> With this methodology, benchmarks are calculated for distinct industrial sectors, and allowances are proportional to product output. For industrial sectors that are at risk and eligible for assistance but for which a product based benchmark is not appropriate, allocations are made based on an benchmarks calculated using the Energy-Based Allocation Calculation Methodology set forth in section 95891(c). For these sectors, allocations are proportional to the use of fuel and steam.

In the calculation of both kinds of benchmarks, an adjustment factor was not made for power purchased from utilities or from non-utility providers of electricity because of the uncertainty about how purchased power will create an indirect carbon cost. It is ARB's goal to see an appropriate carbon price properly embedded in all utility rates and in the power sold from non-utility providers. In establishing the appropriate carbon price in rates, we may need to account for other greenhouse gas-reducing policies, including the 33 percent renewable portfolio standard and the impact of these programs on electric rates. We continue to work with CPUC, CEC, and the publicly owned utilities to ensure that proper carbon pricing occurs.

Once we determine to what degree EITEs face indirect carbon costs from purchased power, we could potentially incorporate compensation for these costs into the product benchmarks to help minimize leakage. Alternatively, reductions in these costs could be created in some other fashion. We will revisit this issue once the California Public Utilities Commission Proceeding addressing utility costs and revenue issues associated with greenhouse gas emissions concludes.

We do not believe that the playing field is tilted against CHP facilities that are not part of EITEs (i.e., do not produce their own generation on site). It is true that independent CHP facilities incur carbon costs, but they can generally pass through the cost of carbon to the industrial entities that purchase the electricity and thermal energy that they generate. Thus, when they pass through the costs, they are compensated through the price they charge for their products, and no protection is needed. We note that some CHP commenters assert they will not be able to pass through costs due to their long-term contracts; we respond to this issue separately. It is important for carbon costs to provide such a price signal in order to provide market incentives to use products (including electricity and thermal energy) that are less carbon intensive.

Finally, in response to the request from CACDGC and others, the Board, in its resolution, directed the Executive Officer to review the treatment of CHP facilities in the cap-and-trade program to ensure that appropriate incentives are being provided for increased use of efficient combined heat and power.

I-95. Comment: The details of how any compensation will be administered appears to be left up to the CPUC and POU governing boards. How auction proceeds are allocated could distort the market and skew choices away from installing efficient CHP to instead purchase electricity from the grid. We suggest that treating CHP facilities the same as other deliverers for allocation purposes could result in CHP facilities being economically disadvantaged if their role as a self-provider is not also accounted for. We believe that CHP facilities act essentially as their own retail provider. Consequently, the distribution of auction revenues to retail providers in proportion to the loads they serve without a comparable distribution of auction revenues to CHP facilities would treat CHP inequitably, and that this inequitable treatment would reduce the economic incentives for installing CHP facilities. We ask ARB to reconsider the joint recommendation of the CPUC and CEC on this issue. The Joint Commissions stated, "We recommend that, for CHP facilities that meet a minimum size requirement, all CHP-generated electricity that is consumed in California, whether delivered to the grid or used on-site, receive allowances on the same basis as other deliverers, and that CHP-generated electricity used onsite receive allowances on the same basis that they are distributed to retail providers." (CACC)

> **Response:** We agree that the use of value given to electric utilities will, to a large extent, depend on decisions of the CPUC and POU governing boards. We are working closely with our sister agencies and the POUs to ensure that EITEs are property compensated. However, we do not expect allowance or allowance value to be passed from utilities to CHP facilities, because CHP facilities should pass through carbon costs to their customers. Furthermore, we have coordinated closely with the CPUC and parties involved in its QF settlement process to ensure that incentives continue to exist to develop new CHP and make existing CHP more efficient.
>
> The Joint Commission's recommendation was made before we chose a primarily product benchmark-based approach to allocation. The Joint Commissions' recommendation to treat CHP as a "retail provider" would not be appropriate, given the needs of both the electricity industry and the industrial emitters covered by this regulation.
>
> We agree that there are similarities between CHP facilities and electrical distribution utilities but we do not employ the term "retail provider." CHP facilities that sell to directly to EITEs are not regulated by the CPUC. The CPUC's role in regulating the disposition of allowance value for ratepayer benefit consistent with the goals of AB 32 could not practically be duplicated for CHP facilities; hence, we do not recommend treating CHP facilities the same as electrical distribution utilities.
>
> While the treatment of indirect emissions from electricity (electricity purchased by an EITE) in the benchmarking process is not the same for indirect emissions as for emissions from self-generation, it cannot be made completely equitable until we are assured that all purchased electricity properly incorporates a carbon cost. We note that EITE's purchasing utility electricity is a much greater portion of total purchased electricity than electricity purchased directly from CHP facilities.

I-96. (multiple comments)
Comment: The proposed allowance allocation methodology for combined heat and power (CHP) facilities creates inconsistent treatment of onsite versus offsite facilities, effectively discouraging the purchase of steam and electricity from offsite CHP facilities, and, as such, provides incentives that are contrary to the goal of reducing GHG emissions by encouraging efficient, low-carbon energy production. An independent offsite CHP facility that transfers thermal energy and electricity across its fence line to

an adjacent industrial facility will receive no allowance allocations, whereas an identical onsite CHP owned by an industrial covered entity will receive thermal and electrical allowance allocations. The program should provide equivalent incentives for both offsite and onsite CHP systems. Therefore, the regulation should be amended to provide allowance allocations to offsite CHP/cogeneration facilities, as it currently does for onsite CHP systems, based on the quantity of thermal and electrical power provided directly to industrial covered entities. This equivalent treatment should be afforded to entities regardless of the ownership structure—treating leased assets the same as wholly owned assets. (APC)

Comment: The cap-and-trade program may also disrupt existing commercial arrangements for the use of CHP at industrial facilities. If a CHP facility sells thermal energy to an industrial facility that is eligible for a direct allowance allocation under section 95890(a), the industrial facility may choose to discontinue its purchase of thermal energy from the CHP facility. This could occur because thermal energy from the CHP facility would have been subject to the cost of a compliance obligation to purchase emissions allowances, whereas thermal energy produced by the industrial facility would be eligible for direct allocation. Consequently, thermal energy from the CHP would carry an incremental GHG compliance cost and could be more expensive than thermal energy produced by the industrial facility, resulting in the unintended consequence of reducing use of CHP.

To avoid this counterproductive result, emissions associated with CHP facilities should be characterized as industrial sector emissions. CHP facilities should be eligible for allowances allocated for “industry assistance” and should be included in Table 8-1. CHP facilities should receive allowances based on the Thermal Energy Based Allocation Calculation Methodology, which would effectively allocate allowances to a source based on a thermal efficiency benchmark (0.05307 GHG allowances / MMBtu). Facilities that beat the efficiency benchmark should be able to sell the surplus emissions allowances in the quarterly auctions (or bank for use in subsequent periods) and, in doing so, CARB would create an investment incentive for repowering and efficiency improvements at existing industrial CHP facilities. (PRAXAIR)

> **Response:** We expect that there will be consistent treatment of CHP, whether it is onsite or offsite, once utility rates reflect the carbon price. Furthermore, CHP will either be compensated because it is part of an EITE facility, or it will be compensated by passing through the carbon costs to a steam or power purchaser.

I-97. Comment: As the regulation bases allowance allocation for exported power from CHP on an assumption of carbon price cost recovery, the regulation must put in place provisions to monitor and ensure cost recovery. CARB should provide (specific) language in the Cap and trade regulation (to) substantially increase investors’ confidence in new or expanded CHP economics and increase the likelihood of new development—consistent with the CHP goals contained in the Scoping Plan. Without proper incentives, a CHP facility and its thermal host are disadvantaged because they take on additional GHG emissions obligations for power produced on-site that otherwise would be the obligation of the utility. The regulation's allowance distribution scheme for CHP must be designed to ensure that the infrastructure required to promote the addition of 4,000 MW of new CHP exists. (BP)

> **Response:** Stand-alone CHP facilities will need to pass through the carbon costs to the purchasers of their thermal and electricity products. We do not believe that the regulation should interfere in CHP facilities' ability to negotiate prices in the markets for electricity and steam. (See also our responses regarding CHP facilities that may be selling electricity under long-term contracts without provisions to pass through carbon costs.) Investor confidence depends on too many variables out of the control of ARB for cap-and-trade to be able to substantially increase investor confidence. We believe that the QF settlement between CHP and cogeneration operators and the utilities has greatly improved the conditions and economics for CHP development. We will continue to work with CPUC and stakeholders to ensure that this regulation creates no disincentives and creates the proper incentives for production of electricity and thermal energy in ways that minimize emissions while maximizing other CHP benefits.

I-98. (multiple comments)
Comment: CARB should monitor market prices for electricity to ensure adequate carbon cost recovery for combined heat and power facilities. CARB's Scoping Plan recognizes CHP as a specific measure in reducing GHG emissions. One potential disincentive to optimally efficient CHP development lies in the larger carbon footprint such development imposes on the industrial facility. Installing CHP increases the emissions responsibility of the facility because it requires coverage of the export emissions. But for the exports, the facility's obligation would be limited to thermal emissions from a boiler. Consequently, to invite development there must be some assurance that a facility exporting CHP power will be able to recover its carbon costs in the market. California regulators universally seem to have taken the position that recovery of carbon costs in the market price of electricity is a theoretical "given." Developers, however, and particularly industrial facilities whose core business is not electricity generation, might not be willing to bet their capital on market theory alone. Consequently, CARB should take action to ensure that CHP export power can recover its power costs in the market. Specifically, CARB should provide the following language in the ISOR rationale for section 95891(a) and (c):

> While allowances will not be allocated to industrial cogeneration to cover emissions associated with electricity exports to the grid, this limitation is based on the assumption that these entities will be able to fully recover their costs in the market.

In addition, the final regulations should provide the following language as section 95891(d):

To ensure that industry assistance through allowance allocations meets the objectives of maintaining competitiveness and avoiding leakage, the Executive Director shall annually review electricity market prices to examine the extent to which these prices permit full carbon cost recovery for efficient cogeneration facilities serving industrial facilities. If the prices do not permit full carbon cost recovery, the Executive Director shall take action to ensure full recovery following consultation with the Public Utilities Commission.

Placing this language in the Cap and trade regulation will substantially increase investors' confidence in new or expanded CHP economics and increase the likelihood of new development. (EPUC)

Comment: Existing CHP is threatened and further CHP development in California is discouraged unless CARB addresses the disincentive that exists for the larger on-site carbon footprint that comes with production of power at an industrial facility. But for the on-site power production, the facility's emission allowance obligation would be limited to thermal emissions such as those from a (potentially less efficient) boiler. As a result, an industrial facility producing and exporting CHP power must have certainty in its ability to recover this additional carbon cost in the market. California regulators universally seem to have taken the position that recovery of carbon costs in the market price of electricity is a theoretical "given." However, industrial facilities whose core business is not electricity generation will not make or maintain capital investments in CHP on market theory alone. CARB must take action to ensure that CHP can recover its carbon costs for power generation in the market price of electricity. In addition, the final regulations should provide the following language as section 95891(d):

To ensure that industry assistance through allowance allocations meets the objectives of maintaining competitiveness and avoiding leakage, the Executive Director shall annually review electricity market prices to examine the extent to which these prices permit full carbon cost recovery for efficient cogeneration facilities serving industrial facilities. If the prices do not permit full carbon cost recovery, the Executive Director shall take action to ensure full recovery following consultation with the Public Utilities Commission.

Placing this language in the Cap and trade regulation will substantially increase investors' confidence in new or expanded CHP economics and increase the likelihood of new development, which is consistent with the CHP goals contained in the Scoping Plan. (BP)

Response: We do not agree that this regulation creates a disincentive for industrial facilities that produce power. Allowances are required for on-site CHP emissions just as they are for emissions from stand-alone CHP facilities. If an industrial facility also exports power, then the exported power has not been included in the calculations that determine the benchmark. Instead, we expect the industrial facility to pass through the cost of allowances to utility purchasers and other purchasers. As noted, the QF Settlement was made in large part to provide better incentives for the continuation, expansion, and new development of efficient CHP to meet the Scoping Plan target. We will continue to work with the energy agencies to ensure that increased effective and efficient CHP is economically viable.

While we did not add the language suggested by the commenter, we modified the product output-based allocation calculation methodology (section 95891(b)) to include a true-up to account for output not properly accounted for in previous years. This will help to maintain competiveness and avoid leakage. We will also continue to monitor the electricity market and the ability of EITEs to recover the appropriate level of carbon costs in the price of electricity sold.

I-99. Comment: CARB should provide the following language in the ISOR rationale for sections 95891(a) and (c):

While allowances will not be allocated to industrial cogeneration to cover emissions associated with electricity exports to the grid, this limitation is based on the assumption that these entities will be able to fully recover their costs in the market. (BP)

Response: No response needed. The regulatory process requires no changes to the Staff Report; this Final Statement of Reasons addresses comments.

Imported Electricity to EITEs

I-100. (multiple comments)
Comment: Finally, operation of a cogeneration or self-generation plant, and decisions about additional capital expenditures to repower or enhance its efficiency, turn in part on the relative cost of operation and value of electric and thermal energy produced compared to the forecasted costs for separate electric commodity purchases from the grid and thermal energy production. If the electric distribution utilities receive free allocations that will result in a transfer of value back to customers taking electricity from the grid, but no similar value is rebated to the loads served by on-site cogeneration or self-generation, then the cost comparison will skew against use of or investment in cogeneration or self-generation. This would be inconsistent with CARB's goals to increase use of cogeneration and self-generation as a GHG emission reduction strategy. (PRAXAIR)

Comment: In various sections of the ISOR it is implied that the electricity produced by a CHP facility that is sold to an IOU or into the grid, will be governed by the same rules that will apply to independent generators competing in the electricity sector. Specifically, cogenerators will need to purchase allowances at auction for their emissions associated with the exported electricity. On October 8, 2010, the CHP Program Settlement Agreement was filed at the CPUC and an expedited schedule was adopted with the goal of securing a Commission Decision before the end of 2010. The new Short Run Avoided Cost (SRAC) energy pricing structure that will be implemented through the settlement, allows that in the event of a GHG cap and trade program in California, the energy price will be subject to a GHG Floor Test as described in section 10.2.2 of the Settlement. In this test, the energy price will be the higher of two formulas provided in this section. One of the formulas includes recovery of the GHG Allowance price up to a set heat rate for a specified calendar year. Consequently, it was envisaged in the settlement process that while the market should reflect the cost of allowances purchased by generators at auction, a GHG floor test would be available in the first compliance period to ensure a mechanism to recover the cost of carbon for those qualifying facility (QF) contracts that pre-date the mid-2000s. After the first compliance period the SRAC energy price will be at "market" and presumably the full cost of allowances will be in the market. While this seems to be a universally accepted notion, it would seem prudent for some mechanism to be put in place to regularly monitor electricity market prices to examine whether the prices permit full recovery of carbon costs for efficient cogeneration facilities. ARB appears to suggest in the ISOR, specifically in Figure J-5, that ARB will not provide an allocation of allowances to cover CHP emissions associated with exported power to a utility or to the market. This implication should be made explicit in the cap and trade regulation. (CACC)

> **Response:** Loads served by electricity generated onsite are typically the loads of an EITE that operates a production facility as well as the on-site generation. The EITE is compensated with allowances through the benchmark methodology on a per-product basis. Therefore, there is no skewing against investment in cogeneration or self-generation once the price of all purchased electricity includes an appropriate carbon cost. We fully expect utilities to pass through appropriate carbon costs in rates to EITEs to whom they sell electricity. We believe that efficient cogeneration facilities selling power and/or steam will be able to recover their carbon costs in the markets for power and steam.

