Comment: Increasing the frequency of auctions is the most efficient tool to control the risk of market manipulation. Research included in our August Letter demonstrates that the most effective way to curb the risk of market manipulation is to hold auctions frequently. More auctions reduce the risk of market abuse because of the decreased value at stake in smaller auctions. They also minimize price volatility experienced at the time of allowance auctions and the risk of any one market player exercising excessive market power between auctions. For those reasons, most agencies managing carbon markets have moved to a weekly auction schedule, including in Europe and Germany where, by law starting in 2013, auctions must be held on a weekly basis or more frequently. RGGI is an outlier whose design dates back to 2006/2007. The RGGI quarterly auction schedule has been largely untested, because the RGGI market is historically long (i.e. characterized by excess allowance supply) and trading activity is low. We recommend that ARB use the 2012 auctions to identify any significant issues related to auction frequency and provide an opportunity for all market participants to experiment with the auction process. Starting in 2013, we recommend that ARB move to a monthly, semi-monthly or weekly auction schedule in accordance with the most recent research conducted worldwide on carbon auctions. (CHEVRON5)

> **Response:** The comment is outside of the scope of the second 15-day changes to the regulation. No response is required. Nevertheless, our stakeholder consultations held in 2009 and 2010 brought up other factors affecting our decision to hold quarterly auctions. First, stakeholders did believe that the quarterly format was operating successfully at the time. Second, both stakeholders and ARB were concerned with the ability of all covered entities to participate in frequent auctions due to the costs and time commitments. Some California-covered entities have extensive experience with auctions and commodity markets, and have resources to conduct extensive auction and secondary carbon market participation. Others do not. We believe that retaining the quarterly format will give covered entities time to develop the capabilities for more frequent auction participation. Third, ARB has not operated auctions or financial activities on this scale before, and we must develop the contract services, internal procedures, and enforcement mechanisms needed for successful implementation. We note that the EU ETS auctions are generally conducted by national ministries with extensive experience in market operations. Auctions pose no great institutional challenges for them.
>
> We conclude that the quarterly format can be successfully implemented without damaging the market. At the same time, we do see some value in evaluating a potential move to a more frequent auction once we develop the institutional capability, stakeholders develop familiarity with the process, and we can review a longer period of market information from the EU ETS.

Auction Limitations

D-4. Comment: MSCG largely has no objections to the non-disclosure provisions for auction participants in section 95914(d)(1)(A). However, we do not see the harm to the market that might come from simply revealing that a company has qualified to bid in the auction. It would be normal business practice in many circumstances to simply represent to potential clients and/or customers that MSCG was qualified, and was an eligible market participant, as a way to promote our capabilities when soliciting business. For this reason, we recommend that the prohibition on revealing qualification status be eliminated. (MSCG4)

> **Response:** The case brought up in the comment, that of an entity serving as an advisor, is covered under section 95914(d)(2), not section 95914(d)(1), which covers general auction participants. Section 95914(d)(2) would allow advisors to recruit clients and advise them. However, this comment is outside the scope of the second 15-day changes to the regulation because we have not proposed any

change to the rules governing disclosure of information on auction participation. No further response is needed.

Reserve Supply

D-5. Comment: We understand that it is ARB's intent to fix any problems through the regulatory process or initiate the emergency provision of the Health and Safety Code section 38599, if the reserve is depleted. We believe that the regulatory process may be too time consuming to respond in a timely manner and that relying on the emergency trigger creates undue disruptions and is unwarranted when it can be handled in a less draconian manner through preplanning. CCEEB recommends that ARB identify reserve indicators to monitor and the criteria and process for backfilling the reserve before it is completely depleted. The refill mechanism should trigger once the reserve is 50 percent depleted to bring more supply into the market, recognizing that use of the reserve indicates scarcity in the market and potential liquidity problems. (CCEEB4)

Response: This comment is outside the scope of the second 15-day changes to the regulation because we did not propose any change to the funding of the reserve in section 95870 or add any language on depletion of the reserve anywhere in the regulation. Therefore, no response is needed.

Purchase Limits

D-6. (multiple comments)
Comment: In addition, the Purchase Limit currently establishes a ceiling of 15 percent of the allowances offered per auction. While this proposal would have little, if any, impact on relatively small emitters of GHG, such a proposal for relatively larger emitters or those with corporate associations may create constraints on their ability to choose which auctions to enter, when to purchase allowances from the auction, etc. In recognition of these disparate impacts on Covered Entities, the Purchase Limit should generally remain at 15% of the allowances offered for auction; however, for large covered entities or a group of covered entities with a corporate association, CARB should set the Purchase Limit for these entities such that it recognizes different magnitudes of compliance obligations. IEP believes that this adjustment may only apply to a very small subset of covered entities or a group of covered entities with a corporate association. This amendment should be made to the regulation prior to the first auction in 2012. (IEPA3)

Comment: We reiterate that Purchase Limits (section 95911(c)) should be waived or increase in the event that allowances would otherwise go unsold in an auction. This provision would preserve ARB's stated goal of ensuring "fair and equitable access to allowances sold at auction, "but also allow for a more liquid and efficient market in the event that the auction would otherwise close undersubscribed. (CE2CC2)

Response: We heard similar concerns from covered entities, and we raised the purchase limit from 10 percent to 15 percent for covered entities. The purchase limit continues to apply only to the first compliance period. Based on our reviews of emissions data and consultations, we believe the limit is high enough to allow all covered entities to purchase their emissions needs, net of direct allocations, from the auction. We believe the new limit, together with the existing limit on non-covered entities, does level the playing field.

We are entering a phase of considering linkage with other jurisdictions in the WCI. We anticipate that the calculation of the purchase limit may have to change to reflect the size distribution of emitters and total allowance supply in the WCI. The WCI is discussing alternative ways of setting the purchase limit for a WCI joint auction. As linking will require a new regulatory effort, we will continue to seek advice from stakeholders as the WCI linking is evaluated.

Auction-Bid Guarantee

D-7. Comment: Minimize unnecessary bureaucratic requirements. Investment grade credit-rating should be permitted in lieu of bid guarantees in sections 95912(h) and 95913(e)(2). (CCEEB4)

Response: This comment is outside the scope of the second 15-day changes to the regulation because we did not propose any change to the bid guarantee requirements. No response is needed.

Consignment Auction and Allowance Limits

Purchase Limits

D-8. Comment: The Regulation Should be Revised to Avoid Discriminatory Impacts on Independent Generators Through Application of the Auction Purchase Limits.

The utilities' exemption from the purchase limit should be deleted. The purchase limit on allowances applies to all regulated entities, except electrical distribution utilities. Distribution utilities that purchase allowances to cover their own compliance obligation should be treated the same as any other entity subject to a compliance obligation. Specifically, independent generators directly compete with UOG and this preferential provision could provide an unfair advantage to UOG, especially as allowances become scarcer in the later years of the program. This limitation could also create a skewed competitive playing field where utility distribution companies can obtain more allowances than they need for their own compliance obligation, only to sell back to their IPP competitors when prices are high. When applying the purchase limit to covered entities in a non-discriminatory manner, the purchase limit must be established such that all covered entities face equivalent opportunities to buy (or not buy) out of the auction allowances necessary to meet their compliance obligations. (IEPA3)

> **Response:** This comment is outside the scope of the second 15-day changes to the regulation because we did not propose any change to the exemption of utilities from the purchase limit. No response is needed.

Market Readiness

D-9. Comment: ARB should release a "formal declaration of readiness" at least 60 or 90 days prior to "going live" with their first auction. The CAISO for the Market Redesign and Technology Upgrade underwent this process including system testing by market participants and CAISO ran into some software problems. It is important for ARB to have the same type of formal action to notify market participants. Furthermore, this declaration would be an opportunity for stakeholders to raise to ARB's attention any concerns they may have about the status of the program and readiness to go live. (CCEEB4)

> **Response:** Readiness testing of administrative systems is not part of this rulemaking. However, we will have a readiness testing requirement as part of the contract with the auction system operator. We anticipate that stakeholders, as well as our Market Surveillance Committee of academic experts, will have the opportunity to address to us concerns they may have about the auction platform.

Other Auction-Related Comments

D-10. Comment: PG&E understands the intent of the auction format is for the price to be set at the Auction Reserve Price when there are unsold allowances. However, the current text in section 95911(d)(4) does not ensure this outcome. Further, Section 95911(b)(3), which describes the process for returning unsold allowances, is predicated on there being unsold allowances only when the Auction Settlement Price equals the Auction Reserve Price. This may not always be the case. Assume there are four allowances consigned and there is a single bid for three allowances at $15/allowance. In accordance with section 95911(d)(4), the regulation does not specify what the Auction Settlement Price would be because there is no additional bid below the Auction Reserve Price of $10/allowance. Further, even if the example included an additional bid for two allowances at $5/allowance, the current regulation suggests that the Auction Settlement Price would be the “current price” of $15/allowance instead of the Auction Reserve Price of $10/allowance as intended. PG&E recommends the following changes to address both these possibilities and ensure the auction operates as intended. Modify section 95911(d)(4)(A) as follows:

> (A) The next lower bid price is less than the ~~a~~<u>A</u>uction ~~r~~<u>R</u>eserve ~~p~~<u>P</u>rice <u>or there are no additional bids</u>, in which case the ~~current price~~ <u>Auction Reserve Price</u> becomes the ~~a~~<u>A</u>uction ~~s~~<u>S</u>ettlement ~~p~~<u>P</u>rice; or (PGE5)

> **Response:** While we agree that allowances can remain unsold when the auction settlement price is above the auction reserve price, there is no problem,

because the process of re-auctioning the allowances is not affected. We will consider clarification in future regulatory amendments.

E. COMPLIANCE OBLIGATION / COMPLIANCE CYCLE

Untimely Surrender

E-1. Comment: ARB's clarifications on untimely surrender of compliance instruments in section 95857 are appreciated. The 5 percent flexibility threshold and six-month time period to surrender compliance instruments allow some room to respond to a changing system. However, as this regulatory framework is likely to evolve on several levels, Ag Council requests that ARB consider the remainder of the first compliance period as a grace period for implementation for participants in cap and trade. Participants will be learning more about their technology and the regulatory requirements as the first compliance period begins in 2013, as will ARB staff and enforcement officials. By removing the 5 percent threshold and increasing the six-month timeframe to the end of the first compliance period, it will provide more flexibility for participants and staff to create a system that works for everybody. (ACC5)

> **Response:** We disagree. We effectively already allowed our emitters a grace period for their GHG emissions in 2012 by removing the compliance obligation for that year. To make sure that the cap-and-trade program properly incentivizes reductions, it would be inappropriate to further extend that grace period. Emitters have had time during 2011, and will have further time in 2012, to learn more about their technology.

E-2. Comment: Section 96014(b) refers to the "Untimely Surrender Period." However, this term is not defined and is not used elsewhere in the Regulation. In order for covered entities to be aware of the circumstances in which this penalty provision will apply, it is important to replace this term with a reference to the relevant section of the Regulation, which is section 95857(b)(6). This change can be made without further 15-day public comment, as it is "nonsubstantial or solely grammatical in nature" for the purposes of section 11346.8(c) of the Government Code. Modify section 96014(b) as follows:

> (b) A separate violation accrues every 45 days after the <u>date determined pursuant to section 95857(b)(6)</u>~~end of the Untimely Surrender Period~~ for each required compliance instrument that has not been surrendered. (SCPPA8)

> **Response:** For further clarification, we added a reference to section 95857 for section 96014(b).

E-3. Comment: NCPA supports the Proposed Revision to section 95857(b)(4) that would allow compliance entities to meet one-quarter of their untimely surrender obligation with offsets, rather than requiring only allowances to be surrendered. In section 95857(b)(6), NCPA continues to urge CARB to allow at least two weeks (or 10 business days) between the first auction or reserve auction following the surrender date and the deadline for surrendering the untimely obligation. (NCPA4)

Response: We disagree. We believe that the five days provided in section 95857(b)(6) provides emitters ample time to meet their compliance obligations.

E-4. Comment: As required in section 95857, making up excess emissions at a 4:1 ratio is a good deterrent. However, the rules are structured so that this is not due until five days after the next auction or reserve sale conducted by CARB. This presumes that these will be the only mechanisms for market participants to obtain compliance instruments and may introduce unnecessary delays in obtaining the make-up compliance instruments. We suggest that the excess emissions be due in 30 days, and then appropriate additional enforcement action can be taken for delays. (SCAQMD5)

Response: We disagree. We do not presume that the auction and reserve sale will be the only mechanisms for emitters to obtain compliance obligations. However, we want to make sure that emitters have access to these mechanisms. Thus, the regulation provides emitters the opportunity to access at least one of these mechanisms before the deadline to comply with an untimely surrender obligation.

E-5. Comment: While section 95858 provides for a notification from ARB when there has been under-reporting, there does not appear to be the same notification in section 95857. Instead, there is a reference to an "assessment" (without reference to notification to the regulated entity) which triggers a short window to purchase additional allowances before a penalty of four times the missing allowances is required. (UNITEDAIRLINES3)

Response: This comment correctly notes that section 95857 does not require ARB to "notify" those with an untimely surrender obligation for their new obligation. Rather, the new obligation is "assessed." Section 95858 specifies that we notify any emitters of a compliance obligation for underreporting. In part, this is because underreporting requires ARB to make a determination. By contrast, there is far less expertise needed to determine whether there is an untimely surrender obligation. It should be readily apparent to each emitter whether they surrendered enough compliance instruments to comply with their original compliance obligation.

E-6. Comment: While the amendments made to the regulation now allow for up to one fourth of an entity's compliance obligation for untimely surrender to be filled with ARB offset credits, rather than solely with GHG allowances (section 95857(a)(4)), the framework of the untimely surrender obligation still penalizes entities that are in compliance with the cap-and-trade program by creating allowance supply constraints. Currently, the cap-and-trade regulation requires that covered entities that do not retire the requisite number of allowances for their triennial compliance obligation will be subject to an "untimely surrender obligation" for the shortfall. The untimely surrender obligation is four times the shortfall and must be satisfied by submitting allowances or offsets in order to satisfy the untimely surrender obligation. As a result, there will be significantly more demand in the auction for allowances, creating upward pressure on prices. Due to the high allowance prices resulting from this heightened demand in the auctions, covered entities that are in compliance with the cap-and-trade program will inappropriately be penalized, in the form of higher prices for GHG allowances, for the actions of others who were not in compliance. To avoid penalizing complying entities, CARB should require the entity subject to the shortfall to obtain allowances for its compliance obligation (i.e., 1/4 of the untimely surrender obligation), thereby avoiding the price effect of increased demand for allowances and maintaining the integrity of the "cap." On the other hand, the same entity should be required to meet the rest of the penalty (i.e. 3/4 of its untimely surrender obligation) via a financial payment, based on the auction clearing price, to be paid to the Air Pollution Control Fund. (IEPA3)

> **Response:** We disagree. We carefully considered the merits of the two approaches to require extra allowances or a financial payment for a compliance obligation that is not met within the specified time. We consulted with experts from other cap-and-trade programs and with our Western Climate Initiative (WCI) partners. Following those consultations, we concluded that the approach requiring additional compliance units was the most appropriate for California. If an entity surrenders additional compliance instruments because of an untimely surrender, one of those compliance instruments is retired (if offsets are submitted, the offsets would be retired), and the remaining instruments are placed into a future auction.

E-7. Comment: While the Utilities continue to believe that the eight percent overall limit on the use of offsets provides sufficient protection to ensure real and permanent GHG reductions, we support and appreciate the changes in section 95857(b) which will allow one-fourth of an entity's Untimely Surrender Obligation to be fulfilled with offset credits. (MID4)

> **Response:** Thank you for your support.

Timely Surrender

E-8. Comment: Section 95856(b)(2) of the regulation states, that "To fulfill any compliance obligation, a compliance instrument must be issued from an allowance budget year within or before the year during for which an annual the compliance obligation is calculated, or the last year of a compliance period for which a triennial compliance obligation is calculated, (. . .)" We think that the wording does not clearly say which allowances can be used for the triennial compliance obligation. The paragraph should be altered so that it becomes obvious if allowances only from the corresponding vintage year or allowances from the corresponding compliance period can be surrendered. (TSG)

> **Response:** We disagree. We believe the wording is clear. For an annual compliance obligation, allowances from that vintage or an earlier vintage may be used. For a triennial compliance obligation, allowances from the final vintage of the compliance period or from any earlier vintage may be used.

E-9. Comment: CLFP supports emissions borrowing. The current regulation only allows emissions banking in the cap-and-trade. CARB should allow borrowing allowances with some limits and standards. The ability to borrow will aid in reducing costs and allow companies to meet obligations without penalty for short periods of time. (CALFP4)

> **Response:** We disagree. After consultation with experts from other cap-and-trade programs and with our WCI partners, we decided not to allow borrowing.

Under-Reporting

E-10. Comment: The Utilities support the inclusion of an eight-year statute of limitations on the determination of under-reporting in section 95858(d). (MID4)

> **Response:** Thank you for your support.

E-11. Comment: The Second 15-Day Revisions clarify that the compliance obligation associated with underreporting in a previous period (found in section 95858) are not subject to the untimely surrender obligation (section 95857) or direct penalty provisions (section 96014) if the obligation is met within six months. The Proposed Revisions would also place an eight-year limit on the look-back period for underreporting. NCPA supports these proposed changes for inclusion in the Cap-and-Trade Regulation and urges CARB to adopt them. (NCPA4)

> **Response:** Thank you for your support.

E-12. Comment: We were surprised to see the addition of language in section 95858(d) which states that the ARB can go back eight years in determining whether there has been under-reporting of emissions. This is much longer than the time period provided for under most federal and state environmental regulations. The reason for shorter periods under many laws is the fairness of seeking to defend against such an enforcement action after a significant amount of time has passed. While there is an obligation to maintain records under the Cap and Trade for ten years, there can be related communications and documents which would serve to provide context to the circumstance, along with the potential for faded memories and changes in applicable personnel. We would ask that ARB re-consider inclusion of this enforcement time period in the cap-and-trade regulation. (UNITEDAIRLINES3)

> **Response:** We appreciate the concern. However, we believe that the eight-year provision is appropriate. It is also supported by some stakeholders (see above). As the program moves forward, we will continue to evaluate this provision and other provisions in the regulation.

E-13. Comment: Section 95858(d) was added, which states that a facility is not held responsible for under-reporting emissions if CARB has not taken action for inaccurate emission reporting after eight years. This usually is an adequate period of time for a regulatory agency to discover the violation, investigate and take appropriate enforcement action if necessary. However, three-year compliance periods, along with a period of six months to make up under-reported emissions, may allow facilities to escape liability for what could be significant violations. (SCAQMD5)

> **Response:** We acknowledge the concern. We believe that eight years strikes the appropriate balance allowing us to enforce against under-reporting but also providing emitters some certainty that enforcement action will not be taken for actions that are from a more distant past.

E-14. Comment: In section 95858(a), we are very concerned that the provision of a five percent "free" under-reporting will introduce a potentially significant failure of the market to reach its required goals. The Mandatory Reporting rules also allow up to three percent of emissions (up to 20,000 MT CO_2e) to be considered "de minimus" with less rigorous reporting requirements, which compounds this potential problem to potentially allow up to eight percent under reported emissions. For larger emitters these percentages can be a substantial amount of emissions. In addition, the formula in the rule does not represent an adequate deterrent against under-reporting. Under-reported emissions should also be made up at a 4:1 ratio, if a shortfall occurred, regardless of whether it was from under-reporting or not surrendering enough compliance instruments to cover reported emissions. Six months is also too long to make up the shortfall. This should be shortened or left to CARB discretion considering the amount of emissions due. RECLAIM requires reconciliation within 30 days for quarterly reporting periods and 60 days for the annual period. (SCAQMD5)

> **Response:** We disagree that the provisions against under-reporting need to be strengthened. We believe they are appropriate. The six months allows enough time for entities to participate in an auction or reserve sale to acquire additional compliance instruments. The five percent in the formula is consistent with how reported emissions are reviewed during verification. The commenter is mistaken in how they have pulled several parts of the MRR and cap-and-trade requirements together to conclude the program is not designed to deter under-reporting. Independent of the additional compliance instruments needed for cap-and-trade, the MRR has very stringent penalty provisions to address under-reporting. The two rules work together to build a strong program without “layering” penalties for the same issue.

E-15. Comment: In section 95858(c) it is unclear why "subsequent" year compliance instruments are usable for correcting under-reporting, when they are not usable for the original obligation. This could encourage facilities to deliberately under-report emissions. At a minimum, we suggest that the "subsequent" years be limited to the year in which the under-reporting obligation is being satisfied. (SCAQMD5)

Response: We acknowledge that allowing "subsequent" vintage years could encourage facilities to deliberately under-report emissions. However, we believe this is approach is the most appropriate. Requiring allowances from the compliance period with under-reported emissions could be an issue. For example, if midway through the third compliance period an under-reporting issue was discovered for an emitter in the first compliance period, it may not be possible to find allowances from the first compliance period, since allowances banked from the first compliance period may have been used to meet compliance obligations from the second compliance period.

Compliance Obligation

E-16. Comment: Section 95853 states that a covered entity that initially exceeds the threshold in section 95812 in the first year of a compliance period is a covered entity for the entire period. ARB should allow compliance instruments issued from an allowance budget throughout a triennial compliance period be available for use to meet a triennial compliance obligation not just the last year of a compliance period for which a triennial compliance obligation is calculated as stated in Section 95856(b)(2). Valero does not believe that ARB's intent was to limit the use of compliance instruments for a triennial compliance period to those compliance instruments issued during the last year of the triennial period. The language in Section 95856(b)(2) is confusing and Valero recommends that the language be changed to match the language that is used in the Summary of Proposed Modifications. Modify section 95856(b)(2) as follows:

> (2) Compliance instruments issued for the last year of a compliance period, or from a previous vintage, may be used for a triennial obligation, for that compliance period. ~~To fulfill any compliance obligation, a compliance instrument must be issued from an allowance budget year within or before the year for which an annual compliance obligation is calculated, or the last year of a compliance period for which a triennial compliance obligation is calculated, unless:~~ (VALERO3)

> **Response:** We made a minor grammatical edit to section 95856(b)(2) to clarify which vintage allowances may be used to meet a triennial compliance obligation.

Exemption for Federal Agencies

E-17. (multiple comments)
Comment: We respectfully request the regulations remove the limits on our participation and regulation include, but are not limited to, the following:

- Provide Federal facilities an initial allowance budget with a modestly declining balance over the three compliance periods and provide Federal facilities with appropriate mechanisms to allow compliance in the case of a national emergency or military operations outside of normal day-to-day operations; or

- Add “NAICS 928110 National Security” to “Table 8-1: Industry [and Military] Assistance” and expand the related discussion to include national security activities. The expanded discussion could address the fact that military installations may not have the benefit of moving across state lines to minimize regulation due to their extensive infrastructure investments in close proximity to existing airspace and ranges in California. It could also address the fact that the military cannot pass along the cost to consumers, and without equitable assistance, the cost to taxpayers either increases or training and readiness activities suffer. (USDOD3)

Comment: The Marine Corps hereby incorporates by reference comments made in the following correspondence:

- January 20, 2010 (DoD Comments on Preliminary Draft Regulation)
- December 14, 2011 (DoD Comments on Proposed Regulation Order)
- June 28, 2011 (Supplemental Legal Analysis (attached to Comment 49)
- September 16, 2011 (Assistant Secretary of the Navy Letter to Chair, ARB (attached to Comment 47).

Finally, while we generally support the ARB's recognition of issues unique to the military, we respectfully renew our request for a permanent exemption from compliance obligations. (MCAGCC)

Comment: Specific to the California cap and trade program, we are extremely concerned with the regulations implementing AB 32, as fiscal and constitutional law presents barriers to federal participation. I strongly support the DoD Regional Environmental Coordinator’s current proposed language seeking permanent regulatory relief, and would request that ARB give it careful consideration. (USDON)

Comment: Allowing the DoD to address GHGs through its own internal planning allows for a more comprehensive approach and it gives flexibility to the commanders of troops on the ground to determine how to achieve reductions without compromising National Security. It is important to note that while the federal plan achieves greater GHG reductions, those reductions might not derive solely from facilities that exceed the cap-and-trade applicability threshold. The SSPP does not guarantee any one facility will meet the same goals as cap-and-trade, but it does guarantee that GHG mitigation goals will be achieved across DoD. (USDOD3)

Comment: Before these regulations become final, we hope you will strongly consider either modifying them to remove the legal constraints of our participation or acknowledge that federal facilities have no compliance obligation under the regulations as they are currently drafted by including one of the following new provisions. Modify section 95852.2(g) or add section 95815 as follows:

> (g) Emissions from Federal Facilities that meet the definition of a covered entity as set forth in Subsection 95802(a)(44).

Section 95815. Military Facilities. Military facilities that qualify as a "covered entity" pursuant to Section 95811 and that exceed the applicability threshold herein are exempt from this regulation. (USDOD3)

Response: We continue to work with the Department of Defense's representatives to resolve concerns that they have raised. The second 15-day changes to the regulation provided a new exemption in section 95852.2(c). We do not believe it is appropriate to further modify the regulation at this point for how they may participate in the cap-and-trade program, but we will continue to work with them for how we modify the regulation in the future. Board Resolution 11-32 directs the Executive Officer to coordinate with stakeholders to develop a mechanism to achieve GHG emission reductions from the national security/military sector (NAICS 92811) beginning January 1, 2014.

Transportation Fuels

E-18. (multiple comments)
Comment: Transportation fuels are not covered under the cap and trade program until the second compliance period. Since hydrogen is a low-carbon fuel, the carbon footprint of its production is equivalent to a conventional fossil fuel's carbon footprint during use. As such, hydrogen used as a transportation fuel during the first compliance period should be exempt from a compliance obligation, consistent with the absence of a compliance obligation imposed on fossil-fuel based transportation fuels during the first compliance period. The hydrogen fuel exemption would also be consistent with the lack of a compliance obligation for natural gas used as a transportation fuel during the first compliance period. This temporary exemption can be realized by CARB allowing a reduction in a hydrogen producer's overall compliance obligation proportional to the fraction of total production which is sold as a transportation fuel. Alternatively, CARB could make an allowance allocation equal to the emissions associated with the amount of such hydrogen produced and sold as transportation fuel. (APC3)

Comment: Hydrogen produced for use as a transportation fuel should be exempted from a compliance obligation until the second compliance period. (IGPACC2)

Response: We recognize the potential of hydrogen as a clean transportation fuel. However, we do not agree that it is appropriate to exclude from a compliance obligation or to provide an explicit incentive for this use of hydrogen through free allocation. The purpose of allowance allocation is not to "pick winners" among the many greenhouse gas-reducing technologies that may become more widely used in response to the carbon price signal created by the cap-and-trade program.

In addition, we modified the regulation to allow for a different allocation to liquefied hydrogen production facilities in the future if necessary. If, in the future, any carbon costs from purchased electricity are included in consideration of the product benchmark values, the high level of indirect emissions from liquefaction of the hydrogen would likely lead to a different benchmark value for liquefied hydrogen. The current framework could also allow for a change in the leakage risk classification for liquid hydrogen based on any new information that may arise as we continue to analyze leakage risk per the direction in Board Resolution 10-42 and Resolution 11-32.

E-19. (multiple comments)
Comment: Our recommendation is that fuels not be included under the cap. Including fuels under the cap is redundant with the low carbon fuel standard and vehicle mileage standards. As presently structured treatment of fuels under the cap is inequitable relative to treatment of utility power. The cost to producers and for consumers of fuels will be excessive. (TESORO3)

Comment: The inclusion of transportation fuels under the cap beginning 2015 should be re-visited. The economic impacts of California-only fuels under the program should be further evaluated, including cost and consideration for the fact that California is already implementing the Low Carbon Fuel Standard (LCFS). (CALCHAMBER4)

Comment: We also believe treatment of fuels-under-the-cap issue needs to be revisited. The Scoping Plan proposed inclusion of transportation fuels in the cap-and-trade program beginning in 2015, largely due to the expectation that Western Climate Initiative states would address fuels this way in their state programs. Since California is already implementing the Low Carbon Fuel Standard, and no WCI states are prepared to link to California, we recommend that the leakage impacts of a California-only fuels-under-the cap (on top of the LCFS) be re-examined. Since CARB does not intend to implement Fuels under the Cap until the 2015-2017 compliance period, it is important for CARB to take the opportunity now to assess all available alternatives in addressing transportation fuels in a simple and comprehensive framework under AB 32. (AB32IG3)

Response: The cap-and-trade regulation will help transition California away from carbon-intensive fossil fuels to cleaner and more-efficient fuels. The fossil fuel portions of biofuels and bioenergy are under the cap. Transportation fuels and fuel suppliers will have a compliance obligation. However, biomass-derived fuels are exempt from a compliance obligation, since CO_2 emissions resulting from the combustion of biomass are considered biogenic. Emissions from biomass-derived fuels must be reported and verified pursuant to the MRR. Source categories that are not listed under section 95852.2 (Emissions without a Compliance Obligation) or that have not received a qualified positive or positive verification statement must be reported as “other biomass CO_2.” Other biomass emissions that cannot be verified pursuant to the MRR are not considered biomass-derived, and will hold a compliance obligation.

Furthermore, California’s Low Carbon Fuel Standard (LCFS) addresses all lifecycle emissions (not just fossil fuel) in its regulation. The LCFS also plans to reduce the carbon intensity of transportation fuels 10 percent by 2020. Since

GHG lifecycle emissions from transportation fuels are already regulated through the LCFS, biofuels do not need to be addressed in cap-and-trade regulation. California's LCFS comes from Executive Order S-01-07, which mandates that a statewide goal is established to reduce the carbon intensity of California's transportation fuels by at least 10 percent by 2020. This standard applies to all transportation fuels unless otherwise noted in the law. Specifically with regard to transportation fuels, ethanol from biomass (Agriculture, Municipal, and Forestry) is covered under the LCFS, while biomass electricity is excluded from the regulation. As noted in the LCFS regulation, "The California Low Carbon Fuel Standard regulation, title 17, California Code of Regulations (CCR), sections 95480 through 95490 (collectively referred to as the "LCFS") applies to any transportation fuel, as defined in section 95481, that is sold, supplied, or offered for sale in California, and to any person who, as a regulated party defined in section 95481 and specified in section 95484(a), is responsible for a transportation fuel in a calendar year."

Biomass/Biofuels

E-20. Comment: CERP appreciates ARB's modifications to section 95852.1.1(a)(2), which clarify the circumstances under which biogas may have a purchasing contract dated on or after January 1, 2012. Allowing the conversion to beneficial use through the recovery of fuel will be a helpful incentive for facilities to create useful energy transfer from biogas. CERP supports ARB's approach of allowing a later contracting date where there is "an increase in the biomass derived fuel production, at a particular site." (section 95852.1.1(a)(2)(A)). This provision makes sense because an overall increase in fuel production from a particular site is distinguishable from a "resource shuffling"-type scenario. However, section 95852.1.1(a)(2)(A) has some ambiguity because it measures the "increase" in terms of "any amount over the average production at that site over the last three years." It is not clear whether this language applies in the case of a newly constructed facility. One valid interpretation of this phrase is that production from a new facility would qualify as an increase because there would have been zero "average production" from the "particular site" in the previous three years. It would be very helpful if ARB, in the Final Statement of Reasons, clarified that this interpretation of section 95852.1.1(a)(2)(A) is valid. Alternatively CERP recommends that ARB clarify the regulations in the next rulemaking by modifying section 95852.1.1(a)(2)(A) to state "an increase in the biomass derived fuel production capacity, at a particular site or a new production facility …" (CERP5)

Response: The interpretation above is incorrect because provision 95852.1.1(a)(2)(A) reads that the increase would have to be over the average production within the last three years. There are two options for fuel being provided under a contract dated on or after January 1, 2012. The second provision (95852.1.1(a)(2)(B) states that the fuel being provided must only be for an amount associated with recovery of the fuel at a site where the fuel was previously being vented or destroyed without producing useful energy. We will continue to evaluate this issue and consider rule modifications as part of a separate rulemaking.

E-21. (multiple comments)
Comment: CERP has noticed a contradiction between section 95852.2(a)(8), which states that biomethane and biogas from all animal, plant and other organic matter, as well as landfill gas and wastewater treatment plants, do not count toward an entity's compliance obligation, and section 95852.1.1, which requires that the biogas fuel have a contract for purchasing prior to January 1, 2012. CERP recommends that in the next rulemaking ARB modify section 95852.2(a)(8) to state: "Biomethane and biogas that is eligible under section 95852.1.1, as applicable, and from the following sources." This will clarify that in order to be eligible for the compliance exemption biogas must adhere to applicable regulations. (CERP5)

Comment: Camco is concerned that as currently written the regulations would not permit gas from a new biogas facility to earn a compliance exemption for the emissions produced when that gas is destroyed (section 95852.1.1). The construction of new biogas facilities represent an overall increase in the amount of biogas, not resource shuffling. Contracts for purchasing biogas from a newly constructed facility should be able to receive a compliance exemption, and such biogas should also be able generate RECs and offset credits. Under the current regulations, it appears this may be the case, but it is not clear. To clarify this position for developers, Camco hopes that ARB can provide further clarification in its Final Statement of Reasons. Furthering this uncertainty is the contradiction between section 95852.2(a)(8), which states that biomethane and biogas from all animal, plant and other organic matter do not count toward an entity's compliance obligation, and section 95852.1.1, which requires that the biogas fuel have a contract for purchasing prior to January 1, 2012. (CIG3)

> **Response:** The regulation language states clearly that emissions from the source categories and from the combustion of the fuel types listed in section 95852.2 count toward applicable reporting thresholds, as applicable in the MRR, but do not count toward a covered entity's compliance obligation. These emissions include CO_2 emissions from: combustion of biomethane and biogas from animal, plant, and other organic waste, or from landfills and wastewater treatment plants.

E-22. Comment: CERP further supports the modifications to section 95852.1.1(a)(1)(C) that allow for flexibility in the contracting date by counting the date that an entity submits an application to CEC as meeting the requirements for January 1, 2012 contracting date. However, the requirement that gas start to flow 10 days after the completed CEC application may not reasonable for some purchasers depending on the contractual structure in place, and CERP requests that the period be extended to 30 days. (CERP5)

> **Response:** We revised section 95852.1.1(a)(1) to specify that a contract for purchasing any biomass-derived fuel must be executed prior to January 1, 2012.

Prior versions of the regulation had stated that contracts must have been in effect prior to January 1, 2012.

E-23. Comment: CERP commends ARB for its efforts to clarify section 95852.1.1(b) to make it clearer that offset credits can be generated from projects without removing their compliance exemption. However, the provision is still very difficult to parse. It would be helpful if ARB offered an explanation of the provision in the Final Statement of Reasons. CERP's understanding is that this section provides for the following:

- Credits and allowances are not available for CO_2 emissions associated with combustion of biomethane, biogas, or other biomass-derived fuel (or the reduction in CO_2 emissions associated with use of fuel for energy instead of the flaring of that biomethane or biogas); provided that
- Credits may be available for avoided methane emissions associated with biomethane or biogas produced from digesters or landfills pursuant to the relevant offset protocols. Such credits may not exceed 23.75 metric tons of CO_2e per ton of captured (or avoided) methane.
- Nothing in section 95852.1.1 prevents the generation of Renewable Energy Credits associated with biomass-derived fuels. (CERP5)

Response: We clarified the text to allow for biogas from a digester offset project to be exempt from a compliance obligation for its combustion emissions. The offset project only credits the capture and destruction of methane. The exemption applies to the combustion CO_2.

E-24. Comment: Modifications made to section 95852.1.1(b) go some-way to making ARB's intention on the offset and other environmental credit biogas facilities may earn clear. However, Camco feels that this language could be made clearer and/or accompanied by an explanation in the Final Statement of Reasons clarifying the intent and meaning of the regulation. As Camco understands the regulation, ARB intends to permit biogas facilities to generate offsets equivalent to the GHG emissions avoided through the installation of a digester or cap to capture methane which would have otherwise been emitted and permit the facility to generate Renewable Energy Credits from the generation of energy through use of the gas. However, offset credits are not available for CO_2 emissions associated with the combustion of the biogas. (CIG3)

Response: We do not believe a change is necessary. The regulation allows CO_2 emissions from biogas from a landfill participating in the voluntary offset program to be exempt from a compliance obligation if used at a covered entity in lieu of a fossil fuel.

E-25. Comment: The proposed modifications include no changes in response to our previous comments that GHG emissions from the combustion of woody biomass should be included under the cap and generate compliance obligations. "Entities combusting these fuels should be excused from compliance obligations only to the extent that they can demonstrate that the production and use of the biomass fuel resulted in reduced or avoided greenhouse gas emissions over a timeframe relevant to AB 32, that is, by 2020." That is, any exemption from compliance obligations must be based on an explicit and source-specific determination of the GHG emissions associated with the production and combustion of the feedstock. In the case of forest biomass, such a determination would need to take into account fuel characteristics and sources, secondary emissions associated with harvesting and processing, land use impacts, and effects on future sequestration. The blanket exemption proposed in both the original draft regulation and the proposed modifications satisfies none of these criteria, and thus lacks any evidentiary basis. From our numerous conversations with ARB staff on this topic we understand that ARB remains committed to this blanket exemption for the GHG emissions associated with the combustion of woody biomass. To date, however, ARB has not presented any analysis or evidence to support this approach. As our December 15, 2010 comments and the numerous scientific articles and studies attached thereto demonstrated, there is no basis in scientific fact for treating GHG emissions from biomass as if they have no effect on the climate. Indeed, the scientific evidence against such an approach to biomass carbon accounting continues to mount. For example, a recent paper released by the Scientific Committee of the European Environment Agency directly contradicts and warns against this type of blanket exemption for the GHG emissions from the combustion of plant biomass. "It is widely assumed that biomass combustion would be inherently 'carbon neutral' because it only releases carbon taken from the atmosphere during plant growth. However, this assumption is not correct and results in a form of double-counting, as it ignores the fact that using land to produce plants for energy typically means that this land is not producing plants for other purposes, including carbon otherwise sequestered. If bioenergy production replaces forests, reduces forest stocks or reduces forest growth, which would otherwise sequester more carbon, it can increase the atmospheric carbon concentration. If bioenergy crops displace food crops, this may lead to more hunger if crops are not replaced and lead to emissions from land-use change if they are. To reduce carbon in the air without sacrificing other human needs, bioenergy production must increase the total amount of plant growth, making more plants available for energy use while preserving other benefits, or it must be derived from biomass wastes that would decompose and neither be used by people nor contribute to carbon sequestration." (EEA at 1, italics added.) "Proper accounting needs to reflect not merely the loss of existing carbon stocks in the pursuit of biomass production for energy, but also any decline of carbon sequestration that would occur in the absence of bioenergy use. For example, forests worldwide, but particularly in the northern hemisphere, are accumulating biomass and carbon for a variety of reasons, and this growth absorbs carbon from the atmosphere. Some estimates of bioenergy potential suggest that biomass reduces greenhouse gas emissions so long as it only harvests this net forest growth and leaves the carbon stocks of the forests stable. But merely keeping carbon stocks stable ignores the additional carbon sequestration that would occur in the absence of wood harvest for bioenergy (the counterfactual) and therefore does not make bioenergy carbon neutral. For this reason, sustainable forestry in the traditional sense does not necessarily mean that bioenergy produced from a forest is carbon neutral." (EEA at 5, italics added.) ARB has never explained its proposal to adopt a complete exemption from compliance obligations for this category of greenhouse emissions. The facts, however, are clear: leaving all biomass emissions outside the cap, exempt from any compliance obligation whatsoever, ignores the physical realities of biomass production and combustion. This exemption will result in uncontrolled greenhouse gas emissions above and beyond the cap, and thus will interfere with the goals and purpose of AB 32. ARB has no authority to adopt regulations that conflict with fundamental statutory goals. In short, the biomass exemption is arbitrary, capricious, and lacking in evidentiary support. ARB's failure throughout this year-long process to explain its decision to adopt this exemption also flies in the face of clear statutory procedural requirements. We urge ARB once again to refrain from adopting this unlawful, unscientific, and unwise exemption. (CBD5)

> **Response:** ARB wants to correctly identify and separately treat biomass-derived fuels from fossil fuels. Section 95103(j) of the MRR states that the operator or supplier must separately identify, calculate, and report all direct CO_2 emissions resulting from the combustion of biomass-derived fuels as specified in section 95115 for facilities, and sections 95121-95122 for suppliers. Biomass-derived fuel emissions must be identified by the source of fuel, as described in section 95852.2 of the cap-and-trade regulation. A biomass derived fuel not listed in that section will be required to hold a compliance obligation under section 95852.1. For a fuel listed under section 95852.2, reporting entities must also meet the verification requirements in section 95131(i) of this article, or the fuel must be identified as an Other Biomass-Derived Fuel and be subject to a compliance obligation under section 95852.1. By not including biomass-derived fuels under the cap, we are recognizing that the use of a biomass-derived fuel is preferred over the use of fossil fuels at capped sources for the purposes of achieving the AB 32 emissions target.
>
> The scope of this regulation is to apply a compliance obligation on direct emissions from capped entities. Any lifecycle analysis of biomass-derived fuel and its potential emissions or impacts beyond the emissions at the capped entities is not within the scope of this regulation. The program will include transportation fuels under the cap starting in 2015; therefore, GHG emissions associated with the transport of biomass material will be covered under the cap. As described in the Adaptive Management Plan that the Board approved in Resolution 11-32, we are committed to monitor and adjust the program for unanticipated adverse impacts as a result of projects under the U.S. Forest Protocol. We do not believe that exempting emissions from combustion of woody biomass will result in the harmful removal of woody biomass from forests, as there are existing environmental protection laws that serve to protect against the denuding of the forests. The data collected under the MRR will help ARB monitor increases in biomass-derived fuels, types of specific fuels, and source location to monitor for any changes to the use of biomass-derived fuels as a potential result of this program. The reporting requirements in the MRR have been subject to a public review and comment process as part of that rulemaking.

Municipal Solid Waste

E-26. (multiple comments)
Comment: Inclusion of WTE facilities in the CARB Cap and Trade Program ignores the scientifically recognized GHG benefits of this technology and will ultimately result in more landfilling and more GHG emissions generated in California. Covanta Energy and the communities it partners with support a compliance obligation exemption for the three existing Energy-from-Waste facilities in California. An exemption is consistent with the major cap and trade systems currently in place (EUETS or RGGI). Our request is based on the conservative analysis that demonstrates that GHG emissions will increase from landfills if these facilities are included in the cap. Additionally, the communities will lose the electricity revenues generated from the sale of electricity at these facilities. These are revenues that these communities use to fund their recycling programs. In July 2011, CARB concurred, concluding that inclusion of the three WTE facilities in the cap and trade program could increase state-wide GHG emissions. Subsequently, CARB has reversed its assessment. First relying on an unfinished model in a manner completely inconsistent with its intended purpose, and then second relying on a brief spreadsheet calculation that misapplies its own regulation. CARB's abrupt policy reversal, based on the misapplication of a draft model and a cursory spreadsheet calculation resulting in a position contrary to a significant body of international and domestic policy and research, is, to put it mildly, concerning. As a direct consequence, we sincerely request that CARB defer compliance obligations under AB 32 for the three existing municipal waste to energy facilities at least until such time that an external non-conflicted expert panel has provided an approach to calculate the lifetime methane emissions associated with the disposal of municipal solid waste in landfills, taking into consideration CARB's existing analysis and all other relevant available information, and CARB has had an opportunity to apply that approach to satisfy all the risk of leakage resulting from the inclusion of waste to energy facilities in the proposed cap and trade program. (COVANTA2)

Comment: British Columbia has a history of following California's leadership on climate mitigation related initiatives. As a member of the Western Climate Initiative, British Columbia has already passed enabling cap and trade legislation (Bill 18). If the government of British Columbia decides to fully implement a Cap and Trade system, it will almost certainly look towards regulatory guidance from California. As such, ongoing deliberations regarding California's Cap and Trade Program will also have profound influence on other jurisdictions. A number of landfills in British Columbia are reaching capacity. As a consequence, several regions, including Metro Vancouver and the Capital Regional District, have begun to explore other options for dealing with their solid waste. Metro Vancouver recently completed an extensive assessment process and recommended a plan to the Province of British Columbia that was subsequently approved. The plan called for the introduction of substantial waste diversion, recycling and composting programs together with waste-to-energy (WTE) for the remaining solid waste. Metro Vancouver cited that an important reason for moving to WTE was its substantive GHG mitigation potential relative to landfills, even with existing methane capture technology. For reasons that are entirely unclear, California appears to have taken the odd position of including WTE in their cap and trade legislation while excluding landfills. This suggests that WTE is being treated as being part of the energy sector instead of being considered within the solid waste sector. This makes little sense as an internationally recognized means of reducing greenhouse gas emissions ends up being assigned punitive regulatory measures. In addition, a life cycle analysis of WTE within a cap and trade system would need to account for avoided methane emissions from landfill, avoided CO_2 emissions from fossil fuel energy sources, and other avoided GHG emissions associated with the recovery and subsequent recycling of metals. At the same time, it makes little sense to treat emissions within the solid waste sector separately from each other. Under the United Nations Framework Convention on Climate Change common reporting format for the national GHG inventories, waste sector emissions are listed together. Given California's influence on environmental regulation both within the U.S. and Canada, it is extraordinarily important for potential inconsistencies in the treatment of sectoral emissions to be dealt with prior to finalizing California's cap and trade system. The differential treatment of WTE versus landfill emissions is inconsistent with international standards. It will likely have the unfortunate and ironic consequence of encouraging enhanced GHG emissions within the waste sector. (UOV)

Comment: The Sanitation Districts Board of Directors unanimously adopted the enclosed Resolution in response to the sudden change to the proposed rule, regarding waste-to-energy facilities. This action was contrary to your Board's December 2010 Resolution concerning these facilities. The Sanitation Districts request removal of waste-to-energy facilities from the proposed program. The Sanitation Districts are co-owners, with the host cities if Long Beach and Commerce, of two waste-to-energy facilities. The new costs which your proposed rule will impose on the facilities will be a significant burden, and could well result in shutdown of one or both, and elimination of all employee positions (green jobs). In addition, the post-recycled solid waste now used to directly produce energy would instead be diverted to landfills for disposal. (LASD4)

Comment: The Coalition has serious concern regarding the Board's changed position in which WTE facilities will now be subject to the proposed regulations' CO_2e allowance purchase requirement, which is contrary to the Board's previous recognition that imposing such a requirement on WTE facilities would increase waste diversion to landfills and result in more rather than fewer GHG emissions in California. We understand that Board staff are now suggesting two alternative rationales to justify the Board's about-face. The first rationale is a hybrid approach that uses the CALMIM model's hypothetical oxidation rate for uncollected landfill methane, and, based on the Board's analysis, typically approaches 100 percent oxidation. The second rationale is based on the assumption that landfill methane collection systems will continue to operate for up to 260 years post-closure. Both of these suggested rationales are invalid as well as contradictory. First, the CALMIM Model's 100 percent oxidation rate is irrational. A life cycle comparison of the GHG impacts of landfills versus WTE requires, an estimate of the landfill methane that would result if a given quantity of waste is diverted from WTE processing to landfilling. One component of that estimate is the amount of methane that is oxidized within the landfill cover and never released to the atmosphere. The widely accepted standard value for such oxidation (in fact, the method used by ARB in its own regulations for control of landfill methane) is 10 percent oxidation. Instead, the Board is relying on its new hybrid approach that uses the CALMIM model to determine fugitive methane emissions post-closure with no landfill gas collection system in operation. Aside from the fact that the CALMIM model is apparently still in development and has a number of technical problems that require correction, CALMIM (as used by ARB to compare life cycle GHG impacts of landfills vs. WTE) yields oxidation rates that typically approach 100 percent. Such hypothetical oxidation rates cannot be reconciled with the 10 percent oxidation rate that is the well established regulatory default value for oxidation. If such oxidation rates were valid, landfill methane collection systems would be unnecessary and serve no purpose. U.S. EPA's 10 percent oxidation rate is well supported in scientific literature. Significantly, the IPCC Guidelines' default value for oxidation of landfill methane is zero. If the methane oxidation rates yielded by the CALMIM model were valid, ARB's regulations for control of landfill methane would be completely unnecessary and an unlawful exercise of agency authority. The second of the two alternative (and contradictory) rationales that we understand was suggested by Board staff is the assumption that landfill methane collection systems will continue to operate for 260 years post-closure. If that were true, a significant portion of the landfill methane that ARB had previously recognized as being released to the atmosphere post-closure would instead be captured and controlled, and the relative GHG impact of landfills versus WTE would change accordingly. The 260-year assumption is, however, arbitrary in the extreme and contradicts reality. In that regard, U.S. EPA and ARB regulations allow landfill gas collection systems to shut down permanently if certain performance criteria are met. Additional regulations require landfill operators to provide funding (or alternative financial assurance) to satisfy post-closure maintenance obligations. These federal and State regulations address long-term, post-closure care of landfills, including methane collection systems, as well as reasonably foreseeable corrective actions. Nowhere do they contemplate a requirement for post-closure operation of methane collection systems for anything approaching 260 years. Nor is there any requirement that landfill operators set aside the massive amount of funding that would be necessary to satisfy such a daunting requirement. The absence of such requirements is quite understandable. They would have no justification, environmental or otherwise. Moreover, if such multi-century post-closure care and financial assurance requirements were to be established, landfill tipping fees would soar, with increases many times current levels. In sum, nothing in the administrative record supports ARB's changed position in which WTE facilities would be subject to the CO_2e allowance purchase requirement under the Board's proposed cap-and-trade regulations, and the result of such action will clearly be adverse for the environment, as explained in the comments the Coalition submitted to the Board last month (a copy of the Coalition's August 11 comment letter is attached). Accordingly, the Coalition respectfully submits that the regulations exclude WTE facilities from the proposed CO_2e allowance requirement. While the exclusion should, at a minimum, apply to California's existing WTE facilities, in the interest of achieving a significant future reduction in waste management sector GHG emissions in California, the same policy should also apply prospectively to new WTE capacity. (LGCRE3)

Comment: WM requests confirmation of the proper interpretation of section 95852.2(a)(7), Emissions without a Compliance Obligation, with respect municipal solid waste that is directly combusted or converted to a cleaner burning fuel. First, what is the definition of “cleaner burning fuel”? Cleaner than what? Further clarification is needed here to comply with the clarity standard of the California Administrative Procedure Act. Secondly, attorneys with whom we have consulted interpret the language to exempt from compliance MSW that is directly combusted or converted to cleaner-burning fuel regardless of its biogenic origin. The phrase, “including MSW directly combusted or converted to a cleaner-burning fuel” appears to be inclusive of all solid waste, regardless of biogenic or anthropogenic origin. If this is CARB’s intent, we concur. As we have repeatedly stated, a life-cycle assessment of WTE facilities clearly demonstrates an overall reduction in GHG emissions. The language you have modified in the 2nd 15-day comment period appears to embrace this concept, and WM certainly supports that there should be an exemption for the entire municipal solid waste stream that is beneficially converted to renewable energy. In the July draft of the regulations, CARB had reversed its recognition of WTE’s ability to lower GHGs. The discussion draft regulations initially proposed that the three existing WTE facilities operating in California would be excluded from a Cap and Trade compliance obligation. As we stated in our comments on the July draft, CARB’s reversal threatened these facilities’ operations and could significantly increase municipal costs of waste management, environmental impacts from truck traffic and distance to disposal, and GHG emissions. We strongly support exclusion from compliance obligations for all municipal waste that is converted into cleaner burning energy. This exclusion should be applied to all technologies, including conversion technologies that can demonstrate their ability to lessen the amount of greenhouse gas emissions into our atmosphere. (WM4)

Comment: CARB staff removed from the discussion draft of the 15-day amendments, released on July 8, 2011, language in section 95852.2 that excluded from compliance obligations, "Direct combustion of municipal solid waste with energy recovery in an existing permitted facility" because of concerns over lifecycle analysis assumptions that originally supported this exclusion. However, we believe these concerns to be unsupported. The uncertainty expressed by CARB focused on landfill methane surface emissions post-closure with no GCCS. CARB used two approaches to support their decision to reverse the exclusion. The first is based upon a hybrid model of gas generation to determine lifetime fugitive landfill emissions. Based upon our review and subsequent meetings, CARB appears to have backed off on the first approach because of demonstrated technical problems with the analysis. CARB' s second analysis utilizes a first order decay model to estimate how long it would take, post-closure, for landfill gas generation to reach a heat rate of three million BTUs per hour (MMBtu/hr). CARB has arbitrarily chosen this heat rate to define the time at which a landfill gas collection system could be turned off; approximately 260 years for the Puente Hills Landfill and 93 years for the Fink Road Landfill. CARB then plugged these new time estimates in a lifecycle analysis to conclude that landfilling produces less GHG emissions than combusting an equal amount of waste in a waste-to-energy facility. We have serious concerns with this approach. Methane collection systems do not operate and are not required or designed to operate for anything approaching 260 years and landfill operators are not required to set aside the funding that would be necessary to satisfy such a requirement. With so much regulatory focus on placing bounds on how long GCCS need to operate in the post-closure period, it is very clear that an analysis that would assume a full GCCS operating for a 260 year post-closure period is absurd, and not based in reality. More appropriate estimations of the time to tum off the GCCS Regulations couple a time-certain period with performance standards to define when a GCCS can be turned off. By using the CARB integrated surface standard of 25 ppm coupled with air dispersion modeling, a landfill gas generation model can be used to determine the approximate time into post-closure where the integrated surface levels will be no greater than 25 ppm (assuming no GCCS). The results of this analysis demonstrates that the Puente Hills Landfill will reach the 25 ppm integrated methane surface level in approximately 26 years post-closure, and the Fink Road Landfill in approximately 57 years. Both these estimates provide a more reasonable, and expected, time by which a GCCS can be turned off. In addition, these estimates mirror the assumptions used in the original lifecycle approach used by CARB, which is the basis for the original exclusion language. Finally, even these results should be viewed as conservative since, landfills would phase out portions of their GCCS prior to the 26 and 57 years determined for the Fink Road and Puente Hills Landfill, respectively. A more thorough analysis clearly demonstrates that when a suitable modeling approach is used to estimate when a GCCS will be removed, the resulting time frames fall within those contained in the original analysis on which CARB previously made its decision to exclude the existing waste-to-energy facilities. On this basis, we request the exclusion language be re-inserted in section 95852.2. (LASD5)

Comment: The 15-day modification discussion draft contained in section 95852.2, language that excluded from compliance obligations, "Direct combustion of municipal solid waste with energy recovery in an existing permitted facility.'" CCEEB requests that the language contained in the discussion draft be re-inserted in section 95852.2. The owner/operators of these facilities have previously demonstrated to the satisfaction of CARB staff that the existing waste-to-energy facilities cannot spread the cost of allowances to a consumer base; haulers would simply take the post-recycled waste to the cheaper option, landfills, resulting in much higher levels of GHG. The facilities would have no choice but to absorb the cost of the allowances creating a huge financial burden for already financially strapped local governments. CARB has presented two analyses justifying the removal of the waste-to-energy exclusion language, both of with have been demonstrated to be flawed technically. To date, nothing in the administrative record supports CARB's changed position. The fact remains that subjecting the existing waste-to-energy facilities to the proposed cap and trade regulations will have an adverse impact on the environment. Also, re-inserting the language is consistent with the resolution adopted at the 12/16/10 Board meeting requiring, "the Board determine and report back to the Board a mechanism to satisfy all the risk of emissions leakage and compliance obligations of existing municipal waste-to-energy facilities in the proposed cap-and-trade program." (CCEEB4)

Response: When the Board first considered the cap-and-trade regulation in December 2010, some stakeholders raised concerns about including waste-to-energy facilities in the regulation. In response to this concern, the Board directed ARB staff to investigate whether including waste-to-energy facilities in the cap would result in "leakage" of greenhouse gas emissions. Our analysis indicates that diversion of waste from waste-to-energy facilities to landfills would not increase greenhouse gas emissions. This is because of California's strict statewide and district regulations that require capture of methane emissions from landfills. Thus, we would not expect that including waste-to-energy facilities in the cap-and-trade program would increase greenhouse gas emissions.

There are also important policy reasons to include waste-to-energy facilities in the cap. The cap-and-trade program is designed to both place an enforceable and declining cap on greenhouse gas emissions and to send a price signal to encourage more efficient energy use. As part of this program, it is important to create a level playing field in order to send a consistent price signal. If we were to remove waste-to-energy facilities from the cap, it would inappropriately incentivize electricity generated by these facilities, since they would not be subject to the price signal. In addition, our partner in the Western Climate Initiative, British Columbia, is also planning to include waste-to-energy facilities as a covered sector in their cap-and-trade program.

We do recognize that the waste management system in California is complex, and that it is important to consider the broader picture of waste management, which includes landfills, waste-to-energy facilities, recycling, and composting, as well as reduction in the use of resources at the front end. Board Resolution 11-32 directs the Executive Officer to continue to work with Cal/Recycle and other stakeholders to characterize lifecycle emissions reduction opportunities for different options for handling solid waste, including recycling, remanufacturing of recovered materials in state, composting and anaerobic digestion, waste-to-energy facilities, landfilling, and the treatment of biomass. The Executive Officer shall identify and propose regulatory amendments, as appropriate, so that AB 32 implementation, including the cap-and-trade regulation, aligns with statewide waste management goals, provides equitable treatment to all sectors involved in waste handling, and considers the best available information. The Executive Officer shall report on progress in summer of 2012.

E-27. (multiple comments)
Comment: In October 2010, CARB released the proposed regulation for the cap and trade program. In a later meeting with CARB staff, the staff agreed to add language to section 95852.2, Emissions without a Compliance Obligation, under Fugitive and Process emissions, "CH_4 and N_2O from Municipal Wastewater Treatment Plants." The sheet with that change was introduced at the December 16, 2010 Board meeting where all the documents were approved by the Board, but the Resolution 10-42 required that Attachment B be subject to 15-day public review, and comments considered. The first 15-day package was release in July 2011. The language cited above was contained in

this package. To our knowledge, no negative comments were received addressing this specific language. Unfortunately, the second 15-day package released removed the language with no explanation. It is our opinion that if there were no negative comments from the first 15-day period, the above listed language should not have been removed from the document. We respectfully request correction of this oversight as part of the second round of review comments processing at this time. (CWCCG)

Comment: Streamlining the federal mandatory reporting program with the State program caused some unintended consequences. The federal program requires the estimation and reporting of fugitive CH_4 emissions from landfills. When the two programs were combined, this estimation now had the unintended effect of drawing landfills into the cap and trade program. In December 2010, staff introduced language in section 95852.2 excluding fugitive CH_4 from landfills. In the most recent 15-day package the language was removed from this section, but the exclusion was introduced into the State mandatory reporting regulation, as an exclusion of landfill reporting, from State reporting requirements, as defined in the specific section cited in the federal regulations. This in effect would currently exclude landfills from the cap and trade program, but not fully protect them into the future. Future changes in federal regulations could potentially cause this problem to re-occur. More importantly though, when CARB decided to regulate landfills under the Early Action Measures, it was with the understanding and full cooperation of the landfill industry, that this action was in place of including landfills in the cap and trade program. The landfill industry worked with CARB to promulgate the most stringent landfill regulation in the world on that basis. In the spirit of that understanding, landfills should receive a full exclusion from the cap and trade program. We therefore recommend that the original language, "CH_4 from landfills", be re-inserted back in section 95852.2 under fugitive and process emissions. This action would not only be consistent with the understanding reached when the Early Action Measures were adopted, but also avoids any unintended consequences of changes to federal mandatory reporting regulations. With similar concerns that future revisions to the federal mandatory reporting program could require reporting of fugitive/process CH_4 and N_2O emissions from municipal wastewater treatment plants, and inadvertently draw these facilities into the state cap and trade program, staff agreed to proactively include exclusion language in section 95852.2 for these emissions (language introduced during the December 2010 Board meeting). This action was prudent to avoid having to re-open the rule in the future. In conversations with staff questioning the removal of this language, they were unaware of the original purpose for including them. We therefore, recommend that the language "CH_4 and N_2O from Municipal Wastewater Treatment Plants." be re-inserted back in section 95852.2 under fugitive and process emissions. (LASD5)

Comment: The exemption from a compliance obligation for landfill fugitive emissions and wastewater treatment plants has been removed in revised sections 95852.2(b)(4) and (5). We are very concerned that deleting this language is contrary to our previous understanding these fugitive emissions would not incur a reporting obligation. While we are pleased that the CARB stated reason for this modification appears to recognize that there can't be a compliance obligation for emissions that will not be required to be reported, that does not remove the need to make sure it is clear that there is no compliance obligations for fugitive emissions from landfills and wastewater treatment plants. Restoring the deleted language provide necessary clarity in the regulations. With respect to landfill fugitive emissions, we specifically request that "Methane from Landfills" be added back into those fugitive emissions that are excluded from a compliance obligation in section 95852.2(b) for the following reasons:

- It is virtually impossible to accurately measure fugitive emissions from landfills. Unless revised, the proposed regulations may impose a compliance obligation on emissions that cannot be accurately measured imposing an untenable regulatory burden on our facilities.
- CARB has already included fugitive methane emissions from landfills in a discrete early action measure, the Landfill Methane Control Measure Regulations. These regulations require owners and operators of certain uncontrolled MSW landfills to install gas collection and control systems, and existing and newly installed gas and control systems to operate in an optimal manner. These regulations represent the most stringent landfill methane control regulations in the country and there is no reason to impose an additional compliance obligation for fugitive landfill emissions.
- These regulations should provide an incentive to maximize the capture and beneficial use of biomethane as a replacement for fossil fuel. As currently written, these draft regulations may well provide a disincentive through multiple compliance and reporting obligations. Similar arguments can be made for fugitive methane from waste water treatment plants. We ask that you restore the specific exemptions from a compliance obligation in section 95852(b) for "Methane from Landfills," and "CH_4 and N_2O from municipal wastewater treatment plants." (RSI)

Comment: WM is concerned that the exemption from a compliance obligation for landfill fugitive emissions and waste water treatment plants has been removed in revised sections 95852.2(b)(4) and (5). This omission is contrary to our previous understanding and discussions. The explanation given in the reasons for the modifications in the 2nd 15-day notice is found in an explanatory document. While we are pleased that CARB recognizes in its notation that there cannot be a compliance obligation for a source that is not required to report emissions, that recognition in a non-binding explanatory note to the regulation is insufficient to ensure that there is no compliance obligations for fugitive emissions from landfills and wastewater treatment plants. Failure to restore the deleted language will result in a lack of clarity in the regulations that is contrary to the California Administrative Procedure Act. With respect to landfill fugitive emissions, we specifically request that "Methane from Landfills" be added back into the listing of fugitive emissions that are excluded from a compliance obligation in section 95852.2(b) for the following reasons: It is widely acknowledged that there is no accurate method to measure fugitive landfill methane emissions and therefore it is against good public policy to impose a compliance obligation on a source whose emissions cannot be accurately measured. Inclusion of landfill fugitive emissions in the Cap and Trade regulation is duplicative and punitive. CARB has acted to regulate fugitive methane emissions from landfills in one of the Agency's first early action measures: (http://www.arb.ca.gov/cc/landfills/landfills.htm). Through this regulation, CARB has taken direct action to limit fugitive methane emissions to the lowest achievable level. These regulations represent the most stringent landfill methane control regulations in the world. CARB achieves nothing by leaving the regulatory door open for a Cap and Trade compliance obligation for fugitive landfill emissions for a source category that is already subject to a stringent command and control regulation under the same underlying statute (AB 32). Strong incentives are in place to maximize the capture and beneficial use of biomethane as a replacement for fossil fuel. CARB should recognize that there is strong economic and technological reason to capture fugitives as a fuel source and virtually no incentive to produce fugitive methane emissions and waste valuable renewable energy. Similar arguments can be made for fugitive methane from wastewater treatment plants. We ask that you restore the specific exemptions from a compliance obligation in section 95852(b) for: Methane (CH_4) from Landfills, and CH_4 and nitrous oxides (N_2O) from municipal wastewater treatment plants. (WM4)

> **Response:** CO_2 emissions from combustion of biomethane and biogas from landfills and wastewater treatment plants are exempt from having a compliance obligation. We modified the MRR to exclude reporting of fugitive emissions from farms, livestock operations, and landfills; thus, landfills are not covered under the cap-and-trade regulation.

Emissions Without a Compliance Obligation

E-28. Comment: Include a process to add to the list of fuels without a compliance obligation in section 95852.2. Modify section 95852.2 as follows:

> Emissions from the following source categories and from the combustion of the following fuel types count toward applicable reporting thresholds, as applicable in MRR, but do not count toward a covered entity's compliance obligation set forth in this article unless those emissions are reported as non-exempt biomass derived CO_2 under MRR. <u>The Executive Officer may add additional source categories meeting similar criteria.</u> Emissions without a compliance obligation include: (CCEEB4)

> **Response:** This comment falls outside the scope of the second 15-day changes to the regulation. No response is necessary.

Issuance of Compliance Instruments

E-29. Comment: In section 95820(c), there should be criteria on cause to terminate or limit authorization to emit. If not, then this provision should be deleted. Modify section 95820(c) as follows:

(c) Each compliance instrument issued by the Executive Officer represents a limited authorization to emit up to one metric ton in CO_2e of any greenhouse gas specified in section 95810, subject to all applicable limitations specified in this article. ~~No provision of this article may be construed to limit the authority of the Executive Officer to terminate or limit such authorization to emit.~~ A compliance instrument issued by the Executive Officer does not constitute property or a property right. (CCEEB4)

Response: This comment falls outside the scope of the second 15-day changes to the regulation, which included no modifications to section 95820(c). No response is necessary.

Carryover

E-30. Comment: ARB should fix the "buyer liability" issues with regard to offsets and allow carryover of the 8 percent compliance limit across years and compliance periods. Modify section 95854(b) as follows:

(b) The total number of compliance instruments identified in section 95854(a) that each covered entity may surrender to fulfill the entity's compliance ~~obligation for a compliance period~~ must conform to the following limit:

Oo/S must be less than or equal to Lo

In which:
Oo = Total number of compliance instruments identified in section 95854(a) submitted <u>since January 1, 2013</u> to fulfill the entity's <u>total</u> compliance obligation ~~for the compliance period~~ <u>through the current compliance year</u>.
S = Covered entity's <u>total</u> compliance obligation <u>beginning January 1, 2013 through the current compliance year</u>.
Lo = Quantitative usage limit on compliance instruments identified in section 95854(a), set at 0.08. (CCEEB4)

Response: This comment falls outside the scope of the second 15-day changes to the regulation, which included no modifications to section 95854(b). No response is necessary.

Miscellaneous

E-31. (multiple comments)
Comment: Per section 95850, an emission violation is based on the reports submitted by the verification body and reporting entity. We recommend that the regulation, to the extent possible, prohibit the execution of indemnification agreements between the program participants and the verification/reporting agencies. In order to establish a foothold in the program, it is foreseeable that reporting agencies might offer or facilities might demand, indemnification agreements which will provide that, in the event that a

violation is established through one of their repots, the reporting agency will bear the penalty. This will dilute the incentive for program participants to accurately report their emissions and may result in the concealment of information from the verification body. (SCAQMD5)

Comment: CCEEB recommends that the program allow compliance entities to hold, in holding accounts, sufficient allowances to cover their obligation for the entire compliance period based on a rolling three-year emissions obligation. This change would free up allowances for the major compliance entities and enable a much more liquid market where an entity could adequately hedge its forward risk without major complications. While there are still allowances locked in compliance accounts in some years, the increase in holding limits makes these limitations much more manageable. (CCEEB4)

Comment: Business fluctuations at the end of a compliance period are anticipated. These fluctuations could adversely impact the smooth operation of the market. CCEEB recommends that vintage allowances (i.e., borrowing from current year) be allowed to be used during the true-up period. This will provide a mechanism for the end of compliance truing-up that will increase market confidence. (CCEEB4)

Comment: Section 95814(b)(1) would prevent air districts from serving as a verification body or as an offset verifier from holding compliance instruments. This should be allowed for air districts, as holding a small amount of compliance instruments may be needed for insurance purposes for verification services. (SCAQMD5)

Comment: Section 95852 provides that suppliers of RBOB, distillate fuel oils, natural gas liquids, and blended fuels are required to account for allowances for combustion of these fuels by their downstream users and there is not a concern regarding double-regulation since the downstream users are not required to account for such allowances. In contrast, while natural gas suppliers are required to hold allowances that represent the natural gas that is used by downstream users who do not fall under the scheme, they are not required to hold allowances for entities that fall under the scheme (covered entities) since those covered entities will be required to hold such allowances. Our concern is that there will be (at best) confusion over this issue and (at worst) manipulation of this issue such that downstream users of natural gas who are covered entities will face both prices of natural gas that includes the cost for allowances (even though the provider does not have to obtain such allowances) while the covered entity must still obtain the allowances itself. We note that ARB added language at Section 95852(c)(3) such that ARB will provide to the natural gas suppliers a list of all their customers that are covered entities—including information on the aggregate natural gas volumes and emissions calculated from the supplier's natural delivered to the covered entity. This is a helpful addition in that it may help natural gas providers to understand which of their downstream users already have to pay for their allowances; however, it doesn't provide any mechanism for avoiding (or addressing) the situation in which the natural gas provider still embeds the cost of allowances into the sale price for the covered entity (resulting in double-payment). We continue to seek that ARB incorporate a mechanism to address this concern. Such a mechanism could include a requirement of transparency on the part of the natural gas provider along with a mechanism to discount the amount of allowances the downstream user is required to obtain in order to avoid a double payment. (UNITEDAIRLINES3)

Comment: Section 95852(c) of the Second 15-day Revisions recognizes that natural gas suppliers' compliance obligation will be reduced by the amount of natural gas supplied to an entity that already has a compliance obligation under the Cap-and-Trade Program, and properly includes that metric in the calculation of their overall obligation. However, there is still disconnect between this reduced compliance obligation for the natural gas supplier and the ability to track the fuel sold to compliance entities in forward markets. Because forward contracts for natural gas are transacted on electronic exchanges, there is no way to identify sales to covered entities in advance of completing the transaction. Accordingly, it is likely that natural gas suppliers will incorporate the cost of the GHG compliance obligation into the price of the natural gas contracts, since CARB computes the compliance obligation after the fact, rather than at the time of the sale. Because futures markets are going on even at this time—for fuel that will be sold during the second compliance period—there is a need to address this issue now, and not wait until the second compliance period. Without some direct means to track the contracts between buyers and sellers before the price of the gas is set, buyers of natural gas with a compliance obligation under the Cap-and-Trade Program will still face the prospect of paying twice for emissions associated with that gas. This is because the seller will not know at the time that the contract is entered into whether or not the buyer is a covered entity. Therefore, since the seller's compliance obligation will not be known at the time of the sale, they will need to include the potential compliance cost in the price of natural gas sold. In order to address this, NCPA recommends that CARB provide allowances to these covered entities in an amount equal to the amount of CO_2e of GHG emissions for natural gas delivered to covered entities to offset the emissions associated with the compliance obligation that will be borne by the covered entities for the delivered natural gas. This adjustment does not create any additional allowances, as the compliance obligation associated with the supply of natural gas will have increased by an equal amount to the covered entity's free allocation. This is the most efficient means by which to eliminate the potential for double charging the buyer (covered entity) for the carbon cost. NCPA urges CARB to address this issue now, and not wait until 2014. (NCPA4)

> **Response:** These comments present issues that ARB will continue to monitor during the implementation of the program. However, for the present purposes, they fall outside the scope of the second 15-day changes to the regulation. No further response is necessary.

E-32. Comment: The CCC recommends that the compliance obligation exemption in section 95852.2 be extended to State institutions such as universities and prisons. Where a third party CHP operator is supplying the thermal and/or retail electricity, then the compliance obligation for the emissions associated with the energy purchased by the host state entity should be exempted from the cap and trade regulation until the end of 2013. (CACC3)

> **Response:** We did not exempt large cogeneration facilities at universities and prisons from the compliance obligation. As directed by Board Resolution 11-32, the Executive Officer will work with State universities and stakeholders to identify options for how universities can comply with the regulation or propose rule amendments, as appropriate.

E-33. Comment: Section 95852(a)(1) describes the operators of facilities that have cap-and-trade compliance obligations and includes references to Petroleum and Natural Gas Systems. Section 95852(h) describes certain requirements for obligations from this sector, but also contains the language "except as specified in section 95852.2." In describing the compliance obligation for Petroleum and Natural Gas Systems in section 95852(a)(1), there is not provision or reference to section 95852.2. The same exception should also be included in section 95852(a)(1) to make it clear that compliance obligations are required, except as provided in 95852.2. We therefore recommend that the first sentence of section 95852(a)(1) be amended to include the phrase "except as specified in section 95852.2" at the end of the sentence. (PGE5)

> **Response:** We did not make the suggested changes. Section 95852.2 is entitled "Emissions without a Compliance Obligation." We believe this provides sufficient clarity to explain that these emissions do not count toward a covered entity's compliance obligation.

E-34. Comment: SMUD does not support, in general, allowing borrowing between compliance periods, as we believe this may result in a lack of balance between the amount of compliance instruments available in early years and the amount needed for compliance, in effect causing delays in investments that may be needed to achieve compliance by 2020. However, adverse circumstances, such as a two or three year sequence of low hydro years combined with more rapid than expected economic growth, could cause allowance prices to spike in the last year of a compliance period, and then fall as a new compliance period affords additional flexibility. This kind of price volatility will also cause delays and uncertainty in needed investments. SMUD believes that one indicator of such inter-compliance-period volatility is a significant price increase so that obligated entities substantially purchase allowances from the Allowance Price Containment Reserve. SMUD believes that a mechanism to react to this potential circumstance, and act to smooth long-term allowance prices in the transition between compliance periods would be beneficial to the market. Addressing this will also delay or prevent an unfortunate "run" on purchasing allowances from the Reserve, but making additional supply available in limited circumstances as suggested. Modify section 95856(b)(2) as follows:

> (2) To fulfill any compliance obligation, a compliance instrument must be issued from an allowance budget year within or before the year for which an annual

compliance obligation is calculated, or the last year of a compliance period for which a triennial obligation is calculated, unless:

(A) The allowance was purchased from the Allowance Price Containment Reserve pursuant to section 95913;

(B) The allowance is used to satisfy an excess emissions obligation; or

(C) The compliance instrument is from the allowance budget year following a triennial compliance period and 40% of the allowances in the Allowance Price Containment Reserve have been purchased for compliance during the compliance period. (SMUD4)

Response: We did not allow the type of borrowing that the commenter proposes. We believe we have provided sufficient flexibility to deal with issues such as low hydro years. The multi-year compliance periods are in place to help with year-to-year variability that may affect the emissions obligation.