No Allocation for EITE's "Exported" Electricity or Thermal Energy

I-101. Comment: Consistent with the ISOR, the regulations should clarify that CARB contemplates no allowance allocation for power exported by EITE facility CHP. A CHP policy settlement was filed before the CPUC on October 18, 2010, and is currently pending approval. Provisions of the settlement require clarification from CARB that none of the allowances allocated to EITE entities that own exporting CHP generation are intended to cover carbon costs associated with exports. The settlement provides that free allocation of allowances to cover carbon compliance costs associated with exported electricity can decrease a CHP facility's short-run marginal cost (SRAC) energy payments. The settlement on page 67-68 provides a formula for allocating free allowances between on-site use and exported power in the event that CARB or another agency fails to make clear the purpose of a free allowance allocation:

(ii) If CARB (or any other Governmental Authority) does not allocate Free Allowances received by Seller as described in subsection (i) above, then Seller shall set forth in the Free Allowance Notice the quantity of Free Allowances allocated to the energy

generated by the Generating Facility and delivered to Buyer during the applicable time period (FAd) utilizing the following formula:

*FAd = FAt * (Ge/(Ge+ Gt)) * (Ed/(Esh + Ed))*

Implicit in the regulations and ISOR is the notion that any free allowance allocation is provided only for CHP power used by the industrial host. The ISOR and accompanying appendices suggest that CARB would not provide an allocation of allowances to cover industrial CHP emissions associated with exported power, but this clarification is not reflected in the draft regulations. Importantly, Table J-7 provides that an industrial facility would be allocated allowances to cover emissions associated with heat consumed and electricity generated and used on-site. Not stated is CARB's expectation that industrial CHP must recover GHG compliance costs associated with exported power from the market. Failure to clarify this point in the Final Statement of Reasons and regulation could leave industrial CHP exposed to significant compliance costs, moving free allowances from the industrial to the utility side of the ledger. This would in turn, compromise the contemplated levels of industry assistance noted in Table 8-1 of Subarticle 8, which indicates that from 2012-2014, all industrial facilities, regardless of leakage risk, would receive 100 percent industry assistance.

To address this significant gap in the proposed regulations, the following language must be added to the following sections of section 95891:

> Section 95891(a):
>
> *"A_t" is the amount of California GHG allowances directly allocated to the operator of an industrial facility for all activities with a product output-based allocation from budget year "t."* <u>This allocation shall exclude GHG compliance costs associated with electricity generated by the facility and exported to an interconnected utility.</u>
>
> Section 95891(c):
>
> *"A_t" is the amount of California GHG allowances directly allocated to the operator of an industrial facility with a thermal energy-based allocation from budget year "t."* <u>This allocation shall exclude GHG compliance costs associated with electricity generated by the facility and exported to an interconnected utility.</u>

CARB should also consider modifications to the regulations to clarify how the treatment of exported power may impact the allowance allocation to the EITE host. (EPUC)

> **Response:** We did not add the language recommended by EPUC. However, we modified sections 95891(b) and (c) to clarify the benchmarking methodology. Neither of these sections allocate allowances explicitly to cover GHG compliance costs associated with electricity sold or "exported" by an industrial facility in the benchmarks that determine allocations to energy-intensive trade-exposed industrial facilities. In this way CHP is treated in a consistent fashion to all other

power generators selling into power markets. It is true that we expect industrial facilities to attempt to pass through as much of their GHG compliance costs as the markets for electricity and thermal energy will accept.

Allocation of New or Increased CHP

I-102. (multiple comments)
Comment: Regulations should ensure parity in allowance allocations for new or expanded reliance on CHP. Providing allowances to encourage incremental reliance on CHP will promote the Scoping Plan. Section 95853(e) provides free allowances to a new entrant in the first year following the year in which its emissions exceed the threshold in section 95812. It further provides that the allowance allocation in the first qualifying year will be "*twice the number calculated pursuant to section 95891.*" This provision should clarify that this treatment applies not only to new entrants, but that industrial facilities' increasing reliance on CHP will receive allowances in parity with other similarly-situated, existing facilities. Modify section 95853 as follows:

> *For a new entrant that is eligible to receive free allowances pursuant to subarticles 8 and 9, the first year for this entity to receive free allowances is the year ….The number of free allowances for this new entrant to receive in that year is twice the number calculated pursuant to section 95891. <u>For purposes of this provision, "new entrant" includes an existing facility that increases its reliance on cogeneration.</u>* (EPUC)

Comment: CARB should clarify that investment in new CHP or expanded reliance on CHP will benefit from the free allowances designated for new entrants in section 95853(e) in an amount that ensures parity with other similarly-situated EITE entities. (EPUC)

Comment: Transition of CHP ownership is another issue that will need to be addressed in the solution for third-party energy suppliers with existing contracts. For example, what happens if, at an EITE industrial site, the CHP facility is owned by a third party in 2012, but in 2014 it is purchased by the industrial host? If the industrial host did not emit enough emissions to be a "Covered Entity" or an "Opt-in Facility" in 2012, what happens in 2014 when the industrial host purchases the CHP facility and is suddenly responsible for the GHG emissions compliance costs associated with the CHP facility? Will the ARB provide an allocation of free allowances? The preferred solution for this issue will likely depend on the solution implemented for allowance allocation for third-party legacy contracts. (CACC)

> **Response:** For new entrants and for existing facilities that increase operations, free allocation for the purpose of leakage minimization is always aimed at encouraging efficient production. We prefer the allocation to be based on production levels wherever possible. If a facility that receives allocation based on the product-based allocation methodology increases its production capacity and also increases its reliance on CHP, its allocation will increase based on

increased production of the benchmark product, but will not be impacted by its increased onsite consumption of CHP electricity or thermal energy. We are willing to work with all industries to develop additional product benchmarks if necessary. If a facility that receives allocation based on the energy-based allocation methodology increases its reliance on CHP through a change in ownership, the allowances initially allocated for purchased steam would cover a large portion of the CHP carbon costs.

Contracts with No Pass-Through

I-103. (multiple comments)
Comment: The proposed regulation makes no allocation for generators subject to long-term contracts that do not allow for recovery of the costs associated with purchasing allowances. Nor does it otherwise provide transitional assistance to such generators until such time as their existing contracts expire or are substantively amended.

Further, while the California Public Utilities Commission's (CPUC) proposed qualifying facility (QF) settlement would allow combined heat and power (CHP) generators to recover costs associated with purchasing allowances for generation of power sold to the grid, the QF settlement does not address the allowance costs such generators will bear as a result of their obligation to provide steam and electricity to industrial consumers pursuant to long-term contracts that provide no mechanism for recovery of allowance costs. The problem affects not only generators selling power to IOUs and POUs, but also those who are selling electricity and/or useful thermal energy to nearby or collocated industrial operations under long-term contracts. These CHP or cogeneration facilities represent a highly efficient, environmentally preferable alternative to meeting industry's energy needs. For this reason, CARB has made expansion of CHP a significant component of its overall Scoping Plan, which targets an increase of 4,000 MW of installed CHP capacity within the State by 2020. This measure is intended to displace approximately 30,000 gigawatt-hours (GWh) of demand from other power generation sources, resulting in a targeted reduction of 6.7 million metric tons of CO_2e in 2020. However, without providing transitional assistance for generators subject to long-term contacts that do not allow for recovery of costs associated with purchasing allowances, the continued viability of many existing CHP generators will be seriously threatened.

Further, the CPUC's proposed QF settlement does not address the potentially serious economic consequences to CHP generators subject to long-term contracts that do not provide a mechanism for recovery of allowance costs associated with generation of electricity and steam sold to their industrial customers. Because of the importance of existing CHP facilities to assuring a highly efficient source of power and useful thermal energy for industry in California, CARB must provide transitional assistance to CHP owners subject to long-term contracts that do not provide a mechanism for recovery of GHG compliance costs. Where a covered entity or opt-in covered entity would receive a direct allocation for industry assistance under the Proposed Regulation, but that entity purchases power and/or steam from a CHP generator pursuant to a contact that provides for no recovery of allowance costs, Calpine believes that allowances attributable to the purchased power and steam should be provided to the long-term contract generator, and not the industrial host, since the industrial host would not in those circumstances experience an increase in costs associated with its purchase of such power and steam.

Calpine would propose that CARB publish a revision to the proposed regulation that provides for a direct allocation of emissions allowances to generators subject to long-term contracts that provide no mechanism for recovery of allowance costs. The proposed revisions would merely provide transitional assistance until such time as the existing contract expires or is substantively amended. Under the proposed revisions, CARB would provide allowances to qualifying long-term contract generators based upon their historic emissions, as established in their most recent verified emissions report submitted to CARB pursuant to the MRR. For conventional generators, the allocation would come from the 89 million metric tons CO_2e of allowances allocated to the load-serving entities for the 2012 budget. For cogeneration facilities, the allocation would come from the approximately 11 million metric tons CO_2e of emissions from cogeneration facilities, which the ISOR acknowledges have not been included within the 89 million tons allocated to the load serving entities, but have yet to be apportioned. This allocation to long-term contract generators would then be subject to an annual "true-up" based upon actual reported emissions for the year in which an allocation is made. No entity awarded allowances under this provision would be able to sell, transfer or otherwise use such allowances, except to meet their annual and triennial compliance obligations. Nor would they be allowed to bank such allowances for future use; any surplus allowances would be returned to the Allowance Price Containment Reserve after each annual true-up. To accomplish these changes, Calpine proposes the following revisions to the proposed regulation, which are largely based upon the provisions concerning long-term contract generators appearing within proposed federal climate change legislation and regulations implementing RGGI. Modify sections 95802, 95870, 95890, and 95894 as follows:

> 95802(a)(111) "Long Term Contract" means a sales or tolling agreement governing the sale of electricity and/or useful thermal energy from an electric generating facility or cogeneration facility at a price (whether a fixed price or price formula) that does not allow for recovery of the costs of compliance with this regulation and that is at least five (5) years in duration, provided that such agreements are not between entities that were affiliates of one another at the time at which the agreement(s) were entered into.
> (a)(112) "Long-Term Contract Generator" means a covered entity which is not an electric distribution utility and which operates an electric generating facility or cogeneration facility pursuant to one or more long-term contracts.
>
> 95870(a) Allowance Price Containment Reserve. On December 15, 2011, the Executive Officer shall transfer allowances to the Allowance Price Containment Reserve, as follows:

(c) Allocation to Public Utilities.

(1) Electrical Distribution Utilities. The Executive Officer will place an annual individual allocation in the holding account of each eligible distribution utility on or before January 15 of each calendar year from 2012-2020 pursuant to section 95892. Allowances available for allocation to electrical distribution utilities shall be 89 million multiplied by the cap adjustment factor in Table 9.2 for each budget year 2012-2020 ~~2020, less the amount of allowances for that year that are allocated to long-term contract generators pursuant to section 95894(a)~~

95890(d) Eligibility for Long-Term Contract Generators. A long-term contract generator that has demonstrated its eligibility to the satisfaction of the Executive Officer pursuant to section 95894 of the regulation shall be eligible for direct allocation of California GHG allowances if it has complied with the requirements of the MRR and has obtained a positive or qualified verification statement for the prior year pursuant to the MRR. The owner of a facility shall cease to be eligible to receive emissions allowances under this subsection upon the earliest of the definition of a long-term contract generator or the requirements of this paragraph.

95894(a) Direct Allocation to Long-Term Contract Generators. Not later than February 1, 2012, and each calendar year thereafter, the Executive Officer shall deposit in the compliance account of the owner or operator of each eligible long-term contract generator a quantity of emission allowances of the same vintage year that is equal to the average number of tons of greenhouse gas emitted as a result of sales pursuant to long-term contracts during the three preceding calendar years. Any allowances received by a covered entity pursuant to this paragraph shall remain within such entity's compliance account and shall not be transferred or sold to any other party or used for any other purposes, other than to satisfy the annual or triennial compliance obligation of the covered entity.
(b) Demonstration of Eligibility. To be eligible to receive a direct allocation of allowances under this section, an authorized representative of a long-term contract generator shall submit each of the following in writing to the Executive Officer no later than September 30 of the year preceding the calendar year for which it is seeking an allocation:

(1) A copy of any long-term contracts for which it is seeking an allocation;
(2) A statement certifying that each such long-term contract does not allow the covered entity to recover the cost of GHG allowances from the counterparty purchasing electricity and/or useful thermal energy from the facility;
(3) A statement that the long-term contract was originally executed prior to January 1, 2007, remains in effect and has not been amended since the effective date of this regulation to change the terms governing the price or amount of electricity or useful thermal energy sold or the expiration date;
(4) A statement of the covered entity's total GHG emissions reported pursuant to the MRR for the three preceding calendar years;

(5) A statement of the covered entity's GHG emissions during the three preceding calendar years resulting from sales of electricity and/or useful thermal energy pursuant to qualifying long-term contracts; and

(6) The following certification statement by the authorized account representative or any alternative authorized account representative: "I am authorized to make this submission on behalf of the long-term contract generator requesting allowances. I certify under penalty of law that I have personally examined, and am familiar with the statements and information submitted with this document and all its attachments. Based on my inquiry of those individuals with primary responsibility for obtaining this information, I certify that the statements and information are to the best of my knowledge and belief true, accurate, and complete. I consent to the jurisdiction of California and its courts for purposes of enforcement of the laws, rules, and regulations pertaining to title 17, article 5, sections 95800 et seq., and I am aware that there are significant penalties for submitting false statements and information or omitting required statements and information, including the possibility of fine or imprisonment."

If, subsequent to the submittal of the foregoing information and supporting documentation, there is any material change in the information and statements provided to the Executive Officer, the persons who submitted such information and statements shall submit a supplemental certification and supporting material addressing any such material change within 30 days after the change occurs. For purposes of this paragraph, a long-term contract shall be deemed to be originally executed prior to January 1, 2007 if it was originally executed prior to such date, but was subsequently amended and restated prior to the effective date of this regulation due to the bankruptcy or reorganization of the long-term contract generator or its parent company or affiliate.

(c) Determination of Eligibility. Upon receipt of the information required by paragraph (b) of this section, the Executive Officer shall determine whether the party submitting such information has demonstrated that it is eligible to receive a direct allocation of allowances pursuant to this section and shall notify that party of his other determination by January 30 of the calendar year for which the allocation is sought.

(d) Annual True-Up Obligation. By March 1 of the year following the calendar year for which allowances have been provided pursuant to this section, the long-term contract generator shall submit a report to the Executive Officer stating the actual emissions of GHG resulting from a sales of electricity and/or useful thermal energy pursuant to qualifying long-term contracts during the preceding calendar year.

(1) Distribution of Surplus Allowances to Long-Term Contract Generators with a Shortfall. If the amount of allowances previously allocated by the Executive Officer to a long-term contract generator for any given calendar year exceeds the long-term contract generator's actual emissions resulting from the sales of electricity and/or useful thermal energy pursuant to qualifying long-term contracts during such calendar year, the Executive

Officer shall deduct the surplus allowances from the long-term contract generator's compliance account and shall then distribute them to long-term contract generators that reported a shortfall in the amount of allowances previously allocated to them for a given calendar year, in comparison to their actual emissions resulting from the sale of electricity and/or useful thermal energy pursuant to qualifying long-term contracts during such calendar year.

(A) If the amount of surplus allowances available for distribution for a given calendar year is less than the shortfall reported by all long-term contact generators for the same calendar year, the Executive Officer, shall distribute an equal percentage of the surplus allowances to each long-term contract generator that experienced a shortfall, with the numerator equal to the total amount of surplus allowances to be distributed and the denominator equivalent to the total shortfall experienced by all long-term contact generators for such calendar year. For example, if the total number of surplus allowances available for distribution pursuant to this paragraph is 100,00 metric tons of CO_2e and the total shortfall claimed by five long-term contract generators is 200,00 metric tons of CO_2e, then each of the five long-term contract generators would receive allowances in an amount equivalent to 50 percent of its respective shortfall.

(B) If the amount of surplus allowances available for distribution for a given calendar year is greater than the shortfall reported by all long-term contract generators for such calendar year, the Executive Officer shall transfer the remaining portion of surplus allowances to the Allowance Price Containment Reserve administered pursuant to section 95913 of this regulation.

(2) The requirements of this paragraph shall not change the date when a covered entity's reporting obligation is due under MRR.

As an alternative to a direct allocation to the long-term contract generators, the proposed regulation could be revised to require that the electric distribution utilities set aside a portion of the allowances allocated to them pursuant to section 95892 to meet the compliance obligation for all power purchased pursuant to long-term contracts. The electric distribution utilities would then be required to transfer the necessary allowances to the long-term contract generators' compliance accounts within 30 days of the relevant surrender date for the annual and triennial compliance obligations. Under this approach, the allowances attributed to CHP generators' sale of power and steam to industrial hosts could also be drawn from the pool of allowances allocated to the load serving entities, assuming that CARB added to that pool the approximately 11 million metric tons of emissions attributable to cogeneration, which are not reflected by the load serving entities' current allocation of 89 million metric tons CO_2e for 2012. (CALPINE1, CALPINE2

Comment: The issue of existing contracts for third-party thermal energy supply and electricity supply (collectively referred to as “energy supply”) does not appear to have been fully contemplated in the proposed cap-and-trade regulation. Figure J-5 indicates that Heat Sold and Electricity Sold will have “Full Carbon Cost Pass-Through”, but qualifies these statements by “assuming no existing contract issues.” For the CHP sector, this assumption is more likely to be the exception rather than the rule. The majority of CHP contracts were executed with industrial hosts prior to the passage of AB 32 and do not contain provisions for carbon cost pass-through. Natural gas-fired CHP facilities are inherently energy intensive. CHP facilities that can pass through carbon costs are not trade exposed, but those facilities with existing contracts that do not allow any carbon cost pass-through are arguably more trade exposed than any other industry in California. Unlike other energy intensive trade exposed (EITI) sectors, third-party CHP facilities with existing contracts are not eligible for any allowance allocation. The cap-and-trade program needs to have some mechanism to address this issue. The concern about legacy contracts may be a transition issue. When the commercial agreement between parties expires, any new agreement could include carbon cost recovery provisions. (CACC)

> **Response:** We believe that the best way to solve problems with contracts that do not include specific provisions for addressing carbon costs is to amend the contracts. In this response, we focus on issues regarding long-term contracts for electricity, and we consider contracts for steam in the next response. We are aware of a potential inequity if generators, be they CHP facilities or other electricity generators, cannot pass through carbon costs to purchasers. Stakeholders that are party to contracts for which there are no cost pass-through provisions approached ARB prior to the release of the proposed cap-and-trade regulation. ARB staff collaborated with industry to develop a survey to assess the magnitude of the issue. Staff received information from stakeholders representing over 50 generation facilities. In addition, many stakeholders have informally discussed their long-term contract issues with staff. Most of the long-term contract issues concern CHP facilities, while a smaller number involve electricity generators that do not also provide useful thermal energy. In this response, we consider long-term contract issues for CHP facilities; other long-term contract issues are covered in a separate section of response.
>
> Based on information provided by stakeholders, we have divided long-term contracts into categories based on how we expect the cost pass-through issue to be resolved. Many CHP facilities provide electricity to an IOU. CCAC, an association that represents cogeneration facilities told us informally in an email that “all 16 facilities [members of CCAC with long term contract issues] provide wholesale electric sales to an investor-owned utility, and that portion of their output is covered by the avoided cost pricing in the CHP QF settlement agreement.” The same email noted that many of these facilities sell steam or steam and electricity to an industrial host, and that the majority provide energy to EITEs. Furthermore, if there are remaining contract issues regarding sale of electricity to utilities, we believe that they can be resolved through the CPUC

proceeding addressing utility cost and revenue issues associated with greenhouse gas emissions. This process began when the CPUC issued an Order Instituting a Rulemaking in March 2011, and we understand from the CPUC that pass-through of carbon costs in long-term contracts will be addressed. We believe that this is the proper venue to resolve contract issues for electricity sold by CHP generators to IOUs.

Other CHP generators sell electricity to EITEs. Some of the contracts commenced or were amended after AB 32 became law. We believe that facilities that negotiated these contracts had the opportunity to include provisions for future carbon costs, and no action by ARB is needed.

Some stakeholders have claimed long-term contract issues for facilities that either have no compliance obligation or a very small obligation. These include some biomass facilities, which may combust a small amount of fossil fuel, and others that are below the threshold for a compliance obligation. Since these facilities have little or no compliance cost, they have no cost pass-through issues to resolve.

Other CHP facilities may be able to resolve issues by switching from high-emitting fuels such as coal or coke to lower-emitting fuels, and by renegotiating contracts with their counterparties.

We have strongly encouraged stakeholders on both sides of these contracts to renegotiate these contracts so that the sellers are not disadvantaged and costs are passed through.

There is a very wide variety of ways to account for risk in electricity contracts. Even with the information provided in response to the survey, it is not clear how issues of risk were resolved. We are encouraged by progress reported by entities that have begun the renegotiation process.

The calculation of allocation to utilities is based on assumptions of carbon cost pass-through from generating facilities. We are still considering withholding allowances from utilities that do not face carbon costs due to long-term agreements with a generator that truly prevents the generator from recovering any carbon costs. This change would require a future regulatory action.

Steam Contracts with No Pass-Through

I-104. (multiple comments)
Comment: CARB is developing protocols for combined heat and power ("CHP") facilities related to the allocation of compliance responsibility between the electric and thermal components of the CHP operations. IEP supports this initiative. However, solving the allocation of compliance responsibility between the electric and thermal components of the CHP operation will not be sufficient, because not all CHP facilities

are similarly situated. Specifically, the proposed regulation does not address the condition in which a CHP project contractually provides electrical output to the grid and, via a separate contract, it sells steam to the thermal host; and the steam contract fails to provide a reasonable means of cost recovery to the merchant generator for any GHG compliance costs that it may bear in relation to the steam production. In this situation, the CHP entity may have two separate contracts in which the electric contract OR the steam contract fails to provide a reasonable expectation of recovery of GHG costs incurred by the CHP entity. In this situation, the steam contract should be treated similarly to the electric contract (proposed above). Accordingly, the proposed regulation must be modified to provide the Executive Officer the authority to address this situation. IEP recommends that the proposed regulation should be amended to clarify that CHP entities, upon a requisite showing to CARB that they are unable to reasonably recover the costs of GHG allowances associated with their pre-existing steam contracts, will be provided directly from CARB free allowances sufficient to meet their GHG regulatory obligations associated with the production of the steam for their thermal host. Modify section 95891(a), under Allocation for Industry Assistance, as follows:

(a) The Executive Officer shall determine the amount of allowances directly allocated to each eligible covered entity or opt-in covered entity using the product output-based benchmarking allocation calculation methodology specified in subsection (b) if the entity is from the sector listed in both Table 8-1 and Table 9-1. The Executive Officer shall determine the amount of allowances directly allocated to each eligible covered entity, or opt-in covered entity using the thermal energy-based benchmarking allocation calculation methodology specified in subsection (c) if the entity is from the sector listed in Table 8-1 but not listed in Table 9-1. <u>The Executive Officer shall determine the amount of allowances directly allocated to eligible covered entities providing steam for industrial processes for which a reasonable means of cost recovery for allowances associated with the production of steam is unavailable. In making this determination, the Executive Officer shall use the thermal energy-based benchmarking allocation calculation methodology specified in (c).</u> (IEPA)

Comment: PEB has a long term steam sales agreement with UC-8 that expires in August 2017. This long term agreement has no mechanism in which to pass through any GHG costs that PEB incurs while meeting its contractual obligations to UC-8. PEB, on average, supplies the UC-8 campus with 1,050,000 MMBtu/year and any future GHG costs (that cannot be recouped by a pass through mechanism) would be economically devastating to PEB. The impact of the "Proposed Regulation to Implement the California cap-and-trade Program" (proposed regulation) on Combined Heat and Power (CHP) facilities is an issue of significant importance to PEB as we evaluate the regulatory landscape of California and consider options under the CHP Program Settlement Agreement. These options for PEB include whether to sign contract amendments adopting an energy payment calculation based on perceived exposure to GHG risk, repower the existing facilities or develop a new project on the UC-B campus. (MAZOWITA)

Comment: ARB should consider altering allowance allocation for cogeneration facilities owned by electric utilities with long-term steam sales. SMUD invested in three cogeneration facilities in the 1990's to encourage cleaner electricity generation and low-emissions industrial facilities. The plants jointly produce roughly 1,000,000 tonnes of CO_2 per year, nearly 10 percent of which is associated with steam sales made to four industrial heat hosts. Because these heat hosts are counterparties in long-term steam sales agreements with no clauses for pass-through of carbon costs associated with cap and trade regulations, SMUD feels it is important that the ARB allocate the allowances that otherwise would have been allocated to these heat hosts had they been responsible for an emissions obligation instead to the cogeneration facilities who will have the financial obligation for compliance with the cap and trade regulation for these emissions. SMUD is not able to re-open the contracts without substantial risks, and it is unlikely that the heat hosts would agree to re-opening the contracts due to lack of benefit to them as well as past difficulty in negotiating these contracts at the outset of the agreements. (SMUD1)

> **Response:** We believe that the best way to solve problems with contracts that do not include specific provisions for addressing carbon costs is to amend the contracts. Parties to contracts have many ways of handling a great variety of risks within contracts, including, for example, regulatory cost risks. We have no way of knowing what risks were taken into account when long-term contracts for steam were put in place.
>
> In addition to questions about what risks were considered, there are questions about how hard or easy it would be to renegotiate a contract to allow pass-through of some or all of the carbon costs.
>
> With reference to the comments above from CACC, Calpine, and IEPA, we note that many of these contracts are between oilfield cogeneration facilities and petroleum producers, frequently providing thermal energy that is used primarily for enhanced oil recovery. In many cases, the purchaser of the steam is an EITE in the crude petroleum and natural gas extraction industry, or the natural gas liquid extraction industry. The thermal energy provider may be the only available source of the thermal energy and may be in a strong position to renegotiate. Furthermore, in some cases, the CHP facility providing thermal energy is a subsidiary of a covered EITE in the oil and gas industry. In these cases, the owner of the parent firm is allocated allowances under the regulation, even if the CHP facility per se is not.
>
> We did not modify the regulation as requested by IEP because such a one-size-fits-all would not be appropriate for many situations. It would be very difficult, if not impossible, for the Executive Officer of ARB to determine what kind of risk trade-offs were made internally by either party to a long-term steam contract.
>
> It appears that one option is to sign contract amendments adopting an energy payment calculation that includes GHG risk. We recommend proceeding with

that option where acceptable to both counterparties. Alternatively, repowering or developing a new project could potentially reduce GHG emissions while also occasioning a new contract.

If SMUD's steam hosts qualify as EITEs they may be eligible for allowance allocation. It appears from the comment that SMUD has not yet asked the steam hosts to consider reopening the contracts, as recommended by ARB to all stakeholders with long-term contact issues. The counterparties may also face risks if contracts are re-opened.

Allocation for leakage prevention and transition assistance is based on an assumption of purchased steam creating a carbon cost. We are still considering withholding allowances from EITEs that do not face carbon costs in cases where long-term contracts prevent thermal energy sellers from recovering these costs. This change would require a future regulatory action.

Threshold-Incentive

I-105. Comment: A commercial/industrial customer should not be bumped over the cap-and-trade threshold of 25,000 $MTCO_2e$ because of clean Onsite CHP. A 4–5 MW CHP system can trigger the 25,000 $MTCO_2e$ threshold even if there are no other GHG emission sources onsite. As most sites will already have some level of natural gas use, the threshold could be reached with CHP systems much smaller than 4 MW. Cap-and-trade has a negative stigma associated with it which will affect the CHP decision process for commercial/industrial customers facing Cap and Trade compliance only if they install CHP. In addition to the perception that CARB is looking at CHP as a carbon emitter, other customer deterrents regarding Cap and Trade include the cost and complexity of obtaining carbon allowances and the extra scrutiny, monitoring and reporting that will be required. We strongly recommend that customers facing Cap and Trade because of CHP be exempted. (CACDGC)

Response: Most commercial/industrial customers below the threshold have GHG emissions primarily from natural gas. When delivered natural gas is covered starting in 2015, and carbon costs are passed through from natural gas and electric utilities to commercial/industrial users, these users will face carbon costs on all direct and indirect emissions. Few CHP systems from 4-5 MW have been built or are currently planned. Commercial and industrial facilities will benefit from installing efficient CHP and lowering their total carbon footprint by the time most of these systems can be planned and built. We encourage this action.

Other

I-106. Comment: Another issue related to third-party energy supply is the requirement to be a covered entity in order to receive an allowance allocation. Table J-75 states that facilities will receive a direct allocation of allowances for thermal energy imported from off-site. But, in order to be eligible for any allocation of allowances, a facility must be a covered entity or an opt-in covered entity. This means the facility must report at least 10,000 metric tons of CO_2e to qualify to opt-in. Consequently, a facility that purchases the majority of its thermal energy from a third-party will have very high indirect emissions, but no direct emissions, and may have an incentive to increase direct emissions in order to become a covered entity and be eligible for an allowance allocation related to off-site thermal supply. (CACC)

> **Response:** This comment is highly speculative. It is not true that a facility must report 10,000 metric tons to opt in. We believe that it is likely that a facility that imports very large amounts of thermal energy is already covered under the 25,000 $MTCO_2e$ threshold. If indirect emissions are properly priced, the incentive for efficient energy supply will be correct.

General

I-107. Comment: In reviewing the ISOR it is clear that the development of product based benchmarking and the identification of output metrics to establish benchmarks is at varying stages of development, depending upon the industrial sector. For those industrial entities where CHP is an integrated part of the process and will be subject to product based benchmarking, there is some confusion as to how the energy (both thermal and electric) and associated emissions will be incorporated into the product based and energy use benchmarks. We anticipate that if the proposed regulation is adopted in December, work will continue into 2011 to finalize the benchmarking design. Members operating in specific industrial sectors would like to provide input to that process. (CACC)

> **Response:** No response needed.

I-108. Comment: Despite the fact that CARB identified increased deployment of CHP as an important mitigation measure in its AB 32 Scoping Plan, the proposed Cap and trade program effectively penalizes some early adopters of CHP. The proposed cap-and- trade program will both penalize the University for early action, and will curtail the University's ability to invest in projects that directly reduce its greenhouse gas emissions. The University is regulated under cap-and-trade largely because it operates five large combined heat and power (CHP) plants. But for these CHP plants, several UC campuses would likely fall below CARB's cap and trade compliance threshold until 2015. CHP is just one of the investments that the University has made to meet its commitment to mitigate its own greenhouse gas emissions. The University adopted a policy goal of reducing emissions to 2000 levels by 2014, and to 1990 levels by 2020. To meet its ambitious GHG emission reduction targets, the University has made substantial investments in onsite renewable energy generation and has an aggressive energy efficiency program through which it is spending approximately $250 million on energy reduction projects over a three-year period ending in 2012, and plans for additional energy reduction and renewable energy projects after 2012. To comply with CARB's Cap and Trade program, the University will have to use its limited state-allocated funds to purchase allowances, rather than investing in projects that directly reduce greenhouse gas emissions. This problem could be corrected through an allocation of allowance value to the University, for the explicit purpose of investing in greenhouse gas mitigation projects. (UC1)

> **Response:** UC is not an EITE and does not qualify for allowances, because it is not an industry that is energy intensive or trade-exposed. UC supplies both commercial and residential load from its cogeneration. In the absence of an on-campus cogeneration unit, a UC campus would still face a carbon price for the heat it produced and the power it purchased from an electric utility (assuming an appropriate carbon price in power and gas purchased from utilities). Full carbon pricing creates both the correct incentives to reduce greenhouse gases in the future and rewards for early CHP installation that lowered the total GHG footprint of a campus. We would expect UC to pass through its carbon costs in both cases. That said, at the October 20, 2011 meeting, the Board directed staff in Resolution 11-32 to coordinate with State universities and stakeholders to evaluate options for compliance, with amendments to the regulation as appropriate, including options for the use of auction revenue and to report back to the Board in summer 2012.