F. CO-POLLUTANTS

F-1. Comment: The cumulative impacts of the proposed changes haven't been analyzed, especially in low-income communities of color. For example, Wilmington, California hosts many heavy polluting sectors. Consequently, the regulation's specific provisions that loosen standards for these polluters, and effectively subsidize these highly concentrated industries through free allocations and loose benchmarks, have a major potential to encourage further expansion and increase cumulative impacts. About a third of the entire State's oil refinery capacity is located in or next to Wilmington. The Wilmington oil field (about the third largest in the country) is also located here, as well as the most extreme goods movement and transportation sources in the State. The proposed changes actually encourage the worst polluters through subsidizing credits for the most intensive types of oil drilling. We urge CARB to evaluate the cumulative impacts of the regulation. (CBE3)

> **Response:** We disagree that the revised allocation would incentivize practices that would lead to an increase in co-pollutant emissions.
>
> Moreover, we evaluated the cumulative impacts of the proposed cap-and-trade regulation in Wilmington in Appendix P: Co-Pollutant Emissions Assessment in the *Staff Report: Initial Statement of Reasons.* The proposed changes will not modify the overall findings of the Emissions Assessment. Therefore, it is not necessary to reanalyze the impacts of the regulation. This regulation does not loosen standards for co-pollutants or alter or "loosen" in any way the existing national, state, and local rules and regulations for co-pollutant emissions. Any options chosen by facilities to meet the cap-and-trade requirements must be done in the context of existing air quality regulations. The cap and trade regulation will not affect the stringency of these programs and as such, they provide an additional mechanism to ensure continued air quality improvement.

G. DEFINITIONS

G-1. Comment: The new draft changes the definition for “permanent” to the detriment of the public, and to the environment. The lifetime of CO_2 is actually hundreds of years (clearly much longer than 100 years) for the bulk of CO_2 emissions, and essentially forever for about 25 percent. Redefining “permanent” to mean 100 years may seem effectively permanent compared to most regulatory contexts, but in this context, the opposite is true. CARB is fully aware that climate change is projected to be far worse in 100 years, even if California’s Cap and Trade were to be effective (an assumption we challenge). And with respect to the establishment of forests or to the impacts of CO_2 emissions, one hundred years is not long at all, and is definitely not permanent. The regulation change would essentially allow forests to be liquidated completely in 100 years, and any other offset would be allowed to be reversed at that time. It is understandable that CARB and offsets industry lobbyists would want to limit their responsibilities to a finite period of time, but the real need for actual permanent reductions illustrates the difficulty in enforcement of “permanent” offsets. If instead we directly replace polluting industries with a clean alternatives infrastructure, we don’t have to worry about overseeing out-of-state offsets programs forever or even for 100 years. (CBE3)

> **Response:** The definition for “permanent,” section 95802(a)(192) as it relates to offsets, was modified in response to issues raised during the first 15-day changes to the regulation to improve clarity. Since the estimated atmospheric lifetime of an anthropogenic CO_2 emission is far longer than any minimum offset project term currently being considered, we deleted that portion of the definition and focused on the issue important to the environmental integrity of ARB’s cap-and-trade program; that GHG reductions or removal enhancements are either not reversible or that mechanisms are in place to replace any reversed GHG emission reductions or removal enhancements. Sequestration projects are required to monitor and verify that any credited carbon remains sequestered for 100 years. This requirement is consistent with international standards.

Forest Owner Definitions

G-2. Comment: The definition of Forest Owner is too broad, as it includes many parties lacking control over timber management and land conversion. Requiring parties such as recreation and mineral right holders, as well as easement-holding non-profit land conservation groups, to take on liability for future reversals and invalidations for which they are not responsible, will prevent many projects from transitioning to ARB and reduce the supply of offsets to the compliance market. It also remains unclear in the definitions and body of the regulation, which specific forest owners bear responsibility for reversals and invalidations. We recommend the definition of Forest Owner be amended to “parties with ownership interest in timber holdings and control of harvest or conversion decisions,” both definitions add clarification that it is the forest Offset Project Operator that is responsible for intentional reversal and invalidation obligations under the regulation. (BLUESOURCE3)

Response: There are too many forest holders and carbon pools and sources involved in forest offset projects for ARB to make a determination of who is liable for activities that are undertaken on forest land. These kinds of liability issues must be worked out between the parties through third-party contractual agreements. From our perspective, we must ensure the enforceability of the regulation, and we believe the definition of Forest Owner with the regulatory provisions allows ARB to enforce against those parties that are responsible for reversals and invalidations.

G-3. Comment: CERP wants to bring the definition of "Forest Owner" (section 95802(a)(109)) to ARB's attention. CERP appreciates that ARB modified the definition of forest owner such that it does not include public parties who own conservation easements, but is unclear why the definition change was limited to public parties. CERP requests that ARB further modify the definition such that it also excludes private parties who hold conservation easements from liability. It does not make sense for private parties to be required to have liability for forest reversals if their only connection to the forest project is through a conservation easement. (CERP5)

Response: We clarified the definition in the forest protocol and in the regulation with respect to conservation easement holders. The definition states that a

> "Forest Owner is the owner of any interest in the real (as opposed to personal) property involved in a Forest Project, excluding government agency third party beneficiaries of conservation easement; and that Generally, a Forest Owner is the (owner in fee) of the real property involved in a Forest Project. In some cases, one entity may own the land while another entity may have an interest in the trees or the timber on the property, in which case all entities or individuals with interest in the real property are collectively considered Forest Owners, however, a single Forest Owner must be identified as the Offset Project Operator."

We believe this makes the exclusion of easement holders explicit. We also modified text where needed to ensure consistency in the term as defined in the protocol and the Regulation.

G-4. Comment: CARB has defined "Air Dried Ton of Paper" as paper with 6 percent moisture content (section 95802, page A-6). Since the industry definition for Air Dried Ton is 10 percent moisture content, the proposed definition should be changed to reflect the industry standard or be written based on "bone dry" or "oven dry" tons (both defined as 0 percent moisture content) to avoid potential inconsistencies with other reported production data generated by industry. (TI2)

Response: This comment was previously submitted under the first 15-day comments and was responded to under the 15-day changes to the regulation. Therefore, no additional response is required.

G-5. Comment: There appear to be inconsistencies between definitions in the MRR and the cap-and-trade second 15-day modifications. Unfortunately, many of the new definitions in the MRR were not added to the cap-and-trade regulation and in other cases the cap-and-trade definitions were not conformed to the new or revised MRR definitions. Due to limited time to review both regulations in detail, we are unable to provide a complete list of our concerns, but offer the following examples. We suggest that the MRR staff convene a conference call of affected parties to explain the proposed changes and ensure that they are consistent with other federal and state legislation, and ultimately are workable.

> (i) Definition of Cogeneration – should be the same in both regulations, and should not be inconsistent with federal legislation, e.g. the Public Utility Regulatory Policies Act (PURPA) and the Federal Power Act (FPA). The definition in the cap-and-trade regulation requires "onsite" generation, and in the MRR definition the word "onsite" is struck. Before we can provide constructive comment we need an explanation of why the requirement was added to both definitions and then in only one regulation was deleted.
> (ii) It is unclear why MRR Definitions (206), (207), and (209) have been inserted only in the MRR but omitted from the cap-and-trade regulation. These definitions could be helpful in addressing ambiguities in the cap and trade regulation associated with the use of the terms "on-site" and "off-site." (CACC3)

Comment: In addition to the fact that the California Public Utility Commission approves the natural gas specifications that utilities must deliver to their customers, it must be noted that requiring at least 90 percent methane by volume would narrow the number of sources that can apply a default value to emissions calculations but would serve no other relevant purpose in either the MRR or the Cap and Trade Regulation. In fact, the opposite would occur, causing natural gas users to conduct excessive analysis with insignificant results. SoCalGas and SDG&E request ARB exclude the 90 percent methane requirement from this rule pending further study of the effects and burden of this "enhanced" reporting requirement. The portion of section 95802(a)(197) "and which is at least ninety percent methane by volume," should be deleted. (SEMPRA4)

Comment: Use of the word "quality" in section 95802(a)(197) "Pipeline Quality Natural Gas" is used in the context of these regulations to define a default "range" for purposes of MRR calculations. While ARB has added the qualifier, "As used in this regulation," the word "quality" can be eliminated without changing meaning or function. The California Public Utility Commission (CPUC) approves the natural gas specifications that utilities must deliver to their customers. Since CPUC has authority over natural gas quality issues, ARB should choose a different term to define the "default range" for the calculations required under this regulation. Additionally, the word "quality" implies a standard or grade that has an intrinsic value, characteristic or features. In many cases the word "quality" is used to imply excellence or grade and implies a positive connotation wherein anything that is not "quality" creates a negative connotation. The use of the word "quality" may create a level of confusion among natural gas users because it could be construed as implying that gas that meets pipeline specifications is nevertheless not “pipeline quality.” The phrase “pipeline quality natural gas” should be modified throughout the regulation to state “pipeline natural gas.” (SEMPRA4)

Comment: Deleting the clause “does not include the holder of a conservation easement” from the definition of “Forest Owner” inadvertently and unilaterally exposes holders of conservation easements to the various liabilities imposed on Forest Owners in the Rules. We recommend that this exclusion be re-instated. (TCF3)

> **Response:** The above comments fall outside the scope of the second 15-day changes to the regulation, and therefore do not require a response.

H. ECONOMIC IMPACTS

H-1. (multiple comments)
Comment: Verallia's Madera facility is "directly affected by this rulemaking" understates the potential significance of CARB's proposed Cap and Trade Program because the program as set forth in the proposed regulations potentially threatens the plant's long-term ability to compete, particularly with the substantial capital investments which will be required at the plant between now and 2020. Further, as CARB Staff documented, the container glass sector as a whole has a "high risk" of leakage due to its high energy intensity and trade exposure. For a number of reasons, including the cost-sensitivity of the business and the already high cost of manufacturing in California, the "protections" in the proposed Cap and Trade Program intended to mitigate this "high risk" for container glass manufacturing currently fall well short of providing the necessary relief. Thus, despite the fact that shutting down bottle manufacturers in California will simply force the State's wine industry to import significant quantities of non-California produced domestic bottles by truck, rail or other mobile GHG sources, (or further increase the wine industry's growing reliance on imports of glass bottles from China and other locations that are today much less environmentally conscientious with respect to emissions such as GHGs), the currently proposed Cap and Trade Program threatens the continuing existence of the container glass sector in California, especially for already efficient operations like Madera. (SMITHS2)

Comment: Should the Cap and Trade program force container glass facilities such as Verallia's Madera facility to shut down, the need for bottles by California's wine industry would likely result in importing those bottles by truck from neighboring states or from overseas. Under this scenario, the bottles necessary to support California's wine industry would cost more (given the additional costs of transportation) and generate additional GHG emissions (given the additional tracking distances). At the same point, GHG emissions would be increased at the out-of-state / out of country (e.g., Chinese) manufacturing facility; resulting in a net global increase in GHG emissions should our Madera facility be forced to close due to CARB's rulemaking. These environmental detriments would come in addition to the very real costs associated with eliminating hundreds of existing jobs and loss of local tax revenues associated with a plant closure. Thus, in addition to the high risk of leakage documented by CARB staff for container glass facilities, there are additional negative consequences associated with the leakage given the fundamental need for bottles by the California wine industry. (SMITHS2)

> **Response**: For the purposes of transition assistance, and to prevent economic leakage, facilities in the glass sector will be receiving most of their allowances for free. Allocating the allowances for free using emissions efficiency benchmarks and production will reward companies that have already made investments in energy efficiency and carbon reductions, and will not penalize those that produce goods in California. The classification of the glass sector as "high-risk" ensures that the glass sector will receive a greater amount of leakage protection for a greater duration than other firms that are deemed to be at less risk of economic leakage, therefore providing more protection for this industry.

Furthermore, in Resolution 11-32, the Board directed the Executive Officer to continue to review information concerning the emissions intensity, trade exposure, and in-state competition of industries in California, and to recommend to the Board changes to the leakage risk determinations, if needed, prior to the initial allocation of allowances for the first or second compliance period, as appropriate, for industries identified in Table 8-1 of the cap-and-trade regulation, including glass manufacturers.

H-2. Comment: Imposing a 10 percent tax on business via CARB's haircut proposal does nothing to 'maximize the environmental benefits' requirement under AB 32, and it is not needed to ensure the stringency of the overall cap—emission reductions will still be achieved by the 2020 goal. The tax proposed by CARB contradicts the AB 32 requirements of 'minimizing costs' and 'maximizing benefits' for California's economy in the design of emission reduction measures. The tax will negatively affect all California businesses, in addition to the anticipated fuel, energy and other cost increases that will be passed down to businesses from upstream providers. Ultimately, as California's economy suffers so too will employment, as an impact on business means an impact on jobs. Employers will be forced to reduce productions or lay off employees as the cost of compliance will make California less competitive with out-of-state businesses. With a 12 percent unemployment rate it is irresponsible to ignore the adverse economic impacts of the haircut by continuing to move forward with this egregious tax proposal. (CALCHAMBER4)

Response: The comment is unclear, but we understand it to mean that they are conflating the stringency of the benchmarks with the imposition of a 10 percent tax on business. This would not be a correct interpretation of the benchmark. In all of the industrial sectors there is at least one producer that we expect will receive nearly 100 percent of their allowances for free at the outset of the program. In fact, all facilities will receive the bulk of their allowances for free in the first compliance period, and many will receive the bulk of their allowances for free in the second compliance period.

Less-efficient industrial facilities will have to purchase some allowances, with the amount they have to purchase dependent on their efficiency relative to the benchmark. An average facility will have to purchase about 10 percent of their allowances, while the most efficient will need few, if any, additional allowances after allocation through the first compliance period where the assistance factor is 100 percent for all sectors.

The cap-and-trade program has been designed to reduce the potential for emissions leakage by providing a significant number of allowances for free. Allocating the allowances for free using emissions efficiency benchmarks will reward companies that have already made investments in energy efficiency and carbon reductions, and will not penalize all of those that produce goods in California. We believe that the program should reward only the most efficient facilities, while simultaneously minimizing the potential for leakage among all producers, including the less-efficient facilities. The stringency of the benchmark ensures this outcome.

H-3. Comment: Based on the proposed changes, cap and trade may result in the selling of the same kind of derivatives and futures which in other circumstances caused the major crash of the last few years. In 2009 when the U.S. considered a national cap and trade system, numerous financial and government experts highlighted that cap and trade could mean a massive futures commodity market. Due to the vast size of this new market, it could endanger our precarious economy. (CBE3)

Response: The comment falls outside of the second 15-day changes to the regulation. The provisions in the second 15-day changes to the regulation will have no effect on the development of a futures market because ARB has no control over whether a futures market develops. In fact, an independent futures market for California allowances (not operated by ARB) has been in existence since the adoption of the regulation in 2010, even though our cap-and-trade program is not yet in operation, and we have yet to issue a single allowance. Futures markets provide a useful service by allowing entities to reduce risk by entering into agreements that let them buy or sell allowances at a future date at a guaranteed price. We will retain the services of an independent market monitor to monitor the secondary market.

H-4. Comment: The proposed cap-and-trade regulations are effectively a direct tax on our operations, products and customers. The provisions are not fuel-neutral and place in-state refining operations at a disadvantage relative to other international operations and other energy supplies such as electricity. These higher costs will be felt by all energy-intensive businesses and will ultimately be borne by the citizens of the State in higher costs for goods and services. (CONOCO3)

Response: The comment falls outside of the second 15-day changes to the regulation. However, we recognize that there will be price increases from the cap-and-trade program. We do not believe that these price changes will result in large negative impacts to the state economy. Table N-3 and Table N-7 of the Staff Report highlight estimated changes in energy prices and resulting economy-wide estimates of impact. The estimated impacts show relatively small changes in economic growth and employment when compared to growth otherwise expected over 2007 to 2020. Please see Chapter VIII and Appendix N of the Staff Report for additional information about our economic analysis of the cap-and-trade regulation.

The comment also appears to conflate the stringency of the benchmarks with the imposition of a 10 percent tax on business. This would not be a correct interpretation of the benchmark. In all of the industrial sectors there is at least one producer that we expect will receive nearly 100 percent of their allowances for free at the outset of the program. In fact, all facilities will receive the bulk of their allowances for free in the first compliance period, and many will receive the bulk of their allowances for free in the second compliance period.

Less-efficient industrial facilities will have to purchase some allowances, with the amount they have to purchase dependent on their efficiency relative to the benchmark. An average facility will have to purchase about 10 percent of their allowances, while the most efficient will need few, if any, additional allowances after allocation through the first compliance period where the assistance factor is 100 percent for all sectors.

The cap-and-trade program has been designed to reduce the potential for emissions leakage by providing a significant number of allowances for free. Allocating the allowances for free using emissions efficiency benchmarks will reward companies that have already made investments in energy efficiency and carbon reductions, and will not penalize all of those that produce goods in California. We believe that the program should reward only the most efficient facilities, while simultaneously minimizing the potential for leakage among all producers, including the less-efficient facilities. The stringency of the benchmark ensures this outcome.

I. ELECTRICITY

Imported Electricity: Section 95852(b) and Related Definitions

Support of Modifications to Imported Electricity Provisions

I-1. (multiple comments)
Comment: PG&E appreciates a number of the modifications reflected in the latest version of the proposed regulation, to include: accounting for the greenhouse gas reduction value of out-of-state Renewable Portfolio Standard (RPS) eligible resources; providing increased flexibility for the surrender of allowances within a compliance period; and deferring to the California Public Utilities Commission to determine the manner in which consignment auction proceeds are returned to investor-owned utility customers. PG&E would also like to thank ARB for continuing to recognize the need to design allowance allocation and the use of auction proceeds for the benefit of utility customers. Finally, PG&E supports ARB's decision to defer the start of the cap-and-trade compliance obligation until 2013 to allow necessary market simulations and testing of auction systems, design and protocols in the first half of 2012. (PGE5)

Comment: The Utilities support the clarifying changes to the definition of "Qualified Export" in section 95802(a)(225); the removal of the definition for "Replacement electricity" in section 95802(a)(237); and the removal of Subsections (A) and (B) from the definition for "Resource Shuffling." The Utilities agree that an intentional act to commit resource shuffling purely to game the cap-and-trade market and avoid an emissions obligation should be discouraged. However, there are numerous provisions in California statute that either prohibit the delivery of high emitting GHG resources (SB 1368) or encourage the delivery of zero emitting GHG resources (SBx1 2), leaving it unnecessary to include Subsections (A) and (B). (MID4)

> **Response:** We thank the utilities for their support of the second 15-day changes to the regulation.

Electricity Importer Definition

I-2. (multiple comments)
Comment: The Proposed Changes amend the definition of "electricity importer" (section 95802(a)(87), p. 18) to remove the requirement for the electricity importer to be the entity that holds title to the electricity that it imports into California. Similar changes are made to other definitions. In some cases these changes will result in a different entity becoming liable for emissions associated with the imported electricity. SCPPA supports LADWP's comments regarding those changes. The new point of liability for imported electricity does not conform to the method by which allowances have been allocated between utilities. As a consequence, one utility may need to transfer allocated allowances to a second utility (or otherwise compensate the second utility) to cover the compliance obligation for emissions associated with electricity owned by the first utility but imported by the second utility. The Second 15-Day Change Notice does not

sufficiently explain the rationale for these changes, and stakeholders have not been given an adequate opportunity to discuss these changes with ARB staff in full. For these reasons and the reasons presented more fully by LADWP, these changes should be reconsidered, or an opportunity for further review of these provisions should be provided in 2012. (SCPPA8)

Comment: LADWP is seeking clarification from ARB regarding the modified definition for “Electricity Importers” in section 95802(a)(87) for facilities located outside the State of California with the first point of interconnection to a California balancing authority's transmission and distribution system. It is unclear that the out-of-state facility would fall under the jurisdiction of California, so the facility operator would not be an appropriate point of regulation. Additionally, it is unclear if this new amendment is intended to address electricity imports that do not cross a balancing authority boundary and therefore do not necessarily generate a NERC E-tag. (LADWP5)

Comment: The cap-and-trade definitions for “electricity importer” were substantially revised in the September 12, 2011 version of the cap-and-trade regulation. The definition provides that the importer is the purchasing and selling entity (PSE) on the physical path where the delivery point is in California [section 95802(a)(87)]. IEP remains concerned that there are instances when the PSE on the e-tag does not correctly identify the entity that owns power as it crosses the State’s borders. Moreover, the definition no longer refers to having “title” to the power or that the downstream entity will be the importer when CARB does not have jurisdiction over the seller. These additional changes make application of the definition to real-world power transactions far less clear. IEP believes that these provisions require further revision to specifically address circumstances when e-tags do not accurately reflect the title to power as it crosses the California border. This issue should be explicitly recognized by the Board as an area that will be addressed in a subsequent rulemaking prior to the start of the cap-and-trade program. (IEPA3)

Comment: Under CARB’s September 12, 2011 Proposed Amendments to the Regulation, the definition of “Electricity Importer” was revised such that the importer is the Purchasing Selling Entity (PSE) on the physical path where the delivery point is in the state of California. Iberdrola Renewables reiterates its concern that the PSE on the e-Tag may not correctly identify the entity that owns the power as it crosses the state border. In the previous version of CARB’s regulation, the definition of Electricity Importer included a requirement that the entity holding title to the power as it crossed the state border incurred the compliance obligation for the transaction. Although the accurate demonstration of the entity holding title would have been complicated, this previous structure was much more legally defensible. The current regulation creates uncertainty around import transactions and is likely to subject CARB to significant legal challenge if implemented. The Board should explicitly recognize this important issue as one requiring subsequent rulemaking prior to the final cap and trade program implementation. (IBERDROLA2)

Response: Many stakeholders objected to the use of the word “title” in the definition of “Electricity importer” included in the first 15-day changes to the regulation. We agree and removed the reference to “title”, and the definitions of “electricity importer,” “purchasing-selling entity,” and “marketer” were modified to clarify that delivery to the grid, not title, is the critical determinant of responsibility. ARB must rely on a clearly identifiable and verifiable entity that delivers electricity into California. Which party holds title to electricity may become a matter of dispute between counterparties and does not provide the certainty needed.

SCPPA8 believes that the removal of the word “title” means that “the new point of liability for imported electricity does not conform to the method by which allowances have been allocated…” but agrees that entities would be able to compensate each other as a result of their electricity transactions. We disagree, and clarify that removing the word “title” from the definition of electricity importer does not change the point of regulation, which has been and remains the first deliverer. Because this has consistently been the point of regulation, the allocation methodology remains consistent with this methodology. POUs are offered flexibility in compliance with this regulation, including consignment allowances at auction and transferring allowances to a Joint Powers Agency with which they have an agreement, as specified in the regulation. We recommend that these entities take steps to ensure that they compensate each other appropriately.

LADWP is concerned that entities with a first point of interconnection to a California balancing authority (BA) system might not be subject to California jurisdiction. The regulation states that the electricity importer is “the facility operator or scheduling coordinator”. If the out of state facility is connected directly to a California BA, the facility can both sell and schedule the electricity into California, in which case they are the importer. Alternatively, the facility desiring to sell electricity for import to California can find an SC that is willing to be the first deliverer and pay the compliance obligation.

In response to IEPA3 and Iberdrola, we note that we have consistently taken the approach that the first deliverer is responsible for compliance obligation. We do not rely on e-Tag information to establish the entity holding title to the electricity. We recognize that there are times when a covered entity has contracted with another entity to schedule the delivery of electricity. That Scheduling Coordinator will be listed on the e-Tag as the PSE. The PSE will have the obligation and will need to include the cost of compliance in their contract with the covered entity. Determining the entity that holds title would only add uncertainty for regulated entities, because such determinations for each transaction could be subject to dispute and may be documented in less accessible and reliable forms than e-Tags. The regulation is intended to provide the certainty which commenters have requested by specifying a straightforward mechanism such as e-Tag data that ARB will use to determine whether an entity is a first deliverer.

I-3. Comment: The changed definition of electricity importer provides that "For facilities physically located outside the state of California with the first point of interconnection to a California balancing authority's transmission and distribution system, the importer is the facility operator or scheduling coordinator." This definition disregards the role of a scheduling coordinator (SC) and imposes an obligation where none exists. A SC simply provides a communication service between the facility operator and the California Independent System Operator. It has a contract to perform scheduling and settlement services and is merely a conduit of dollars between the generator and the ISO; the SC does not have a mechanism to recover carbon costs. Only the facility operator should be considered the sole importer for out-of-state facilities that are directly connected to a California balancing area authority. The facility operator performs under an ISO participating generator agreement, and is an ISO dispatchable resource; it should be treated no differently than any other in-state resource. Modify section 95802(a)(87) as follows:

(87) "Electricity importers" are marketers and retail providers that deliver imported electricity. For electricity delivered between balancing authority areas, the electricity importer is identified on the NERC E-tag as the purchasing-selling entity (PSE) on the last segment of the tag's physical path, with the point of receipt located outside the state of California and the point of delivery located inside the state of California. For facilities physically located outside the state of California with the first point of interconnection to a California balancing authority's transmission and distribution system, the importer is the facility operator ~~or scheduling coordinator~~. Federal and state agencies are subject to the regulatory authority of ARB under this article, and include Western Area Power Administration (WAPA), Bonneville Power Administration (BPA) and California Department of Water Resources (DWR). (SHELLENERGY2)

Response: We do not agree with the modification suggested by Shell. The definition for “electricity importer” applies to deliveries that cross balancing authorities, and to deliveries that do not cross balancing authorities. The compliance obligation for imported electricity falls on the first deliverer. Not all electricity is delivered through the transmission system operated by the CAISO, and CAISO does not own a transmission system, but instead operates it on behalf of the owning entities.

Imported electricity not delivered to the transmission system operated by CAISO can be delivered with a first point of interconnection to another California BA transmission or distribution system. The other BAs in California are publicly owned utilities that own and operate their own transmission and distribution systems.

When a facility is directly connected to a California POU’s BA, it may or may not be the first deliverer. If not, it may be outside the jurisdiction of California. Therefore, we cannot place the compliance obligation upon the facility only. When the facility is not the first deliverer, the electricity is delivered by an importer, identified as the PSE on a NERC e-Tag. The PSE could also be the

Scheduling Coordinator (SC). The SC is defined in FERC-approved reliability rules. Purchasing-selling entities are designated on NERC e-Tags for each segment of the physical transmission path, which provides the means for reporting entities to clearly identify the quantities of electricity they import, export, and wheel across the California border. Market participants bidding into the CAISO markets are required to document electricity deliveries via NERC e-Tags, pursuant to CAISO Tariff section 4.5. Determining which transactions are specified or unspecified relies on written power contracts (and supporting records), settlement data, and invoices.

Shell states that a SC "has a contract to perform scheduling and settlement services and is merely a conduit of dollars between the generator and the ISO; the SC does not have a mechanism to recover carbon costs." We agree that the SC has a contract for these services. We identify the SC in these direct delivery cases with first point of interconnection to a California BA because the SC must have a contract to perform scheduling and settlement services and to be a conduit of dollars for the entity that owns the electricity that the SC schedules. Once the cap is in place, settlement will need to include the compliance obligation costs.

We note that the SC may be the agent of a facility, or of a California utility. In general, SCs are agents empowered by entities selling electricity into California (or elsewhere) to bind their counterparties to transactions like delivering electricity and making or taking payment.

In sum, it is appropriate to apply the compliance obligation in these certain, but limited, cases to the "facility or scheduling coordinator" because either of these may be the first deliverer. Once the cap is in place, to protect their interest, SCs will need to ensure that their agency agreements empower them to pay and be reimbursed for compliance obligation, as well as other current costs required to settle the delivery of electricity into California.

Other Definitions

Definition of EDU

I-5. (multiple comments)
Comment: The amendments to the definition of "electrical distribution utility" are broad enough to unintentionally include electric generators. The amendments made in the September version of the Cap and Trade regulation defines electrical distribution utility (EDU) as an "entity that owns and/or operates an electrical distribution system…" [section 95802(a)(85)]. While IEP does not believe that it is CARB's intent to incorporate electric generators into the definition of "Electrical Distribution Utility," the proposed amendments to this definition would include anyone that owns and or operates a gen-tie for purposes of generation interconnection (i.e. an electric generator). In order to remedy this effect, IEP recommends returning to the specific

language that was previously drafted in the July 2011 version of the cap and trade regulations, or alternatively creating a more narrow definition that would not capture individual generators, but that would solely speak to IOUs, publicly owned utilities and electrical cooperatives. (IEPA3)

Comment: Remove the added language in proposed section 95802(a)(85) defining an Electrical Distribution Utility as an “entity that owns or operates a distribution system” because it is not reasonably necessary to effectuate the purpose of the statute. This definitional change is incorrect and not reasonably necessary to effectuate the purpose of the statute. Owning or operating an electric distribution system is not the touchstone for having the ability to pass allowance value onto ratepayers. As ARB staff correctly stated in Appendix A, having a direct transactional relationship between the entity providing “public utility” services and the retail ratepayer is the proper test. The original definition for an EDU in the First 15-Day Modifications provided sufficient clarity and was consistent both with the language of AB 32 and the Air Board’s direction in Resolution 10-42. Several types of public entities are authorized to provide electric service to end-users. There is no requirement that these entities actually own or operate a distribution system in order to purchase electricity at wholesale, establish retail rates, and sell the electricity to end-use customers. The respective governing boards and/or councils of each entity type serves as the local regulatory authority (LRA) in regard to electricity rate-setting. These LRA’s are authorized by law to make all the decisions that would affect low-income consumers, as well as the entity’s investments in energy efficiency and renewable power. Public Utilities Code sections 224.3, 10001, and 11509; and Water Code section 22120 make clear that each LRA’s decisions are authorized by law without regard to whether the respective entity owns or operates a distribution system. In order to achieve the statutory purposes for distributing allowances to the electric sector, the phrase “entity that owns or operates a distribution system” should be removed from section 95802(a)(85) in the Second 15-Day Modifications. This language is neither consistent with the statute nor reasonably necessary to effectuate the purpose of the statute. (BBM)

> **Response:** It is not our intent to capture generators in this definition. We worked closely with the CPUC to refer to the CPUC code most applicable to IOUs and POUs that will receive allowances pursuant to section 95892. The recent change to the definition was intended to clarify that we do not want to pull in water utilities. Some water utilities are also under the jurisdiction of some of the POUs identified in Table 9-3. In addition, the design of our program is intended for allowance allocation to utilities that have a direct relationship with the end-user. Not all water purveyors in California have a direct relationship with an end-user of the water.
>
> We do not believe that a gen-tie is an electrical distribution system. In the electricity sector, a distinction is made between generation, transmission, and distribution. Distribution systems provide distribution-level transport of electricity and the electricity commodity. We are not aware of any generators that operate distribution systems that would qualify them as EDUs, although we are aware

that some generators sell electricity, essentially wholesale, “over-the-fence” without connecting to the utility grids. This type of activity is not included in the meaning of EDU, because the generator is not a utility.

Definition of Marketer

I-6. Comment: Marketers should be treated as any other PSE that imports electricity. The definition of "marketer" in section 95802(a)(159) does not accurately reflect the standard use of the term in wholesale electricity markets. A retail provider can also be a marketer and elect to purchase or sell electricity on the wholesale market. A marketer may also hold title to the power and be listed as the PSE on the market segment (market path) that tracks title and responsibility on a NERC E-tag, but may not be listed as a PSE on the physical path which would reflect a movement of energy. As amended, it appears that marketers may avoid the point of regulation for electricity imports that they own. (LADWP5)

Response: We agree that a retail provider can engage in purchasing and selling electricity like a marketer. However, the regulation needed to distinguish between retail providers and marketers that do not provide retail electricity to load in California. If a marketer delivers electricity to a first point of delivery (FPOD) in California, the marketer will directly or indirectly face the compliance obligation. To sell or deliver into California, a marketer or a retail provider may use an agent to accomplish the delivery across the state line, as discussed in responses above. It is common for electricity owners to authorize SCs to schedule and deliver electricity. We believe that an SC would be unwilling to deliver electricity and pay the compliance obligation without reimbursement or some kind of compensation from the owner/seller of the electricity for compliance costs.

Definition of Unspecified Source

I-7. Comment: The defined terms of “Unspecified Source of Electricity” or “Unspecified Source” appear in both the MRR and Cap-and-Trade regulations in section 95102(a)(399) and section 95802(a)(279), respectively, and are used throughout each regulation. Because the two sets of regulations together form the requirements of the reporting entities, the defined terms in the respective regulations need to be identical for reporting entities to consistently comply with the regulations. In addition, PG&E has revised the definition to further clarify that an unspecified source will have no reference to any specific generation facility or unit in the transaction and that the treatment of electricity as unspecified cannot be contradicted by subsequent information. Modify sections 95102(a)(399) and 95802(a)(279) as follows:

“Unspecified source of electricity” or “unspecified source” means electricity procured and delivered without ~~limitation~~ reference ~~at the time of transaction~~ to a specific facility’s or unit’s generation at the time of transaction, regardless of the specification in the corresponding NERC E-Tag, settlements data, or any other applicable information. Unspecified sources contribute to the bulk system power pool and typically are dispatchable, marginal resources that do not serve baseload. (PGE5)

> **Response:** While in general we agree that consistency in definition between the MRR and this regulation is beneficial, it is not necessary in all cases, and in some cases is inadvisable because the regulations have different purposes. We do not agree with the change suggested by PG&E. The suggested language would limit the ability to tie the delivery to a specific facility if there was evidence as displayed on the e-Tag, settlement data, or other information.

Compliance Obligation for Electricity

I-8. Comment: Iberdrola Renewables understands that CARB has relied upon electricity importers to “self-report” emissions under its existing GHG reporting program. Captured entities have been required to report all import transactions, engage a certified CARB verifying entity to verify its annual reports, and pay significant charges for all non-specified import transactions. It appears numerous importing entities have not been participating in the existing CARB reporting program and it is unclear how the CARB will ensure these entities are appropriately captured when the cap and trade compliance obligations are implemented. Failure to properly capture all electricity importers will significantly disadvantage entities subject to the cap and trade regulations. Iberdrola Renewables requests CARB clarify its efforts to ensure comprehensive capture of all entities importing electricity into the State of California. (IBERDROLA2)

> **Response:** This comment falls outside of the second 15-day changes to the regulation and addresses the MRR. However, ARB maintains the right to review data, when the entity does not report, and enforce penalties. The cap-and-trade regulation clearly states whom ARB recognizes as the first deliverer of electricity, and it is consistent with the amended MRR. For most electricity imported into California, including the market bids that are awarded by CAISO, delivery is documented on NERC e-Tags, and the purchasing-selling entity is clearly identified. ARB will rely on a variety of data sources.

I-9. (multiple comments)
Comment: NCPA supports the revisions to section 95852(b)(1) that adds the entire calculation for determining a compliance obligation of first deliverers in the Regulation, rather than references to the Mandatory Reporting Regulation (MRR). Including the relevant information and calculation within the Cap-and-Trade Program Regulation avoids confusion and the potential for miscalculations by removing the need to continually cross-reference the two regulations. (NCPA4)

Comment: The Utilities support the changes to section 95852(b)(1), which are needed to avoid confusion with the MRR. (MID4)

Comment: The compliance obligation calculation for electricity generators should refer only to the relevant section of the MRR. Section 95852(b)(1)(A), setting out the compliance obligation for operators of electricity generating facilities in California, refers generally to "all emissions reported and verified or assigned pursuant to MRR." This is too broad. Particularly for SCPPA members and other POUs, first deliverers that are operators of California generating facilities may also be electricity importers and report under both sections 95111 and 95112 of the MRR. Not all data reported under section 95111 of the MRR will result in a compliance obligation, so it is incorrect to state that all emissions reported under the MRR by a utility that operates a generating station count towards that utility's compliance obligation. Section 95852(b)(1)(A) should be revised to clarify that the compliance obligation for operators of electricity generating facilities in California is based on emissions reported under section 95112 of the MRR only. This change can be made without further 15-day public comment, as it is "nonsubstantial or solely grammatical in nature" for the purposes of section 11346.8(c) of the Government Code. Modify section 95852(b)(1)(A) as follows:

> (A) For first deliverers that are operators of an electricity generating facility in California, the calculation for compliance obligation includes all emissions reported and verified or assigned pursuant to MRR section 95112, except emissions without a compliance obligation pursuant to section 95852.2.
> (MID4)

Comment: The compliance obligation calculation for electricity importers should include more specific cross-references. The formula in section 95852(b)(1)(B) (p. 89) is of crucial importance to electricity importers and should be made as clear as possible. To this end, more accurate cross-references to the relevant sections of the Regulation and the MRR should be included. For example, the definition of "$CO_2e_{\text{specified}}$" refers generally to meeting the requirements of section 95111 of the MRR. Not all requirements set out in section 95111 relate to specified sources. To avoid confusion, only the relevant subsections of section 95111 should be referenced. (This comment also applies to the other references to section 95111 in section 95852(b)(1)(B)). In addition to section 95111 of the MRR, requirements for specified sources are also set out in section 95852(b)(3) of the Regulation. For completeness, section 95852(b)(3) should also be referenced in the definition of "$CO_2e_{\text{specified.}}$" These changes can be made without further 15-day public comment, as they are "nonsubstantial or solely grammatical in nature" for the purposes of section 11346.8(c) of the Government Code. Modify section 95852(b)(1)(B) as follows:

(B) For first deliverers that are electricity importers, emissions with a compliance obligation are calculated using the following equation:

$CO_2e_{\text{unspecified}}$ = Annual metric tons of CO_2e from imported electricity from unspecified sources calculated pursuant to MRR section 95111(b)(1).
$CO_2e_{\text{specified}}$ = Annual metric tons of CO_2e from imported electricity from specified sources that meet the requirements of section 95852(b)(3) and MRR sections 95111(a)(4), (b)(2) and (g).

$CO_2e_{\text{specified-not covered}}$ = Annual metric tons of CO_2e without a compliance obligation pursuant to section 95852.2 from specified sources that meet the requirements in MRR section 95111(g).
$CO_2e_{\text{RPS\_adjustment}}$ = Annual metric tons of CO_2e calculated pursuant to MRR section 95111(b)(5) that meet the requirements of section 95852(b)(4).
$CO_2e_{\text{QE\_adjustment}}$ = Annual metric tons of CO_2e from qualified exports reported pursuant to MRR section 95111(a)(6) that meet the requirements of section 95852(b)(5).
(SCPPA8)

> **Response:** We appreciate the support of NCPA and the utilities that submitted the MID4 comment letter, and we understand their support to mean that they find section 95852(b)(1) sufficiently clear. We do not agree with the modification suggested by SCPPA8 because we believe that it is clear that section 95852(b)(1)(A) refers to the emissions reported by first deliverers as operators of one or more generating facilities in California. We use this section to separately state the compliance obligation for emissions reported by a California electricity generating facility and those reported, in 95852(b)(1)(A), by an electricity importer. We agree with SCPAA8 that some first deliverers do both kinds of reporting. However, they must report separately as electricity importers from their reporting for facilities they own. We do not agree with the suggested modifications made by SCPPA8 to section 95852(b)(1)(B), because they are unnecessary. We agree with SCPPA that not all requirements in section 95111 relate to specified sources. However, reporters need only meet the requirements that apply for each category. Furthermore, it is possible that the specific paragraphs that SCPPA would like us to refer to will be modified in future rulemakings. By referring to the whole section, we can avoid the unnecessary cost and confusion that would result from modifying this regulation because a section of the MRR is renumbered.

Specified Sources

I-10. Comment: LADWP is concerned that for some specified sources of imported electricity, the amendments that are being proposed may result in these imports being incorrectly assigned default emissions under circumstances where the first deliverer that is scheduling the power into California on behalf of another party assumes responsibility as the first deliverer, and therefore must also include such imports as part of their MRR report. However, the entity scheduling the power under this scenario cannot demonstrate ownership in the facility or a written power contract for that electricity. This could have the potential unintended consequence of assigning default emissions to non-emitting specified imports (renewables, nuclear and hydro) that are currently reported based on ownership or contract rights. For example, a transmission outage occurs and the owner of electricity from a nuclear or hydroelectric generating facility must make arrangements to have that power imported through another transmission path by another entity that has transmission rights, but does not hold title to the power. Under this scenario, the regulation would assign default emissions to that zero-emission electricity for no other reason than the entity scheduling the power does not own the power. This outcome is unreasonable and does not accommodate commonly occurring situations related to specified imports. To add more complexity to this, the entity that schedules this zero-emitting power into California that is now assigned default emissions must also surrender allowances on behalf of the party that holds title to the power. This outcome is unreasonable and should be avoided. A separate issue of transparency also arises when the first deliverer of renewable energy is not also the entity owning the power. For example, LADWP schedules electricity imports into California from the Milford Wind Project in Utah on behalf of other SCPPA entities. Rather than correctly reporting the zero emission attribute in the MRR report of the entity that owns the electricity, the regulation requires that the first deliverer (i.e. LADWP) report the zero-emission renewable energy on LADWP's MRR report. This inappropriately distorts the emissions profile of the affected parties. (LADWP5)

> **Response:** Under the MRR, we require retail providers to report power imports to serve their own load. This means that even if LADWP is importing power for another utility, the other utility must also report, but has no obligation under the cap-and-trade regulation. Since we will have these data, if there are emergency situations as described above by LADWP where transmission could go down, we will have the ability to work with the entity with the obligation to match the reported data within that hour and will work with the covered entity on an appropriate emission factor.

I-11. Comment: CARB should harmonize its proposed regulations with those the California Energy Commission is considering in its proceeding under Docket 11-RPS-01, and those the California Public Utilities Commission is considering in its proceeding under Order Instituting Rulemaking, R.11-05-005. Both entities are currently receiving comments on the recently enacted California Renewable Energy Resources Act (sometimes referred to as "SB2 [(1X)]"). This is particularly important for publicly owned utilities where the CARB has the potential to impose penalties under the Public Utilities Code section 399.30(o). Rather than come up with different definitions, it would be more efficient for the regulated entities and the regulating authorities to provide consistent definitions for the same concepts. For example, under the "resource shuffling" and "electricity imports" concepts, CARB's focus of electricity is on the "delivery" of electricity while the California Renewable Energy Resources Act's focus is on procured and scheduled electricity. The California Renewable Energy Resources Act will reward utilities that comply early by allowing them to apply excess procured electricity products to satisfy subsequent compliance periods under the law. However, under the proposed concepts of "resource shuffling" and "electricity imports," LADWP may be penalized for not actually delivering electricity that it took credit for in an earlier compliance period for SB2 (1X)]. Therefore, it is unclear whether LADWP will be rewarded for early compliance with the California Renewable Energy Resources Act, yet run afoul of Cap-and-Trade regulations under AB 32. Another example is the definition of "eligible renewable energy resource" which "has the same meaning as defined in section 399.12 of the Public Utilities Code." Because the Renewable Portfolio Standard (RPS) program is currently undergoing modifications, it is unclear if this cross reference includes the entire legislative section as it does not expressly indicate that other portions of Section 399.12 are excluded. LADWP recommends that the cross reference be made to the California Energy Commission's Renewables Portfolio Standard Eligibility Guidebook, rather than Section 399.12. Without clarification on this definition, inclusion of the entire Section 399.12 would include the definition of "retail seller" which is different from "retail provider" in that it expressly does not include publicly owned utilities. Additionally, section 399.12 does not include eligible renewable energy from incremental improvements at hydroelectric facilities as allowed under existing law (Public Utilities Code, section 399.12.5). The CEC Guidebook is the standard for RPS eligibility. These definitions should be more closely aligned to avoid confusion and potential conflicts in legal interpretation, especially given the unique role that ARB will have to establish penalties for enforcement of the 33 percent RPS for publicly owned utilities. (LADWP5)

Response: We will finalize this regulation before the regulatory proceedings at the CPUC and CEC to implement SBX1 2 regulations are complete. LADWP will not be penalized if some of its electricity that is not delivered has been given credit for SB X1 2. However, any electricity that LADWP, or any other stakeholder, wishes to use in the RPS adjustment pursuant to this regulation must meet the requirements of section 95852(b) as modified.

For the reasons that we do not agree with the modifications proposed by LADWP, please see the other responses in the section that address the RPS adjustment and RECs. The regulation will limit double-counting while still allowing an emissions adjustment credit for RPS generation, provided the regulations requirements are met.

LADWP recommends that we refer for our definition of “eligible renewable energy resource” to a definition in CEC guidelines that we believe will soon be changed to be congruent with the new section 399.12 definition of the term. We believe LADWP’s recommended change would cause uncertainty and therefore, did not make the requested change.

Default Emissions Factor

I-12. Comment: LS Power requests that staff continue to evaluate the appropriateness of the default emissions factor set forth in the Mandatory Reporting Regulation, striving for consistency with the emissions determinations of other regulatory agencies and establish emissions factor that is the most reflective of imports into California. CARB should amend the default emissions factor to be more representative of generation within the WECC and consistent with the CEC’s Emissions Performance Standard. Section 95111(b)(1) of the MRR sets the default emissions factor at 0.428 Metric Tons of CO_2e/MWh. As noted in LS Power’s comments on the July 25, 2011 version of the regulation, LS Power believes that the current default emissions rate is set too low and will compromise CARB’s GHG emissions goals. An emissions factor of 0.428 creates an incentive for any out-of-state power plant with an efficiency factor higher than 0.428 to enter into a transaction with a marketer so that it can report its emissions as unspecified. Consequently, the actual GHG emissions attributable to the State will be higher than what is reported and satisfied through the cap-and-trade compliance obligation of unspecified importers. Moreover, in-state generation will be disadvantaged in the market because the emissions rate against which their compliance obligation is determined will be higher than the imputed value of unspecified emissions applied to out-of-state resources that will carry a lower compliance obligation. LS Power requests CARB continue to evaluate the default emissions factor, striving for greater consistency with the CEC's Emissions Performance Standard and a number that is more representative of generation within the WECC. Specifically, CARB should adopt a capacity-weighted average, which will result in a default emissions factor that is much closer to the EPS. LS Power also requests that CARB consider the more detailed comments on this issue that were submitted on September 27, 2011 in its response to the September 12, 2011 version of the Mandatory Reporting Regulation. (LSPOWER2)

> **Response**: This comment does not address changes identified in the second 15-day changes to the regulation. The comment addresses the MRR. No further response is required. However, we are aware of the potential for this regulation to create an incentive to shuffle resources, including an incentive for electricity importers to attempt to import power from a source with an efficiency factor (EF) greater than 0.428 metric tons of CO_2e/MWh, but claim the default EF of 0.428 pursuant to the MRR. Because such resource shuffling activity could interfere with accurate accounting, and because such activity could result in leakage, we have prohibited resource shuffling in section 95852(b)(2) of this regulation. Furthermore, the EF identified in the Emission Performance Standard (EPS) was recommended by the CEC and CPUC only as an interim default EF for consideration only until a WECC-wide tracking system was in place. WCI agreed upon a methodology to determine a default emission factor for unspecified sources that would be representative of a source on the margin. The factor is determined pursuant to the MRR. The MRR uses the WCI methodology to derive a default EF specifically for California based on power plants in WECC that are on the margin (i.e., with a capacity factor less than 60 percent.) The data will be updated annually, and the default factor will be set prior to the commencement of a compliance period. We do not agree with the use of a WECC-wide capacity-weighted average because most WECC baseload power (e.g., nuclear, hydroelectric, coal) is not available. It is already fully subscribed due to its low operating costs.

Emission Factors for Imported Power: BPA

I-13. (multiple comments)
Comment: The current regulation includes a carve out for "Asset Controlling Suppliers" which enables an entity to claim "specified" imports for all transactions regardless of the actual generation source. It is a fact that the identified Asset Controlling Supplier makes extensive market purchases with generation sources that are likely in excess of the specified level attributed to owned resources. Many of these transactions, conducted for the purpose of maximizing secondary revenues, include imports into the state of

California from carbon-emitting generation sources and should trigger a corresponding compliance obligation. Enabling an Asset Controlling Supplier to report all electricity transactions as “specified” imports with a reduced emissions profile is inequitable and inappropriate. Iberdrola Renewables strongly urges the CARB to require all electricity importers to properly identify and report the emissions associated with import transactions to ensure a level playing field and avoid a considerable and unfair market advantage for Asset Controlling Suppliers. (IBERDROLA2)

Comment: Bonneville Power Administration’s emissions are calculated dissimilarly from other imported resources. Bonneville Power Administration is defined as an Asset Controlling Supplier under the proposed Cap and Trade Regulation that is assigned a specified source emission factor by ARB for the wholesale electricity procured from its system and imported into California [section 95802(a)(14)]. As IEP understands it, BPA has a unique default emissions factor that is substantially less than the factor applied to all other unspecified imports. According to section 95111(b)(3) of the MRR, BPA has a default system emission factor that is twenty percent of the default emission factor for unspecified sources. This specific emission factor for BPA fails to recognize the interconnected nature of the Western Interconnection and treats some resources differently irrespective of their actual emissions profiles. Accordingly, ARB should adopt a single default emission factor for all unspecified purchases, and thereby effectuate similar treatment for imported power. Furthermore, in order to foster a stable, competitive environment that is not discriminatory between resources (both in and out of state), CARB should ensure that imported resources, for specified and unspecified power, accurately reflect the emissions profiles of the resources that they represent. (IEPA3)

Comment: Bonneville Power Administration’s emissions are calculated dissimilarly from other imported resources. Accordingly, ARB should adopt a single default emission factor for all unspecified purchases, and thereby effectuate similar treatment for imported power. Furthermore, in order to foster a stable, competitive environment that is not discriminatory between resources (both in and out of state), CARB should ensure that imported resources, for specified and unspecified power, accurately reflect the emissions profiles of the resources that they represent. (IEPA3)

> **Response:** This comment pertains only to the MRR; therefore, no response is required. However, we estimated BPA’s system emission factor based on the

following considerations, in response to comments regarding ARB recognition of asset-controlling suppliers. The default emission factor for unspecified sources is set pursuant to the MRR.

BPA markets wholesale electrical power from thirty-one federal hydro projects in the Columbia River Basin, one nonfederal nuclear plant, and several other small nonfederal power plants. The dams are operated by the U.S. Army Corps of Engineers and the Bureau of Reclamation. BPA purchases a small fraction of its electricity, relative to its generation, to balance its system. BPA only sells surplus system power, after the demand of its preference customers in the Pacific Northwest has been met. In addition, surplus electricity from the BPA system has a long history of serving California load. For these reasons, ARB concluded it is more accurate and appropriate to recognize BPA as an asset-controlling supplier and assign an emission factor representative of its sources. The system emission factor for BPA is appropriate, because BPA purchases a small fraction of its electricity, relative to its generation, to balance its system, and sells only surplus system power after the demand of its preference customers in the Pacific Northwest has been met.

We do not agree there should be one default factor that would also apply to asset-controlling suppliers such as BPA.

Qualified Exports

<u>QE Adjustment Calculation</u>

I-14. Comment: SCE has serious concerns about the Qualified Exports Adjustment ("QE Adjustment") for adjusting compliance obligations based on net imports and exports. SCE strongly supports this concept, and ARB's proposed revisions to the Qualified Exports language do make the rule easier to apply. However, the current proposed QE Adjustment rules remain extremely problematic and could create perverse incentives contrary to the emissions reduction goals of AB 32. The QE Adjustment rules as currently written create significant perverse incentives for market players. Qualified Exports provisions should be designed to be easily applicable and to create incentives for proper market behavior. However, SCE has identified a number of situations where the proposed rules could penalize a market participant who chooses to import low-GHG energy instead of high-GHG energy. In other words, these provisions could provide a disincentive to import clean energy. SCE strongly urges ARB to change the structure of this rule to provide incentives to drive greenhouse gas reductions. SCE provides two proposals: (1) a simple redline change, and (2) a more robust overhaul of the QE Adjustment using a "lowest first" calculation. In either case, ARB must weigh the outcomes of these changes as well as the possibility of unanticipated outcomes. Neither proposal fully aligns market incentives correctly, although the more robust proposal could possibly fully eliminate the potential disincentives of the current rule.

The simple, redline improvement to the current proposal would set the GHG emissions rate on qualified exports as the “the lowest non-zero emissions factor” of any of the imported and exported power of that hour. This small change eliminates the disincentive to import zero-GHG energy and is likely to improve the rule. Using the ten-MWh example described above, the total compliance obligation calculated under this rule is unchanged if the importer opts to import one MWh of zero-GHG energy. Thus, this rule change eliminates the perverse incentive to avoid importing zero-GHG energy. However, this small redline solution remains imperfect, because it penalizes power marketers who import energy on the margin with cleaner or near-zero emissions factors.

Moreover, the market-changing effects of this rule on BPA-sourced or other low-emissions imports are difficult to anticipate. Before adopting this simple redline change, ARB should assess how often BPA-sourced power is expected to be the marginal import and whether the size of the BPA supply pool justifies these concerns. Accordingly, ARB should also strongly consider a more robust market design option to supersede this “no regrets” move.

As an alternative, SCE suggests a more nuanced set of QE Adjustment rules that may bring about a more robust market structure. SCE proposes a “lowest first” QE Adjustment calculation: megawatt-hours (MWh) of qualified exports should be assigned an emissions factor based on the emissions factor of that hour’s imports, in a sequence, starting with the lowest emissions rate imports first. Compare this proposal to the existing rule using the same example as above, where a power marketer imports ten MWh—nine at the system default rate and one with an emissions rate of zero—and exports five MWh. Under this new rule, one MWh of exports would be assigned an emissions rate of zero, while the remaining four would be assigned the system default emissions rate. Unlike the existing rules, or the simple redline change proposed above, this “lowest first” QE Adjustment calculation provides no disincentive for entities to import any form of cleaner energy on the margin. In addition, this approach more accurately reduces the excess GHG obligation. The QE Adjustment would thus become far more functional and effective.

SCE recommends that ARB continue to make improvements to the design and structure of the QE Adjustment. SCE’s “lowest first” approach eliminates the disincentives for importing any form of clean energy. It may not create incentives for importing cleaner energy, although other programs and policies are already in place to provide these incentives. Ultimately, the QE Adjustment should work to provide needed flexibility for power marketers while aligning market behaviors in a manner that supports the goals of AB 32 and drives market efficiency.

In light of these design deficiencies and the potential for unintended consequences, SCE continues to support market preparedness efforts, and urges ARB to revisit this topic in the upcoming market readiness rulemaking. Market preparedness efforts should include an action plan for quickly adjusting the QE Adjustment rules, as well as a full market simulation and modeling on the impacts of the cap-and-trade rule on electricity market transactions. Because prices and behavior will undoubtedly shift over time to respond to GHG pricing and regulations, proper system modeling highlight distortional or negative impacts on markets that result from the cap-and-trade regulation. Even with modeling data, some market effects may be difficult to anticipate. Thus, ARB should be prepared for market-changing consequences by articulating a strategy for revisiting and adjusting the rules as needed. (SCE4)

> **Response:** We appreciate the commenter's thoughtful analysis. SCE provides an example of an hour in which an importer imports renewable electricity with a zero emission factor; for example, wind, solar, or geothermal. If there are other imports and exports during the same hour, the importer would be allowed zero QE adjustment for the hour, while if they imported no zero emission factor power, they could use the adjustment calculated using a non-zero emission factor.
>
> We agree with SCE that it is theoretically possible that an LSE or marketer would choose not to import renewable electricity based on economic interest. If they stopped having that electricity directly delivered (if it is possible to deliver it somewhere else) we believe that in the short run, SCE's purchase of and retirement of RECs for that electricity would still be useful in reducing WECC-wide emissions, while, through the RPS adjustment, also helping SCE or its counterparty to reduce a compliance obligation.
>
> We will continue to monitor the electricity market, paying special attention to the role of the QE adjustment factor. If in our ongoing discussions with stakeholders and monitoring of the electricity market we come to believe that a new QE approach becomes necessary to maintain the program's integrity, we will recommend making either the change recommended by SCE or other modifications to the regulation, as appropriate.

I-15. Comment: Assembly Bill 32 directs CARB to account for emissions associated with all electricity consumed in the State. WPTF has previously raised concerns that the approach taken by CARB, which imputes emission liability for imports on the basis of gross electricity imports, would significantly overstate electricity consumption in the State, arbitrarily and unnecessarily raise allowance and ultimately electricity prices, and make the cap and trade regulation more vulnerable to legal challenges from electricity importers.

The modified regulation has partially addressed this concern through inclusion of a "Qualified Export (QE) Adjustment" in section 95852. Under the QE Adjustment individual entities may net exported electricity against imported electricity within same hour. However, because the QE Adjustment does not provide for netting across individual entities, it would still overestimate statewide electricity consumption due to residual exports that are not accounted.

Absent a mechanism to account for these residual exports within the cap and trade program, the market will create opportunities for electric power entities to coordinate their import and export transactions into wheel-through transactions. While this behavior would better reflect electricity consumed in the State, it would increase transaction costs for importers and place additional burden on the California Independent System Operator (CAISO). We therefore recommend that CARB work with electricity sector stakeholders, the CAISO and other California Balancing Area Authorities to develop a mechanism to ensure that electricity imports subject to the cap and trade program match net interchange.

A second problem with the QE Adjustment is the new requirement that emission rate of the qualified export be equal to the emission rate of the cleanest import or export in that hour. Consequently, whenever the export portion is of lower intensity than the import portion or when there are multiple import transactions of varying intensity, the QE Adjustment would be less than the liability that could be avoided if the transaction were conducted as a wheel-through on a single tag—which are exempt from reporting. This inconsistent treatment creates an economic incentive for increasing use of the single tag wheel-through schedule types in the CAISO, instead of the more flexible simultaneous import/export schedules, thereby increasing economic inefficiencies without reducing GHG emissions.

The requirements for the calculation of the emission intensity for the QE Adjustment are overly restrictive, unnecessary and inconsistent with the treatment of wheel-throughs. Modify section 95852(b)(5)(A) as follows:

(A) During any hour in which an electricity importer claims qualified exports and corresponding imports, the maximum amount of QE adjustment for the hour shall not exceed the product of:

> 1. The lower of either the quantity of exports or imports (MWh) for the hour; multiplied by
> 2. The <u>weighted average</u> lowest emission factor of any portion of the qualified exports or corresponding imports for the hour. <u>If the quantity of qualified exports is less than the quantity of corresponding imports for the hour, then the weighted average is calculated by ranking the imports in intensity from highest to lowest and applied to the volume from subsection (1) accordingly.</u> (WPTF3)
>
> **Response:** The commenter requests that we net across individual entities to prevent overestimating statewide electricity consumption due to residual exports that are not accounted for. We believe that economic exchanges may be simultaneous, within the hour, or non-simultaneous and typically seasonal. Simultaneous exchanges are accommodated via the provision for qualified exports adjustment to covered emissions, as a limited means to control leakage. Non-simultaneous exchanges cannot be netted, since we believe that would violate the requirements of AB 32. Pursuant to AB 32, statewide GHG emissions include both emissions from electricity generation facilities located in California and emissions from electricity that is imported and consumed. The direction given in AB 32 to account for all electricity provides equal incentives to reduce

the carbon intensity of electricity generated in California, whether it is provided for export or for consumption in-state.

WPTF states that the QE adjustment “would still overestimate statewide electricity consumption.” However, the QE adjustment does not attempt to estimate or consider statewide electricity consumption, and the compliance obligation is not solely based on emissions from electricity consumed in California. Instead, the compliance obligation falls on all GHG emissions not excluded pursuant to sections 95852.1 to 95852.2 that are due to electricity generated in California even if it is exported, and to similar emissions associated with imported electricity.

It is not clear what is meant by WPTF in regard to use of the term “residual exports.” We agree that there are some hours in which California is exporting electricity, and we did not intend for those exports to be included in any kind of QE adjustment. There is no statewide netting of exports and imports; we only allow the netting of exports and imports during an hour by the same electricity importer.

We understand that there may be hours in which one importer is importing and another importer is exporting, but we did not reduce compliance obligation for either party in such a situation. We will monitor reported data, and if we find evidence that indicates that a change to the QE adjustment is required, we will work with stakeholders under a future rulemaking.

WPTF also recommends a change to section 95852(b)(5)(A)(2), to use a weighted average emission factor. However, for reasons explained in the response to comments above, we did not make this change.

I-16. Comment: Section 95852(b)(5)(A) of the Cap-and-Trade Rule allows for an adjustment to a PSE’s emissions obligation for times when that PSE imports and exports electricity in the same hour (a “Qualified Export Adjustment” or “QE Adjustment”). Powerex supports ARB’s proposal to include a QE Adjustment in the Cap and Trade Rule. Indeed, without a QE Adjustment, the Cap-and-Trade Rule could have significant distorting effects on the California energy market. Specifically, if the Cap-and-Trade Rule does not include an appropriate method of adjusting a PSE’s emissions obligations whenever that PSE has both imports and exports during the same hour, the PSE will be incented towards a wheel through transaction in which power moves through the State rather than incurring carbon liability for electricity that was not ultimately consumed in California. A QE Adjustment potentially solves the problem by removing any incentive for the importer to select a wheel through over a set of import/export transactions for the same hour.

Unfortunately, as currently proposed, the QE Adjustment still has substantial potential to distort the underlying power markets by inflating the emission obligation of the deliverer and incenting increased use of wheel through transactions in situations where energy is being both imported and exported in the same hour. ARB proposes to calculate the adjustment by multiplying the lower of either the volume of exports or the volume of imports for the hour (MWh) by the lowest emission factor of any portion of those imports or exports. See section 95852(b)(5)(A)(1) and (2).

Powerex agrees that the volume of qualified exports should be based on the lower of the quantity of exports and imports for that hour. That is consistent with how a PSE would set up wheel through transactions to accomplish the same purpose. But it is not appropriate to require a PSE to use the lowest emission factor associated with any of the imports/exports in that hour. Restricting PSEs to using only the lowest emission factor may incent wheel throughs of unspecified power and leave lower emission imports to be imported for consumption inside the state. As currently written, PSEs will, on the margin commit to wheel through transactions, since these would be based on an intensity ranking, from highest to lowest, of the imports for that hour and applied to the volume proportionately. To eliminate any incentive for PSEs to use wheel through transactions to adjust for qualified exports, we suggest the following modifications. The suggested changes make the QE Adjustment's calculation method more akin to the calculations that underlie a typical wheel through transaction. Moreover, they also appropriately focus the calculation on the carbon intensity of the electricity being imported but not used in California. Finally, the changes eliminate the confusion that could arise under the current proposal when, as is often the case, a PSE procures export energy through the CAISO and the carbon intensity is unknown. Modify section 95852(b)(5)(A)(2) as follows:

> (2) The <u>weighted average</u> ~~lowest~~ emission factor of ~~any portion of the qualified exports or~~ corresponding imports for the hour. <u>If the quantity of qualified exports is less than the quantity of corresponding imports for the hour, then the weighted average is calculated by ranking the imports in intensity from highest to lowest and applied to the volume from subsection (1) accordingly.</u> (POWEREX2)
>
> **Response:** We appreciate Powerex's support of a QE adjustment. Powerex states that the QE adjustment will provide an incentive for wheel-throughs. While we disagree with this modification, we will monitor and analyze reported data, as discussed above. If we become convinced that the regulation has, or would have, any significant unintended consequences, we will take action to address the issue.

<u>*Transmission Loss Factor for Qualified Exports*</u>

I-17. Comment: ARB has proposed a Transmission Loss Correction Factor (TL) of 1.02 to imported electricity from unspecified and specified sources in order to account for transmission losses between the measurement at the busbar and the measurement at the first point of receipt in California. However, ARB has not included such a TL in the QE Adjustment calculation. Applying a TL factor only to imported electricity, but not applying the same TL factor credit to offsetting exported electricity, will create an inconsistency that is unfair and leads to unintended consequences. Without the TL, the

QE Adjustment will always be lower than the GHG emissions calculated for imported electricity by the 2 percent adjustment factor. Qualified Exports should be able to offset all of the GHG emissions calculated for imported electricity. Accordingly, ARB should apply the same TL factor to the QE Adjustment to maintain this consistency in the regulations. (SCE4)

> **Response:** Section 95852(b)(5) describes the requirements for the Qualified Export adjustment. Transmission losses are not applied to exports pursuant to MRR section 95111(a)(6). ARB concluded that the losses between the busbar and the last point of delivery inside California will remain under the cap and will not be subtracted from the compliance obligation.

Potential Overstatement of Imports

I-18. Comment: Citi has identified and done yeoman's work investigating and defining the issue of "net imports" across scheduling coordinators. Current drafts of calculation rules provide for netting imports and exports within an individual scheduling coordinator's portfolio, which is appropriate. However, the lack of a way to calculate net imports and exports across different Scheduling Coordinators does indeed appear to create a significant systemic bias towards aggregate overstatement of the level of imported power. Such an overstatement will add extra costs to imports, thus unintentionally and inappropriately disadvantaging them commercially against indigenous resources with which they would otherwise be economically competitive. Furthermore, by definition, such a cost overstatement will redound to consumers, artificially and inappropriately increasing the cost of the GHG reduction program for consumers.

MSCG observes that identifying the problem is much simpler than identifying the solution. We do not at this point have a specific recommendation for resolving the issue. However, we do support the view that the issue is valid, significant, and merits further investigation and ultimately, resolution. We would observe that the largest practical problem in identifying the solution will be in developing a way to allocate a "credit" of some sort, due to the aggregate overstatement of imports, back to individual market participants who are responsible for submitting compliance instruments. Two variant ideas that suggest themselves are 1) some form of "backward looking" credit, or refund, of compliance instruments, or 2) a forward looking "reduction factor" to the compliance obligation, based on historical calculations, regularly adjusted and trued up. There may very well be other types of solutions. This problem probably can't be resolved in time for the October Board vote. Therefore, we urge the ARB to "flag" this issue for further development, and resolution in 2012 before the start of the compliance obligation in 2013. (MSCG4)

> **Response:** We thank MSCG4 for the comment. Statewide GHG emissions include emissions from delivered electricity from both electricity generation facilities located in California and emissions from electricity that is delivered and consumed. AB 32 requires that we account for all electricity to provide equal

incentive to reduce the carbon intensity of electricity generated in California, whether it is provided for export or for consumption in-state. Pursuant to Health and Safety Code (HSC) section 38505(m), "Statewide greenhouse gas emissions" means the total annual emissions of greenhouse gases in the state, including all emissions of greenhouse gases from the generation of electricity delivered to and consumed in California, accounting for transmission and distribution line losses, whether the electricity is generated in state or imported. Economic exchanges may be simultaneous, within the hour, or non-simultaneous and typically seasonal. Simultaneous exchanges are accommodated via the provision for qualified exports adjustment to covered emissions as a limited means to control leakage. Non-simultaneous exchanges cannot be netted, since that would violate the requirements of AB 32. We believe that the regulation as it stands is sufficient and that electricity importers may find ways, such as scheduling more wheel-throughs, that would reduce any possible overstatement of the level of imported power. Since no commenter has shown convincingly that a change is needed in the QE adjustment, and since we are unaware of any quantitative analysis on possible “overstatement of the level of imported power,” we did not change the adjustment. We will monitor reported data and will make modifications in the future if we find evidence that the QE adjustment would lead to unintended negative consequences.

e-Tags and Commerce Clause

I-19. (multiple comments)
Comment: PacifiCorp remains concerned that the regulation continues to rely on the use of e-Tags to determine when an entity is a first-deliverer under the definition Electricity Importer. The changes made do not resolve the fundamental problem with relying on e-Tags to establish the first-delivered electricity and in fact exacerbate the risk of potential legal challenges to the regulations. To minimize these risks and provide greater clarity, PacifiCorp encourages ARB to identify the first deliverer provisions as an issue that will be further evaluated before the first cap-and-trade auction in July 2012.

The importer provisions should not exclusively rely on NERC e-tags, and ARB should not remove reference to title and potential regulation of downstream purchasers in these provisions. The Proposed Regulation includes substantial revisions to the definitions for Electricity Importer (95802(a)(87)) and Imported Electricity (95802(a)(137)). The definitions no longer refer to the title holder when determining the entity that will be considered the importer subject to ARB jurisdiction, and thus the first deliverer with the cap-and-trade compliance obligation. Instead, the regulations rely exclusively on the purchasing-selling entity (PSE) identified on the North American Electric Reliability Corporation (NERC) e-Tag.

The regulations also remove language that would have provided: “When PSEs are not subject to the regulatory authority of ARB, including tribal nations, the electricity importer is the immediate downstream purchaser or recipient that is subject to the regulatory authority of ARB.” Further, language was added to the definition of Electricity

Importer stating that “for facilities physically located outside the state of California with the first point of interconnection to a California balancing authority’s transmission and distribution system, the importer is the facility operator or scheduling coordinator.” These changes are problematic for three reasons: 1) they potentially violate the dormant commerce clause and will therefore expose the cap-and-trade regulation to litigation risk; 2) they do not solve the complex problem of how to identify the correct entity importing power into California that is consumed in California; 3) they lack clarity and will therefore create confusion and uncertainty for parties transacting at trading hubs outside California.

The importer definitions potentially constitute an over-reach of California’s jurisdiction. The aforementioned sentence beginning “when PSEs are not subject to the regulatory authority of ARB. . .” served as an explicit recognition that ARB does not have jurisdiction over interstate transactions occurring wholly outside the state. The previous version of the Proposed Regulation properly recognized that ARB can only regulate the entity that holds title when power crosses the state line, typically the downstream purchaser when title is passed to a purchaser at a delivery point physically located out of state. This legal structure has ARB jurisdiction properly attached when the power is within the state boundary. The removal of this language is exacerbated by the simultaneous deletion of reference to title in the beginning of the definition.

ARB relies on the PSE designation on the e-Tag, and specifically the PSE identified in the last segment of the physical path of the e-Tag to identify the electricity importer. As PacifiCorp noted in its comments on the July 25th version of the Proposed Regulation, e-Tags are not used to establish title to energy or transmission. Rather, e-Tags were originally designed as a tracking system for interchange transactions. As such, e-Tags facilitate communication and tracking of interchange transaction information between counterparties, balancing authorities, and transmission providers. Using e-Tags as the exclusive determinant for identifying electricity importers is inappropriate because, as is more fully described below, there are instances when the entity identified as the PSE in the last segment of the physical path crossing into California does not hold title to the power and is therefore not importing energy to be consumed in California. Further, because e-Tags are not intended to establish or confirm title, there are not currently mechanisms in place to monitor, track, and ensure that the PSE on the e-Tag is correctly identified in every instance. Adopting rules that impose compliance obligations based on e-Tag information will require PSEs to develop controls to ensure accuracy of commercial information on e-Tags, which are tools designed to ensure reliability and not to document commercial activity.

Attaching a California compliance obligation to an entity who is not importing energy into California could amount to California’s regulation of activities outside of the state of California. The removal of the language in the definition that refers to the entity that holds title does not solve these fundamental flaws associated with the definition and the use e-Tags to identify importers.

PacifiCorp, in its capacity as a FERC-jurisdictional service provider, has wholesale transactions for its system power where it is identified as the PSE on the physical path for energy scheduled into California even though the purchasing entity took title to the power at a point within PacifiCorp's multi-state balancing authority area. As an example, PacifiCorp routinely sells energy to the CAISO in the real-time market at the California-Oregon border (COB), a trading hub made up of multiple scheduling points, including Captain Jack and Malin500. In this example, there are two relevant e-Tag line segments: 1) JohnDay-MALIN500; and 2) MALIN500-NP15. PacifiCorp contends that the sale to the CAISO occurs at Malin. PacifiCorp has title to the energy from the source to Malin, where the CAISO takes title to the energy and delivers it into California, sinking the energy in NP15. However, in compliance with CAISO Operating Procedure – 2510, the e-Tag lists only PacifiCorp as a PSE. Most importantly, the e-Tag lists PacifiCorp as the PSE on the MALIN500-NP15 segment, where the energy enters California. In this example, then, PacifiCorp could be determined to be the electricity importer and be required to carry the cap and trade compliance obligation. PacifiCorp asserts that it is the CAISO, and not PacifiCorp, that is importing electricity into California to be consumed in California. It is not appropriate for the ARB to attach a compliance obligation on an out of state entity that is not importing electricity into California.

If these provisions are implemented as is, the Cap-and-Trade Program will be vulnerable to legal challenge. The Commerce Clause of the United States Constitution (Article I, Section 8, Clause 3) empowers Congress to regulate interstate commerce. This provision has been interpreted by courts to prohibit states from regulating activities which occur wholly outside the State.

In the context of electricity imports, when title is conferred from the seller to the purchaser at a location outside of California, the commercial transaction takes place wholly outside of California. ARB may have authority to regulate the purchaser that is delivering energy to be consumed in California, but ARB will not have jurisdiction over the seller. However, if the selling entity is nevertheless identified on the e-tag as the PSE on the physical path coming into California, and ARB seeks to regulate the selling entity as the importer, then ARB will exceed the extent of its jurisdiction in violation of the Commerce Clause. These risks should be avoided because they will create uncertainty and price volatility in the cap-and-trade markets.

PacifiCorp is sympathetic to ARB's desire to have a simple mechanism that will clearly identify the entity importing electricity into California to be consumed in California. However, due to complexity of the wholesale market and transmission scheduling systems, it is highly unlikely that there is any way to simply and clearly establish the entity that actually holds title to energy as it crosses into California and then is consumed in California. Certainly, for the reasons described above, the desired data is not practically captured via an e-Tag. Further, reliance on the e-Tag mechanism to identify the importer is also problematic because it calls into question the constitutionality of the Cap-and-Trade Program as it implies to importers.

PacifiCorp proposes that a more practical and legally supported solution would be to calculate, on some regular interval, the quantity of unspecified net imports and require the buyer/importer (located in California) to allocate the related compliance obligation to sellers. This would more accurately and easily account for imported energy, as well as wheels and exports, and does not rely on scheduling information that may be subject to change and does not necessarily reflect actual energy flow. In this way, imports could be calculated based on actual flow data that already is or could be captured by the CAISO. The buyer/importer would be identified as the entity with the compliance obligation and it would then determine how to spread the costs of compliance to sellers. Further, this solution could allow for more certainty in the wholesale market and could more accurately capture the allowance price embedded in the price of energy because the price will be based on a net consumption amount.

In sum, the risk of litigation and lack of clarity created by the importer definitions is an issue that needs resolution by ARB. Regardless of whether or not ARB is willing to consider the solution described above, more work is needed in order to work through the complexities associated with identifying the electricity importer. Since staff has indicated that there will not be another 15 day rulemaking package released before the October Board hearing, PacifiCorp requests that ARB identify the importer definitions and first deliverer provisions generally as a topic area subject to further rulemaking activity in 2012. These issues should be resolved well before the July 2012 start of the cap-and-trade auctions. PacifiCorp continues to encourage ARB staff to consult a range of technical experts on issues affecting the wholesale energy market and continues to offer its own technical expertise from the perspective of a balancing authority and a MJRP. (PACIFICOR4)

Comment: The CPUC/CEC interim decision on the point of regulation for the electricity sector recommended the first deliver as the "owner" of the electricity. Point of regulation for the electricity sector was extensively vetted during the CPUC and CEC joint proceeding (Rulemaking 06-04-009) in which the "First Deliverer" was recommended in March 2008 by the CPUC and CEC jointly. More specifically, the agencies further recommended to the ARB that the first deliverer be the entity that holds title to the power. This has been a long-standing position held by the majority of the electric sector since 2008. As the rulemaking evolved since that time, it appears that ARB has focused on the use of NERC E-tags to identify the purchasing-selling-entity holding title to the power at the point of delivery to California, and only recently as part of this Second 15-Day Modified Text removed the ownership requirement.

LADWP strongly recommends that ARB retain the current emissions reporting requirements for entity reports under MRR that are based on electricity that is owned or under a power purchase agreement. Since Intermountain is directly linked to LADWP's Balancing Authority area, the entity that holds title to the power at the busbar is known. Such approach more correctly aligns the emissions reporting, compliance obligation, and attestation requirement to the party that has the most discretion and control over the electricity.