I-109. Comment: Free allowances for select industrial sectors could compromise CHP if offsetting GHG emissions at the CHP site and at the central power plant are not taken into account. Industrial benchmarking for select industries should not compromise CHP implementation. Additional free allowances should be considered for CHP that recognizes the system wide benefits and not just onsite emissions. (CACDGC)

> **Response:** It is not clear what the commenter means by offsetting GHG emissions. We do not provide free allowances to CHP except indirectly when CHP is part of an EITE. Otherwise, we expect CHP to pass through carbon costs.

I-110. Comment: Facilities that self-generate electricity or make use of on-site CHP cogeneration have made significant investments in generation technology (and emissions control equipment) that have helped remove load from the grid, avoid electrical transmission losses and avoid gas transmission compression costs. The GHG emissions from these long-term investments must not create a benchmark penalty for collocated upstream oil and gas operations. There are many challenging market barriers (e.g., departing load charges, lack of contracts, and resistance from utilities) faced by CHP operators and developers that limit the State from realizing the emission reduction potential of CHP. (OPC)

> **Response:** EITE facilities that self-generate or make use of on-site CHP will receive allowances based on product or energy benchmarks. They will be able to avoid carbon costs in the price of power they would otherwise have purchased from utilities.

I-111. Comment: A key emission reduction measure is the proposed cap and trade program. Its effect on combined heat and power (CHP) is of significant interest to me. Senate Bill 412, enacted in 2009 seeks, among others, CHP technologies to be considered by the PUC to be added to the Self Generation Incentive Program. My co-authors, Senators Padilla and Blakeslee, and Assembly member Nancy Skinner, firmly believe that CHP with its superior efficiency and greenhouse gas performance compared to central station power plants in California will help our state achieve its greenhouse gas reduction goal. I believe there are several technical and public education/outreach issues that will need to be addressed after Board action on December 16, 2010. I urge staff to work closely with the CHP industry to address all remaining issues and do what is necessary and appropriate to have a robust CHP industry in the state that enables the ARB to achieve its goals for this technology sector. (SENKEHOE)

> **Response:** We agree that efficient CHP is important to help California achieve its emission-reduction goals. We have continued to work with the CHP industry to address their issues and believe that the cap-and-trade regulation will be compatible with a robust CHP industry in California; and in fact, provides incentives for efficient CHP to be developed.

I-112. Comment: Onsite CHP GHG emissions should not be compared with the average emission rate of the entire utility system as inferred in the proposed regulation. The Scoping Plan correctly benchmarks CHP against the avoided fossil generation emissions. Likewise, Cap and Trade price signals should reflect CHP's GHG impact relative to the same standard and not to the average GHG emission rate for the entire utility generation mix. Our recommendation would be to grant free allowances to Onsite CHP to properly compensate for the price signal error. (CACDGC)

> **Response:** We agree that a marginal, rather than average, emissions rate should be used when comparing the avoided emissions from displacing grid power. Carbon price signals in electricity rates should reflect the emissions rate of the marginal generator dispatched into the power markets.

I-113. Comment: The AB 32 Scoping Plan calls for the state to increase CHP energy generation by 30,000 GWh, yet the cap and trade regulation provides no incentives for development or expansion of CHP. In fact, the threat of creating a cap and trade compliance obligation is likely to discourage facilities including wastewater treatment plants from installing or expanding efficient CHP systems. We therefore encourage ARB to direct some portion of allowance value to development of a program that incentivizes CHP. (BACWACC)

> **Response:** We believe that the design of the program, and the incorporation of the price signal into the cost of electricity, will create an incentive for the development of efficient CHP. Other agency's programs provide incentives for various scales of CHP, and for renewable energy production at wastewater

treatment plans. It is not necessary to provide allowance value as requested in order to provide an incentive for cost-effective and efficient CHP.

I-114. Comment: To avoid potential conflicts associated with implementation of the qualifying facility/combined heat and power (QF/CHP) settlement pending at the California Public Utilities Commission (CPUC), CARB's regulations must explicitly state what is implicit in the draft regulation: none of the free allowances allocated to EITE entities will be provided to cover the emissions associated with those entities' power exports to the grid. (EPUC)

Response: The product output-based benchmarks do not include allocation of allowances for electricity exported by an EITE. Furthermore, the energy-based allocation methodology (modified from what was previously the thermal energy based benchmarking methodology in section 95891(c)) adjusts to exclude electric sales when calculating free allowances for EITEs.

I-115. (multiple comments)
Comment: Third, the proposed regulation is not adequate in its treatment of combined heat and power (CHP). Third party CHP's serving the refining industry should be treated as part of the refining sector with respect to electrical and thermal energy distributed to a refinery and as part of the power sector with respect to electrical energy distributed to utilities. (TESORO)

Comment: Oil refineries have pushed for subsidized cogeneration, a truly bad idea, which would replace clean energy electricity, with oil refinery-generated electricity. While industrial energy efficiency is essential, and while existing refinery processes should be required to capture waste heat, adding unneeded, expanding oil refinery electricity is directly counter to the RPS (Renewable Portfolio Standard), which is aiming at converting fossil fueled electricity into clean electricity. CARB must not allow oil refinery-generated electricity to subvert this process and take us backwards. (CBE1)

Response: We do not agree with TESORO that third-party CHPs distributed to a refinery should be treated as part of the refining sector. Rather, we expect CHPs that are not part of an EITE to pass through carbon costs. If and when a carbon price is present in all purchased power, the compensation for these carbon costs could be incorporated into the product benchmarks (or reductions in these costs created in some other fashion) to help minimize leakage. The regulation will not subsidize inefficient cogeneration, and we agree that adding inefficient electricity generated from fossil fuels is undesirable.

I-116. Comment: Cogeneration and self-generation are efficient, clean, and reliable approaches to generating power and thermal energy from a single fuel source. That is, they use heat that is otherwise discarded from conventional power generation to produce thermal energy. This energy is used to provide cooling or heating for industrial facilities, district energy systems, and commercial buildings. By recycling this waste heat, cogeneration and self-generation systems can achieve a dramatic improvement over the conventional fossil-fueled power plants, or from separate production of electricity and useful thermal energy. Cogeneration plants' higher efficiencies reduce air emissions of nitrogen oxides, sulfur dioxide, mercury, particulate matter, and carbon dioxide.

Moreover, cogeneration and self-generation facilities reduce net grid demand and associated transmission losses, a fact recognized by the Modeling GHG Reductions Strategies California Air Resources Board ENERGY 2020 Inputs and Assumptions. See page 21. Appendix N – Economic Analysis, Figure N-3, of the proposed regulation identifies cogeneration as a favored policy of the state. (PRAXAIR)

Response: No response is needed.

I-117. Comment: Allowances should be freely allocated to cogeneration facilities supporting industrial operations. As a covered entity under section 95811(a) of the proposed regulation, the operators of cogeneration plants serving industrial energy needs should directly receive free allowances. CARB should ensure that the potential industrial customers' investment in combined heat and power (CHP), with its significant greenhouse gas reduction benefits, is not discouraged by the Cap and Trade regulation. As currently structured, the Cap and Trade program will undermine the Scoping Plan's CHP goal by placing significant, additional direct compliance costs on new and existing cogeneration facilities, regardless of the efficiency of a particular facility, especially if the facility is sized to meet on-site loads and does not make substantial quantities of electric power for wholesale sales. This is particularly true in Praxair's case, where as the owner of the self-generation facility in a sector not provided any relief via direct allowance allocations, its potential investment in CHP could be rendered uneconomic because of the direct compliance burden, particularly when compared to electricity procurement from the grid where there is a potential level of rebate from the IOU or POU. The AB 32 Scoping Plan sets "a target of an additional 4,000 MW of installed CHP capacity by 2020, enough to displace 30,000 GWh of demand from other power generation sources." However, the Cap and Trade program does not account for the reductions in GHG emissions attributable to CHP facilities. The rationale for inclusion of CHP facilities in the Cap and Trade program states that "It is necessary to include emissions from cogeneration units because these units are widely used by industries and represent a large share of California GHG emissions. The use is expected to grow and the efficiency is expected to improve." This anticipated growth and efficiency enhancement is not recognized through financial support in the proposed regulation—the financial support provided through free allowances that is offered by CARB to many other industrial sectors. (PRAXAIR)

Response: Allowances are not allocated to cogeneration facilities separate from EITEs, for reasons discussed above. However, it appears that PRAXAIR's main interest is in onsite cogeneration, in which the facility is "sized to meet on-site loads." PRAXAIR is in the Industrial Gas Manufacturing industry, involved in hydrogen production. We modified Table 8-1 in section 95870 to add this industrial classification as an EITE. PRAXAIR will receive allowances through the product benchmarking methodology. In general, the cap-and-trade program does not account for reductions, but rather requires allowances for emissions. The regulation does not provide direct financial support for CHP, but instead uses price signals to support the production that is most efficient from a greenhouse gas perspective. It encourages the most efficient use of CHP within EITEs, and allows independent CHP to compete with carbon costs properly internalized.

I-118. Comment: The draft Cap and Trade Program does little to incentivize efficient CHP facilities. The District recommends free allowances or a reduction in the compliance obligation for emissions from high-efficiency CHP systems. The AB 32 Scoping Plan calls for the state to increase CHP energy generation by 30,000 GWh, yet the draft Cap and Trade regulation provides no incentives for development or expansion of CHP. In fact, by treating CHP facilities as any other combustion source and therefore creating a compliance obligation for these facilities, ARB is likely to discourage industries, including wastewater treatment facilities, from installing or expanding efficient CHP systems.

For example, at the District, staff has been considering upsizing our CHP facility to a unit that produces approximately 30 percent more power with only 10 percent additional fuel (natural gas) a project that would be a net environmental benefit. With the compliance burden that AB 32 Cap and Trade would assign to such an expansion, the return on investment may not warrant such a project. Instead, we will likely draw more of our power from the grid, adding more demand and increasing the number of renewable energy projects that power utilities are complete to meet the State's renewable energy portfolio goals.

We therefore suggest that CARB reincorporate the incentive for efficient CHP units by either including efficient CHP in Table 8-1: Industry Assistance, page A-76 of the draft regulations, making such facilities eligible for industry assistance in the form of free allowances, or by reducing the compliance obligation for GHG emissions from high efficiency CHP systems by giving GHG credit for the steam captured for useful work, as was the plan in the previous version of Cap and Trade. (CCCSD)

Response: As discussed elsewhere, we believe that CHP facilities exporting heat and power will be able to pass through the cost of compliance in the prices of their products, and that, given the multiple benefits of efficient CHP, the regulation will complement other regulatory incentives for CHP. Furthermore, since emissions from biomethane from wastewater facilities to not create a compliance obligation, it appears that CCCSD is likely to benefit economically from the upsizing of the CHP under consideration.

Allocate EITE for Electricity

I-119. (multiple comments)

Comment: The proposed regulations would not adequately compensate an EITE facility for GHG compliance costs associated with imported power.

Recommendation: Dow urges ARB to give EITE entities (rather than utilities and their governing agencies) the responsibility for deciding which GHG investments to pursue at EITE facilities.

Rationale: The ISOR specifies direct rebates to residential customers. The ISOR suggests that industrial electricity customers' allowance value would be provided through energy efficiency (EE) benefits, rather than bill relief. The ISOR states, "The proposed regulation limits how the return of allowance value to customers might function. Staff believes that any rebates to residential customers should be made as separate payments and not simply deducted from customer bills…."

Appendix J to the ISOR further states, "As shown in Table J-7, electric distribution utilities are expected to reduce the carbon costs faced by industrial sources due to power purchased from the grid. Staff envisions this compensation would be in line with that given to other customer classes. However, the form of compensation to industrial ratepayers might best be structured as energy-efficiency programs rather than per-customer rebates."

It is unclear, however, whether additional energy efficiency programs will have material value to EITE industries in the future, especially for those facilities, like Dow Pittsburg that have already implemented most of the efficiency measures. Energy-intensive entities have been leaders in EE because of the impact of energy costs on profitability. Even if an energy-efficiency program could be leveraged, an EITE entity may not be able to realize full carbon cost recovery. Energy efficiency programs and incentives may encourage incremental investments but they do not guarantee that EITE entities will be adequately compensated for the carbon costs associated with imported power. ARB also leaves this issue to be resolved by the CPUC, which further increases uncertainty related to this issue. (DOWCHEM1, DOWCHEM2)

Comment: Allocation of Allowances to Utilities Alone Will Not Assure Recovery of Carbon Costs Associated with Utility Power Imported by an EITE Entity: The proposed regulations would not adequately compensate an EITE for GHG compliance costs associated with imported power. While the ISOR appropriately contemplates direct rebates to residential customers, industrial customers' allowance value would be provided through energy efficiency (EE) benefits, rather than bill relief. (EPUC)

Comment: It is unclear, however, whether additional EE programs will have material value to EITE industries in the future. Energy-intensive entities have been leaders in EE because of the impact of energy costs on profitability. Moreover, even if an energy-efficiency program could be leveraged, a trade-exposed entity may not be able to realize full carbon cost recovery. Energy efficiency programs and incentives may encourage incremental investments but they will not adequately compensate EITE entities for the carbon costs associated with imported power. Importantly, CARB also leaves this issue to be resolved by the CPUC, which further increases uncertainty related to this issue. In other words, EE incentives, particularly those that have not yet been litigated, are not sufficient to ensure the competitiveness of EITE facilities.

The proposed regulation leaves EITE entities exposed to carbon costs associated with power imported from non-utility sources: The ISOR Table J-7, makes clear that EITE entities will be covered for the emissions costs associated with electricity generated and consumed "on site." As discussed above, this characterization leaves power imports from the utilities fully exposed. (EPUC)

> **Response:** Section 95892(a) was modified to require that allowances allocated to utilities "must be used exclusively for the benefit of retail ratepayers… consistent with the goals of AB 32." The CPUC and governing boards of publicly owned utilities will also impose limitations on the use of these funds. We agree that it is unclear whether additional energy-efficiency programs would have material value to some EITEs. Furthermore, we believe it is important for utilities to pass through allowance value in a manner that helps to minimize leakage from EITEs and incentivizes greenhouse gas reductions. The CPUC (for IOUs) and the publicly owned utility governing bodies have the authority to ensure that electricity rates for EITEs reflect carbon costs. We will continue to work with these entities to ensure that rates and uses of allowance value are appropriate.
>
> We determined the level of leakage risk for different covered sectors through the analysis that is found in Appendix K of the Staff Report. Instead of guaranteeing full carbon cost recovery, it determined the level of leakage risk for different industrial sectors and classified them into three categories: high leakage risk, medium leakage risk, and low leakage risk. Covered entities can receive compensation in the form of direct allocation from ARB and in the form of compensation from utilities. ARB will work closely with the CPUC to ensure that the level of compensation will align with that necessary to minimize leakage. Energy-intensive entities that have been leaders within their industrial sectors will benefit because the benchmark for the industry rewards such entities relative to their less-efficient competitors.
>
> The calculation of product and energy benchmarks does not account for indirect emissions from electricity purchased or imported by EITEs. As stated in footnote 8 on page 3 of Appendix A of the 15-day changes to the regulation, an adjustment factor was not made for power purchased in establishing the product-based benchmarks. This is because purchased power may not create an indirect carbon cost in all California utility service territories for EITEs that purchase from utilities. It is ARB's goal to see a carbon price properly embedded in all utility rates. If and when this occurs, the compensation for these indirect carbon costs and for indirect costs associated with electricity imported from non-utility generators could be incorporated into the product benchmarks (or reductions in these costs created in some other fashion) if needed to help minimize leakage.

I-120. Comment: The proposed regulation leaves EITE entities exposed to carbon costs associated with power imported from non-utility sources: The ISOR Table J-7, makes clear that EITE entities will be covered for the emissions costs associated with electricity generated and consumed "on site." As discussed above, this characterization leaves power imports from the utilities fully exposed. Moreover, an additional ambiguity in the proposed regulation—the boundary between "imported" and "on-site" power—leaves one additional category of EITE entities exposed to carbon costs associated with power. It is not clear whether entities securing non-utility power using non-utility wires would qualify as importers or receive a free allowance allocation as "on-site" generation to cover the emissions associated with that power. The proposed regulation's use of the term "on-site" power is unclear. Does this mean that carbon costs for electricity must be generated on the same physical real property as the host operation? If so, the definition would preclude cost recovery by entities that own and operate generation, or purchase from non-utility generators that may not be located directly on the host property site.

Consider the following scenarios:

- EITE 1 owns a CHP generator that delivers power to its industrial operation, and that generator is located physically on the same real property as the industrial operation;
- EITE 2 holds an ownership interest in a CHP generator that is physically on the same real property as the industrial operation and buys its power from that generator;
- EITE 3 owns a CHP generator that delivers power to its industrial operation, but that generator is not located physically on the same real property as the industrial operation;
- EITE 4 holds an ownership interest in a CHP generator that is not physically on the same real property as the industrial operation and buys its power from that generator.

There appears to be no basis on which to discriminate against any of these EITE entities based on the geographic location of the serving generation or the ownership. Regardless of ownership or geography, these entities will incur carbon costs for their power use—whether directly as a generating cost or indirectly as a power purchase cost. Likewise, regardless of ownership or geography, these entities will not have an alternative means to recover their carbon costs. For this reason, the boundary of free allowance allocation can and should be drawn simply. There should be no distinction drawn based on the physical location or ownership of the generation. (EPUC)

> **Response:** Section 958102 precisely defines a facility as "any physical property, plant, building, structure, source, or stationary equipment located on one or more contiguous or adjacent properties in actual physical contact or separated solely by a public roadway or other public right-of-way and under common ownership or common control, that emits or may emit any greenhouse gas."

The regulation applies to operators of facilities, including electricity generating facilities (sections 95812(c)(1) and (2)(A)). Compliance obligation falls on operators of facilities that have operational control. "Operational control" and "operator" are defined in section 95802(a)(186) and (187). Operational control means the authority to introduce and implement operating, environmental, health and safety policies, and if such authority is shared, the operator is the entity holding the permit to operate from the local air pollution control or air quality management district.

The descriptions of the cases provided by this commenter are not sufficiently precise for us to determine the exact treatment of each situation. As discussed elsewhere, compensation to EITEs to reduce carbon costs in purchased power depends on future analysis of rates properly reflecting carbon costs, and on actions of the CPUC and the governing bodies of publicly owned utilities. We continue to work with the CPUC, utilities, and stakeholders to make the regulation as equitable as possible for all EITEs.

I-121. (multiple comments)
Comment: As CARB correctly notes, current competitiveness can be maintained only if the regulations ensure that all GHG compliance costs are recovered. CARB's proposal does not meet the agency's own objective of ensuring that trade-exposed entities receive coverage of the emissions associated with electricity use. CARB can mitigate the potential competitive impacts in one of two ways. Under the proposed framework, CARB can require the utility to share the benefits of free allowance value with trade-exposed entities through direct rebates. The direct rebate could be based on the average carbon adder factor per MWh. This can be accomplished with the incorporation of the following language as subpart D):

Section 95892(b)(3)

Auction proceeds obtained by an electrical distribution utility shall be used exclusively for the benefit of retail ratepayers of each electrical distribution utility, consistent with the goals of AB 32, and may not be used for the benefit of entities or persons other than such ratepayers.

(D) <u>Utilities shall provide auction proceeds to energy-intensive, trade-exposed industrial ratepayers through a direct rebate equal to the carbon costs embedded in the ratepayer's average MWh rate multiplied by the MWh consumed by the ratepayer.</u>

An alternative, simpler way to achieve this objective would be for CARB to provide an EITE entity a direct allocation of free allowances for power purchased from a distribution utility. To avoid double counting, CARB could then exclude these allowances from the allocation of free allowances to the entity's serving utility. If CARB elects to take this approach, the following modifications should be reflected in section 95891:

Section 95891(a):

"A_t" is the amount of California GHG allowances directly allocated to the operator of an industrial facility for all activities with a product output-based allocation from budget year "t." <u>This allocation shall include allowances to cover the carbon costs associated with electricity imported from an interconnected utility.</u>

Section 95891(c):

"A_t" is the amount of California GHG allowances directly allocated to the operator of an industrial facility with a thermal energy-based allocation from budget year "t." <u>This allocation shall include allowances to cover the carbon costs associated with electricity imported from an interconnected utility.</u>

In addition, the final regulation should provide for allowance allocations to recover the carbon costs of non-utility power, whether self-generated or otherwise procured over proprietary wires. The following modifications are required:

Section 95891(a):

"A_t" is the amount of California GHG allowances directly allocated to the operator of an industrial facility for all activities with a product output-based allocation from budget year "t." <u>This allocation shall include allowances to cover the carbon costs associated with electricity self- generated or procured over private distribution facilities from a source other than facility's interconnected utility.</u>

Section 95891(c):

"A_t" is the amount of California GHG allowances directly allocated to the operator of an industrial facility with a thermal energy-based allocation from budget year "t." <u>This allocation shall include allowances to cover the carbon costs associated with electricity self-generated or procured over private distribution facilities from a source other than facility's interconnected utility.</u>

In short, CARB should eliminate any distinctions between power produced "on-site" and imported. Making the distinction solely based on whether or not the power is procured from the entity's interconnected utility. To better ensure that all imported power receives the same treatment, CARB could provide for a direct allocation of allowances (in sections 95891(a) and (c)) to cover the carbon costs associated with imported power from a utility. (EPUC)

Comment: CARB's proposed regulations leave open critical gaps that may compromise its ability to adequately provide transition assistance to EITE entities. CARB proposes to provide free allowance allocations to EITE entities to "avoid imparting undue initial economic gain or loss" in the early program years and to prevent leakage. CARB notes that current competitiveness is maintained if the free allocation covers all of the EITE's carbon costs (Free allocation = carbon costs – carbon cost recovered). While CARB intends to directly reduce carbon costs associated with heat consumption and on-site energy consumption, an EITE facility will be exposed to GHG compliance costs associated with "imported" power. CARB does not intend to provide free allocation of allowances for the carbon costs associated with imported power because it assumes that carbon costs associated with these imports will be offset by the allocation of allowances to its interconnected utility: Indirect carbon costs arising from purchased electricity from the grid will be reduced through compensation from distribution utilities that are given allowance value for the purpose of ratepayer protection (see Appendix J, at J-32). The rationale for section 95891(c) reiterates these expectations. In discussing thermal-energy based equations, the ISOR states: Electricity purchased from off-site is not part of the thermal energy-based allocation equation but receives indirect compensation through (the) distribution utility to offset the expected indirect GHG costs, as described in section 95892 (see ISOR at IX-59).

The regulations, however, do not assure that this form of compensation will occur. In addition, CARB's analysis leaves unclear the boundary between power "produced on-site" and "imported from off-site." The place in which this boundary is drawn will undermine the goal of maintaining EITE entities' competitiveness. While the proposed regulations aim to maintain competitiveness by permitting carbon cost recovery, the implementation of this principle could be comprised, depending on the mechanics of the allowance allocation formula. First, if the utilities return the allowance value to industrial customers as contemplated in the ISOR, an EITE entity may receive no coverage for the carbon costs embedded in its utility rates. Second, depending on where the boundary is drawn between "on-site" and "imported" power, EITE entities receiving power from non-utility generation over non-utility wires may not receive any coverage for the carbon costs associated with the electricity they consume. As noted below, effective transitional assistance to industrial facilities requires recovery of GHG compliance costs associated with power purchased from a utility or non-utility. (EPUC)

> **Response:** We prefer allocation to be provided per unit of production wherever possible. The goal of this approach is to protect production activities, not emitting activities. Updated compensation provided per megawatt-hour (MWh) consumed does not create the correct incentives to conserve electricity and thus reduce greenhouse gases.
>
> As discussed elsewhere, we believe that, once utility rates reflect carbon cost, it might be appropriate to modify the benchmarking methodologies to include electricity purchased by EITEs, including electricity purchased from utilities or from other electricity generators. ARB will work closely with the CPUC and the publicly owned utilities toward ensuring that rates reflect an appropriate carbon cost, and that allowance value flows appropriately to minimize leakage and transition risk for EITEs.

I-122. Comment: CHP users should be provided with allowances for any emission savings resulting from installing energy efficient CHP plants. Allowances should be calculated by comparing the CHP efficiencies with the weighted average energy efficiency of all natural gas electric generation plants located in California. (SWGASCORP)

> **Response:** Allowance value is allocated to EITE facilities for leakage prevention and transition assistance. The goal of the allocation methodology is not to explicitly incentivize or “pick winners” between various greenhouse gas reduction strategies, including CHP. Correct carbon pricing will create the proper incentives for instillation of efficient CHP.

Long-Term Contracts

I-123. (multiple comments)
Comment: ARB's essential premise in developing the Cap and Trade Rule provisions for electrical generators is that they can pass through the costs of GHG allowances purchased at auction under the Cap and Trade Rule. This premise is not correct, for electrical generators like HDPP, as the staff suspected. The ARB staff should now quantify the effects of "locked-in" contracts over time; develop alternatives for addressing this issue; consult with the CPUC, CEC, California ISO, the affected electrical generators and other affected stakeholders; and develop a solution that complies fully with the provisions of AB 32, the cost-containment and other principles adopted by the Board in approving the Cap and Trade Rule and the other provisions of the final Cap and Trade Rule to be developed during 2011 by the Executive Officer. (HDPP2)

Comment: Some California generators sell power under electricity contracts that do not allow the pass through of the costs of acquiring GHG allowances during the early years of the California Cap and Trade program. These contracts were lawfully entered before the proposed Cap and Trade compliance periods and they continue into the first compliant period (and perhaps beyond)—but they expire at fixed terms. ARB's proposed Cap and Trade program excludes electricity generators from the allocation of free allowances, based on the assumption that all electricity generators are capable of passing these costs through the wholesale power market. This assumption appears to be generally correct. However, this assumption is not correct for some generators for some years, for the reason stated above, with potentially severe, unintended consequences to the affected generators and California energy markets. (HDPP1)

Comment: Both the staff report and Appendix J (Allowance Allocation) note that there are independent power producers who, due to terms in pre-existing contracts, are unable to pass-through the cost of allowances in their electricity prices, and that modification of the regulation may be needed to include provisions to address these situations. WPTF urges inclusion of provisions in the regulations that:

- Define the conditions under which an independent power producer would be eligible to receive allowances (e.g., contracts entered into after adoption of AB 32 would not be eligible for such relief).

- Require documentation by the producer to demonstrate that it meets these conditions.
- Provide for direct allocation of allowances to independent power producers to cover emissions associated with these contracts.
- Reduce the direct allocation of allowances to individual electrical utilities that are counter-parties to these contracts by the amount of allowances directly allocated to independent power producers. (WPTF)

Comment: CARB should evaluate pre-AB 32 contracts on a case-by-case basis. Whether a contract includes such a cost recovery mechanism should be evaluated by asking the following questions:

1. Was the contract entered into or its pricing provisions amended after the effectiveness of AB 32 (December 31, 2006)? If the answer is yes, then the parties should be presumed to have considered GHG cost risk.

2. Does the contract contain a "change of law" provision that provides for a re-open opportunity in the event that by virtue of new law or regulation in which case the parties will meet and confer/renegotiate to maintain the balance of risks and benefits? If the answer is yes, then the contract has a mechanism to directly consider new costs and risks such as those that are the result of GHG regulation.

3. Does the contract provide an explicit accounting for and pass-through of GHG costs? Prior to AB 32, contracts like that were rare, but if the answer is yes, then the parties have directly considered GHG cost risks.

4. Does the facility owner make the decision whether to generate and deliver energy to the purchaser? If the answer is yes, then the project has the ability (a mechanism) to take GHG costs into consideration when deciding whether to generate energy.

5. Does the contract provide for energy payments that are measured by a competitive market that allows bidders to include GHG costs? If the answer is yes, the purchase agreement has a payment mechanism that includes appropriate GHG costs. As CARB staff correctly points out "because the price of electricity in the (CAISO) wholesale electricity market will reflect the cost of those purchased allowances, staff expects that independent generators will incorporate their cap and trade compliance costs into their bids in the wholesale power markets" (ISOR at II-32). For other pre-AB 32 contracts, GHG costs "may be addressed through the recently announced combined heat and power settlement at the California Public Utilities Commission" (ISOR footnote 22 at II-32).

If the answer to all of these questions is "no", there is no need for further investigation; the particular generator's contract clearly does NOT provide a mechanism for appropriate recovery of GHG costs. For Fresno Cogeneration Partners, LP (one of the generators with which Wellhead has a relationship), the answer to each of the questions is "no." This project operates under an agreement where the purchasing utility makes the dispatch decision and pays for delivered energy based on: i) start-up costs; ii) a fixed heat rate, iii) the cost of natural gas fuel, and iv) a fixed variable operating and maintenance expense. The price paid is independent of and does not include any consideration of GHG or any other new or emerging cost components. This project, accordingly, precisely fits the case CARB staff recognized. (WEC)

Comment: If an Independent Power Producer (IPP) is operating under an existing contract that predates the effective date of Assembly Bill (AB) 32 and that provides no reasonable means to recover greenhouse gas (GHG) allowance costs, these IPPs should be provided access to allowances for the remaining term of their existing contract. This approach would place them on a basis comparable to other electric generators that have a reasonable means of GHG cost recovery, particularly the electric utilities. To accomplish this outcome, we recommend the following language changes in two separate sections of the proposed regulation.

Add subsection (d) to section 95890. General Provisions for Direct Allocations.

<u>(d) Eligibility for Electric Generators not otherwise defined as an Electrical Distribution Utilities. An electric generator shall be eligible for free, direct allocation of California GHG allowances if it has complied with the requirements of the MRR and has obtained a positive or qualified verification statement on its sales number for the prior year pursuant to the MRR; it is operating under an existing contract that was effective as of the effective date of AB 32; and it has demonstrated to the satisfaction of the Executive Officer that it cannot reasonably expect to recover the costs of GHG allowances needed to meet its compliance obligation under the existing contract.</u>

Modify section 95802 as follows:

> (a)<u>(153). "Pre-AB 32 Power Purchase Agreements" means a power purchase agreement for the sale of electricity to an electric distribution utility, which (1) was originally executed on or before December 31, 2006; and (2) does not provide the seller with a reasonable opportunity to recover its costs of complying with regulations governing emissions of greenhouse gases. A power purchase agreement shall no longer qualify as a Pre-AB 32 Power Purchase Agreement if, after the effective date of this article, it expires, terminates, or is amended to change any of the terms governing the price or amount of electricity sold pursuant to the agreement or the expiration date of the agreement.</u>
>
> <u>The Executive Officer shall establish guidelines for determining whether a power purchase agreement provides the seller with a reasonable opportunity to recover its costs of complying with regulations governing emissions of greenhouse gases. In developing these guidelines, the Executive Officer shall consider:</u>
>
> a. <u>Whether the power purchase agreement includes provisions on changes in laws or regulations or force majeure provisions that affect recovery of</u>

the cost of complying with regulations governing emissions of greenhouse gases.

b. Whether loss of some or all of the deliveries from the units providing power pursuant to the power purchase agreement would affect the reliability of the electric grid.

c. Whether the power purchase agreement provides for compensation in part from market prices, and whether those market prices include the costs of generators' compliance with regulations governing emissions of greenhouse gases.

d. The extent to which the owners or operators of the units providing power pursuant to the power purchase agreement control the dispatch of the units.

e. The net effect on greenhouse gas emissions if the units providing power pursuant to power purchase agreement do not recover the costs of complying with regulations governing emissions of greenhouse gases and, as a result, shut down.