In the most recent amendments (September 12, 2011), the definition of "first deliverer" stripped the requirement that the electricity importer hold title to the power being imported. Only at the time of this most recent amendment (September 12, 2011) did the definition of "first deliverer" strip the requirement that the electricity importer hold title to the power being imported. The public notice for this Second 15-Day Modified Text provides a vague description but no real explanation for why these definitional changes were made. LADWP strongly recommends that ARB hold off on making these definitional changes until further consideration can be given to the amendments as part of the new proceeding in 2012. The ARB Board should not adopt the amendments to definitions that strip the requirement to "hold title" as these changes will have a ripple effect on specified imports that is not well understood and may be unintentional, and should be avoided. LADWP strongly recommends that the ARB not strike this requirement (i.e. to hold title) as part of the adoption of this regulation without adequate vetting from all stakeholders. This change has the potential to impact any entity that is importing electricity from a specified source, and it is essential that ARB seek different viewpoints from those that advocated only recently to remove this requirement from the definition. LADWP's ultimate objective is to ensure that the proper entity is attributed the emissions obligation (for fossil emissions) or zero emissions attribute (nuclear, hydroelectric or renewables) and that the regulation does not inadvertently impose an emissions obligation on zero-emitting specified imports, regardless of how the owner of the imported electricity elected to have it imported. (LADWP5)

Comment: NERC defines the Purchasing-Selling Entity" as "the entity that purchases or sells, and takes title to, energy, capacity, and Interconnected Operations Services..." and yet the ARB has elected to remove a fundamental part of this definition—title and responsibility—and ignore the market segments on the NERC E-tag where a PSE may also be listed. According to the NERC Electronic Tagging Function Specification, Version 1.8.1, "market segments contain information that describes the market information, such as the identity of the market participant, the firmness of energy the market participant is delivering, and the physical segments the entity is responsible for providing." LADWP strongly recommends that these definitional changes being proposed by staff in sections 95802(a)(264), 95852(b)(1)(C), and 95852(b)(3), be revisited in order to provide consistency and alignment between the Cap-and-Trade program and standard wholesale market transactions. (LADWP5)

> **Response:** We disagree with PacifiCorp. The regulation does not exclusively rely on the PSE on an e-Tag as the identifier of the first deliverer. Some imported electricity does not cross balancing authority areas (BAA) boundaries, and the MRR relies on other data to establish the identity of the first deliverer in these cases.
>
> PacifiCorp claims that our use of the term “PSE” is something other than the meaning of PSE used in federally approved documents and definitions that set reliability standards nationwide. Some of the documents are proprietary, but can be viewed by scheduling coordinators and PSEs. LADWP5, we believe correctly, quotes NERC’s definition of PSE. PacifiCorp asserts that use of e-Tags in the

regulation will be problematic for three reasons: it potentially violates the dormant commerce clause, it does not identify the correct entity importing power into California that is consumed in California, and it lacks clarity and will therefore create confusion in the electricity market.

While we agree that ARB does not have jurisdiction over commercial transactions occurring wholly outside of the state, we do believe that ARB has jurisdiction where electricity is delivered into California state boundaries. The regulation applies the compliance obligation to first deliverers who are electricity importers for electricity imported into California, which are identified as PSEs on e-Tags. We apply the compliance obligation on entities that deliver power into a California point where it is sold, or used in some other way by an importer that acquires the electricity outside of California. There are no regulatory requirements until such time as electricity has entered California. This confines obligations under the regulation to electricity that is brought into the state, and the system allows California to most effectively account for such electricity without imposing requirements that could possibly violate the Commerce Clause.

Commenter raises a concern that an entity bringing electricity into the state may not own title to such electricity, and regulation of that entity bringing electricity into California is improper unless that entity also owns title to such electricity. As described above, we rely on e-Tag data as a demonstration that electricity was delivered from a point outside of California to a point inside of California and for identification of the entity associated with such electricity. Commenter is mistaken in its belief that we use e-Tag information as a proxy for title. The definitions of electricity importer, electricity exporter, purchasing-selling entity, and marketer were modified to clarify that delivery and not title is the critical determinant of responsibility. ARB must rely on a clearly identifiable and verifiable entity that delivers electricity into California. Which party holds title to electricity may become a matter of dispute between counterparties and does not provide the certainty needed in a mandatory GHG program. The regulation in this context simply looks at electricity that is brought into California and the entity that has done so without determining who holds title. Accordingly, commenter’s discussion asserting that CAISO takes title to electricity at nodes outside of the state is not the key determination. It is the entity that brings electricity from a point outside of California to a point inside of California who we consider as an electricity importer in the regulation, and for which we use e-Tag information. We believe that this provides a simple and straightforward means to identify the electricity importer for electricity brought into California.

Commenter additionally expresses angst that the definition of electricity importer lacks clarity and will cause confusion in the electricity market. We disagree and believe the title requirement would have only added to uncertainty for regulated entities, because determinations on which entity holds title for each transaction could be subject to dispute and may be documented in less accessible and reliable forms than e-Tags. ARB concluded that the existing NERC e-tag system used to support reliability standards for the North American bulk power system provides consistent and reliable source data and independent documentation of electricity delivered across balancing authority areas. NERC is the electric reliability organization (ERO) certified by the Federal Energy Regulatory Commission to establish and enforce reliability standards for the bulk-power system. The current regulation language is intended to provide the certainty which commenters have requested by specifying a straightforward mechanism such as e-Tag data that ARB will use to determine whether an entity is a first deliverer.

In sum, we do not agree that PacifiCorp, or any electricity importer, as implied in the comment, is not able to correctly identify the PSE on the last segment of an e-Tag that schedules delivery of electricity to a FPOD in California. A sale cannot be made unless either: (1) the electricity is delivered to a California FPOD by the importer that identifies itself as the PSE, or (2) the non-importer PSE on the previous segment finds a counterparty willing to purchase the electricity at the last Point of Receipt (POR) outside of California and to agree to be the PSE. PacifiCorp also comments on our removal of language that would have identified a downstream purchaser as the electricity importer. As we have discussed above, the PSE and SC listed on the e-Tag is the importer of electricity when the e-Tag indicates that electricity has been moved from a point outside of California to a point inside of California. Because we believe e-Tags will provide an accurate and reliable means of tracking electricity that is delivered into California, as well as the entity associated with such deliveries, we see no need at this time to designate additional entities as possible electricity importers.

With respect to the comment of LADWP, we take a first-deliverer approach, as recommended by the CPUC and CEC. The regulation clearly identifies the first deliverer, and we note that the understanding of the first deliverer approach has evolved significantly during ARB's work with stakeholders over the last six months in coordination with CEC and CPUC staff. We developed the concept in greater detail for use in this regulation, and we very much appreciate the hard work of CEC and CPUC and stakeholders in the process that identified the first-deliverer approach. The fourth paragraph of the LADWP5 comment above addresses the MRR, so we do not respond here.

LADWP is also concerned with the removal of the words "entity that holds title to delivered electricity is" in the definition of electricity importer for the case when the electricity is delivered between balancing authority areas. We share LADWP's desire to ensure compliance obligations are properly assigned. As discussed more fully above, we believe the regulation will do so by identifying the PSE associated with electricity delivered from a point outside of the state to a point inside of the state. Additional determinations regarding title for each transaction could create uncertainty in the market, because determinations on which entity holds title for each transaction could be subject to dispute among the parties and may be documented in less accessible and reliable forms than e-Tags.

Finally, we will continue to work with stakeholders to ensure there is clarity as we work to implement this system.

I-20. (multiple comments)
Comment: ARB staff made changes to a number of definitions that appear to resolve a problem with unspecified electricity imports into the CAISO pool (unspecified electricity is electricity that cannot be tracked back to the source). However, those revisions may result in unintended consequences for reporting emissions and compliance obligations for other electricity imports that are specified (originate from a known facility or source—can be renewable, coal, nuclear, etc). Changes to the following Cap and Trade and MRR definitions remove the requirement that the importer "hold title" to the power, including: 1) electricity importers, 2) marketer, and 3) purchasing selling entity. In the electricity sector, there are contractual arrangements where an entity that owns the electricity may not have the transmission capacity to schedule it into California and thus contracts with another entity to "move" it into California.

At this point, ARB has not adequately vetted this issue before making the amendments they made in this Second 15-Day set of amendments, and it appears that this "tiny" change will have a ripple effect on imports that otherwise are very straightforward and uncomplicated. CCEEB recommends that ARB not remove the requirement to hold title to power imports until the potential impacts on reporting and compliance obligations for specified imports is more fully vetted and it can be demonstrated that such changes to key definitions are both warranted and do not cause harm to other entities with specified imports. ARB recommends that the ARB Board direct staff to further evaluate this potential change to electricity imports as part of the new regulatory proceeding in 2012. (CCEEB4)

Comment: LS Power is engaged in the development, acquisition and management of power generation and transmission infrastructure. In addition to its natural gas-fired facilities, LS Power is currently investing in wind and solar resources. LS Power, as an importer of power into the CA markets, seeks, as do other market participants, regulatory certainty around the newly developing cap-and-trade market and to have the regulations promulgated by this agency withstand the legal challenges that are sure to arise on a myriad of issues. LS Power's primary concern with the most recent regulatory package is that CARB continues to rely on e-tags to designate ownership of imported power and has removed language which utilized the title holder of power as the power crosses the political border of California as the point of regulation over imported power. Title is the concept that makes the assertion of CARB's jurisdiction over imports much clearer from a legal and commercial perspective. In the current version, the cap-and-trade program does not adequately contemplate the interstate nature of the western electricity system or the legal bounds of CARB's jurisdiction. For the reasons explained below, the cap-and-trade program, with respect to its treatment of electric transactions occurring at locations outside of California, violates the Commerce Clause of the U.S. Constitution which limits the ability of a state to regulate commercial activities occurring outside its borders.

To provide a means of correcting this deficiency, LS Power requests that CARB, in its resolution approving the cap-and-trade program, include a direction to staff which identifies the electricity importer definition as a specific topic that will be addressed in a subsequent rulemaking before the cap-and-trade program takes effect.

The September 12, 2011 Revisions to the Cap-and-trade Regulation Expose the Program to Litigation Risk by Violating the Commerce Clause of the United States Constitution. The stated intent of the cap-and-trade program, as it applies to the electricity sector, is to impose a compliance obligation on in-state power plants and imports into this state from out-of-state power plants. At the highest level, these points of regulation appear simple. But in its application to the interstate electric marketplace, the regulation seeks to impose CARB's jurisdiction over activities that are exceedingly complex. The wholesale electricity markets are operated in real time, across state and international borders. In California, there are several balancing authority areas, some of which extend beyond the State's borders. In other words, the western electricity system is a quintessential example of "interstate commerce", and as CARB seeks to regulate the California portion of this system, CARB must carefully evaluate the legal scope of its jurisdictional reach. The most recent changes to the regulation obscure the line between regulating in-state activities and those which occur entirely out-of-state. If these issues are not remedied, LS Power is concerned that the regulation is susceptible to legal challenge on the basis of the Commerce Clause.

The September 12, 2011 version of the regulation includes three substantial revisions to the definition for Electricity Importer (Proposed 17 Cal. Code Reg. section 95802(a)(87)). First, the following sentence has been deleted: "when PSEs are not subject to the regulatory authority of ARB, including tribal nations, the electricity importer is the immediate downstream purchaser or recipient that is subject to the regulatory authority of ARB." This sentence helped clarify that when CARB does not have jurisdiction over an import because the delivery occurred out-of-state, CARB's jurisdiction will apply to the entity that it can regulate: the purchaser bringing the power into the state. Second, the electricity importer definition no longer refers to the entity holding title to the power, and instead relies solely on the purchasing-selling entity (PSE) identified on the NERC e-tag. As noted in LS Power's August 11th Comment letter on the previous version of the regulation, e-tags do not accurately track ownership of power, and are an imprecise and inappropriate tool for determining the reach of CARB's jurisdiction.

Third, the electricity importer definition includes new language stating that the operator of an out-of-state facility is an importer when the first point of interconnection is to a "California Balancing Authority." As noted above, a California Balancing Authority can have territorial areas located outside of California and an operator of such an out-of-state facility may not hold title to power when it comes across the border into California. Collectively, these changes will lead to circumstances where CARB's jurisdictional reach seeks to regulate a seller of electricity even though the seller never owns power as the power is transmitted across California's borders.

States cannot regulate commercial activities occurring wholly outside their borders, and doing so constitutes a violation of the Commerce Clause. Article 1, Section 8, Clause 3 of the United States Constitution provides that "The Congress shall have power to regulate Commerce with foreign nations, and among the several States, and with the Indian Tribes." The importance of the Commerce Clause extends beyond simply describing the power of Congress. The Commerce Clause has been interpreted by courts to implicitly govern the power of states. For example, in New York Life Insurance Co. v. Head, 234 U.S. 149 (1914), the U.S. Supreme Court determined that "it would be impossible to permit the statutes of Missouri to operate beyond the jurisdiction of that State . . . without throwing down the constitutional barriers by which all the States are restricted within the orbits of their lawful authority and upon the preservation of which the Government under the Constitution depends."

More recently, in Edgar v. Mite Corp., the U.S. Supreme Court interpreted the Commerce Clause to "preclude the application of a state statute to commerce that takes place wholly outside of the State's borders, whether or not the commerce has effects within the State." (See, Edgar v. Mite Corp. 457 U.S. 624, 642, (1982), emphasis added.) This language was quoted by the Court in Healy v. the Beer Institute, 491 U.S. 324 (1989), when the Court struck down a Connecticut statute requiring out-of-state shippers to affirm that the prices charged to wholesalers in Connecticut were no greater than prices charged in neighboring states. In Healy, the Court concluded that the Connecticut statute had the "undeniable effect of controlling commercial activity occurring wholly outside the boundary of the State." (Healy v. The Beer Institute, at p. 337). Importantly, in both of these cases, the underlying activities that started the lawsuits had impacts on the states. Even though the commerce had effects within the state, the commerce occurred wholly outside the state's borders. Similarly, in the context of an electricity import, when title to the power is transferred to a purchaser at a point physically located out-of-state, the commercial activity occurs wholly outside the State of California. Even though the power eventually comes into California, CARB's jurisdiction cannot extend to the sellers in these instances without offending the Commerce Clause. Moreover, CARB's California program, and the manner it would attach to importers and operators of certain generators located outside the state, will undoubtedly influence the prices for interstate transactions occurring at market hubs located outside California.

Thus, in the current form, the cap-and-trade regulation creates a significant risk that the program could be challenged because it violates the Commerce Clause. Such litigation risk creates uncertainty for the program and undermines confidence in the cap-and-trade markets, which is especially needed in the incipient stages of the program. Moreover, out-of-state sellers participating in CAISO markets by delivering to out-of-state nodes, such as LS Power, who may choose not to challenge the regulations, will be at a competitive disadvantage compared to out-of-state sellers that may not choose to submit to CARB's jurisdiction. In sum, the invalid extension of CARB's jurisdiction through the importer definitions is a significant deficiency in the cap-and-trade program that needs to be remedied before the program starts. Accordingly, LS Power requests that CARB specifically acknowledge these deficiencies through a Board Resolution if and when the cap-and-trade program is adopted and approved at the October Board hearing. The board resolution should specifically direct staff to address these concerns in a subsequent rulemaking before the start of the program (i.e. early 2012). (LSPOWER2)

> **Response:** The regulation relies, via the MRR, on a variety of documentation to verify electricity transactions reports, including NERC e-Tags, settlements data, and contracts. ARB concluded that the existing NERC e-Tag system used to support reliability standards for the North American bulk power system provides consistent and reliable source data and independent documentation of electricity delivered across balancing authority areas. NERC is the electric reliability organization (ERO) certified by the Federal Energy Regulatory Commission to establish and enforce reliability standards for the bulk-power system. NERC develops and enforces reliability standards; assesses adequacy annually via a 10-year forecast and summer and winter forecasts; monitors the bulk power system; and educates, trains, and certifies industry personnel.
>
> When electricity is delivered across balancing authority areas (BAAs), NERC e Tags are created to request, approve, and document the interchange transaction from source (generation) to sink (load), designating the market path and physical path from first point of receipt (POR) to final point of delivery (POD). Therefore, for electricity that crosses BAAs, imports, exports, and wheels are defined pursuant to subsection 95102(a) with respect to the location of the first POR the final POD as documented on NERC e-Tags. This convention, based on NERC Reliability Standards and supporting business practices, provides for rigorous and consistent accounting of emissions from electricity.
>
> Purchasing-selling entities are designated on NERC e-Tags for each segment of the physical transmission path, which provides the means for reporting entities to clearly identify the quantities of electricity they import, export, and wheel across the California border. Use of NERC e-Tags to document is necessary for consistent reporting and verification. Determining which transactions are specified or unspecified relies on written power contracts (and supporting records), settlement data, and invoices.
>
> We modified the definitions of “electricity importer,” “electricity exporter,” “purchasing-selling entity,” and “marketer” to clarify that delivery and not title is the critical determinant of responsibility. ARB must rely on a clearly identifiable and verifiable entity that delivers electricity into California. Which party holds title to electricity may become a matter of dispute between counterparties and does not provide the certainty needed in a mandatory GHG reporting program.

The cap-and-trade regulation applies the compliance obligation to first deliverers who are electricity importers for electricity imported into California. In most cases, these importers are identified as PSEs on e-Tags, as discussed above. We apply the compliance obligation on entities that deliver power into a California point where it is sold, or used in some other way by an importer that acquires the electricity outside of California. ARB does not apply a compliance obligation on transactions outside of California, and ARB does not attempt to regulate commercial activities outside its borders, as discussed in our previous response.

While we agree that interstate commerce takes place within the western electricity system, transactions take place within identifiable jurisdictions at the State level. We note that we have read the legal arguments put forward by parties involved in the CPUC and CEC process in which those agencies recommended the first-deliverer approach. We regulate electricity through the entity that delivers power into the California grid. We apply the compliance obligation to the entity that brings the power across the state border and either: (1) owns and keeps the power in the next stage of delivery, or (2) sells the power to another entity at the FPOD in California. Thus, while the WECC is clearly a multi-jurisdictional system, ARB regulates transactions in California.

LS Power (and PacifiCorp) comment that ARB explicitly recognized that we do not have jurisdiction over certain cases, but misinterpret what we meant by deleting language that included the words “tribal nations.” ARB may not have jurisdiction over actions of tribal nations, and that was the reason we considered including the language that was removed. However, we decided that we need not address the activities of tribal nations that are PSEs in section 95802(a)(87). We are only aware of one power plant in California operated by a tribal nation, and e-Tags are not required to be used to schedule that power because it is generated and may be consumed within the boundaries of the State of California.

LS Power misstates the regulation in claiming that the electricity importer definition newly state that “the operator of an out-of-state facility is an importer when the first point of interconnection is to a California BA.” The regulation states that in such cases the electricity importer is “the facility operator or scheduling coordinator. If the out-of-state facility is connected directly to a California BA, the facility can both sell and schedule the electricity into California, in which case they are the importer. Alternatively, the facility desiring to sell electricity for import to California can find an SC that is willing to be the first deliverer and pay the compliance obligation. We believe that parties will work this out in the electricity market. As noted above, an entity cannot schedule through the CAISO system without selling the power in a California transaction at a California FPOD.

FERC Jurisdiction

I-21. Comment: ARB should consider Federal Energy Regulatory Commission (FERC) exclusive jurisdictional issues when it comes to the regulation of imported wholesale energy. The definitions of electricity importer and imported electricity, as well as many other elements of the proposed regulations that may affect the wholesale energy market (inside and outside California), may be problematic in light of the Federal Energy Regulatory Commission's (FERC) exclusive jurisdiction to regulate the rates, terms, and conditions of sales for resale of electric energy in interstate commerce by public utilities. To the extent that the cap-and-trade program regulates the wholesale energy market by setting prices or establishing conditions for participation in the market, it may be subject to federal preemption. PacifiCorp strongly encourages ARB to engage FERC staff to ensure that no aspects of the cap-and-trade program are pre-empted by federal law and do not violate the Federal Power Act.
(PACIFICOR4)

> **Response:** The Supremacy Clause of the United States Constitution declares unlawful state laws that "interfere with, or are contrary to," federal law. *Hillsborough County, Fla. v. Automated Med. Labs., Inc.*, 471 U.S. 707, 712 (1985) (quoting *Gibbons v. Ogden*, 22 U.S. (9 Wheat.) 1, 211 (1824)); see also U.S. Const. art. VI, cl. 2. Preemption analysis starts "with the assumption that the historic police powers of the States were not to be superseded by the Federal Act unless that was the clear and manifest purpose of Congress." *Rice v. Santa Fe Elevator Corp.,* 331 U.S. 218, 230 (1947). "[T]he purpose of Congress is the ultimate touchstone of preemption analysis." *Cipollone v. Liggett Group,* 505 U.S. 504, 516 (1992) (internal quotation marks omitted). Federal law can preempt state law in three ways. First, Congress may expressly preempt state law. Second, preemption may be inferred where Congress has occupied a given field with comprehensive regulation. Third, a state law is preempted to the extent that it actually conflicts with federal law. An "actual conflict" exists when "'compliance with both federal and state regulations is a physical impossibility[.]'" Automated Med. Labs., Inc., 471 U.S. at 713.
>
> A preemption claim involving state actions that conflict with the Federal Power Act ("FPA") are predicated on the Supremacy Clause. See *Duke Energy Trading & Mktg., L.L.C. v. Davis,* 267 F.3d 1042, 1055 (9th Cir. 2001). The FPA grants to FERC "'exclusive authority to regulate the transmission and sale at wholesale of electric energy in interstate commerce.'" *Transmission Agency of N. Cal. v. Sierra Pac. Power Co.,* 295 F.3d 918, 928 (9th Cir. 2002) ("TANC") (quoting *New England Power Co. v. New Hampshire,* 455 U.S. 331, 340 (1982)). Through the FPA, "'Congress meant to draw a bright line easily ascertained, between state and federal jurisdiction …. This was done in the Power Act by making [FERC] jurisdiction plenary and extending it to all wholesale sales in interstate commerce except those which Congress has made explicitly subject to regulation by the States.'" *Nantahala Power & Light Co. v. Thornburg,* 476 U.S. 953, 966 (1986)

(quoting *Fed. Power Comm'n v. S. Cal. Edison Co.,* 376 U.S. 205, 215-16 (1964)).

When enacting the Federal Power Act, Congress gave no indication that it intended to preempt state environmental programs such as greenhouse gas regulations. The regulation here is designed and intended to regulate greenhouse gas emissions in California and is not intended to regulate the rates, terms, or conditions of sales of electric energy in interstate commerce. Therefore, regulation was not expressly preempted.

“Field preemption occurs when the federal statutory scheme is sufficiently comprehensive to infer that Congress left no room for supplementary regulation by the states.” *Gadda v. Ashcroft,* 363 F.3d 861, 869 (9th Cir. 2004). “When the federal government completely occupies a given field or an identifiable portion of it . . ., the test of preemption is whether ‘the matter on which the State asserts the right to act is in any way regulated by the Federal Act.’” *Pac. Gas & Elec. Co. v. State Energy Res. Conservation & Dev. Comm’n,* 461 U.S. 190, 212-13 (1983) (quoting *Rice v. Santa Fe Elevator Corp.,* 331 U.S. 218, 236 (1947)).

One purpose of the federal statutory scheme concerns the reasonableness of interstate power rates and nondiscriminatory access to interstate power transmission. In contrast, California’s purpose for enacting AB 32 was to reduce emissions of greenhouse gases, and we are proposing to regulate the environmental impacts of electric generation and consumption. The FPA’s regulation of wholesale sales does not cover the environmental impacts associated with electricity generation and consumption. The commenter asserts that certain definitions in the regulation may impact the wholesale electricity market, but has not specified how such definitions could result in regulation by ARB of the wholesale electricity market. That some part of the regulation could indirectly affect the electricity market does not demonstrate that the provision will result in regulation of wholesale electricity sales, such as setting prices or establishing conditions for participation in the wholesale electricity market. Therefore, this regulation is a separate field related to the regulation of greenhouse gas emissions unrelated to the rates or access to power transmission.

If it is impossible to comply with both state law and federal law, then the state law is preempted. See *Gade v. Nat’l Solid Waste Management Ass’n,* 505 U.S. 88, 108 (1992). The commenter has not indicated that it would be impossible to comply with the regulation and federal law. Because the regulation here relates to greenhouse gas emissions and does not purport to regulate wholesale electric energy sales, we do not believe that a conflict exists.

Moreover, the FPA leaves room for state environmental regulation. Indeed, 16 U.S.C. section 824(a) states: "Federal regulation . . . [under the FPA extends] only to those matters which are not subject to regulation by the States." This

> broad savings clause supports the conclusion that because air pollution is subject to regulation by the States, and not by the FPA or FERC, state regulation of GHG emissions caused by the generation and consumption of electricity is not preempted by the FPA, but may be regulated by the States. While such GHG regulation may have some impact on the wholesale prices paid for electricity, it is no more preempted by the FPA than state regulations limiting the amount of other pollutants that may be emitted by electric power plants—that may affect the cost of generating electricity and therefore indirectly affect the price of wholesale electricity. For these reasons, we do not believe the FPA preempts this regulation.

CAISO on E-Tags

I-22. Comment: The California Independent System Operator Corporation (ISO) appreciates the opportunity to provide comments in response to the above-referenced notice issued by the California Air Resources Board (ARB) on September 12, 2011. As part of this notice, the ARB modified the definition of Electricity Importers in its proposed regulation. The ISO recommends that the ARB change this definition to clarify that the ISO is not an electricity importer when scheduling energy and/or capacity during an emergency in the ISO balancing authority area or in an adjacent balancing authority area. ARB's proposed regulation defines Electricity Importers to mean "marketers and retail providers that deliver imported electricity." The definition also provides in part:

> For electricity delivered between balancing authority areas, the electricity importer is identified on the NERC E-tag as the purchasing-selling entity (PSE) on the last segment of the tag's physical path with the point of receipt located outside the state of California and the point of delivery located inside the state of California.

The ISO is a nonprofit public benefit corporation chartered under the laws of the state of California for the purpose of operating and maintaining the reliability of the statewide electric transmission grid for the benefit of the citizens of California. The Federal Power Act requires that the ISO plan and operate the power grid in compliance with federal and regional mandatory reliability standards.

By way of example, the disturbance control performance standard BAL-002-0 requires the ISO as a balancing authority to deploy and utilize its operating reserves to stabilize the power grid and return interconnection frequency to defined limits within 15 minutes after the occurrence of a contingency. As part of complying with reliability standards, the ISO must have operating agreements with adjacent balancing authorities that shall, at a minimum, contain provisions for emergency assistance. The ISO must also request emergency assistance if it cannot comply with specific standards such as disturbance control performance standard BAL-002-0.

As ARB is aware, the ISO operates a wholesale electricity market. The ISO does not provide electricity to retail end users. The ISO does not own any electric generating resources inside or outside the state of California and does not operate a portfolio of contracts for the delivery of power from entities importing electricity into California. Despite these facts, the ISO may be required to request emergency assistance from other balancing authority areas, including balancing authority areas outside of the state of California. In addition, the ISO may be required to provide emergency assistance to an adjacent balancing authority area.

Emergency assistance may involve a schedule of energy and/or capacity between balancing authority areas. This schedule may result in the identification of the ISO as a purchasing selling entity on an E-tag. This convention may arise because during periods of emergency assistance there is not another scheduling coordinator to identify on the E-tag. The ISO tariff provides specific criteria to avoid the need for requesting emergency assistance from other balancing authority areas.

As a result, the need for the ISO to request emergency assistance is extremely rare. For example, in 2010, the ISO relied on emergency assistance once, which amounted to less than one ten-thousandth of a percent of all power delivered on the ISO grid that year.

The ISO recommends that the ARB add the following language to the definition of Electricity Importer to exempt the ISO from the definition when the ISO schedules energy and/or capacity during an emergency in the ISO balancing authority area or in an adjacent balancing authority area:

> The CAISO is not an "electricity importer" if it is identified as a purchasing-selling entity on the NERC E-tag as a result of requesting or providing emergency assistance during a declared emergency in order to comply with applicable reliability criteria, pursuant to either an agreement required by NERC standards regarding emergency assistance or section 42.1.5 of the CAISO tariff or a successor provision.

This exemption is appropriate for at least two reasons. First, ARB should not make the ISO a point of regulation for the extremely rare occurrence and minimal quantities of power it may request from or provide to neighboring balancing authority areas during an emergency. Second, when the ISO requires or must provide emergency assistance, it acts under tight time constraints with one purpose only—ensure the reliability of the electricity grid. Under these circumstances, the ISO should not pause to consider the type and location of a resource providing energy and/or capacity from a neighboring balancing authority or whether the ISO should or should not appear as a purchasing-selling entity on an E-tag. ARB's regulation governing mandatory reporting of greenhouse gas emissions does not apply to generating units designated as emergency generators in a permit issued by an air pollution control district or air quality management district. A similar exemption is appropriate here. (CAISO)

> **Response:** We did not make the modification requested by CAISO; however, CAISO is not a PSE or an electricity importer. ARB treats all first deliverers of

electricity impartially, does not distinguish between electricity delivered under normal operations versus emergency operations, and does not determine whether a PSE was entered in error on a NERC e-Tag. However, as noted by the CAISO, the definition of electricity importer specifies that for "electricity delivered between balancing authority areas, the electricity importer is identified on the NERC e-Tag as the purchasing-selling entity (PSE) on the last segment of the tag's physical path with the point of receipt located outside the state of California and the point of delivery located inside the state of California." Since CAISO is only registered as an Operating/Security Entity in the Electric Industry Registry maintained by NERC, and CAISO is not registered as a PSE, CAISO does not meet the definition of an electricity importer.

Resource Shuffling Support

I-23. (multiple comments)
Comment: SCE supports the modifications to the resource shuffling provisions. In section 95802(a)(251), ARB revised the definition of "Resource Shuffling," removing two hypothetical situations where delivery of electricity to the California grid could be considered resource shuffling. In addition, ARB has removed the unnecessary use of the term "fraud" in section 95852(b)(2). SCE agrees with the changes, and thanks ARB staff for responding to SCE's concerns. The scenarios were too broadly written and could too easily encompass situations where a covered entity was either (1) acting for valid economic dispatch reasons, or (2) engaging in activities that resembled resource shuffling with no intent to circumvent emissions regulations. (SCE4)

Comment: Pacificorp supports the changes to the resource shuffling provisions and plans to further revise and clarify their applicability. PacifiCorp supports staff's indication that there will be an opportunity to provide further input on those sections. PacifiCorp is pleased to see that the September 12th update to the Proposed Regulation addresses PacifiCorp and other parties' concerns about the Resource Shuffling provisions by removing reference to fraud and the confusing standards for "historically serving load in California" (see section 95802(a)(251)). (PACIFICOR4)

Comment: LS Power supports the changes to the resource shuffling provisions, provided that there will be further clarification before the program starts. LS Power expresses its support for the changes to the Resource Shuffling provisions and staff's recognition that further clarification is needed for those provisions. The Resource Shuffling provisions (Propose 17 Cal. Code Reg. section 95802(a)(251), and 95852(b)(2)) have been modified to remove two specific activities from Resource Shuffling. LS Power supports the general goal of discouraging importers from misrepresenting their GHG emissions. However, parties, including LS Power, expressed significant concerns in comments on the July 25, 2011 version of the Resource Shuffling provisions because it was unclear when an otherwise legitimate and commercially rational transaction could become illegitimate because it fell within the vague definition. The most recent changes on this topic are an improvement. (LSPOWER2)

Comment: Iberdrola Renewables applauds the CARB's action to remove the reference to "fraud" from the definition of "Resource Shuffling" in the revised version of the cap and trade regulation. (IBERDROLA2)

> **Response:** We appreciate commenters' support of the modifications, and recognition of the need to address resource shuffling.

I-24. Comment: The definition of resource shuffling should be clarified. The Proposed Changes remove troublesome sections that were included in the definition that was circulated in the First 15-Day Change Notice, but the text of the abbreviated definition is very vague. The definition should be revised to include sufficient detail to enable an entity to know in advance whether a particular energy transaction constitutes resource shuffling. This is particularly important, given that section 95852(b)(2) requires attestations that no resource shuffling has occurred. Additionally, while the concept of resource shuffling should apply only to electricity generated outside California, the definition does not contain this limitation. The general phrase "delivery of electricity to the California grid" could include electricity from in-state generating facilities. It is not appropriate to extend the concept of resource shuffling to in-state generation given that the emissions liability for in-state generation is imposed directly on the operator of the generating facility and cannot be "shuffled" in any way. The impact of the resource shuffling provisions on the wholesale electricity market should be fully evaluated. Given the harsh penalties that the ARB would impose for resource shuffling and the uncertainty about what actually constitutes resource shuffling, the resource shuffling provisions that are currently in the Proposed Changes could remove liquidity from the wholesale electricity market, reducing the potential for cost-effective trades as well as for trades that enhance system reliability while increasing electricity prices. That would be a negative and counterproductive consequence of having an overly broad and ambiguous resource shuffling rule.

The potential for the resource shuffling provisions to discourage emission reductions should be fully evaluated. Although subparagraph (B) of the definition of resource shuffling that was circulated in the First 15-Day Change Notice has been deleted in the Proposed Changes, it remains unclear under the revised definition whether an entity that permanently retires a power plant that has an emissions factor that is higher than the default emissions factor and replaces the output of the plant with unspecified system power would be considered to be engaging in resource shuffling. This would be an undesirable result as the consequence of retiring the high-emitting plant would be to reduce GHG emissions in total. The resource shuffling provisions should not require covered entities to continue operating high-emitting plants until the deadline imposed by the SB 1368 Emissions Performance Standard (EPS). Entities should be able to withdraw from such plants before the EPS deadline without fear of committing resource shuffling. A full review of resource shuffling should be undertaken in 2012. SCPPA understands that the Board intends to provide an opportunity for full review of the resource shuffling provisions in a new rulemaking in 2012. SCPPA strongly supports having that new rulemaking. The Resolution should provide for that new rulemaking. Suggested wording for such a provision is set out below:

> BE IT FURTHER RESOLVED THAT the Board directs the Executive Officer to initiate a public process for the review of the resource shuffling provisions in section 95802(a) and section 95852(b) no later than February 2012, for the purpose of ensuring the appropriate operation of those provisions, including clarifying that those provisions apply only to electricity generated outside California and in a jurisdiction where a GHG emissions trading system has not been approved for linkage by the Board.

SCPPA looks forward to providing further input on resource shuffling during the review process in 2012. (SCPPA8)

Comment: The Resource Shuffling provision does not provide clarity regarding financial divestiture of an emission source [section 95802(a)(251), page A-44; and section 95852(b)(2), page A-90] The definition of resource shuffling, as amended in the Second 15-Day Modified Text has been shortened to the following in section 95802 (page A-44): "Resource Shuffling means any plan, scheme, or artifice to receive credit based on emissions reductions that have not occurred, involving the delivery of electricity to the California grid." LADWP remains concerned that the resource shuffling provision, even as revised in the Second 15-Day Modified Text, does not provide clarity that early divestiture of LADWP's share of Navajo Generating Station would be treated as an emission reduction, and not as resource shuffling. It is LADWP's interpretation that such divestiture should be recognized as an emission reduction, especially since the very same action (i.e. financial divestiture) in 2019 would be recognized by the state of California as contributing to emission reductions toward the 2020 statewide goal. If this provision remains in the regulation, then LADWP strongly recommends that the ARB Board include a directive in its Board resolution that staff address LADWP's concerns regarding financial divestiture as soon as possible in the new regulatory proceeding so as to not impede our near-term negotiations to divest this asset prior to 2019 or long-term resource planning to replace this asset with cleaner generation resources. (LADWP5)

Comment: The resource shuffling provision and related attestation requirement are included in section 95851(b)(2) (page A-90) as they relate to the emission categories used to calculate compliance obligations for first deliverers of electricity. Separately, the Second 15-Day Modified Text includes new amendments to the definition of "Electricity Importers" (pg A-18) that removes the requirement that the importer hold title to imported electricity. First, LADWP is not a "scheduling coordinator" (a unique term used by CAISO), but it is a "scheduling agent" for Glendale Water and Power (GWP) and Burbank Water and Power (BWP) for electricity imported from Intermountain Power Project (Intermountain). Based on these new amendments, it appears that LADWP may be identified as the first deliverer, not just for its own electricity imports, but also electricity owned by GWP and BWP that LADWP schedules and imports into California on their behalf.

Second, LADWP is a retail provider for the load that it serves, but it is not a retail provider for load served by GWP or BWP. Currently, the MRR entity-level emissions report aligns correctly with each retail provider's respective electricity imports from Intermountain. However, if this amendment is adopted, then LADWP becomes the first deliverer for GWP and BWP electricity imports from Intermountain. LADWP will not only be required to report on its LADWP entity-specific emissions for electricity it owns, but it will also have to add in the emissions for electricity from Intermountain that is owned and used by GWP and BWP for their retail load. Conversely, BWP and GWP entity-level emission reports will not include emissions associated with their share of Intermountain electricity imports, which might lead to more confusion and less transparency for the public. The result is that the entity-level report will no longer accurately reflect the true emissions profile for electricity imported for each affected retail provider. For BWP's and GWP's share, LADWP will be subject to regulatory requirements such as surrendering allowances and enforcement action. This outcome provides an inaccurate reflection of LADWP's emissions, and should be avoided.

Third, the entity that is best positioned to make decisions regarding whether or not to import power into California from a specified source like Intermountain is the entity that holds title to the power. LADWP, as a scheduling agent, does not make the decision for BWP or GWP. Instead, BWP or GWP would identify in their schedule how much energy they intend to have imported into California. As such, when it comes to electricity imports that originate from a known, specified source like Intermountain, it is the owner of the power that has the most control and discretion over what is done with it, whether to lay it off outside California or import it into California, and not the entity scheduling the power.

LADWP is also concerned that it will be required to sign a resource shuffling attestation, as noted above, for these same non-LADWP emissions. As an illustration, if the electricity is "cargo" and the first deliverer is the "mail courier" this approach equates to making the mail courier responsible as if it is the owner of the contents of the cargo (i.e. the emissions profile of the electricity). In fact, the mail courier may not own the cargo and may be contracted to deliver the cargo, but does not make any decisions regarding the contents. The mail courier cannot buy or sell the cargo either, and can only deliver it from point A to point B as determined by the owner of the cargo. The only accurate information that the mail courier can reasonably attest to is how much cargo he delivered on his truck (MWhs), when it was delivered (date/time), and to what location inside California (point of interconnection). The mail courier cannot reasonably attest to the contents or destination of cargo that may be on another truck (i.e. resources that are shuffled elsewhere). (LADWP5)

Comment: When ARB revises the Resource Shuffling sections, ARB should recognize that a multi-jurisdictional utility's resource decisions made pursuant to a multi-state cost allocation methodology does not constitute resource shuffling. Currently, the definition provides that “Resource Shuffling” means any plan, scheme, or artifice to receive credit based on emissions reductions that have not occurred, involving the delivery of electricity to the California grid." The regulation also still requires regulated entities to attest to not engaging in Resource Shuffling (section 95852(b)(2)). As a MJRP, PacifiCorp allocates its resources to loads in different states consistent with regulatory directives.

In their current form, the Resource Shuffling provisions still lack clarity with respect to the treatment of a MJRP's resources and should not be adopted in their current form, unless the staff explicitly notes in the regulation or elsewhere that the Resource Shuffling provisions will be subject to further revision and clarification in 2012. When ARB revises the Resource Shuffling provisions, ARB should recognize that a multi-jurisdictional utility's resource decisions are made pursuant to a specific cost allocation methodology, and potentially other legitimate regulatory or commercial activities such as the provision of ancillary services, and will not constitute resource shuffling. PacifiCorp appreciates the opportunity to provide comments on the September 12th 15-day modifications of the Proposed Regulation. Overall, we would like to remind the Board that a multi-jurisdictional utility has unique reporting and compliance challenges, and that the Proposed Regulation should be subject to further stakeholder vetting to ensure that the Cap-and-Trade Program is properly considers interstate activities such as the sale and operation of the western-wide wholesale electricity markets. The final regulation as implemented in July 2012, when the first auction occurs, should strive to better recognize the extent of ARB's jurisdiction over out-of-state activities. Also, PacifiCorp reiterates its proposal to apply the Cap-and-Trade compliance obligation based on a calculated net import amount to identify the electricity importer and PacifiCorp looks forward to working with staff towards the successful adoption and implementation of the Cap-and-Trade Program. (PACIFICOR4)

Comment: The remaining language stating that "'Resource Shuffling' means any plan, scheme, or artifice to receive credit based on emissions reductions that have not occurred, involving the delivery of electricity to the California grid" still lacks clarity. LS Power therefore requests that the Board specifically address this as an area that will be subject to further revision before the start of the cap-and-trade program. In addition, staff should continue to consider LS Power's previous suggestion to include additional changes to the regulations that would allow for an upfront determination that a specified importer is not engaged in resource shuffling where CARB has issued a specified emissions factor for a particular facility that is applied to output sold into the CAISO or other California markets. (LSPOWER2)

Comment: Significant uncertainty remains with regard to what specific activities will constitute Resource Shuffling under the final regulation. Iberdrola Renewables requests the CARB to identify this issue for further rulemaking and commit to work with interested stakeholders to clarify conditions under which import transactions would be considered Resource Shuffling. (IBERDROLA2)

Comment: ARB revised the definition of "Resource Shuffling" in section 95802(a)(251), removing two hypothetical situations where delivery of electricity to the California grid could be considered resource shuffling. In addition, ARB has removed the unnecessary use of the term "fraud" in section 95852(b)(2). CCEEB appreciates the changes. The scenarios were too broadly written and could too easily encompass situations where a covered entity was either (1) acting for valid economic dispatch reasons, or (2) engaging in activities that resembled resource shuffling with no intent to circumvent emissions regulations. However, the regulation still lacks the necessary clarity to regulated entities regarding what electricity transactions would constitute resource shuffling and which transactions should be excluded. For example, the regulation does not include procedures that can be followed during emergency scenarios when a utility may be called upon to provide power for another load-serving entity. Because the resource shuffling provision has the potential to impact the wholesale electricity markets beyond California, CCEEB recommends that ARB address additional resource shuffling provisions as soon as possible as part of the new regulatory proceeding in 2012 and seek the input from other entities, including the Federal Energy Regulatory Commission (FERC), North American Electric Reliability Corporation (NERC), and Western Electricity Coordinating Council (WECC). (CCEEB4)

Response: SCPPA8 comments that the definition of resource shuffling should be "revised to include sufficient detail to enable an entity to know in advance whether a particular energy transaction constitutes resource shuffling." LS Power requests a provision be added to allow for an up-front determination regarding resource shuffling. We did not make the requested changes, because resource shuffling could take a multitude of varied forms. Our intent is to address all forms of the prohibited conduct, and we believe that unintentional conduct has been excluded from this definition by use of the terms "plan, scheme or artifice" in the definition.

We agree, in general, that it is unlikely that resource shuffling could occur involving in-state generating facilities. However, if an in-state generator failed to comply with the requirements of the MRR and sold power with high GHG emissions in an export, and then imported zero-emission power, that could be resource shuffling. In such a case, an entity could be in violation of the MRR and also could be part of a resource shuffling plan. Our prohibition against resource shuffling is applicable to all delivered electricity.

This regulation imposes a compliance obligation based on GHG emissions; we expect to see some changes in the electricity market. We expect that, all else being equal, first deliverers will prefer electricity from sources with lower emissions, within the context of seeking cost-effective electricity supply. We will monitor reported data pursuant to the MRR, and if there is evidence that indicates that resource shuffling is occurring, we will consider a new rulemaking to mitigate such consequences by working with stakeholders to make needed changes, and we will continue to consider electricity market operations.

ARB applauds any action by an entity to permanently retire a power plant with a high emissions factor. It is not our intent to capture typical or normal market activity, or implementation of plans by a utility to meet EPS requirements. Where the commenter has engaged in conduct to receive credit for emissions reductions that have occurred, such conduct would not be resource shuffling. In Resolution 11-32, the Board directed the Executive Officer to continue discussions with stakeholders to identify and propose, as necessary, during the initial implementation of the cap-and-trade program, potential amendments to the regulation, including the definition of “resource shuffling,” to: (a) provide appropriate incentives for accelerated divestiture of high-emitting resources by recognizing that these divestitures can further the goals of AB 32; and (b) ensure that changes in reported emissions from imported electricity that serves California do not result merely in a shift of emissions within the Western Electricity Coordinating Council region, but instead reduce overall emissions.

We agree with LADWP that it will be identified as the first deliverer for deliveries that it makes for GWP and BWP, and we do not contest LADWP’s assertion that it is not the retail provider that serves GWP and BWP customers. However, we note that the compliance obligation is applied to the first deliverer of electricity and not the retail provider. In LADWP’s words, this is electricity that “LADWP schedules and imports into California on their behalf.” LADWP is the electricity importer, which is the first deliverer with the compliance obligation. We do not define “scheduling coordinator” in the regulation. However, as a “scheduling agent” for GWP and BWP, we recommend that LADWP make arrangements with GWP and BWP so that those entities reimburse LADWP for the compliance obligation that LADWP incurs on electricity delivered for GWP and BWP.

ARB will continue to clarify the resource shuffling definition and prohibition in 2012. If we believe that a new rulemaking in 2012 is necessary to prevent unintended consequences, we will initiate a new rulemaking. SCPPA’s comments on a non-existent resolution do not apply to the second 15-day changes to the regulation, and require no response. However, we look forward to SCPPA's continued participation in discussions of resource shuffling, and we will work with the Board to develop the resolution as the Board sees fit, taking into consideration requests of SCPPA and other commenters.

PacifiCorp’s comment emphasizes the particularities of an MJRP. We do not agree that the resource shuffling provisions are unclear. The legitimate activities that PacifiCorp engages in pursuant to state law and multi-jurisdictional agreements are not resource shuffling. With respect to the proposal reiterated by PacifiCorp, we modified the regulation to change how we calculate the QE adjustment. This is our method of calculating the compliance obligation to recognize net imports for each hour in which an electricity deliverer is both exporting and importing power.

LS Power asks for additional changes to “allow for an upfront determination” regarding resource shuffling. We did not make the change. We note that we will continue to engage with LS Power and other stakeholders on this topic. If, after further consideration, we are convinced that additional changes are needed, we will initiate a new rulemaking.

I-25. (multiple comments)
Comment: The Revisions regarding resource shuffling set forth in sections 95802(a)(245) and 95852(b)(1) clearly move in the right direction. These changes acknowledge the concerns raised by NCPA and other stakeholders that legitimate market operations and transactions can be inappropriately caught up in the wide net that was cast by the definition proposed in the first proposed 15-day revisions. NPCA understands that CARB intends to continue to review this matter and attempt to define the prohibited transaction as part of a new Rulemaking that will address revisions to the Rulemaking. In doing so, NCPA urges staff to work closely with the electricity sector stakeholders. It is imperative to the success of the Cap-and-Trade Program and the efficient and cost-effective operation of the electricity grid throughout the Western Electricity Coordinating Council that this definition be carefully crafted. The final definition adopted by CARB has the potential to adversely impact electric utilities and should be carefully crafted to ensure that the result is not a prohibition on standard and existing electric transactions that maximize the efficient use of the State's electric transmission system and economic dispatch of electric generation resources. Rather, resource shuffling should be narrowly defined in order to avoid adverse and inadvertent impacts on typical electricity market activity, but broad enough to ensure that true malfeasance is prohibited. NCPA looks forward to continuing to work with CARB Staff on this crucial issue. NCPA also supports CARB's removal of the reference to fraud, and the Proposed Revisions to the attestation requirements that properly acknowledge that the affirmation is done by the individual in his or her official capacity as an employee of the compliance entity, rather than personally. (NCPA4)

Comment: More clarity is needed on resource-shuffling and requirements for specification of imports. In comments on the first 15 day package, WPTF and other stakeholders raised serious concerns that provisions in that package related to "resource-shuffling" could result in electricity importers being subject to financial penalties and potentially criminal consequences for events that are outside that entity's control. In response to these concerns, CARB staff has modified the definition of resource-shuffling to eliminate specific elements that were considered particularly problematic. We appreciate CARB's efforts to address stakeholder concerns, but unfortunately, the revised language is now so broadly defined that it provides no clarity or regulatory certainty regarding which transactions would be considered legitimate specified or non-specified imports and which would be considered resource-shuffling.

To remedy these shortcomings, WPTF strongly urges CARB to further develop the provisions related to resource-shuffling and specification of imported electricity through a formal stakeholder process next year. The goal of this process should be to develop a clearer definition of resource shuffling and requirements for specified imports that are consistent with goals of AB32 and normal electricity market practices. WPTF also recommends the development of guidance documents that could be used by importers and verifiers to determine whether imports can or must be claimed as specified. Such guidance documents should provide examples of normal and anticipated import scenarios. (WPTF3)

Comment: Sections 95802(a)(251) and 95852(b)(2) have been modified to remove the specific activities constituting Resource Shuffling, as well as the reference to fraud. The remaining portion of the definition states that resource shuffling is a "plan, scheme, or artifice to receive credit based on emissions reductions that have not occurred, involving the delivery of electricity to the California grid." While the current revisions are an improvement, the application of the Resource Shuffling provisions in their current form will still cause significant confusion among regulated entities. Without clarification, regulated entities will not know when otherwise legitimate market transactions would be perceived as avoiding an emissions obligation, and thus constitute resource shuffling. In light of the fact that the current language is unclear and still creates a level of uncertainty, IEP requests that CARB identify these provisions as an area that will be subject to further rulemaking activity before the start of the program. (IEPA3)

> **Response:** We developed the definition of "resource shuffling" to have a precise legal meaning. We believe that once understood completely, the current definition will not have unintended consequences. However, as discussed above, we will continue to work with stakeholders to consider their concerns, and to take actions, if necessary, to clarify our treatment of resource shuffling.
>
> For reasons discussed elsewhere, we do not agree with WPTF that the prohibition of resource shuffling could result in penalties to electricity importers for "events that are outside that entity's control."
>
> IEPA3 seeks additional clarification of resource shuffling, and requests that we identify these provisions as "an area that will be subject to further rulemaking activity before the start of the program." We acknowledge their request to continue to work with stakeholders, to further their understanding that our intent is not to capture typical electricity transactions, but to capture transactions that are attempting to report emissions from electricity imports that are not representative of transactions occurring in the WECC.
>
> In Resolution 11-32, the Board directed the Executive Officer to continue discussions with stakeholders to identify and propose, as necessary, during the initial implementation of the cap-and-trade program, potential amendments to the regulation, including the definition of "resource shuffling," to: (a) provide appropriate incentives for accelerated divestiture of high-emitting resources by recognizing that these divestitures can further the goals of AB 32; and (b) ensure that changes in reported emissions from imported electricity that serves California do not result merely in a shift of emissions within the Western Electricity Coordinating Council region, but instead reduce overall emissions.

Resource Shuffling Clarification

I-26. Comment: The resource shuffling provisions require additional clarification; further work is needed to refine the cap-and-trade rule's definition of "resource shuffling." Powerex appreciates that ARB has revised the definition of "resource shuffling" in response to the concerns raised by Powerex and other stakeholders in the comments on ARB's first set of proposed 15-Day Modifications to the two rules that provisions in the definition could have subjected electricity importers to civil and even criminal penalties for circumstances entirely outside of their control. However, the newly proposed definition is sufficiently vague that the regulated community does not have certainty as to what ARB would consider legitimate specified or non-specified imports of electricity and what would be considered illegal "resource shuffling." Accordingly, Powerex urges ARB to clarify the scope of the resource shuffling provisions of the Cap-and-Trade Rule in a formal stakeholder process next year. Powerex also requests that next year ARB develop guidance documents (with example scenarios) that importers and verifiers can use to determine whether imports can or must be claimed as specified under the Cap-and-Trade Rule. In anticipation of the additional work on the provision, Powerex recommends that ARB modify the definition of "resource shuffling." Modify section 95802(a)(251) as follows:

> (251) "Resource Shuffling" means any plan, scheme, or artifice to receive credit based on emissions reductions that have not occurred, involving the delivery of electricity to the California grid, in accordance with any additional guidance developed by the California Air Resources Board. (POWEREX2)

Comment: The relationship between section 95111(g)(4) of the MRR and the cap-and-trade rule's definition of resource shuffling remains unclear. In its August 11, 2011 comments, Powerex asked ARB to explain the relationship between resource shuffling, as that term is defined in the Cap-and-Trade Rule, and the "specified source" requirements of section 95111(g)(4) of the MRR. Section 95111(g)(4) appears to list characteristics whereby if at least one of them is applicable to an electricity delivery from a specified source, that delivery will not be considered to be resource shuffling. ARB did not respond to Powerex's request for clarification. If, indeed, the characteristics listed in section 95111(g)(4) of the MRR are intended to function as categories of "safe harbor" under the resource shuffling provisions, then Powerex urges ARB to make the following changes. First, in order to satisfy the United States' obligations under NAFTA, the special treatment afforded to the federally-owned power suppliers under Section 95111(g)(4)(B) must be extended to provincially-owned entities such as Powerex, which is wholly owned and controlled by BC Hydro, a foreign sovereign. As noted above in Section I above, NAFTA's National Treatment standard requires that Powerex and BPA be accorded parity treatment. Modify section 95111(g)(4)(B) as follows:

> (B) Deliveries from existing federally or provincially owned hydroelectricity facilities by exclusive marketers. Electricity from specified federally or

provincially owned hydroelectricity facility delivered by exclusive marketers. (POWEREX2)

Comment: Powerex urges ARB to eliminate section 95111(g)(4)(C) of the MRR because the phrase "deliveries from existing federally owned hydroelectricity facilities allowed under contract" appears to excuse from the definition of resource shuffling the precise type of activity that the Cap-and-Trade Rule seeks to discourage. The clause seems to presume that deliveries by the exclusive marketers of federally owned hydroelectricity facilities are limited to surplus electricity and, thus, would never constitute resource shuffling. But this is a false assumption. In fact, there is no way to ensure that entities with such contracts would limit their deliveries of this electricity to California to its surplus rather than maximizing the delivery of this federal power to California and back filling its load requirements with market power. Rather, as currently drafted, this provision would give these entities an incentive to engage in such activity to maximize the value of the emissions-free power from the federal facilities. Surely such activity would qualify as a "scheme or artifice to receive credit based on emission reductions that have not occurred"—*i.e.*, resource shuffling. Accordingly, Section 95111(g)(4)(C) should be deleted. (POWEREX2)

Response: Powerex states that the new definition of resource shuffling is too vague for the regulated community to have certainty about what would be considered resource shuffling. We did not accept Powerex's proposed modification of section 95802(a)(251). We believe that the definition, which uses words with specific legal meaning, is sufficient to enable first deliverers to discern what is considered to be resource shuffling and what is not.

We note that portions of Powerex's comment not responded to immediately above are pertinent to the MRR. No additional response is required here because the comment is outside of the scope of the second 15-day changes to the regulation. Because Powerex also submitted comments in the MRR rulemaking, these parts will be addressed in that venue.

Reserve Section for Resource Shuffling

I-27. Comment: The changes to the resource shuffling provisions in the second 15-day Modifications are a step in the right direction, but the definition of resource shuffling remains vague—too vague to be useful and too vague for the required resource shuffling attestations. ARB should use a placeholder for the definition until it undertakes further study of the issue.

SDG&E and SoCalGas share ARB's concern for the integrity of the cap-and-trade program and the desire to prohibit resource shuffling. The changes to the resource shuffling provisions in the second 15-day Modifications move in a positive direction, but the definition is too vague for market participants to know whether they have engaged in such action. For ARB to effectively deal with Resource Shuffling, the definition of resource shuffling needs to be more precise. ARB has indicated that it will refine the definition of resource shuffling next year and that should be part of the Board Resolution adopting the regulation.

Given the proposed attestation about resource shuffling, however, the definition should be reserved until it is fully fleshed out. No entity could sign an attestation based on the current vague definition of resource shuffling, where ARB is the sole determinant of what the definition means. The Cap-and-Trade Regulation should leave a placeholder for the precise definition of Resource Shuffling or should eliminate the attestation. Modify section 95802(a)(251) as follows:

> (251) “Resource Shuffling” ~~means any plan, scheme, or artifice to receive credit based on emissions reductions that have not occurred, involving the delivery of electricity to the California grid.~~ (SEMPRA4)
>
> **Response:** Sempra also contends that the definition of resource shuffling remains “too vague to be useful and too vague…for the required attestations.” We disagree, for reasons stated in response to Comments I-25 through I-27. We did not make the proposed modification. We have defined resource shuffling precisely, with specific words that require a plan, scheme or artifice on the part of a party for its action to fall under the definition. In Resolution 11-32, the Board directed the Executive Officer to continue discussions with stakeholders to identify and propose, as necessary, during the initial implementation of the cap-and-trade program, potential amendments to the regulation, including the definition of “resource shuffling,” to: (a) provide appropriate incentives for accelerated divestiture of high-emitting resources by recognizing that these divestitures can further the goals of AB 32; and (b) ensure that changes in reported emissions from imported electricity that serves California do not result merely in a shift of emissions within the Western Electricity Coordinating Council region, but instead reduce overall emissions.

Scheduling Coordinators

I-28. (Multiple comments)
Comment: The resource shuffling provision is included in section 95851(b)(2) [sic] (page A-90) as they relate to the emission categories used to calculate compliance obligations for first deliverers of electricity. Separately, the Second 15-Day Modified Text includes new amendments to the definition of "Electricity Importers" (pg A-18) that removes the requirement that the importer hold title to imported electricity. First, LADWP is not a "scheduling coordinator" and Burbank Water and Power (BWP) for electricity imported from Intermountain Power Project (Intermountain). Based on these new amendments, it appears that LADWP may be identified as the first deliverer, not just for its own electricity imports, but also electricity owned by GWP and BWP that LADWP schedules and imports into California on their behalf. Second, LADWP is a retail provider for the load that it serves, but it is not a retail provider for load served by GWP or BWP. Currently, the MRR entity-level emissions report aligns correctly with each retail provider's respective electricity imports from Intermountain. However, if this

amendment is adopted, then LADWP becomes the first deliverer for GWP and BWP electricity imports from Intermountain.

LADWP will not only be required to report on its LADWP entity-specific emissions for electricity it owns, but it will also have to add in the emissions for electricity from Intermountain that is owned and used by GWP and BWP for their retail load. Conversely, BWP and GWP entity-level emission reports will not include emissions associated with their share of Intermountain electricity imports, which might lead to more confusion and less transparency for the public. The result is that the entity-level report will no longer accurately reflect the true emissions profile for electricity imported for each affected retail provider. For BWP's and GWP's share, LADWP will be subject to regulatory requirements such as surrendering allowances and enforcement action. This outcome provides an inaccurate reflection of LADWP's emissions, and should be avoided. Third, the entity that is best positioned to make decisions regarding whether or not to import power into California from a specified source like Intermountain is the entity that holds title to the power. LADWP, as a scheduling agent, does not make the decision for BWP or GWP. Instead, BWP or GWP would identify in their schedule how much energy they intend to have imported into California. As such, when it comes to electricity imports that originate from a known, specified source like Intermountain, it is the owner of the power that has the most control and discretion over what is done with it, whether to lay it off outside California or import it into California, and not the entity scheduling the power.

The resource shuffling attestation (section 95851(b)(2)) is problematic for a first deliverer that does not hold title to imported electricity. LADWP is concerned that it will be required to sign a resource shuffling attestation for non-LADWP emissions. As an illustration, if the electricity is "cargo" and the first deliverer is the "mail courier" this approach equates to making the mail courier responsible as if it is the owner of the contents of the cargo (i.e. the emissions profile of the electricity). In fact, the mail courier may not own the cargo and may be contracted to deliver the cargo, but does not make any decisions regarding the contents. The mail courier cannot buy or sell the cargo either, and can only deliver it from point A to point B as determined by the owner of the cargo. The only accurate information that the mail courier can reasonably attest to is how much cargo he delivered on his truck (MWhs), when it was delivered (date/time), and to what location inside California (point of interconnection). The mail courier cannot reasonably attest to the contents or destination of cargo that may be on another truck (i.e. resources that are shuffled elsewhere).

LADWP strongly recommends that ARB retain the current emissions reporting requirements for entity reports under MRR that are based on electricity that is owned or under a power purchase agreement. Such an approach more correctly aligns the emissions reporting, compliance obligation, and attestation requirement to the party that has the most discretion and control over the electricity. (LADWP5)

Comment: LADWP is concerned that for some specified sources of imported electricity, the amendments that are being proposed in sections 95802(a)(264), 95852(b)(1)(C), and 95852(b)(3), may result in these imports being incorrectly assigned default emissions under circumstances where the first deliverer that is scheduling the power into California on behalf of another party assumes responsibility as the first deliverer, and therefore must also include such imports as part of their MRR report. However, the entity scheduling the power under this scenario cannot demonstrate ownership in the facility or a written power contract for that electricity. This could have the potential unintended consequence of assigning default emissions to non-emitting specified imports that are currently reported based on ownership or contract rights. For example, a transmission outage occurs and the owner of electricity from a nuclear or hydroelectric generating facility must make arrangements to have that power imported through another transmission path by another entity that has transmission rights, but does not hold title to the power. Under this scenario, the regulation would assign default emissions to that zero-emission electricity for no other reason than the entity scheduling the power does not own the power. This outcome is unreasonable and does not accommodate commonly occurring situations related to specified imports. To add more complexity to this, the entity that schedules this zero-emitting power into California that is now assigned default emissions must also surrender allowances on behalf of the party that holds title to the power. This outcome is unreasonable and should be avoided. A separate issue of transparency also arises when the first deliverer of renewable energy is not also the entity owning the power. Rather than correctly reporting the zero emission attribute in the MRR report of the entity that owns the electricity, the regulation requires that the first deliverer report the zero-emission renewable energy on their MRR report. This inappropriately distorts the emissions profile of the affected parties. (LADWP5)

Response: We disagree with LADWP's assertion that it is not a scheduling coordinator. We recognize LADWP as a scheduling coordinator, i.e., an entity that schedules power for delivery, for itself, and for BWP and GWP. We do not define "scheduling coordinator." LADWP correctly identifies itself as the first deliverer of power owned by GWP and BWP.

LADWP has reporting requirements pursuant to the MRR for electricity that it imports as a first deliverer, and it also must report other data as a retail provider, pursuant to the MRR. See response to Comments I-2, I-3, and I-4 for the role of LADWP as an agent for BWP and GWP. LADWPs comments about the "true emission profile" have no relevance to this regulation. LADWP has a compliance obligation for electricity for which it is the first deliverer, regardless of LADWP's "true emission profile."

Please see the first response in this (resource shuffling) section for our reasoning about a first deliverer's attestation. We believe that LADWP and all stakeholders should be able to determine if they have intentionally engaged in resource shuffling.

Renewable Portfolio Standard and RECs

Consistency with RPS

I-29. (multiple comments)
Comment: CEERT appreciates CARB's efforts to refine the treatment of imported electricity, and supports the revisions to the regulation. However, given the ongoing uncertainty around the requirements for imported electricity under the California Renewable Portfolio Standard, it is not yet possible to fully evaluate the fairness or soundness of the changes to section 95852(b). CEERT views the RPS and cap-and-trade programs to be loosely linked by the allowed use of RECs as a compliance tool in both programs. We strongly suggest that the ARB work in close coordination with the California Public Utilities as they develop a decision on the portfolio content categories and the California Energy Commission as they develop the RPS eligibility guidebook and regulations for the municipal utilities on the treatment of Renewable Energy Credits and imported electricity. Specifically, CEERT recommends that the ARB include a statement of intent to reevaluate and modify this section as appropriate, pending decisions by the CEC or CPUC, to ensure that policies of the three energy agencies are aligned and that the goals of the programs remain intact. (CEERT2)

Comment: Provisions related to renewable imports must be modified for consistency with the RPS. The MRR provides two scenarios under which an importer may claim a clean emission rate for imported power: (i) direct delivery from a renewable generator and (ii) through the RPS adjustment for renewable procurement that is firmed and shaped. In both cases, the regulation requires that the Renewable Energy Credits (RECs) associated with the renewable energy generation be retired/used for compliance with the RPS. This requirement would mean that an entity that wishes to claim either direct delivery or the RPS adjustment for renewable procurement would have to retire the associated REC in the same calendar year in which the REC was generated. Further, because the language pertaining to the RPS adjustment states the REC "must be used to comply", it suggests that the RECs that are retired and banked by a California retail provider for later compliance use cannot be used for an RPS adjustment. Both results are inconsistent with the RPS compliance flexibility provided under California's RPS law.

For directly delivered renewable energy, the regulation requires that "If RECs were created for the electricity generated and reported pursuant to MRR, then the RECS must be retired and verified pursuant to MRR." For the RPS adjustment, the regulation requires that "The RECs associated with the electricity claimed for the RPS adjustment must be used to comply with the California RPS requirements during the same year in which the RPS adjustment is claimed."

SB X1-2 allows RECs to be traded for three years after generation. After three years the RECs must be retired. Further, importers under the cap and trade program may be generators, marketers or load-serving entity. Generators and marketers of imported renewable energy may not be able to avail themselves of the cleaner emission rate because they are not the end-user of the RECs and cannot compel retirement.

While many of the details of implementation of SB X1-2 remain to be determined through CPUC and CEC proceedings, it would be inappropriate for CARB to prejudge the outcome or to adopt regulations in the cap and trade program that conflict with the RPS program, and therefore the modified regulation should clearly specify that the CARB regulations are not intended to conflict with the RPS compliance requirements or to reduce the compliance flexibility afforded in the RPS statute.

Per conversations with CARB staff, we understand that the requirement for REC retirement was added to the regulation to address two objectives: that renewable imports not be claimed for both an allowance retirement under the cap and trade program's Voluntary Renewable Energy set-aside and that there is a clear nexus between any claims to renewable energy imports under the cap and trade program and the RPS program. WPTF does not object to these goals, but believes they could be accomplished in a way that does not conflict with RPS Law nor restrict flexibility under the RPS program. Specifically, we recommend that the regulation be modified to make claims to imported renewable energy or the RPS adjustment contingent upon procurement of RECs, rather than reporting the REC"s for compliance. CARB can avoid potential double-counting with the VRE program simply be prohibiting the same energy from being claimed for both the RPS adjustment and the VRE program. This would be easily verified by requiring reporting of REC serial numbers under both the VRE and the RPS adjustment. Modify section 95852(b)(3) and (4) as follows:

(3) The following criteria must be met for electricity deliveries to calculate their compliance obligations based on an ARB facility specific emission factor specified pursuant to MRR section 95111 less than the default emission factor for unspecified electricity specified pursuant to MRR section 95111:
(A) Electricity deliveries must be reported to ARB and emissions must be calculate pursuant to MRR section 95111;
(B) The electricity importer must be the facility operator or have ownership or a written power contract, as defined in MRR section 95102(a) to the amount of electricity claimed and generated by the facility or unit claimed;
(C) The electricity must be directly delivered, as defined in MRR section 95102(a), to the California grid, and
(D) ~~If RECs were created for the electricity generated and reported pursuant to MRR, then the RECs must be retired and verified pursuant to MRR.~~ <u>If the electricity claimed is from an eligible renewable energy resource, the electricity importer must have ownership or contract rights to procure RECs associated with the claimed electricity or a contract to import the electricity on behalf of a California entity that has ownership or contract rights to procure RECS associated with the claimed energy.</u>

(4) RPS Adjustment. Electricity imported ~~or procured~~ by an electricity importer from an eligible renewable energy resource reported pursuant to MRR must meet the following conditions to be included in the calculation of the RPS adjustment:

(A)The electricity importer must have either:
(1) Ownership or contract rights to procure RECs associated with the electricity generated by the eligible renewable resource or
(2) Have a contract to import electricity on behalf of a California entity that has ownership or contract rights to procure RECs associated with the electricity generated by the eligible renewable energy resource, ~~as verified under MRR.~~
~~(B) The RECs associated with t~~The electricity claimed for the RPS adjustment must be imported ~~used to comply with California RPS requirements~~ during the same calendar year in which the RECs procured from the eligible renewable energy resource are generated; ~~RPS adjustment is claimed.~~
(C) The quantity of emissions included in the RPS adjustment is calculated as the product of the default emission factor for unspecified sources, pursuant to MRR, and the reported electricity generated (MWh) that meets the requirements of this section, 95852(b)(4).
(D) No RPS adjustment may be claimed for an eligible renewable energy resource when its electricity is directly delivered or claimed as Voluntary Renewable Energy.
(E) No RPS adjustment may be claimed for electricity generated by an eligible renewable energy resource in a jurisdiction where a GHG emissions trading system has been approved for linkage by the Board pursuant to subarticle 12. (WPTF3)

Comment: The Cap-and-Trade Regulation and MRR should be closely aligned with the 33 percent RPS, including consistent definitions. Rather than come up with different definitions, it would be more efficient for the regulated entities and the regulating authorities to provide consistent definitions for the same concepts. For example, the California Renewable Energy Resources Act will reward utilities that comply early by allowing them to apply excess procured electricity products to satisfy subsequent compliance periods under the law. However, under the proposed concepts of "resource shuffling" and "electricity imports" LADWP may be penalized for not actually delivering electricity that it took credit for in an earlier compliance period for SB2 (1X). Therefore, it is unclear whether LADWP will be rewarded for early compliance with the California Renewable Energy Resources Act, yet run afoul of Cap-and-Trade regulations. Another example is the definition of "eligible renewable energy resource" which "has the same meaning as defined in Section 399.12 of the Public Utilities Code." Because the RPS program is currently undergoing modifications, it is unclear if this cross reference includes the entire legislative section as it does not expressly indicate that other portions of section 399.12 are excluded. LADWP recommends that the cross reference be made to the California Energy Commission's RPS Eligibility Guidebook, rather than Section 399.12. Without clarification on this definition, inclusion of the entire Section 399.12 would include the definition of "retail seller" which is different from "retail provider" in that it expressly does not include publicly owned utilities. Additionally, section 399.12 does not include eligible renewable energy from incremental improvements at hydroelectric facilities as allowed under existing law (Public Utilities Code, section 399.12.5). The CEC Guidebook is the standard for RPS eligibility. These definitions should be more closely aligned to avoid confusion and potential conflicts in legal interpretation, especially given the unique role that ARB will have to establish penalties for enforcement of the 33 percent RPS for publicly owned utilities. (LADWP5)

Comment: Noble Solutions believes that ARB staff has been attentive to entities that are engaged in the importing of electricity into California, and has drafted modifications to the proposed regulations that address many of the concerns raised by these stakeholders. However, there remains an ambiguity in the proposed regulation at section 95852(b)(4)(B), which is proposed as follows:

> The RECs associated with the electricity claimed for the RPS adjustment must be used to comply with California RPS requirements during the same year in which the RPS adjustment is claimed.

This sentence appears to contemplate a direct linkage between compliance with the RPS statute and compliance with the GHG the program. While there is no question that these two laws are complementary—perhaps it is better to say that RPS compliance is one of the tools that can be used to achieve GHG objectives—they are still different programs administered by different agencies. Conflating the two does not serve the purposes of either.

To illustrate the point plainly, consider the following transaction. A reporting entity executes a firming and shaping contract calling for the import of 1000 MWh of energy and 1000 qualified RECs during Year 1. For GHG reporting and compliance purposes, the "RPS adjustment" would be claimed in the first year. However, RPS rules permit banking of RECs under certain conditions. It might be desirable for the reporting entity to hold these RECs for RPS compliance purposes until the second year. But as section 95852(b)(4)(B) is currently written, this apparently would not be permitted, since the RECs "used to comply with California RPS requirements" would not be used in the same year as the RPS adjustment was claimed.

Noble Solutions does not understand what GHG compliance purpose such a restriction can have. As long as the RPS adjustment is linked to a qualified import transaction in the same reporting year, it is completely irrelevant when—or even if—the RECs associated with that RPS adjustment are claimed for California RPS compliance purposes. It is simply not within the purview of ARB to specify how an entity complies with California RPS requirements. Clearly, there is a serious jurisdictional question presented, since section 95852(b)(4)(B), as drafted, usurps the prerogative of the California Public Utilities Commission to design the implementation rules—including the banking of RECs—under the RPS statute. Modify section 95852(b)(4)(B) as follows:

> ~~The RECs associated with t~~The electricity claimed for the RPS adjustment must be imported ~~used to comply with California RPS requirements~~ during the same calendar year in which the RECs procured from the eligible renewable resource are generated. ~~RPS adjustment is claimed.~~ (NAES2)

Comment: MSCG applauds the elimination of the requirement that "Replacement Electricity" (Substitute Power or Substitute Electricity in the latest draft) must originate from the same balancing authority. Related to the same issue, one additional flaw has come to our attention, regarding the calculation of the "RPS Adjustment" used for determination of emissions responsibility for imported electricity. Section 95852(b)(4) requires that RECs associated with the electricity claimed for the RPS adjustment must be used to comply with California RPS requirements during the same year in which the RPS adjustment is claimed.

This creates two problems. First, RECs are "bankable." So, it is likely that some RECs may not be used for compliance in the year that they are generated. If ARB requires use for compliance in the same year, there is a misalignment with state policy regarding use of RECs for Renewable Portfolio Standard purposes. Second, as a purely practical matter, the entity importing the power will, in many cases, not be the entity submitting the REC for compliance. Put another way, the importer in a typical "firming and shaping" deal will have no idea whether or not its customer submitted an associated REC for compliance in any given year.

The solution seems straightforward. Simply require that the associated REC be created (as verified by WREGIS) and imported into California (as verified by NERC E-tags) in the same Calendar year, as opposed to submitted for compliance. This should accomplish the underlying purpose of an annual "match-up" of associated renewable generation and substitute power occurs. This approach will meet the state requirement for eligibility for "firming and shaping" deals. (MSCG4)

Comment: Additionally, 3Degrees wishes to note the distinction between REC ownership and REC retirement. Currently, section 95852(b)(3)(D) requires the outright retirement of RECs pursuant to guidance in the MRR, a stipulation that decreases the liquidity of the renewable energy markets in California. While the retirement of the RECs associated with specified electricity imports is necessary to prevent double counting, ARB should maintain flexibility to allow trading of the REC within California boundaries. 3Degrees welcomes discussion with ARB staff on this issue. (3DEGREES3)

Comment: LS Power asks CARB take care to avoid limiting the flexibility provided for in the new RPS law which allows firming and shaping of renewable energy throughout the multi-year compliance periods. ARB should avoid imposing regulations that conflict with the RPS Program. LS Power is concerned that CARB's proposed rules regarding the treatment of power used to firm and shape RPS deliveries, particularly power used to deliver renewable energy credits (REC) into California at a time later than the production from the renewable resource, will conflict with provisions found in the new 33 percent RPS law. Specifically, new Public Utilities Code section 399.16(a)(6) provides a 36 month "shelf life" for RECs. Provisions in the CARB regulations would hinder the flexibility provided by the Legislature by imposing a current year delivery requirement to avoid a compliance obligation for power imported to deliver the REC (the RPS Adjustment mechanism).

This should be avoided. The implementation details for the RPS program are still under development at the CPUC and the CEC. It is critical for the developers, marketers and purchasers of RPS products, particularly those contemplating firmed and shaped transactions, to not lose the additional flexibility for delivery and multi-year compliance periods provided in the new 33 percent RPS law.