Add the following language to section 95892(c), Allocation to Electrical Distribution Utilities for Protection of Electricity Ratepayers:

(3) The electrical distribution utility shall set aside allowances for each calendar year in an amount sufficient to satisfy the compliance obligation of any covered entity attributable to generation of electricity purchased by the electrical distribution utility pursuant to a Pre-AB 32 Power Purchase Agreement, as defined in Subarticle 2. These allowances shall be set aside prior to each auction that the electrical distribution utility offers allowances for sale. If the verified emissions attributable to the Pre-AB 32 Power Purchase Agreements exceed the amount of allowances set aside by the electrical distribution utility, the electrical distribution utility shall obtain the remaining amount of allowances from the next quarterly auction, or through the Allowance Price Containment Reserve. The electrical distribution utility shall transfer the required amount of allowances to the covered entity from which it purchases electricity under the Pre- AB 32 Power Purchase Agreement no later than 30 days before the covered entity's annual and triennial compliance obligation. (IEPA)

Comment: Add to section 95802 (a) as follows:

"Pre-AB 32 Power Purchase Agreements" means a power purchase agreement for the sale of electricity to an electric distribution utility, which was originally executed on or before December 31, 2006 and does not provide a mechanism for recovery of greenhouse gas compliance costs. A Pre-AB 32 Power Purchase Agreement shall not include a power purchase agreement that, after the effective date of this article, has expired, is terminated, or is amended to change any of the terms governing the price or amount of electricity sold pursuant to the agreement or the expiration date of the agreement. Whether a power purchase agreement qualifies as a Pre-AB 32 Power Purchase Agreement shall be subject to review by the Executive Officer to ensure compliance with the preceding requirements. (WEC)

Comment: Appendix J of the ARB staff report recognizes the potential issue surrounding stranded costs created by the currently proposed GHG cap and trade program and born by some independent energy producers under existing power agreements. Some pre-existing power purchase contracts do not allow the generator to pass-through the cost of purchasing allowances or offsets. NextEra Energy believes that the proposed regulation needs to be amended in order to mitigate the impact that could result from these situations. The addition of a provision to mitigate these stranded costs would require ARB to at least: Define the eligibility requirements for this provision; Establish the conditions under which these facilities continue to receive assistance or relief; Determine the form the relief will take (example-allowance allocation, auction revenue, surcharge to off-taker, etc.); Documentation requirements. (NEXTERAENERGY)

Comment: Section 95811 requires generators and importers of electricity into California to account for the CO_2 emissions associated with their power production and imports. Shell Energy understands the need to include emissions from the power sector under the cap and trade program. However, for generators located within, or connected to the California Grid that entered forward term contracts at fixed prices, this requirement may create an economic loss that was not accounted for at the time the transaction was executed.

We recommend that a portion of the allowances for each affected vintage year be made freely available to generators who entered into forward term fixed price agreements prior to the ARB Rules having been adopted in order to prevent penalizing those entities that transacted in good faith under existing regulations. (SHELLENERGY)

> **Response:** We are aware of a potential inequity if generators, be they combined heat and power (CHP) facilities or other electricity generators, cannot pass through carbon costs to purchasers. This response first explains our approach to long-term contract issues for electricity generation facilities that are not CHP (cogeneration) facilities and then addresses specific comments.
>
> Stakeholders who are parties to contracts for which there are no cost pass-through provisions approached ARB prior to the release of the proposed cap-and-trade regulation. ARB staff collaborated with industry to develop a survey to assess the magnitude of the issue. Staff received over 50 responses to a survey

sent out to California generators. In addition, we met with many representatives of electricity generating facilities, most of whom were also survey respondents.

Most of the long-term contract issues concern CHP facilities; we have responded to CHP long-term contract issues contracts in a separate section. Here we consider only facilities concerned with long-term contract issues that are not CHP facilities. We note that the facility operated by Fresno Cogeneration Partners LP provides electricity to the grid and is not considered to be a cogeneration because it does not provide useful thermal energy. Because we have a great deal of information provided about individual facilities' contract issues, we take a case-by-case approach, and build on that approach by categorizing facilities with similar issues.

One category is facilities that have contracts that end before January 1, 2013. We have resolved the issue for these facilities by modifying section 95856 and the definition of "compliance period" in section 95802(a) such that there is no compliance obligation for emissions prior to 2013.

Another category consists of facilities with contracts that either commenced or were amended after the passage of AB 32. For these facilities, we believe there was an opportunity for both parties to assess risk and incorporate expectations about future carbon costs while negotiating contracts or amendments, and we believe no further action is required.

A third category of facilities with long-term contracts have no compliance obligation, or an insignificant compliance obligation, because most or all of their emissions are excluded pursuant to section 95852.2. For example, section 95852.2 clearly excludes fugitive and process emissions from geothermal facilities from a compliance obligation. Most geothermal facilities have no other emissions with a compliance obligation, although a few may have a compliance obligation for a very small amount of emissions from fossil fuels.

A fourth category consists of electricity-generating facilities that have long-term contracts with investor-owned utilities. For these contracts, we believe the proper venue for assessing and resolving contract issues is the California Public Utilities Commission (CPUC) proceeding addressing utility costs and revenue issues associated with greenhouse gas emissions.

A fifth category includes facilities that combust primarily coke and coal. Some of these facilities are owned by GWF, and we address long-term contract issues for these facilities below in our response to GWF's comments.

In addition, we are aware of a very small number of facilities that do not fall into any of the categories described. We continue to work with stakeholders to find solutions for these.

We have strongly encouraged stakeholders on both sides of these contracts to renegotiate the contracts so that neither sellers nor purchasers are disadvantaged, and costs are passed through when appropriate. We note that in the electricity sector, there are many sophisticated methods of dealing with risk in electricity contracts. Parties may explicitly or tacitly assume risk, and prices may depend on the two parties' assumptions about future risk and who will bear it. Even with the information provided in response to the survey, it is not clear how issues of risk were resolved. This is one of the reasons that we encourage bilateral renegotiation. We are encouraged by progress reported by entities that have begun the renegotiation process.

With regard specifically to the HDDP2's comment. we note that we consulted with the CPUC, the California Energy Commission (CEC), and the California Independent System Operator (CAISO) as we developed our approach. We believe that long-term contract issues can be resolved by the parties themselves, or in other regulatory venues, and that HDPP2 does not face issues for its contract that ended in 2012.

Several commenters claim that the Staff Report or Appendix J stated that some power producers cannot pass through costs. This is not accurate. Both documents note that stakeholders have reported the inability to pass through costs in some cases, and the Staff Report notes that ARB will evaluate these cost pass-through issues on a case-by-case basis.

WEC requests that ARB evaluate contracts on a case-by-case basis, and we have done so for all facilities that participated in our survey and contacted us with information about their contracts. WEC also recommends five questions that could be asked for each contract, and states that if the answer to each question is no, then that contract does not have a pass-through mechanism. We asked some of these questions in the survey, and also asked stakeholders to provide additional information that would indicate need or potential for passing through carbon costs.

WEC states that Fresno Cogeneration cannot pass through costs due to the nature of the contract, including the assertion that price paid by the purchaser does not include any consideration of GHG emissions costs. Because the contract is with a utility, we believe the venue for resolving contract issues is the CPUC proceeding mentioned above. We did not add the definition proposed by WEC and instead have followed the approach discussed in this response.

NextEra Energy believes the regulation needs should be amended to provide for relief to parties involved in long-term contracts. We did not act on this recommendation because we believe that there are many other options to resolve these issues, and that the difficulty of assessing parties' assumptions about risk when contracts were negotiated makes a regulatory approach infeasible.

We did not modify sections 95890, 95802, and 95892(c) as requested by the Independent Energy Producers Association (IEPA) for the reasons above, and because we prefer the approach outlined in the beginning of this response.

Finally, notwithstanding our belief that issues can be resolved without changing the regulation, it is not our intent to provide allowances to entities for carbon costs that they do not, in some manner, incur. If pass-through of carbon costs in long-term contracts remains an issue in the future, we may consider other methods, including those mentioned by commenters, if necessary.

I-124. (multiple comments)
Comment: GHG allowances allocated to a purchasing utility should be redirected to suppliers under PPA's that do not provide for appropriate recovery of GHG costs. This approach does not require any change to the existing power contract and ensures that the purchasing utility, that has dispatch control, accounts for GHG allowance costs (along with all its other considerations) in their dispatch decision. Failure to provide for the purchasing utility's use of the allowances would almost certainly result in the purchasing utility dispatching a facility when lower GHG emitting facilities were available (because the GHG impact would be invisible to the purchasing utility). This outcome would directly contravene and thwart the basic purpose of AB 32. (WEC)

Comment: CARB's regulations could cause generators to not receive appropriate GHG cost recovery. Wellhead is concerned that if CARB is not careful about the precise wording of its regulations, it will create an entirely new class of generators that do not have appropriate GHG cost recovery. A number of existing power contracts that do have GHG cost recovery mechanisms contemplate that the seller will purchase any required allowances and that such costs will be reimbursed by the purchaser. However, language included in both Southern California Edison and San Diego Gas & Electric proforma Power Purchase Agreements (which are publicly available on the utility web sites as part of RFO activities) contemplate that such costs will be paid to the regulatory authority imposing the compliance requirement. Specifically, the PPAs state that:

"(Utility) shall reimburse Seller for (GHG costs) after (Utility's) receipt from Seller of documentation: (iv) that the (GHG cost) was imposed upon Seller by an authorized Governmental Authority in which the Generating Unit is located, or which otherwise has jurisdiction over Seller of the Generating Unit; and (v) that Seller has paid the agency identified under (iv) the full amount of the (GHG cost) for which Seller seeks reimbursement from (Utility).

Since the regulations are creating the framework where a third party(ies) may auction the allowances, the regulations have the potential to create a new class of generators that do not receive appropriate GHG cost recovery due solely to the allowance sales framework CARB is creating. To avoid this unintended outcome, CARB must either: i) be the entity that receives the payments for all GHG allowances purchased from an authorized auctioneer in complying with the regulations; or ii) make it very clear in the regulations that allowance costs procured from an authorized auction process shall be deemed to be procured from CARB for all purposes in a contract with provisions comparable to the proforma power purchase agreement language cited above. (WEC)

Comment: In the ISOR in support of the proposed regulation, CARB staff points out that there may be a class of generators that do not have a mechanism, contractual or otherwise, to recover GHG costs. "Some generators have reported that some existing contracts do not include provisions that would allow for full pass-through of cap and trade costs" (ISOR, p. II-32 at n22). In addition to the financial hardship, the inability to pass through these costs will distort the economic dispatch order, undermining the purposes of the Cap and Trade program, which is to implement the required AB 32 reduction of GHG emissions. These "counter to AB 32" impacts will occur because pre-AB 32 contracts without GHG cost recovery will cause less efficient generators (i.e., higher heat rate thermal units that emit more GHG per kWh produced) to appear less costly in the economic dispatch order of the purchasing utility because there are no GHG costs included. (WEC)

> **Response:** WEC suggests that GHG allowances allocated to a utility should be redirected to electricity generators that cannot pass through carbon costs. We disagree, and prefer our approach which calls for renegotiation of contracts to allow pass-through of costs when appropriate. WEC also has concerns about utility pro-forma power purchase agreements (PPAs) and wants ARB to make changes due to the PPA language. While we agree that the PPA language may not be appropriate, the proper venue for dealing with these issues is either through negotiation of contracts or through the CPUC proceeding mentioned above.
>
> We agree that under some contracts, utilities' economic interest could lead them to prefer to purchase electricity from higher-emission power plants if the carbon cost is not passed through. Again, this is a matter for the CPUC proceeding. We continue to work with CPUC on these issues so costs can be appropriately passed through, and in order to avoid distortions in the dispatch order that could cause higher-emission resources that cannot pass through carbon costs to generate electricity when electricity from lower-emission resources are available.

I-125. (multiple comments)
Comment: GWF requests that the proposed Cap and Trade Regulations be amended such that GWF receives allowances for its GHG emissions associated with its pre-AB 32 PPAs, declining throughout the 2012-2020 period at the same rate provided for the cement manufacturing industry. GWF's contractual obligations for its petroleum coke power plants were established pursuant to long-standing federal and state waste-to-energy policies that precede AB 32. This allowance allocation will serve to prevent the negative economic impact to GWF from its inability to recover compliance costs. (GWFPS1, GWFPS2)

Comment: GWF's electrical generating facilities are not the only petroleum coke fueled facilities in California. For example, some cement manufacturers burn petroleum coke for their energy needs. See ARB, Appendix F, Compliance Pathways Analysis, at p. F-26-27 (Oct. 28, 2010) (2006 data indicates that cement kilns employ petroleum coke for 19.7 percent and coal for 66.6 percent of their energy needs, respectively). The cement manufacturers with similar GHG emissions profiles and challenges related to GHG emission reduction would receive allowances under the proposed Cap and Trade Regulations. See sections 95890(a)-95891, and Tables 8-1, 9-1, and 9-2 (cement industry to receive direct allocations of allowances under a cap that declines to reach a 7.5 percent reduction by 2020). As a matter of policy equity, GWF should be treated similarly to similarly-situated industries. (GWFPS1)

Comment: ARB staff has acknowledged, however, that some long-term contracts may not permit IPPs to recover their compliance costs by increasing the price of electricity they sell to IOUs. ARB staff has further acknowledged that IPPs with long-term contracts that do not allow cost recovery may require special consideration in the proposed Cap and Trade Regulations. ARB, Appendix J, Allowance Allocation, p. J-16 n. 15 (Oct. 28, 2010). GWF could not recover its compliance costs because the avoided cost rate (as defined above) would not reflect the high cost of compliance that GWF would incur relative to the electricity market as a whole. Over the course of the three compliance periods, GWF's compliance costs would quickly reach enterprise threatening levels. (GWFPS1)

Comment: GWF's 30-year Standard Offer power purchase agreements (PPA) pre-date AB 32 and place GWF in the category of independent power producers (IPP) without a reasonable basis for recovery of compliance costs associated with the proposed Cap and Trade Regulations. As described in detail below, the proposed Cap and Trade Regulations will have an immediate and potentially crippling impact on GWF's enterprise because the Cap and Trade compliance costs for its petroleum coke power plants due to the chemical makeup (high carbon content) of the waste fuel source are significantly higher than a typical natural gas fueled power plant and these costs were not anticipated when the PPAs were executed in the mid 1980s. Therefore, the PPAs do not provide a mechanism under which GWF could recover compliance costs related to the use of a byproduct fuel source associated with the proposed Cap and Trade Regulations. (GWFPS1, GWFPS2)

> **Response:** Our overall approach to allocating allowances to industry is product-based and energy-based benchmarking. This is to encourage the most GHG-efficient methods of production. We have not used the benchmarking methodology for the electricity industry, because electricity production in California is not an energy-intensive trade-exposed (EITE) industry. However, we note that if such a methodology had been used, carbon-intensive electricity such as that produced at GWF’s coal and coke burning power plants would have received far fewer allowances than less carbon-intensive power plants. Since electricity generation is not an EITE industry, we treat it differently than cement manufacturing, which is energy-intensive and trade-exposed. Electricity

generators are expected to pass through the carbon cost to purchasers of electricity. Because GWF sells power to an IOU, we encourage GWF first to work with its counterparty to renegotiate contracts, and to participate in the California Public Utilities Commission proceeding addressing utility costs and revenue issues associated with greenhouse gas emissions.

Generation facilities such as GWF's plants that use alternative, high-emitting, sources of fuel were placed into service under a policy that would encourage the development and use of alternative fuel sources, and required contract structures to ensure consistent delivery of electricity. The qualifying facility (QF) settlement between CHP and cogeneration operators and the utilities addresses the cost-recovery of a portion of the GHG costs for these plants, but it does not cover all of the compliance costs or sources of fuel that emit GHGs that exceed that of an efficient natural gas power plant. However, one of the purposes of this cap-and-trade regulation is to encourage the refueling of these types of plants and to move toward the use of fuels that will help California to meet AB 32 goals of reducing GHG emissions. Because the regulation's purpose is to encourage switching to less carbon-intensive production, we also encourage GWF to consider repowering their power plants to use less carbon-intensive fuels. We understand from informal discussion with GWF that this may be possible.

We will continue to work with GWF to investigate potential modification of power plants to reduce emissions, and on other options to address GWF's concerns.

I-126. (multiple comments)
Comment: Fairness of allocations and pass-through costs for IPPs should be thoroughly developed in a public participatory process. The proposed rule provides for free allocations to the electric utilities, but there is no corresponding free allocation to the merchant or contracted power plants. These facilities will be placed at an extreme economic disadvantage because the independent power producers (IPP) and qualified facilities (QF) cannot pass through environmental control costs to the consumers. This is a part of the contract with the utility and is also part of the law that formed the basis of the IPPs and QFs. Constellation Energy believes that the allocation scheme for all generating facilities should be rethought to help smooth the imposition of a carbon price to ensure the success of the program. (CONSTELLATIONENERGY)

Comment: Constellation Energy requests that a formal public participation process be initiated to assess the issue of pre-existing power purchase agreements with IPPs. The issue of pass through of carbon costs must be resolved. (CONSTELLATIONENERGY)

Response: Constellation Energy is able to pass through certain carbon costs for electricity sold to utilities under the terms of the QF settlement. However, because the QF settlement encourages low-emission electricity production, and Constellation's power plants are high-emission facilities, not all of the costs can be passed through. This is consistent with the goals of this regulation.

Furthermore, the CPUC proceeding mentioned above is a public participation process that will include assessing pre-existing power purchase agreements between utilities and IPPs, and that is the best venue for this issue.

I-127. (multiple comments)
Comment: In developing its approach for the Cap and Trade program, ARB has attempted to create incentives to reduce emissions, to treat all covered entities fairly and equitably, to protect electric utility customers, to protect industry and to prevent leakage. This proposed limited free allowance provision for "locked-in" electricity generators would serve ARB's goals of fairness and equity in the Cap and Trade program. If they do not receive this limited relief, electricity generators with "locked-in" power sales would face massive costs that they could not pass through, unlike other generators. As described above, the "locked-in" generators would face new regulatory compliance costs that are new and highly disproportionate to any prior regulatory costs. Neither the Legislature nor the Governor anticipated that AB 32 would impose such costs and not allow them to be passed through. Neither did the ARB Board when it adopted the AB 32 Scoping Plan or ARB staff when they proposed the PDR for a Cap and Trade Program in 2009.

Also, the Legislature, Governor and ARB clearly desire to create incentives to invest in technology that lowers GHG emissions. The Cap and Trade program should not punish low GHG-emitting plants. If all wholesale generators are required to purchase allowances through the auction, the end result would be that some high-efficiency, low emissions plants are punished while less efficient, but higher GHG emitting plants are not. Instead, the program should provide incentives for the reduction of GHG emissions through the use of benchmarks that recognize more efficient power plants, such as the most efficient, new combined cycle natural gas plants.

The California power market would continue to receive the power from the "locked-in" generators. In consultation with CEC and CPUC, ARB could determine the appropriate deductions from the aggregate annual free allowance pool during the early years of the program. ARB, also in consultation with CEC and CPUC, could also adjust its future allocations of free allowances during each compliance year to achieve equity among the utilities and generators during each compliance year. Of course, the relief provided should only extend to the amounts of power "locked-in" for the "locked-in period and should expire when the contracts expire, terminate or are materially amended. (HDPP1)

Comment: Some California generators sell power under electricity contracts that do not allow the pass through of the costs of acquiring GHG allowances during the early years of the California Cap-And-Trade program. Without a mechanism to pass-through GHG allowance costs, these "locked-in" generators would have to purchase allowances to cover their compliance obligations but, unlike other generators, they could not pass the costs through the California energy markets to the utilities. These costs will vary depending on the price of allowances and the levels at which the affected power plants are dispatched by the contract customers, but could easily total from $16 million to $80 million per year for a nominal 75 MW combined-cycle power plant. These costs would place an enormous financial burden on the generator which could adversely affect the generator's ability to fund plant maintenance activities, to purchase fuel, to compete with other generators, to generate electric power for California consumers, and even to remain in business.

The proposed solution is ARB should cap the affected generators but allocate "free" allowances in a limited amount for a limited time to electricity generators located in California whose existing contracts do not allow the pass-through of Cap and Trade allowance costs. After the "lock-in" period, the covered generator would participate in the GHG auction like all other generators. The amount of free allowances allocated should be determined by applying current GHG emission benchmarks for electricity generation located in California. During the first compliance period (2012-2014), the benchmark for electricity generating power plants should be the GHG emission performance standard adopted by the CEC in 2007, which is 1,100 pounds (0.5 metric tons) of CO_2e per megawatt hour (MWh) of electricity. See 20 CCR section 2902.

The free allowances would only be made for the first Cap and Trade compliance period (2012-14), unless extended by further ARB Board action based on how the program works during the first compliance period. No banking or monetization of these allowances would be allowed. Eligible generators would be defined in ARB's final Cap and Trade regulation to include a facility with one or more power sales contracts executed before [November 24, 2009] that govern the facility's electricity sales and provide for sales at a price (whether a fixed price or a price formula) for electricity that does not allow for recovery of the costs of compliance with the limitation on greenhouse gas emissions under ARB's Cap and Trade regulation.

The owner or operator of the power plant would cease to be eligible to receive "free" GHG allowances when the contract expires, is terminated or is materially amended in a way that changes the price (whether a fixed price or price formula) for electricity, the quantity of electricity sold under the contract, or the expiration or termination date of the contract. To be eligible to receive "free" GHG allowances, the owner or operator of a "locked-in" generator would have to submit the following information to the Executive Officer within 60 days after the effective date of the final ARB Cap-And Trade rules, and also not later than [September 30] of each vintage year for which the generator wishes to receive GHG emission allowances:

(A) Identify each owner and each operator of the facility.
(B) Identify the units at the facility and the location of the facility.
(C) Certification by the designated representative that the facility meets all the requirements of the definition of a "locked-in" generator.
(D) The expiration date of each "locked-in" electricity sales contract.
(E) A copy of each "locked-in" electricity sales contract, to be submitted to ARB as confidential business information.

Not later than 30 days after a facility or a contract ceases to meet the eligibility requirements for distribution of" free" GHG emission allowances, the designated representative of such facility must notify the Executive Officer in writing when, and on what basis, such facility or contract ceased to meet such requirements. (HDPP1)

Comment: The High Desert Power Project (HDPP) believes that we can compete and provide cost-effective and low-emitting electric power to the California market under the ARB's Cap and Trade Rule with one critical exception: unlike some other electrical generators, we cannot pass the cost of GHG allowances to the markets during 2012 due to a locked-in power sales contract. The ARB's proposed Cap and Trade program will affect the various segments of the electricity sector differently. POUs and IOUs would receive direct (i.e., free) allocation of GHG allowances. However, for independent electricity generators, such as HDPP, ARB staff assumed this part of the electricity sector could pass-through 100 percent of the cost of the allocations to the wholesale power market (see ISOR, Appendix J, J-10) and therefore proposed that wholesale electricity generators be required to purchase all GHG allowances from auction from the outset of the program in 2012. Wholesale electricity generators would not receive any direct (i.e., free) allocation of allowances, starting in 2012 (see ISOR, Appendix J, J-16).

Unfortunately, the HDPP Plant currently has a fixed price contract to sell electricity from the period of February 2011 through December 2012. At the time the contract was entered in 2006, it was not anticipated—and could not reasonably have been anticipated—that HDPP would need to purchase over 1.5 million GHG allowances in 2012. Because HDPP has no mechanism to pass through the carbon costs of the proposed Cap and Trade program, HDPP would bear the entire cost of purchasing GHG allowances at a public auction to cover their compliance obligations, unlike other electric generators. (The HDPP Plant may also be able to obtain GHG offsets, but the proposed rule limits offsets so severely that the HDPP Plant could not operate at commercial levels with GHG offsets). If HDPP were to purchase all GHG required allowances for calendar year 2012 through auction at the price levels contained in the proposed Cap and Trade Rule, the 2012 cost could range from approximately $16- $80 million (at the floor or reserve prices in the proposed Cap and Trade sections 95911, 95913). Costs could be even higher if HDPP Plant dispatch increases in 2012. For many generators that are unable to pass through these costs, the added costs of purchasing GHG allowances could be punitive, could severely impact the generator economically and could even result in some cases in a suspension in operations to deal with this financial crisis which would adversely affect electric reliability in the State. We do not believe that the Legislature intended this result when it enacted AB 32, that the Governor intended this result when he signed AB 32 that the ARB Board intended this result when they adopted the AB 32 Scoping Plan or that ARB staff intended this result when they developed or proposed the California Cap and Trade program. To cure this fundamental inequity, we have prepared two alternative solutions and presented them to ARB staff:

I. The ARB Board should adopt language to provide direct allocations for the first compliance period (which runs through 2014) where an affected independent energy generator can show, to the satisfaction of the Executive Officer, that it cannot pass-through the cost of purchasing allocations due to the existence of a fixed price contract; or
2. The Board should provide clear direction to the Executive Officer to work with "locked-in" generators, CEC, and other stakeholders during the first half of 2011 to provide appropriate, limited relief in the final Cap and Trade Rule before the Executive Officer sends it to OAL.

Add the following language to the Board Resolution to be adopted on December 16, 2010:

"WHEREAS, some California electrical generators have reported that some existing power sales contracts do not include provisions that would allow full pass-through of cap and trade costs. These contracts pre-date the ARB's development of a proposed California cap on GHG and a proposed market-based compliance mechanism regulation. Many of these contracts may be addressed through the recently announced combined heat and power settlement at the California Public Utilities Commission but some may not be addressed. Staff continues to gather information, consult with CPUC, CEC, the California ISO and affected stakeholders and to evaluate this issue to determine whether some electrical generators may require special treatment for a limited period on a case-by-case basis;"

"BE IT FURTHER RESOLVED, that the Board authorizes and directs the Executive Officer to meet and confer during the first quarter of 2011 with California electrical generators that provide power to the California market subject to existing power sales contracts that do not include provisions that would allow full pass-through of cap and trade costs and, as appropriate, to provide special treatment in the final regulation to those affected generators, such as making direct allocations to those affected generators for the first compliance period (which runs through 2014) if an affected generator can show, to the satisfaction of the Executive Officer, that it cannot pass-through the cost of purchasing GHG allowances due to the existence of a fixed price or fixed formula contract." (HDPP2, HDPP3)

Comment: ARB should estimate the aggregated allowances allocated to "locked-in" generators during each year of the Cap and Trade program. The amount will diminish as the "lock-in" contracts expire. During the initial years when the aggregate amount is highest, the effect on the overall Cap and Trade and AB 32 programs should be minimal since the program is designed to phase in gradually during those years. When the pace of GHG reductions increases in later years under the Cap and Trade program, the aggregate allowances allocated to "locked-in" generators also diminishes due to contract expirations.

The U.S. Senate, when considering a similar Cap and Trade program, included specific allowance relief for "locked-in" generators. The Senate provision includes both IPPs and cogenerators. In light of the cogeneration settlement in California allowing cogenerators to pass through GHG allowance costs directly to their utility counter-parties, it appears that ARB need not address the issue for some or all California cogenerators. However, ARB should provide allowance relief for other "locked-in" California generators that are not covered by the settlement, on appropriate and fair terms.

Under ARB's October 28, 2010 proposal, HDPP would receive no GHG allowances, would have to purchase over 1.6 million GHG allowances at auction in 2012 but would have no way to recover or "pass through" its GHG allowance costs. Depending on the auction prices in 2012, the costs could far exceed $16 million (at $10 each) and even approach $80 million (at $50 each). Costs could be even higher if plant dispatch increases in 2012. These costs would cripple this plant. It could result in a quick failure of the plant economically and even in a suspension in operations to deal with this financial crisis. We do not believe that the Legislature intended this result when it enacted AB 32, that the Governor intended this result when he signed AB 32, that the ARB Board intended this result when they adopted the AB 32 Scoping Plan or that ARB staff intended this result when the developed or proposed the California Cap and Trade program. (HDPP1)

> **Response**: We responded to most of HDPP’s comments in the first part of the section. We did not adopt HDPP’s proposed solution involving allocation of allowances directly to independent power producers, because we prefer our approach described above, which offers a variety of solutions appropriate for particular long-term contracts or groups of similar contracts. We did not add the requested language to the Board resolution or to adopt language to provide direct allocations to independent energy generators. However, we will continue to work with such generators on options to satisfy their concerns.
>
> For the HDPP power plants specifically, the contract terms of concern are only an issue through 2012. We modified section 95856 and the definition of “compliance period” in section 95802(a) such that there is no compliance obligation until 2013. HDDP will not need allowances for 2012 emissions.

I-128. (multiple comments)
Comment: Calpine proposes the following revisions, which are largely based upon the provisions concerning long-term contract generators appearing within proposed federal climate change legislation and regulations implementing RGGI. Modify section 95802(a) as follows:

(111) “Long Term Contract" means a sales or tolling agreement governing the sale of electricity and/or useful thermal energy from an electric generating facility or cogeneration facility at a price (whether a fixed price or price formula) that does not allow for recovery of the costs of compliance with this regulation and that is at least five (5) years in duration, provided that such agreements are not between entities that were affiliates of one another at the time at which the agreement(s) were entered into.

(112) “Long-Term Contract Generator” means a covered entity which is not an electric distribution utility and which operates an electric generating facility or cogeneration facility pursuant to one or more long-term contracts. (CALPINE1, CALPINE2)

Comment: Modify Section 95802(a)(153) as follows:

(153). "Pre-AB 32 Power Purchase Agreement" means a power purchase agreement between the owner and/or operator of an electrical generating facility and an electric distribution utility for the sale of electricity that does not provide the owner and/or operator of the electrical generating facility with a reasonable opportunity to incorporate the full cost of regulations governing emissions of greenhouse gases. A power purchase agreement qualifies as a "Pre-AB 32 Power Purchase Agreement" where:

a. The power purchase agreement was executed on or before December 31, 2006, for a term greater than five (5) years.

b. The owner and/or operator of the electrical generating facility is a covered entity, but does not qualify as an electrical distribution utility.

c. The executed power purchase agreement does not allow the electrical generating facility to incorporate the full cost of regulations governing emissions of greenhouse gases into the price it charges the electrical distribution utility for electricity.

d. A power purchase agreement shall no longer qualify as a "Pre-AB 32 Power Purchase Agreement" if, after the effective date of this article, it expires or terminates.

e. The fact that a power purchase agreement includes a change in law or regulation provision, or a force majeure provision, shall not disqualify a power purchase agreement from being a "Pre-AB 32 Power Purchase Agreement" unless both parties to the power purchase agreement agree that such a provision entitles the owner and/or operator of the electrical generating facility to recover the cost of complying with regulations governing emissions of greenhouse gases. (GWFPS1)

Response: We did not add these definitions in section 95802(a) because they are not necessary, due to the approach we took to assess options for dealing with long-term contract issues on a case-by-case or categorical basis. Our approach to long-term contract issues is described at the beginning of this section.

Consignment Auction

I-129. Comment: Option for publicly-owned utilities to direct allowances to either auction by consignment or simple compliance provides flexibility but carries risk. Section 95982 (b)(2) states that publicly-owned electric distribution utilities must inform the Executive Officer at least 90 days prior to receiving annual allowances what portion of the allowances should be placed in the utility’s compliance account to be used only for compliance, and the utility’s limited use holding account to be consigned for auction. While SMUD appreciates the flexibility provided to publicly-owned utilities to choose to apply their allowance allocation to compliance without the price risk inherent in allowance auctions, we see other risks in this approach that we believe ARB should carefully weigh prior to adoption. These risks include the possibility that reduced auction participation by some public entities will increase allowance prices and price volatility because of reduced participation. In addition, since the provisions of 95982(d) would no longer apply to allowance value that is reflected in the allowances placed in an entity's compliance account, there is the potential for reduced revenues dedicated to AB 32 purposes. This may serve to increase allowance prices in the long run if such reduction in specifically dedicated revenues leads to fewer investments in energy efficiency and renewables. (SMUD1)

> **Response:** Section 95892 was strengthened to require electrical distribution utilities to use allowance value (not simply auction revenue) for the benefit of ratepayers, consistent with the goals of AB 32. ARB explains why all utilities should not be required to consign their allowances for auction based on the discussion starting on page II-30 and the rationale starting on page IX-61 of the Staff Report.
>
> We do not agree with the implication that a direct allocation will lead to higher and more volatile auction prices. Several POU representatives have indicated that they would pursue a buy-as-you-go approach to the auction, in which they purchase allowances at auction as close in time as possible to when they incur an obligation. To implement this strategy, POUs would bid high for the number of allowances they need. For this reason staff does not believe that the POUs will be setting the auction settlement price. That will instead be done by entities following more speculative purchase strategies. These would be entities that are willing to run the risk of not acquiring allowances at an auction in order to maximize profits.
>
> If utilities must consign the allowances, the utilities would have to use ratepayer funds to purchase them back at auction for compliance or for transfer to a JPA. The net effect of this, together with the small share of the sector in overall compliance, suggests that the magnitude of the effect suggested by the comment would be small.