In conclusion, LS Power requests that in a board resolution, CARB identify the electricity importer definition as a specific topic that will be addressed in a subsequent rulemaking before the cap-and-trade program takes effect. LS Power also requests that the Board note the lack of clarity in the Resource Shuffling provisions and direct Staff to revise those provisions with further stakeholder input. LS Power requests that the Board amend the default emissions factor to be more consistent with the emissions factors adopted by other regulatory agencies and a better representation of generation within the WECC. Finally, provisions impacting the use of RECs under the RPS program must be revised to avoid truncating the flexibility provided for in the new RPS law. LS Power appreciates the opportunity to provide these comments, and looks forward to continuing its efforts with staff on these matters. (LSPOWER2)

Comment: The Utilities support the removal of the “Replacement Electricity” requirement. Although the Utilities are generally supportive of the new concept, “RPS Adjustment”, we have concern that it is difficult to follow and suggest removal of the RPS Adjustment altogether. Instead, the Utilities suggest that CARB consider simply applying an emission factor of zero for all imports related to RPS eligible generation. (MID4)

Comment: Iberdrola Renewables is very concerned with the CARB’s revised regulation’s requirements for qualification of the Renewable Portfolio Standard Adjustment (RPS Adjustment). The revised regulation requires an Electricity Importer to demonstrate that a Renewable Energy Credit (REC) was used for RPS compliance in the same year that the RPS Adjustment is claimed. This requirement appears to conflict with the current RPS rules which require an entity to demonstrate sufficient RECs to support firming and shaping transactions for a calendar year but do not require the REC to be retired in that same year. Similarly the RPS legislation passed in 2011, and the ongoing rulemaking implementing it, focuses entities on making retirements for multi-year compliance periods. The retirement targets a total number of RECs for the compliance period—not retirement quantity for a specific year. A cap and trade regulation requirement that reduces an importers flexibility to comply with the RPS is unacceptable and CARB must structure its regulation to be consistent with the broader California RPS program. Iberdrola Renewables requests the Board explicitly direct the CARB to enter into subsequent rulemaking to ensure the final regulation is aligned with the California RPS program and not in conflict. (IBERDROLA2)

Comment: CARB should utilize the Proposed Revision as the basis for reviewing the emissions obligations associated with renewable energy contracts, rather than the more onerous “replacement electricity” provisions found in the July 27 Modified Text that would have placed restrictions on the calculation of the compliance obligation based balancing authority boundaries that had no relationship to the actual production or delivery of the renewable resource. NCPA cautions, however, that the language should not place restrictions on ownership types, in order to ensure that none of the various interests in these renewable resources are precluded from utilizing the RPS adjustment. Likewise, this is the case with regard to the “contracts” to import electricity for the compliance entity set forth in section 95852(b)(4)(A)(2), the arrangements for delivery of the electricity may take different forms, and there should not be strict adherence to the term “contract,” as long as a legitimate arrangement exists between the parties. (NCPA)

Comment: NextEra appreciates the efforts of the California Air Resources Board (ARB) staff to date in the development of the regulations implementing the California Global Warming Solutions Act of 2006 (AB 32). As this is the final opportunity for stakeholders to submit formal written comments to ARB staff on this rule, NextEra would like to emphasize that overall the rule is an effective step toward establishing the framework to enable California to meet its GHG emissions reduction goals. In response to the proposed language changes released on September 12, 2011, NextEra supports the comments submitted by two of our trade groups; the Independent Energy Producers of California (IEP) and the Western Power Trading Forum (WPTF).

Highlighted below are several issues we feel must be addressed by ARB staff. Please refer to the comments submitted by IEP and WPTF on these issues. Specifically, the criteria for utilizing the “RPS Adjustment” for imported renewable energy are not consistent with the California Public Utility Commission (CPUC) RPS program. (NEXTERAENERGY3)

> **Response:** The first 15-day changes to the regulation contained provisions in section 95852 that allowed the replacement electricity needed for eligible variable renewable electricity to not result in a compliance obligation. Stakeholders claimed that we should recognize all procurements that meet RPS requirements as not having a compliance obligation under the cap-and-trade program. In the second 15-day changes to the regulation, we removed the requirements for replacement electricity, which applied only to variable renewable resources, to come from the same balancing authority. We replaced the provision with the RPS adjustment calculation pursuant to 95852(b)(4). The RPS adjustment results in an adjustment to a compliance obligation for a first deliverer’s covered emissions.
>
> Before making this recent change, we reviewed RPS compliance options with respect to the direction provided in AB 32 and chaptered in Health and Safety Code (HSC) section 38562(d). HSC section 38562(d)(1) requires us to ensure that the greenhouse gas emission reductions achieved are real, permanent, quantifiable, verifiable, and enforceable by the State board. ARB considered whether “avoided emissions” attributed to procurement of renewable energy (with bundled RECs) or attributed to tradable RECs (purchased without the underlying electricity) are quantifiable and enforceable. In addition, HSC section 38562(d)(2) requires that any reduction of greenhouse gas emissions used for compliance purposes, such as compliance offsets, must also be in addition to

any greenhouse gas emission reduction otherwise required by law or regulation, and any other greenhouse gas emission reduction that otherwise would occur.

We considered the RPS delivery arrangements, including tradable RECs paired with imported electricity, various firming and shaping arrangements that include procurement of the renewable electricity (and bundled RECs), and direct delivery as defined pursuant to MRR section 95102(a). We also considered relaxing the focus on direct delivery, to allow any electricity from the same balancing authority area or jurisdiction to be recognized as being from a specified source located in that balancing authority area. As suggested by stakeholders, we considered whether siting and transmission constraints should be factored into justification for an avoided emissions approach or a relaxed delivery definition for various facility types. Facility types included variable renewable resources (wind, solar, and run-of-river hydroelectricity) that generate electricity on an intermittent basis, all eligible renewable resources recognized by California's RPS program, all facilities that generate electricity from renewable energy, all resources recognized as zero GHG-emitting, or resources with emissions exempt from a compliance obligation.

Finally, we considered how various alternatives may be implemented to assure impartiality across all electricity importers, whether they are strictly marketers or are retail providers that also purchase and sell wholesale power.

ARB concluded that the RPS was not designed to adequately quantify avoided GHG emissions incorporated in RECs, or reduced emissions as required by AB 32. Factors that can complicate quantification of GHG reductions associated with renewable energy include whether a particular facility is located in a region that has an oversupply of electricity. Oversupply can dampen price signals relative to California that would otherwise produce GHG reductions through efficiency and conservation. Another factor is the uncertainty regarding the emissions profile of the actual electricity-generating facilities that stop operating, operate less often, or will not be built as a result of a particular renewable energy resource. These may be hydroelectricity resources with no covered emissions or newer natural gas plants with different efficiencies than those of older facilities. Finally, emissions leakage, which may occur when less-efficient out-of-state natural gas facilities provide firming and shaping to replace the out-of-state renewable energy that cannot be directly delivered, may cause less demand for electricity from more efficient in-state natural gas facilities.

We also considered the intent of the recently enacted legislation, SBX1 2, which requires 33 percent of total retail sales of electricity from utilities in California per year by December 31, 2020. SBX1 2 is on a path toward implementation through proceedings taking place at the California Public Utilities Commission and the California Energy Commission. The intent of the bill is to increase the amount of electricity generated from eligible renewable energy resources per year, so that amount equals at least 33 percent of total retail sales of electricity in

California by 2020. The RPS is designed to advance this important State policy, and we recognize that significant GHG emission reductions will occur as a result. For electricity that is procured from out-of-state facilities to meet the RPS compliance obligation of retail providers, but is not directly delivered into California, we decided that an RPS adjustment factor could be incorporated to reduce the compliance obligation. This approach maintains the rigor and consistency necessary for GHG emissions reporting and addresses stakeholders' concerns about additional cost of the RPS program.

We were concerned that the right to claim avoided emissions from out-of-state renewable energy resources is not as settled as commenters describe and would be unenforceable by us under a regional cap-and-trade program. A REC is not a compliance instrument ,and it does not contain a right to claim avoided emissions to comply with any GHG regulatory program. This is explained in the WREGIS Operating rules. RPS compliance mechanisms cannot guarantee that null power (electricity generated by a renewable energy resource and sold without the RECs) generated outside California would be assigned a GHG emission factor.

We also considered whether tradable RECs may be a workable mechanism to assign and track avoided emissions, but determined that they would act similar to an offset, but would only be available to the electricity sector. Tradable RECs do not meet the rigorous requirements for compliance offsets, intended to be available to all sectors, particularly additionality. The GHG emission reductions outside California that occur as a result of RPS compliance are not additional, since the purchase is required by California's RPS program. Many commenters take the position that all RPS-eligible procurement should also be eligible for an adjustment in their compliance obligation. We do not agree with this entire approach. We believe the appropriate way to think about renewable electricity is that most times it represents emissions avoided, rather than emissions reduced. Once a cap is in place, renewable electricity no longer reduces greenhouse gas emissions; it simply helps to meet the cap. Some commenters, such as SEMPRA, provide additional rationale for allowing for the use of tradable or RECs, unbundled from the underlying electricity, to the extent that tradable RECs qualify under the RPS. However, the cap-and-trade compliance obligation is based on source-based GHG emissions reporting and verification for emissions from electricity from specified and unspecified sources. The accounting simply cannot accommodate the tracking and calculation of avoided emissions. It is not necessary for this regulation, which regulates metric tons of GHG emissions, to be completely coordinated with the RPS, which is a program that tracks megawatt-hours of electricity generated represented by RECs.

When electricity is generated by a renewable resource and is directly delivered to California, then it is treated just like any other specified resource. These requirements are contained in section 95852(b)(3). The first deliverer must have a written power contract for electricity generated by the facility, and the electricity importer must report the delivery as a specified import. 3DEGREES requested clarity in regard to the reporting of RECs associated with specified electricity. In response, we require that, if RECs were created for the electricity generated and reported pursuant to the MRR, then the RECs must be retired and verified pursuant to the MRR. Electricity importers must be able to provide documentation for verification within 45 days following the June 1 reporting deadline that the RECs have been retired. If the electricity importer's verifier cannot confirm that the RECs are retired, the reporting entity will be in non-conformance, but the claim to the zero GHG emission factor (0 MT of CO_2e/MWh) remains valid. While we recognize the emissions profile of the imported electricity, REC retirement is needed to ensure that other GHG accounting programs that may assign emission attributes do not double-count any avoided emissions.

For eligible renewable electricity which cannot be directly delivered, we provide an adjustment for the procured electricity as long as it meets the requirements to take the RPS adjustment in section 95852(b)(4). There are various situations in which renewable electricity is not able to be directly delivered to California. Some commenters such as Noble Energy view this electricity as "firmed and shaped." However, we do not use that term. All electricity that is procured for the purpose of RPS must report to the MRR separately. In other words, if a specified or unspecified source is used to meet RPS delivery requirements, then the emissions will be reported pursuant to MRR under the requirements for reporting specified and unspecified sources. The megawatt-hours from the eligible renewable facility will also be reported. We will adjust down the first deliverer's compliance obligation for the megawatt-hours of the renewable electricity. The RPS adjustment applies to electricity procured, during the same data year from eligible renewable facilities to meet the requirements of California's RPS program. The equation for the calculation of the RPS adjustment that allows a reduction of covered emissions is based on the default emission factor for unspecified sources, pursuant to MRR. We require the same data year because our program is based on annual emissions reported to support the implementation of triennial compliance periods, in which there are annual surrender requirements. RECs associated with the RPS adjustment must be retired in order to claim the adjustment to the compliance obligation. Electricity importers must be able to provide documentation for verification. If we were to fully align with RPS delivery arrangements, which allow for RECs to be banked and traded for up to three years, then it is possible the cap-and-trade program could be allowing for an adjustment to a compliance obligation in a reporting year. A few years later, the REC could be sold to another utility and could be used again, whether for meeting the California RPS—which could also be attached to an cap-and-trade RPS adjustment that year—or could be used in another utility in another state to meet their RPS.

Noble Solutions' proposed modification cannot work because the RPS adjustment is for electricity that is not able to be directly delivered to California as a result of the characteristics of the renewable resource and the distribution system. We believe that it is clear that the RPS adjustment is calculated based on electricity generated at, and procured from, the eligible renewable energy resource during the same year that it is claimed for the adjustment. The MRR requires annual reporting, and the compliance obligation for a year is based on the equation. We are interested in the new NERC e-Tag/WREGIS renewable delivery verification function in the WREGIS system, to see if that could assist in the tracking of electricity that has already been assigned an adjustment under our program. ARB will be looking into this new functionality and will be determining in the coming year if it can assist in our data needs.

We note that NCPA wants to "ensure that none of the various interests in these renewable resources are precluded from utilizing the RPS adjustment" and recommends that the regulation not "place restriction on ownership types." We believe that it is critical that a first deliverer seeking to use the RPS adjustment be required to have ownership or contract rights to procure the electricity generated by the eligible renewable resource, or have a contract to import electricity on behalf of a California entity that has ownership or contract rights" to the same. These are the ownership and contract conditions to which the RPS adjustment is subject in the modified regulation. We believe that the word "contract" covers virtually all documentable legitimate arrangements for the exchange (including purchase or sale) of electricity between parties. We also believe that it would be imprudent for a California entity that has ownership or contract rights to the electricity generated by [a] renewable energy resource" to make an agreement with another first deliverer to deliver this electricity without a contract. A written contract may authorize the use of other forms of contracting (e.g., e-mail, telephone conversation) However, any of these types of contractual activity authorized by a written contract must necessarily be verifiable by, for example, a recording of a telephone conversation, a digital document exchanged between parties, or some other documentation sufficient to meet the MRR's verification requirements.

NCPA and PG&E would like us to remove section 95852(b)(4)(E), which contains a sunset clause for the RPS adjustment for purchases of eligible renewable electricity from jurisdictions that we have an established linkage, pursuant to subarticle 12. Because renewable electricity does not reduce GHG emissions in a capped jurisdiction, as discussed at length, we disagree and did not remove section 95852(b)(4)(E). California is in agreement with WCI that RECs have no place in GHG accounting, since they are not a measure of emissions. We make it clear that an RPS adjustment may not be claimed when the eligible renewable resource is located in a jurisdiction where a GHG emissions trading system has been approved for linkage by the Board pursuant to subarticle 12, consistent with treatment of electricity from eligible renewable facilities under California's cap. As mentioned previously, once a cap is in place, renewable electricity no longer reduces emissions; they avoid emissions and help to meet the cap.

In Comment I-30, SEMPRA claims that "the recent change to the rule creates an inconsistency between AB 32 and the recently signed SBX1-2," and that "[t]his inconsistency is at odds with the ARB's Scoping Plan." It is true that the Scoping Plan expected significant GHG reductions from a recommended new 33 percent RPS mandate. But as discussed elsewhere, RPS electricity does not always reduce GHG emissions. When California is capped, any single RPS project cannot reduce emissions below the cap, even though it would be much more difficult for California industry, including the electric sector, to meet the cap if the separate RPS mandate did not exist. This is not an inconsistency, but is in the nature of the early years of transition to an economy with a GHG emissions cap. Our responses to 15-day comments explain more about the cases in which renewable electricity does, or does not, reduce emissions. An adjustment to allow a first deliverer "credit" for RPS electricity that is not delivered means that some double counting may occur, we decided to recognize past investments in the RPS by the utilities through a limited RPS adjustment. This is because we recognize that, during the transition, it is helpful to recognize that utilities were required by law to invest in renewable electricity generation and that until the cap is in place, that generation is very likely to be accompanied by reduced need for emitting resource generation somewhere in the WECC.

We believe our regulation is as consistent and as aligned as possible with SBX1 2, at this point in time. SBX1 2, while not yet implemented by CPUC and CEC, phases down the use of renewable electricity that cannot be directly delivered, and purchases of RECs only without the underlying electricity (unbundled REC). Although 25 percent of a utility's RPS compliance obligation can be met with these so-called "category three" products in the RPS compliance period ending December 31, 2013, only 10 percent can be used associated with contracts executed after June 1, 2010, to be used after 2016.

CEERT suggests that ARB work with "the California Public Utilities" (we believe CEERT means the CPUC) and CEC as they develop decisions on "portfolio content categories." We will continue to work with CPUC and CEC. However, it is necessary, for reasons already discussed, for this regulation to treat renewable electricity differently than does the RPS. We do not necessarily expect CEC and CPUC to treat RPS eligible electricity the same as we do, because this regulation measures reductions in metric tons of GHG emissions, and the RPS program measures sales of MWhs of renewable electricity to consumers. RPS encourages new renewable electricity generation regardless of its effect on GHG emissions, while this regulation implements a cap on GHG emissions.

RECs Separate from the Electricity

I-30. Comment: ARB has made changes with respect to out-of-state renewable energy credits (REC) which will result in a reduction of greenhouse gases, meeting the purpose and intent of both the Renewable Portfolio Standard (RPS) and AB 32. However, the recent change to the rule creates an inconsistency between AB 32 and the recently signed 33 percent RPS mandate. Specifically, certain purchases resulting in transactions that meet RPS requirements will not count toward GHG reductions under AB 32. This inconsistency is at odds with the ARB's Scoping Plan for AB 32 which states, "For the purposes of calculating the reduction of greenhouse gas emissions in this Scoping Plan, ARB is counting emissions avoided by increasing the percentage of renewables in California's electricity mix from the current level of 12 percent to the 33 percent goal…" SoCalGas and SDG&E strongly recommend that ARB revise the language to not exclude tradable RECs, purchased apart from the electricity, from the RPS adjustment that reduces GHG emission compliance obligations. Because the Cap-and-Trade Regulation should be consistent with SB1x 2 ARB should modify the RPS adjustment to cover tradable RECs.

SDG&E and SoCalGas support ARB's modification to the Cap-and-Trade Regulation with respect to proposed changes in the second set of 15-day modifications regarding out-of-state renewables. The regulation now recognizes the greenhouse gas (GHG) reduction benefits of all of SDG&E's renewable contracts entered into to meet California's renewable goals and so will count the GHG benefits from those contracts and will not artificially tighten the cap.

The proposed language remains inconsistent with the RPS, however, insofar as it appears to disallow the counting of tradable RECs toward the RPS adjustment. As presented in the second set of 15-day modifications, the RPS adjustment requires a contract for the electricity and not just the REC. In contrast, under SB1x 2, unbundled RECs sold to a retail seller would meet RPS requirements, subject to limitations. Such transactions would result in a reduction of greenhouse gases, meeting the purpose and intent of both the RPS and AB 32. However, under the proposed Cap-and-Trade Regulation, RECs purchased apart from the electricity would not be treated as reducing GHG emissions. If ARB intended to align its regulation with the purpose and intent of SB1x 2, the Cap-and-Trade Regulation should be modified to allow tradable RECs to the same extent as SB1x 2. There is no justification for treating the RPS and AB 32 implementation differently, and to do so would undermine the ARB's own Scoping Plan and the Legislature's policies adopted in the RPS. Modify section 95852(b)(4) as follows:

(4) RPS adjustment. Electricity imported by an electricity importer or procured by an electricity importer from an eligible renewable energy resource reported pursuant to MRR, or RECs must meet the following conditions to be included in the calculation of the RPS adjustment:
(A) The electricity importer must have either:
1. Ownership or contract rights to procure the electricity or RECs generated by the eligible renewable energy resource; or
2. Have a contract to import electricity on behalf of a California entity that has ownership or contract rights to the electricity generated by the eligible renewable energy resource, as verified under MRR. (SEMPRA4)

> **Response:** We considered whether tradable RECs could be a workable mechanism to assign and track avoided emissions, but determined that they would act as *de facto* offsets only available to the electricity sector, and not a compliance instrument also available to other covered entities for use in meeting a compliance obligation. Tradable RECs do not meet the rigorous requirements for compliance offsets, intended to be available to all sectors, consistent with our regulation, particularly in terms of additionality. The GHG emission reductions that occur as a result of RPS compliance are not additional, since they are required by California's RPS program. Also, RPS allows for the procurement of the REC only, without the actual electricity. Allowing for the use of a REC only, without the electricity, would result in inaccurate accounting of emission reductions attributable to the electricity sector.

Ancillary Services

I-31. Comment: The RPS adjustment provisions should be better coordinated with the RPS program. The September 12th version of the regulation deletes reference to replacement electricity, and instead provides for an RPS Adjustment [section 95852(b)(4)]. For an importer to avoid the compliance obligation for ancillary services supporting a firming and shaping agreement, it must demonstrate that a REC was retired in the same year that the RPS adjustment is claimed. This limitation is one example of how the new requirements may be inconsistent with the current RPS program and potentially the rules under development at other public agencies, including the California Public Utilities Commission (CPUC) and the California Energy Commission (CEC). IEP notes that the CPUC and the CEC are currently considering how to deal with these types of transactions for compliance with the 33 percent RPS and there is concern that the timeframe for retiring RECs between the RPS and the C&T program may not be the same. This inconsistency could detrimentally impact the intended functioning of the RPS markets. IEP therefore requests that CARB commit to evaluate how the RPS program matches up with CARB's cap-and-trade regulation and make changes over the next year, where necessary, to be consistent with the RPS program. (IEPA3)

> **Response:** Please see response to Comment I-30. In addition, we disagree with the comment regarding ancillary services. We do not agree that ancillary services are firming and shaping services. We believe these services are services provided by a host balancing authority area to maintain or manage the system.

MRR Reporting Requirements for RECs

I-32. (multiple comments)
Comment: Section 95852(b)(3)(D) (p. 91) refers to RECs from specified sources being "retired and verified pursuant to MRR." However, the MRR does not set out reporting and verification provisions relating to RECs. Nor does it need to. The existing REC tracking system endorsed by the California Energy Commission, the Western

Renewable Energy Generation Information System, collects all necessary information regarding RECs. ARB can access this information if required. Section 95852(b)(3)(D) should be amended to remove the reference to verification of RECs under the MRR. This change can be made without further 15-day public comment, as it is "nonsubstantial or solely grammatical in nature" for the purposes of section 11346.8(c) of the Government Code. Modify section 95852(b)(3)(D) as follows:

(D) If RECs were created for the electricity generated and reported pursuant to MRR, then the RECs must be retired.~~ and verified pursuant to MRR.~~ (SCPPA8)

Comment: As previously mentioned, 3Degrees welcomes this additional language to prevent double counting of the emissions characteristics associated with specified electricity imports from renewable energy facilities. However, 3Degrees suggests that ARB provided clarity as it relates to the reference to RECs "retired and verified pursuant to the MRR." The MRR does not provide guidance on REC retirement and verification. Including an explanation of this language would add clarity and prevent participant confusion. (3DEGREES3)

> **Response:** These comments fall outside the scope of the second 15-day changes to the regulation. These comments would be more appropriately posed under the MRR. However, pursuant to cap-and-trade regulation subsection 95852(b)(4)(B), RECs associated with the RPS adjustment must be retired in order to claim the adjustment. Under the MRR, electricity importers must be able to provide documentation for verification within 45 days following the June 1 reporting deadline that the RECs have been retired. If the electricity importer's verifier cannot confirm that the RECs are retired, the reporting entity will be in non-conformance, but the claim to the zero GHG emission factor (0 MT of CO_2e/MWh) remains valid. While ARB recognizes the emissions profile of the imported electricity, REC retirement is needed to ensure that other GHG accounting programs that may assign emission attributes to RECs do not double-count any avoided emissions.

I-33. Comment: A TL (transmission loss) factor must be applied to the RPS adjustment. As noted above, ARB has proposed a TL of 1.02 to imported electricity from unspecified and specified sources to account for transmission losses when it is measured at the first point of receipt in California rather than the busbar. ARB has not included such a TL in the RPS Adjustment calculation. Applying a TL factor to imported electricity implies that the emissions reported for replacement electricity (imported to satisfy RPS requirements), will be adjusted upwards by the TL. As with the QE Adjustment calculation, not applying the same TL factor to the RPS Adjustment will create an unfair inconsistency that could lead to unintended consequences. Without the TL, the RPS Adjustment will always be lower, by the 2 percent adjustment factor, than the GHG emissions calculated for imported RPS-eligible replacement electricity. Because the GHG emissions credit calculated as the RPS Adjustment should completely offset the GHG emissions of the imported electricity that qualifies for the RPS Adjustment, ARB should apply the TL factor to the RPS Adjustment. (SCE4)

Response: This comment falls outside of the scope of the second 15-day changes to the regulation. However, we do not agree with SCE that the transmission line loss factor needs to be incorporated into the RPS adjustment in this regulation. This comment would be more appropriately addressed within the MRR. Section 95852(b)(1)(B) refers to the MRR for calculation of the RPS adjustment. Transmission losses are factored into the reporting of electricity, for which the RPS adjustment is provided. These requirements are contained in the MRR. In the MRR, transmission losses are included in the RPS adjustment factor when the megawatt-hours (MWh) are procured at the busbar of the renewable energy resource. Otherwise, ARB assumes that any transmission losses that are additional to the MWh procured are made up by GHG-emitting resources.

Linking Issue

I-34. (multiple comments)
Comment: While NCPA supports the inclusion of the RPS adjustment, the current proposal to automatically sunset the use of the RPS adjustment upon linking (set forth in section 95852(b)(4)(E)) should be removed. While the Cap-and-Trade Program will undoubtedly benefit from an increased number of trading partners, it is going to be necessary for CARB and stakeholders to carefully examine aspects of the California program that will be impacted by linking. Accordingly, the appropriate time to review and analyze how the RPS adjustment should be addressed when linking with a partner jurisdiction is during that rulemaking process, and until that process is complete, there should be no cloud cast over how a compliance entity's RPS adjustment will be calculated in any given year. Treatment of the RPS adjustment should be included in the list of issues reviewed in the process of the subarticle 12 rulemaking specifically addressing linking, and accordingly, section 95852(b)(4)(E) should be stricken in its entirety at this time. (NCPA4)

Comment: PG&E appreciates the modifications to section 95852 that establish a mechanism to account for the GHG reductions associated with out of state RPS eligible resources. We believe a mechanism like this is crucial to ensure that California is able to account for the full GHG reduction benefits of the State's renewable programs. We remain concerned however with section 95852(b)(4)(E) that states that the RPS adjustment would not be allowed if a renewable resource is located in a jurisdiction which links with California's cap-and-trade program in the future. We understand ARB's intent to prevent double counting the GHG attributes of the renewable facility, however this prescriptive approach would prevent Californians from receiving credit for renewable investments in which the environmental attributes were conveyed to them contractually, solely to the fact that the state opted to develop a cap-and-trade program. As ARB has yet to determine whether and to what extent it will link with other jurisdictions and the rules under which linkage may occur, PG&E believes it is premature to disqualify out-of-state RPS eligible projects from such jurisdictions at this time. Accordingly, we recommend deleting the current language and inserting the following:

> (E) ARB will re-assess the subject of RPS adjustment if the underlying renewable resource becomes part of a linked jurisdiction in the future. (PGE5)

I-35. Comment: The Utilities do not believe that section 95852 (b)(4)(E) is necessary. As set forth under Subarticle 12, CARB will undergo a separate and distinct rulemaking each time linkage to another jurisdiction is considered. Then, and only then, should changes to the RPS Adjustment be considered. (MID4)

> **Response:** We did not make the requested change, because renewable electricity does not reduce GHG emissions in a capped jurisdiction. California is in agreement with WCI that RECs have no place in GHG accounting, since they are not a measure of emissions. We make it clear that an RPS adjustment may not be claimed when the eligible renewable resource is located in a jurisdiction where a GHG emissions trading system has been approved for linkage by the Board pursuant to subarticle 12, consistent with treatment of electricity from eligible renewable facilities under California's cap. As mentioned previously, once a cap is in place, renewable electricity no longer reduces emissions; they avoid emissions and help to meet the cap.

Renewable Portfolio Standard – Legal Arguments

I-36. (multiple comments)
Comment: The renewable portfolio standard adjustment includes a potentially fatal flaw that can be easily fixed. Powerex understands that the RPS adjustment provisions are critical to ensure that the zero-emission components of renewable energy are properly counted under the RPS, the MRR and the Cap-and-Trade Rule. Powerex therefore supports the inclusion of some form of RPS Adjustment in the Cap-and-Trade Rule. However, as currently drafted, the RPS Adjustment is at risk of legal challenge on two grounds.

First, the RPS Adjustment may impermissibly intrude upon the jurisdiction of FERC. The Federal Power Act ("FPA"), 16 U.S.C. sections 791-828c, gives FERC exclusive jurisdiction over sales of electricity at the wholesale level in U.S. interstate commerce, and over the interstate transmission of electricity. 16 U.S.C. 824(b); *Duke Energy Trading & Marketing, LLC v. Davis*, 267 F.3d 1042 (9th Cir. 2001); *State of Cal. v. Dynegy, Inc*., 375 F. 3d 831 (9th Cir. 2004). This jurisdiction preempts other federal or state agencies from taking any action that would encroach on matters entrusted by Congress to FERC alone, including matters such as the justness and reasonableness of rates and charges of wholesale power sellers, the use of interstate transmission capacity, and, most important here, the operation of interstate power markets, including review of any action or conduct that could result in undue discrimination against, or undue preference to, a market participant.

In its currently-proposed form, the RPS Adjustment could constitute impermissible discriminatory treatment of imported power. Specifically, the proposed RPS Adjustment methodology at section 95852(b)(4) of the Cap-and-Trade Rule that requires the associated RECs to be used to comply with California RPS requirements improperly restricts the low carbon intermittent generation that can be delivered and credited to those entities under contract to deliver RPS power to California load serving entities (LSE). This has the practical effect of granting an undue preference to the California LSEs, and unduly discriminating against first deliverers of imported power into the state that do not have RPS contracts with a California LSE. In addition, by limiting the low-carbon intermittent generation to “eligible renewable energy resources” as defined in section 399.12 of the Public Utilities Code, it also appears that the RPS Adjustment would interfere with the flow of certain power deliveries in interstate commerce in favor of California’s local interests. Shaping of intermittent generation is inherently incident to sales of electricity at the wholesale level in interstate commerce. As a result, the RPS Adjustment, as currently drafted, falls plainly within FERC’s FPA jurisdiction, both because of its impact on the movement of wholesale electricity across California’s border and its undue discrimination in favor of California LSEs.

Second, the restriction of the RPS Adjustment to California LSEs makes it vulnerable to a Commerce Clause challenge. Specifically, by limiting the RPS Adjustment to California LSEs, the Cap-and-Trade Rule discriminates against interstate commerce in favor of local interests in much the same way as Louisiana’s first use tax on natural gas pipelines crossing the state did, a regulation that was struck down as unconstitutional by the United States Supreme Court in *Maryland v. Louisiana*. 451 U.S. 725 (1981). FPA preemption and constitutional challenges under the Commerce Clause could pose serious threats to the RPS Adjustment and thus to the Cap-and-Trade Rule itself. This is unfortunate, as the objective of the RPS Adjustment is not discriminatory; rather, it is to ensure the proper accounting of the zero-emission components of renewable energy. Fortunately, protecting the RPS Adjustment from these challenges requires only minor changes to the proposed regulatory text. (POWEREX2)

Comment: The definition of the term “eligible renewable energy resource,” as it is used in section 95852(b)(4), should be expanded to include sources outside of the RPS program. This not only avoids a characterization of the RPS Adjustment as discriminatory in favor of local interests, it wisely expands the pool of resources available to California for meeting its GHG reduction goals. In creating the RPS program, California had various reasons for excluding certain categories of renewable energy sources from its scope. However, those reasons are independent of the sources’ carbon intensity. There are numerous valid, high-quality renewable energy sources that are not part of the RPS program but are excellent sources of emissions-free electricity for the state. To make the requisite change, Powerex suggests revising section 95802(a)(88) of the Cap-and-Trade Rule to include ARB’s previously proposed definition of “variable renewable resource.” The change would have the effect of expanding the definition—and, thus, the scope of the RPS Adjustment—to include numerous small hydroelectric facilities throughout the Western Interconnection that are not currently eligible renewable energy resources. At the same time, it avoids any circumvention of ARB's limitation on resource shuffling because the MRR already requires that renewable energy facilities be new, be repowered, or have a historic relationship with California. *See* MRR section 95111(g)(4). Modify section 95802(a)(88) as follows:

(88) "Eligible Renewable Energy Resource" has the same meaning as defined in Section 399.12 of the Public Utilities Code, as well as run-of-river hydroelectric, solar, or wind energy that requires firming and shaping to meet load requirements. (POWEREX2)

Comment: Expand the RPS Adjustment to allow the retirement of RECs outside of the RPS Program. To extend the RPS Adjustment to non-RPS sources, section 95852(b)(4) must be revised to allow entities that do not have RPS obligations to retire RECs. This can be achieved by creating an option to use an ARB REC retirement account. Under the "retirement account" option proposed here, market participants would set up ARB-specific retirement accounts in the Western Renewable Energy Generation Information System (WREGIS) that are associated with imported power. They would have to show evidence of delivery into the state in the same manner as required under the RPS program, and then retire the associated REC into a WREGIS "California ARB Retirement Account." This is exactly the same process that would be used by entities with RPS obligations, but instead of using the RECs to satisfy the RPS, the RECs would be retired into the WREGIS ARB Retirement account. WREGIS is a robust platform that has a sufficient level of integrity to allow ARB to be certain that a renewable was shaped and delivered into the state and that the REC associated with the RPS adjustment was actually retired. Setting up a WREGIS ARB retirement account would be a simple process that is already enabled in the current WREGIS configuration that could be accomplished simply by means of an ARB policy direction to users of WREGIS (i.e., electricity deliverers and their verifiers.) The RECs would be verified by through the ARB annual reporting and verification process in exactly the same way as if the REC had been retired for RPS purposes. Modify section 95852(b)(4)(B) as follows:

> (B) The RECs associated with the electricity claimed for the RPS adjustment must be <u>either retired into a dedicated California Air Resources Board retirement account operated by the Western Renewable Energy Generation Information System or</u> used to comply with California RPS requirements during the same year in which the RPS adjustment is claimed. (POWEREX2)
>
> **Response:** We do not agree that the RPS adjustment would be preempted by the FPA. The Supremacy Clause of the United States Constitution declares unlawful state laws that "interfere with, or are contrary to," federal law. *Hillsborough County, Fla. v. Automated Med. Labs., Inc.,* 471 U.S. 707, 712 (1985) (quoting *Gibbons v. Ogden,* 22 U.S. (9 Wheat.) 1, 211 (1824)); see also U.S. Const. art. VI, cl. 2. Preemption analysis starts "with the assumption that the historic police powers of the States were not to be superseded by the Federal Act unless that was the clear and manifest purpose of Congress." *Rice v. Santa*

Fe Elevator Corp., 331 U.S. 218, 230 (1947). "[T]he purpose of Congress is the ultimate touchstone of preemption analysis." *Cipollone v. Liggett Group,* 505 U.S. 504, 516 (1992) (internal quotation marks omitted). Federal law can preempt state law in three ways. First, Congress may expressly preempt state law. Second, preemption may be inferred where Congress has occupied a given field with comprehensive regulation. Third, a state law is preempted to the extent that it actually conflicts with federal law. An "actual conflict" exists when "'compliance with both federal and state regulations is a physical impossibility[.]'" *Automated Med. Labs., Inc.,* 471 U.S. at 713.

A preemption claim involving state actions that conflict with the Federal Power Act ("FPA") are predicated on the Supremacy Clause. See *Duke Energy Trading & Mktg., L.L.C. v. Davis,* 267 F.3d 1042, 1055 (9th Cir. 2001). The FPA grants to FERC "'exclusive authority to regulate the transmission and sale at wholesale of electric energy in interstate commerce.'" *Transmission Agency of N. Cal. v. Sierra Pac. Power Co.,* 295 F.3d 918, 928 (9th Cir. 2002) ("TANC") (quoting *New England Power Co. v. New Hampshire*, 455 U.S. 331, 340 (1982)). Through the FPA, "'Congress meant to draw a bright line easily ascertained, between state and federal jurisdiction …. This was done in the Power Act by making [FERC] jurisdiction plenary and extending it to all wholesale sales in interstate commerce except those which Congress has made explicitly subject to regulation by the States.'" *Nantahala Power & Light Co. v. Thornburg,* 476 U.S. 953, 966 (1986) (quoting *Fed. Power Comm'n v. S. Cal. Edison Co.,* 376 U.S. 205, 215-16 (1964)).

When enacting the Federal Power Act, Congress gave no indication that it intended to preempt state environmental programs such as greenhouse gas regulations. The regulation here is designed and intended to regulate greenhouse gas emissions in California and is not intended to regulate the rates, terms or conditions of sales of electric energy in interstate commerce. Therefore, the regulation was not expressly preempted.

"Field preemption occurs when the federal statutory scheme is sufficiently comprehensive to infer that Congress left no room for supplementary regulation by the states." *Gadda v. Ashcroft,* 363 F.3d 861, 869 (9th Cir. 2004). "When the federal government completely occupies a given field or an identifiable portion of it . . ., the test of preemption is whether 'the matter on which the State asserts the right to act is in any way regulated by the Federal Act.'" *Pac. Gas & Elec. Co. v. State Energy Res. Conservation & Dev. Comm'n,* 461 U.S. 190, 212-13 (1983) (quoting *Rice v. Santa Fe Elevator Corp.*, 331 U.S. 218, 236 (1947)).

One purpose of the federal statutory scheme concerns the reasonableness of interstate power rates and nondiscriminatory access to interstate power transmission. In contrast, California's purpose for enacting AB 32 was to reduce emissions of greenhouse gases, and we are proposing to regulate the environmental impacts of electric generation and consumption. The FPA's regulation of wholesale sales does not cover the environmental impacts associated with electricity generation and consumption. Commenter asserts that certain definitions in the regulation may impact the wholesale electricity market, but has not specified how such definitions could result in regulation by ARB of the wholesale electricity market. That some part of the regulation could indirectly affect the electricity market does not demonstrate that the provision will result in regulation of wholesale electricity sales, such as setting prices or establishing conditions for participation in the wholesale electricity market. Therefore, this regulation is a separate field related to the regulation of greenhouse gas emissions unrelated to the rates or access to power transmission.

If it is impossible to comply with both state law and federal law, then the state law is preempted. See *Gade v. Nat'l Solid Waste Management Ass'n,* 505 U.S. 88, 108 (1992). Commenter has not indicated that it would be impossible to comply with the regulation and federal law. Because the regulation here relates to greenhouse gas emissions and does not purport to regulate wholesale electric energy sales, we do not believe that a conflict exists.

Moreover, the FPA leaves room for state environmental regulation. Indeed, 16 U.S.C. section 824(a) states: "Federal regulation . . . [under the FPA extends] only to those matters which are not subject to regulation by the States." This broad savings clause supports the conclusion that because air pollution is subject to regulation by the States, and not by the FPA or FERC, state regulation of GHG emissions caused by the generation and consumption of electricity is not preempted by the FPA, but may be regulated by the States. While such GHG regulation may have some impact on the wholesale prices paid for electricity, it is no more preempted by the FPA than state regulations limiting the amount of other pollutants that may be emitted by electric power plants—that may affect the cost of generating electricity and therefore indirectly affect the price of wholesale electricity. For these reasons, we do not believe the FPA preempts this regulation.

Regarding alleged discrimination, while the RPS Adjustment requires the retirement of RECs for compliance with the California RPS, any low carbon intermittent generation that can be delivered to California will not have a compliance obligation (unless GHG emissions with a compliance obligation are emitted in the generation of the intermittent low carbon electricity). Currently, there are limited circumstances under which intermittent power can be delivered across balancing authorities, but conditions for these circumstances are rapidly changing. For example, only recently has direct delivery through a dynamic transfer agreement been allowed into California BAAs. However, there are several kinds of these arrangements that are, or may soon, be available for use in importing intermittent electricity to California. Another way of providing direct delivery may be to aggregate sets of wind and solar power to produce a statistically valid firm schedule. Firming with non-renewable power could be used when needed for the schedule, subject to a compliance obligation, but there need be no obligation (if there are zero emissions) during the hours in which firming or shaping is not needed. Although Powerex alleges that “shaping is inherently incident to sales of electricity at the wholesale level in interstate commerce” this is not the case for dynamic transfer agreements. We note that the RPS adjustment is a transitional provision that will no longer have effect when California is linked to other jurisdictions pursuant to Section 12.

Because any first deliverer can use the RPS adjustment (provided they can show that RECs have been used for compliance with the California RPS), all first deliverers are treated uniformly. We note that only the first deliverer, which for imported electricity is the electricity importer, can use the RPS adjustment. Foreseeing the likelihood that LSEs would assist their counterparties in making use of the adjustment that could not be used by the LSE, section 95852(b)(4)(A)(2) allows for first deliverers to use the RPS adjustment even if they do not have ownership or contract rights to the electricity generated, if they have a contract to import the electricity on behalf of a California entity. Practically speaking, this is expected to cover all imported electricity that is RPS-eligible.

Commenter asserts that the RPS adjustment discriminates in favor of local interests, similar to the first-use tax in *Maryland v. Louisiana,* 451 U.S. 725 (1981). However, unlike the first-use tax imposed in *Maryland v. Louisiana,* the regulation here makes the RPS adjustment available to all first deliverers. The first-use tax in *Maryland v. Louisiana* included exemptions and credits that were available only to in-state uses, but here the RPS adjustment available to all first deliverers. We do not agree that the RPS adjustment discriminates between California and non-California first deliverers.

We did not expand the definition of “eligible renewable energy resource.” We note that a renewable generator located anywhere within the WECC can be considered an “eligible renewable energy resource”, and in many cases, a renewable resource that meets the requirements of other RPS programs will also meet the California requirements. This defined term does not favor California renewable generators, because eligibility is available to renewable generators located anywhere within the multi-state Western Interconnection.

The current RPS definition of “eligible renewable energy resource” provides the types of generating facilities that have been determined in the RPS program to have renewable attributes. Commenter proposes appending the definition of “eligible renewable energy resources” with resource types that have not been determined to be renewable. Doing so would contravene the existing statutory definition and create regulatory inconsistencies. Therefore, we did not make the proposed amendment. Accordingly, we also did not allow use of RECs for the RPS adjustment if they are not used to comply with California’s RPS.

As noted above, there is no discrimination among first deliverers; California and non-California deliverers alike must demonstrate the use of RECs for compliance.

Voluntary Renewable Energy

Reserve Account Cap Section 95831

I-37. (multiple comments)
Comment: In numerous past submissions to ARB, REMA has encouraged ARB to avoid placing a cap on the total allowances for the VRE Reserve Account. Such an inflexible cap would place an artificial ceiling on the growth of the voluntary market for renewable energy, while an annual adjustment would provide flexibility and encourage additional demand for VRE purchases. However, should ARB decide to maintain its proposed VRE allowance cap, REMA strongly recommends clarifying language in section 95870(C) ("Disposition of Allowances") that describes VRE allocations for under and over subscription scenarios outlined below. (REMA3)

Comment: As stated in previous comments, 3Degrees urges ARB not to adopt a pre-determined cap and to allow the budget adjustment to be determined solely by the ex-ante estimate of need based on demonstrated demand. This will send a clear market signal and promote the continuing future growth of voluntary renewable energy purchases. Should ARB decide to pursue a cap on the number of allowances that can be placed in the holding account, 3Degrees strongly recommends that the cap be subject to annual review and adjustment rather than at the start of each compliance period, or that an automatic review be triggered whenever demand exceeds the cap for two years in succession. (3DEGREES3)

Response: This comment falls outside of the scope of the second-15 day changes to the regulation. There were no changes proposed in sections 95831(b)(6). The language describing the Voluntary Renewable Electricity Account was not subject to public comment under the second 15-day changes to the regulation. Because the comment falls outside of the scope of the notice, no further response is required. However, we acknowledge 3Degrees, REMA, and others' concern regarding a cap on the pool of allowances and the potential for this to affect funding of renewable generators. As mentioned in the first 15-day changes to the regulation, there are a limited amount of allowances available for this purpose. The set-aside account is a form of transitional assistance for the voluntary sector. We understand the high cost of renewable electricity and the concern expressed by the voluntary sector to compete with the demand to meet RPS. However, our goal is to transition to 100 percent auction. To that end, it will be necessary for the voluntary sector to eventually participate in the program by registering as a voluntarily associated entity, and to purchase and retire allowances on behalf of the voluntary contributions.

VRE Program Timing

I-38. Comment: The Utilities continue to have concerns with the inclusion of a Voluntary Renewable Energy (VRE) set-aside program. As stated in our previous comments, the Utilities believe that a VRE market should only be considered after both the 33 percent Renewable Portfolio Standard (RPS) and the cap-and-trade programs are underway as the Utilities believe the VRE market will act in direct competition with the RPS market. The Utilities believe that delaying the start of the VRE market until 2014 is a start in the right direction; however, the Utilities suggest that additional stakeholder discussions be held in the interim to fully examine the impacts that this program will have on both the cap-and-trade and RPS markets. (MID4)

> **Response:** These comments are outside of the second 15-day changes to the regulation. However, as explained in first 15-day changes to the regulations, we do not agree with MID. The purpose of the VRE program is to remove the excess allowances for generation provided by the voluntary sector. The delay in the commencement of allowance retirement is to reflect the change in the year that allowances will be deposited into the Voluntary Renewable Electricity Account pursuant to section 95870(c). This change was made to accommodate the change in the first compliance year to January 1, 2013, and was changed to directly delay the commencement of the VRE program.

True-up/Rollover

I-39. (multiple comments)
Comment: REMA recommends that ARB include language in section 95870(c) that clearly outlines the allocation process in the case that the VRE Reserve Account is under-subscribed. In this scenario, unused allowances would be rolled-over into future compliance years to account for years when the VRE allowance supply exceeds demand. This, at the very least, will create a slim buffer to allow for VRE market growth in the succeeding program years. Under no situation should allowances designated for the Reserve Account be released into the general pool for compliance purposes; to increase its contribution to deployment of clean, renewable energy, the voluntary markets requires certainty in allowance allocations. This rollover of allowances into future years would strike a compromise between the competing policy cap vs. no cap VRE options. A periodic review and adjustment prior to the start of each compliance period would improve the oversight of the program; several Regional Greenhouse Gas Initiative (RGGI) states have adopted a similar provision. (REMA3)

Comment: REMA proposes that ARB provide clarifying language in section 95870(c) for the potential scenario of VRE Reserve Account over-subscription. Should requests for allowance retirement exceed the remaining reserve pool, REMA recommends that allowances be divided and retired equally among all qualifying applicants, such that each MWh receives the same carbon value. (REMA3)

Comment: As stated previously, 3Degrees urges ARB not to adopt a pre-determined cap and to allow the budget adjustment to be determined solely by the ex-ante estimate of need based on demonstrated demand. Should ARB decide to cap the number of allowances that can be retired each year, 3Degrees strongly recommends that the language in this sub-section be amended such that:

- In the case that demand for VRE allowances exceeds supply in a given year, ARB should distribute and retire VRE allowances distribution equally among qualifying MWhs and/or RECs. As written, the proposed regulation is unclear on this point.
- In the case of demand for VRE allowances for not equaling supply, then ARB should roll over excess allowances into future compliance years. This, at the very least, will create a slim buffer to allow for VRE market growth in the succeeding years. (3DEGREES2)

Comment: While section 95841.1 addresses many of the details necessary to effectively operate a VRE set aside, the one key item missing is how to account for oversubscription. CARB should outline exactly what will happen if the number of allowances requested for the VRE set aside in a given year exceeds the size of the set aside specified in section 95870(c). These details are necessary in order to provide more certainty and less risk to market participants in the event of oversubscription. The preferable solution is to follow the RGGI Model Rule, and "true up" allowances at the end of each compliance period. In this scenario, a predetermined amount of allowances are taken out of circulation at the beginning of the compliance period. At the end of the period, if the number of allowances requested for the voluntary market exceeds the set aside amount, then the appropriate number of allowances are taken out of circulation in the subsequent compliance period. Having a truing up mechanism reduces the risk that there won't be enough allowances for all voluntary sales in a given year, thus providing more market certainty and aiding in the growth of renewable energy capacity in California. If it is not possible to exceed the amount prescribed in section 95870(c), it is important that CARB specifies exactly how the limited allowances will be retired on behalf of VRE market participants (i.e. will they be retired for VRE market participants on a first-come first-served basis, or will they be distributed equally among VRE market participants on a MWh or REC basis). (KUSTIN17)

Response: These comments fall outside of the scope of the second 15-day changes to the regulation. The only changes proposed to section 95870(c) was to accommodate the change in the date that allowances would be deposited into the account, due to the change in the adjustment of the first compliance period. The language describing the amount and dates for allowances to be deposited into the Voluntary Renewable Electricity Account was not subject to public comment under the second 15-day changes to the regulation; therefore, no further response is required. However, we acknowledge the concerns expressed by REMA and others regarding what will happen if the account becomes fully subscribed and there are not enough allowances to cover all of the requests. Again, as described above, one of the goals of our program is to transition to 100 percent auction. Therefore, the design of the program does not support depositing additional allowances into the account. We will monitor the demand to retire allowances against the expected demand, and growth in demand, from the voluntary renewable electricity market. If we determine in future years that demand is exceeding our expectations, we will work with stakeholders to determine the best way to parse out the remaining allowances across all applicants in the remaining compliance period, if needed.

Some comments, such as the comments submitted by REMA and the Coalition, suggest that we include language regarding what happens to allowances if there are remaining allowances at the end of the year or compliance period. We do not include language that would parse out allowances into specific compliance periods for use within that compliance period, but instead have created a "pool" of allowances. The first compliance period allowances will be deposited, and each budget year allowances will continually be deposited according to the schedule outlined in section 95870(c). The allowances will remain in the account until they have been requested to be retired pursuant to the requirements outlined in section 95841.1. We do not include provisions for allowances to be accessed by any other participants, nor for the allowances to be accessed by the Executive Officer for use in the reserve account, or for compliance purposes, as some commenters suggested.

On-Line Date

I-40. (multiple comments)
Comment: Earlier in our comments, REMA noted the improvement to section 95841.1's online date for eligible renewable energy generation. The proposed online date of July 1, 2005 is more inclusive of existing renewable generation than previous iterations of the regulation, but a revised 15-year rolling window would accomplish two goals that the July 1, 2005 date would not. First, it would encourage additional Californian voluntary market participants through broader availability of credible, national renewable energy products from existing renewable energy producers. Voluntary green power sales provide generators an important source of revenue, and the 2005 date would reduce green power products available. Second, the 15-year rolling window would deter Californian utilities from looking towards out-of-state renewable energy generators to meet increased green power demand. Many state utilities offer their customers green power products, and efforts to bolster voluntary demand through the VRE's Reserve Account should support existing Californian green power generation. Two renewable energy industry leaders, the Environmental Protection Agency's (EPA) Green Power Partnership Support (GPP) and the Center for Resource Solutions (CRS) support the 15-year rolling window online date. REMA encourages that ARB consider this revision in the additional round of public input. (REMA3)

Comment: 3Degrees wishes to express its support for the inclusion of a generator online date. However, this date is inconsistent with the new date for the voluntary renewable energy market. The voluntary renewable energy market is a national market with an established 15-year rolling online date. By disallowing facilities with online dates prior to 2005 to qualify for the voluntary renewable energy set aside, many generators based in California would be excluded from participating in this national market. Although 3Degrees understands ARB's rational for its choice of July 1, 2005, we encourage the use of an online date that conforms to the standards already in use by the voluntary market. (3DEGREES2)

Comment: Section 95841.1(a) stipulates that only generation from facilities that served load after July 1, 2005 should be eligible for the VRE set aside. We strongly urge CARB staff to reconsider this date, as it is inconsistent with the established new date for the voluntary renewable energy market. The use of this arbitrary cutoff date would exclude a large portion of the renewable energy capacity currently serving the voluntary market in California, resulting in a reduction in environmental benefits currently supported by voluntary customers, removing an important source of revenue for these generators, and negatively impacting the clean energy industry in California.

The voluntary renewable energy market is a national market with an established 15-year rolling online date. Both the U.S. Environmental Protection Agency's Green Power Partnership and Green-e Energy employ this new date. By disallowing California facilities with online dates prior to 2005 to qualify for the VRE set aside, many renewable energy facilities based in California would be excluded from participating in this national market.

Should CARB keep the 2005 new date, approximately half of California capacity selling into the voluntary renewable market would no longer be able to participate in this national market. This figure includes all biomass, geothermal and landfill gas facilities, and half of the wind capacity in California that currently participates in the national voluntary market. These are generators that anticipated REC revenue from the voluntary market in order to be built, and by using a 2005 new date they would no longer receive this revenue.

We suggest not setting an arbitrary new date that puts California capacity at a competitive disadvantage compared to the rest of the U.S. If CARB moves forward with the 2005 date, REC providers both in California and nationally would turn to out-of-state RECs for their green power products, and the role of California generators in this market would be diminished. This would particularly impact California utilities that offer their customers green electricity, as they tend to own their own generation capacity or buy renewable energy generated within the state. (KUSTIN17)

> **Response:** These comments fall outside of the scope of the second-15 day changes to the regulation. There was no change noted to section 95841.1(a) in the Second 15-day Change Notice for the on-line date for eligible electricity, and was therefore not subject to public comment under the Second 15-Day Change Notice. However, we acknowledge the concerns expressed by the Coalition, REMA, and 3 Degrees regarding the disadvantage that may fall upon the

generators, or investments made to support the development of the facility, that came on-line prior to 2005. This on-line date coincides with the year in which out-of-state renewable facilities are eligible under the RPS. It also coincides with the date of Executive Order S-03-05, which established greenhouse gas emission-reduction targets. We understand that the industry has adopted a 15-year rolling date to determine on-line eligibility. This means systems that went on-line no later than 15 years ago could be eligible for allowance retirement. We want to incentivize the development of new technologies, and we believe that the rolling 15-year on-line date would not provide this incentive. Additionally, as mentioned already in response to other comments received on section 95870, our goal is to move toward greater reliance on auction; this means that the voluntary renewable electricity sector will need to move toward participating in the program in which all of the allowances are auctioned. The voluntary sector will eventually need to register, and purchase and retire allowances, to claim their contributions to reduce greenhouse gas emissions.

VRE Attestations

I-41. Comment: Attestations made by Voluntary Renewable Energy market participants.
In section 95841.1(b)(1)(F)(2), an attestation is required that states the VRE market participant has not "authorized use of, or sold, any renewable electricity credits or any claims to the emissions, or lack of emissions, for electricity for which I am seeking ARB allowance retirement, in any other voluntary or mandatory program." CRS requests clarification that this attestation is to be signed by the VRE market participant on behalf of the end user, and that the end users of the renewable electricity credits are able participate in voluntary renewable energy purchasing programs. It is both commonplace and encouraged for renewable energy purchasers to participate in other programs, including the EPA Green Power Partnership, Green-e Marketplace, the U.S. Green Building Council's LEED certification program, and within GHG registries where REC purchases by the end user can be recorded as zero-emissions electricity use. (CRS3)

Response: Our program will be retiring a certain number of metric tons of allowances for the displacement of an equivalent amount of CO_2e/MWh of generation from an eligible renewable electricity generator. As such, it is our intent the claim to the lack of emissions attribute which allows the participant to retire allowances in our program is not also claimed in another program in which there is an accounting of greenhouse gas emissions reduction. It would not be accurate accounting if the emissions reductions were claimed in our program, and then another program also claimed that the very same MWhs of electricity also reduced emissions in their program. It is not our intention, however, for entities to be prevented from having that claim acknowledged in other recognition programs, such as LEED.

VRE and Double-Counting

I-42. Comment: Sections 95841.1(b)(1)(D) and (b)(1)(E) both require "Contract, tracking system data, or settlement date for the purchase (and sale) of the electricity or RECs associated with the generation of the electricity…" As currently written, this enables double counting as both the REC and the underlying electricity could separately meet the requirements of the VRE set aside using the same MWh. Only the REC, and not the underlying electricity absent a REC, should be allowed to satisfy these requirements, as the REC represents the environmental attributes, including the emissions attribute, of renewable energy generation. CRS recommends striking "electricity or" in each sentence to avoid this potential for double counting. (CRS3)

> **Response:** These comments fall outside of the scope of the second-15 day changes to the regulation. The only change made to the provisions contained in sections 95841.1(b)(1)(D) and (b)(1)(E) was to add the option to use "tracking system data" and require submission of this information. No changes were proposed to the type of data to be reported; therefore it is not subject to public comment under the second-15 day changes to the regulation. Therefore, no further response is required. Nevertheless, we acknowledge the comment provided by CRS. It is not our intention to allow for double-counting. We do not agree with CRS though that the suggested modification would prevent double-counting any more than the provisions already included in this section. CRS suggests that we strike the words "electricity or." If we made this modification, we would eliminate the option to purchase the electricity directly from a generator. We acknowledge CRS's concern, and we will work with stakeholders as we develop specific guidelines for participation in this voluntary program so that we ensure there is no double-counting.

I-43. (multiple comments)
Comment: REMA commends ARB for its improvements on the "First Deliverers" regulatory language outlined in section 95852(b)(3). Program revisions to date have greatly increased the program's integrity of emissions reductions and environmental claims from renewable generation sources. REMA requests that ARB provide clarity within section 95852(b)(3)(D), specifically on reference made to the Mandatory Reporting of Greenhouse Gas Emissions (MRR). The existing language states that "If RECs were created for the electricity generated and reported pursuant to MRR, then the RECs must be retired and verified pursuant to MRR." However, guidance on REC treatment in the referenced MRR section 95111 is unclear. This could be result of placeholder text for future development of the VRE Reserve Account or a general omission. In either case, corresponding MRR language describing the REC retirement process would aid the program's functionality and prevent participant confusion. Additionally, REMA stresses that ARB consider the distinction of REC ownership and REC retirement for purposes of VRE Reserve Account compliance. Currently, section 95852(b)(3)(D) requires the outright retirement of RECs pursuant to guidance in the MRR, a stipulation that decreases the liquidity of the renewable energy markets in California. REC ownership is the critical component in a functioning renewable energy market. Although retirement assists in the validation of environmental claims, REC

ownership satisfies ARB's compliance obligations. Further, outright retirement limits renewable energy trading, overall VRE Reserve Account participation, and possibly the effectiveness of the voluntary program itself. Again, REMA recommends that ARB revise the language in section 95852(b)(3)(D) require ownership of the REC rather than retirement. (REMA3)

Comment: CRS greatly appreciates the addition of section 95852(b)(3)(D) whereby RECs are required in order for electricity importers to claim a zero-emission compliance obligation for delivered electricity from a renewable resource. This requirement will prevent the double counting of renewable energy attributes, help ensure that multiple claims are not made for the same renewable energy generation, and aid in the continued growth of both voluntary and compliance renewable energy markets in the U.S. CRS applauds CARB staff for their careful consideration of this very important issue. It should be noted that while the retirement of the RECs created with electricity imported into California is necessary to prevent double counting, ARB should maintain flexibility to allow trading of the REC within California boundaries, because the final owner and user of a REC may not be the electricity importer. CRS is happy to assist CARB staff with the technical requirements pertaining to this issue. (CRS3)

> **Response:** We do not agree with CRS or REMA and did not incorporate the changes they suggested to allow REC trading beyond the border of California for megawatt-hours that have been reported and applied to the RPS adjustment. Once a REC, which contains the environmental attribute representing the avoided emissions, is used for the RPS adjustment pursuant to section 95852(b)(4), it is required to be retired. If we did not require the retirement of the REC, and it was further traded and used within another voluntary or compliance program, it would be double-counted. The lack of emissions attribute would have already been used under the requirements for receiving the RPS adjustment. If the utility is the entity that will be retiring the REC, then the utility can provide an REC retirement report as documentation to the importer stating the REC was retired for the delivery of electricity, as required pursuant to the MRR.
>
> REMA requests additional clarification of sections contained in the MRR. We acknowledge the comment regarding requirements contained in the MRR. Pursuant to the MRR, electricity importers must be able to provide documentation for verification within 45 days following the June 1 reporting deadline that the RECs have been retired. If the electricity importer's verifier cannot confirm that the RECs are retired, the reporting entity will be in non-conformance. The options for allowable documentation that is acceptable, and that satisfies reporting and verification requirements contained in the MRR, will be included in the guidance document that will be produced as an accompanying document to support the fulfillment of the requirements contained in the MRR.

I-44. (multiple comments)
Comment: In Section 95852(b)(4), language was added whereby firmed and shaped power used to comply with the RPS would receive an adjustment that effectively

eliminated any compliance obligation for first deliverers. If CARB has determined that firmed and shaped power used to meet the RPS should have no compliance obligation, it is consistent to apply this to green pricing programs as well. (CRS3)

Comment: SMUD appreciates the recognition of the need to align the Cap and Trade program with the state's ambitious RPS program. However, we feel it is also important to ensure that resources recognized for RPS compliance are also eligible for green pricing programs that may be offered to customers who would like to purchase renewable energy outside the RPS. While the ARB has included provisions to handle the GHG treatment for purchasing in-state renewable energy for use in voluntary programs, SMUD believes that it is important to ensure harmony where possible with RPS rules that recognize the benefits of out-of-state renewable energy. The following change would allow resources that would normally count for the state's RPS to also be fully viable for voluntary program customer needs without incurring a compliance obligation or challenging the GHG benefits expected from voluntary renewable procurement. Modify section 95852(b)(4) as follows:

(4) Renewable ~~RPS~~ Energy adjustment. Electricity imported or procured by an electricity importer from an eligible renewable energy resource reported pursuant to MRR must meet the following conditions to be included in the calculation of the ~~RPS~~ Renewable Energy adjustment:

(A) The electricity importer must have either:

1. Ownership or contract rights to procure the electricity generated by the eligible renewable energy resource; or

2. Have a contract to import electricity on behalf of a California entity that has ownership or contract rights to the electricity generated by the eligible renewable energy resource, as verified under MRR.

(B) The RECs associated with the electricity claimed for the ~~RPS~~ Renewable Energy adjustment must be deposited prior to verification in a WREGIS account that can only be used:

1. T~~t~~o comply with California RPS requirements ~~during the same year in which the RPS adjustment is claimed~~, or

2. To supply a green pricing program.

(C) The quantity of emissions included in the ~~RPS~~ Renewable Energy adjustment is calculated as the product of the default emission factor for unspecified sources, pursuant to MRR, and the reported electricity generated (MWh) that meets the requirements of this section, 95852(b)(4).

(D) No ~~RPS~~ Renewable Energy adjustment may be claimed for an eligible renewable energy resource when its electricity is directly delivered.

(E) No ~~RPS~~ Renewable Energy adjustment may be claimed for electricity generated by September 2011 an eligible renewable energy resource in a jurisdiction where a GHG emissions trading system has been approved for linkage by the Board pursuant to subarticle 12. (SMUD4)

Response: We do not agree with CRS and SMUD, and did not incorporate the modifications suggested by SMUD to allow for the RPS adjustment to extend to purchases that fulfill utility green-pricing program requirements. We rely upon the requirements set by the California Energy Commission to determine whether a technology or particular generator meets their established eligibility requirements for the Renewable Portfolio Standard. As such, adjustments to a compliance obligation under section 95852 will only be applied for generation that meets these requirements. If electricity under SMUD's green pricing program meets the established RPS requirements, then it will be allowed to take the RPS adjustment. Likewise, if the electricity meets the requirements set forth in section 95841.1 for the voluntary renewable electricity retirement, then SMUD's utility green-pricing program could seek allowance retirement for their green-pricing program.

CRS suggests modifications made to section 95852(b)(4) allow for firmed and shaped electricity used to comply with the RPS adjustment would receive an adjustment, and would thus reduce the compliance obligation. The requirements contained in section 95852(b)(4) address megawatt-hours reported from an eligible renewable facility. All other power needed to firm or shape the renewable purchase will be reported just like any other electricity from a specified or unspecified source. This power will have an obligation for the associated emissions. The adjustment is applied to the compliance obligation of the first deliverer for the megawatt-hours from an eligible renewable facility reported pursuant to the MRR. Therefore, the adjustment is not made directly for, nor tied to, the firmed and shaped power. Again, we do not agree that the adjustment should be extended for renewable electricity generation that does not meet the requirements established by the CEC for RPS eligibility.

VRE Tracking Systems

I-45. Comment: We appreciate the recognition of renewable energy tracking systems in sections 95841.1(b)(2)(D) and (b)(3)(D). Renewable energy tracking systems are the most secure way to guarantee that RECs are properly retired, and help ensure that the correct number of allowances will be retired on behalf of each renewable energy sale.

We seek clarification regarding the required use of renewable energy tracking systems for VRE participants seeking allowance retirement. As currently written, it is unclear if renewable energy tracking systems are or ever will be required for voluntary market participants. While electronic tracking systems are a preferred means for showing REC retirement, they can be cost-prohibitive to generators below a certain size. It is recommended that if renewable energy tracking systems are required, generators below 10 MW be exempt from this requirement. Instead, for smaller generators not in a tracking system, an attestation should be required which states that the market participant has ownership of the renewable energy generation, and that they have not sold the renewable energy attributes separately to other customers or used it to make other renewable energy claims. (KUSTIN17)

> **Response:** We acknowledge the coalition's suggestion to consider attestations required by certification programs for smaller generators less than 10 MW, rather than tracking system data. We are aware that this requirement may place a burden on the smaller generator. However, to accurately account for allowances that will be retired, we will need to verify purchases of electricity and ensure that participants have not separated the REC from the electricity to sell to another entity, or to make a claim in another program. All participants must be able to prove this to ARB. We included a few options to meet this requirement. As we prepare to implement the program, we will prepare guidelines so that participants have a clear understanding of the documentation needed to meet the options included in section 95841.1(b).

General

Jurisdiction, BPA and WAPA

I-46. (multiple comments)
Comment: Bonneville Power Administration (BPA) previously submitted written comments on these matters on December 15, 2010 and August 1, 2011. ARB has not acknowledged or responded to BPA's comments. Western Area Power Administration (WAPA) submitted similar comments, which ARB has also failed to address. BPA will not repeat its earlier comments, but hereby incorporates them by reference. BPA again requests that ARB act on its comments, as set forth in its August 1, 2011 filing. As BPA has previously discussed with ARB staff, it is BPA's intent to voluntarily report on GHG emissions. BPA strongly disagrees with ARB's suggestions in its greenhouse gas reporting rules and cap and trade rules that it has "authority" to regulate BPA and that BPA is "required" to comply. BPA wishes to make clear that BPA is participating in California's GHG reporting program and cap and trade program purely on a voluntary basis, and BPA is not conceding that California has any jurisdiction over BPA. BPA files this letter to preserve that position. (BONNEVILLEPWR3)

Comment: Western Area Power Administration (Western) previously submitted written comments in the above proposed rules. Western will not repeat its earlier comments, but hereby incorporates them by reference. Western continues to express concerns that California Air Resource Board (CARB) is requiring federal agencies to consent to state jurisdiction. For instance, Section 96022 provides: Any party that participates in the Cap-and-Trade Program is subject to the jurisdiction of the State of California. These types of provisions could significantly impact the ability of federal agencies to voluntarily comply with CARB's proposed rules. Federal agencies are unable to consent to state jurisdiction without an express waiver of sovereign immunity. Only the U.S. Congress (with consent by the President) can waive sovereign immunity.

Western continues to encourage CARB to modify these provisions and acknowledge that federal agencies are not subject to state jurisdiction. While Western continues to disagree with CARB's suggestions in its greenhouse gas reporting rules and cap and trade rules that CARB has "authority" to regulate Western and that Western is "required" to comply, Western supports the state initiatives and has attempted to voluntarily participate in the state's green house gas (GHG) programs. Western understands the importance of having all in-state utilities participate in the GHG programs and to this end Western has had numerous conversations with and has provided data to CARB staff.

While Western welcomes continued interaction with CARB, Western wishes to make clear that Western's participation in CARB's GHG reporting program and cap and trade programs are on a voluntary basis and Western is not conceding that CARB has jurisdiction over Western in these matters. After CARB issues its final rule, Western will evaluate if, how, and to what extent, Western can voluntarily participate in CARB's GHG programs. (WAPA3)

> **Response:** ARB believes that section 118 of the Clean Air Act waives sovereign immunity for BPA. Additionally, this document only responds to comments regarding the cap-and-trade regulation (which includes section 95802) but does not include the other specific sections with which BPA takes issue, which are included in the MRR . Although the definition of "electricity importer" has changed through the course of two 15-day notices, BPA, DWR, and WAPA remain specifically named as electricity importers to California and subject to the cap-and-trade regulation.
>
> Section 118 of the Clean Air Act (42 U.S.C. 7418 (a)) provides a waiver of sovereign immunity for regulations to control air pollution:
>
> > "Each department, agency, and instrumentality of the executive, legislative, and judicial branches of the Federal Government … engaged in any activity resulting, or which may result, in the discharge of air pollutants… shall be subject to, and comply with, all Federal, State, interstate, and local requirements, administrative authority, and process and sanctions respecting the control and abatement of air pollution in the same manner, and to the same extent as any nongovernmental entity. The preceding sentence shall apply … (B) to any requirement to pay a fee or charge imposed by any State or local agency to defray the costs of its air pollution regulatory program… This subsection shall apply notwithstanding any immunity of such agencies, officers, agents, or employees under any law or rule of law."
>
> The United States Supreme Court, in *Massachusetts v. EPA,* 549 U.S. 497 (2007) determined that greenhouse gases are "air pollutants" as that term is defined in the Clean Air Act. The regulation constitutes an air pollution regulatory program designed to control greenhouse gas, and therefore falls within the

waiver of sovereign immunity provided by section 118 of the Clean Air Act. ARB appreciates BPA's participation in the programs operated by ARB.

Recommend New Regulatory Proceeding

I-47. Comment: LADWP strongly supports ARB's action to initiate a new regulatory proceeding in 2012 to address outstanding issues, including resource shuffling and electricity imports. LADWP recognizes that ARB plans to finalize this regulation by the October 28, 2011 deadline for submittal to the Office of Administrative Law. It is LADWP's understanding that ARB will initiate a separate regulatory proceeding in 2012 to address outstanding issues related to the implementation of the Cap-and-Trade program. LADWP recommends that this new proceeding be initiated as soon as possible and be flexible for staff to address unresolved issues that have already been identified, such as resource shuffling, as well as any new issues in relation to the Second 15-Day Modified Text, including those related to electricity imports.

As mentioned by many parties in response to the First 15-Day Modified Text, the inclusion of the new resource shuffling provisions requires a significantly more thorough review process to allow ARB staff and stakeholders an opportunity to better understand the intent of the language and to properly vet the potential implications for the electricity sector. This proceeding should include marketers, utilities, other market participants, CPUC, CEC, and CAISO as well as the WECC, NERC and FERC to ensure that this regulation, as it applies to electricity imports to California, accurately and consistently assigns emissions liability, promotes reliability, supports efficient market transactions, appropriately accommodates load emergencies in the WECC, and stands strong against potential legal infirmities. (LADWP5)

Response: ARB will continue to work with other State and federal agencies to monitor the impacts of the regulation all sectors, including the electricity sector. ARB will evaluate all areas of implementation, and will propose additional changes if needed. However, ARB has not specifically committed to opening a new rulemaking in 2012 for the purpose noted by the commenter, nor for any other purpose.

I-48. Comment: The resource shuffling provision does not accommodate load emergencies where a first deliverer may be asked to supply excess power under mutual assistance. The priority for grid operators is, first and foremost, coordinating and promoting bulk electric system reliability to avoid costly regional power outages that risk life and property. LADWP previously expressed concerns that the inclusion of the resource shuffling provision does not necessarily coincide with the normal and emergency operations of the grid required by Federal Energy Regulatory Commission (FERC) reliability standards. The inter-connectedness of the electrical transmission grid was recently demonstrated during a regional 12-hour blackout earlier this month that was triggered in Arizona and that affected areas as far away as San Diego, parts of Orange County and Riverside County and cost an estimated $97-$118 million in losses.

Given the critical nature of blackouts, LADWP strongly recommends that the ARB Board provide direction in the Board resolution to establish procedures under emergency scenarios that allow a covered entity to provide mutual assistance without the risk of penalty enforcement for perceived resource shuffling. A covered entity should not be forced to choose between providing mutual assistance to another load serving entity or staying in compliance with resource shuffling provisions of an emissions Cap-and-Trade program. As currently written, the regulation does not include a mechanism for distinguishing a real load emergency from any other type of market transaction that ARB might legitimately consider resource shuffling, the regulation does not include a mechanism for distinguishing a real load emergency from any other type of market transaction that ARB might legitimately consider resource shuffling. (LADWP5)

> **Response:** It is not our intent to capture typical electricity market activity under resource shuffling. This includes LADWP acting under an emergency situation to import power, or when providing mutual assistance under an emergency situation. The definition of "resource shuffling" and the prohibition are designed to capture intentional changes in market activity to avoid a compliance obligation. Legal requirements pursuant to the final regulation are clear. Consistent with ARB practices in implementing the regulation, we will continue to work with covered entities to ensure a successful program implementation. ARB continually evaluates its programs and will determine when future amendments are appropriate.
>
> In Resolution 11-32, the Board directed the Executive Officer to continue discussions with stakeholders to identify and propose, as necessary, during the initial implementation of the cap-and-trade program, potential amendments to the regulation, including the definition of "resource shuffling," to: (a) provide appropriate incentives for accelerated divestiture of high-emitting resources by recognizing that these divestitures can further the goals of AB 32; and (b) ensure that changes in reported emissions from imported electricity that serves California do not result merely in a shift of emissions within the Western Electricity Coordinating Council region, but instead reduce overall emissions.

Recommended Board Resolution

I-49. (multiple comments)
Comment: NextEra supports the comments submitted by two of our trade groups; the Independent Energy Producers of California (IEP) and the Western Power Trading Forum (WPTF). Highlighted below are several issues we feel must be addressed by ARB staff. Please refer to the comments submitted by IEP and WPTF on these issues. The specific areas NextEra has identified as areas of concern include:

- Criteria for utilizing the "RPS Adjustment" for imported renewable energy are not consistent with the California Public Utility Commission (CPUC) RPS program.
- The Resource Shuffling definition is still very broad and may impede market efficiency.

- Despite the direction of the Board Decision December 16, 2010, ARB staff has not provided a tangible cost-recovery option for independent energy producers subject to pre-existing power purchase contracts.
- The definition of Electricity Importer is still unclear and needs to be further developed in conjunction with CAISO, CPUC, and CEC staff.

It is important for ARB staff to address these issues adequately prior to the program going live in 2013. If these issues are not addressed by the Oct 28, 2011 deadline for submission to the Office of Administrative Law, NextEra urges ARB to open new rulemaking either late 2011 or early 2012 to address these specific issues in the regulation. This will allow time to gather input from all interested parties as well as experts in the electricity markets. It is important that the regulations are effective in reducing GHG emissions at the least cost to consumers. It is also important that the regulation of GHGs does not add unnecessary complexity to the electricity markets and all parties are treated fairly. The timing of the potential new rulemaking is critical and NextEra suggests that every effort be made to complete this process prior to the program launch in January 2013. (NEXTERAENERGY3)

Comment: WPTF remains concerned with several provisions in the Regulation that have the potential to unnecessarily raise costs impair the ability of obligated entities to comply with the cap and trade program. Several provisions could impair the ability of obligated entities to comply with the cap and trade program and the state's Renewable Portfolio Standard (RPS):

- Despite the guidance provided in the December Board Resolution approving the cap and trade program, the modified regulation does not adequately address the issues associated with carbon cost recovery by independent power producers operating under long-term contracts that pre-date AB 32 and do not provide for pass through of those costs.
- The definition of resource-shuffling is overly broad and could inhibit legitimate imports of clean energy.
- Requirements for claims of specified renewable imports and the RPS Adjustment conflict with the multi-year compliance framework of the RPS law.
- The approach to netting of "qualified exports" against an entity's imports within the same hour will significantly overstate California electricity consumption, thereby arbitrarily and unnecessarily raising allowance prices and overall electricity prices, and making the cap and trade regulation more vulnerable to legal challenges from electricity importers.