I-130. Comment: Clarification is required on the timing of auctions given annual distribution of allowances. Subarticle 10 lays out the format and timing of quarterly auctions and allowance distributions. While one quarter of the annual allowances remaining pursuant to section 95870(f) will be auctioned in each quarterly auction, these amounts may be significantly fewer than the allowances distributed under section 95870 (c) to electric distribution utilities and consigned to auction under 95892(c). While it is not clear when utilities that receive such allowances must designate them for auction, section 95910(d)(4) makes clear that these latter allowances will not be included in an auction unless designated for such at least 60 days prior to the auction. Since these allowances are provided to utility distribution companies on or before January 15 of each year (section95870(c)), it seems clear that the allowances provided in each year cannot be included in the first quarterly auction. This may or may not be what ARB intends, but it would imply that the first quarterly auction may have significantly fewer allowances than other quarterly auctions, and some degree of clarification on this timing is desirable. (SMUD1)

> **Response:** We modified sections 958910 and 95870 to clarify the format and timing of auctions and allowance distributions.

I-131. Comment: Insufficient bids for allowances consigned to auction should be sold proportionately, rather than in equal amounts for each entity. Section 95911(b)(3)(B) states that when there are insufficient bids to fully sell all of the allowances that have been consigned to auction, the auction operator will sell an equal number of allowances from each consigning entity. It is appropriate to proportion the allowance sales in this event, but SMUD contends that a proportionate sale of allowances rather than an equal number for each entity is more fair. If entity A consigns 900 allowances for sale and entity B consigns 100, then it is more fair that the auction administrator sell 90 percent of the allowances for entity A and 10 percent for entity B, rather than an equal number for each. (SMUD1)

> **Response:** We agree and modified section 95911(b)(3)(B) as requested.

I-132. Comment: The other implication of auctioning allowances is that the proceeds of the auction that are paid by third parties (such as independent generators, industrial users of fossil fuels and importers of electricity) will be rebated to electric utility customers. These covered entities that are not utilities will be paying for allowances and the benefits will flow to the smaller customers of the IOUs. Meanwhile, the customers of these third party entities will bear higher prices. It is not apparent from the staff explanation of the Proposed Rule that this shift in revenues from other regulated entities to electric utility ratepayers was anticipated or understood. (HOR)

> **Response:** We modified section 95892(a) to require that the benefits (the auction revenue that flows through utilities) be used exclusively for the benefit of retail ratepayers of each utility. Third party entities that are EITEs receive a direct allocation of allowances based on product or energy benchmarking methodology. We expect utilities to pass through carbon costs in their rates, and to compensate all of their customers with allowance value through rebates or other means. Ultimately, as free allocation of allowances is reduced, EITEs will pass through carbon costs in their products, creating the price signal that is the point of a cap-and-trade system. Utility ratepayers include almost all Californians without exception. Because they bear costs both for greenhouse gas (GHG) emissions from electricity production and a separately mandated cost for the renewable portfolio standard, it is important to protect ratepayers from the full cost of both programs.

I-133. Comment: An auction is not good policy either for IOUs or POUs. First, it is unfair to impose a cost immediately for continuing to conduct activities that are now currently lawful and not taxed. Auctioning of allowances serves no legitimate purpose under
AB 32. An auction does not reduce emissions, but (as implemented by ARB) merely serves to move the source of emissions from one group to another. (HOR)

> **Response:** We disagree. Requiring allowances serves to internalize the environmental costs of GHG emissions. Investor-owned utilities (IOUs) will consign their allowances at auction in order to ensure that independent generators have equal access to allowances. The value of those allowances, in the form of auction proceeds, is required to be used for ratepayer benefit. Therefore, utilities consider the emissions intensity of the electricity they purchase and ratepayers are compensated for the carbon costs associated with the electricity. The allocation mechanism for the electricity sector fully compensates ratepayers for the cost of the cap-and-trade program.

I-134. Comment: POUs are not required to purchase allowances because it is politically unpopular to impose such costs on the "public." The distinction made between IOUs and POUs has no apparent basis in AB 32, and fails the requirement under AB 32 to be "equitable." Neither IOUs nor POUs should be required to purchase allowances at auction. Why are POUs not required to purchase allowances at auction? If an auction makes sense for IOUs, then it makes sense for POUs. An auction imposes a cost of carbon that creates a disincentive to emit greenhouse gases. If that is good for IOUs, it should be good for POUs. (HOR)

> **Response:** Publicly owned utilities (POUs) are not required to purchase allowances because they typically own their electricity generation. IOUs compete in an open market for electricity with their own generation and that of third party generators. In order to ensure that independent generators have equal access to allowances, IOUs are required to auction their allowances. We anticipate that they will purchase what they need for their own compliance and likely will purchase allowances for the compliance of generators from which they purchase electricity. POUs argued that, since they own most of their generation, being required to consign their allocations would be akin to requiring them to sell and repurchase their own allowances. In all cases, the price of carbon is what creates a disincentive to emit GHGs. Whether auctioned or not, the price of carbon affects decisions to emit. Even though POUs are not required to consign allocations, they are required to use that value for ratepayer benefit and no other purpose. This is equitable with the requirements on the IOUs.

J. ENFORCEMENT

This section includes comments and responses concerning the enforcement provisions in the regulation, including but not limited to sections 95857 and 96010–96013. The major topic concerns penalties for non-compliance, with sub-topics of the level of penalties, layering of penalties with the Mandatory Reporting Regulation, allowed compliance instruments for payment of penalties, the timing of auctions relative to surrender of compliance instruments, and the need to provide flexibility and ensure strong penalties.

Align with Other Programs/Regulations

J-1. Comment: ARB should consult with the Commodity Futures Trading Commission (CFTC) to ensure the regulation is in full alignment with CFTC regulations that are being developed for natural gas and power markets as part of Title VII of the Dodd-Frank Act. On November 26, 2010, CFTC published a solicitation for public input regarding the oversight of existing and prospective carbon markets to ensure an efficient, secure, and transparent carbon market, including oversight of spot markets and derivative markets in the Federal Register (Vol. 75, No. 227, pg. 72816-17). LADWP recommends that ARB consult with CFTC and review the regulatory proceeding to ensure that the AB 32 cap-and-trade regulation is fully aligned with CFTC regulations moving forward. (LADWP1)

> **Response**: We consulted with technical experts at the CFTC. We will ensure that the cap-and-trade draft regulations are reviewed and aligned with the final CFTC regulations to the extent the CFTC regulations are finalized by October 28, 2011, which is the date that ARB must submit the rulemaking file to the Office of Administrative Law.

Untimely Surrender

J-2. Comment: To increase the impetus for timely and complete compliance, EDF encourages CARB to make the entire untimely surrender obligation be immediately due upon failure to meet the compliance deadline. Although this may be the intent of the rule as written, the phrasing of section 95857(c)(1), is not clear as to what amount is “immediately due.” Is it the entire untimely surrender obligation or just the portion that represents the excess emissions? Accordingly, section 95857(c)(1) should be amended to clarify that it refers to the untimely surrender obligation and refers to the entirety of the amount. (EDF1)

> **Response:** We do not intend to collect the entire obligation “immediately.” New section 95857(b)(6) allows the passage of one auction and one allowance price containment reserve sale before the untimely surrender obligation is due. This ensures that covered entities have sources of allowances other than the secondary market before the untimely surrender obligation is due. This change was made in response to stakeholder comments that having the compliance

instruments due within the time originally allotted would adversely affect the market.

J-3. Comment: Applicability of the untimely surrender obligation should not apply to emissions subject to appeal and under review by the Executive Officer. LADWP recommends that an appeal process be included in the regulation for cases where there may be a difference of opinion between the covered entity and the verifier related to the technical calculation of a compliance obligation. In order to avoid undue penalties while an appeal is being reviewed by the Executive Officer, modify section 95857(a)(3) as follows:

(3) The compliance obligation for untimely surrender shall not apply to a covered entity or opt-in covered entity for emissions that are the subject of a written appeal submitted to the Executive Officer while that appeal is under review and consideration. (LADWP1)

Response: We do not believe that an appeal process that is related to the calculation of compliance instruments required for surrender is necessary. The number of compliance instruments for any entity is calculated based on the emissions that the entity reported pursuant to the MRR that receive a positive or qualified positive verification statement. The MRR provides an appeal process for any entity that receives an adverse verification statement. However, that appeal would not affect the calculation in this regulation. The MRR provides that the appeal of a verifier's statement will be concluded before the surrender obligation is calculated. Therefore, there is no need for a separate appellate process in the cap-and-trade program. Moreover, adding additional procedural steps and delays would add costs and market uncertainty.

Offsets

J-4. (multiple comments)
Comment: In order to ensure that the verifiers meet these standards, the program needs to provide for CARB to regularly conduct disinterested audits of offsets, offset registries, and verifiers, and to decertify as necessary. Requiring an independent reviewer pursuant to section 95977(e)—who may be an employee of the verifier—does not meet this purpose. As written, it is uncertain whether CARB has clearly set up a process that minimizes this potential conflict of interest, and should therefore be clarified. (EDF1)

Comment: CARB set up a process as rigorous as the one required for the offset project registries in section 95987 to avoid attracting lower quality offsets and verifiers with conflicts of interest. Ultimately, CARB should make explicit that verifiers and registries that act in bad faith or repeatedly have Qualified Offset Verification Statements reversed should be subject to decertification for good cause as authorized to the Executive Officer under section 95132(d). (EDF1)

Comment: There also should be a means for third parties to challenge verifiers' certifications. (EDF1)

> **Response:** We do not believe that the recommended changes are necessary. ARB's review of verifiers' certifications will be conducted according to the standards set forth in the regulation. We have full authority to administer and provide oversight of the offset verification program. This ensures consistency across verifications and certainty that the verification services meet the requirements of the regulation. If a third party has specific concerns related to an offset project verification, they should share those with ARB. The concept of independent review within the verification body is consistent with international best practices and does not substitute for an ARB audit or review.

J-5. Comment: CARB should clarify what it will do when 1) offsets are found to be inappropriate or are reversed and 2) verifiers fail to perform their jobs as required. (EDF1)

> **Response:** We added new text to section 95985 to provide clarity on the handling of offset invalidations, including notification, determinations, invalidations, and replacement of invalidation offsets for both sequestration and non-sequestration projects. We modified section 95983 to clarify how reversals for sequestration projects will be handled. We will pursue the appropriate remedy as provided by statute against verifiers that do not adequately perform verification services. However, we anticipate that many of the disputes related to inadequate verification services will be settled by contracts between the offset project operator and the verifier.

Offset Buyer Liability

J-6. Comment: CARB should make clear that it will deny requests for offset credits that fail to meet these criteria and will invalidate any previously issued credits that are discovered to not meet these criteria. (EDF1)

> **Response:** The regulation sets forth the requirements to qualify credits as ARB offset credits. If it is later determined that the offset credits do not meet ARB's criteria, those credits will be revoked in accordance with section 95983 of the regulation.

ARB Jurisdiction

J-7. Comment: The assertion of jurisdiction should be tailored to circumstances in which an entity has a compliance obligation under the proposed regulation. The proposed regulation provides that the purchase or holding of a compliance instrument or receipt of proceeds from the sale of a compliance instrument constitutes consent to the jurisdiction of California and the ARB. Jurisdiction should not extend to circumstances where California links with another jurisdiction and a compliance instrument originating in California is traded in another jurisdiction. For example, if an entity sells an allowance originally created in California to another entity subject to a linked cap-and-trade compliance program, that transaction should not be subject to California law; the mere act of transacting does not in itself warrant jurisdictional claim. In other words, when the compliance instrument is used to satisfy another state's compliance obligation, the entity retiring the compliance instrument should only be subject to the jurisdiction of that state. (PACIFICOR1)

> **Response:** The commenter raises issues related to linkage agreements with other jurisdictions. ARB anticipates that these issues will be finalized during the negotiations of linkage agreements. However, ARB currently is the only jurisdiction in which ARB offset credits will be accepted, so the point made by the commenter is moot at this time.

J-8. Comment: PacifiCorp recommends that the ARB should not assert jurisdiction whenever an entity uses a compliance instrument that was created in California. Specifically, the assertion of jurisdiction in section 96010(b) and (c) should be limited to transactions in California. (PACIFICOR1)

> **Response:** We do not agree. If an offset project operator applies for credits in California's cap-and-trade program, regardless of the operator's location, it is subject to California's jurisdiction. Additionally, if ARB issues an offset credit, ARB must maintain jurisdiction over the use of that offset credit, as it is only authorized for use in ARB's system.

Robust Enforcement

J-9. (multiple comments)
Comment: Make the cap strong and universal. Put solid money into enforcement and oversight measures. Apply stringent rules of compliance for all GHG emitters. (LANGE)

Comment: If California is going to establish a market in greenhouse gas emissions, strict transparency and enforcement requirements are absolutely essential. ARB must vigilantly use transparency and enforcement tools to make sure that the public interest is protected from the self-dealing, fraud, and windfall profits that have plagued other markets. (SIERRACLUBCA4)

> **Response:** We intend to make the operation of the cap-and-trade program as transparent as possible. However, we must also balance the protection of confidential business information to ensure that covered entities do not gain an unfair advantage or obtain knowledge that would allow them to collude on the prices of commodities.

J-10. Comment: The cap part of the Cap and Trade program must be solidly enforceable here in California. All contributory industries are dragging their feet in making necessary changes to how they do business, hoping to avoid having to make the tough decisions that are inevitable and overdue. A strictly enforceable Cap on greenhouse emissions in California must be an example to the rest of the Nation that we can't be lazy and greedy anymore if we truly want to survive. (GOFF)

> **Response:** We understand that many stakeholders are concerned about the possibility that business-as-usual practices will continue. However, a firm regional cap with strong reporting and enforcement rules will provide a high degree of environmental certainty that emissions will not exceed targeted levels. As part of the cap-and-trade program, major sources of emissions will be subject to an emission cap which must be met, regardless of growth. Inclusion of strong reporting and enforcement requirements in this program also provide certainty in achieving the 2020 cap. In addition, the largest sectors will also be subject to other recommended measures, which provide significant cost-effective reductions and complement the cap-and-trade program. Further, the regulation includes strict rules for reporting emissions and trades, with substantial penalties for violations. Transparency in the trading process is important to avoid market manipulation.

Penalties

Clarification Needed

J-11. Comment: This rule sets forth a multitude of violations that are established if trading is manipulated, fraudulent, or based on misinformation or attempts to fix price. However, the consequences for such behavior are unclear. Does a fraudulent trade result in a one-day violation of the Health and Safety Code? Without a clear definition of the number of days of violation or counts associated with these acts, there will be grossly inadequate penalties associated with violations that could result in huge profits. (CAPCOA1, CAPCOA2)

> **Response:** Apart from the Health and Safety Code, laws addressing unfair business practices, antitrust, securities trading, commodities trading, and fraud may apply to fraudulent trading practices, and could be enforced by a variety of state and federal agencies. Health and Safety Code section 38580 also provides for penalties based on “any violation” (in the singular) of the regulation. A fraudulent transaction involving one compliance instrument or offset credit would constitute a violation of the cap-and-trade regulation; a fraudulent transaction involving multiple instruments or credits would constitute multiple violations of the regulation, each subject to significant penalties under section 38580.

Executive Officer Actions on Holding Accounts