Due to the truncated rule-making process this year, WPTF believes that these issues have not been adequately considered and addressed by CARB. In our more detailed comments below, we explain why the Board must take action to ensure that CARB staff may continue to make modifications to address these important issues. WPTF understands the Board's desire to adopt an modified regulation so that implementation of the cap and trade program can proceed in 2012, and the concern that an acknowledgement that further refinements to the modified regulation are necessary may stand in the way of such implementation. WPTF does not believe that action by the

Board to preserve the ability for Staff to continue vetting these important issues with market participants, and to bring modifications to the Board as necessary, will serve in any way to conflict with adoption of the modified regulation in October. In fact, WPTF would support adoption of the cap and trade program in October, provided that CARB work to improve the modified regulation through stakeholder workshops and rule-making in 2012. We therefore urge that the following language be include in the Board Resolution adopting the cap and trade program:

“The Board directs the Executive Officer of the Air Resource Board to initiate Rulemaking to be completed by June 2012 to address the following outstanding issues in the cap and the trade program:

1) Establishment of a process to identify and provide for carbon-cost recovery to independent power producers operating under long-term contracts that do not provide for pass through of costs associated with compliance with the cap and trade program on a case by case basis;

2) Review of the auction purchase and holding limits to ensure that they are equitable to all covered entities and do not impair the ability of entities to manage costs of compliance with the program;

3) Review and modify the requirements for electricity imports, including:

   a. Elaboration of the definition of “resource-shuffling‟ and requirements for specified imports to ensure consistency with AB 32 goals, to provide clarity to importers and verifiers on how to identify (and thus avoid) resource-shuffling, and to permit legitimate claims to specified imports;

   b. Evaluation, and modification, of the requirements for renewable imports and the RPS Adjustment to ensure they are consistent with the statutory RPS framework and implementing regulations developed by the California Public Utilities Commission (“CPUC”) and California Energy Commission (“CEC”).

   c. Revision of the requirements for “qualified exports” and associated emissions subject to the cap and trade program to ensure that compliance emissions for the electricity sector accurately reflect California consumption of electricity;

The Board further directs the Executive Officer to contract with an independent entity with appropriate expertise in wholesale electricity markets to assist staff in addressing the complexities associated with implementing these regulations for electricity imports." (WPTF3)

Response: Legal requirements pursuant to the final regulation are clear. Consistent with ARB practices in implementing the regulation, we will continue to work with covered entities to ensure a successful program implementation. ARB continually evaluates its programs and will determine when future amendments are appropriate. Board Resolution 11-32 directs the Executive Officer to report on the status of the cap-and-trade program at least annually. Board Resolution 11-32 also directs the Executive Officer to continue discussions with stakeholders to identify and propose, as necessary, during the initial implementation of the cap-and-trade program, potential amendments to the regulation, including the definition of “resource shuffling,” to: (a) provide appropriate incentives for accelerated divestiture of high-emitting resources by recognizing that these divestitures can further the goals of AB 32; and (b) ensure that changes in reported emissions from imported electricity that serves California do not result merely in a shift of emissions within the Western Electricity Coordinating Council region, but instead reduce overall emissions.

Long-Term Contracts

I-50. (multiple comments)
Comment: In keeping with CARB staffs preference for long-term contract generators (LTCG) that cannot pass through new environmental costs to work directly with their customers, Panoche has continued to try to resolve this issue with PG&E. Unfortunately, PG&E has refused to work with us to find an equitable solution. Understanding that such negotiations were likely going to prove extremely difficult, Panoche, in its August 11, 2011 comments, urged that "to encourage negotiations between affected LTCGs and utilities, the Board should also consider providing that the parties engage in good-faith bilateral negotiations to resolve the issue of cost of compliance during 2012, before compliance obligations commence on January 1, 2013. If the parties have not come to a mutually-agreeable resolution at that time, the regulation should provide that LTCGs are granted allowances under the outlined terms." Although CARB staff continues to acknowledge this issue and its need for resolution, we were disappointed to find that staff, in its Second Notice of Public Availability of Modified Text issued on September 12, 2011 neither addressed nor resolved this issue.

Having taken staffs advice to attempt to resolve this issue in a bilateral fashion and having exhausted all avenues to try to resolve this issue with PG&E, we again urge CARB to directly address this issue through regulation. As such, we agree with the Independent Energy Producers Association's and Wellhead Electric's proposal for resolving this issue through an amendment of section 95834 "Disclosure of Beneficial Holding Relationships." This equitable solution would require an electric distribution facility to hold and surrender allowances for an LTCG's GHG compliance requirements as long as the LTCG is under a pre-AB 32 long-term contract with the electric distribution utility. Such an arrangement would be consistent with CARB's concept and regulatory construct of "beneficial holding relationships." Without relief provided by regulations, the new costs associated with AB 32 compliance will have a substantial negative impact on the financial viability of our facility as well as a limited number of other LTCGs. (PEC2)

Comment: In its present form the Cap and Trade Regulation is fundamentally unfair to holders of power purchase and sales agreements with electric utilities that were entered into before AB 32 was enacted ("Long-Term Contracts"). Because the Long-Term Contracts do not specifically provide for pass-through of GHG costs, the language of the Cap and Trade Regulation exposes the generators holding the Long-Term Contracts to substantial financial injury if the utilities refuse to assign GHG emission credits or allowances to them. Any hope of utility cooperation that could cure the above-mentioned shortcoming suffered a significant blow within days of the close of the comment period on the Cap and Trade Regulation. It is our understanding that some Fossil generator holders of the Long-Term Contracts (specifically tolling agreements) that have recently inquired have been bluntly notified by their utility counterparties that there will be no consideration whatsoever given to pass-through of GHG costs. It is therefore already quite clear that, absent corrective action by CARB, the imbalance of the economic interests of the parties to the Long-Term Contracts under the current Cap and Trade Regulation will have the predicted consequence of causing an increase in GHG emissions.

Additionally, Midway supports the Independent Energy Producers Association recent filing made to the CPUC concerning this threat and although this may seem to be this may be a small issue in the larger scheme of AB 32 implementation, for those of us impacted by this situation it is very serious. The uncertainty of what the impact of GHG compliance will be is causing apprehension as to the planning for operations and maintenance of these existing facilities. If we remain unable to recover the costs of GHG compliance, are not allocated any allowances and have to perform under our existing long term contracts, it is possible that we could eventually default on loan covenants and in the end cease to operate. We ask that the CARB staff assists in getting a solution in place for the small group of projects affected by this issue. The situation will not just go away.

Starwood Power-Midway, LLC urges that CARB seek to amend Section 95834 of the Cap and Trade Regulation to require utilities to enter into a "beneficial holding relationship" to cover the GHG emissions obligation of generators providing power and energy to the utilities under the Long-Term Contracts. A beneficial holding relationship should be deemed to exist pursuant to Section 95834(a)(1)(A) for any Long-Term Contracts that have not been clarified or renegotiated as of January I , 2012 to address GHG costs. Utility parties to the Long-Term Contracts should be required to purchase and hold allowances for the eventual transfer to generator parties for the sole purpose of supplying generators with credits or allowances sufficient to cover GHG emissions obligation under the Long-Term Contracts. An alternative approach would be to waive compliance on a case-by case-basis for as long as utilities withhold allowances or credits from generator owners that hold Long Term Contracts that can demonstrate financial hardship and good faith efforts to comply with the Cap and Trade Regulation.

In the absence of direct allocation of allowances to generator-holders of Long-Term Contracts, CARB should either amend the Cap and Trade Regulation as described here or grant limited waivers of section 95834 under defined circumstances as it relates to specific Long-Term Contracts. Thank you for your prompt attention to this notification of a predicted problem become real, and proposed solutions to correct a serious flaw in the Cap and Trade Regulation. We again urge CARB to directly address this issue through regulation. The equitable solution would require an electric distribution facility to hold and surrender allowances for an LTCG's GHG compliance requirements as long as the LTCG is under a pre-AB 32 long-term contract with the electric distribution facility. Such an arrangement would be consistent with CARB's concept and regulatory construct of "beneficial holding relationships." Without relief provided by regulations, the new costs associated with AB 32 compliance will have a substantial negative impact on the financial viability of our facility as well as a limited number of other LTCGs. (SPM)

Comment: Wildflower is very concerned that the regulation does not address, much less resolve, the circumstances of generators locked into long-term contracts executed before AB 32 was signed into law. Because these long-term contracts were entered into prior to AB 32, these contracts do not provide for recovery or allow for a pass through of greenhouse gas (GHG) compliance costs. As discussed below, CARB must take steps to specifically address these contracts in order to fulfill CARB's emission reduction objectives in an equitable manner. One of the fundamental assumptions of the cap-and-trade regulation is that generators and marketers will pass their GHG compliance costs onto the utilities. This assumption is not applicable to this special situation of pre-AB 32 long-term contracts.

Wildflower is the owner of Larkspur Energy and Indigo Generation, two natural gas-fired power plants operating in Southern California (facilities). On January 17, 2001, Governor Gray Davis proclaimed a State of Emergency to exist due to the energy shortage in the State of California. Subsequently, on February 8, 2001 and on March 7, 2001, Governor Davis issued Executive Orders D-26-01 and D-28-01, requiring the Energy Commission to invoke the emergency siting procedures in Public Resources Code section 25705 to expedite the licensing of all new renewable and peaking power plants that could be available for service no later than September 30, 2001. In these orders, Governor Davis declared that all reasonable conservation, allocation, and service restriction measures will not alleviate this energy supply emergency and that new generation was needed to avert an immediate threat to public health and safety. Larkspur was the first facility licensed under this emergency siting process and Indigo was similarly licensed under this process. At that time, the State strongly encouraged execution of long-term power purchase agreements for these emergency facilities, in order to avoid some of the spot-market fluctuations that exacerbated the energy crisis. Wildflower's facilities entered into long-term tolling contract with a third-party power marketer through 2021 which does not provide any mechanism for cost recovery of GHG gas compliance costs. The marketer that purchases power under this contract has declined to renegotiate to address these substantial and previously unforeseen GHG costs. Consequently, Wildflower has no ability to recoup the GHG compliance costs starting July 2012, when the first cap-and-trade auction occurs.

Failure to timely address pre-AB 32 long-term contracts undermines the equity and integrity of CARB's cap-and-trade program. One of the assumptions underlying the cap-and-trade is that generators and marketers will pass their compliance costs onto the utilities. Appendix A of the regulation notes that "a central principle of the allowance allocation to the electricity sector is the incorporation of customer cost burden. Cost burden is expected to result from emissions costs associated with fossil, QF, and non-emitting resources priced at market being passed from generators and marketers to utility customers." However, in the case of Wildflower selling to a marketer, the utility will purchase power at a market price that includes a GHG cost assumption, but the marketer will never actually incur the costs of GHG compliance because Wildflower's facilities could not pass on their GHG compliance costs. This potentially gives arise to a (much abhorred) windfall profit opportunity for the marketer.

Further, the fundamental emission reduction goals of the cap-and-trade will be thwarted if CARB does not address these pre-AB 32 long-term contracts. Some of these contracts, including Wildflower's agreements, are structures where the purchasing entity can effectively call on the generator to run (full dispatch control). These contracts will be the only resources where the purchaser does not face a GHG compliance cost. Consequently, the purchaser will have an incentive to run the resource more often, irrespective of its GHG emissions profile. This result has the potential for disrupting the most efficient use of California's resources, and will tend to increase overall GHG emissions levels.

The need to address pre-AB 32 long-term contracts is clear, and yet there is no recognition of the issue in the September 2011 version of the regulation. Moreover, the counter-parties to these contracts currently have no incentive to renegotiate the terms of these agreements. Wildflower requests that CARB specifically acknowledge the need to timely address the pre-AB 32 long-term contract issue in the resolutions for adoption of the cap-and-trade regulation. A draft Board Resolution is attached to this letter as Attachment 1. Additionally, Wildflower requests that CARB direct staff to continue to evaluate and work with affected generators towards the successful resolution of these concerns.

Wildflower provides three proposals with suggested amendments to the regulation to address the pre-AB 32 long-term contract issue in Attachment 2. Wildflower welcomes the opportunity to provide additional input to staff on specific ways in which these issues may be resolved.

Wildflower Proposed Board Resolution Addressing pre-AB 32 Long Term Contracts:

WHEREAS some electricity generators and combined heat and power facilities entered into long-term contracts before the enactment of AB 32, which do not provide any mechanism for pass-through of costs associated with greenhouse gas emissions.

WHEREAS without further consideration from CARB of pre-AB 32 long-term contracts that do not allow for pass-through of costs associated with greenhouse gas emissions, parties that do not bare greenhouse costs compliance costs under these contracts will not have an incentive to renegotiate the contracts to provide pass-through of greenhouse gas costs.

NOW THEREFORE staff will work with interested stakeholders to ensure proper treatment under the regulation of any electricity generators or combined heat and power facilities with pre-AB 32 long-term contracts that do not allow for pass-through of costs associated with greenhouse gas emissions.

Wildflower's Proposals for Cap-and-trade Regulation Amendments to Address Pre-AB-32 Long-term Contracts with no Available Mechanism for Pass-Through of GHG Costs:

Proposal 1: Require the creation of a beneficial holding relationship when parties to a pre-AB 32 long term contract without GHG cost recovery do not renegotiate the agreement. Add Subsection 95834(d):

(d) In the event there is a Long-Term Contract for the sale of electricity at wholesale which: i) does not directly or indirectly provide or refer to GHG costs either explicitly or through a) a CPUC approved contract or, b) a CPUC authorized pricing basis that includes GHG costs, ii) was fully executed before the final approval of AB 32 (September 27, 2006); and, iii) has not been renegotiated as of January 1, 2012 to address GHG costs, then, a beneficial holding relationship is deemed to exist pursuant to section 95834(a) without further action. The purchasing party to the Long-Term Contract shall purchase and hold allowances for the eventual transfer to the other party to the Long-Term Contract for the sole purpose of supplying the second entity with compliance instruments to cover emissions resulting from satisfaction of the Long-Term Contract.

Proposal 2: Provide a narrowly tailored exemption for generators that are operating under a pre-AB 32 long term contract without GHG cost recovery. Add Sub-Section 95852.2(d):

(d) The operators of existing combined heat and power and generation facilities that operate under a contractual arrangement executed before September 27, 2006, does not provide or refer to either explicitly or through a) a CPUC approved contractor. b) a CPUC authorized pricing basis that includes GHG costs, ii) was fully executed before the final approval of AB 32 (September 27, 2006): and iii) has not been renegotiated as of January 1, 2012 to address GHG costs.

Proposal 3: Provide free allocation of allowances. Add Sub-Section 95870(/):

(f) Allocation for the purpose of assistance to generators and combined heat power facilities with no means of GHG cost recovery. The Executive Director shall transfer allowances necessary to cover the operation of the generators or combined heat and power facilities that meet the following qualifications: the operators of existing combined heat and power and generation facilities that operate under a contractual arrangement executed before September 27, 2006, does not provide or refer to either explicitly or through a) a CPUC approved contract or , b) a CPUC authorized pricing basis that includes GHG costs: ii) was fully executed before the final approval o(AB 32 (September 27. 2006): and, iii) has not been renegotiated as of January I, 2012 to address GHG costs. (WILDFLOWER)

Comment: Wellhead Electric Company, Inc. (Wellhead) is disappointed and remains very concerned that the proposed cap-and-trade regulations still do not address the problems associated with contracts that were executed prior to AB 32 which do not have any mechanism available for recovery of GHG costs. As more fully discussed in our comments on the prior version of these regulations, unfairness, counter-to-AB 32 behaviors, and unintended enrichment (windfall profits) will result if the problem is not fixed. The solution is very simple but without action by the California Air Resources Board, it is highly unlikely the issue will do anything other than continue to be a problem. Wellhead does understand from workshops discussions and communications with staff that the problem is recognized and that the California Air Resources Board will address and fairly resolve the problems before the regulations take effect. Our prior comments are attached hereto for your convenience. We look forward to working with the CARB staff to address/resolve this significant problem which the current versions of the regulations ignore. (WEC3)

Comment: ARB should reiterate their policy to consider, on a case-by-case basis, the need for adjustment to allowance allocations for firms operating under long-term contracts. (IGPACC2)

Comment: PEB incorporates by reference and reiterates its previous comments to the first 15-day Amendments that were submitted by PEB and received by CARB on August 11, 2011. PEB strongly believes that those comments reflect the unique posture of PEB as a stranded cogeneration facility and merit immediate consideration. PEB looks forward to the CARB's attention to those concerns as the project anticipates that the current regulations pose a potentially adverse impact upon PEB's long-term financial viability and, in turn, UC-B's access to reliable thermal energy.

PEB notes that in the 2nd 15 day Amendment to the California Cap on Greenhouse Emissions and Market-based Compliance Mechanisms, CARB has selectively encompassed all facilities under NAISC code 92811 and has given them an additional year of compliance exemption (see section95852.2(c)). While this additional exemption is narrow in its current focus, it is our hope that it could provide CARB with a basis to offer a similar exemption to PEB through the expiration of PEB's energy supply agreement with UC-B in 2017, at which point PEB will be free to negotiate a cost recovery mechanism with its thermal customer. A CHP facility such as PEB represents a class of generation assets that merit "appropriate incentives" as outlined in California Cap and Trade Program Resolution 10-42, yet PEB is clearly stranded under the currently proposed modified Cap-and-Trade regulations and lacks a cost recovery or pass-through mechanism tied to the end user of the thermal energy that it generates, as contemplated by AB 32 and by the clear intent of the public policy that underlies this program. A decision by CARB to decline to address this difficult issue facing PEB would only further the inequitable result embodied in the current regulations, which acknowledge certain gaps in the regulations with respect to select affected parties, yet fail to address the real needs of a similarly situated facility. PEB is proud of its record as a responsible environmental steward and looks forward to working with CARB to refine the proposed cap and trade regulations to underscore California's need for efficient cogeneration technology as a critical part of any long term solution to the challenge of limiting man made greenhouse gas emissions. (PEBI2)

Comment: Allowances should be granted to entities with no ability to pass through costs; changes creating new disadvantaged parties should be rejected. In the December Board Resolution approving the cap and trade program, the Modified Regulation Order does not adequately address the issues associated with carbon cost recovery by entities obligated under long-term contracts. As noted in comments and in CARB stakeholder processes, renegotiation is not possible in situations where one party is disadvantaged. There is no incentive for the advantaged party to negotiate. CARB should provide free allowances to those limited number of entities that entered long-term contracts that have no ability to pass through the cost of carbon. (SHELLENERGY2)

Comment: The modified regulation must include a mechanism to adequately address the issues associated with carbon-cost recovery to independent generators operating under long-term contracts that do not provide for pass through of the compliance costs. The CARB Staff proposal for modification to the original proposed regulatory order, submitted to and approved by the Air Resources Board on December 16, stated that "Staff will work with interested stakeholders to ensure proper treatment under the regulation of any electricity generators or combined heat and power facilities with pre-AB 32 long-term contracts that do not allow for pass-through of costs associated with greenhouse gas emissions." WPTF members, as well as other affected power producers have had numerous interactions with CARB staff on this issue over the past year. WPTF understands CARB's desire that such issues should be address by the contractual counterparties, and it is WPTF understanding that attempts to do so remain ongoing. Nevertheless, the fact remains that there is little incentive for a contractual solution when the parties to the transaction are not approaching the negotiations on a level playing field; the current modified regulation disadvantages one counterparty over the other, ultimately discouraging contract renegotiation. WPTF has provided CARB staff with proposed language to address these issues. Despite these efforts, the modified regulation still provides no mechanism to ensure that affected power producers can recover their carbon cost, even though other capped entities that cannot recover carbon costs receive direct assistance in the form of direct allowance allocation. WPTF has previously provided recommendations on criteria for evaluating the situation of power producers under long-term contracts and a process for ensuring cost recovery through allowance allocation. We urge CARB to establish a process to:

- Define the conditions under which an independent power producer would be eligible for cost-recovery assistance (e.g., contracts entered into after adoption of AB 32 would not be eligible for relief);
- Identify documentation to be provided by the producer to demonstrate that it meets these conditions;

- Facilitate renegotiation of contracts in cases where the counter-party receives a direct allocation of allowances under the cap and trade program; and/or
- Provide for direct allocation of allowances to independent power producers to cover emissions associated with these contracts in cases where the contract cannot be renegotiated. (WPTF3)

Comment: Calpine is disappointed that CARB has again failed to address the situation faced by long-term contract generators that cannot recover the cost of allowances from their customers under contracts initially entered into prior to the passage of AB 32.

As we previously noted, the problem is particularly acute for generators selling electricity and/or useful thermal energy to nearby or collocated industrial operations under long-term contracts. These combined heat and power (CHP) or cogeneration facilities represent a highly efficient, environmentally preferable alternative to meeting industry's energy needs. For this reason, CARB has made expansion of CHP a significant component of its overall Scoping Plan, which targets an increase of 4,000 MW of installed CHP capacity within the State by 2020. In light of this mandate, "the Board direct[ed] the Executive Officer [in Resolution 10-42] to review the treatment of combined heat and power facilities in the cap-and-trade program to ensure that appropriate incentives are being provided for increased use of efficient combined heat and power."

As we previously noted, however, in many cases industrial facilities qualifying for free allowances under the Proposed Regulation purchase power and steam from a cogeneration facility pursuant to a contract that does not provide any means for recovery of the cogeneration facility's allowance costs. As a consequence, the industrial host will experience no increase in its energy costs due to a fixed price in a contract that pre-dates AB 32 with a CHP generator, even though it will receive a direct allocation from CARB to address potential leakage concerns. Given the anticipated increase in operating costs associated with purchase of allowance, the CHP facility would, in many cases, have little incentive to continue operating and could very realistically decide to just shut-down. Such a result would not only undermine the Scoping Plan goal of increasing CHP throughout the State by 4,000 MW of CHP capacity, it could result in a net reduction of that amount.

Given this possible outcome and the Scoping Plan's goal, CARB staff committed prior to approval of the Proposed Regulation in December 2010 to "work with interested stakeholders to ensure proper treatment under the regulation of any electricity generators or combined heat and power facilities with pre-AB 32 long-term contracts that do not allow for pass-through of costs associated with greenhouse gas emissions." However, in both the First 15-Day Amendments and the Second 15-Day Amendments, CARB Staff has failed to propose any regulatory provisions that would alleviate the extreme economic burden imposed upon long-term contract generators that cannot recover allowance costs from their customers. Instead, Staff noted the concern in the Notice accompanying proposal of the First 15-Day Amendments and suggested that this problem should be resolved through bilateral contract negotiations.

We understand that CARB Staff may have been reluctant to propose regulatory language that could frustrate ongoing efforts between long-term contract generators and their counterparties to resolve this issue, independent of any resolution within the final regulation. However, by failing to include any mechanism to address this problem in either set of 15-Day Amendments, CARB Staff has not only failed to carry out the Board's instructions to address this issue, but may have frustrated any realistic chance that this problem will be successfully resolved by long-term contract generators and their counter-parties.

As detailed the Initial Statement of Reasons for the cap-and-trade regulation, some generators and industrial steam producers have reported that some existing contracts do not include provisions that would allow full pass-through of carbon costs associated with cap-and-trade. Staff is evaluating this issue to determine whether some specific contracts may require special treatment on a case-by-case basis. In several cases, staff is aware and encouraged that parties are in the process of, or already have negotiated new contracts to resolve this issue. Staff believes that bilateral contract negotiations would provide the best resolution of this issue. Should contract renegotiation not be possible in all cases, staff will continue discussions with counterparties to consider how this issue should be resolved in the regulation. Should the final regulation not address this issue and instead award free allocations to industrial entities purchasing steam or power pursuant to long-term contracts that do not provide for recovery of allowance costs, those entities will have little to no incentive to assume some share of responsibility for the generator's allowance costs.

Calpine is endeavoring to work with its counter-parties to address this situation via bilateral contract negotiations. However, we are not hopeful that we will be able to resolve the situation in all cases, particularly given CARB's failure to address the issue in either package of 15-Day Amendments. We continue to believe that the best way to address this problem is through a direct allocation of emissions allowances to generators subject to long-term contracts that provide no mechanism for recovery of allowance costs. This would merely provide transitional assistance until such time as the existing contract expires or is substantively amended, as reflected by the specific language we proposed in our December 2010 Comments. As we previously proposed, none of the allowances provided for such assistance could be sold or otherwise used by the generator to experience some windfall in profits.

At the very least, we believe CARB must revise the Proposed Regulation so that, where entities that would receive an allocation for industrial assistance will experience no increase in their energy costs due to a pre-AB 32 contract, the allowances will not be awarded to that entity, but will be given to its counter-party instead. If CARB cannot incorporate provisions addressing long-term contract generators into the final regulation, we strongly urge the Board to instruct Staff to address this issue in a separate rulemaking to be commenced at the earliest opportunity in 2012. (CALPINE4)

Comment: We are disappointed that CARB refuses to address the need for a mechanism to allow compliance cost recovery for small generators such as WM's Norwalk combined heat and power (CHP) facility. Failure to provide for equitable resolution of contract provisions will result in small generators shouldering the burden of compliance costs to meet the requirements of cap and trade. The regulation incorrectly assumes contract renegotiation will resolve this cost issue, thus assuming both parties are equal in their contract position. Nothing could be further from the truth. We understand that CARB has deferred the effectiveness of covered entities' compliance obligation under cap and trade regulations until January 1, 2013, perhaps believing there is time to resolve this important issue in future rulemaking. However, time is of the essence. The auctions of GHG emission allowances will begin in the second half of 2012. Thus, by no later than the second quarter of 2012, the Norwalk facility must decide whether and to what extent we must obtain GHG emissions allowances in the auctions. Our compliance decisions must be made based on a clear understanding of whether and how we are able to comply with the CARB regulations. Merely "punting" this issue to the California Public Utilities Commission (CPUC) in hopes that agency will address cost recovery for certain independent power producers like Norwalk will not resolve the issue, as there is no legal proceeding available at this time that has accepted the issue for proper hearing and resolution to make right the current inequity. We urge CARB to reconsider its position to remain silent in the current rulemaking, or move in an expedited fashion as part of another rulemaking to address this issue. (WM4)

Comment: SMUD invested in three cogeneration facilities in the 1990's to provide clean, efficient power for our ratepayers while encouraging low-emissions industrial facilities in our service area. Unlike typical cogeneration facilities, which supply electricity and steam to an industrial facility and sell any excess electricity to the grid, these cogeneration plants provide electricity only to the grid and supply steam which is sold over-the-fence to industrial facilities nearby. The contracts for steam sales to these industrial facilities allow no flexibility for pass through of the carbon allowance costs. Nor were the emissions from providing this steam recognized in the ARB methodology for allocating allowances to electrical distribution utilities, as this was based upon retail load projections alone, ignoring steam sales. Hence, SMUD and SMUD's ratepayers have the obligation of compliance for the emissions associated with the steam sales, but the Cap and Trade program does not recognize this obligation. The proposed 15-day language for the Cap and Trade program imposes an allowance obligation on the extra emissions needed to produce process steam that is delivered to industrial customers near the plant, but not used to cover SMUD's retail load.

A remedy for this apparently uncommon cogeneration arrangement would be to allocate to the steam provider a requisite portion of allowances from the industrial sector to cover emissions associated with provision of steam to the industrial customers. This would partially remove the burden to SMUD ratepayers and the otherwise illogical problem of a combined cycle generation facility with what appears to be a higher heat rate than normal. To acknowledge this situation and accommodate others that may potentially fall in this category, modify section 95891(c) as follows:

(5) Wholesale Steam Sales. For covered entities who are under Long-term Steam Contracts to supply steam to an industrial facility that does not contain a clause to pass through the cost of compliance, allowances will be provided to the steam provider in the amount equivalent to what the industrial facility would have received if its emissions were covered in the industrial sector. (SMUD4)

Comment: SMUD recommends splitting the definition of "Long Term Contract" into two terms—reflecting Electricity and Steam Contracts. Modify section 95802(a)(156) and 157) as follows:

(156)"Long-Term Electricity Contract" means a contract for the delivery of electricity entered into before January 1, 2006 for the term of five years or more.

157)"Long-Term Steam Contract" means a contract for the delivery of steam entered into before January 1, 2006 for the term of five years or more. (SMUD4)

Comment: IEP remains concerned that the cap-and-trade regulations do not address the treatment of existing contracts, executed prior to the passage of AB 32, that do not have a reasonable means of recovering the cost of GHG allowances required for their continued operation. In general, obligated entities under the cap and trade program (e.g. IOUs, publicly owned utilities, industrial entities, refineries, etc.) are to be allocated free allowances to compensate them for the negative impacts of the GHG program on their market positions, regardless of whether they have a market in which they can pass along to consumers the costs of GHG allowances.

The only exception to this rule is the treatment of IPPs, which are all required to obtain allowances via an auction. For many IPPs this approach is acceptable as they have mechanisms available to recover or pass through the costs of GHG allowances. However, for a small subset of IPPs operating under existing contracts, currently no viable mechanisms exist within their existing contract structures to recover the cost of the GHG allowances they must obtain to comply with the Cap and Trade program. This lack of specific consideration in the cap and trade regulation regarding generators caught in these specific circumstances raises serious equity and consistency concerns. (IEPA3)

Comment: Both CARB and other agencies have noted the need for appropriate treatment of this limited group of contracts, yet to date, no remedy has been provided. Recognition of this issue dates back to the early work of the Market Advisory Committee. More recently, CARB itself acknowledged the problem in its Initial Statement of Reasons for the cap-and-trade program as well as subsequent summary documents for previous versions of the regulation. However, the most recent version of the regulation provides no consideration of this issue whatsoever.

CARB Staff has indicated its preference for resolution of this issue through contract renegotiation between contract counterparties; however, the counterparties to the IPPs have no incentive to renegotiate these contracts as these will be the only generation resources for which the electricity purchaser does not incur a carbon cost. A counterparty's ability to avoid these costs enables the buyer to garner windfall profits from the sale of the electricity in a market where the Market Clearing Price (MCP) contains a GHG value.

In the case of tolling agreements where a utility can call on or effectively "run" the generator, the utility will have an incentive not to renegotiate the contract. In fact, the utility has a perverse incentive to run such a generator more because the generator, without the ability to include cost recovery for GHG allowances in its price, will appear relatively cheaper than resources that include the cost of GHG allowances in their price, either through contract price or the wholesale market price. This distortion of the GHG price signal could lead to increased GHG emissions, contrary to the objectives of the cap-and-trade program (e.g. if a higher-emitting resource is dispatched ahead of a lower-emitting resource solely because the higher-emitting resource's price does not reflect the cost of GHG allowances).

In addition to the counterproductive emissions impacts, failure to address these contracts will also undermine CARB's policy for freely allocating allowances to the distribution utilities. The utilities get free allocation under the assumption that ratepayers incur GHG costs when the utility purchases power at wholesale, under bilateral contracts or through the utility's own compliance obligation for UOG. If the utility can avoid the GHG costs for some contracts, then it should not be receiving free allocation to cover the costs of GHG from generation resources with contracts that do not allow them to pass through the cost of GHG allowances. Since the utilities will receive direct allocation for costs they will not bear under long-term contracts, the fundamental emission reduction and cost allocation principles (i.e. CARB's policy rationale for direct allocation to the distribution utilities) will be undermined.

To avoid these detrimental impacts on the program, IEP requests that the Board explicitly recognize this problem and through Resolution provide affirmative direction that CARB will continue to evaluate the issue and provide a remedy for these affected IPPs before the first auction in 2012. Specifically, CARB should create a place for these affected IPPs to receive free allowances by reducing utility or industrial sector allocations when those allocations account for GHG emission costs that the utility did not incur due to a contract that was (1) executed before the passage of AB 32, and (2) that has no ability to recover GHG allowance costs. Alternatively, in instances where the counterparty does not receive free allocations, CARB should state that it will evaluate amendments to direct the compliance obligation to the entity (such as a marketer) that is able to recoup the GHG costs. (IEPA3)

Comment: The current cap-and-trade regulations do not provide a formalized transition process for facilities that can potentially convert from high carbon fuels to lower carbon fuels or technologies. Without a transition mechanism, the new cap-and-trade regulations, which will begin incorporating a carbon cost into the electric sector as soon as 2013, will discourage transitions to lower carbon systems, particularly where those higher transition costs cannot be passed through existing power and/or steam contracts. To avoid premature closure of these facilities and associated economic impacts on employees, related industries, and local economies and governments, CARB should amend the cap-and-trade regulation to allow a limited mechanism to support these plants during the conversion from high carbon fuels to lower carbon fuels or technologies. ACE Cogeneration, Rio Bravo Poso and Rio Bravo Jasmin have identified two methods for achieving such a conversion with respect to costs associated with electric sales. Either method would provide a workable transition path for these facilities. Each proposal includes language which could be incorporated into the cap-and-trade regulation. With respect to costs associated with thermal energy provided under contracts without cost recovery mechanisms, a similar approach should be included for provision to unaffiliated entities in the industrial sector in a way that reflects the contribution of the thermal energy input in the product-based benchmark. General language is proposed here because it is our understanding that the detailed benchmark calculations used for industrial assistance are held in confidence by staff. (ACERIO2)

Comment: Under the regulation, the operators of "third party" CHP facilities face stranded costs in terms of the emissions associated with the thermal, and in some cases retail electricity, provided to the host application under such legacy steam and/or electricity contracts.

The CCC, along with many other stakeholders, has repeatedly described the problem and proposed a variety of solutions. We were disappointed to see that the second 15-day modified rule remained silent on this issue. While parties can attempt to renegotiate existing contracts to enable cost recovery, the reality is that the CHP operator has no leverage in those discussions. Consequently a backstop is essential and in these comments the CCC offers another possible solution that would more accurately allocate allowances to the electricity sector, and preserve a set-aside of allowances for resolving the CHP legacy contract issue. The CCC agrees with the ARB staff proposal to allocate 89 MMT of allowances to the electricity distribution utilities (EDUs) based on the 2008 reported emissions pursuant to the ARB Mandatory Reporting Regulation (MRR) associated with electricity procured from non-CHP generators and importers of electricity. The CCC also agrees that the EDUs should be allocated allowances associated with electricity purchased from CHP generators. The CCC does not agree, however, that the CHP allowances should be based on the proposal by the Joint Utility Group (JUG). The CCC recommends instead that the allowances attributed to CHP should be based on the same MRR data used to calculate the 89 MMT from non-CHP sources. The value of the auction proceeds from these allowances should be distributed to consumers of electricity in a manner that does not discriminate against any supplier, including the supplier of electricity from a cogeneration facility that is consumed directly by an end user located on-site or on an adjacent parcel. The CCC further proposes that a portion of the remaining emissions reported from cogeneration should be made available as allowances for transition assistance to address the thorny and still unresolved issue of legacy contracts for CHP facilities that have no means to pass through the additional cost of AB 32 compliance. CCC agrees that negotiation between a CHP producer and its thermal or electric energy host is the preferred method to resolve the issue of legacy contracts; however there must also be a backstop for those situations in which negotiation is unsuccessful. This backstop should be designed to incent the affected parties to reach agreement rather than to rely on the backstop.

Pursuant to the MRR, each entity that reports GHG emissions associated with cogeneration as its primary or secondary sector, has already provided ARB with the data necessary to distribute emissions from cogeneration between wholesale electricity sold to an EDU for resale, electricity consumed by an end-user pursuant to California Public Utilities Code Section 218(b) and thermal energy consumed by a host. Allowances equal to 90 percent of the emissions associated with wholesale purchases of electricity should be allocated to the EDUs in addition to the 89 MMT associated with non-CHP sources. The source of data for emissions associated with purchases from CHP facilities would then be consistent with the source of data for electricity from non-CHP sources. The quantity of allowances available for allocation to EDUs and to the two special-use holding accounts described below will be subject to the cap adjustment factors in Table 9-2. Allowances equal to 90 percent of the remaining emissions from cogeneration should then be deposited into two special-use holding accounts under the control of the Executive Officer; one account reflecting emissions from retail electricity to address transition issues associated with legacy contracts for retail electricity and the other account for emissions associated with thermal energy. Beginning with budget year 2013, a cogeneration facility with a compliance obligation that is a party to an agreement to sell thermal energy to a non-affiliated thermal host that was executed prior to January 1, 2006 and does not allow the seller to recover GHG compliance costs, may apply for transition assistance. That application must include (i) a copy of all contracts dealing with the purchase and sale of thermal energy and (ii) an affidavit certifying (a) that the submitted contract(s) are a complete and accurate record of all relevant agreements between the parties, (b) that the parties have entered into good faith negotiations to revise the contract(s) to allow for the pass through of GHG compliance costs, and (c) the parties are unable to reach agreement. Copies of contracts may be submitted with a request for confidential treatment. Upon review and verification of the application and all supporting documents, ARB staff will approve the application and request that the Executive Director transfer allowances to the applicant equal to 75 percent of the compliance obligation of the applicant attributed to thermal energy. Additional requests may also be submitted for compliance years 2014 and 2015; However the maximum number of allowances that may be allocated for budget years 2014 and 2015 will be 50 percent and 25 percent, respectively, of the compliance obligation associated with thermal energy for that budget year. No further allowance allocations associated with transition assistance for legacy contracts will be made after budget year 2015. Transfers by the Executive Officer to the registered holding account of the applicant will be made by November 1st of the year following the year in which the compliance obligation was created. For any budget year in which the quantity of transition assistance allowances approved for all applicants exceeds the quantity of allowances allocated to the special-use holding account, the available quantity of allowances will be allocated on a pro rata basis. Any allowances in the special-use holding account in excess of the allowances approved for transition assistance in any budget year will be designated for sale at auction pursuant to section 95870(f). In the special case of a thermal host of an applicant approved for transition assistance that is eligible for EITE assistance pursuant to section 95870(e), an appropriate adjustment will be made to the counterparty's EITE allocation for that budget year to avoid a windfall gain by the host. The CCC proposes a comparable provision in the regulation to address legacy contracts between a cogeneration facility and a non-affiliated host for the sale of electricity pursuant to Public Utilities Code section 218(b) in which there is no provision for the seller to recover AB 32 compliance costs. (CACC3)

> **Response:** Most of the comments above fall outside the scope of the second 15-day changes to the regulation. Nevertheless, we recognize the difficult situation of contract renegotiation for generators and marketers in regard to the compliance cost. We do not agree with stakeholders it is our responsibility to make these parties whole, or move them toward realizing they are whole by providing the various options of transition assistance suggested in the comments. Generally, we believe contract negotiation discussions included which party would bear future costs, and the price agreed upon in the contract reflected this risk. Additionally, if we were to resolve the issue by including language that would make parties whole we would be interfering in potential future contract renegotiation, or negotiation between parties investigating and preparing potential funding to support a switch to fuels which emit less GHGs.
>
> Some stakeholders such as IEP, Wellhead Electric, Starwood Power Midway LLC., Wildflower, and supported by the Panoche Energy Center suggest amendments to section 95834, "Disclosure of Beneficial Holding Relationships." Their suggestion would require an EDU to be obligated for contracts with no cost pass-through mechanism, as long as the contract was entered into before the signing of AB 32. These comments suggest that utilities party to long-term contracts enter into beneficial holding relationships with the other party to purchase and hold allowances for the generator's emissions, and then transfer allowances for these emissions to the generator's compliance account. Again, the comments are outside of changes described in the second 15-day changes to the regulation. However, we believe that, for these legacy contracts that include the IOUs as a party, these generators should continue to work through either the CPUC's GHG Cost Revenue or the Long-Term Procurement Plan proceedings. The scoping memo for the Order Instituting a Rulemaking (OIR) for the cost revenue proceeding includes reference to this situation for both QF and non-QF generators. Nevertheless, we also remind parties of the opportunity to voluntarily participate in a beneficial holding account pursuant to section 95834(a)(3). This provision allows EDUs to serve as the agent in a beneficial holding relationship for another registered entity, if there is a contract between the two parties for the delivery of electricity. Under the requirements contained in this provision the EDU may transfer compliance instruments to cover emissions attributed to the electricity under contract.

As discussed in previous responses, we do not want to interfere in potential re-negotiations of contracts. Some parties were able to renegotiate their contracts to include the cost of the GHG obligation. Additionally, for contracts that expired prior to January 1, 2013, the modification to the compliance obligation commencement date decreased the number of contracts that would be affected. ARB determined that it was necessary to get the market tracking, auction, and market oversight systems in place and operating prior to the commencement of the first compliance period. As a result, parties with contract terms ending prior to this date are now able to renegotiate the GHG cost.

For the other contracts, some entities were able to put many funding options and opportunities together and are investing in plant modifications to support switching to fuel sources; in particular, renewable fuel sources that are RPS eligible. RPS-eligible fuel sources provide an additional funding opportunity to support the fuel switching through the sale of RECs.

However, we acknowledge there are still parties that have not been able to determine a path to resolve GHG costs and are still not able to pass the costs through to consumers. The counterparty has no incentive to open up the contract. Some of these counterparties have fuel and other subcontracts which support the electricity generation. If contract renegotiation were to pass the GHG costs down from the generator, these parties would also have to open up their supporting contracts to pass costs down. For some of these contracts, the fuel costs agreed upon are a result of hedging fuel prices. Counterparties claim they could be stuck with the GHG costs because they are not able to renegotiate the fuel or other supporting contracts.

Constellation Energy for ACE Cogeneration, Rio Bravo Poso, and Jasmin facilities comment that these facilities will undergo modifications to support the transition to a fuel source that emits less GHGs than the current solid fuels. Constellation requests that the regulation be amended to include language for a limited mechanism to support projects that are transitioning fuels, such as the Rio Bravo Poso and Jasmin facilities. They include two options. However, as mentioned above, the suggested changes fall outside the scope of the second 15-day changes to the regulation. We acknowledge the options suggested by Constellation and suggest that Constellation approach the CPUC and/or Public Utility Boards, as this might be an opportunity for use of allowance value by the utilities.

The California Cogeneration Council (CCC) and PE Berkeley comments acknowledge the modifications made to section 95852.2 (c), which provides an exemption from a compliance obligation to military facilities. CCC and Wildflower suggest a similar exemption be extended to the emissions attributed to thermal energy or electricity sold to military facilities, to ensure equitable treatment. However, if the CHP operator is providing thermal or electricity to a military facility, the exemption we provide to the military does not prohibit the generator or CHP operator from passing costs down to the military facility. PE Berkeley, Inc. suggests a similar exemption for their facility because they supply electricity to PG&E and thermal energy to UC Berkeley. They claim they are in a unique situation in providing thermal energy to the UC campus because the contract, which expires in 2017, does not contain a cost pass through mechanism.

The CCC suggests an alternative methodology for assigning emissions for CHP. They propose that assigned emissions be based on the same 2008 MRR data used to calculate the 89 MMT from non-CHP sources. The value of the auction proceeds from these allowances would be distributed to consumers of electricity in a manner that does not discriminate against suppliers of electricity. We do not agree with this suggested use of allowance value, as it goes against the principles of the design of the program for the allowance value to be used to support AB 32 purposes, and not for direct rate relief. They further suggest that a portion of the remaining value be made available for transition assistance for parties that have contracts with no cost pass through provisions, as a backstop if the preferred approach of renegotiation does not come to fruition. We acknowledge this suggestion made by the CCC and PE-Berkeley, Inc. and note that the proposed change is outside of the scope of the modifications noted in the second 15-day changes to the regulation. Again, we point to the parties of the contracts to continue renegotiation.

Other commenters, such as IEP and Wildflower, propose resolution language to direct ARB staff to continue to work with stakeholders to ensure proper treatment of generators or CHP facilities with contracts entered into before the signing of AB 32 and which do not contain cost pass-through provisions. We acknowledge the proposed language.

While Calpine continues to work on contract renegotiation, they believe the best way to address the situation is for a direct allocation of allowances to the generators. At the minimum, they request us to revise the regulation so that if entities are identified to receive industrial assistance, and they have contracts with generators for thermal or electric energy, then they should not receive allowances for emissions attributed to this energy. We acknowledge this suggestion provided by Calpine and encourage the parties to continue to renegotiate contracts and to contact us if they need our assistance in facilitating discussions with the industrial parties.

IEP requests that the Board resolution recognize that this long-term contract issue is still an outstanding issue that needs to be further addressed, and they would like the Board to direct staff to continue to evaluate the situation and provide a remedy prior to the first auction. Specifically, IEP suggests that allowances be reduced from utility allocation for emissions from this generation, and if a counterparty is identified as an entity to receive free allowances, then the resolution should state that ARB staff will draft amendments to direct the obligation to the entity that is able to recoup the GHG costs. Again, we disagree with this position that it is ARB's responsibility to make all of the parties whole.

Western Power Trading Forum requests that we establish a process and define conditions under which a generator would be eligible for assistance to recover costs. WPTF requests us to facilitate contract renegotiation or to provide free allocation to the affected party to cover emissions associated with the contract, if renegotiation is not successful. As mentioned above in the response to Calpine, we are available to assist and facilitate renegotiation discussions with parties.

In summary, we acknowledge this difficult position for some parties that are not yet experiencing success in the renegotiation process of these long-term contracts. We are encouraged by the numbers of contracts that have been successful in renegotiation. These parties are supporting a successful California cap-and-trade program by implementing our design intent through the renegotiation of these contracts so that the costs can appropriately be passed down to the end-user. For parties that have not been successful with renegotiation, we will provide support by facilitating discussions between parties so that they too will be able to support a successful program. We also encourage entities that have contracts with EDUs to approach the appropriate governing board or oversight agency and seek relief through their process. We remind utilities of the opportunity to voluntarily participate in the beneficial holding relationship that allows the EDUs to cover an obligation for emissions under contract for the delivery of electricity.

In Resolution 11-32, Board directed the Executive Officer to monitor progress on bilateral negotiations between counterparties with existing contracts that do not have a mechanism for recovery of carbon costs associated with cap-and-trade for industries receiving free allowances pursuant to section 95891, and identify and propose a possible solution, if necessary. For fixed-price contracts between independent generators and investor-owned utilities, the Board further directed the Executive Officer to work with the California Public Utilities Commission to encourage resolution between contract counterparties.

I-51. Comment: Air Liquide and other industrial gas manufacturers operate hydrogen production facilities in California that supply hydrogen to petroleum refineries under long-term, fixed-price contracts with terms of 15 to 20 years. Some of these contracts were signed years before the passage of AB 32 and before the parties could reasonably have anticipated AB 32's requirements. Because they significantly pre-date AB 32, these contracts may not allow the seller to pass on the costs that will be imposed on greenhouse gas emissions under the proposed Cap-and-Trade program. The September 12 draft does not address the economic dislocations that would occur as a result of such contracts. CARB has previously stated its intention to address long-term contracts in other sectors. In the Initial Statement of Reasons for Adoption of the Cap-and-Trade Rule, CARB recognized the importance of protecting parties to long-term electric power supply contracts, noting that some of those contracts, entered into before the mid-2000s, “do not include provisions that would allow full pass-through of cap-and-trade costs,” and may therefore “require special treatment” under the Cap-and-Trade Rule. This recognition is also reflected in federal Cap-and-Trade proposals, including Waxman-Markey (H.R. 2454) and Kerry-Boxer (S. 1733) legislation, as well as in the Regional Greenhouse Gas Initiative (RGGI), all of which included provisions to provide allowances to certain facilities subject to long-term contracts that did not allow the recovery of the costs of purchasing allowances at auction. CARB should make good on its statements of its intentions and address long-term contracts explicitly. Some CARB staff have expressed the view that Air Liquide and other covered entities that entered into long-term, fixed-price contracts knowingly assumed the risk of changes in the regulatory environment when they did so, and therefore CARB need not address long-term contracts. Air Liquide agrees that contracting parties ordinarily assume the risk of changes in environmental regulations, but the Cap-and-Trade Rule is different in two crucial respects:

- It is specifically designed to change the price terms on which covered entities, such as Air Liquide, based their contracts.
- Because the Cap-and-Trade Rule is designed to change behavior, by promoting efficiency and reducing emissions, through a price-changing mechanism, the magnitude of the likely price effect is huge by comparison with other environmental regulations.

The Cap-and-Trade Rule is unlike other government regulations (for example, workplace safety regulations) which have incidental and usually small effects on prices. The Cap-and-Trade Rule is explicitly designed to impose a price on CO_2 emissions that will be incorporated into the price of products produced by covered entities and that will alter the economic behavior of market participants. The Cap-and-Trade Rule is therefore an intentional interference with the market pricing mechanism, not simply a regulation of a health, safety or environmental matter that may have incidental effects on the market. Because the Cap-and-Trade Rule is an intentional change in the economic terms affecting contracting parties, CARB has an obligation to make sure that it is implemented fairly. There is a simple solution to the economic dislocations that might result from the Rule in its present form. CARB should permit covered entities subject to long-term contracts that do not allow the pass-through of carbon costs to retain a 100 percent industry assistance factor for the life of the current contract, or until it is amended to modify the price and supply terms. Such allowances may be limited, as Calpine has proposed in previous comments to CARB, such that they may not be traded or banked, thus eliminating any possibility of a windfall to contracting parties. If CARB does not act to protect parties to long-term contracts, contracting parties such as Air Liquide may be subject to large losses caused by contractually-required sales at fixed prices that do not account for carbon costs. The environment will not benefit, because the purchaser will not be subject to any increased price associated with carbon emissions, and will have no incentive to reduce its use of carbon-emitting products. The Cap-and-Trade program will also be damaged, because the failure to address long-term contract will create public examples of significant economic dislocations caused by an otherwise laudable program. To the extent that job losses may result, such losses will further damage the program. If CARB fails to address the long-term contracts covering California facilities, which are limited in number and easily addressed, the Cap-and-Trade Rule will produce market advantages for certain companies based not on their facilities' relative efficiency, but instead on the number of years they have committed to serve a particular customer—an arbitrary distinction that has no relation to the efficiencies that the Cap-and-Trade Rule is designed to foster. This market distortion will not serve the intent or further the goals of the Cap-and-Trade program or AB 32. CARB should therefore direct staff to prepare amendments to the Rule that will provide industry assistance to parties that entered into long-term contracts and that are unable to pass through the cost of GHG allowances. (ALLI2)

Response: Air Liquide claims we should provide one hundred percent transition assistance for industrial parties that are not able to pass costs through due to contract provisions that lack a mechanism to do so. We do not agree with Air Liquide that we should provide this type of assistance. Our program was not "… designed to change the price terms." The price terms are contained in the contract between the parties. Contracts vary to include, or not, provisions to accommodate changes to reflect increase or decrease costs due to changes in fuel costs, environmental factors, or regulatory requirements. Whether contracts do, or do not, contain these provisions is up to the parties. Therefore, Air Liquide's statement is not true that our program was designed to change terms. Our design was not specifically tailored to change price terms. Our design intent is for the cost to be passed down to the end-users. Many contracts have provisions which allow for a re-opening of the contract to pass-through environmental regulatory costs, or other costs.

Air Liquide also claims "Because the Cap-and-Trade Rule is designed to change behavior, by promoting efficiency and reducing emissions, through a price-changing mechanism, the magnitude of the likely price effect is huge by comparison with other environmental regulations." We do not agree with Air Liquid. To the extent that efficiency has or has not already been incorporated into the product, then that price effect will vary also. Another variable is the extent the product inherently results in GHG emissions, the opportunities available for the incorporation of efficiency, and the possibility of changing operations for the manufacturing or production of a product in which less GHGs are emitted. The effect could therefore be minimal, or it could be just as much or more than other environmental regulations. It is not our intent to create a market distortion, but a distortion is a result of the status of a certain product prior to the implementation of the regulation. Those that were anticipating, since the signing of AB 32, that the price of carbon would be accounted for in the economy will be most likely to be least affected. If there was implementation of early action, these entities will be best situated at the start of the program. Those early actions would include renegotiating a contract, the investigation and preparation for switching to a fuel source that results in less GHGs being emitted, or implementing efficiencies to reduce GHG cost.

We do not agree that there should be one hundred percent transition assistance due to the inability to pass the cost of compliance down. This would not support the methodology used to determine allowances allocated to the industrial sector. We developed this approach to benchmark stringency after careful analysis of California emissions intensity data and approaches used in other successful cap-and-trade programs. In selecting benchmark stringency we are balancing the need for providing adequate transition assistance and minimization of leakage with meeting the emission reduction goals of AB 32 and prevention of windfall profits through excessive free allocation.

Within each sector, the most efficient facilities with efficiencies better than the benchmark, will be receiving more allowances than they will need and can sell their excess allowances. Less-efficient facilities will need to purchase allowances to fulfill their compliance obligation. Beyond the initial allocation period, the level of free allowances will decline through the use of a cap declining factor and an assistance factor. Because allowances can be traded, the program provides incentives for those with the most cost-effective reduction opportunities to reduce emissions quickly. If we were to provide one hundred percent assistance to industries that could not pass the cost down due to contact issues would skew the incentive for those entities that have strived to be early actors and have made an extended effort to be more efficient. We believe that the contract terms that do not include cost pass-through mechanisms negotiated these terms and conditions and the cost agreed upon reflect the risks taken by one party or the other.

Allocation

I-52. Comment: The University of California (UC) was deeply disappointed by California Air Resources Board's (CARB) draft rulemaking of September 12, 2011. If adopted, this rulemaking will require UC to purchase 100 percent of its allowances starting in year one of the cap-and-trade program at an annual cost of $7-$28 million, or more. The purchase of allowances imposes significant added costs on University operations at a time when State General Fund support for the UC has been reduced by over $1.2 billion in the last 4 years. The University of California supports the goals of AB 32 and has never sought an exemption from the cap-and-trade program. However, the University believes that public entities that are regulated under cap-and-trade should be treated no worse than industrial facilities and utility companies. For the last two years, the University has tried to work with CARB to develop a compliance path that maintains the cap-and-trade program's integrity while minimizing its negative impacts on the University of California's teaching, research, and public service missions. Building on previous discussions with CARB, the University proposes the following:

- UC campuses that are directly regulated under cap-and-trade will be required to submit a five-year plan to CARB that details anticipated investments in greenhouse gas (GHG) abatement.

- Pending CARB's approval of these plans, regulated UC campuses will receive an allocation of allowances sufficient to cover 100 percent of their surrender obligation for the duration of the cap-and-trade program.
- In exchange for this free allocation, CARB will require regulated UC campuses to invest a sum commensurate to 125 percent of the market value of the freely allocated allowances in projects that abate Scope 1 and Scope 2 GHG emissions.
- UC will also commit to reducing its regulated emissions by 7 percent by 2020. This is in line with the overall, state-wide emissions reduction that CARB is targeting with its cap-and-trade program.

The proposal reflects the University's deep commitment to reducing its own carbon footprint. In exchange for the ability to invest compliance dollars in real abatement projects, UC is willing to invest a sum greater than what it would otherwise expect to pay to purchase allowances at auction. Moreover, as a capped sector entity, the University is willing to commit to achieving its proportional share of emissions abatement.

In communications with the University, CARB has expressed concern that accepting UC's proposal will open a Pandora's box and that countless other regulated entities will demand similar accommodation from CARB. CARB's fears are unfounded. In the unlikely event that there are other regulated entities willing to spend more on abatement projects than they would otherwise spend on allowances, and are further willing to commit to a seven percent reduction in surrender obligation by 2020, there is no downside for CARB allowing them to do so.

Over 90 percent of UC's anticipated compliance costs are the direct results of its investment in combined heat and power (CHP) plants. Were it not for these CHP plants, most of the UC sites that are regulated under cap-and-trade would not be facing carbon costs for natural gas usage until 2015. Thus, CARB's rulemaking imposes a penalty for early adopters of CHP, an outcome that directly contradicts the AB 32 Scoping Plan, which expressly encourages increased use of CHP as a major abatement measure. In recent months, CARB has offered the assurance that UC campuses with CHP plants will have access to the allowance value that is being allocated to the State's electric utilities for the benefit of end-use customers.

Even if the utility companies and CPUC were inclined to return this allowance value to self generators like UC, it would be challenging for them to do so because emissions from UC's CHP plants are not included in the allowance allocation that utilities will receive from CARB. The simplest way to remedy this shortcoming would be to allocate allowance value to self-generators, since they effectively function as both a utility and an end-use customer. Barring this approach, CARB should at least include emissions from CHP plants that serve onsite load when determining allowance allocations to utility companies. Lastly, for the record the University hereby incorporates by reference the comments contained in its previous letters to you dated December 3, 2010 from Senior

Counsel Anthony Garvin and August 10, 2011 from Senior Vice President Dan Dooley. (UC4)

> **Response:** While we understand the concerns of the University of California, we expect that the university will be able to fully pass the cost of carbon to campus energy users. With no risk of GHG emissions leakage, the university does not require free allocation. Specifically, we note that UC is requesting free allocation for emissions associated with their combined heat and power plants. At this time, we believe a free allocation would be inappropriate and would bestow favored treatment upon the university, as other independent combined heat and power producers will not receive any form of free allocation. That is, the treatment of UC combined heat and power facilities will be exactly similar to the treatment of independent combined heat and power facilities serving the electricity market.
>
> While free allowances for their direct emissions would be inappropriate, the university should expect to receive some remuneration for the increased cost of procuring electricity from the local distribution utilities that service the campuses. We are working closely with the CPUC and the POU governing boards to determine the appropriate level of remuneration.
>
> In addition, Board Resolution 11-32 directs the Executive Officer to monitor progress on bilateral negotiations between counterparties with existing contracts that do not have a mechanism for recovery of carbon costs associated with cap-and-trade for industries receiving free allowances pursuant to Section 95891, and identify and propose a possible solution, if necessary. For fixed-price contracts between independent generators and investor-owned utilities, the Board further directs the Executive Officer to work with the California Public Utilities Commission to encourage resolution between contract counterparties. Board Resolution 11-32 also directs the Executive Officer to coordinate with the State universities and stakeholders to evaluate options for compliance, with amendments to the regulation as appropriate, including options of the use of auction revenue and report back to the Board in summer of 2012.

I-53. (multiple comments)
Comment: Restrictions on use of allowance value should be deleted or revised. Section 95892(d)(5) (p. 143) prohibits the use of allocated allowances to meet compliance obligations for electricity sold into the California Independent System Operator (CAISO) markets. Section 95892(d)(5) provides that "Use of the value of any allowance allocated to an electrical distribution utility, other than for the benefit of retail ratepayers consistent with the goals of AB 32 is prohibited, including use of such allowances to meet compliance obligations for electricity sold into the California Independent System Operator markets." As written, with the phrase "including use of such allowances to meet compliance obligations for electricity sold into the California Independent System Operator Markets" at the end, section 95892(d)(5) would have the unintended consequence of unduly discriminating against publicly-owned utilities

("POUs") that are members of the CAISO. The section should be deleted or revised to avoid the undue discrimination. Prohibiting the use of allowances to meet compliance obligations for electricity sold into the CAISO would discriminate against POUs that are members of CAISO.

The prohibition on using allowances allocated to POUs to meet their compliance obligations for electricity that POUs generate and sell into the CAISO would discriminate against the POUs that are members of the CAISO. Under section 95890(b) of the Regulation, all electrical distribution utilities will receive a direct allocation of allowances if they comply with the MRR. Under section 95892(b), POUs may direct the ARB Executive Officer to place their allocated allowances in their compliance accounts. POUs that are not members of the CAISO may use the allowances that the Executive Officer places in their compliance accounts to meet their compliance obligations. In fact, their allocated allowances may not be withdrawn from their compliance accounts for any other purpose.

The situation is different for POUs that are members of the CAISO. A peculiarity of the CAISO is that CAISO members are required to sell the electricity they generate or import into the CAISO market and then bid the electricity back in the wash transaction in order to use the electricity that they generate or import to serve their native load. Due to section 95892(d)(5), CAISO POUs would not be able to direct the Executive Officer to place their allocated allowances in their compliance accounts to meet their compliance obligation. If the allowances were place in their compliance accounts, section 95892(d)(5) would bar them from using their allowances to meet their compliance obligation for the electricity they sell into the CAISO market and then buy back to serve their native load. The CAISO POUs would have to have their allowances placed in limited use holding accounts and sent to auction. Thus, as written, section 95892(d)(5) would discriminate against POUs that are members of the CAISO in comparison to non-CAISO POUs solely because they are members of the CAISO.

The discrimination against CAISO POUs would be an unintended consequence of section 95892(d)(5) as currently drafted. The discrimination that section 95892(d)(5) would impose on CAISO POUs is an untended consequence of the section as currently drafted. The ARB climate change staff has made it clear to SCPPA that the prohibition on using allowances to meet compliance obligations for electricity sold into the CAISO is intended to mean that if a POU elects to elect to have its allocated allowances placed in its limited use holding account rather than its compliance account and then sells the allowances, the monetary value of the allowances may not be used to meet the POU's compliance obligation for generation that is sold into the CAISO market. Staff has confirmed to SCPPA that the reference to "the value of any allowance allocated to an electrical distribution utility" in section 95892(d)(5) means the money that a utility receives after auctioning administratively allocated allowances that are placed in its limited use holding account. Thus, under the staff's interpretation, if a CAISO POU directs the Executive Officer to place its allocated allowances in its compliance account, it may use the allowances to cover its compliance obligation just like a non-CAISO POU. While SCPPA is pleased by the climate change staff's interpretation of section

95892(d)(5), SCPPA is concerned that at some future time staff members in the ARB's enforcement branch may interpret this section differently.

Section 95892(d)(5) as currently written might be interpreted to prohibit the use of allocated allowances to meet a POU's compliance obligation for electricity sold into the CAISO. In spite of the climate change staff's interpretation of section 95892(d)(5) as currently written, the section is susceptible to being interpreted differently. Although the staff has told SCPPA that the section only prohibits the use of revenue derived from auctioned allowances to cover the compliance obligation of electricity sold into the CAISO, that interpretation appears to be contradicted by the wording in other parts of section 95892. Elsewhere in section 95892 the term "auction proceeds" is used to refer to revenue from auctioned allowances. The term "allowance value" is used to refer to the value of allocated allowances that are placed in a utility's compliance account and used for compliance rather than being auctioned. For example, section 95892(e) refers to "auction proceeds" in sections (1) and (2) and separately refers to the "value of allowances, deposited directly into compliance accounts" in sections (3) and (4). Section 95892(d)(3) and the first paragraph of section 95892(e) refer to "auction proceeds and allowance value" conjunctively, indicating that each phrase has a separate meaning and that both meanings are addressed in those sections.

Likewise, the Second 15-Day Change Notice distinguishes between "the use of auction proceeds from the sale of allowances" and "the value of allowances freely allocated and used for compliance" in discussing the proposed changes to section 95892(d). Section 95892(d)(5) uses the phrases "allocated allowance value" and "value of any allowance allocated" to a utility and refers to the "use of such allowances to meet compliance obligations." There is no reference to "auction proceeds" in this subsection. Thus, section 95892(d)(5) as currently drafted is susceptible to being interpreted to provide that allowances that are allocated to a CAISO POU and placed in that POU's compliance account cannot be used to meet that POU's compliance obligation.

Section 95892(d)(5) should be deleted or revised to eliminate the unintended consequence of discriminating against CAISO POUs.

Section 95892(d)(5) should be revised to eliminate the unintended consequence of discriminating against CAISO POUs. There are several options for remedying the discriminatory effects of section 95892(d)(5).

Option 1: Delete section 95892(d)(5) in its entirety.
One solution would be to delete section 95892(d)(5) in its entirety. Section 95892(d)(5) is superfluous. Section 95892(d)(3) mandates that both auction proceeds and allowance value "shall be used exclusively for the benefit of retail ratepayers" and not for other purposes:
(3) Auction proceeds and allowance value obtained from an electrical distribution utility shall be used exclusively for the benefit of retail ratepayers of each electrical distribution utility, consistent with the goals of AB 32, and may not be used for the benefit of entities or persons other than such ratepayers.

Thus, section 95892(d)(5) restates as a prohibition which is stated affirmatively in section 95892(d)(3). To the extent that section 95892(d)(5) is redundant, deleting it would be a "nonsubstantial" change under section 11346.8(c) of the Government Code that would not require a further opportunity for 15-day comment.

Option 2: Revise section 95892(d)(5) to limit its applicability to the value of allowances placed in limited use holding accounts.
The second option would be to revise section 95892(d)(5) to reflect the climate change staff's understanding that the section applies only to the use of allowance value associated with allowances that are placed in limited use holding accounts rather than compliance accounts:

Section 95892. Allocation to Electrical Distribution Utilities for Protection of Electricity Ratepayers.
(d)(5) Prohibited Use of Allocated Allowance Value. Use of the value of any allowance allocated to an electrical distribution utility and placed in the electrical distribution utility's limited use holding account, other than for the benefit of retail ratepayers consistent with the goals of AB 32 is prohibited, including use of such allowance to meet compliance obligations for electricity sold into the California Independent System Operator markets.
This revision would be a "nonsubstantial" change under section 11346.8(c) of the Government Code. It merely conforms the wording of section 95892(d)(5) to the staff's understanding of the meaning of section 95892(d)(5).

Option 3: Revise section 95892(d)(5) to refer to "auction proceeds."
An alternative approach to conforming section 95892(d)(5) to the climate change staff's understanding would be to revise the section to refer to "auction proceeds" instead of "allowance value." This would limit the scope of the section to allowances that are placed in a utility's limited use holding account and would be consistent with the terminology used in other subsections of section 95892:

Section 95892. Allocation to Electrical Distribution Utilities for Protection of Electricity Ratepayers.
(d)(5) Prohibited Use of Auction Proceeds. Use of auction proceeds obtained by an electrical distribution utility, other than for the benefit of retail ratepayers consistent with the goals of AB32 is prohibited, including use of such proceeds to meet compliance obligations for electricity sold into the California Independent System Operator markets.

As with the second option, this would be a "nonsubstantial" change under section 11346.8(c) of the Government Code, insofar as it does nothing more than conform the wording of section 95892(d)(5) to the staff's understanding of what is meant by section 95892(d)(5).

Option 4: Revise section 95892(d)(5) to exclude native load. A fourth option would be to revise section 95892(d)(5) as proposed in SCPPA's comment submitted to the ARB on August 11, 2011, to allow CAISO POUs to use their allocated allowances to meet their compliance obligation associated with the electricity they generate or import to serve their native load:

Section 95892. Allocation to Electrical Distribution Utilities for Protection of Electricity Ratepayers.
(d)(5) Prohibited Use of Allocated Allowance Value. Use of the value of any allowance allocated to an electrical distribution utility, other than for the benefit of retail ratepayers consistent with the goals of AB32 is prohibited, including use of such allowances to meet compliance obligations for electricity sold into the California Independent System Operator markets in excess of the electricity needed to meet the electrical distribution utility's native load in the same hour.

Absent deletion or revision, 95892(d)(5) should be addressed in a rulemaking in 2012. If the ARB concludes that the changes discussed above cannot be made at this stage because they would require further 15-day public comment, the ARB should address this issue in a supplemental rulemaking in 2012. To this end, the Resolution should include the following statement:

BE IT FURTHER RESOLVED THAT the Board directs the Executive Officer to initiate a public process for the revision of section 95892(d)(5) no later than February 2012, to ensure that this provision allows POUs to use allowances that are placed in their compliance accounts to meet the compliance obligation associated with the electricity they generate or import to serve their native load.

The resolution should clarify that a POU can direct the executive officer to place a portion of its allocated allowances in another utility's account in certain circumstances under section 95892(b)(2). SCPPA appreciates the efforts of ARB staff to accommodate the particular circumstances of POUs in the provisions on the allocation of allowances to utilities, in particular the situation exemplified by the Magnolia generating facility in Burbank, California. Magnolia is owned by SCPPA, a joint powers authority, but it is operated by Burbank Water & Power ("Burbank"). Burbank rather than SCPPA will have the compliance obligation for Magnolia. As such, Burbank will need to have the other SCPPA members that participate in Magnolia direct the Executive Officer to place a share of their directly allocated allowances into Burbank's compliance account to cover their share of Burbank's compliance obligation for Magnolia. Section 95892(b)(2) (p. 141) appears to permit SCPPA members to direct the Executive Officer to place a share of their allowances in Burbank's account to meet the Magnolia compliance obligation. Section 95892(b)(2) provides:

> (2) Publicly Owned Electric Utilities or Electrical Cooperatives. When allocating to a publicly owned electric utility or an electrical cooperative, the Executive Officer will place allowances in either a limited use holding account or in a compliance account per the entity's preference. Prior to receiving a direct allocation of allowances, publicly owned electric utilities or electrical cooperatives will inform the Executive Officer of the share of their allowances that is to be placed:

(A) In the compliance account of an electrical generating facility operated by a publicly owned electric utility, an electrical cooperative, or a Joint Powers Agency in which the electrical distribution utility or electrical cooperative is a member and with which it has a power purchase agreement; or

(B) In the publicly owned electric utility's or electrical cooperative's limited use holding account. … However, the Second 15-Day Change Notice states that section 95892(b) was amended to clarify that POUs "may only ask for allocations to be placed into compliance accounts of facilities they (or a Joint Powers Agency) operate." This summary of the changes to section 95892(b) is more limited than the actual language in section 95892(b)(2), and it would not accommodate the Magnolia situation. Neither SCPPA nor the non-Burbank SCPPA POUs operate Magnolia. Thus, under the summary, the non-Burbank SCPPA POUs would not be able to direct the Executive Officer to place allowances in the Burbank compliance account to cover Magnolia emissions.

SCPPA is concerned that the restrictive summary in the Second 15-Day Change Notice could result in a misinterpretation of section 95892(b)(2) in the future. To avoid the possibility of misinterpretation, SCPPA requests that the Resolution include the following statement to correct the public record:

WHEREAS, pursuant to section 95852(b) of the [Cap and Trade Regulation], publicly-owned electric utilities may direct the Executive Officer to place a share of their allowances in the compliance account of the operator of an electricity generating facility that delivers electricity to multiple utilities. (SCPPA8)

Comment: The Proposed Regulation includes specific limitations on the use of both auction revenues and allowance value in sections 95892(a) and (d)(3), as well as requirements to annually report to the Executive Officer regarding the use of those allowances and value. These provisions are applicable to all electrical distribution utilities. However, the Proposed Revisions also include a prohibition that singles out compliance entities that are located within the California Independent System Operator (CAISO) for disparate treatment and has the potential to hinder wholesale electric transactions. Section 95892(d)(5) prohibits the use of allowance value "to meet compliance obligations for electricity sold into the California Independent System Operator markets." This provision should be stricken, as it fails to recognize the manner in which energy transactions through the CAISO Balancing Authority work.

For example, entities such as NCPA, who have transactions that must be scheduled through the CAISO Balancing Authority, including self-scheduled energy that is delivered directly to load, this prohibition would place an unreasonable constraint on utility operations. Due to the CAISO's rules for scheduling and bidding, tracking the various permutations of such transactions would be virtually impossible. Further, POUs located in the CAISO Balancing Authority must sell all of their self-owned generation into the CAISO markets, and then purchase the electricity back, even if it is for the exact same quantity of electricity. The provisions of section 95892(d)(5) would preclude these entities from being able to use allowance value to meet their compliance obligations associated with the production of this electricity. This provision places an undue and unwarranted restriction on entities that are mandated to participate in the ISO markets, with no resulting benefit to the underlying intent of the Proposed Regulation to ensure that allowance value is used "for the benefit of retail ratepayers consistent with the goals of AB 32." Accordingly, NCPA urges CARB to strike section 95892(d)(5) it in its entirety. (NCPA4)

Comment: Section 95892(d)(5) uses the terms "allowances" and "allowance value" interchangeably, with the phrase "such allowances" referring back to the "value of any allowance." SCE is concerned that this section, if interpreted broadly, could prohibit the use of any allowance revenues to meet compliance obligations for any electricity that is sold into the CAISO, which would include all utility sales. This is clearly not the intent. The below modifications will ensure that there is only a prohibition on the use of allowances (not allowance value) for meeting compliance obligations for electricity sold into the CAISO. Modify section 95892(d)(5) as follows:

(5) Prohibited Use of Allocated Allowance Value. Use of the value of any allowance allocated to an electric distribution utility, other than for the benefit of retail ratepayers consistent with the goals of AB 32 is prohibited. ~~,including use of such~~

Prohibited Use of Allocated Allowances. Use of any allowances to meet compliance obligations for electricity sold into the California Independent System Operator Markets is prohibited. (SCE4)

> **Response:** Section 95892(d)(5), which was formerly section 95892(f), imposes specific prohibitions on some uses of freely allocated allowances and auction proceeds. The intent of this language is to guarantee that all bids into the CAISO markets correctly include the generator's emissions cost in the generator's CAISO market bid price. Specifically, POUs that wish to transfer allowances to generators that sell into the CAISO market will have to purchase those allowances at the allowance auction or in the secondary market to ensure that the transferred allowance is correctly valued and that freely allocated allowances are not used to suppress CAISO bid prices.
>
> POUs are able to use their freely allocated allowances to directly meet the compliance obligation for generators that do not sell into the CAISO market. We understand that some generators controlled by POUs may sell their electricity into the CAISO market and then purchase it back out of the market to meet their load, due to transmission constraints. We do not consider this a special case. The POUs may not transfer freely allocated allowances to meet the compliance obligation of those generators involved in these wash transactions.
>
> SCPPA provides four options to resolve their issue with the requirements contained in section 95892. They indicate that they have a concern about the provisions contained in section 95892 in regard not to our interpretation of the provisions, but how the enforcement team might interpret the provision. We

assure SCPPA that ARB staff have and will continue to work together on all aspects of the regulation, including verification and enforcement.

We do not agree that modification is needed and do not agree that the options provided by SCPPA would improve the regulation. They first suggest that we delete section 95892(d)(5) because it is repetitive to the provision contained in section 95892(d)(3). We do not believe that section 95892(d)(5) is repetitive. We believe that the inclusion of section 95892(d)(5) is necessary to explicitly prohibit the use of allowance value for covering the emissions or allowance costs associated with electricity sold into the CAISO market. Without this expressed provision, it would be entirely possible for an EDU to purchase allowances to cover a compliance obligation for sales of electricity into the CAISO market and then to argue that it was an appropriate use of value and a benefit to ratepayers. Further, the inclusion of section 95892(d)(5) is essential to avoid distortions in the CAISO market associated with incomplete carbon pricing.

SCPPA's second proposed option is to revise the section to limit the application of section 95892(d)(5) to the "value" of allowances placed into the limited use holding account. We did not make this change, as we believe it is important that the section applies not only to freely allocated allowances but also to the allowance value, a category that includes proceeds from the sale for freely allocated allowances. The utilities are prohibited from using their freely allocated allowances, and the value from the sales of these allowances, for electricity sold into the CAISO market. Sellers into the CAISO market will, if bids are appropriately entered, already receive compensation for their carbon costs, which should be used to cover their carbon obligation. The allowances we provide to the utility is to be used for the benefit of ratepayers and to further the goals of AB 32. The third option is similar to the second option, except that the third option suggests that the limitation apply to the use of the allowance, rather than its value. Again, this change would be inappropriate, as it could eventually cause a distortion in the CAISO market.

The fourth option is to limit the provision to the sales into the CAISO market in excess of the electricity needed to meet native load. We believe that section 95892(d)(5) needs to apply to all of the electricity sold into the CAISO market in order to guarantee that electricity is efficiently dispatched and that the wholesale market includes appropriate carbon pricing. Exempting a quantity equivalent to the native load sold into the CAISO market could result in significant distortions in dispatch and improper uses of allowance value.

We understand that the provision will require some concerted effort on the part of the utility that is required to sell the electricity they generate or import into the CAISO market and then bid the electricity back in a wash transaction, in order to use the electricity they generate to serve their native load. SCPPA is correct; the utility will need to keep accurate accounting for purposes of meeting verification requirements. However, we believe this effort is necessary and justified in order to guarantee the integrity of the cap-and-trade program. Again, we will work to ensure that the regulation is interpreted correctly, and that the utilities receive guidance on evidence that will satisfy verification that the provision has been met satisfactorily, if needed.

Water

I-54. (multiple comments)
Comment: ARB's goal of providing carbon price signals to the end-user will be met by the SWP. However, ARB's goal of mitigating for price increases cannot be met under ARB's current plan to provide the free allocations associated with SWP load to electric distribution utilities. This goal can be met by providing those free allocations to the State Water Contractors in proportion to their energy charges from the SWP. This approach will meet ARB's goals and provide equity and protection to SWP water users. Add section 95890(c) as follows:

> (c) All provisions of this Article applicable to a publicly-owned Electric Distribution Utility shall be applicable to the Contractors of the State Water Project pumping load reported under article 2, section 95111(e), title 17, Greenhouse Gas Emissions Data Report. Where these Contractors are not Water Distribution Utilities, the Allocation provided to the individual Contractor shall be held in trust for its member water distribution utilities**.** (SWC4)

Comment: In the Second Notice of Public Availability, staff noted that language was removed from section 95892(d)(3)(B) and (C) that had indicated particular requirements for use of auction proceeds from the sale of free allowances. Staff noted that ARB does not have authority to appropriate funds, and that the use of revenue obtained from consignment of allowances is the responsibility of the PUC for investor owned utilities and the governing Boards of publically owned utilities. Revising the past decision to conform to the most recently revised language reflecting ARB staff's recent recognition of the financial responsibilities of public utility boards is not only appropriate and consistent, but it also removes a serious inequity and allows the regulation to meet the Board's adopted policy of being economically neutral. As the proposed regulations currently stand, water pumping by the SWP is the only water source that has not received the appropriate allocation of free allowances, and thus does not have the benefit of mitigation from rate shock and protection in the case of market failure. In particular, as the regulations now stand, the lack of provision of allowances to SWC agencies will have the following outcomes which are contrary to Board policy. The proposed regulations are inequitable to SWP‟s customers and will result in an unmitigated rate shock to retail customers of SWC agencies; a transfer of income from southern to northern California; impairment of the ability of SWP water users to compete with those in similar industries; "leakage" of carbon emissions from California industries to those competitors outside the state; and lack of protection for SWP water users in the event of market failure. In conclusion, the currently-proposed language changes reflect appropriate recognition by ARB staff of the organizations that bear the responsibility for determining suitable treatment of emission allowance revenues. However, these changes are inconsistent with ARB's previous decision to withhold free allocations of allowances from SWP water users. To correct this inconsistency, to provide equitable rate shock mitigation to SWP water users, and to meet Board policy objectives, allocations of allowances should be provided to SWP water users. (SWC4)

Comment: In the absence of an exemption or deferral, providing free allowances to Metropolitan is the only equitable alternative. In the absence of a decision to exclude Metropolitan from the category of "covered entities" or to defer our compliance obligations until water sector-specific measures are formulated, the only equitable alternative is an allocation of free allowances. Metropolitan agrees with the ARB's apparent conclusion that we are distinct from the EDUs in important respects. However, it is fundamentally unfair for ARB to treat publicly-owned providers of a critical public resource in the exact same manner as for-profit marketers and, thereby, deny these providers and their customers any sort of price relief. In other words, if the ARB decides to impose the same compliance obligation on Metropolitan that it imposes on energy marketers and EDUs that import energy, it should protect Metropolitan's customers in the same manner that it protects the customers of the EDUs.

The inequity inherent in ARB's free allowance allocation approach is evident in a comparison with Metropolitan's member agencies that serve retail electric load. Many of these agencies have entitlements to energy resources outside of California. As importers, they will be required to acquire allowances to cover the emissions associated with this energy. This activity does not, however, result in these EDUs being characterized as "marketers," which are not entitled to receive free allowances. In addition, although these retail electric utilities will be able to use the free allowances they receive as EDUs to offset costs to their retail electric customers, as purchasers of Metropolitan water they will be unable to mitigate prices increases to their retail water customers resulting from higher power prices at the wholesale water level.

Finally, ARB's articulation of the reasons that wholesale water utilities are ineligible to receive free allowances (*i.e.* no direct end-use customer relationship and thus no price signal) is inconsistent with the rationale provided for the regulations that have been developed. POU retail electric providers will be permitted to retire their free allowances in order to meet their compliance obligations as importers or generators, resulting in no price signals at the retail level. Although the ARB apparently intends for the POUs to use the value of the free allowances to offset rate shock associated with rate increases, there is nothing in the statute that compels this result, and few public agencies will increase rates unless they are required to do so. Thus, not only has ARB created a price signal metric for measuring the need for free allowances that is not found in the statute, but it has also applied that metric in an arbitrary, inequitable manner. (MWDSC4)

Comment: Exempting Metropolitan from the list of "covered entities" is the best public policy option. After careful internal review and discussions, Metropolitan concluded that the cap-and-trade regulatory scheme developed by ARB is simply not viable or feasible for a public water supply agency. As ARB staff has recognized, Metropolitan does not provide electrical service to any load other than the CRA pumping plants and is therefore not an electric utility. However, contrary to the classification to which we have been assigned in the cap-and-trade regulations, Metropolitan is also not a marketer of electricity. To demonstrate our unique status in the California energy markets and support our argument for an exemption from the cap-and-trade regulations, Metropolitan asserted the following in our August 11th comments:

- Metropolitan is not a marketer of electricity, although it is classified as such under the Mandatory Reporting Regulation and Cap-and-Trade Program.
- Metropolitan does not purchase power for the purpose of resale.
- As a public agency, Metropolitan is legally required to pass all of its costs to ratepayers.
- Unlike retail electricity providers, including electric publicly-owned utilities, Metropolitan (based on ARB‟s decision) will receive no cost mitigation for its member agencies and ratepayers.
- As a public agency, Metropolitan should not be compelled to participate in the carbon market against for-profit market participants, including opt-in entities.
- Metropolitan's role, specifically the purchase of imported power to deliver water, is as a consumer of electricity, not a marketer, retail provider, or generator.
- The compliance obligation to acquire and surrender allowances will result in highly volatile costs to Metropolitan because of the variability of Metropolitan's energy imports for the CRA and the anticipated increase in the auction price of allowances. (For example, from 2005-2010 Metropolitan's historical imported electricity has ranged from 0 to 750,000 megawatt-hours.)
- The emissions assigned to Metropolitan's imported electricity are already below its 1990 levels when Metropolitan had an agreement for coal energy from the Navajo Power Plant.

In light of Metropolitan's clear differences with both electric utilities and for-profit marketers, Metropolitan urged the ARB to adopt specific language that would create a new reporting category and definition under the regulations. Under this proposal, Metropolitan would continue to report our imported electricity annually, would continue to maintain the required records and verifications, and would continue to pay the annual Cost of Implementation Fee for our imports. Metropolitan would also agree to certify that, if we alter our market behavior in a manner that would make us a true marketer of electricity, we would become subject to all of the requirements imposed upon covered entities. However, since Metropolitan would not be classified as an electricity marketer or an Electric Distribution Utility (EDU), we would not have a compliance obligation under the cap-and-trade program. (MWDSC4)

Comment: The development of a water sector-specific cap-and-trade compliance program and/or a deferral of the regulations for the water sector until such regulations are developed is appropriate. Metropolitan also proposed the creation of a compliance program to integrate water sector measures for energy efficiency and renewable energy projects, as specified in ARB‟s AB 32 Scoping Plan. This proposal is in fact consistent with the water sector measures that ARB proposed in the "Recommended Actions" section of the Scoping Plan for water. Metropolitan proposed to work with ARB along with other water agencies to develop the program and work towards implementation starting in 2014-2015. Deferring actual implementation of water sector regulations would allow ARB staff to concentrate priorities and resources on implementing the cap-and-trade program for the electric and industrial sector in 2012-2013 and would avoid imposing unnecessary and inequitable costs, potentially through duplicative regulations, on the water sector. To that end, Metropolitan proposed the following:

- Develop a compliance strategy or memorandum of understanding for Metropolitan as a consumer of wholesale electricity that integrates the imported energy issue into a comprehensive water sector program that includes measures identified in the AB 32 Scoping Plan, such as energy efficiency and renewable energy projects; and
- Defer Metropolitan/water sector measures until 2014 or 2015, after the cap-and-trade program is implemented. (MWDSC4)

Comment: The Initial Modifications, in Appendix A, focused exclusively on the alleged obstacles to providing free allowances to the water sector and did not address Metropolitan's exemption and deferral proposals. In our August 11th comments and in numerous meetings with ARB staffers, Metropolitan consistently and vigorously pressed the point that, as a public agency that provides water to much of Southern California, we should not be both treated as a for-profit marketer for purposes of regulation and denied the price mitigation provided to the public agencies that provide electricity to Southern Californians. Not only did ARB staff not provide Metropolitan with any of the revisions to the cap-and-trade regulations that we requested, it did not even address Metropolitan's arguments in the Second Modifications, notwithstanding the fact that the Second Modifications will likely be staff's final opportunity to address the comments of stakeholders prior to ARB‟s planned submission of the cap-and-trade regulations to the Office of Administrative Law (OAL) in October. (MWDSC4)

Comment: The proposed regulations are fundamentally inequitable to Metropolitan and our ratepayers. A consistent theme in the comments submitted by the wholesale water providers has been the inequity inherent in imposing increased costs on both electric and water customers, yet only providing offsetting price mitigation to electric customers. On page 16 of Appendix A to the Initial Modifications, ARB concluded that the publicly-owned water utilities are akin to electricity marketers, not distribution utilities, and that providing free allowances to the water agencies is inappropriate since the wholesale water utilities do not "maintain direct relationships" with their end-use customers and, thus, allocating allowances to these utilities might result in "the deterioration of the emissions price signals in the water sector. This analysis is notable for its flawed assumptions and the facts that it omits or concedes. ARB's analysis does not deny that end-use water customers, like end-use electric customers, will be impacted by cap-and-trade-related cost increases; it does not propose to protect water customers by providing price mitigation to retail water providers; and it does not explain why "price signals" are more important than equity.

ARB's decision to sacrifice equitable treatment of all stakeholders in order to promote the vague economic concept of price signals is indisputably inconsistent with what AB 32 requires. Section 38562(b) of the statute provides that, "to the extent feasible," ARB must "[d]esign the regulations, including the distribution of emissions allowances, in a manner that is equitable." As the court found in a case involving a public agency's elimination of medical services, Morris v. Williams, 67 Cal.2d 733, 757 (1967), the language "to the extent feasible" means that an administrative agency must use every "feasible" effort to accomplish the directive. The court concluded that an administrative agency's discretion in the rulemaking process is circumscribed by the express requirements on the statute and that "feasible, in short, means capable of being done." Id. Thus, ARB can develop regulations that promote price signals, but it does not have the discretion to elevate this goal above the equitable treatment of all entities. Since equitable treatment of all public agencies is feasible, it trumps ARB's price signal goal. Throughout the rulemaking process, ARB staff has expressed the concern that exempting Metropolitan from the coverage of the cap-and-trade regulations will create a gap in the regulations, since all emissions associated with imported energy will not be accounted for. In a conference call between Metropolitan and ARB staff, one ARB staffer indicated that exemptions would undermine the "purity" of the cap-and-trade program. ARB‟s concerns are unfounded. Section 38505(m) of AB 32 does specify that "statewide greenhouse gas emissions" include electricity that is either generated in state or imported. However, the statute does not require that all imported electricity be covered by a cap-and-trade program. The statute merely requires that all greenhouse gas emissions be reported and that these emission levels be reduced to 1990 levels by 2020. Section 38570 permits the ARB to include "market-based compliance measures" in the regulations, provided that the measures consider cumulative impacts, prevent increases in air pollutants, and maximize economic benefits. Ensuring that all emissions are captured within the market-based mechanism is not a requirement. Therefore, the ARB is not prohibited from exempting from cap-and-trade coverage emissions associated with an entity's imports, and it should do so where, as in this instance, including these emissions would result in inequitable treatment. (MWDSC4)

Comment: The proposed regulations will likely result in duplicative regulation of the water sector. ARB has consistently minimized the cost impact of the cap-and-trade regulations on the water sector; it is clear, however, that water customers will be burdened with significant overall cost increases as a result of the regulations. In our December 14, 2010 comments, Metropolitan estimated that the annual cost of purchasing allowances to cover our imported energy needs would be between $11 million and $22 million, depending on auction prices. The decision by ARB to neither exempt Metropolitan from the cap-and-trade regulations nor defer the applicability of those regulations raises the specter of even greater inequities. Specifically, Metropolitan, our customers, and other water agencies will be forced to bear the cost burden of cumulative regulations when the water sector-specific regulations are implemented.

In Section 17 of its Scoping Plan, ARB "recommends a public goods charge for funding investments in water management actions that improve water and energy efficiency and reduce GHG emissions." ARB anticipates that such a charge "could generate $100 million to $500 million." Given that energy efficiency measures will undoubtedly involve reducing GHGs associated with energy consumption, these measures will require Metropolitan to pay a significant amount of money for renewable energy at the same time that we are buying allowances for our imported energy. The likelihood of this additional cost burden is acknowledged in the Scoping Plan, which recommends a "mechanism to make allowances available in a cap-and-trade program" to, among others, "water suppliers," and concludes that an "allowance set-aside will be evaluated during the rulemaking for the cap-and-trade program." Other than the cursory, one-paragraph discussion in Appendix A to the Initial Modifications, no such evaluation has been done.

Similarly, the July 12, 2010 study "Implementing a Public Goods Charge for Water" (PGC Study), authored by three U.C. Berkeley economists on behalf of the Public Utilities Commission and the Water Energy Team of the Climate Action Team (WetCat), estimates that "approximately 20 percent of all electricity consumed in the state" is used for "water delivery, treatment, and use." (PGC Study at 5). The study characterizes the "[g]reenhouse gas emissions from pumping, treating, and heating water" as a "negative externality" that must be taxed in order to accomplish the goals of AB 32. Id. at 6. With respect to the ultimate cost to water consumers, the study concludes that a $680 million dollar per year public goods charge is necessary because, while publicly-owned water utilities have the ability to raise rates to fund GHG-reduction measures, "they are often reluctant to do so."

Thus, ARB's own Scoping Plan, as well as the study commissioned to implement it, have concluded that the water sector should be heavily taxed to fund GHG emissions-reducing measures. By determining in the cap-and-trade regulations that publicly-owned water utilities must incur costs to cover the emissions associated with moving water without providing any indication as to types and magnitude of additional costs that those utilities will incur as a result of to-be-developed water sector measures is grossly unfair. This is particularly true given the strong indications that Metropolitan will be required to mitigate emissions costs associated with our energy imports through both the cap-and-trade regulations and the water sector measures. (MWDSC4)

Comment: DWR refers to its prior comments, dated December 15, 2010, and August 11, 2011, and reminds the Board that the current version has not remedied the deficiencies related to the treatment of DWR as outlined in those comments.
As summarized in the December 15 comment letter:

Under AB 32, DWR's unique status as a state agency requires that it be exempt from this regulation. Alternatively, DWR should receive free allowances to mitigate for the impact on water ratepayers. AB 32 also requires that regulated parties be treated equitably and that early action receive appropriate credit. AB 32 requires the proposed regulation be cost-effective, and applying the regulation to DWR is not cost-effective. The proposed regulation results in a transfer of funds from water ratepayers to electricity ratepayers, which cannot be justified. The proposed regulation poses *undue financial risk to DWR. Environmental and economic impacts on DWR and water users were not addressed. Finally, the imposition or threat of a fourfold penalty on public agencies is unduly punitive and unnecessary to achieve compliance.*

The draft regulation presented to the Board in late 2010 reflected extensive discussions with many interests in the electricity sector—except DWR. The result was that DWR's interests and unique issues were not presented to ARB staff and thus not addressed in the draft regulation. In December, the Board directed staff to work with DWR to address its concerns. ARB and DWR staff did subsequently meet, at which time DWR twice presented proposals for the use of allowances. However, the ARB staff asserted that despite the invitation for public comment, strict adherence to the draft structure established for cap & trade was essential, and that DWR's proposals would upset that structure. Because of this stance, a full exploration of the treatment of DWR and its proposals did not occur.

Clearly there are a number of instances in which the draft regulation has been changed to accommodate unique issues and deviate from painstaking adherence to cap and trade's underlining economic theory. It is thus disingenuous to suggest that similar accommodations could not be made for DWR. In fact, equity demands that such accommodations must be made; specifically, DWR should receive allowances similar to the POUs and re-open discussions with ARB staff on the appropriate use of allowance proceeds.

Therefore, DWR requests the Board to direct staff to identity a method for incorporating equitable mitigation of the impact cap and trade will have on DWR as the operator of the State Water Project. As a single entity with unique issues relative to other regulated parties and moreover as a fellow state agency and member of the Governors Climate Action Team it is appropriate to address these issues in a memorandum of understanding rather than in regulation. (DWR3)

> **Response:** We do not agree that DWR, SWP, or MWD should receive an allocation of free allowances. Some water purveyors also sell electricity into the CAISO market. The GHG emissions compliance costs must be passed through to end-users. If we allocated allowances to these water purveyors and then they offered their surplus electricity without an appropriate carbon price into the CAISO market, the dispatch order in the CAISO market could be distorted, eventually leading to greater GHG emissions. To avoid this perverse outcome, we believe it is important that these entities, as even an occasional seller of electricity into the CAISO market, be subject to an equitable cost of carbon.
>
> The purpose of allowance allocation to the electric utilities is not for price mitigation, but to provide ratepayer relief while maintaining the price signal. We believe that DWR, MWD, and the SWCs are able to pass the cost of compliance down to the entities they serve, which in turn will pass the cost of carbon on down to the end-user, or final consumer of water. EDUs are allocated

allowances for the benefit of ratepayers, and we expect the EDUs to pass through the cost of GHG emission compliance obligations to their ratepayers.

Because Metropolitan, DWR, and the SWC are not providers of water services to end-use customers, we directed the allowances associated with their electricity usage to electric utilities, IOUs, and POUs, which do have relationships with end-use customers that allow them to return value in a manner that does not distort the incentives created by the cap-and-trade regulation. Some of the POUs also serve end-use water customers. In this way, we balance equity and efficiency by providing transition assistance for water customers while maintaining the integrity of the cap-and-trade program.

Regulation of the water sector through the cap-and-trade program is not duplicative. All major sectors covered by the program, including water, are now, or may in the future be, subject to complementary policies aimed at bringing about long-term change and GHG emissions reductions. The cap-and-trade program provides additional incentives to achieve the reductions already targeted by individual sectors, as well as other cost-effective reduction strategies that may not be targeted. In this way, the cap-and-trade program can be a cost-effective overlay to any preexisting policy.

We also do not agree the water purveyors should be exempt from the program. As DWR notes, AB 32 directs us to include emissions from imported electricity used to serve California end users and to take into account the relative contribution of each source. DWR is a covered entity because DWR imports electricity. DWR's compliance obligation is equivalent to the obligation for electricity importers. Likewise, MWD imports electricity and is similarly covered by the regulation. We believe this treatment best ensures the integrity of the cap.

Furthermore, in Resolution 11-32, the Board directed the Executive Officer to continue discussions with stakeholders to identify and propose, as necessary, during the initial implementation of the cap-and-trade program, potential amendments to the regulation, including distribution of allowance value associated with cap-and-trade compliance costs from using electricity to supply water and the expected ability of allowance allocation and other measures to adequately address the incidence of these costs equitably across regions of the State.

J. ENFORCEMENT

Penalties

J-1. Comment: In section 96014, the Second 15-Day Revisions properly recognize that “daily” penalties are excessive, and that separate violations should accrue every 45 days for compliance instruments that remain unsurrendered, rather than on a daily basis. NCPA urges CARB to further address the issue of potentially excessive penalties and, when looking at violations under this section, consider each 1,000 compliance instruments (or portion thereof) as a single violation, rather than one compliance instrument. Given the order of magnitude of allowances in the Cap-and-Trade Program, violations based on each 1,000 instruments is a viable option that still holds compliance entities accountable, without being excessive. (NCPA4)

> **Response:** We did not bundle the allowances into 1,000 allowance units for purposes of determining penalties. One metric ton of CO_2e is the basic unit for both reporting under the MRR and for compliance or trading under the cap-and-trade regulation. It is therefore an appropriate unit by which to count violations under both rules. Moreover, Health and Safety Code section 38580(b)(3) authorizes ARB to define penalties on a per-unit basis, proportional to the conduct, rather than defining violations purely in terms of days. The penalty structure has also been revised to provide that, rather than having penalties for unsurrendered allowances accrue daily, penalties accrue every 45 days. This provides flexibility to the compliance entity to obtain additional allowances, either through an auction or purchase of allowances through the allowance price containment reserve, and also reduces the potential liability for compliance entities.

J-2. Comment: The Utilities support the change in section 96014(b) that “A separate violation accrues every 45 days after the end of the Untimely Surrender Period for each required compliance instrument that has not been surrendered.” (MID4)

> **Response:** We thank the commenter for its support.

J-3. Comment: The removal of allowances in order to satisfy a penalty in a quantity that exceeds actual emissions penalizes all market participants, not just the entity in violation of the regulation. The penalty portion of an enforcement action should be either direct monetary payment or an “in kind” payment. (NEXTERAENERGY3)

> **Response:** We believe that commenter refers to the excess compliance obligation provision of the regulation. This is not a penalty. Nevertheless, we note that the regulation does not remove the additional allowances permanently from the market. It places the additional surrender obligation allowances back in the auction account, making those allowances still part of the market. The additional surrender obligation is an additional deterrent to noncompliance.

J-4. Comment: We ask that ARB reconsider its proposed modification to section 96014(b) to calculate violations every 45 days rather than daily. We find the proposal needlessly curtails ARB's ability to ensure penalty amounts are sufficient to deter non-compliance. On the surface, calculating violations daily allows for large penalty amounts to accrue, but the concern that this will result in gross and excessive penalty amounts belies other requirements in the Health and Safety code and decades of ARB's experience in enforcing regulatory programs under those provisions. Calculating violations daily is the standard approach to assess penalties under the Health and Safety Code, which are the penalty provisions applicable to violations of the cap-and-trade rule. Before imposing any penalty amount, ARB is required to consider all relevant circumstances for each violation, including a set of criteria that weighs heavily against levying an excessive penalty for failure to meet an untimely compliance obligation. However, the additional leeway afforded by daily calculation of violations would afford ARB greater ability to tailor penalty amounts in proportion to the nature and extent of the violation. Given ARB's extensive experience in enforcing regulatory programs under these provisions, we do not find credible assertions that the cap-and-trade rule warrants special treatment through periodic rather than daily calculation of penalties. The success of the cap-and-trade program is contingent on ARB ensuring market participants play by the rules. To ensure fair play, it is incumbent on ARB to retain the full range and extent of enforcement tools at its disposal. (KUSTIN19)

> **Response:** We instituted the change in response to analysis and stakeholder comments that demonstrated that leaving the "per ton-per day" calculation in place would result in penalties that may be disproportionate to the violation. ARB fully intends to enforce its regulations and ensure that market participants "play by the rules." We believe that the penalties in place in the final regulation balance these interests appropriately. See also responses to Comments J-15, J-20, J-23, J-25, and J-33 in the 45-day responses.

Conflict Resolution

J-5. (multiple comments)
Comment: Currently the cap-and-trade and mandatory reporting regulations give CARB's Executive Officer sole authority on program implementation, including determining whether regulated parties have complied with regulations and to determine penalties. Absent costly and time consuming litigation, there is currently no independent administrative option for stationary source facilities to challenge the Executive Officer's decisions that could not be resolved. The AB 32 IG believes the Executive Officer should not have the final decision on such a comprehensive program as AB 32, and instead it would be in both CARB's and the regulated industry's best interest that a formal, autonomous dispute resolution process should be established in order to provide independent decision making with equity for all parties involved in any dispute. This program should use an unbiased mechanism to resolve disputes, variances and penalty disagreements with the Executive Officer. Without such a program issues that could be resolved relatively quickly could become time-consuming litigation which could hinder the goals of AB 32. (AB32IG3)

Comment: CalChamber supports the adoption of a formal autonomous dispute resolution process that would enable facilities to challenge and resolve disagreements prior to potential enforcement actions through an equal process for all parties involved in any dispute. (CALCHAMBER4)

Comment: Currently, the ARB Executive Officer and staff make significant enforcement decisions that are not subject to review. The only appeal process available to a regulated party is to sue the State. The AB 32 program requires that the ARB create a brand new, far reaching, and complex program under very tight statutory deadlines. The statutory deadlines are driving rapid development of regulations, which may have unintended consequences and unknowable problems at every individual facility. Since every facility is different these types of problems, which bridge both energy and air pollution issues, CCEEB recommends that ARB establish an independent administrative dispute resolution process that will provide a fair, efficient, and predictable process available to all individual facilities. This will reduce the money and time spent defending lawsuits and in informal negotiations. It will also increase the transparency of the appeal process as all interested stakeholders can weigh-in during a hearing. The proposed dispute resolution process could be modeled after existing air pollution hearing processes for disputes at individual facilities that occur under local air district rules. (CCEEB4)

Comment: Currently the cap-and-trade and mandatory reporting regulations give CARB's Executive Officer sole authority on program implementation, including determining whether regulated parties have complied with regulations and to determine penalties. Absent costly and time consuming litigation, there is currently no independent administrative option for stationary source facilities to challenge the Executive Officer's decisions that could not be resolved. CLFP believes the Executive Officer should not have the final decision on such a comprehensive program as AB 32, and instead it would be in both CARB's and the regulated industry's best interest that a formal, autonomous dispute resolution process should be established in order to provide independent decision making with equity for all parties involved in any dispute. This program should use an unbiased mechanism to resolve disputes, variances and penalty disagreements with the Executive Officer. Without such a program issues that could be resolved relatively quickly could become time-consuming litigation which could hinder the goals of AB 32. (CALFP4)

> **Response:** The Executive Officer does not unilaterally "set" penalties. Health and Safety Code section 38580 provides ARB with enforcement authority over AB 32 regulations, including the authority to define the violations. This authority does not extend to assessing, imposing, or determining final penalty amounts. The governing statutes allow ARB to *seek* penalties in an administrative or judicial proceeding. In many of its enforcement actions, ARB and the entity from whom ARB is seeking penalties will reach a mutual settlement agreement, including an agreed-upon penalty amount. ARB may seek penalties in an administrative or judicial action, in which the ultimate penalty

amount is determined by a neutral judge, based on the statutory penalty structure. In no instance is ARB or its Executive Officer able to unilaterally assign a penalty amount on a violator. Additionally, ARB notes that the creation of a dispute resolution process is outside and beyond the scope of these regulatory amendments. Notwithstanding this, ARB disagrees with the underlying premise of the commenter's suggestion; namely that there is no fair, independent, autonomous method of resolving these disputes. As the commenter acknowledges, the existing recourse is to challenge a decision in court. That process is well established and understood by regulated entities, the public, and ARB. Inventing a new, additional dispute resolution process, whether that would be through the creation of a hearing board or an administrative hearing, will not necessarily reduce the time or expense of resolving such disputes. In fact, and contrary to the claimed rationale of the commenter, ARB believes such additional process may actually increase the time and expense of resolving these matters, since parties could still ultimately end up back in court. Including an additional dispute resolution process would give rise to delay that could have broad market impacts given the timelines in the cap-and-trade regulation. As such, ARB does not agree that including such a process would be appropriate.

Regarding variances, ARB does not believe the "variance" process used by the air districts is necessary for the MRR or cap-and-trade regulations and believes that it could disrupt the market features of the cap-and-trade regulation, which relies on the emissions data reports from the MRR. Unlike the future emissions addressed by air district variance processes, the emissions at issue in the MRR and cap-and-trade regulation have already occurred and been reported to ARB. As such, no "variance" is required; therefore, the formal variance process used by the air districts would be inappropriate for the MRR. In addition, instead of a formal variance process, the MRR includes a process by which a facility may petition for an interim data collection method under certain circumstances that result in data loss due to unforeseen reasons. The MRR also contains a dispute-resolution process for when a reporting entity and its verifier do not agree on the quality of the emissions data report. We believe that these two design features will ensure an efficient market process where timely data are critical to the functioning of a well-developed market program and that they will address the commenter's concerns.

See also response to Comment J-37 in the 45-day responses.

Violations

J-6. Comment: The recently proposed enforcement provisions that consider failure to report every ton of excess emissions and submittal of inaccurate information as separate violations would potentially result in unwarranted and excessive penalties, relative to other criteria pollutant penalties. GHG emissions levels are a thousand times higher than criteria pollutant levels. The mandatory reporting rule is complex, and the volume of data collected is enormous; the sheer size and complexity significantly increases the potential for unintended reporting errors. In addition, the proposed enforcement language would still permit ARB to impose penalties for the period between submission of the initial unverified repot and the final verified emissions repot if the verified report indicates inaccuracies in the initial report. ARB should further amend this section so that changes in reported emissions occurring between the initial emissions data report and submission of the final verified emissions data report are violations only if initial under-reporting was due to intentional misrepresentation. (CCEEB4)

Response: This comment addresses the Mandatory Reporting Regulation provisions. No response is required.

J-7. Comment: In section 96014, the provision was deleted that stated each day of violation is a separate offense under subpart (b). The new language specifies that a separate violation accrues every 45 days for an untimely surrender. This is a substantial reduction in the number of days for each violation and results in a dramatic reduction in the potential civil penalty available by statute. We strongly recommend reinstating the previous language which clearly establishes daily violations for each day of the compliance period. (SCAQMD5)

Response: See response to Comment J-4, above.

J-8. Comment: We recommend reinstating section 96014(c). The Health and Safety Code is based on actual days of violation, so this provision is of critical importance. If an enforcement action is taken to court, the extent to which actual days of violation can be established will be persuasive to a judge. Accordingly, in order to ensure adequate deterrent value in cases which may be based on negligent or intentional conduct, we recommend that the rule provide that a separate day of violation is established for each day of the applicable compliance period unless the program participant can establish compliance for each of those days. The violations continue until final compliance is achieved. This will provide an adequate number of days of violation to deter future misconduct at the facility and throughout the regulated community. We recognize that AB 32 allows CARB to develop a method of converting a violation of any rule adopted under AB 32 into "days of violation" (Health and Safety Code section 38580(b)(3)), but we believe it is important to maintain the ability to seek a penalty for each day of violation. (SCAQMD5)

Response: See response to Comment J-4, above.

Miscellaneous

J-9. Comment: Many of the proposed amendments made within the second 15 day changes make this a stronger more enforceable regulation. Changes made within section 95921(g) requiring holders of clearing accounts to maintain transaction records for ten years and to provide transaction records within ten days of a request by the Executive Officer are helpful with transparency and related enforcement. (SCAQMD5)

Response: We thank the commenter for its support.

K. LEGAL

Public Process

K-1. Comment: The development of the cap-and-trade regulations did not occur through an open process. Metropolitan has provided comments to the Board in response to every iteration of the cap-and-trade regulations articulating most of the concerns that Metropolitan is still expressing today. Staff stated at the December 2010 Board meeting adopting the cap-and-trade regulations that, with respect to the wholesale water utilities, ARB staff had “missed an important category of customers” and indicated a willingness to talk to wholesale water agencies. Metropolitan began meeting with ARB staff following the Board adoption of the regulations and has since met with them several times to discuss Metropolitan’s concerns and to advocate specific proposals for addressing those concerns. At some of these meetings, ARB staff indicated that they were reluctant to make changes to the regulations that would be unpalatable to the EDUs, including publicly-owned utilities, investor owned utilities, and the Joint Utilities Group (JUG). Ultimately, ARB staff did not adopt any of the recommendations made by Metropolitan. Metropolitan is very concerned that, in working directly with the JUG to craft price mitigation measures for their members, ARB staff may have impermissibly made decisions without engaging non-JUG members. The Public Meetings Act, as contained in section 11120 of the Administrative Procedure Act (APA), provides that it is the intent of that law “that actions of state agencies be taken openly and that their deliberation be conducted openly.” AB 32 itself reinforces this directive by requiring that the ARB “adopt rules and regulations in an open public process.” The sequence of events leading to ARB’s determination that free allowances would only be given to Local Distribution Companies (LDC) gives rise to the concern that stakeholders such as Metropolitan did not have an adequate opportunity to advocate their positions prior to a de facto decision made by ARB staff. Following the issuance of a recommendation by the ARB’s Economic and Allocation Advisory Committee on January 2, 2010, the JUG, representing all of the major LDCs in California, began meeting with ARB staff on a regular basis to discuss the allocation of free allowances. According to information made available to Metropolitan, the JUG met with ARB staff on numerous occasions prior to the release of the draft cap-and-trade regulations in October of 2010. In a February 11, 2010 meeting, held seven days prior to the public Ad Hoc Committee meeting to discuss allowance allocation, the JUG provided ARB staff with a recommendation that largely tracks the draft cap-and-trade regulations with respect to free allowances. At an August 16, 2010 meeting, staff indicated that they were hopeful that they could build on the agreement reached by the utilities. In advance of the spring 2011 workshops at which allowance allocation was publicly discussed, Metropolitan received information from a member agency indicating that ARB planned to meet with a subgroup of utilities prior to the public meetings to discuss allowance allocation. One consequence of the failure to include the water sector in this process is that allowances associated with the emissions of the wholesale water utilities were allocated to other entities. ARB has in fact acknowledged this inequity in Appendix A to the Initial Modifications, where, in reference to the water utilities, it states that “each of these entities use electricity to transport water into and around California, and the emissions associated with this activity are included in the pool of allowances set aside for the electric sector." This strongly suggests that the EDUs who participated in the emissions allocations discussions obtained not only the free allowances associated with their own electricity usage, but also a pro rata share of the allowances associated with the electricity use of the water utilities. Metropolitan does not raise the issue of transparency in order to cast aspersions on either ARB staff or JUG members. Metropolitan assumes that the representatives from ARB and the JUG were attempting to resolve issues pertinent to the retail electric utilities in a time-constrained environment in advance of the October 2010 issuance of the proposed cap-and-trade regulations. However, an unintended consequence of these closed meetings was that stakeholders, such as Metropolitan, which were not included in meeting announcements, were unable to voice their concerns and assert their interests in a process that led to the formulation of regulations with a profound impact on many entities outside of the JUG. While staff and the Board made the ultimate decision with respect to the regulations, they did so without the input of many affected parties. (MWDSC4)

> **Response:** ARB has complied with all provisions of the Administrative Procedure Act. The commenter admits that ARB met with the commenter on multiple occasions during the pendency of the rulemaking, including receiving comments from the commenter on numerous occasions that were not limited to the comment periods required by Government Code sections 11346.8. The commenter claims in submitted comments that it is not an electrical distribution utility. ARB agrees with this assertion. As such, it would not have made sense for ARB to include the commenter in discussions with electrical distribution utilities. ARB always meets with a variety of groups with similar interests, including refineries, electrical distribution utilities, and environmental groups. The groups representing the water interests chose to meet with ARB separately on multiple occasions. ARB cannot require that groups with common interests work together. ARB held multiple public workshops, both before and after the start of the official rulemaking process required by the APA. The commenter submitted comments and those comments are answered elsewhere in this document. ARB disagreed with the commenter's concerns and solutions, and ARB has explained in response to those comments the reasoning behind not accepting those suggestions. ARB included language in the resolution adopted on October 20, 2011, to continue analyzing the issues presented by the commenter and report back to the Board at a later time about the progress and results.

K-2. Comment: Contrary to the requirements of the APA, ARB did not respond to Metropolitan's comments. In addition to requiring open meetings, the APA requires that public agencies be responsive to public input. As the court articulated in Morning Star Co. v. State Board of Equalization, 38 Cal.4th 324, 333 (2006) (citing Gov. Code section 11346), "[i]f a rule constitutes a „regulation‟ within the meaning of the APA it may not be adopted, amended, or repealed except in conformity with, basic procedural requirements ‟that are exacting." The court notes that one of those exacting requirements is that the public agency must "respond in writing to public comments," and cautions that "[a]ny regulation or order of repeal that substantially fails to comply with these requirements may be judicially declared invalid." Save for the one-paragraph discussion in Appendix A to the Initial Modifications regarding the propriety of allocating free allowances to water utilities, the ARB has not addressed the arguments repeatedly proffered by Metropolitan with respect to cap-and-trade. Although, as discussed below, allocating free allowances to wholesale water utilities provides a bare minimum of protection for water customers against rising costs, Metropolitan's primary arguments regarding exemption and deferral have been completely ignored in the numerous iterations of the cap-and-trade regulations that the ARB has released in the last year. While the AB 32 implementation proceedings are governed by the APA, ARB's blatant disregard for public input and administrative dictates in its development of the cap-and-trade regulations is highly analogous to ARB's violation of CEQA in its approval of the Scoping Plan, as found by a court in Association of Irritated Residents v. ARB, Statement of Decision, Case No. CPF-09-509562, Superior Court of California, County of San Francisco (March 18, 2011). There, as here, the ARB failed to adequately respond to public comments prior to making a determination. ARB's repeated failure to address Metropolitan's comments on the cap-and-trade regulations makes it susceptible to the same type of legal challenge. (MWDSC4)

> **Response:** ARB has fully complied with the Administrative Procedure Act throughout the course of this rulemaking. The Administrative Procedure Act requires an agency to respond to all comments in the Final Statement of Reasons, which is typically made available at the end of the rulemaking process. Government Code section 11346.9(a)(3) requires the Final Statement of Reasons to include the comments and the agency's response to the comments, and to identify changes made in response to comments or explain the reasoning behind rejecting suggested changes. The commenter appears to believe that because ARB did not implement the changes suggested by the commenter, that they were disregarded. The APA does not require that comments be responded to prior to a decision, only that they be considered. The Board considered these comments prior to its adoption of the regulation on October 20, 2011. ARB also disputes that its previous approval of the Scoping Plan violated CEQA. See response to Comment K-25 in the 45-day responses.

Federal Agencies

K-3. (multiple comments)
Comment: DoD commitments to reduce greenhouse gas (GHG) emissions will accomplish much greater reductions while maintaining military flexibility to accomplish those reductions without threatening National Security. The charges for participating in the cap-and-trade program constitute a tax on the federal treasury. It is impermissible to obligate federal funds to pay state taxes. Therefore, no DoD comptroller may allow the purchase of allowances or compliance certificates with federal dollars. The cap-and-trade regulation has the perception of discriminating against the military and the federal government because it does not apply to federal entities "in the same manner and to the same extent" as other nongovernmental entities. As such, it does not fit

within the conditional waiver of sovereign immunity in the Clean Air Act (CAA). (USDOD3)

Comment: Is the allowance charge an approximation for the benefits received by the government facility? No, the charge is derived from the per capita allowance for the right to emit GHGs. Moreover, the sale of allowances at auction will necessarily generate revenues that exceed the costs of the program and have already been proposed by the California legislature to be set aside for community benefit funds. (USDOD3)

Comment: Is the allowance charge structured to produce revenues that will not exceed the total costs to the government of the benefits to be provided? No, the charge for the right to emit GHGs is designed to produce revenue that may be appropriated later by the State of California for purposes to be determined after the revenues from the auction are received. The Resolution 10-42 specifically describes returning allowances to disadvantaged households and legislation like SB 535 and AB 1405 demonstrate the State of California's intent to leverage funds generated under the cap-and-trade program against costs outside of the program itself. (USDOD3)

Comment: Is the program is implemented in a non-discriminatory manner? No, the program has the practical effect of discriminating against Federal agencies because it does not allow for full participation of Federal agencies given their contracting and appropriation constraints under the Antideficiency Act and implementing regulations. The GHG allowance allocation portion of this program has been significantly influenced by the goal to eliminate economic risk, and as a result is outside the CAA section 118 waiver of sovereign immunity, which only allows state authority over Federal agencies for the control and abatement of air pollution. (USDOD3)

Comment: Do some aspects of the allowance allocation scheme directly discriminate against federal agencies? Yes. As illustrated in Figure J-5 (p. J-20) and Table J-7 (p. J-32), in the On-site Fuel Combustion and Process Emissions category and the Heat Purchased, Electricity Purchased, or Combined Heat and Power (CHP or COGEN) produced on-site category, federal facilities that become a "covered entity" must purchase all allowances required to cover their GHG emissions from on-site fuel combustion to comply with the program. Yet under Table 8-1 industrial facilities will receive free allocations of allowances to cover their benchmarked direct costs for GHG emissions from these source categories. (USDOD3)

Comment: The CAA's Federal Facilities section 118, which conditionally waives sovereign immunity, authorizes the payment of reasonable regulatory fees in support of air pollution abatement program. According to the text of the statute, "[T]he Federal Government [shall] be subject to any requirement to pay a fee or charge imposed by any State or local agency to defray the costs of its air pollution regulatory program." There are many aspects of the cap-and-trade program, but the heart of the program is a trading of emissions allowances. This trading will generate revenues for both the State of California and for some covered entities. These revenues will bear no relationship to the costs of the regulatory program. These excess costs are the signature feature of the program that renders its costs as taxes rather than reasonable regulatory fees. Under the Supremacy Clause, the United States and its instrumentalities are immune from direct taxation by state and local governments. Appropriated funds are not available to pay tax assessments without a specific act of Congress waiving sovereign immunity. (USDOD3)

Comment: Military Comptrollers are required to follow all binding legal opinions, as well as those rendered by the DOJ and the GAO. Put plainly, Congress has not authorized the use of appropriated funds to participate in a market-based commodity exchange of pollution permissions where the generated revenues do not exclusively support the air pollution control program. Congress has authorized federal agencies to pay fees commensurate with the services performed for and benefits accrued to the federal pollution programs. Auction sales do not meet that definition. (USDOD3)

Comment: Under section 118(a) of the CAA, Federal agencies are only subject to state requirements and authority "respecting the control and abatement of air pollution in the same manner, and to the same extent as any nongovernmental entity." The California cap-and-trade program discriminates against Federal facilities. The program does not impose air pollution control and abatement requirements on Federal facilities in the same manner and to the same extent, because certain industrial facilities and distribution utilities operating the same type of emission units will be regulated differently. (USDOD3)

Response: The response to Comment K-8 in Chapter III generally describes the waiver of sovereign immunity contained in section 118 of the Clean Air Act (CAA), and why ARB believes this provision applies to federal agencies and departments (like the Department of Defense (DOD)) that are subject to the cap-and-trade regulation.

DOD claims that "the charges for participating in the cap-and-trade program constitute a tax on the federal treasury" that is not within the scope of the section 118 waiver provision. In support of this contention, DOD offers a number of arguments that can be distilled down to one: that although section 118 of the CAA waives sovereign immunity for the payment of reasonable regulatory fees to defray the costs of California's air pollution program, the costs imposed by the cap-and-trade program are an impermissible tax because the revenues generated bear no relationship to the cost of the program or the services provided to federal facilities, and the revenues will be spent for the general public benefit instead of controlling greenhouse gas (GHG) emissions.

DOD uses the three-part test applied by the Supreme Court in the 1978 case of *Massachusetts v. United States* (1978) 435 U.S. 444 to reach the conclusion that the charges for allowances constitute an illegal tax. However, it is not certain that the courts would apply the three-part test set forth in *Massachusetts*. It can be argued that a challenge to the cap-and-trade regulation by a federal agency must be brought in state court, and California law regarding taxes and fees would apply instead of federal law (see *South Coast Air Quality Management District (SAQMD) v. United States,* (C.D. Cal. 1990) 748 F. Supp. 732, 1990, in which a federal District Court refused to apply the three-part *Massachusetts* test because the court found that section 118 provides a complete waiver of sovereign immunity).

If one assumes that the three-part *Massachusetts* test does apply, however, we believe that the cap-and-trade program does not impose a tax under this test. First of all, DOD's analysis assumes that the revenues that will be generated by the cap-and-trade program will be appropriated by the Legislature in such a way that they would be a tax under the Massachusetts test. This is speculation, because no revenues have yet been collected by ARB or appropriated by the Legislature, and no decision has yet been made by the Legislature regarding how the revenues will be appropriated once they are collected.

In addition, DOD's analysis does not accurately characterize the many federal court decisions that have interpreted the *Massachusetts* test. DOD's analysis implies that a monetary charge paid by federal facilities is a "tax" except in very limited situations, such as where a state is charging for a specific service provided to a fee payer, or attempting to cover the administrative costs of running a regulatory program. Case law is not so limited. To give just one example, In *New York State Department of Environmental Conservation v. U.S. Department of Energy* (N.D., New York 1991) 772 F. Supp. 91), a federal district court affirmed state action to recover environmental regulatory fees owed to it by federal facilities. The Court noted that the charges imposed varied in relation to the size or quantity of each facility's operations (e.g., gallons, pounds, vehicles) rather than upon the particular services provided by the New York Department of Environmental Conservation (NYDEC). The Department of Energy (DOE) claimed that the fees sought were impermissible taxes and that they were unreasonable in light of the services provided by the NYDEC to their facilities. The Court examined the charges in light of the *Massachusetts* test. With regard to DOE's assertion that the charges failed the second prong of the test because they were based upon the size or quantity of an entity's operations rather than upon the actual services provided, and because NYDEC failed to correlate the charges assessed against specific federal facilities to the cost of services rendered, the Court agreed with the State "that the United States has misinterpreted and incorrectly applied the second portion of this test" because

> "the relevant inquiry is not whether the charges assessed by a state exceed the <u>specific services</u> rendered to a facility by the government. Rather, this prong relates to the <u>overall</u> benefits a facility receives from the government's services. In fact, the Supreme Court voted that this portion of the test is not failed even when a particular entity receives no specific services from the government at all." (emphasis added)

In the cap-and-trade program, the money expended to purchase allowances by DOD and private participants could be characterized as the payment of fees for the right to emit GHGs into the atmosphere. Contrary to the DOD's claim that the "cap and trade program creates a personal property interest in the right to emit a GHG allowance and then confiscates the property interest by requiring the possessor of the allowance to surrender the interest to the State of California for the general health and welfare," there exists no property interest and no vested right to pollute. No "right" of DOD is confiscated.

Finally, DOD claims that the cap-and-trade program discriminates against federal facilities, and therefore does not fall within the waiver of sovereign immunity provided in section 118 of the Clean Air Act, because certain industrial facilities operating the same types of emission units (such as cogeneration) may receive free allocation of compliance allowances, while federal facilities must purchase all of their allowances. We do not agree that the program discriminates against federal facilities, because federal facilities will be evaluated based on the same criteria as any other facility in California. However, as directed in Board Resolution 11-32, we will continue to work with the Department of Defense to ensure that appropriate GHG reductions are achieved by DOD.

Use Of Auction Proceeds

K-4. Comment: CARB has estimated the sale of allowance proceeds to be about $500 million in the first compliance period and up to $2 billion in the second and third compliance periods. CalChamber has long maintained that CARB's proposal to raise funds via an auction for reasons outside of administrative fee purposes is beyond CARB's regulatory authority. And throughout the regulation process, CARB has publicly identified possible revenue uses from the sale of allowances, even directing CARB's Executive Officer to deposit a percentage of annual proceeds to fund programs that 'reduce GHG emissions or mitigate direct health impacts of climate change, and promote green collar employment opportunities in the most impacted and disadvantaged communities in California...'. We caution CARB that these and other spending proposals are clearly outside the scope of administrative or regulation-related fees. CARB must keep in mind the State Constitutional requirement that fees must provide either a direct benefit or service to the fee payer, or be directly connected to a reasonable regulatory program serving the fee payers, otherwise, these fees are actually taxes and must be approved by a two-thirds vote of the legislature. Without a legitimate nexus, the above mentioned auction revenue proposals will likely be challenged since they are not only contrary to the legislative intent of AB 32 but are contrary to the procedural requirements of the State Constitution. (CALCHAMBER4)

Response: We believe that AB 32 provides ARB with the authority to conduct an auction as part of a cap-and-trade program. AB 32 authorizes ARB to "adopt a regulation that establishes a system of market-based declining annual aggregate emission limits for sources or categories of sources that emit greenhouse gas emissions" (Health and Safety Code section 38562(c); see also section 38570, which specifies additional criteria for market-based compliance mechanisms). These statutory provisions authorize ARB to adopt a cap-and-trade regulation and, in order to initiate a cap-and-trade program, emission allowances must somehow be allocated to participating sources. Thus, AB 32 directs ARB to “Design the regulations, including distribution of emissions allowances where appropriate, in a manner that is equitable, seeks to minimize costs and maximize the total benefits to California and encourages early action to reduce greenhouse gas emissions.” (Health and Safety Code section 38562(b)(1); emphasis added.)

There are a variety of ways to allocate allowances; they can be distributed free of charge, they can be sold at a predetermined price, they can be auctioned off with competitive bidding, or some other allocation method can be developed. AB 32 does not direct ARB to use any particular method to distribute allowances, and does not specify that some methods are allowed and others are not. Each method of distribution has pros and cons, and different methods will vary in their ability to meet the statutory criteria set forth in AB 32. Auctioning of allowances is one widely recognized method to distribute allowances, and is in fact the method that has been recommended by the Market Advisory Committee and many other economists. We believe that in authorizing ARB to distribute allowances, and requiring that market-based compliance mechanisms must meet certain criteria, the Legislature did not intend to forbid ARB from choosing this widely recognized distribution method. In other words, as the administrating agency charged with interpreting AB 32, ARB believes that AB 32 provides ARB with the authority to include auctions as a feature of a cap-and-trade program.

L. MARKETS

Trading, Market Conduct and Oversight

L-1. Comment: Throughout the rulemaking process, Evolution Markets has commented on provisions contained within section 95921 on "Conduct of Trade". We believe elements of this section provide an important foundation for California's carbon trading market. The market exists to offer entities the flexibility to find the lowest cost means of compliance with ambitious greenhouse gas reduction targets. Should rules governing trading activity unnecessarily constrain transactions or provide insufficient oversight, the market cannot effectively provide this important function. ARB correctly understands that the carbon market is likely to evolve to include a variety of transaction structures that allow entities to manage risk and achieve low-cost compliance. Provisions in section 95921 also allow the ARB Executive Officer to review requests for transfers to ensure they meet basic criteria for reporting and adherence to holding limit regulations. As an important proposed change, ARB suggests building in a "cure period" that offers an element of flexibility. Deficient transfer requests will be given three days to resubmit the request before transfers are executed. Transfer requests that are deemed deficient after transfer occurs will be given five days to resubmit the request, or the transfer will be reversed. Previously, ARB only had the authority to reverse trades, which would have forced entities to automatically unwind trades in the event of a deficiency. (EVMKTS3)

> **Response:** No response is required.

L-2. Comment: GreenX provided comments explaining how the Executive Officer's authority to reverse trades is extremely problematic and will have a disruptive effect on the market. In particular, the provision, as described in section 95920(b)(4), will interfere with the sanctity of contract, result in litigation between market participants, and will cause a lack of confidence in the secondary market for compliance instruments. (GREENX2)

> **Response:** We disagree with the comment. Section 95920(b)(4) states that the process for dealing with rule violations follows section 95921(b). In all cases when a deficient transfer request is detected, the parties to the underlying transaction will have the opportunity to correct the deficiency. In some cases the correction may involve resubmitting the corrected transfer request or submission of entirely new requests that solve the rule violation. A recorded transfer would only be reversed if the parties to the underlying transaction refuse to correct the deficiency.

(multiple comments)
L-3. Comment: While the "cure period" is a noted improvement, Evolution Markets still has strong concerns with the ability of the Executive Officer to reverse a transfer of compliance instruments. Reversing commercial transactions between counterparties creates a host of contractual and compliance issues. The foundation of a properly

functioning market is that commercial contracts between counterparties cannot be unwound. An obligation to sell allowances to another counterparty must be met, and once the transfer of allowances and cash has taken place counterparties cannot be expected to reverse this transaction. To create the possibility of a transaction reversal would introduce an unacceptable measure of risk to carbon transactions. Furthermore, such reversals may create a daisy chain of violations of holding limit provisions. In the instance of ARB reversing a transaction, the buyer of allowances will return the allowances to the seller. The seller may have sold the allowances to ensure it did not violate its own holding limits, and the return of allowances from the reversed transaction might then put the seller over its holding limit. This would, in turn, generate another series of reversals which would impact still other counterparties.

Lastly, ARB's transfer reversal authority could result in opportunities for market participants to game the cap-and-trade system. Entities that have either filed a deficient transfer request or have surpassed their holding limit may well welcome the ability of ARB to reverse a transfer, particularly if the trade underlying the transfer is out of the money at that given time. Therefore, Evolution Markets supports the introduction of a "cure period" and believes the proposed three or five day period is sufficient. Evolution Markets encourages ARB to eliminate the authorization to reverse of trades, and instead institute a penalty for non-compliance should the entity not remedy the deficient transfer request in the allotted time. (EVMKTS3)

Comment: GreenX is increasingly concerned with potential market manipulation and "gaming of the system" that could result if trades that breach holding limits are reversed. By way of example, suppose an entity entered into a contract to purchase allowances at a predetermined price at a specific date in the future. Further suppose that during the time between the date contract was entered and the date the contract expired, the price of allowances declined dramatically, thereby making the contract out-of-the-money. Under the current provision, said entity could, however, go to the spot market and purchase allowances up to their holding limit, knowing that the futures/forward transaction would be reversed as soon as the excess allowances triggered the holding limit provision. This type of gaming would thwart the development of exchange-traded futures and over-the-counter forward markets, destroying the mechanism by which forward price signals are created. (GREENX2)

> **Response:** Under the revisions made to section 95921(b) in the second 15-day changes to the regulation, we will retain the ability to reverse the recording of a transfer request into the system, but we do not automatically require reversal of an underlying transaction. A transfer would only be reversed if the parties to the transfer request do not correct the deficiency. As deficient transfer requests represent some failure to follow the regulation, the remedy may be the imposition of a penalty instead of reversal.
>
> We understand the concern that parties to an underlying transaction may attempt to use the reversal of a transfer as an option to completing the transaction, but we believe the contracts governing the underlying transaction should address the

failure of either party to adhere to market regulations. In any event, the reversal of a transfer request is not automatic. The filing of deficient transfer requests, as well as the failure to correct such requests, would be subject to financial penalties. The regulation also gives the Executive Officer the ability to suspend or revoke the registration of any voluntarily associated entity and to place conditions on the registration of any covered entity. Between the financial penalties and the ability to control who may participate in the market, we believe we have the tools to remove any economic benefit a market participant may gain from the scenario described in the comment.

We have clarified the distinction between the act of transferring control of a compliance instrument on the tracking system and the underlying agreement in the secondary market between entities which would result in a transfer. We modified section 95920(b) to replace the term “transaction” with the term “transfer request.” This change was made to sections 95920(b)(3) and (4).

The term “transaction” means an understanding among registered entities to transfer the control of an allowance from one entity to another, either immediately or at a later date. The “transfer” of a compliance instrument means the removal of the serial number of a compliance instrument from one account and placement into another account. In the California cap-and-trade program, a transfer will be affected through a “Transfer Request” submitted by an authorized account representative or an alternate authorized account representative to the accounts administrator, in order to register a transfer of allowances between accounts into the tracking system.

L-4. Comment: GreenX, requests ARB to reduce the records retention requirement for transactions from ten years to five years. Regulated exchanges like GreenX are required by the CFTC to maintain transaction level records for five years. To impose a longer record keeping period on exchanges is unnecessarily burdensome and costly. Record retention of this magnitude would require significant hardware investment, an expense exchanges would likely pass on through transaction fees to market participants. (GREENX2)

Response: We imposed the records retention requirement in section 95921(g)(2) because we have minimized the role of the exchange clearing holding account in reporting transfer information, such as in section 95920(b)(3) and 95921(g)(3). We anticipate needing the information for market transaction investigations. Having a long retention period is what allows us to not require the information to be provided as transactions are cleared.

L-5. Comment: ARB proposes changes to this section which apply rules on the conduct of trade to transfers of compliance instruments, rather than “transactions.” IETA welcomes this clarification, as we believe it would have been impractical for ARB to regulate the underlying transactions in a future carbon market. A carbon market that consists of a combination of spot, forward, future, and options transactions would make interpreting the positions of market participants relative to their holding limits difficult, if not impossible. Furthermore, requiring a review of every market transaction by ARB would have had a significant negative impact on market liquidity. As IETA has asserted previously, a lack of liquidity in the market can result in higher transaction costs and higher costs of compliance. IETA has reservations regarding the authority of the ARB Executive Officer to reverse transfers of compliance instruments. Markets underlying the cap-and-trade program rely on the certainty of transactions, in which the transfer of compliance instruments is completed based on agreed upon terms and cannot be reversed. IETA understands ARB's need to create a mechanism for the enforcement of the holding limit and to ensure compliant requests for transfer of compliance mechanisms. However, reversals of non-compliant trades could result in market disruptions that, again, are likely to restrict market liquidity. IETA recognizes, however, that ARB has proposed significant changes to this section to allow for a cure period in the event of deficient transfer requests. The ability for transferees to correct deficient transfer requests within three days of notification of the deficiency (and within five days in the event of a retroactive notification) is a considerable improvement. Previously, ARB only had the authority to reverse trades, which would have forced entities to automatically unwind trades in the event of a deficiency. This would result in the market disruptions described above. Although the current draft of this section is an improvement, IETA believes a host of unintended consequences could result from ARB's ability to reverse trades in instances of transfer requests that exceed an entity's holding limit. As IETA has stated previously the reversal of a transfer could result in a daisy chain of entities exceeding holding limits stemming from counterparties forced to take back transferred allowances. More importantly, the ability of a regulator to reverse trades undermines the core tenant of markets that trades cannot be reversed. The result could be a lack of confidence in the California carbon market and the inability of regulated exchanges and other trading venues to develop the infrastructure necessary for a transparent and fair market. This is perhaps why we are not aware of another cap-and-trade program existing that provides its regulatory such trade reversal authority. This authority also provides an opportunity for gaming of the market. For instance, an entity taken over its holding limit by an allowance transfer could use ARB's reversal authority to have allowance purchases reversed that it believes are outside of its commercial interest. For instance, the entity could choose to allow ARB to reverse a trade that is out of the money, thereby using regulatory powers to financial benefit. Therefore, IETA recommends ARB eliminate the transfer reversal authority from the regulations. Instead, ARB can retain the new language providing for a cure period, and at the end of the cure period impose a penalty pursuant to section 96013 should the entity not reduce its holdings to below the holding limit or rectify a deficient transfer request. (IETA4)

> **Response:** We disagree with the conclusion reached in the comment that having ARB retain the right to refuse recording a deficient transfer request undermines the market. We contend that markets will rely on the integrity of our record of ownership in order to function. Under the modifications made to section 95921(b), we retain the ability to reverse the recording of a transfer request into the system, but we do not automatically require reversal of an

underlying transaction. A transfer would only be reversed if the parties to the transfer request do not correct the deficiency. As deficient transfer requests represent some failure to follow the regulation, the remedy may be the imposition of a penalty instead of reversal.

We understand the concern that parties to an underlying transaction may attempt to use the reversal of a transfer as an option to completing the transaction, but we believe the contracts governing the underlying transaction should address the failure of either party to adhere to market regulations. In any event, the filing of deficient transfer requests, as well as the failure to correct such requests, would be subject to financial penalties which could remove the economic benefits obtained through rule violations. The regulation also gives the Executive Officer the ability to suspend or revoke the registration of any voluntarily associated entity and to place conditions on the registration of any covered entity. Between the financial penalties and the ability to control who may participate in the market, we believe we have the tools to remove the incentives for entities to attempt the gaming scenarios described in the comment. We also will not be left in the position of being unable to remedy transfers we know to be defective and potentially fraudulent.

L-6. Comment: Section 95921(e), “General Prohibition on Trading”, in part, casts ARB in the role of market regulator by prohibiting trades that attempt to mislead or manipulate the market. ARB has stated that it will rely on federal oversight of futures and swaps trading markets under the Dodd-Frank Act, which is now being implemented by the Commodity Futures Trading Commission. However, ARB seeks to fill the gaps in regulation by overseeing the spot and forward trading markets. IETA offers that effective and efficient regulation of environmental trading markets is essential to market confidence and, ultimately, their ability to assist in meeting stated environmental objectives—such as reducing concentrations of greenhouse gases. Overly restrictive market regulation or lack of proper oversight can have the same negative impacts. Therefore, getting market regulation right is essential. IETA is concerned that ARB does not have the proper expertise or resources to effectively oversee the trading market, particularly the forward transaction market. As an environmental regulatory body, ARB has responsibility for environmental compliance, but has not previously overseen a trading market corresponding to these environmental programs. ARB has recently published requests for proposals for an independent market monitor and market monitoring staff training. These are important programs, but only part of the regulatory resources needed to effectively oversee markets. IETA encourages ARB to seek, and the California State Legislature and Brown Administration to provide, the proper level of resources to properly oversee markets. IETA also encourages ARB to continue its close collaboration with the CFTC. (IETA4)

Response: The comment is outside of the scope of the second 15-day changes to the regulation. No response is required. However, we are already pursuing the course of action recommended by the commenter. As mentioned, we have issued a Request for Proposal for a market monitor and have secured resources and expect to issue contracts for market monitoring training for agency staff . We have also secured resources for a Market Surveillance Committee composed of academic experts on markets and resources to conduct readiness testing of auction, reserve sales, financial services, and tracking systems. We are also continuing our discussions with the U.S. Commodity Futures Trading Commission and the California Department of Justice on market oversight and enforcement. Therefore, we believe that we have resources and infrastructure in progress to effectively implement the program.

Purchase Limits, Holding Limits and Beneficial Holding Relationships

L-7. Comment: The Council represents non-obligated entities, as well as large and small obligated entities, including independent power producers, investor owned utilities (IOU), and publicly-owned utilities (POU). BCSE believes that to be successful, the Proposed Regulation must, to the extent possible, prevent market manipulation, provide flexible compliance mechanisms to minimize costs, and not discriminate between large and small obligated entities. However, the Proposed Regulation's auction purchase limit and holding limit may pose problems for larger obligated entities and therefore result in discrimination among and between larger and smaller obligated entities and non-obligated entities. BCSE encourages the Board to reexamine these provisions and whether or not the auction purchase and holding limits should be tied to the size of an obligated entities verified annual emissions. (BCFSE2)

Response: We revised the purchase limit for covered entities from 10 percent to 15 percent. Our examination of emissions and allocations data shows that the new purchase limit will ensure that covered entities can purchase their full emissions obligation, net of allowances directly allocated by ARB, at the auction.

On the liquidity issue for larger covered entities, in the first compliance period, all entities will have the ability to keep up to about 6 million MT of allowances in their holding accounts for trading purposes. This limit increases to over 11 million MT in the second compliance period. We believe this is sufficient for entities to be able to sell into the secondary market in response to short-term price spikes. In addition, if one entity is constrained in its purchases, the allowances will then be purchased and held by entities that are not constrained, so any resulting effect on market liquidity would be negligible.

Currently, we are in discussions with members of the WCI on how we could set holding limits and the purchase limits for a joint WCI auction. As part of those discussions, we are considering the proposal in the comment that the purchase limit be tied to the size of an entity's compliance obligation. If we decide to modify the limits when we link to the other WCI jurisdictions' programs, the new limits will be part of a new regulatory development process for linkage.

L-8. Comment: The use of auction purchase limits can have the unintended consequences of both restricting liquidity and creating an unlevel playing field between entities. Companies with a large compliance obligation will require more annual allowances than the purchase limit at a quarterly auction. This could increase the potential for price manipulation and price spikes by limiting a company's ability to sit an auction out if prices are excessively high in that particular auction. In addition, such companies would have limited ability to buy allowances to sell in the secondary market, which could further reduce liquidity. Finally, this policy could create a situation where some compliance entities are forced to purchase allowances in the secondary market instead of at auction—likely with a markup reflecting the sellers' leverage in the market. IETA re-iterates our request that the purchase limits be revised further in order to increase liquidity and create a level playing field for all entities. IETA recommends that all covered entities be allowed to purchase an amount equal to the greater of either a) the auction purchase limit; or b) their compliance obligation plus the current proposed 4 percent granted to non-covered entities. (IETA4)

> **Response:** We revised the purchase limit for covered entities from 10 percent to 15 percent. Our examination of emissions and allocations data shows that the new purchase limit will ensure that covered entities can purchase their full emissions obligation, net of allowances directly allocated by ARB, at the auction.
>
> On the liquidity issue, in the first compliance period all entities will have the ability to keep up to about 6 million MT of allowances in their holding accounts for trading purposes. This limit increases to over 11 million MT in the second compliance period. We believe this is sufficient for entities to be able to sell into the secondary market in response to short-term price spikes. In addition, if one entity is constrained in its purchases the allowances will then be purchased and held by entities that are not constrained, so any resulting effect on market liquidity would be negligible.
>
> Currently, we are in discussions with members of the WCI on how we could set holding limits and the purchase limits for a joint WCI auction. As part of those discussions, we are considering the proposal in the comment that the purchase limit be tied to the size of an entity's compliance obligation. If we decide to modify the limits when we link to the other WCI jurisdictions' programs, the new limits will be part of a new regulatory development process for linkage.

L-9. Comment: IETA reiterates its recommendation that purchase limits and holding limits be replaced with more frequent auctions, for example on a monthly basis. Based on recent experience, many will point to RGGI's quarterly frequency and bidding rules as a relatively simple and straight-forward auction design, which is well understood and accessible to a host of entities. While a quarterly auction might be appropriate for small jurisdictions with low demand, IETA believes the implementation of a quarterly auction schedule becomes inconsistent with recent research and analysis conducted in connection with the management of allowance auctions in the EU ETS. Based on analyses, starting in 2013 the EU requires that all regional allowance auctions be conducted on a weekly basis (if not more frequently). The European Commission's decision to hold frequent auctions was driven by the large volume of allowances going to auction in the future, as well as the desire to curb potential price spikes, price volatility, and opportunities for market manipulation. In light of the above, California officials might want to consider timing the frequency of its allowance auctions based on the number of allowances to be auctioned over each period. Weekly auctions are likely to work well in jurisdictions with a large pool of allowances, such as the EU ETS. However, in jurisdictions with constrained coverage and/or large gratis allocations, weekly/monthly auctions could exhibit such small available volumes as to make auction participation high-cost with relatively low-value. IETA welcomes the opportunity to meet with officials to discuss auction design, frequency options and trade-offs. (IETA4)

> **Response:** The comment is outside of the scope of the second 15-day changes to the regulation. No response is required. Nevertheless, our stakeholder consultations held in 2009 and 2010 brought up other factors affecting our decision to hold quarterly auctions. First, stakeholders did believe the quarterly format was operating successfully at the time. Second, both stakeholders and ARB staff were concerned with the ability of all covered entities to participate in frequent auctions due to the costs and time commitments. Some California-covered entities have extensive experience with auctions and commodity markets, and have resources to conduct extensive auction and secondary carbon market participation. Others do not. We believe that retaining the quarterly format will give covered entities time to develop the capabilities for more frequent auction participation. Third, ARB has not operated auctions or financial activities on this scale before, and we must develop the contract services, internal procedures, and enforcement mechanisms needed for successful implementation. We note that the EU ETS auctions are generally conducted by national ministries with extensive experience in market operations. Auctions pose no great institutional challenges for them.
>
> We conclude that the quarterly format can be successfully implemented without damaging the market. At the same time, we do see some value in evaluating a potential move to a more frequent auction once we develop the institutional capability, stakeholders develop familiarity with the process, and we can review a longer period of market information from the EU ETS.

L-10. Comment: ARB should allow agents to acquire and transfer compliance instruments for beneficial holding directly to their own Compliance Accounts. From there, the compliance instruments could later be transferred to one or more of their principals' Compliance Accounts. ARB's proposed rules regarding the disclosure of beneficial holding relationships would then apply. Specifically, agents must report the identity of the principal(s), their account information, and the nature of the relationship to the Executive Officer. SCE proposes that agents, both annually and as-needed, inform ARB of the specific facilities for which they will be procuring beneficial holding allowances for compliance in the following calendar year. This will provide a baseline for the Executive Officer to ensure that agents do not abuse this rule by drastically over-procuring compliance instruments, and thus circumventing the intent behind holding limits. Once it is established that an entity will act as an agent in this type of beneficial holding relationship, SCE proposes that ARB should allow the agent to purchase allowances–either in the auction or the secondary market–and place them directly in its own compliance account. ARB should then allow the Executive Officer to transfer compliance instruments from the agent's Compliance Account to the principal's Compliance Account upon the agent's request. Until such transfer is initiated, such compliance instruments that are added to the agent's compliance account for beneficial holding will be subject to the agent's Compliance Account-based limited exemption. In order for agents to temporarily hold allowances for their principals in this way, their Compliance Account-based limited exemption to the holding limit would need to be expanded. SCE suggests that ARB calculate this increase as the sum of the positive or qualified positive verification statements from the previous year of all of the principals' facilities with which the agent has a beneficial holding relationship. The identity of these facilities will be reported to ARB at least annually, as described above. This amount, which may be referred to as the "Beneficial Holding Compliance Instruments Limit," would be added to the limited exemption from the agent's holding limit. After the compliance instruments have been transferred to the principal's Compliance Account, they would be captured under the principal's limited exemption calculations. Meanwhile, because the compliance instruments are still subject to the existing limitations on the Compliance Accounts, there is no economic incentive for the principal to simultaneously over-procure compliance instruments and place them in their own Compliance Account, which could violate the intent of holding limits and the Compliance Account-based limited exemption to the holding limit. While increasing the holding limits for entities such as electric distribution utilities would be the most simple and effective solution to utility holding limit concerns, the proposal described here may serve to address concerns while maintaining the general structure of the beneficial holdings language. (SCE4)

> **Response:** We disagree and did not make the changes suggested for two reasons. First, the procedure in section 95834 is voluntary and requires the active participation of both principal and agent. This approach is needed to ensure that the principal can manage its accounts under the holding limit without being subject to unilateral actions by the agent. Second, the proposed changes would require us to completely restructure the rules governing compliance accounts, and add a number of new procedures for agents to give instructions to the Executive Officer on the disposition of allowances in compliance accounts.

L-11. Comment: The beneficial holding language in sections 95802(a)(28) and 95834 has significant inconsistent, uncertain, and unfeasible provisions. As currently structured, this language would at the very least create major market issues and potentially prove to be completely unworkable. Certain aspects of the beneficial holdings provisions, specifically those relating to the "Disclosure of Beneficial Holding," are not clear. Section 95834(b)(2) lays out a process whereby a principal must confirm a transfer of allowances. However, it is not clear which transfer must be confirmed—the initial transfer to the agent's account, or the transfer between the account of the agent and the principal. In addition, although this section refers to "transactions," it references only the provisions for "trading" in Section 95921(a). Thus, an agent that bids into

ARB's auction has no guidance on acquiring allowances for beneficial holding purposes. SCE offers one possible interpretation of these provisions: an agent must earmark allowances for a specific principal before purchasing these allowances from an auction or in the secondary market. The principal for which the agent is procuring must agree to this purchase, and also approve the transfer of these allowances into the agent's holding account. Upon transfer into the agent's holding account, these allowances count against the principal's holding limit. The agent will have up to one year to transfer these allowances into the principal's holding account. SCE has numerous concerns with the draft provisions under this interpretation. They include the following:

- For entities such as SCE, who are likely to enter into multiple agent-principal relationships due to a large and varied contractual portfolio, it would be very problematic to earmark allowances to specific principals before acquiring the allowances; this will result in inefficient processes.
- Requiring principals to agree to each compliance instrument purchase adds numerous complications and could completely disrupt the bilateral market and auction process. In addition, requiring a principal's approval to transfer allowances to an agent's account will give the principal a "veto power" to reject any purchase or transfer without having to provide any justification.
- Accounting for the allowances that are in all of the agents' accounts when calculating the principals' holding limits will likely place a large administrative burden on ARB. (SCE4)

Response: Section 95834(b)(2) refers to the agent "acquiring" a compliance instrument on behalf of a principal, while transfer to the principal is described in section 95834(b)(3). Therefore, section 95834(b)(2) cannot be reasonably construed to refer to the transfer between the account of the agent and the principal, as suggested in the comment, so the meaning is clear.

The comment suggests that the reference to section 95921(a) in section 95834(b)(2) is vague, as it seems to refer to the whole section on "trading." We contend there is nothing unclear about the references. First, the reference in section 95834(b)(2) to section 95921 is not to trading in general, but explicitly to "submitting a transfer request." Since section 95921 begins with the process for transfers between accounts, and continues with other rules applying to transfers, the reference is clear. Second, the reference in section 95834(b)(2) referring to section 95921(a) clearly refers to the time limit for submitting transfer requests which is contained in 95921(a). Again, the reference is clear.

There is no requirement that allowances be "earmarked" prior to their being acquired. The transfer request is the disclosure mechanism, so the disclosure does not happen before the allowances are acquired.

It is not clear why having both parties to a beneficial holding confirm a transfer would disrupt the bilateral market or the auction. Nothing prevents the agent from purchasing on its own account. The principal cannot "veto" such transactions. The beneficial holdings arrangements only apply when the agent wants some of its holdings to be counted against the principal's holding limit and the principal agrees.

We are aware of the workload for ARB associated with various provisions of this regulation. While we appreciate the comment's concern, we believe the workload is manageable.

L-12. Comment: In sections 95921(c)(4) and (5), disclosure of unnecessary information will place significant unnecessary reporting burden (i.e. Time of transaction, time of settlement, price) and should be deleted. (CCEEB4)

Response: We removed the requirement for the transfer request to include the time of the transaction agreement and the time of settlement. However, the remainder of the comment is outside the scope of the second 15-day changes to the regulation because we did not modify the text referred to in the comment, so no response is required.

L-13. Comment: The Holding Limit Should Address the Magnitude of an Obligated Entity's Compliance Obligation and Not Discriminate Among or Between Obligated Entities.

The holding limit, as currently proposed, unfairly limits the ability of large obligated entity's such as large independent generators to use the flexible compliance mechanisms provided by CARB, including unlimited banking of allowances. As a result of this limitation, some large entities will have to surrender enough allowances to meet their total annual emissions, rather than using the flexible compliance period to decide when to submit their allowances, in order to avoid exceeding the holding limit. IEP notes that CARB here again essentially exempted utilities from this provision through the creation of a new "beneficial holding relationship" which affords the IOU's significant flexibility in managing their contractual obligations and requires the purchased allowances to count against the IPP's holding limit; although, they may not physically take ownership for up to one year [Section 95834(b)(3)]. This puts independent generators at a competitive disadvantage to IOUs. In addition, the regulation recognizes that limiting an entity's flexibility is punitive because it authorizes the Executive Officer to impose sanctions on registered entities that violate the provisions of the Cap-and-Trade Regulation, including increasing the annual surrender obligation for a covered entity. Thus, as proposed, the holding limit imposes this penalty on large generators (and not IOUs) for no other reason than their sheer-size.

While IEP shares CARB's concerns regarding hoarding, market manipulation, etc, there needs to be a mechanism in place to address the compliance needs of large obligated entities where the current holding limit potentially creates discriminatory impacts, with respect to flexible compliance instruments.

In order to compensate for these disparate impacts on obligated entities, CARB should adjust the holding limit calculation for large obligated entities to reflect the different magnitudes of compliance obligations among obligated entities. IEP requests CARB amend the regulation prior to the first auction in 2012 so that the holding limit is tied to the size of an obligated entity's compliance obligation. (IEPA3)

Response: The comment on the structure of the holding limit is outside the scope of the second 15-day changes to the regulation because we did not modify the structure of the holding limit, so no response is required.

The comment on section 95834 on beneficial holdings is within the scope. However, we disagree with the comment. The comment claims that utilities will have flexibility not afforded to generators when utilities are allowed to count allowances held pursuant to section 95834 against the holding limit of the generator. However, the comment ignores section 95834(a)(3)(A), which requires a principal to confirm the existence of a beneficial holdings relationship, as well as sections 95834(b)(2) and (3), which require the principal to be notified of any action taken by an agent and to confirm that action. Thus, the arrangement is entirely voluntary, and the utility does not gain any flexibility not approved by the principal. The notification and confirmation provisions ensure that the utility serving as agent does not gain a competitive advantage over the principal. The result is an entirely voluntary path allowing utilities and generators to accumulate and transfer allowances to cover emissions from contracted generation.

L-14. Comment: Holdings limits are intended to prevent one entity from cornering the market. However, this also places significant strain on many compliance entities. Auction frequency would ostensibly alleviate the concern of one entity concerning the market while creating more liquidity within the market. CCEEB recommends moving towards monthly auctions in order to avoid the need for holding limits. (CCEEB4)

Response: The comment is outside of the scope of the second 15-day changes to the regulation. No response is required. However, we disagree with the comment's assertion that more frequent auctions would eliminate the need for the holding limit. The limit is needed to prevent concentrated holdings through multiple auctions and secondary market purchases. More frequent auctions, however, could deal with some of the manipulative acquisition strategies that we intend to prevent through the auction purchase limit.

Currently, we are in discussions with members of the WCI on how we could set holding limits and the purchase limits for a joint WCI auction. As part of those discussions, we are considering the proposal in the comment that the purchase limit be tied to the size of an entity's compliance obligation. If we decide to modify the limits when we link to the other WCI jurisdictions' programs, the new limits will be part of a new regulatory development process for linkage.

L-15. Comment: WPTF has previously raised a concern that the holding limit will disadvantage capped entities with large compliance obligations. Because the holding limit is set at the same level for all entities, regardless of the scale of each entity's compliance obligation, some entities would be able to purchase and hold a quantity of allowances significantly higher than their compliance obligation while other entities would not even be able to hold sufficient allowances to cover their obligation in a single year. The holding limit thus discriminates among capped entities, and will hinder the ability of some entities to effectively manage their compliance with the cap and trade program, to the likely benefit of those entities who are not subject to the same restrictions. WPTF recommends that CARB review and modify the auction purchase and holding limits to ensure that they are equitable to all capped entities and do not impair their ability to comply with the program. (WPTF3)

> **Response:** We revisited the purchase limit and revised it from 10 percent to 15 percent to ensure that all covered entities will be able to purchase their allowance needs, net of direct allocations, at the auction. In the first 15-day changes to the regulation, we revised the limited exemption to the holding limit, to ensure that covered entities could accumulate, in advance if needed, more than enough allowances to meet their compliance obligations.

L-16. Comment: The ongoing monitoring and reviewing of the allowance market, and particularly the auctions and availability of allowances in the Reserve Account, are crucial elements needed for the success of the entire program. NCPA urges CARB to pay close attention to the start-up procedures and market simulations, and to include provisions in the Regulation, or at a minimum, in a Resolution approving the revisions to the Cap-and-Trade Program, that will allow the agency to delay the initial auction if problems are discovered that cannot be timely corrected. While NCPA understands CARB's eagerness to move forward with the program and begin auctions for allowances in the second half of 2012, doing so without a full analysis of potential problems will have more adverse ramifications than delaying the auctions at the onset of the program. (NCPA4)

> **Response:** No response is required.

L-17. Comment: NCPA supports the Proposed Revisions to section 95833 that increases the threshold for determining a "direct corporate association" from 20 percent to 50 percent, as well as the intent of the provision to "apply only in instances where one entity has clear control over another." (NCPA4)

> **Response:** Thank you for your support.

L-18. Comment: NCPA fully supports the Reserve Account established in section 95831(b)(4), but continues to be concerned that the Proposed Revisions to this section do not include a mechanism to ensure the availability of allowances in the Reserve Account. Since this account is created as a means by which to ensure that allowances prices are contained in the market, it is imperative that there be an ample supply of allowances in the Reserve Account for compliance entities to purchase in the event that the market is not stable. NCPA joins with other stakeholders in urging CARB to ensure that there is mechanism in place to guarantee a minimum number of allowances in the Reserve Account throughout the duration of the Cap-and-Trade Program. (NCPA4)

Response: No response is required.

L-19. Comment: ARB has stated that the holding limits are required to ensure the market is not manipulated. WSPA believes that it is critical that controls be in place to prevent market manipulations, but we disagree with the one size fits all holding limit. We are additionally concerned with the deletion of the provision that excluded application of holding limit for associated entities that were prohibited by regulations from coordinating market activities. WSPA believes that this provision should be reinstated. We do not believe that there is any support for forecasting that disruptions in the allowance market are likely to occur between entities prohibited by regulations from coordinating market activities. We recommend ARB reject the proposed deletion of the provision in section 95920(f) and return the original language. (WSPA4)

Response: We removed the text from section 95920(f) because in that location the exemption only applied to the holding limit. We replaced it with new language that was added to section 95833(a)(4), so that it would apply to the corporate associations determination itself.

Outside the Scope of the 15-Day Changes to the Regulation

L-20. Comment: A large number of deliveries of exchange contracts occur on a single day, or several days, throughout the course of a calendar year. On these specific days, millions of allowances may pass through clearinghouses' registry accounts. To facilitate timely and accurate deliveries, the clearinghouse will often dedicate the entire Deliveries Team (five to ten staff members) to the process. By allowing up to ten users access to the exchange clearing holding account, these risks will be mitigated. Modify section 95832 as follows:

(i) For exchange clearing trading accounts, the authorized representative may designate up to ten delivery analysts responsible for the account to directly access the account and assist in performing the functions of an entity meeting the requirements of 95814(a)(3) and making submissions pursuant to 95832(h). (GREENX2)

Response: The comment is outside of the scope of the second 15-day changes to the regulation. No response is required.

L-21. Comment: CalChamber is concerned that CARB intends to fill the allowance reserve, which was intended to be a cost-containment mechanism, with allowances from the haircut. These are allowances that should otherwise be freely allocated in order to minimize emissions leakage. Instead, CARB is proposing to profit at industry's expense by selling the reserve allowances at arbitrarily high prices, a major concern for CalChamber. This proposal negates the purpose of an allowance reserve as a cost-containment measure by increasing program cost with no overall program benefit. (CALCHAMBER4)

> **Response:** The comment is outside of the scope of the second 15-day changes to the regulation. No response is required.

L-22. Comment: Price containment in the proposed allowance reserve is necessary if the reserve is to be a true cost-containment mechanism. (CALCHAMBER4)

> **Response:** The comment is outside of the scope of the second 15-day changes to the regulation. No response is required.

L-23. Comment: While many of the changes in the market design (such as increased purchase limits) will have a positive effect on developing an efficiently functioning market for all participants, several significant policies remain that threaten to diminish the effectiveness of the market and hinder economic recovery. The holding limit provision creates inequitable impacts on larger covered entities imposing constraints on their ability to participate in the market and optimize trading activity and requiring earlier surrender of allowances compared to those less impacted by the holding limits. (CHEVRON4)

> **Response:** The comment is outside of the scope of the second 15-day changes to the regulation. No response is required.

L-24. Comment: The changes made in the definition of affiliates mark a significant improvement in the cap and trade rule. However, it would be helpful to obtain clarification on section 95833(1) (A) to ensure that a right of first refusal is not equated *with the "right to acquire" or "option to purchase" so that an entity is not deemed to have* a corporate association with another merely because it holds a priority right to obtain an interest in that other entity exercisable only when that interest is being offered to a third party. A "right to acquire" or "option to purchase" means that the power to trigger the transaction rests with the potential buyer. In other words, the "buyer" initiates the sale by exercising the right/option to purchase the shares. This differs from a "right of first refusal" in which the authority to trigger the transaction rests with the owner, and the buyer only has the right to be offered the shares the owner decides to sell. See, e.g., Campbell v. Alger, 71 Cal.App.4th 200, 206-207 (1999) (A right of first refusal is the conditional right to acquire property, depending on the owner's willingness to sell. The right does not become an option to purchase until the owner of the property voluntarily decides to sell the property and receives a bona fide offer to purchase it from a third party). (CHEVRON4)

> **Response:** The comment is outside of the scope of the second 15-day changes to the regulation. No response is required.

L-25. Comment: ARB's Proposed Rule on Holding Limits has a discriminatory impact on large covered entities. The primary problem with the proposal on holding limits is that, instead of treating all entities within the same sector equally, it arbitrarily discriminates against and penalizes large covered entities, the very companies that have the most resources invested in the State of California. Because the current holding limit is lower than the compliance obligations of certain large covered entities but higher than the compliance obligations of all smaller covered entities and non-covered entities, large covered entities will be required to comply with the cap-and-trade program earlier than the smaller covered entities. This disparity has a significant economic impact on the large covered entities. For example, assuming Chevron gradually acquires or holds allowances to track its emissions, the holding limit will require Chevron to comply earlier than its competitors by transferring into its compliance account significantly more allowances than the 30 percent prescribed in the proposal for 2013. As illustrated in the chart below (which is based on the most recent publicly available information), no other covered entity operating in the oil and gas sector will be impacted by the holding limit in 2013. As allowances moved into a compliance account cannot be withdrawn, the holding limit essentially requires Chevron to comply with the cap-and-trade program ahead of the prescribed deadline, in this case 16 months before any other entity in its sector. This design flaw will distort the market and make it more costly for Chevron to comply relative to its competitors, for no overall market benefit or rational policy objective. The problem is only exacerbated during the second compliance period; by 2017, based on data provided to us by Chevron, we estimate that the number of allowances Chevron will need to move into its compliance account will exceed 100 million, whereas its closest competitor in the sector will have to move less than 50 million allowances into its compliance account in order to comply with the holding limit. In addition, the holding limit will effectively preclude large compliance entities such as Chevron from minimizing their compliance costs by participating fully in the market. Although it is difficult to accurately value this opportunity cost, the prohibition is a significant limitation on the ability of these entities to use market mechanisms to comply with their legal obligations in the most efficient manner. (CHEVRON5)

> **Response:** The comment is outside of the scope of the second 15-day changes to the regulation. No response is required.

L-26. Comment: The holding limits are unprecedented and unsupported by the record. As we pointed out in our August letter, there is no data or research that demonstrates or otherwise purports to show precisely what positive impact the holding limit rule will have on the carbon market. The holding limits contained in section 95920 of the Regulations are derived from a rule designed by the CFTC to govern futures markets, in which regulators' leading concern was systemic risk, not market manipulation. ARB has pointed to no evidence supporting the extension of a rule designed for futures markets to the inventory market at issue here. Whereas systemic risk is indeed an issue in large, highly liquid futures markets, such risks will be non-existent by design in the California allowance market, where large covered entities will be engaging in the market primarily for compliance purposes and where relatively few counterparties will be exposed to any risk associated with such entities' market positions. Indeed, it is important to reiterate the conclusions presented in our August Letter, which explained that there are no other commodities markets and no other major carbon markets in existence, either compliance or voluntary, including the German, French, UK and EU-wide emissions trading systems, with a holding limit. The only rationale ARB has provided to justify its approach to holding limits is contained in its "Staff Report: Initial Statement of Reasons" released in October 2010. In that report, ARB cites the conclusions of Jeffrey H. Harris, a professor of finance at the University of Delaware and the author of a report on holding limits prepared for the Western Climate Initiative Markets Committee (the "WCI Report"). Yet this WCI report is not part of the record and was not subject to any notice and comment rulemaking procedures. Had ARB formally included the WCI Report in the record, stakeholders would have had the opportunity to examine its conclusions and raise concerns about the applicability of Dr. Harris' logic to the specifics of the California carbon market. Specifically, stakeholders may have noted that the proposed limit is set below the compliance obligations of certain covered entities, a fundamental flaw that Dr. Harris never identified, discussed or justified in the WCI Report. In fact, Dr. Harris conducted his analysis for WCI at a time when multiple states and provinces were expected to join WCI. Since the holding limit is a function of the size of the cap, Dr. Harris' discussion and conclusions are based on market conditions that feature a much higher cap, at least double that of California's, that will not exist under the California proposal. Accordingly, the WCI Report is a poor tool to help guide policy decisions for the California carbon market. (CHEVRON5)

> **Response:** The comment is outside of the scope of the second 15-day changes to the regulation. No response is required.

L-27. Comment: Covered entities should be allowed to hold the number of allowances needed to satisfy their compliance obligations. We recommend this change to address the increased costs and added burdens solely borne by large covered entities, which would maintain the holding limit as it is currently configured under section 95920 but exclude from the limit the number of allowances needed by a covered entity to comply with its compliance obligation during the applicable compliance period. Accordingly, a covered entity holding the number of allowances equal to its compliance obligation is placed in the same position, for holding limit purposes, as a non-covered entity that does not hold a single allowance, thereby creating a level playing field among all market participants and entities within the same sector. It is imperative that the appropriate changes to the holding limit are made now as opposed to next year or some other time in the future. Waiting until the future will result in a loss of the momentum necessary to make such changes, and implementing changes after the adoption of the Regulation could prove to be cumbersome, may result in confusion by market participants (including in connection with their underlying investment strategies) and would introduce unnecessary regulatory risk prior to any such adoption. Modify section 95920(d)(2)(A) as follows:

(2) ~~A Limited Exemption from the Holding Limit is calculated as:~~The limited exemption is the number of allowances which are exempt from the holding limit. (CHEVRON5)

Response: The comment is outside of the scope of the second 15-day changes to the regulation. No response is required.

L-28. Comment: The holding limit has a flaw that may allow speculators to exert excessive market power. Because the policy fails to distinguish between covered and non-covered entities, it may, under certain circumstances, exacerbate the possibility for market abuse, the precise outcome the holding limit policy was designed to mitigate. When a large covered entity such as Chevron is forced to shift allowances into its compliance account to comply with the holding limit, the size of the market will effectively shrink. Depending on the degree to which large covered entities must move allowances into their compliance accounts in order to comply with the holding limit, the policy may create a considerable reduction in market volume, effectively reducing liquidity. By constraining the amount of allowances circulating freely in the market, the holding limit policy increases the probability that any one market participant, including a trader or speculator, can acquire a position that would allow it to exert market power. (CHEVRON5)

Response: The comment is outside of the scope of the second 15-day changes to the regulation. No response is required.

L-29. Comment: IETA understands that ARB views an allowance holding limit as a mechanism to reduce the possibility of a market participant exercising allowance market power. However, holding limits are likely to prove ineffective in this regard, and may create unintended consequences because they will severely limit market liquidity, thus creating conditions that could allow certain entities, including speculators, to exert undue market power in an illiquid trading environment. The potential for price manipulation and the exercise of market power is greater in illiquid markets, even if a quantitative restriction on holding permits prevents a single entity from acquiring undue market share. This is due to the fact that non-covered entities and other market participants can gain the ability to shape prices in secondary allowance markets and collect unnecessary economic rents through a markup. This incentive for gaming is particularly applicable to large entities with small compliance limits, as they can hold permits above their compliance obligation but below the holding limit, giving them the potential to exert market power over larger entities with more limited flexibility. Furthermore, with these limits in place, larger covered entities will face greater pressure to participate in all auctions regardless of price conditions. They have limited ability to hold allowances to offset this price risk, and are unable to then provide allowances back to the market when the market is short. This inflexibility will raise the compliance cost for these entities, which will be passed on to ratepayers. Counterparties in these transactions can, at the same time, extract economic rents from selling allowances for a markup to large covered entities forced to purchase. Based on the aforementioned arguments, IETA continues to recommend that holding limits be discarded. If holding limits are retained, IETA recommends that at a minimum they be adjusted to reflect, in addition to the amounts held in non-trading compliance accounts, the greater of either the holding limits currently proposed in section 95920 or a quantity equal to a covered entity's compliance obligation. (IETA4)

Response: The comment is outside of the scope of the second 15-day changes to the regulation. No response is required.

L-30. Comment: ARB has announced a one-year delay of the compliance elements of the cap-and-trade program, which SCE enthusiastically supports. The additional time is crucial for allowing greater scrutiny and adequate independent testing of the auction and market design. (SCE4)

Response: The comment is outside of the scope of the second 15-day changes to the regulation. No response is required.

L-31. Comment: ARB has also indicated that it will open a 45-day rulemaking in 2012 to address market readiness and market testing issues. SCE supports the decision to open a new rulemaking, and strongly urges ARB to begin this process as soon possible. Because market readiness is key to the success of this regulation, this new rulemaking should be completed well before the launch of the first allowance auction. As part of the market testing and readiness rulemaking, ARB should re-evaluate the Allowance Reserve, which was designed to allow covered entities a means for cost containment. ARB staff has made several important revisions to the Allowance Reserve, including allowing allowances unsold at auction to be returned to the general market rather than into the Allowance Reserve. In the impending rulemaking, ARB staff should continue to improve the rule by identifying a means to refill the reserve in the event that it is stressed, or when at least one-third of the allowances it contains are sold. Electricity markets move and fluctuate rapidly, and it is critical that ARB develop an approach in advance of any adverse market event to refill the Allowance Reserve.

SCE looks forward to a collaborative process with ARB staff and stakeholders to design a cap-and-trade auction and market that limits gaming opportunities and the risk of another electricity crisis. (SCE4)

Response: The comment is outside of the scope of the second 15-day changes to the regulation. No response is required.

L-32. Comment: SCE reiterates its position that the holding limit for a regulated electric company should be based on its annual GHG cost exposure (using the annual allowance allocation as a proxy). California IOUs such as SCE have no incentive to speculate in their energy and energy-related procurement activities, including the purchase and sale of GHG compliance instruments. These activities are governed by the IOUs' CPUC-approved AB 57 Bundled Procurement Plans, and are conducted on a cost-pass-through basis, with their customers paying for all the costs and receiving all of the benefits. There is no opportunity for IOU shareholders to make any profit under these plans. Because the CPUC will maintain its regulatory oversight of the IOUs, ARB should recognize that the IOUs are not at risk of manipulating or speculating in the GHG compliance instrument market. Rather, SCE and the other IOUs have strong interests and obligations to hedge customer price risk efficiently and effectively, subject to the oversight and direction of the CPUC. ARB should adjust holding limits for the regulated electric distribution companies to allow them to mitigate their GHG cost exposure and protect their customers from significant financial risk. The new market design and testing rulemaking is an appropriate venue for reevaluating these holding limits to improve them further. In the meantime, modest adjustments must be made before the final regulations are submitted to the Board for approval, in order to create a workable framework before the cap-and-trade program officially begins. We recommend ARB adjust the holding limits based on a regulated entity's GHG market exposure while recognizing that regulated utilities such as SCE will be unable to manipulate the market. Modify section 95920(d)(1) as follows:

(1) The number given by the following formula:
Holding Limit = <u>the greater of</u>
<u>1)</u> 0.1 * Base + 0.025*(Annual Allowance Budget – Base)

In which:

"Base" = 25 million metric tons of CO_2e<u>, or</u>
<u>2) an individual utility's allowance allocation for that same year as defined in Table 9-3.</u> (SCE4)

Response: The comment is outside of the scope of the second 15-day changes to the regulation. No response is required.

L-33. Comment: Minimize unnecessary bureaucratic requirements. Investment grade credit-rating should be permitted in lieu of bid guarantees in sections 95912(h) and 95913(e)(2). (CCEEB4)

Response: The comment is outside of the scope of the second 15-day changes to the regulation. No response is required.

L-34. Comment: Deadlines should be established for ARB decision-making processes to provide entities with a degree of certainty. Modify sections 95830(e) and 95912(l)(2) as follows:

(e) Completion of Registration. Registration is completed when the Executive Officer approves the registration and informs the entity and the accounts administrator of the approval. <u>The executive officer shall approve or deny a registration application within 30 days of submittal.</u>

(2) After certification, <u>immediately</u> direct the financial services administrator to: (CCEEB4)

Response: The comment is outside of the scope of the second 15-day changes to the regulation. No response is required.

L-35. Comment: CCEEB supports ARB's decision to contract with an independent market monitor. Market monitoring is essential to help ensure reasonable market behavior and results, and to instill confidence with market participants and other stakeholders. CCEEB recommends that the Independent Market Monitor that ARB selects be established with authority to: (1) review the auction and certify results prior to any consummation of any trades from that auction prior to the running of any auction; (2) provide analysis of the competitiveness of any auction, preferably on an ex-ante basis (e.g. prior to running the auction); and (3) report findings and concerns to the ARB. (CCEEB4)

Response: The comment is outside the scope of the second 15-day changes to the regulation. No response is required.

L-36. Comment: The holding limit is too low for regulated entities with large compliance obligations and may be unnecessarily high for entities that lack any compliance obligation. As amended, significant amounts of allowances, for large compliance entities will be locked in compliance accounts. This creates an uneven playing field that favors traders over regulated entities. Compliance entities, especially those with large compliance obligations, must be able to hold and trade a larger portion of their allowances to adequately manage their risk throughout the cap-and-trade program. (CCEEB4)

Response: The comment is outside of the scope of the second 15-day changes to the regulation. No response is required.

L-37. Comment: We propose that ARB revisit the issue of holding limits in section 95920(d), as they create a number of market inequities created by the "one size fits all" holding limit, regardless of an entity's compliance obligation. ARB reasons that large entities can hold the necessary allowances for compliance by placing allowances into their compliance account. However, once there, entities are precluded from later selling these allowances, which may be required to manage the cost exposure associated with a fluctuating carbon price. Restricting the number of allowances an entity can freely hold to less than an entity's annual compliance obligation is fundamentally discriminatory against entities with large compliance obligations, and does not create a level playing field between market participants. In fact, it punishes companies who have invested more in California and rewards competitors in the same sector who have invested less. In addition, such a policy will exacerbate potential hoarding, as many entities that may want to sell their bank of allowances will be prevented from doing so. This will artificially drive up the cost of compliance. Finally it will also reduce market activity and liquidity, another cost driver, by reducing the number of allowances available in the market because larger compliance entities will be required to comply earlier and retire allowances to avoid violating the arbitrary holding limits. This action, in turn could constrain the supply of allowances available in the market. To our knowledge, no other cap and trade program imposes holding limits on market participants. We recommend ARB allow holding limits up to compliance obligation levels for covered entities. (WSPA4)

> **Response:** The comment is outside of the scope of the second 15-day changes to the regulation. No response is required.

L-38. Comment: ARB's regulations still impose a "one size fits all" holding limit, regardless of an entity's compliance obligation. ARB reasons that large entities can hold the necessary allowances for compliance by placing allowances into their compliance account. However, once there, entities are precluded from later selling these allowances, which may be required to manage the price exposure associated with a fluctuating carbon price. Restricting the number of allowances an entity can freely hold to less than an entity's annual compliance obligation is fundamentally discriminatory against entities with large compliance obligations, and does not create a level playing field between market participants. In addition, such a policy will exacerbate potential hoarding, as many entities that may want to sell their bank of allowances will be prevented from doing so. This will artificially drive up the cost of compliance. We recommend ARB allow holding limits up to compliance obligation levels for covered entities. (SHELLENERGY2)

> **Response:** The comment is outside of the scope of the second 15-day changes to the regulation. No response is required.

L-39. Comment: Could the cap and trade regulation cause another and more severe market meltdown? In this case, “follow the money” is good advice for understanding why this regulation is being politically pushed. For example, section 95814 identifies that Voluntarily Associated Entities and Other Registered Participants are allowed to enter the program as “an entity providing clearing services in which it takes only temporary possession of compliance instruments for the purpose of clearing transactions between two entities registered with the Cap-and-Trade Program. A qualified entity must be a derivatives clearing organization as defined in the Commodities Exchange Act (7 U.S.C. section 1a(9)) that is registered with the U.S. Commodity Futures Trading Commission pursuant to the Commodities Exchange Act (7 U.S.C. section 7a-1(a)).

A study by Duke University's Nicholas Institute for Environmental Policy Solutions anticipates that if the United States passes a cap-and-trade law, the derivatives trade will probably exceed the market for the allowances themselves. Banks like JPMorgan Chase, Morgan Stanley, and Goldman Sachs already have active carbon trading desks that deal in instruments connected to Europe's cap-and-trade system and voluntary markets in the United States. Business is expected to explode with expansion of cap-and-trade in the United States. This is not something that has been focused on by most environmentalists. Among environmental groups, there is, understandably, less focus on the finer points of financial regulation. Another article found that the banks are preparing to do with carbon what they’ve done before: design and market derivatives contracts that will help client companies hedge their price risk over the long term. They're also ready to sell carbon-related financial products to outside investors. The International Emission Trading Association acknowledges the concerns and states that they are fixed by the Dodd-Frank Act, but many sources find that the mentioned regulatory fixes to prevent a recurrence of market manipulations and collapse were extremely weak and ineffective, leaving us open to even worse collapses in the future with such continued practices. (CBE3)

> **Response:** This regulation is one of many strategies to address the mandates of AB 32. The market-based program was chosen because it provides the lowest cost-effective way for the regulated entities to reduce GHG's and help achieve the mandates under AB 32. The market-based program also provides the covered entities flexibility in how they can best meet the GHG emissions reductions that are required with the declining cap. By choosing a market-based program, compliance instrument trading will be a feature of the program. As such, we expect participation by clearing houses and financial dealings to occur. We have worked closely with the State Attorney General's office to design a program that is enforceable and to add features to address market manipulation and gaming. ARB will also contract for external experts for a Market Surveillance Committee and Market Monitor to help with oversight of the market program. As part of program implementation, we will continue to work with the State Attorney's Office and CFTC on addressing oversight of the market.

Other Market-Related Comments

L-40. Comment: Section 95831(b)(2) contains an errant reference in subpart (D). The reference should be to section 95857(d)(1)(A), not 95857(d)(a)(A). Also, there should also be a subpart (E), as follows:

> <u>(E) The allowances consigned to Auction by the Executive Officer pursuant to 95831(D).</u> (SMUD4)

> **Response:** We agree and corrected the reference to read 95857(d)(1)(A). We did not add a subpart (E). The commenter's suggested reference was unclear.

M. OFFSETS

Limits on Offsets

No Offsets/Reduce Number of Offsets

M-1. (multiple comments)
Comment: We propose that section 95854 of the revised regulation be modified so that, in the second and third compliance periods, the percentage of total emissions that would be permitted to come from offsets is reduced. We propose that no more than two percent of total emissions in the second compliance period and no more than one percent of total emissions in the third (and any subsequent) compliance period be permitted to come from any type of offset credit. This would be equivalent to roughly one-third of the emission reductions required in the 2nd compliance period, and approximately 15 percent of emission reductions required in the 3rd compliance period. (UCS9)

Comment: We propose that section 95854 of the revised regulation be modified so that, in the second and third compliance periods, the percentage of total emissions that would be permitted to come from offsets is reduced. We propose that no more than two percent of total emissions in the second compliance period and no more than one percent of total emissions in the third (and any subsequent) compliance period be permitted to come from any type of offset credit. This would be equivalent to roughly one-third of the emission reductions required in the second compliance period, and approximately 15 percent of emission reductions required in the third compliance period. These modifications in quantity will help promote technological innovation in the highest emitting sectors, increase opportunities for in-state co-benefits (including air quality benefits), and reduce the risk that a high proportion of compliance credits do not represent real and additional reductions in emissions. (UCS8)

Comment: While 8 percent offsets might sound relatively small, the 8 percent refers to the total emissions, not the total reductions. Table 9.2 of the regulation shows that the nominal cap emission reduction over time is 7.5 percent for some sectors and about 15 percent for others (think of an average for discussion purposes of about 10 percent emissions reductions). This means that 8 percent offsets equals about 80 percent of emission reductions. This issue has been brought up repeatedly by the Union of Concerned Scientists, but has not been addressed by CARB. Given the highly speculative benefit of offsets, counting on 80 percent of them to fulfill the cap and trade aim is unconscionably high. (CBE3)

> **Response:** We did not change the limit on the use of offsets in the program. We believe that a limited use of offsets is necessary in the program to contain costs and incentivize reductions in uncapped sectors. The program imposes a limit on what we believe is an appropriate amount of offsets that an individual covered entity can use for compliance. All offsets used for compliance are real reductions, albeit outside the cap. Allowing a limited number of offsets into the

program provides cost-containment benefits and ensures that some GHG emissions reductions occur within the sectors covered by the cap-and-trade program. The program includes provisions that would allow a maximum of 201 $MMTCO_2e$ of offsets through the year 2020. This limit will be enforced through a limit on the use of offsets by an individual entity equal to eight percent of its compliance obligation. Combined with the Allowance Price Containment Reserve, this limit ensures that reductions from the program come from sources covered by the program at expected allowance prices, while use of the reserve will relax that constraint if prices rise.

Unlimited Offsets/Increase Number of Offsets

M-2. (multiple comments)
Comment: CARB should not continue to set an arbitrary limit on the number of offsets that can be used to meet a compliance entity's surrender obligation. The proposed 8 percent limit is no more likely than the previous 4 percent limit to provide enough offsets to meet the needs of a growing economy in California. As with the arbitrary withholding of necessary allowances for leakage prone industries, this arbitrary limit on the number of offsets that can be used increases costs and leakage. (AB32IG3)

Comment: IETA continues to support the removal of any quantitative usage limits placed on covered entities for using offsets to meet their compliance obligations. As long as only real, permanent, and verifiable offset credits are allowed into the market, usage limits that are small relative to overall compliance obligations will only serve to constrain investment in reductions of greenhouse gas emissions in a cost-effective manner. Offsets provide critical cost-containment and price stability by providing flexibility to covered industries to find the lowest available cost emissions reductions across a range of options. For this reason, IETA continues to recommend that California eliminate the use of quantitative offset usage limits. (IETA4)

Comment: Section 95854 limits the volume of offsets that facilities can use for their annual and triennial compliance obligation to only 8 percent, thus artificially raising the cost of compliance. This restriction, combined with the expected use of auctions as a means to distribute the allowances will marginalize (render inconsequential) the use of offsets, reduce offset supply, discourage out-of-program sources that would otherwise be subject to CARB control (for it is only such sources that can create credits) from taking steps that would have otherwise be taken to reduce emissions, and increase the cost of compliance. Offset creators will be more likely to choose to expend their capital in regions that allow for the greater use of offsets and potential offset buyers will be more likely to choose to expand and possibly move their operations to regions that are not burdened with such restrictions. BGC Environmental Brokerage Services, L.P. recommends that CARB remove the quantitative restriction. Instead, limits should be based on quality of offset credits. Any offset credits which meet CARB's qualitative criteria should be allowed to be used by sources. (BGCEBS)

Comment: California businesses will need access to a pool of verifiable offsets and allowances stating in 2012. Developing a new ARB offset review and approval process to review credits and allowances for use in California that have already been reviewed in the EU is costly and unnecessary. The EU carbon markets produce robust offsets and allowances. Linking to the EU would ensure a supply of high-quality and tradable market instruments for California's carbon market. Relying on a limited market CO_2 cap-and-trade program to reduce emissions in California without linkage to a broad liquid market loses the economic efficiency of the market-based approach and undermines the policy goals. CCEEB recommends expediting linkage and making it a priority to be completed. If linkage is not possible, then CCEEB believes that other cost-containments measures must be adopted to soften the economic impact of this regulation and limit leakage of jobs and emissions. (CCEEB4)

Comment: CCEEB supports the use of high-quality offsets to constrain costs. Although ARB adjusted its limits on the use of offsets, from 4 percent to 8 percent, this limitation is still unnecessary. Arguments in favor of limiting offsets due to localized impacts have been eliminated by the ARB Co-Pollutant Emission Assessment that indicates de minimis co-pollutant co-benefits from quantitative and geographic restrictions of offsets. As such, there is no reason to limit the use of offsets as a compliance instrument. Offset credits should be allowed without any geographical or quantitative restrictions. Restricting offsets generation to projects located within a certain geographic sphere or to those that provide co-benefits is contrary to what should be the fundamental aim of an offsets program, i.e. maximizing GHG reductions at the least cost to mitigate the effects of global warming. Moreover, imposing limits on the use of offsets—either quantitative or geographic—simply raises the cost of the emission reduction program to California residents. This increased cost will affect the ability to reach longer term and increasingly challenging emission reduction targets at a cost that is acceptable to society. Instead, ARB should move rapidly to begin the process to delegate approval of offsets to third party registries, adopt offset protocols, and recognize other national and international offset programs, while establishing a process early for developing projects in California. This will ensure that local benefits are captured while still leading the developing world towards a low carbon future. In addition, the restriction on carrying over unused portions of an entity's offset limit into subsequent compliance periods should be removed. CCEEB recommends that ARB begin the process to delegate approval of offsets to third party registries and adopt new protocols rapidly to ensure that adequate supply is available in the first compliance period. Additional supply options should include use of five additional Climate Action Reserve Protocols; use of offsets from Western Climate Initiative Partners; support the development of Pilot REDD Projects; allow use of Climate Action Reserve Landfill Credits generated before 2012; and approve protocols developed by California air districts, as appropriate. (CCEEB4)

Comment: ARB has not provided documentation that demonstrates how offsets are going to be made available in quantities sufficient to facilitate cost-effective compliance. For example, in the August, 2011 presentation, ARB staff (slide #17) asserts that the maximum offsets demand for the first compliance period (2012-2014) is 26 million metric tons. Yet, in June of 2010, staff asserted (Slide #27) that only 3 million metric tons will be available from sources in California. In fact, only when offsets from Ozone Depleting Substances (ODS) from sources outside California are included, does ARB predict that 30 Million MT of offsets will be available. In other words, only by using virtually all the offsets from outside the State, can ARB assert that the offset supply is adequate during the first compliance period. This is inconsistent with ARB's historic reliance on in-state emission reductions subject to verification by ARB. Indeed, it is not apparent to WSPA members at this time how the very large volume of offsets would be available to all companies for all years as is suggested in the most recent proposal. Finally, we remind ARB that the intent of offsets is to provide options for emission reductions rather than to offset inequities or the effects of arbitrary benchmarks. We recommend ARB remove the 10 percent reduction in free allowances so that the demand on supply matches anticipated availability. (WSPA4)

Comment: ConocoPhillips is not confident that offsets with approved protocols will be available in 2013-2014 to substantially reduce the additional costs to refiners imposed by the 10 percent reduction in allowances. ARB has maintained its ability to invalidate offset credits after issuance. ARB has maintained that the Buyer shall bear the liability related to offset revocation. While ARB has tightened the statue of limitations to five years if a project undergoes a second verification after three years of issuance of the credits, this does not do enough to ensure a robust offset market that meets the cost containment function ARB initially intended. ConocoPhillips believes that ARB's ability to invalidate issued credits and require the Buyer to replace the credit—in effect making the Buyer "pay twice"—will have devastating impacts on the offset market. Covered entities may choose to forego the offset market due to the inability to clearly identify and mitigate the risks associated with offset revocation. In Appendix A of ARB's Second 15-Day Cap-and-Trade Regulatory Text, ARB makes assumptions that are based on "maximum usage of offsets." This "maximum usage of offsets" will be completely undermined if Buyer's Liability remains a part of the cap-and-trade program. With the inability to identify and mitigate risks, covered entities will be reluctant to utilize and maximize their potential usage of offsets. Because of this reluctance by covered entities, offset developers will not be able to ensure demand for projects thus making financing of projects infeasible. This spiral will significantly retard the offset market and make the "maximum usage of offsets" scenarios which ARB identified infeasible. ConocoPhillips supports the proposal submitted by the International Emissions Trading Association (IETA), which involves a Compliance Buffer Account funded by a hold back of a certain percentage of credits from each offset project. ARB should also hold the responsible parties liable for making the system whole in the case of fraud or error. The IETA proposal, which is very widely supported by market participants including WSPA, would allow covered entities to address risk associated with offsets and ultimately reduce costs related to compliance. (CONOCO3)

Comment: Offsets represent an important cost containment tool for many food processors and producers and should the economy ever rebound, offsets will be vital to keeping the cost of allowances from skyrocketing as industries begin to ramp up production to meet demand. CLFP has recommended that CARB not take a restrictive approach to the use of emission offsets by cap-and-trade program participants such as limiting the number or percentage of offsets that can be used; the geographic location of offsets; or the types of offsets that would be eligible. Allowing the use and availability of a large quantity of offsets from the very beginning of the program will be crucial to the program's success. Policies that increase the likelihood of an inadequate supply of offsets and the inability to link to other cap and trade program will greatly decrease the potential for a cost effective California program. CLFP recommends that CARB instead focus on the quality of offsets; that they meet the requirements of being real, additional, quantifiable, verifiable, and permanent. As long as offsets meet that rigorous standard then their use by regulated entities should not be limited for compliance purposes. CLFP recommends that the proposed 8 percent level be established as a floor, and that additional offsets be allowed as necessary to maintain costs of the program within acceptable limits. For the same reason, we also recommend that the regulation not impose geographic limitations at this time. (CALFP4)

> **Response:** We did not increase the amount of offsets allowed to be used in the program. The program imposes a limit on the amount of offsets that an individual covered entity can use for compliance. All offsets used for compliance are real reductions, albeit outside the cap. Allowing a limited number of offsets into the program provides cost-containment benefits and ensures that some GHG emissions reductions occur within the sectors covered by the cap-and-trade program. This limit will be enforced through a limit on the use of offsets by an individual entity equal to eight percent of its compliance obligation. Combined with the Allowance Price Containment Reserve, this limit ensures that reductions from the program come from sources covered by the program at expected allowance prices, while use of the reserve will relax that constraint if prices rise.

Carry Over of Offset Limit

M-3. (multiple comments)
Comment: In an effort to provide flexibility and reduce compliance costs to regulated entities, companies should be allowed the flexibility of banking unused offsets on a year-to-year basis. Another mechanism that should be available to regulated entities is the ability to trade the balance of their remaining offsets to another company. (CALFP4)

Comment: The offset quantitative usage limit of 8 percent (section 95854) should be applied to the full duration of the proposed cap-and-trade program (i.e., 2013-2020) and not to each multi-year compliance period (i.e., 2013-2014, 2015-2017, and 2018-2020). (OFFSETSWG4)

Comment: Should California continue to have a quantitative usage limit, IETA continues to recommend that the usage limit apply to an entity's compliance requirement over the program's entire timeframe, currently out to 2020. Currently the usage limit expires with the end of each compliance period and unused capacity cannot be carried over to the next period. To the extent that a compliance entity does not fully utilize its quantitative offset limit, the absolute number of "unused" offset credits would be calculated and carried over to the entity's next compliance period. So, assuming the 8 percent rule applies, in the subsequent compliance period, a compliance entity's ability to use offset credits would equal 8 percent of "new" emissions during the compliance period, plus the absolute number of unused "carryover" credits from the prior period. Similarly, in all subsequent compliance periods, actual offset credits used would be subtracted from the "theoretical" offset credits allowed, for each entity, and that new absolute number would be the "carryover" for the next period, and so on, in perpetuity—so if the program were to carry on beyond 2020, unused offsets' compliance potential would not be foregone forever. Should the quantitative usage limit remain in place, IETA strongly recommends the inclusion of an administratively fair "carryover" by entity to the next compliance period provision for the full length of the program—eight years or from 2013 to 2020. (IETA4)

Comment: SCE continues to be concerned about offset supplies in the first two compliance periods. While the new shorter offset invalidation period will certainly help ensure a fungible market of high-quality offsets, any potential for invalidation may have the unintended effect of delaying the entry of offsets to market until they no longer have any risk of invalidation. Under the current rules, this time period is between three to five years. Accordingly, supply may be shifted from the first compliance periods—where it is already tight—to the later years of the program. Given the regulatory interest in maintaining a secondary invalidation option, it is critical that ARB establish regulations that recognize and address this potential delay. As the current offset use limit is applied to each discrete compliance period, such a limited supply could prevent compliance entities from using offsets toward the full 8 percent of emissions reductions authorized in the regulation. This will significantly limit opportunities for cost containment. To address this problem, SCE again suggests two specific modifications to the offset provisions. First, regulated entities should have the flexibility to use offsets up to 8 percent of reported emissions over the entire eight years of the cap-and-trade program. There is no environmental reason, nor any environmental benefit, to applying the 8 percent limit to discrete compliance periods. The global, long-term nature of climate change means that limiting the share of offsets within a particular compliance period is not environmentally relevant. As projects are gradually implemented under the four approved offset protocols, an increase in offset supply will likely come in the later years of the cap-and-trade program. To take advantage of this future expansion in supply, ARB should allow covered entities the flexibility to use offsets up to 8 percent of all reported emissions up to the time of offset submission. In doing so, ARB would be assured that the use of offsets would never exceed 8 percent of the entity's compliance obligation while affording flexibility to minimize the cost of compliance over the entire term of the cap-and-trade program. Modify section 95854 as follows:

> (a) Compliance instruments identified in section 95820(b) and sections 95821 (b), (c), and (d) are subject to a quantitative usage limit when used to meet a compliance obligation.
> (b) The total number of compliance instruments identified in section 95854(a) that each covered entity may surrender to fulfill the entity's compliance obligation ~~for a compliance period~~ must conform to the following limit:

Oo/S must be less than or equal to Lo

In which:

Oo = Total number of compliance instruments identified in section 95854(a) submitted since January 1, 2013 to fulfill the entity's total compliance obligation ~~for the compliance period~~ through the current compliance year.
S = Covered entity's total compliance obligation beginning January 1, 2013 through the current compliance year.
Lo = Quantitative usage limit on compliance instruments identified in section 95854(as), set at 0.08. (SCE4)

Comment: In order to promote lower cost compliance and market efficiency, CARB should allow facilities to carry forward and trade unused offset capacity. Facilities and market participants have expressed concern that they cannot bank unutilized offset compliance requirements for use between compliance periods. As the rules are currently drafted, for example, a facility uses offsets to satisfy only 6 percent of their annual compliance obligation in the first compliance period, cannot bank the remaining 2 percent for use in the second and third compliance periods, or trade the remaining amount to other facilities. As a means to reduce compliance costs and provide flexibility, sources should be given the ability to carry forward and trade unused offset capacity. (BGCEBS)

Comment: As long as ARB has rules in place to ensure that offset credits are high quality, there is no reason to implement artificial limits on their usage. ARB could be more encouraging investment in projects and could be more supportive during the long time horizon required for planning and investing in projects. Limits on the use of offsets will serve to inhibit investment and create uncertainty regarding the monetization of the carbon reduction portion of the projects. If ARB believes that a limit is needed on the use of offsets, the Trust recommends that ARB extend the time period for the quantitative limit to the full length of the program (from 2013-2020). This allows a maximum number of years for a compliance entity to invest in projects, or purchase credits in the market, in an efficient and cost effective manner. This is especially important because it is most efficient for projects to execute a single emission reduction purchase agreement for all credits. It is also more efficient for the compliance buyer to implement long-term contracts and they are involved in the projects for a longer period of time if they have flexibility to use offsets across all compliance periods rather than to meet obligations of a single compliance period. (TCT2)

Response: The regulation requires that offsets account for no more than eight percent of an individual entity's emissions over a three-year period. We did not allow the carryover of unused offsets within this time frame, to ensure that emission reductions are being achieved by capped sources throughout the life of the program. Keeping it to the compliance period allows some flexibility by giving three years to total emissions, but still requires that emission reductions are coming from within capped sectors in all years of the program.

Sector-Based Credits Limit

M-4. Comment: To ensure adequate supply of offsets is available, the Council encourages ARB to revise section 95854(c) to allow a complying entity to use up to 50 percent sector-based offsets toward the quantitative offset limit in the second compliance period. The limit as written would likely put further restrictions on the use of offsets, compounding shortages that many analysts predict will occur, particularly in the later years of the program. (BCFSE2)

> **Response:** We did not make this change. In the first 15-day changes to the regulation, the language was inadvertently changed so that the higher threshold applied to the second and third compliance periods. This was an error. In the second 15-day changes, we have reverted to the provisions in the originally proposed regulation, in which the higher threshold only applies to the third compliance period.

Ensuring Offset Quality and Criteria of AB 32

M-5. Comment: As we have stated in our previous comment letters, the establishment of specific, standardized, quantitative criteria to be applied in the review of compliance offset protocols is critical to providing clarity, transparency, and consistency in offset protocols and the offset credits they generate. The Cap-and-Trade regulation should identify explicit determinations, based on standardized criteria, that ARB will apply in their evaluation of all offset protocols. For example, the regulation should require specific determination of the risk of non-additionality, reversal, and leakage associated with an offset protocol, based on a quantitative analysis with explicit standards. This determination should be provided in the context of the volume of offset credits an offset protocol is expected to generate, and also should include a comparison of these factors among project types within an offset protocol and among offset protocols. To offer a specific example taken from Section 95792: "To be approved by the Board, a Compliance Offset Protocol must . . . (6) Ensure GHG emission reductions and GHG removal enhancements are permanent." This critical requirement is presented in the regulation here, and only here, as a general finding made by ARB upon adoption of an offset protocol. The permanence of GHG reductions, and the board's understanding of the risks associated with the protocol, would be much better assured if this provision required ARB to make a specific determination of the permanence of the credits provided by the protocol, based on a quantitative analysis of the persistence of the associated reductions, risk of reversals, and a comparison of those risks among different offset project types. (CBD5)

> **Response:** We believe that the Compliance Offset Protocols, in conjunction with all of the strict and thorough requirements in the regulation regarding offsets, meet the requirements of AB 32. The Compliance Offset Protocols adopted

under the cap-and-trade regulation have been established with multiple levels of review, use conservative methods to account for uncertainty and emissions leakage, and establish the additionality of offset projects in setting project baselines. The regulation requires that all Compliance Offset Protocols address activity-shifting and market-shifting leakage. Each protocol incorporated by reference, including the forest protocol, accounts for leakage in the quantification of the reductions or removals achieved by the offset projects. In addition, when uncertainty exists in quantifying GHG reductions, ARB will only issue offset credits when there is a high level of confidence that reductions actually occurred. The regulation employs a principle of conservativeness in the quantification of emissions reductions. This method will ensure that the accounting will underestimate, rather than overestimate, any reductions when there is a high level of uncertainty.

We agree that offset protocols must ensure environmental integrity. Generally, we do not include implementation-related procedures in our regulations. As directed in Board Resolution 11-32, we will develop guidance documents related to the protocol approval process in 2012. In addition, all offset protocols used in the compliance program must be adopted by the Board after undergoing a full regulatory process, including an ARB stakeholder process, in accordance with the Administrative Procedure Act, and an environmental review. ARB plans to look at further offset protocols for potential inclusion in the cap-and-trade program beginning in 2012. The details surrounding any new offset project types for which ARB adopts an offset protocol will be addressed during that specific rulemaking, and modification will be made to the cap-and-trade regulation as needed.

M-6. Comment: As stated in our previous comment letters, ARB's proposed regulation similarly lacks standards and safeguards necessary to ensure that offsets are "additional" as required by AB 32. AB 32 requires ARB to ensure that emissions reductions achieved through a market-based compliance program are "in addition to any greenhouse gas emission reduction otherwise required by law or regulation, and any other greenhouse gas emission reduction that otherwise would occur." Health & Safety Code section 38562(d)(2) (emphasis added). As a threshold matter, the additionality requirements of proposed section 95973 are not entirely consistent with the statutory language. Under the proposed regulation, "[t]he activities that result in GHG reductions and GHG removal enhancements, are not required by law, regulation, or any legally binding mandate applicable in the offset project's jurisdiction, and would not otherwise occur in a conservative business-as-usual scenario." Section 95973(a)(2)(A) (emphasis added); see also section 95802(a)(3). The proposed regulation does not otherwise define "business-as-usual scenario," and the conservativeness principle—while certainly appropriate in this context—does not fully ensure that all reductions are in addition to those "that otherwise would occur," as AB 32 requires. (CBD5)

Response: We disagree with the statements about additionality. We believe that the Compliance Offset Protocols, in conjunction with all of the strict and thorough requirements in the regulation regarding offsets, meet the requirements of AB 32. The Compliance Offset Protocols adopted under the cap-and-trade regulation have been established with multiple levels of review, use conservative methods to account for uncertainty and emissions leakage, and establish the additionality of offset projects in setting project baselines.

The regulation does define "Business-as-Usual Scenario" in section 95802(a)(36), and "Conservative" is defined in section 95802(a)(60). We believe the definitions of these terms ensure that the requirements of AB 32 will be met for the adoption of protocols and for ensuring additionality.

M-7. Comment: We appreciate that ARB may have intended to address this shortcoming of the regulation in part through section 95972(a)(9), which as proposed in this 15-day notice requires Compliance Offset Protocols to: "Establish the eligibility and additionality of projects using standard criteria, and quantify GHG reductions and GHG removal enhancements using standardized baseline assumptions, emission factors, and monitoring methods." However, "standard criteria" in this provision is left undefined; again, the regulation provides no assurance that credits created under these protocols will be additional as required by AB 32. Again, a more meaningful provision would require ARB to make a specific determination of the risk of non-additionality, reversal, and fraud associated with an offset protocol, based on a quantitative analysis with explicit standards, and provided in the context of the volume of offset credits an offset protocol is expected to generate and a comparison of these factors among project types within an offset protocol and among offset protocols. In addition, this provision should include the components of additionality set forth in subsection 95973(a)(2)(A) or be cross-referenced to that subsection. (CBD5)

Response: We agree that offset protocols must ensure that GHG reductions and the GHG removal enhancements resulting from them meet the criteria listed by the commenters. To ensure that GHG reductions and GHG removal enhancements credited as offsets are real, the regulation requires that all Compliance Offset Protocols address activity-shifting and market-shifting leakage. Each protocol incorporated by reference accounts for leakage in the quantification of the reductions or removals achieved by the offset projects. In addition, when uncertainty exists in quantifying GHG reductions, ARB will only issue offset credits when there is a high level of confidence that reductions actually occurred. The regulation employs a principle of conservativeness in the quantification of emissions reductions. This method will ensure that the accounting will underestimate, rather than overestimate, any reductions when there is a high level of uncertainty.

Generally, we do not include implementation-related procedures in our regulations. As directed in Board Resolution 11-32, we will develop guidance documents related to the protocol approval process in 2012. In addition, all offset protocols used in the compliance program must be adopted by the Board after undergoing a full regulatory process, including an ARB stakeholder process, in accordance with the Administrative Procedure Act, and an environmental review. ARB plans to look at further offset protocols for potential inclusion in the cap-and-trade program beginning in 2012. The details surrounding any new offset project types for which ARB adopts an offset protocol will be addressed during that specific rulemaking, and modification will be made to the cap-and-trade regulation as needed.

We believe that the requirements for offset protocols in section 95972 and our Compliance Offset Protocol stakeholder processes will ensure that this is met.

M-8. Comment: The proposed modifications would change Section 95972(a)(4) to read as follows: "[To be approved by the Board, a Compliance Offset Protocol must] . . . [a]ccount for activity-shifting leakage and market-shifting leakage for the offset project type, unless the Compliance Offset Protocol stipulates eligibility conditions for use of the Compliance Offset Protocol that eliminate the risk of activity-shifting and/or market-shifting leakage." The addition of this exception appears targeted toward the Compliance Offset Protocol U.S. Forest Projects ("Forest Offset Protocol"), which contains very high risks of leakage, especially when compared to other protocols. To be clear, the Forest Offset Protocol does not—and cannot—"eliminate" the risk of leakage. At the very least, the regulation should require a specific quantitative determination of the risk of leakage associated with an offset protocol, provided in the context of the volume of offset credits an offset protocol is expected to generate, and a comparison of these factors among project types within an offset protocol and among offset protocols. (CBD5)

Response: This provision is not targeted to the forest protocol. Instead, the provision was added to accommodate those project types that may be able to completely eliminate the risk of leakage, which may be the case in some agricultural project types. If a protocol can completely eliminate the risk of leakage, it will not need to account for it in the quantification of emissions reductions. This provision is not intended to allow a less rigorous interpretation.

M-9. (multiple comments)
Comment: According to the AB 32 statute, offsets must be additional to any greenhouse gas emission reduction that would otherwise occur. It is this additionality that is so difficult to determine. As such, the use of offsets as a compliance instrument, *not* inherent to a cap-and-trade system, presents substantial risks of not genuinely achieving the emissions reductions called for in AB 32. When offsets credits are generated by business-as-usual projects that were going forward regardless of the offsets payments, the companies under the cap are able to emit more than the cap, but equivalent additional emissions aren't reduced elsewhere. The companies are simply paying project owners outside of the cap to do what they were doing anyway. The cap-and-trade program would therefore be effectively weakened by the number of non-additional business-as-usual offset credits allowed for compliance. We strongly recommend that the regulation include a requirement that an additionality assessment

be conducted of new protocols prior to adoption, and periodically on all existing protocols.

- These additionality assessments should be made publicly available.
- Each additionality assessment should evaluate whether the protocol is likely to meet CARB's requirements that all credits are real and additional using the following evaluation criteria (in addition to other criteria already in the draft regulation):
  - There is a very high degree of confidence that the total number of credits generated by projects under the protocol will not exceed the total amount of reductions enabled by that protocol in addition to what would have happened without that protocol,
  - The project types that qualify under the protocol, absent being eligible as part of the compliance offset protocol, are not likely to be pursued, are likely to result in reductions that are negligible in number, or would likely have been pursued at significantly lower rates; and
  - The protocol conservatively accounts for uncertainty in quantification factors for the offset project type.
- In addition, periodic reviews of existing protocols should assess the influence that the protocol has already had on new project development.

Moreover, a review should be triggered when any of the following would result in substantial changes in the estimation of emissions reductions from offset projects:

- Research advancements on quantifying emissions reductions from protocol project types;
- Updates to related registry protocols that lead to more accurate or conservative measurement of emissions reductions;
- Significant changes in market conditions affecting the rate at which projects would be developed without the offset protocol; or
- Changes in the baseline. (UCS9)

Comment: Further enhancements to verifier and registry oversight are needed to ensure that offset project developers do not over-estimate the reductions from their projects. Modify section 95971 as follows:

<u>(c) A review shall be triggered when any of the following would result in substantial changes in the estimation of emissions reductions from offset projects:</u>

<u>(1) Research advancements on quantifying emissions reductions from protocol project types;</u>
<u>(2) Updates to related registry protocols that lead to more accurate or conservative measurement of emissions reductions;</u>
<u>(3) Significant changes in market conditions affecting the rate at which projects would be developed without the offset protocol; or</u>
<u>(4) Changes in the baseline.</u> (UCS8)

Comment: We would like to reiterate the importance of providing further clarification regarding how new and existing protocols will be evaluated to ensure that the credits they will generate will represent real and additional reductions. The biggest challenge in running an offsets program is ensuring that the credits generated are real and additional since it is so difficult to determine what might or might not have occurred in the absence of the protocol. This requires performing an additionality analysis on all new protocols when they are considered for adoption, and periodically assessing existing protocols. An additionality analysis assesses the projects that are likely to be credited under the protocol and evaluates whether there is a high level of confidence that the protocol will not create more credits in total than the reductions the protocol causes (above what would have happened in the absence of that protocol). In addition, a protocol review also involves an analysis of the additionality of the credits that have been issued under the protocol in the prior period. Since this is essential to running an offsets program, we request that such an analysis be made explicit in the regulation, or perhaps for some provisions, in a supplemental document. These additionality assessments should be made publicly available. (UCS8)

> **Response:** We believe that the Compliance Offset Protocols, in conjunction with all of the strict and thorough requirements in the regulation regarding offsets, meet the requirements of AB 32. The Compliance Offset Protocols adopted under the cap-and-trade regulation have been established with multiple levels of review, use conservative methods to account for uncertainty and emissions leakage, and establish the additionality of offset projects in setting project baselines.
>
> Generally, we do not include implementation-related procedures in our regulations. As directed in Board Resolution 11-32, we will develop guidance documents related to the protocol approval process in 2012. In addition, all offset protocols used in the compliance program must be adopted by the Board after undergoing a full regulatory process, including an ARB stakeholder process, in accordance with the Administrative Procedure Act, and an environmental review. ARB plans to look at further offset protocols for potential inclusion in the cap-and-trade program beginning in 2012. The details surrounding any new offset project types for which ARB adopts an offset protocol will be addressed during that specific rulemaking, and modification will be made to the cap-and-trade regulation as needed.

M-10. Comment: CARB should evaluate the enforceability of offsets. Can CARB oversee these offsets even for 100 years? What about CARB's intention to link to the Western Climate Initiative and to other countries? Will CARB be able to enforce out of state and international offsets for even 50 years, if at all? Will CARB have the ability to enforce offsets if our relations with another country turn sour? In decades, conditions can change drastically, rendering the offsets unenforceable. It is patently obvious that instead of providing this major offsets program, that allows polluters to avoid 80 percent of the reduction aims of this program, CARB would have a vastly more enforceable program if it performed its normal function of regulating the polluters right in California. (CBE3)

Response: The role of offsets is to provide cost containment for the market program. Covered entities will have to weigh the costs of purchasing offsets for meeting a near-term compliance obligation versus investing in onsite reductions that would provide emissions reductions throughout the three compliance periods. We believe the current regulation is enforceable. There are no international offsets included in the cap-and-trade regulation. The issues raised on this point will be part of a separate, future rulemaking, where we will have to evaluate and ensure that any offsets, including international offsets, meet the AB 32 criteria. Also see the response to Comment M-13 in this chapter.

M-11. Comment: We are submitting the following press release at: http://yosemite.epa.gov/opa/admpress.nsf/0/0fdbab7c7ab964d28525791700614ae0?OpenDocument to document the pressures that dairies are under to improve manure management and insure that they do not impact other local agriculture and waterways. As this press release provides additional evidence that it is not possible to discern whether a dairy or other livestock farm decides to use an anaerobic digester because of the offset program/payment and when this decision would have occurred otherwise, in the absence of the offset program, as a result of other pressures, including the threat of regulatory enforcement against discharges and potential nuisance and tort actions by neighboring landowners and communities. As noted in our prior comments (August 2008, December 13, 2010, July 27, 2011, and August 10, 2011) offset credits that lack integrity and are not additional will undermine the integrity of the entire AB 32 program and its accounting of reductions, and is contrary to the requirements of AB 32. (WILLIAMSZ4)

Response: Currently, there are no regulations or proposed regulations to mandate the implementation of anaerobic digesters. The implementation of anaerobic digesters is also not something currently considered common practice. Regulatory additionality is assessed based on the regulatory environment at the time of the offset project's implementation. Additionality is not intended to look at what types of regulations could potentially be implemented in the future. The purpose of the offsets program is to incent actions to reduce GHG emissions for those activities that are not already required or being implemented as part of current practices. ARB will periodically assess all offset project types to determine if they are still additional. If a new law is passed or an activity has become common practice, no new offset projects would be able to be implemented. As such, it is not practical or technically accurate to consider an activity unadditional because there may be some unforeseen regulations that could be implemented in the future.

M-12. Comment: Several important additions and clarifications were incorporated into the regulation regarding periodic reviews of offsets protocols (95971(b)), and performance reviews of verifiers (95132(c)(2) and (4) of the MRR) and registries (95986(k)(5)(B)). We support and appreciate these changes, and believe these reviews are essential to ensuring that offsets credits generated under CARB's offsets program meet the criteria outlined in the regulation. Moreover, it is important for all involved to have a sense of certainty that these procedures will be implemented, and for those being evaluated to be made aware of review procedures they can expect. (UCS8)

Response: Thank you for your support. We plan to develop guidance documents related to the protocol approval process in 2012. We also have included provisions in the regulation for performance reviews in the regulation, as mentioned by the commenters.

M-13. Comment: California is in a position to create a model for other carbon offsets programs. The track record of offset programs has been poor with regard to the quality of the credits for GHGs or for other gases. While the proposed regulation is structured to potentially have better results than other offsets programs, additional protections and oversight provisions are still needed. Given that the total number of offsets allowed for compliance under California's cap-and-trade program cumulatively through 2020 equals approximately 80 percent of cumulative emission reductions required under the program, the integrity of those offsets is critical to the effectiveness of the market-based program overall. (UCS8)

Response: We believe offsets are real GHG reductions, albeit from outside the cap. We also believe that the Compliance Offset Protocols, in conjunction with all of the strict and thorough requirements in the regulation regarding offsets, meet the requirements of AB 32. The Compliance Offset Protocols adopted under the cap-and-trade regulation have been established with multiple levels of review, use conservative methods to account for uncertainty and emissions leakage, and establish the additionality of offset projects in setting project baselines. To assure offset quality, the program includes rigorous oversight and audit procedures for all ARB-accredited offset verifiers, offset project developers, and offset project registries. In addition, the registry system for compliance instruments is being designed to provide strong enforcement capabilities, including mechanisms to prevent double-counting, public disclosure requirements, and methods to clearly define ownership.

The regulation proposes a robust monitoring program for offset projects—both the verification that the offsets are real, additional, and enforceable, and that Offset Project Operators, verifiers, and Offset Project Registries are operating according to regulatory requirements. In addition to the ARB audits, Offset Project Registries are required to conduct oversight of their registry program and randomly audit verifications to ensure that our regulatory requirements are being met by Offset Project Operators and verification bodies. We will provide rigorous oversight of our approved Offset Project Registries. Each year, the Offset Project Registries will provide us with a report providing basic information related to any offset project listed using a Compliance Offset Protocol and any findings related to verification audits. We will require Offset Project Registries to provide any information related to an offset project when requested by us as part of the registry's oversight of their program for Offset Project Registry. During the course of an offset project, the Offset Project Registry will track any guidance or information provided to an Offset Project Operator related to a compliance offset project and report this information monthly to ARB. This approach will ensure that we understand any issues or concerns related to the registry's compliance offset program as Offset Project Operators implement the actual offset projects.

M-14. Comment: A slight change in section 95971(b) may better reflect the intension of this revision. The reviews rather than the revisions should be periodic; revisions should be made as needed. Modify section 95971(b) as follows:

(b) All Compliance Offset Protocols shall be periodically reviewed and ~~periodically~~ revised if needed. (UCS8)

Response: We did not make this change. We believe the current language shows the correct intent.

M-15. (multiple comments)
Comment: Where there is systematic uncertainty (defined here as when an incorrect value would result in the incorrect estimate of the emissions reduced by all projects of a certain type in the same direction (high or low)), calculation methods should be conservative. This is necessary to ensure that California meets its emissions reduction targets. Reductions under an offsets program are inherently less certain than similar reductions under a cap because an offsets program measures emissions reductions against a counterfactual scenario. So that CARB's offsets program does not allow fairly certain reductions under the cap to be replaced with less certain, and therefore poorer quality, reductions outside of the cap, systematic uncertainty must be addressed conservatively. Modify section 95972(a)(5) as follows:

(5) Conservatively account for uncertainty in quantification factors for the offset project type. (UCS8)

Comment: A protocol should not over-credit emissions reductions. It is impossible to assure that every single credit represents a real and additional reduction. But it is possible to have a high degree of confidence that, in total, the protocol does not generate more credits than the total reductions it enables (causes). We recommend adding the following statement. This statement is at the heart of what an additionality assessment of a protocol would assess and is meant to provide an operational definition of the terms "real" and "additional." Modify section 95972(a) as follows:

(11) Ensure, with a very high degree of confidence, that the total number of credits generated by projects under the protocol will not exceed the total amount of reductions enabled by that protocol in addition to what would have happened without that protocol. (UCS8)

Comment: By statute, all offsets credits used for compliance under AB 32 must represent real and additional reductions. By definition, if reductions are additional, one of the following three options must be met: the reductions would not have happened otherwise, or the reductions that would have happened otherwise are negligible in number, or the reductions that would have happened otherwise are very small in number compared to the additional reductions caused by the protocol. The only other possibility is that the reductions that would have happened without the protocol is not small compared to the additional reductions, in which case the protocol does not meet ARB requirements. We therefore believe that the following requirement is necessary for the additionality requirement to be met, and should be made explicit in the regulation to avoid any potential misunderstanding. Modify section 95972(a) as follows:

> (12) Ensure the project types that qualify under the protocol, absent being eligible as part of the compliance offset protocol, are not likely to be pursued, are likely to result in reductions that are negligible in number, or would likely have been pursued at significantly lower rates; (UCS8)
>
> **Response:** We agree that offset protocols must ensure that GHG reductions and GHG removal enhancements resulting from them meet the criteria listed by the commenters. We did not make any changes based on the comment because we believe that the requirements for offset protocols in section 95972, along with our Compliance Offset Protocol stakeholder processes, will ensure that these criteria are met.

Offset Supply and Additional Offset Protocols

M-16. (multiple comments)
Comment: Carbon offsets from non-capped sectors in California's cap and trade program will be an essential cost containment mechanism available to covered entities. They will provide lower-cost emission reductions, particularly if purchased and banked early in the program before escalating marginal abatement costs. The quality and the integrity of the carbon offset are critical to safeguard in the design of the offsets program, and because of this, quality and integrity rather than project type, should be the primary concern of the ARB. Although the latest round of proposed rule changes do not include additional early action protocols, ARB staff has indicated their intention to consider offset protocols relating to the replacement of high-bleed pneumatic valves and changes in agricultural processes. Evolution Markets applauds ARB's efforts to expand its early action protocols, and encourages the Board to adopt these protocols as expeditiously as possible. In addition, the ARB should publish a list of "priority" protocols for adoption by the Board next year. Evolution Markets believes, however, that the potential volume from these protocols will continue to be insufficient to meet early demand for offsets. Therefore, Evolution Markets recommends ARB consider additional high-volume protocols for adoption in the early action program. (EVMKTS3)

Comment: ARB has made no modifications to the draft regulations regarding the list four CAR protocols used to classify compliance-eligible offsets and those eligible to receive early action credit. IETA commends ARB for providing some guidance on three additional protocols, and also providing notice that it will suggest further protocols for review at the Board meeting in October. IETA has concerns that there will be offset supply shortages if the current project types are not increased and, in the short-term, about the infrastructure being in place to enable offsets from early-action projects to come to market as quickly as possible. IETA also has concerns about the transparency with which new offset protocols are assessed and announced. Without additional protocols, a timeline for infrastructure development and a more transparent process for new protocols being considered the market will not be able to provide sufficient supply when needed to effectively mitigate costs to California consumers. (IETA4)

Comment: Emission reductions from all qualified existing CAR projects should be brought into the compliance system and become compliance eligible. In addition, ARB should consider recognizing protocols from other high-quality carbon project standards organizations, such as the Verified Carbon Standard, the American Carbon Registry and the Gold Standard. Recognizing existing projects will help to create a greater initial supply of offset credits for the market. (IETA4)

Comment: In the first compliance period, the supply of offsets will very likely be too limited to cover the eight percent of emissions as allowed for under ARB's proposal. The BCSE was very encouraged to hear ARB staff state during the August 24, 2011 public meeting the consideration of three specific additional offset protocols, including protocols for Conversion of Pneumatic Controllers, N_2O Reductions from Changes in Fertilizer Management, and Emissions Reductions in Rice Management Systems. The first two of these are protocols of BCSE member Winrock International's American Carbon Registry (ACR), and the third is currently going through the ACR approval process for publication this fall. To ensure adequate offset supply and cost containment for the larger cap-and-trade program, the BCSE encourages ARB to work quickly to approve these and other protocols. (BCFSE2)

Comment: We encourage the Board to adopt additional high-quality, publicly-developed, standardized offset protocols that have been tested and improved through real-world use such as those employed by the Climate Action Reserve. (CAR5)

Comment: Offsets have been referred to as a small piece of a much larger program. While that may be accurate from a volume perspective, the pricing impact of inadequate offset supply as a cost containment measure cannot be understated. In addition to the three protocols that ARB indicated they would consider at the August 24, 2011 Board meeting (American Carbon Registry (ACR) pneumatics valves, ACR nitrogen fertilizer management, and rice cultivation) we encourage ARB to consider additional protocols which have significant issued credits to date that could address the immediate need for offsets in the first compliance period. The ACR nitrogen fertilizer management protocol has no issued tons to date and the rice cultivation protocol(s) have yet to be finalized. Offset projects take many months to develop and contract. Given the risk and uncertainty, it is unlikely that there will be substantial investment in the three proposed project types unless and until the Board approves these additional protocols. Additionally, the one year delay of the program compliance obligation combined with the uncertainty regarding both invalidation liability and Early Action offset transition to ARB offset process and costs have discouraged investment in the four approved protocols sufficient to meet offset demand in the first compliance period. As such, we recommend evaluating additional Early Action protocols that, in addition to being real, additional, quantifiable, permanent, verifiable, and enforceable, have the potential to add immediate supply to the program. Specifically, we encourage ARB to consider the Early Action CAR US Landfill Gas Protocol (4.9 $MMTCO_2e$ issued (net retirements)) and VCS Coal Mine Methane Protocol (1.2 $MMTCO_2e$ issued (net retirements)). Regarding Early Action CAR US Landfill Gas in particular, we support that statements made by PG&E and contend that Early Action ARB offset credits should be issued to US landfill operators that voluntarily reduced emissions in advance of California's Landfill Methane Control Measure that was approved on June 17, 2010 but allows landfills 18 months to install a collection system. (CE2CC2)

Comment: One of the biggest issues yet to be addressed by ARB is the introduction of additional offset compliance protocols. While CERP recognizes that the 15-day rulemakings are not the appropriate place to introduce new protocols, CERP urges ARB to move forward with new protocols as quickly as possible in order to offer the market certainty concerning what project types will be included. Offset projects take significant time to implement, and thus there will be significant lag time after new protocols are accepted by ARB before projects can be expected to be introduced into the market. (CERP5)

Comment: CERP requests that ARB move expeditiously toward introducing new offset protocols with the ability to contribute significant supply to the compliance market. (CERP5)

Comment: A robust supply of offsets is required in order to reduce program costs. Therefore, a consideration of offset protocols, outside the four currently under consideration, is encouraged. (CALCHAMBER4)

Comment: The protocols in this second 15-day administrative rulemaking are being revised in the right direction, but the revisions do not go far enough. Two key actions are necessary to support the development of a robust offset market that will lower compliance costs and ultimately reduce the program's impact on the California economy. First, we strongly encourage ARB to continue evaluating and adopting additional protocols for compliance under AB 32. As more protocols are adopted, the supply of high quality offsets will increase and will drive down overall offset and compliance costs to the market. Second, ARB quickly needs to establish a process and requirements for entities to convert early action offsets into compliance-grade offsets. The sooner this happens, the sooner market participants will make investments in early action offsets. This will jump start the establishment of a robust offset supply that will be able to meet the demand, especially in later compliance periods. (CHEVRON4)

Comment: There is a great need for ARB to provide more clarity regarding additional project types that may become eligible for offset credit. Developing offsets is a long and complex process that requires significant investment. It can take years for new projects to become market ready. Considering the demand for offsets will only rise over time, giving project investors as much foresight as possible will help ensure adequate supply is available. (IETA4)

Comment: Because offsets are critical for cost containment, SCE continues to strongly support their use in the cap-and-trade program. SCE offers four essential principles that ARB staff should consider when reviewing and revising the offset rules:

- Robust supply. A strong supply of offsets, especially in the first years of the cap-and-trade program, will ensure that compliance entities are able to maximize their use of these important compliance instruments.
- Cost-effectiveness. High-quality but inexpensive offsets will allow compliance entities to limit their compliance costs, furthering the goals of the cap-and-trade program without unduly jeopardizing California economic vibrancy.
- High-quality offsets. High-quality offsets, mandatory for environmental integrity, will also ensure that the risk of invalidation does not overly constrict supply or raise prices in the offset market.
- Offset market liquidity. A liquid market with fungible products will provide an efficient way for the regulated community to access these high-quality and cost-effective offsets. (SCE4)

Comment: SCE strongly urges ARB to work towards developing and approving additional offset protocols. SCE supports ARB's consideration of new protocols addressing replacement of high bleed pneumatic values and improved agricultural practices, as presented in a recent staff update on AB 32 climate change program activities. Given the lengthy timeframes for offset project development, implementation and verification, SCE urges ARB to expeditiously consider and obtain Board approval of these and other new protocols in early 2012. (SCE4)

Comment: The four compliance offset protocols included in this rulemaking specify, in general, that all eligible projects must be located within the United States. This requirement appears to be in conflict with the principle of reciprocity announced by the Western Climate Initiative (WCI), of which the State of California is a partner. Under that principle, offsets issued by one WCI Partner Jurisdiction will be recognized and accepted for compliance in all other Partner Jurisdictions. As the ARB protocols are currently written, it appears that a project following one of the ARB protocols, but undertaken in a Canadian Partner Jurisdiction, could not be issued compliance offset credits in California. Clarify the ARB offset protocol requirements to ensure that projects following those protocols but undertaken in jurisdictions with which California has linkages will be eligible for recognition in California. (VCSA2)

Comment: NextEra would like to strongly urge ARB to consider incorporating more offset protocols into the program. We understand that this requires additional rulemaking. ARB staff has indicated that rulemaking could potentially take place in 2012 to address this as well as other issues. NextEra would support that effort and be willing to participate in the process to assist ARB in reviewing protocols to ensure they meet the goals and requirements of AB32. We feel the availability of offset credits is critical to controlling the cost of allowances and the impact the cap and trade program will have on consumers. In addition, some projects result in the production of co-benefits to the public and the environment. We would ask that ARB staff seriously consider adding the following list of offset protocols to the regulation and also consider the following additions to existing protocols:

- Improved forestry management. Including protocols for specific geographic areas. Forestry practices vary depending on the location and species of trees
- Industrial gas abatement. Add N_2O and SF_6 to protocol for abatement of ozone depleting substances (ODS)
- Landfill gas. Projects outside of CA where regulations do not require controls.
- Coal mine methane abatement. Potential projects exist across WCI region.
- CO_2 sequestration (NEXTERAENERGY3)

Comment: TFI would like to commend ARB for its decision to evaluate agricultural protocols for compliance purposes as outlined in the August Board meeting presentation. Agricultural soil management accounted for over 200 million metric tonnes of carbon dioxide equivalent (CO_2e) and nitrous oxide emissions from nitric acid production accounted for over 21 million tonnes of CO_2e in California and the United States in 2009. There are numerous opportunities to reduce these GHG's in California and the United States that are real, measurable and verifiable with significant environmental benefits. (TFI2)

Comment: TFI recommends ARB review and adopt the existing CAR's Nitric Acid Production Protocol for compliance purposes during your protocol review in 2011/12. The nitric acid sector is currently at the forefront of environmental stewardship through the reduction of GHGs in commercial and organic fertilizer manufacturing. Nitric acid plants can be large GHG emitters through release of nitrous oxide (depending on the type of pollution abatement system historically implemented) in the production process. Fortunately, the development of the CAR Nitric Acid Production Project Protocol has allowed five projects to develop voluntarily that will generate 2 million offset credits per year this year and over 2.5 million offset credits by 2012. In addition, there are a number of other facilities planning additional projects using the CAR Nitric Acid Production protocol. It is important to note that the nitric acid industry participants can guarantee the offsets to the end buyer and are very comfortable with the requirements of section 95985—Invalidation of ARB Offset Credits. The offsets generated from N_2O destruction are the most verifiable offsets achievable. Currently there are two nitric acid facilities in California that supply the fertilizer production industry with feedstock to make nitrate based fertilizers. Preliminary discussions with ARB staff have highlighted early support for adoption of the protocol with potential changes to how production facilities would be included in the overall GHG capped sectors. TFI looks forward to engaging ARB on this issue in the future. (TFI2)

Comment: TFI is currently developing a new, comprehensive field protocol based on the "4R" nutrient stewardship system (using the right nutrient source at the right rate, right time and right place). This protocol should also be reviewed and adopted for compliance purposes to ensure the agriculture sector is working to develop long-term solutions to reduce sectoral GHG emissions. TFI's 4R protocol is aimed at reducing

GHG's from agricultural nutrient management (i.e. fertilizer field application) in a comprehensive, quantifiable and verifiable manner. TFI's process is aligned with both the Canadian and Iowa/Illinois Nitrous Oxide Emission Reduction Protocols and calls for stringent requirements to ensure the highest quality of offsets. Quality is maintained through detailed descriptions of growers' past and future activities and by utilizing an output-based approach and regional coefficients calculated via USDA GHG quantification methods and tools. The protocol was designed according to technical recommendations given by the Technical Working Group on Agricultural Greenhouse Gases (T-AGG). Finally, the protocol pledges to remain technology neutral, guaranteeing the acceptance of alternative approaches such as organic, dynamic or conventional application methods. A key additional benefit from TFI's 4R protocol is that it is focused on changing farmer behavior through the 4R stewardship education program. The protocol is being tested, through USDA grant funding, on Iowa/Illinois producers in corn-bean rotations. TFI is playing a leading role in development of the protocol using its expertise on serving on the USDA Agricultural Air Quality Task Force which provides recommendations on emerging regulatory issues related to agricultural air quality for USDA. TFI also serves on the board of the Conservation Technology Innovation Center, an organization devoted to educating and increasing uptake of nutrient and conservation based practices such as no-till and low-till systems including cover crops, buffer strips, and 4R nutrient management. In conclusion, the fertilizer industry is demonstrating strong leadership in environmental stewardship within the agricultural sector. The industry recognizes the potential impacts of improper nutrient management and is promoting uptake of 4R nutrient management and site-specific conservation practices. Accepting the proposed TFI 4R nutrient management protocol would be a win-win for both California's agricultural producers and regulated entities under AB 32. (TFI2)

> **Response:** These comments fall outside the scope of the second 15-day changes to the regulation; therefore, no further response is required. Responses to similar comments can be found in this category under the 45-day comment responses.

M-17. Comment: State officials must continue to consider how to practically link with external offset and allowance programs, including the Western Climate Initiative (WCI), the Regional Greenhouse Gas Initiative (RGGI), Clean Development Mechanism (CDM), and EU ETS. (IETA4)

> **Response:** This comment falls outside the scope of the second 15-day changes to the regulation; therefore, no further response is required. Responses to similar comments can be found in this category under the 45-day comment responses.

M-18. (multiple comments)
Comment: IETA recommends ARB establish an open and defined official path or mechanism through which offset project developers can propose new project types and

methodologies for consideration. At the moment, there is no formal path for introducing such methodologies and this would greatly streamline the process. (IETA4)

Comment: The modified draft rule provides no formal path for submitting methodologies for review, evaluation and approval by ARB. An open, transparent process for receiving, reviewing, evaluating and approving offset methodologies provided and/or developed by third parties is a necessary signal for the market to continue developing protocols (and projects) that will provide the offsets necessary for effective cost-abatement. ARB should establish an open and defined mechanism through which offset project developers can submit new project types and methodologies for consideration. VCSA suggests that ARB consider adopting a process similar to that employed by the Australian Department of Climate Change and Energy Efficiency for inviting parties to submit methodologies for review and approval under that country's forthcoming Carbon Farming Initiative. Details about that submission process can be found at http://www.climatechange.gov.au/government/initiatives/carbon-farming-initative/methodology-development/methodology-guidelines.aspx. (VCSA2)

Comment: Despite our earlier recommendations and similar recommendations provided by other parties, the proposed rule makes no provision for a defined mechanism by which ARB will receive and consider offset methodologies developed and/or presented by third parties for approval as compliance offset protocols and/or early action offset project protocols. We believe that the absence of a defined mechanism is not in the public interest, as it enables a closed non-transparent process that can result in unequal treatment being given to project and methodology developers seeking consideration by the Board. By limiting the opportunity for third parties to submit protocols for consideration, the absence of a defined submission mechanism does not serve ARB's own interest in executing the most administratively efficient program. Moreover, failing to provide clear guidance regarding the parameters that offset protocols must follow risks establishing a system that is inconsistent across project types. (VCSA2)

> **Response:** This comment falls outside the scope of the second 15-day changes to the regulation; therefore, no further response is required. Responses to similar comments can be found in this category under the 45-day comment responses.

Offset Project Registries

Registry Approval Process and Requirements

M-19. (multiple comments)
Comment: Given the central role that registries play in ensuring the environmental and financial integrity of an emissions reduction and trading program, it is important that the providers of registry services are themselves technically capable, financially sound, and managerially competent entities. VCSA believes that the requirements for Offset

Project Registries outlined in the proposed rule are not robust enough for purposes of establishing the sound, long-term functioning of the offsets program. For its own program, the VCSA requires its registry service providers to meet strict financial standing requirements (including, for example, more extensive insurance coverage than required by ARB and minimum net asset requirements), and have in place insolvency protections and conflict of interest policies (including prohibitions on proprietary trading of carbon instruments) that go beyond the requirements indicated in the modified draft rule. We suggest that ARB establish similar standards. Amend section 95986(c) to include requirements that Offset Project Registry applicants meet more robust financial standing standards similar to those established by VCSA for its registry service providers. Annex 1 to this letter provides a summary list of the requirements set out by the VCSA as part of the RFP issued for VCS registries. (VCSA2)

Comment: We would encourage the Board to continue to strengthen the offsets component of the Regulation by ensuring offset registries meet the highest possible standards. We believe that more can and should be done in this regard. In particular, the reserve encourages the Board to impose much stronger competency and conflict of interest requirements for offset registries. We would expect such requirements to, at a minimum, mirror or, more preferably, exceed those imposed on verification bodes since registries will serve as ARB's first point of contact and provide vital oversight of ARB's verification system. (CAR5)

> **Response:** The regulation requires that ARB will only approve registries that meet a high standard under the regulation. Once a registry is approved, it is subject to ARB's enforcement. We provide registries some flexibility in how they structure themselves to be responsive to offset project developer needs, and to ensure that the registry can provide the registry services at the level dictated in the regulation. The registry staff will be required to demonstrate practical knowledge of the protocols approved by the Board. The regulation contains requirements for regular information-sharing between the registries and ARB. The regulation allows for ARB to request information or discussions with registry staff at any point. As with many of ARB's regulations, compliance training will be available, and in this case required, to ensure that the highest qualified personnel are on staff at the registries.
>
> In addition, we made changes to the registry approval section that we believe strengthen the requirements for registries. Section 95986(c)(1)(E) was modified to change the amount of professional liability insurance that Offset Project Registries must maintain from fifty million to five million dollars. This change reflects stakeholder comments that the dollar amount was too high and that insurance was not offered at that level of coverage. Sections 95986(c)(2)(A)(1.) and (2.) were modified to specify what type of conflict-of-interest policies Offset Project Registries must have.

M-20. Comment: The addition of performance requirements and non-offset related consulting conducted by registries in section 95986 helps with transparency and conflict of interests. (SCAQMD5)

> **Response:** Thank you for your support.

M-21. Comment: Regarding the performance review of registries in section 95986(k)(5)(B), we appreciate CARB's inclusion of this vital provision. However, a single review every ten years is insufficient. There should also be ongoing oversight over their work and/or a review at least once every five years. (UCS8)

> **Response:** We believe that the registry performance review, combined with ARB's strict oversight of the registries, will provide sufficient assurance that the registries are performing according to the requirements in the regulation. To ensure that our regulatory requirements are being met by Offset Project Operators, we will provide rigorous oversight of our approved Offset Project Registries on an ongoing basis. Oversight functions are part of implementation and need not be specified in the regulation.

Registry Services

M-22. Comment: Under the Kyoto Protocol's offsets program, the Clean Development Mechanism, all data reports (Project Design Documents and Monitoring Reports) are made publicly available along with validation and verification reports. This has been an important source of information for the CDM governing bodies in overseeing the program and discovering reporting errors. The following recommendation enables stakeholders and other experts a chance to catch inaccuracies in the data reports, and provides CARB with another avenue for catching misstatements. Modify section 95987(b)(2) as follows:

> <u>(F) Offset Project Data Report for each year the Offset Project Data Report was verified. Confidential information shall be treated as per section 96021.</u> (UCS8)

> **Response:** We did not make this change. ARB will establish a minimum list of information for each project data report that will be made publically available for each project type as part of program implementation. This standardized approach will provide consistency across the program and ensure that confidential data are protected.

M-23. Comment: In section 95987(e), we are concerned that the verifiers will be informed beforehand which reports will compose the 10 percent of reports audited by the registry and which site visits will be accompanied by a registry representative. If the verifier knows ahead of time which reports and site visits will be audited, the audits only assess the ability of the verifier to do a proper job for those 10 percent of reports. If instead the verifier does not know which reports will be audited, they have an incentive to perform well on all verifications. CARB should specify that the verifier should not know all of the reports that will undergo increased scrutiny. (UCS8)

> **Response:** Every verification report will be subject to review before Registry Offset Credits can be issued. On the audits, ARB and Registry staff will inform the verification body of an audit once a Notice of Verification Services form is submitted. This form includes the names of the specific staff and times of activities that will be part of the audit. If a verification body chooses to make changes to staff or times after being notified of an audit, the verification body will have to discuss the need for changes. This process ensures that verification bodies do not adjust verification teams to represent only the staff perceived to be the most confident, but that audit process allows for ARB and Registries to audit verification staff randomly.

Monitoring, Reporting, and Record Retention Requirements

Record Retention Requirements for Offset Project Operators and Offset Verifiers

M-24. Comment: Section 95976 requires that documents shall be retained in paper, electronic, or other usable format for five years after the end of the crediting period. Clearly a sequestration project could be allowed to establish a final crediting period baseline plus all offsets credits registered and then enter a monitoring process that would not require maintenance of all the preceding decades of documents. Of course during the active crediting period, these records are necessary. (CFA3)

> **Response:** The record retention requirements in section 95976(e)(2) were changed to 15 years following the issuance of ARB offset credits, due to stakeholder concerns about an unnecessarily long record retention requirement for forestry projects. Verifiers are also required to retain related documents for 15 years. The record retention requirements must be extensive enough for verification of each Offset Project Data Report. This provision is necessary to ensure that ARB or an OPR will have enough data to confirm the crediting project has been operating in accordance with the appropriate ARB-approved protocol.

Verification

General Verification Process

M-25. Comment: Requiring too many actions to verify increases costs by increasing the verifiers workload and creating additional paper trails and lowers the flexibility, which is important for small-scale projects. Examples of this include

- The requirement that that offset verification team has a final discussion with the Offset Project Operator (95977.1(b)(3)(R)4(D));

- Understanding data management systems used by Project Operators (95977.1(b)(2)(b)). We believe that it is sufficient for data management systems to comply with the data collection and storage provisions of the Protocol without further requiring additional data.
- Requiring each offset verification to be reviewed by an independent reviewer who has had no involvement with the offset project. Many verification companies only have two or three accredited staff for a particular protocol. We believe it would be better for the ARB accreditation process to require verifiers to have an approved review process rather than require this in the regulations.
- 95977(b)(3)(D) requires verifiers to make a site visit every year. We agree that a verifier should visit a site as part of each verification. However, the wording of this regulation provides little flexibility as to when a site visit should take place. It is not clear whether it should be each calendar year, or within a year of the previous visit or some other period. We suggest that it would be more flexible if verifiers were required to undertake a site visit within two months of the end of the reporting period, allowing the project developer flexibility as to when to schedule a site-visit while still requiring a site visit to take place in order for offsets to be issued. (CIG3)

  Response: Regarding the commenter's first point, in our experience with inventory verification under the MRR, too often the verifiers failed to communicate their findings to their clients before submitting a verification statement to ARB. It is important for offset project developers to understand the findings from verification services from their verifiers.

  On the second point regarding understanding data management systems, the verification team will focus its attention on the systems that directly support data collection or processing for the project. These will be specified in the protocol. We don't believe a change is necessary based on this comment.

  Regarding the third point, we disagree with the comments regarding the requirements for independent review. The commenter's suggestion is contrary to the basic premise that an offset project be subject to an internal independent review to ensure the verification process and findings are appropriate for the offset project.

  On the fourth point, we changed the regulation to require that a site visit for non-sequestration projects must be conducted in the year that offset verification services occurs. For smaller projects that opt to conduct verification every two years, a site visit will only be required in the second year (the year in which full offset verification services are provided).

M-26. Comment: The complexity of verification and the associated costs are the principal barriers currently facing many credible small scale projects from entering the market. The current rules contain examples of verification prescriptions that translate into additional costs, but seem to have little benefit in terms of enhancing project credibility. Section 95977.1(b)(2)(b) requires verifiers to “understand data management systems.” This is a broad and subjective term that could lead to an excessive review, when a clear requirement such as review data management systems to verify adherence to protocol requirements is sufficient. Section 95977.1(b)(3)(R)(1) requires an independent reviewer within the verification body who is not involved in the project. This could further limit the availability of qualified verifiers and lengthen the process for projects to receive issued credits. There are verification firms who lack sufficient personnel to have an additional independent qualified reviewer to fulfill this role although this may change over time. Rather, the requirement could be limited to a lead verifier providing approval and attestation before submission to ARB. (TCT2)

> **Response:** We did not make a change to the requirements for independent review. The commenter’s suggestion is contrary to the basic premise that an offset project be subject to an internal independent review to ensure that the verification process and findings are appropriate for the offset project. Verification covers the systems that are used to collect and process data for the specific project. We do not believe the regulation text as written will lead to an excessive review.

M-27. Comment: CERP appreciates that ARB has added a small degree of flexibility to section 95977.1(b), which now requires each Offset Verification Statement to be independently reviewed within the body by an independent reviewer not involved in services for that offset project. However, this provision remains unreasonably restrictive. For example, if a project utilized one verification body on a project for the full six years otherwise permitted under the conflict of interest requirements, the verification body would have to have available six different individuals who have not worked on the particular project, yet have sufficient expertise with the project type to provide an independent review. This provision adds cost and complexity to offset verification without a corresponding increase in environmental protection. (CERP5)

> **Response:** We did not make this change. The commenter’s suggestion is contrary to the basic premise that an offset project be subject to an internal independent review to ensure that the verification process and findings are appropriate for the offset project.

Offset Verifier Conflict of Interest

M-28. Comment: At present, offsets developers directly hire verifiers to verify the reductions they claim to have made. There is an inherent conflict of interest in the relationship between the developer and the verifier. Under this arrangement, verifiers have incentives to charge less, do less, and be less strict in their assessments in order to be hired again by the same developer or other developers. As experience is gained, we should consider implementing a system which would ensure stronger government oversight over the program and would avoid the conflicts of interest in the current system. Modify section 95977 as follows:

(e) The Board shall periodically review and evaluate the relationships between verifiers and verification bodies and project developers and consider a system where the Board assigns verifiers or verification bodies for each project. (UCS8)

Response: We did not make this change. We believe our conflict-of-interest rules for offset verifiers are very strict and meet a high standard of rigor. We included language requiring offset verifiers and Offset Project Registries to undergo performance reviews. In addition, the regulation proposes a robust monitoring program for offset projects—both the verification that the offsets are real, additional, and enforceable, and that Offset Project Operators, verifiers, and Offset Project Registries are operating according to regulatory requirements. Offset Project Registries are required to conduct oversight of their registry program and randomly audit verifications to ensure that our regulatory requirements are being met by Offset Project Operators and verification bodies. We will provide rigorous oversight of our approved Offset Project Registries. In addition, we designed our regulatory offset verification program to provide a transparent process by which we can review verification documents and fully understand any findings uncovered during the course of verification of an offset project by an ARB accredited verification body. We will also develop an audit and oversight program for offset project verifications. All oversight functions are part of implementation and need not be specified in the regulation.

M-29. Comment: Without strong program oversight and penalties, offset project data reports could easily over-estimate reductions from offsets projects. Offsets are particularly vulnerable to such over-estimation because of conflicts of interest inherent in the relationships between the offsets developers and the verifiers, compounded by the large physical distance between CARB and many of the offsets projects they will oversee around the country and the continent. At present, offsets developers directly hire verifiers to verify the reductions they claim to have made. We put forward the following suggested additions to the verifier and registry oversight provisions in the draft regulation that we believe are important for further strengthening the oversight elements of the regulation.

- All Offset Project Data Reports should be made publicly available. This enables stakeholders and other experts a chance to catch inaccuracies in the data reports, providing CARB with another avenue for catching misstatements. Under the Kyoto Protocol's offsets program, the Clean Development Mechanism, all data reports (project design documents and monitoring reports) are made publicly available along with validation and verification reports. This has been an important source of information for the CDM governing bodies in overseeing the program and discovering reporting problems.
- Regarding the added performance review of registries, we believe that a single review every ten years is insufficient. There should be ongoing oversight over the work of participating registries and a review at least every five years.
- We recommend that CARB periodically review and evaluate the relationships between verifiers and verification bodies and project developers and consider a

system where the Executive Officer assigns verifiers or verification bodies for each project. (UCS9)

Response: We did not change the requirements for posting Offset Project Data Reports. ARB will establish a minimum list of information for each project data report that will be made publically available for each project type as part of program implementation. This standardized approach will provide consistency across the program and ensure that confidential data are protected.

We believe that the registry performance review, combined with ARB's strict oversight of the registries, will provide sufficient assurance that the registries are performing according to the requirements in the regulation. To ensure that our regulatory requirements are being met by Offset Project Operators, we will provide rigorous oversight of our approved Offset Project Registries on an ongoing basis. All oversight functions are part of implementation and need not be specified in the regulation.

We also did not make changes regarding conflict of interest. We believe our conflict-of-interest rules for offset verifiers are very strict and meet a high standard of rigor. We included language requiring offset verifiers and Offset Project Registries to undergo performance reviews. In addition, the regulation proposes a robust monitoring program for offset projects—both the verification that the offsets are real, additional, and enforceable, and that Offset Project Operators, verifiers, and Offset Project Registries are operating according to regulatory requirements. Offset Project Registries are required to conduct oversight of their registry program and randomly audit verifications to ensure that our regulatory requirements are being met by Offset Project Operators and verification bodies. We will provide rigorous oversight of our approved Offset Project Registries. In addition, we designed our regulatory offset verification program to provide a transparent process by which we can review verification documents and fully understand any findings uncovered during the course of verification of an offset project by an ARB-accredited verification body. We will also develop an audit and oversight program for offset project verifications. All oversight functions are part of implementation and need not be specified in the regulation.

Issuance of ARB Offset Credits and Registry Offset Credits

Timing for Issuance

M-30. Comment: To provide greater flexibility, we urge ARB to require registries to issue offsets 15 days after payment has been made. (CIG3)

Response: We did not make this change. We did make changes to the timing for issuance of ARB offset credits in sections 95981 and 95981.1, to shorten the timing for issuance.

Crediting Periods for Compliance Offset Projects

M-31. Comment: The Compliance Offset Protocol for U.S. Forest Projects states in section 3.3 that the crediting period for forest projects is twenty-five years. However, section 95972(b) states that the crediting period for a sequestration offset project shall be no less than 10 years and no more than 30 years. Presumably sequestration offset projects include forest offset projects. At a minimum, the discrepancy in the language is confusing. We recommend that the language in the cap and trade rules replace the language in the Forest Protocol as a thirty year timeframe would provide the greater timeframe necessary to allow meaningful changes in carbon stocks (i.e., forest growth and carbon sequestration) to occur. (NC9)

> **Response:** The regulation specifies a range for sequestration projects, including forestry projects, of 10 to 30 years. The individual protocols for sequestration project types must set a crediting period within this range that is appropriate for that project type. Given this, we do not agree that the crediting period for forest carbon projects should be extended. The intent of a 25-year crediting period is not to limit sequestration of carbon and offset issuance from forest projects. In fact, renewal periods allow for forest projects to sequester carbon and obtain offset credits beyond the 25-year crediting period. A crediting period of 25 years allows for the updating of protocols, if necessary, ensuring that projects use the more up-to-date factors (e.g., leakage, buffer account) and scientific standards.

Invalidation and Forest Reversals

Invalidation Provisions

M-32. Comment: UCS supports the buyer liability language in section 95985(h). (UCS8)

> **Response:** Thank you for your support.

M-33. (multiple comments)
Comment: The ability to mitigate invalidation risk to three years by undertaking second verification is an important option for project operators and developers. However, this option is currently only available to projects verified against ARB's Compliance Protocols. Projects verified under Early Action Offset programs are excluded. This exclusion will cause early action projects to trade at a discount, pointlessly reducing the supply of offsets to the compliance program. We recommend Early Action Offset Program protocols, in particular the CAR Forest Project Protocol, be added to this section. (BLUESOURCE3)

Comment: Section 95985(b)(1)(B) limits the option for three year invalidation to projects registered under the Compliance Protocols. This excludes offsets from projects which have already registered with an Early Action Offset Program from the possibility of reducing their invalidation exposure to 3 years regardless of the number of times they have been verified. We recommend that ARB include protocols from Early Action Offset Programs in this section. (FINITE2)

Comment: Section 95990(l)(1), Invalidation of Early Action Offset Credits, references the full rules for invalidation of ARB offsets credits in section 95985(a) through (h) plus (j), so that Early Action offset credits are subject to the same requirements. Within those requirements, section 95985(b)(1)(B) enables offset project operators/designees to reduce the time period during which offset credits may be invalidated by using a different verifier for later monitoring periods, and meeting other requirements. However, this provision is specifically restricted to projects verified using the ARB Compliance Offset Protocols. This restriction would seem to exclude Early Action offset project operators from the opportunity to eliminate invalidation risk until eight years after issuance. Especially in light of the fact that all Early Action offset credits must undergo two verifications prior to issuance, this exclusion is unwarranted and we hope it was an oversight. (TPI6)

> **Response:** It is our intent that early action offset projects of the corresponding project type as a Compliance Offset Protocol also have the same option for statute of limitations as those developed directly under Compliance Offset Protocols. Once the early action offset credits are issued, they are considered the same as credits issued under the Compliance Offset Protocols.

M-34. (multiple comments)
Comment: Moreover, the regulation as written would require a one-year delay in undertaking this second verification, a period in which the project's credits would trade at a discount, again pointlessly reducing the supply of offsets to the compliance program. We recommend ARB allow second verification to immediately follow first verification prior to initial registration. (BLUESOURCE3)

Comment: Section 95985(b)(1)(B) allows forestry projects to be subject to invalidation for a maximum period of three years if a subsequent project data report is verified by a different verifier within three years of the first. This would require a one-year period between the time of project registration and when a project owner could reduce its invalidation exposure to three years. Since a shorter invalidation period will be more valuable in the market and the risk can be managed more easily, it would be beneficial to forest owners to eliminate the one-year wait. This is possible for ODS offsets per section 95985(b)(1)(A) if they re-verify the project with a different verifier, likely because an ODS project does not require subsequent verifications. However, forestry projects, unlike Ag methane projects, do not require a subsequent site verification for another six years and are eligible for less-intensive verification in the interim years which should afford them the same treatment as ODS projects. We recommend that in addition to the current language, forestry offset projects should be able to utilize the same re-verification process as ODS projects which would allow a forestry project to issue offsets with a three-year invalidation period at the time of registration. (FINITE2)

Comment: Statute of Limitations on Offset Invalidation (Section 95985(b))
Again, we appreciate ARB's decision to provide the option to reduce the statute of limitations for offset invalidation from five to three years if the project is verified by a different verifier within three years, versus the requisite six years. We reiterate the regulation should also include two additional options:

a. Eliminate the Statute of Limitations if the Offset Project Operator or Early Action offset holder elects to use two different verifiers at the time of verification for Compliance projects or regulatory re-verification (i.e. desk review) for Early Action offsets; and

b. Allow the Statute of Limitations to be reduced to one year if a project voluntarily uses a different verifier after one year.

These options allow more flexibility and would continue, as stated in the regulation, to, "encourage a quicker verifier rotation so that any issues that may occur may be uncovered sooner, further enhancing the integrity of the offset program." (CE2CC2)

Response: Offset projects developed under Compliance Offset Protocol Ozone Depleting Substances can undertake an immediate second verification by another verification body; however, the ARB offset credits may still be subject to invalidation for three years. We determined that three years is appropriate because that is sufficient time for any new information regarding an Offset Project Data Report for that project type to be discovered.

For offset projects developed under the other three Compliance Offset Protocols, we included provisions to allow offset projects developed under the other three Compliance Offset Protocols to also qualify for a three year statute of limitation if a different verification body verifies a subsequent Offset Project Data Report from that offset project within three years. This provision provides some flexibility to Offset Project Operators to switch verification bodies before the six year verification body rotation requirement is reached so that the project can be reviewed by a different verifier which could bring to light any irregularities in the offset project data or confirm the validity of the offset project implementation and subsequent issued ARB offset credits.

We included different statute of limitation requirements for the various project types based on the size and volume of credits that may be issued and the cost of conducting a second verification in the same Offset Project Data Report. Double verification on each Offset Project Data Report could be cost prohibitive for some smaller project types.

M-35. Comment: The proposed revised language in section 95985(b) on timing of invalidation of ARB Offset Credits from ODS projects could be interpreted in different ways:

- Credits from ODS projects may be invalidated within 3 years of credit issuance;

- Credits from ODS projects may be invalidated within 3 years of credit issuance but only if those projects are "re-verified" within those 3 years—otherwise the credits may be invalidated up to eight years after credit issuance;
- Early action credits from ODS projects conducted before 2014 that are re-verified may be invalidated within three years of credit issuance—credits from ODS projects that are not re-verified that are completed after 2014 cannot be invalidated.

Because we do not know the intent of the revision, we are not proposing alternative language but we do recommend that the language be clarified. (EOSC4)

> **Response:** The interpretation in the second bullet is correct. The credits may be invalidated within three years as long as the Offset Project Data Report in question has been re-verified by another verification body within three years of credit issuance. If this does not occur, it can be invalidated for up to eight years.

M-36. Comment: Section 95985(b) was amended to provide for a shorter, three-year invalidation period for offsets that are approved under an ARB-approved offset protocol. There is still an eight year invalidation period for other offset types, such as those approved under The Climate Registry. The regulation does not provide a clear rationale for this differing treatment. To avoid unintended impacts and potential favoritism for certain offset programs, PacifiCorp encourages ARB to apply the same invalidation period to all types of offsets. (PACIFICOR4)

> **Response:** The commenter's interpretation of the regulation is incorrect. All projects have the option to reduce the statute of limitation to three years. Section 95985(b)(1)(B) specifies that offset projects developed under the listed protocols may have a statute of limitations of three years if a different verification body verifies a subsequent Offset Project Data Report from that offset project within three years. This provision provides some flexibility to Offset Project Operators to switch verification bodies before the six-year verification body rotation requirement is reached, so that the project can be reviewed by a different verifier, which could bring to light any irregularities in the offset project data or confirm the validity of the offset project implementation and subsequent ARB-issued offset credits. It is our intent that early action offset projects of the corresponding project type as a Compliance Offset Protocol also have the same option for statute of limitations as those developed directly under Compliance Offset Protocols. We will continue to evaluate how to make these provisions more clear as part of a future rulemaking.

M-37. (multiple comments)
Comment: It is not made explicit or clear that the liability for replacement of invalidated forest offset credits in retirement accounts is limited to the Offset Project Operator, not other Forest Owners. This limitation seems to be the purpose of references to "Forest Owner identified in Section 95985(e)(2)" but this is not clear or consistently applied across these sections. Moreover, in many cases it is possible that offset credits will be

transferred into Retirement Accounts from entities other than the Offset Project Operator or any other Forest Owner. We recommend these sections be clarified by replacing “Forest Owner” and “forest owner” with “Offset Project Operator.” (BLUESOURCE3)

Comment: The definition of forest owner has been amended between the July 25th and September 12th drafts to reflect concerns that several entities with interests in a property may be held responsible for reversals. ARB therefore now only allows one “Forest Owner” to be designated as the Offset Project Operator. While this change goes a long way to address prior concerns, a further change is needed. While only one owner can be the Offset Project Operator and only the Offset Project Operator is required to sign the attestation, the “forest owner” is responsible for replacement. Section 95983(c)(3) requires the forest owner to replace in the event of an intentional reversal. Section 95985 Page 290 (i)(1)(D) states that in the event of invalidation the “Forest Owner(s)” is responsible for replacing the invalidated offset in a retirement account. We recommend the term “forest owner” and “Forest Owner(s)” in sections 95983(c)(3), 95985(e)(2), and 95985(i)(1)(D) be clarified so that the Offset Project Operator is responsible for the replacement of intentionally reversed and invalidated offsets. (FINITE2)

Comment: Sections 95985(i)(1)(A), (B), and (C) contain a misplaced reference, which should read “The Forest Owner identified in section 95985(e)~~(2)~~(3) . . .” as section 95985(e)(2) refers to “The entity for which ARB transferred any ARB offset credits from the applicable Offset Project Data Report into the Retirement Account” and Section 95985(e)(3) refers to “. . . for forest offset projects the Forest Owner(s)”. In addition, as noted above in comment #1, we would recommend that these section read “The Offset Project Operator ~~Forest Owner~~ identified in section 959859(e)~~(2)~~(3) . . .” (NEWFOREST3)

> **Response:** Thank you for your comment. We agree that it is confusing and made non-substantive changes to the references in section 95985(i)(1) to clarify that it is always the Forest Owner.

M-38. Comment: Section 95985(g) allows ARB to remove invalidated offsets from any account prior to retirement of the offsets. However, once retired, according to section 95985(i) forest owners are required to replace offsets that are invalidated once they are retired. While it is in the interest of forest owners to reduce liability, in this particular situation it is beneficial to require that landowners also be responsible for replacement of invalidated offsets removed from holding accounts. For each offset sold, a forest owner must assume that the offset will be retired and he will therefore be liable for replacement in the event of invalidation. This extra liability will result in a premium price for forestry offsets. However, due to the fact that any offset sold will be subject to invalidation risk where the offset could disappear at any time prior to retirement, forestry offsets will still face a discount. Therefore, the forest owner must be prepared to take on the invalidation risk of every offset sold, but will not be able to realize the full value of that offset because of the interim risk for the buyer prior to retirement. We recommend that ARB amend this section so that forest owners are liable for the replacement of invalidated offsets removed from holding accounts other than the forest owner's holding account. (FINITE2)

> **Response:** We did not make this change. If the offsets have not been retired, they do not need to be replaced to ARB, they just need to be removed from the system. Holders of the ARB offset credits can seek replacement from Forest Owners through third-party contracts outside of ARB.

M-39. (multiple comments)
Comment: We appreciate that the language in section 95985(c)(1) spells out in more detail how reporting errors are determined. We however repeat the request from our letter dated August 11th that a buffer pool mechanism be established to cover credits for this category to mirror unintentional reversals of forest projects where reporting errors are found to be caused by unintentional errors in calculations. (PFT4)

Comment: A significant cost and leakage driver in the offsets requirements is CARB's ability to decertify an offset after it has been purchased (and even surrendered) and impose liability for this decertification on the offset purchaser. Given the stringency of offset approval, it is questionable why CARB would even propose to decertify offsets that had already qualified under the most rigorous rules. It arbitrarily increases costs and leakage to then punish an offset purchaser by imposing liability for the decertification on the purchaser. This will have the direct effect of pulling allowances out of the market as a hedge against decertified offsets, raising allowance prices and compliance costs and leakage for all capped entities. (AB32IG3)

Comment: While there has been improvement in the language related to the invalidation of offsets, the current process for invalidation still creates large, uninsurable risks for project developers which, in turn, restricts the already limited offset market. The issue of buyer liability is critical to BCSE members seeking to comply under the cap and trade program, as well as those involved as offset verifiers and registries. The BCSE encourages ARB to consider alternatives presented by BCSE members on specific issues related to buyer liability and offset invalidation. (BCFSE2)

Comment: We oppose buyer liability in the event of offset invalidation. Imposition of liability upon the buyer creates uncertainty that could raise transaction costs and suppress the market. While CalChamber recognizes some positive changes were made in the Second-15 Day Rulemaking Package, these changes are not significant enough to relieve our concern that the buyer liability provision will prevent the creation of an adequate offsets market. (CALCHAMBER4)

Comment: The "buyer liability" approach to offset credit invalidation remains unworkable if the goal is to create a robust cap-and-trade program. CERP and others have come forward with an alternative recommendation—a Compliance Buffer Account—that would that provide the same or greater environmental integrity and impose a smaller administrative burden on ARB than a system in which it must chase down every holder and user of credits from a project. (CERP5)

Comment: CERP also commends ARB for adding section 95985(d) to the invalidation section of the regulations. This new addition addresses one of the primary administrative hazards of a buyer liability approach: it will keep offset credits that are under investigation from trading in the market. The provision is very welcome. However, we still remain concerned that a buyer liability regime will lead to scenarios in which even a rumor of ARB activity results in problems in the marketplace and waves of commercial disputes. (CERP5)

Comment: As we stated clearly in prior comments, market certainty and stability are essential elements to the success of the new Cap and Trade program. We continue to believe that the risk that an offset can be invalidated eight years after its certification will undermine market stability and increase program costs. Furthermore, placing that risk of invalidation on the purchaser will lead to unnecessary but substantial increased costs. The State of California must stand behind its offset validation system and, absent fraud or intentional misrepresentation, stand behind a certified offset. This approach will provide the security essential for a strong and cost-effective Cap and Trade program. (WM4)

Comment: IETA, together with other major industry associations, submitted to ARB a white paper in early May 2011 outlining a broad consensus view regarding the market constraints imposed by these provisions, and proposed a workable solution using a “compliance buffer account” funded by offsets withheld at issuance. The primary concerns of this group, which represents the majority of market participants by both volume and consumer base, relating to the invalidation approach can be found in IETA’s August 11 letter submitted in response to the first 15-Day rulemaking package. In addition, the outline of the group’s “Compliance Buffer Account” proposal can be found as Appendix 1 to that letter. We acknowledge and greatly appreciate the attention ARB has devoted to reviewing our efforts and analyzing different scenarios. We realize that ARB staff and officers have integrated significant portions of our collective members’ input into their latest rulemaking language, and that they have genuinely worked to offer improved regulation in this area. With those observations as prologue, IETA offers generally positive reactions and has suggested modifications to the conditions and process for the invalidation of offsets. While we believe we understand the motivations for the implementation of such a rule, IETA respectfully requests the Board give ARB officers and staff the opportunity to explore new consensus during the upcoming implementation phases, and to consider repealing the invalidation rule in section 95985, so that the use of offsets can achieve its highest potential to contain costs for California’s consumers and ratepayers. (IETA4)

Comment: CCEEB is concerned that the risks associated with invalidation of approved offset credits will inhibit the development of the offset market. We appreciate the changes that ARB has made in establishing a criteria and limitations to the invalidation process. However, more work must be done. CCEEB supports the IETA proposal and recommends that ARB should expand the Forest Buffer Account concept to create a compliance buffer account for all offset credits. (CCEEB4)

Comment: In addition, the issue of offset supply becomes even more critical as we rely on it to address impacts to companies from the stringent benchmarks and changes in industry assistance. Therefore, we are even more concerned that offset liability will cause offset supply to be unduly reduced and that any offsets generated will be more costly due to the increased transaction costs from the liability requirements. We believe that taking allowances from the price reserve to replace invalidated offsets is the most cost-effective mechanism to address offset liability. This spreads the minimal cost of replacement among the entire market, which is the most cost-effective liability solution. Without changes to address these issues, large covered entities that invested heavily in the state and created jobs for Californians will be unfairly disadvantaged. (CHEVRON4)

> **Response:** We do not agree that we should eliminate buyer liability associated with the invalidation of ARB offset credits. Requiring the user to replace the invalidated offsets ensures that purchasers and users of offset credits do their due diligence in seeking out high-quality offset credits. We have clear enforcement authority over covered entities that will be using ARB offsets for compliance. If the covered entity replaces any invalidated offset credits, they may then take appropriate action through third-party contractual arrangements they may have established prior to purchase. These arrangements currently exist in the voluntary offset market, and we expect that as the offset market becomes more established, that additional mechanisms to deal with the risk of invalidation will also be established. In the event that the offset credit has not yet been used or retired, it will be canceled in the market tracking system and removed from any Holding or Compliance Accounts. These provisions in no way diminish our authority to assess penalties under section 96014 on any offset project developer or verifier that has provided false information to ARB.

M-40. Comment: We have strong concerns about ARB's "buyer liability" approach to addressing situations in which problems are identified with offset credits at some point after issuance. We believe the risk of such post-issuance problems is small because of the rigor of the ARB offset regulations. However, any policy under which already-issued offset credits carry a risk of invalidation will prevent the development of a market in offsets. In an offsets program, covered entities should be able to rely on the work of verifiers—and on ARB itself as credit issuer. For this reason, making covered entity buyers liable for problems not detected through the regulatory system will impose substantial new costs on buyers without materially reducing the risk that such problems will occur. We continue to believe that the risk that an offset can be invalidated eight years after its certification will undermine market stability and increase program costs. In our view, the State of California must stand behind its offset validation system and, absent fraud or intentional misrepresentation, stand behind a certified offset. This approach will provide the security essential for a strong and cost-effective Cap and Trade program. (RSI)

Response: We do not agree that we should eliminate buyer liability associated with the invalidation of ARB offset credits. Requiring the user to replace the invalidated offsets ensures that purchasers and users of offset credits do their due diligence in seeking out high-quality offset credits. We have clear enforcement authority over covered entities that will be using ARB offsets for compliance. If the covered entity replaces any invalidated offset credits, they may then take appropriate action through third-party contractual arrangements they may have established prior to purchase. These arrangements currently exist in the voluntary offset market, and we expect that as the offset market becomes more established, that additional mechanisms to deal with the risk of invalidation will also be established. In the event that the offset credit has not yet been used or retired, it will be canceled in the market tracking system and removed from any Holding or Compliance Accounts. These provisions in no way diminish our authority to assess penalties under section 96014 on any offset project developer or verifier that has provided false information to ARB.

We do not agree that an offset credit should remain viable under all conditions. To ensure the enforceability of compliance offsets, we need to have the ability to investigate and take action for violations or noncompliance with the regulation. In the event of fraud or malfeasance on the part of project developers or verifiers, there may be cause to invalidate offset credits after they have been issued, to protect the environmental integrity of the program.

M-41. Comment: Section 95985 states that users of credits which at the time of their acquisition were determined to be eligible for use that later turn out to be invalid are required to replace bad credits or suffer sanctions. Making the buyer liable for offset maintenance is problematic because buyers suffer sanctions and/or must replace credits that, though approved by the CARB, later turn out to be invalid; offset transaction and due diligence costs will be higher; programmatic compliance costs will be higher; offsets, when compared to allowances, will become second class compliance instruments; sources on the margin will be more inclined to contribute to leakage by expanding their operations and/or export jobs outside the jurisdiction of AB 32; ignored will be important lessons gained through successful implementation of seller liability provisions in CA, US, and EU programs; and as compared to a seller liability program, the environment will not gain enhanced protection and CARB will have fewer tools to guarantee environmental protection. An approach that relies purely upon the use of high quality credit verifiers (even with multiple reviews) will not work because verifiers are not officers of the government and do not have the ability to stand in CARB's shoes when it comes to determining if the credit creating activity meets the requirements of the rules as may be subsequently determined by the CARB; cannot (and are not paid to) monitor a project after the credits are claimed and/or transferred; will find it very challenging to secure professional liability insurance; will be unable to charge a fee that adequately compensates them for the cost of doing initial and ongoing assessments, paying for liability insurance, and setting aside cash reserves in the event that any credits which have been reviewed by the verifier are subsequently determined to be bad, and will only validate only the project data that is provided them. It will be difficult to write conveyance contracts in a fashion to remove buyer risk because credits may change hands many times, each time with a different buyer and seller. Nor should CARB conclude that the problem of offset reversals can be adequately managed through the use of insurance or financial derivative products because such products may initially reduce the risk of purchasing offsets, but the instruments will, if priced considering consequential damages, sell at prices that dramatically increase transaction costs; given the plethora and magnitude of such risks, a dispassionate observer should be concerned that the insurance provider does not have the ability to understand, much less mitigate the potential financial consequences of offset reversals. BGC Environmental Brokerage Services, L.P. recommends that CARB amend the language in a way that will simultaneously protect the environment, its “currency” (i.e., the offsets), and the buyer by

- Allowing a source to secure CARB/air district review and approval of credits. Specifically, as with offsets useable for new source review, the company creating the reduction must apply to the regulator (i.e., CARB or the anointed Air District) for recognition of such reductions. Upon receipt of an application CARB should approve those credits that satisfy AB 32 criteria and protocols; or deny those that do not, and conditionally approve those credits which may be subject to revocation. Two different kinds of credits will emerge from this process—those with CARB approval (which cannot be invalidated or withdrawn—and which will sell at a premium); and those that lack CARB approval (which the buyer will be aware are at risk of revocation—and which the market will discount).
- Issuing CARB/air district permits to offset-creating sources. Such permits would be issued to sources under CARB control, would mandate the maintenance of the reductions, and sanctions for non-compliance that would have the dual effect of, in the event that the credits are not maintained, protecting the environment and penalizing (and gain recompense from) the offset creator.
- Creating an CARB-administered insurance pool that is either privately funded with credits or through a CARB administered shave that is applied to each credit issued and/or traded. (BGCEBS)

  Response: We do not agree that we should eliminate buyer liability associated with the invalidation of ARB offset credits. Requiring the user to replace the invalidated offsets ensures that purchasers and users of offset credits do their due diligence in seeking out high-quality offset credits. We have clear enforcement authority over covered entities that will be using ARB offsets for compliance. If the covered entity replaces any invalidated offset credits, they may then take appropriate action through third-party contractual arrangements they may have established prior to purchase. These arrangements currently exist in the voluntary offset market, and we expect that as the offset market becomes more established, that additional mechanisms to deal with the risk of invalidation will also be established. In the event that the offset credit has not yet been used or retired, it will be canceled in the market tracking system and removed from any Holding or Compliance Accounts. These provisions in no way diminish ARB's authority to assess penalties under section 96014 on any offset project developer or verifier that has provided false information to ARB.

With regard to the comments related to the development of insurance, we believe that given all of the clarifications to section 95985 the market should be able to quantify and cover the risk associated with invalidation. We expect that insurance products will emerge once the market has been established.

The cap-and-trade program is designed with a clear system for issuance of compliance instruments, under the jurisdiction of ARB to ensure enforceability and oversight of the system. The suggested changes to include air districts would add complexity to the program without further increasing the environmental integrity of the system.

M-42. Comment: In Section 95985 of the proposed rule, ARB continues to make significant modifications and clarifications to the mechanism for the invalidation of offset credits. While Evolution Markets appreciates these changes, we continue to believe the process for invalidating offset credits and resting the liability for replacing the credits solely with the buyer introduces an unacceptable element of uncertainty to the offset market. The result could be a reluctance of market participants to invest in offset projects and a difficulty in creating necessary liquidity in secondary offset markets, which makes low-cost offsets available to all compliance entities. In the interest of constructive engagement on this important issue for the emerging California carbon market, Evolution Markets offers the following feedback on the rule changes recently proposed by ARB:

1.) Reduction in Statute of Limitation: ARB has proposed reducing the statute of limitations from five years to three years for ozone depleting substance (ODS) projects and from eight years to three years for livestock and forestry projects should these projects undergo a second verification within three years of credit issuance. This is a significant improvement, and Evolution Markets believes the emphasis on benefits of double verification is appropriate.

    However, Evolution Markets suggests ARB eliminate the statute of limitation altogether once projects have completed a satisfactory second verification. Presumably, the second verification will be the mechanism for the discovery of any discrepancies that could cause an invalidation. Should the second verification validate the first, ARB should then eliminate that project from the risk of invalidation. The certainty such a change would provide is sure to encourage investment in not only a second verification, which improves the integrity of the offsets program, but also offer sufficient incentive to stimulate investment in offset projects.

2.) Tightened Criteria for Invalidation: ARB has modified its proposal to permit invalidation only if the overstatement of reductions is more than 5% of the total issuance, the project activity was not in accordance with federal, state, or local environmental regulations, or the credits had already been used under another voluntary or mandatory program.

ARB also now has the ability to invalidate only the amount of credits actually overstated, and these invalidations will be imposed on all holders of credits from the project in question on a *pro rata* basis. Evolution Markets supports both of these changes and believes they will assist in encouraging investments in offset projects.

3.) Extended Replacement Time for Invalidated Offsets: Evolution Markets also supports ARB's suggested rule change to allow entities that have used invalidated offsets for compliance to take up to six months to replace these credits. Although Evolution Markets anticipates the actual amount of invalidated offsets to be small, providing this flexibility to compliance entities will protect against market disruptions that could have an adverse impact on credit prices and raise the overall costs of compliance. (EVMKTS3)

Response: We do not agree that we should eliminate buyer liability associated with the invalidation of ARB offset credits. Requiring the user to replace the invalidated offsets ensures that purchasers and users of offset credits do their due diligence in seeking out high-quality offset credits. We have clear enforcement authority over covered entities that will be using ARB offsets for compliance. If the covered entity replaces any invalidated offset credits, they may then take appropriate action through third-party contractual arrangements they may have established prior to purchase. These arrangements currently exist in the voluntary offset market, and we expect that as the offset market becomes more established, that additional mechanisms to deal with the risk of invalidation will also be established. In the event that the offset credit has not yet been used or retired, it will be canceled in the market tracking system and removed from any Holding or Compliance Accounts. These provisions in no way diminish ARB's authority to assess penalties under section 96014 on any offset project developer or verifier that has provided false information to ARB.

We do not agree that ARB offset credits should no longer be invalidated in the event that a second verification is performed on the Offset Project Data Report. The minimum statute of limitations is three years if the Offset Project Data Report or a subsequent Offset Project Data Report, depending on project type, is verified by a different verifier within that time frame. If the offset project does not qualify under these requirements the default statute of limitations is eight years. We do not believe that any time period less than three years would provide sufficient time to detect all relevant new information or uncover any mistakes that verifiers may have missed or may have been unintentionally omitted.

Thank you for your support under items 2 and 3.

M-43. Comment: Regarding the first instance of an invalidation determination (section 95985(c)(1), many market participants believe that it ought to be the responsibility of the project owner or other relevant entity that committed the error (not automatically the buyer as the first instance), to reimburse lost credits due to invalidation. This does not eliminate the ultimate liability of the buyer, and does not change any duties of the regulator. But instead it establishes a clearer chain of claims when appropriate, and puts even more incentive on project owners and investors to initiate and execute projects of the highest environmental integrity in the first place. (IETA4)

> **Response:** We do not agree that the responsible party of an invalidated ARB offset credit should be the offset developer. We have clear enforcement authority over covered entities that will be using ARB offsets for compliance. If the covered entity replaces any invalidated offset credits, they may then take appropriate action through third-party contractual arrangements they may have established prior to purchase. These arrangements currently exist in the voluntary offset market, and we expect that as the offset market becomes more established, that additional mechanisms to deal with the risk of invalidation will also be established. In the event that the offset credit has not yet been used or retired, it will be canceled in the market tracking system and removed from any Holding or Compliance Accounts. Requiring the user to replace the invalidated offsets ensures that purchasers and users of offset credits do their due diligence in seeking out high-quality offset credits.

M-44. (multiple comments)
Comment: The language contained in section 95985(c)(2) is overly broad and could lead to invalidation of large numbers of offset credits for issues that are either immaterial to the offsets themselves, and/or are minor technical violations that are in the process of being remedied and for which no actual enforcement action has been taken by the relevant agency. Further, these violations could be beyond the control of a Forest Owner in situations where a court may have issued a change in interpretation of the law, but no administrative remedies for compliance are yet available. At the very least, a violation should be material, and should be the subject of a final notice of non-compliance after the violation has been through its relevant adjudication process with the jurisdiction of authority over the relevant statute and regulations. Modify section 95985(c)(2) as follows:

> The offset project activity and implementation of the offset project was found by a court or administrative body of competent jurisdiction to be not in material accordance with all local, state, or national environmental and health and safety statutes and regulations, as interpreted by a court of competent jurisdiction from which an appeal cannot be taken, during the Reporting Period for which the ARB offset credit was issued. (PFT4)

Comment: Consider amending section 95985(c)(2) to acknowledge legal ambiguity and de minimis and inadvertent non-compliance with applicable laws and regulations.

Section 95985(c)(2) states that ARB “may determine that an ARB offset credit is invalid for the following reasons . . . The offset project activity and implementation of the offset project was not in accordance with all local, state, or national environmental and health and safety regulations during the Reporting Period for which the ARB offset credit was issued”. In the event of an invalidation for this reason, under the current draft the Forest Owner must replace all credits that were issued to an invalidated offset project data report and that had been retired after issuance. As drafted, this provision does not account for common situations of legal ambiguity, inadvertent or de minimis non-compliance with applicable laws and regulations, and patterns of enforcement by agencies with enforcement discretion over applicable laws and regulations. We would recommend changes to section 95985(c)(2) that would give ARB clearer discretion to avoid credit invalidation in situations of legal ambiguity, de minimis violations or pending actions by enforcement agencies.

For example, it is a common occurrence for appellate courts in the United States to interpret federal environmental laws and regulations in different ways. It can take years before these regional discrepancies are resolved by the Supreme Court, and in the meantime it may be impossible for forest owners to comply with a given court’s interpretation of an environmental law because the regulating agency has not yet created a permitting avenue for such compliance. In such cases a forest owner is technically in violation of a national environmental regulation but has no way to comply, and the law may change again in a year or two. ARB should have clear discretion to avoid credit invalidation in such instances where legal non-compliance is beyond the control of the landowner.

Similarly, many environmental regulations are complex and compliance is complicated. The California Forest Practice Rules, for example, contain detailed provisions related to logging roads and stream crossings. Regional Water Quality Control Boards may interpret applicable law differently and require different capital improvements of logging roads from Forest Owners. In most instances, if a forest owner is found by a regulating agency to not be in complete compliance with a regulation despite good faith efforts at adherence, the forest owner is given time by the regulating agency to comply with the regulation. ARB should not be in the business of second-guessing regulating agencies and imposing penalties for temporary non-compliance, and ARB should have clear discretion to avoid credit invalidation in situations of de minimis non-compliance.

While the permissive “may” language in section 95985(c)(2) does make clear that ARB has enforcement discretion over credit invalidation, we would recommend the changes to section 95985(c)(2) below. These changes would: (1) protect ARB from being forced to adjudicate legal non-compliance in areas that are regulated by a different agency; (2) protect ARB from being forced to invalidate credits for immaterial non-compliance; and (3) protect ARB from being forced to invalidate credits when a judicial interpretation of an applicable statute or regulation is not yet settled. Modify section 95985(c)(2) as follows:

(2) The offset project activity and implementation of the offset project was found by a court or regulatory body of competent jurisdiction to be not in material accordance with all local, state, or national environmental and health and safety statutes and regulations, as interpreted by a court of competent jurisdiction from which an appeal cannot be taken, during the Reporting Period for which the ARB offset credit was issued. (NEWFOREST3)

Comment: We recommend modifying section 95985(c)(2) to add a materiality element, i.e., by limiting the scope of the provision to situations in which a project is "not in material accordance" with regulations. (CERP5)

Comment: The language in section 95985(c)(2) regarding invalidation due to the project activity or its implementation not being "in accordance with all local, state or national environmental and health and safety regulations…" should have additional specificity. To provide additional certainty to this provision and those relying on it, we recommend that CARB provide additional guidance regarding how such a determination would be made. For example, such determinations could be based on agency enforcement actions or court decisions. (NC9)

Comment: CERP members have developed deep concerns about the breadth of the language included in section 95985(c)(2), under which invalidation can occur if the project activity "was not in accordance with all local, state, or national environmental and health and safety regulations" during the relevant Reporting Period. As a practical matter, project activities may temporarily fall out of compliance with any number of unrelated legal requirements in a manner that has no material effect on the extent to which the project generates real emission reductions or removals. The requirement under (c)(2), therefore, could result in "gotcha" scenarios that undermine the offsets program. (CERP5)

Comment: Section 95985(c)(2) invalidates offsets if the project activity "was not in accordance with all local, state, or national environmental and health and safety regulations...." This is very broad and vague. There should be some nexus between the failure to accord and the goals and objectives of the Rules. Given the thousands of health and safety regulations, there may be technical violations that have no material effect on health and safety, much less ARB's air quality objectives. In addition, there should be some definition of what constitutes a "determination" that results in an invalidation. Will ARB or a verifier determine what may ultimately be regulatory or judicial facts and circumstances as to whether the project activity or its implementation is in "accord"' with a regulation? We recommend that the Rules be changed to provide that offsets are invalidated only if the appropriate agency or court has finally and definitively found the project activity to not be in accord with a regulation. (TCF3)

Comment: On the surface, IETA is comfortable with the spirit of capturing illegal activity in the offset invalidation provisions of section 95985(b)(3). The question arises when the wrong codes of laws or regulations are applied to making the determination that illegal behavior occurred; the regulation (c)(2) currently states "…not in accordance with all local, state, or national environmental and health and safety regulations…;" We respectfully ask that at a minimum the regulation say that "all relevant and applicable" instead of just "all," and that ARB staff narrow this language further to minimize the chance for nuisance claims and the potentially negative legal exposures this current language poses for ARB. (IETA4)

> **Response:** We did not make the requested changes to sections 95985(c)(2) and (c)(3) and believe that the text is clear in its intent. We do not want to issue offset credits for projects that are not in conformance with applicable regulations. We will continue to coordinate with stakeholders to identify further refinements and criteria as part of a future rulemaking.

M-45. Comment: The determination and process of invalidation, at present, do not require or allow any independent assessment concerning the amount of the overstatement. The Offset Project Operator should be able to request a second certification of the emissions reduction and ARB should take the result of any second verification into account. The current approach may result in ARB interpreting Protocol or other guidance in a different way from that on an experienced verifier. At minimum the Offset Project Operator should have the right to, and ARB should be required to, consider a second, independent opinion. (CIG3)

> **Response:** We did not make this change. ARB is the only agency that can determine whether ARB offset credits are invalid. We do not agree that this administrative step is necessary, as we will base the invalidation on the third-party verification that was performed by an ARB-accredited verifier.

M-46. (multiple comments)
Comment: IETA is encouraged by many of the revisions proposed to section 95985, and respectfully submits that more specificity is needed for when ARB determines that an offset project performance has been overstated by more than 5 percent (section 95985 (c)(1)). While it is not yet clear that the 'yardstick' for the project's performance is the Offset Project Data Report, it also is not clear 1) how the grounds for invalidation can occur, 2) whether it is based on a second verification or 3) if determinations will get made by a generally accepted industry auditor or by a related regulator or another official body. Regardless of the liability approach ARB adopts, it is important to ensure that the process for offset credit invalidation is well designed.

Comment: IETA is pleased to tightening of the offset invalidation language in section 95985(b)(2) regarding the liability once the 5 percent threshold is exceeded, such that only the difference—i.e. the overstatement beyond 5 percent gets invalidated. However, as a practical matter, the means by which the "errors in emissions reductions achieved" versus the Offset Project Data Report is calculated needs more clarity. How will ARB make this finding? How will ARB make the calculation? As a further practical matter, this error and quantitative finding could be exposed and assessed in the second validation and that determination could be final. If there were legal issues (e.g. the Verifier or some other party was suspect in some way) around the circumstances of the second validation, then ARB would naturally be the “next judge” to make the finding and subsequent assessment. And of course, if the project did not undergo a second validation, then ARB would be the natural authority for making the finding and quantifying the subsequent invalidations. (IETA4)

> **Response:** The purpose of including section 95985(c)(1) in the regulation is to detect any relevant new information or uncover any mistakes that a verifier may have missed. It would not be based on a second verification. It would be based on the verification that was performed by an ARB-accredited verifier. ARB is the only agency that can determine whether ARB offset credits are invalid. This section also includes details in what information shall be considered by ARB in making a finding.

M-47. (multiple comments)
Comment: For the situations defined in section 95985(c)(3), forest owners have no control over how their credits are used after they are sold. In this instance, holders of credits should be liable for invalidated credits if after an ARB offset credit was sold, an entity used it to comply with some other obligation in addition to using it as a compliance instrument in the California Cap and Trade system. (PFT4)

Comment: TNC commends staff’s recent improvements to the forest owner definition that help clarify that only entities with an interest in real property would qualify as a forest owner. While clear, this broad definition coupled with the liability provisions still casts a brought net of liability without specifically establishing a chain of liability to provide greater certainty to transactions. The forest owner is identified as the liable party for replacing forest offsets in instances of intentional reversals and invalidation. This means that at any given time, the fee owner, the easement holder, the timber rights holder and/or the carbon rights holder could be liable for replacing forest offsets. This uncertainty could discourage transactions and the development of offset projects. TNC recommends that CARB staff identify that the offset project operator (OPO) would initially be held responsible for replacement of offsets in the events of invalidation or intentional reversals. Since the regulations state that only one forest owner can be the OPO, a forest owner would still be liable for replacement of offsets. This approach would provide more certainty by identifying up front who would be initially responsible (i.e., the OPO). Furthermore, it would not preclude other parties from ultimately being responsible for offset replacement. (NC9)

Comment: PFT thinks there is still some inconsistency in the regulations in how the definition of Forest Owner works in relation to a forest Project Operator. The definition states that one Forest Owner must be designated as the Project Operator, and language was removed from the definition that is consistent with keeping responsibility for forest offset projects clear. However, there are several places in the regulations where responsibility is split between the Project Operator and the Forest Owner. For instance, Project Operators sign attestations when a project is listed accepting legal responsibility for the integrity of the project and accepting the jurisdiction of the State of California for enforcement of the cap and trade regulations. On the other hand, the

Forest Owner(s) is/are responsible for paying back credits in the case of intentional reversals and credit invalidation. Given that by definition, there can be more than one forest owner (e.g., owner in fee of the land and owner of additional forest rights in an easement), we recommend that the regulatory language allow for one forest owner, the Project Operator, to be designated as responsible for all aspects of a project, including submitting relevant reporting data, signing attestations, and replacing credits in the case of reversals or invalidation. The one forest owner party responsible should be identified in the listing information. In the case of invalidation or reversals, language could be added to name other forest owners in the event that the Project Operator is no longer in business. (PFT4)

> **Response:** We disagree and did not make this change. Forest Owners have physical custody of the carbon stocks, and therefore should have liability for the offset projects. The Forest Owners can establish contractual arrangements among themselves for establishing specific responsibility for invalidated credits.

M-48. Comment: CE2 appreciates the adjustments and clarifications that ARB has made regarding offset invalidation. However, we reiterate our proposal that ARB develop and manage a separate "Invalidation Buffer Account." Unfortunately, requiring regulated entities to replace invalidated credits will unnecessarily restrict the supply of high quality offsets without real net environmental gains. The problem lies in the assumed benefits of this system. Buyers (regulated entities) are assumed to be protected from receiving bad credits through use of insurance mechanisms, trained offset verifiers, innovative contracting, and extensive due diligence. It is also assumed that ARB is more likely to recover an invalidated offset credit if a regulated entity is held liable for its replacement. There are several fundamental problems with these assumptions:

> a. No private carbon offset insurance products currently exist. Given the low overall number of potential offsets that can be used in the California market (up to 218 $MMTCO_2e$) it is not practical to assume that a product will be actuarially viable or cost effective. If ARB believes this product is or could be available and cost effective, ARB should define the parameters of an acceptable policy and mandate its use.
> b. The private sector cannot mandate that all projects and offset holders purchase a common insurance policy or participate in a common buffer account. Without a common policy or buffer account, economies of scale cannot be achieved and transaction costs will increase effectiveness of offsets and decreasing investment in emission reductions outside of the capped sectors.
> c. If a voluntary insurance policy or buffer account were to exist, it would suffer from "adverse selection" as (1) project developers and sellers would be incentivized to submit only their riskiest projects to the voluntary insurance policy or buffer account; and (2) they would sell the least risky projects directly to large compliance entities via bilateral contract.
> d. If only the riskiest projects trade on exchanges, transparency will be sacrificed and market oversight would be more difficult.

e. Smaller compliance entities would not have equal access to quality offsets. Larger entities are better able to diversify invalidation risk across multiple projects and counterparties and devote staff to evaluating the invalidation risk of individual offset projects.

The solution to addressing the problems associated with holding regulated entities responsible for replacing an invalidated offset credit is to mirror the current ARB Forest Buffer Account structure and procedures to apply separately (and additionally) to all Compliance offset projects. Once an offset is invalidated by ARB, the first step would be to notify the Offset Project Operator and allow them six months to replace the invalidated credits. If the Offset Project Operator does not replace the invalidated credits within six months, ARB would retire credits from the ARB Invalidation Buffer Account. If the credits are not replaced with six months of ARB's retirement, the Offset Project Operator would be subject to enforcement action. This system would reduce transaction costs while maintaining environmental integrity in the overall cap and trade system. This system would also align the incentives of Offset Project Operators, verifiers, buyers, sellers, and regulated entities, as well as result in a fungible, commoditized offset market which is equitable, accessible by all compliance entities, and would allow transparent trading and clearing via exchange.

Relying on the establishment of an Invalidation Buffer Account could be seen as increasing the risk of default to ARB and placing new administrative burdens on an already stressed ARB staff. However, the changes proposed herein are merely an extension of the buffer account management and enforcement action responsibilities already undertaken by ARB for forestry projects, and will actually reduce invalidation risk because the incentives of Offset Project Operators will be properly aligned to ensure the quality of their projects.

Whereas section 95985(h)(C)(l) states that the Offset Project Operator would be responsible for replacement in the event that the entity who retired the credits is no longer in business, the chain of responsibility should simply be reversed to first require that the Offset Project Operator replace, while the retiring entity is responsible only in the event that the Offset Project Operator is no longer in business. (CE2CC2)

Response: We do not agree that the responsible party of an invalidated ARB offset credit should be the offset developer or that we should eliminate buyer liability associated with the invalidation of ARB offset credits. Requiring the user to replace the invalidated offsets ensures that purchasers and users of offset credits do their due diligence in seeking out high-quality offset credits. We have clear enforcement authority over covered entities that will be using ARB offsets for compliance. If the covered entity replaces any invalidated offset credits, they may then take appropriate action through third-party contractual arrangements they may have established prior to purchase. These arrangements currently exist in the voluntary offset market, and we expect that as the offset market becomes more established, that additional mechanisms to deal with the risk of invalidation will also be established. In the event that the offset credit has not yet been used or retired, it will be canceled in the market tracking system and removed from any Holding or Compliance Accounts. These provisions in no way diminish ARB's authority to assess penalties under section 96014 on any offset project developer or verifier that has provided false information to ARB.

With regard to the comments related to the development of insurance, we believe that given all of the clarifications to section 95985 the market should be able to quantify and cover the risk associated with invalidation. We expect that insurance products will emerge once the market has been established.

M-49. Comment: Under the current proposal, ARB proposes to look to the compliance entity to "make good" for any invalidated allowances previously submitted for compliance purposes. If the compliance entity is out of existence, or otherwise unable to make good, then ARB proposes to have secondary recourse to the offset project owner/developer. MSCG strongly believes that this sequence should be reversed. ARB should first approach the offset project owner/developer to "make good" for any offset credits created by its project that are invalidated. Only if it is unable to meet that obligation should ARB look to the compliance entity as a matter of secondary recourse. Using this approach provides ARB with exactly the same remedies as the current draft, but better comports with the (hopefully) universally accepted principle that the entity that causes a problem should be responsible for fixing it. The legal obligation to replace invalidated credits can be instilled as part of the conditions for project approval and offset credit issuance. Indeed, such an obligation should go beyond just replacing offset credits previously submitted for compliance, and should include replacement for all invalidated offset credits, regardless of where currently held. The replacement can be made using any still-valid credits held by the owner/developer, or by buying credits or allowances on the open market and distributing them to the "victimized" holders. This approach would also address a potential inequity, whereby the project owner/developer that has some portion of its credits invalidated, appears to be able to keep its "ill-gotten" proceeds. Nothing about the "buyer liability" approach appears to create a mechanism whereby the offset owner/developer must relinquish the revenues associated with the invalidated credits. For all the reasons discussed above, MSCG strongly believes that good public policy principles are best served by looking first to the owner/developer for redress on invalidated credits, with only secondary recourse to compliance entities. (MSCG4)

Response: We do not agree that the responsible party of an invalidated ARB offset credit should be the offset developer or that we should eliminate buyer liability associated with the invalidation of ARB offset credits. Requiring the user to replace the invalidated offsets ensures that purchasers and users of offset credits do their due diligence in seeking out high-quality offset credits. We have clear enforcement authority over covered entities that will be using ARB offsets for compliance. If the covered entity replaces any invalidated offset credits, they may then take appropriate action through third-party contractual arrangements they may have established prior to purchase. These arrangements currently exist in the voluntary offset market, and we expect that as the offset market becomes more established, that additional mechanisms to deal with the risk of invalidation will also be established. In the event that the offset credit has not yet been used or retired, it will be canceled in the market tracking system and removed from any Holding or Compliance Accounts. These provisions in no way diminish ARB's authority to assess penalties under section 96014 on any offset project developer or verifier that has provided false information to ARB.

M-50. Comment: "Forest Owner" is defined in section 95802(a)(109) (page A-21) to include "the owner of any interest in the real . . . property involved in a forest offset project", excluding government agency third-party beneficiaries of conservation easements, but a single Forest Owner must be designated as the Offset Project Operator. We noted in our August 8, 2011 comments that this could be interpreted to include real property interest holders who have no control over forest management, such as a right-of-way easement holder, and recommended that the definition of "Forest Owner" be limited to those with real property interests that affect forest management—the fee owner, any holder of timber rights, and any holder of a working forest conservation easement that touches or concerns forest management, as applicable. Only the Offset Project Operator is required to submit an attestation with the project affirming voluntary participation in the cap and trade scheme and agreeing to personal jurisdiction and venue in California courts pursuant to section 95975(c)(2) (page A-202). At the same time, the credit invalidation and replacement provisions in section 95985(i) (pages A-288 to A-290) state that "The Forest Owner . . . must replace ARB offset credits" in the event that credits in a Retirement Account are invalidated (emphasis added). ARB and the State of California will not, however, have clear jurisdiction to enforce the cap and trade regulations against Forest Owners who are not required to submit an attestation to ARB pursuant to section 95975(c)(2). Furthermore, because the definition of Forest Owner is drafted so broadly as to include owners of real property interests that have no impact on forest management, it would be unnecessary and infeasible to seek attestations from all entities that qualify as Forest Owners as that definition is currently drafted. (Real property interest holders with no capacity to affect forest management should not be Forest Owners. For example, it would be unrealistic to structure the regulation such that an owner of a private driveway through a forest area could face a contingent financial liability due to the forest management of an entirely different party).

In summary, while "Forest Owner" is defined to include all holders of a real property interest on the project area, in the most recent draft only one Forest Owner is the Offset Project Operator, and only the Offset Project Operator submits an attestation submitting to personal jurisdiction and venue in California courts. However, in the section on credit invalidation, the Forest Owner rather than the Offset Project Operator is responsible for replacing invalidated credits that have been retired. The change in the definition of "Forest Owner" in this draft indicates an appropriate and reasonable intention to hold (in the first instance) only the Offset Project Operator legally liable for proper and lawful operation of the offset project. We would therefore recommend that ARB amend section 95985(i)(1) and (2) to state that only the Offset Project Operator (*not* the Forest Owner) must replace ARB offset credits in the event of invalidation of a credit in a Retirement Account pursuant to section 95985. We also recommend the following change to section 95985(e)(3). This would ensure that section 95985 properly reflects the changes to the definition of Forest Owner, with only one being designated an Offset Project Operator, and the scope of the State of California's enforcement capabilities pursuant to section 95985(c)(2). Modify section 95985(e)(3) as follows:

> (3) The Offset Project Operator and Authorized Project Designee~~, and, for forest offset projects the Forest Owner(s)~~. (NEWFOREST3)

> **Response:** At least one forest owner has to be delegated as an offset project developer. It is the forest owners that have physical custody of the sequestered carbon stocks. We acknowledge there may be more than one forest owner for a project, and we advise those parties to develop third-party contracts on roles, responsibilities, and liabilities when participating as a group in the Compliance Offsets program.

M-51. (multiple comments)
Comment: Section 95985(b)(1)(A) and (B) should read "An O~~o~~ffset P~~p~~roject Data Report developed . . ." (NEWFOREST3)

Comment: The definition of "$TOT_{holding}$" might be clearer in section 95985(g)(1) if it was rephrased as "'$TOT_{holding}$' is the total number of ARB offset credits from the applicable Offset Project Data Report currently being held in a Compliance and/or Holding Account by each party identified in section 95985(e)(1) ~~for the applicable Offset Project Data Report~~." (NEWFOREST3)

Comment: Section 95985, as a whole, uses the phrase "invalidation of offset projects" interchangeably with "invalidation of offset credits." We recommend that all references to "invalidation of offset projects" be eliminated to make clear that only offset project credits are subject to invalidation. (TPI6)

> **Response:** We did not make these changes. We believe the language is clear as written and conveys the intent.

M-52. Comment: Section 96985(e)(2) should read "The entit~~y~~ies for which ARB transferred any ARB offset credits . . ." (NEWFOREST3)

> **Response:** Thank you. We made this non-substantive change in the regulation.

M-53. (multiple comments)
Comment: CERP supports the changes to the regulatory language that allow for a three year statute of limitations for ODS projects if an Offset Project Data Report for a particular credit is re-verified by a different verifier within three years. We also support the provision allowing for a three year statute of limitations for other offset project types—currently livestock, urban forest and forest projects—when they have a subsequent Offset Project Data Report re-verified by a different verifier and issued a Positive or Qualified Positive Offset Verification Statement within three years of

issuance. (section 95985(a)(1)). CERP appreciates these changes because the revised process will maintain a very high level of environmental integrity while also allowing projects the flexibility to undertake a second verification to shorten the statute of limitations period and thus remove the cloud of invalidation uncertainty in a timely manner. (CERP5)

Comment: We extend appreciation for ensuring that an issued credit not become subject to invalidation, in the future, due to a change to the underlying protocol. (IETA4)

Comment: IETA is pleased to see the elimination of section 95985(b)(1)) of the offset invalidation rules. It represented a broad reach of oversight authority beyond discrepancies that would have material effects on the environmental integrity of projects. (IETA4)

Comment: SCE appreciates the improvements that ARB has made to the offset provisions of the regulation, particularly the increased overall clarity in the offset rules. SCE especially applauds the strengthening of the criteria by which ARB may invalidate offset credits that have already been validated. Specifically, ARB has shortened the timeframe for offset invalidation from five years to three years for ozone-depleting substance projects. In addition, ARB has allowed for a second verification to shorten the invalidation timeframe for projects created under the other three offset protocols. Section 95990, which addresses early action offset credit provisions, has been revised and much improved. For example, the latest date that an early action offset project can be registered has been changed from January 1, 2013 to January 1, 2014. In addition, ARB has modified the rules to allow GHG reductions that occur in 2014 under an early action protocol to be verified by September 30, 2015. ARB has also revised Section 95985 to create a clear process for determining which offsets have been invalidated and must be retired. SCE supports the provisions of Section 95985, which also identifies the responsible parties if an offset project overstates its GHG emissions reductions. In addition, the replacement provisions are limited to only those offsets that have been retired. These revisions to the offset reversal provisions will provide market participants with increased certainty and liquidity, which will lead to additional opportunities for cost containment. (SCE4)

> **Response:** Thank you for your support.

M-54. Comment: Section 95985(c)(3) invalidates offsets if ARB determines that “offset credits have been issued in any other voluntary or mandatory program with the same offset project boundary....” This puts the burden on the Offset Project Operator to determine what its various holders may have done with their offset credits, which is infeasible. ARB should require holders of offset credits to attest that they have not used the offset in any other voluntary or mandatory program and hold them liable, not the Offset Project Operator, if they have. (TCF3)

> **Response:** We disagree that this is not the liability of the holder. Holders are allowed to sell the offset credits but do not have the rights to the offset project.

New section 95975(c)(5) of the regulation now requires that an Offset Project Operator or Authorized Project Designee disclose any offset credits issued for the same project for any other purposes in any other program. In addition, we added new attestations to section 95981(c). Offset Project Operators and Authorized Project Designees must make these attestation(s) in order for ARB to issue offset credits. Therefore, if ARB finds that ARB offset credits were issued to the offset project for the same GHG reductions or GHG removal enhancements, ARB may invalidate the ARB offset credits pursuant to section 95985, and it will be the Offset Project Operator or Authorized Project Designee that will have violated the provisions of the regulation.

M-55. (multiple comments)
Comment: In its earlier language, ARB introduced a statute of limitations of eight years for invalidation of already-issued offset credits with a shortening of the statute of limitations to five years if a project undergoes a second verification after three years of issuance of the credits. We are extremely pleased to see ARB integrate reforms that tightened the time limit to three years for ODS projects and three reporting periods for all other types of projects, but in practice we believe this could still be shortened and in fact eliminated for all but the most extreme circumstances. We have noted, as have ARB officers, that the second verification accords a significant “yardstick of credibility;” ARB considers the validity of offset credits sufficiently established and quantified, once the project has been reviewed by a second, independent ARB-accredited verifier and the second verifier has not identified any grounds for invalidation. To this end, IETA urges ARB simply to allow the invalidation period to expire upon the date of ARB’s acceptance of the second verification. Because the second independent verification is the means by which a credit may be invalidated, a positive or successful second verification logically fulfills ARB’s need to confirm and attest to the quality of a credit. IETA believes this yardstick of credibility is a well-grounded tool for standing by the environmental integrity of issued offsets. Also, it provides a basis for minimizing an otherwise extended period of time during which issued—and “double-approved” for all intents and purposes—offset credits remain subject to invalidation. In particular, we think it would lead many entities buying ODS projects in the offsets market to manage their risk by obtaining a second verification of the data report immediately following the issuance of credits—furthering the credibility of the program. In short, the second verification acts as the de facto insurance for ODS offsets. Although we cannot speculate that insurance products will emerge to manage the risk of validation (whether before and after the second verification), this much shorter period will enable a more manageable time horizon for transactions. The second verification public record will also build a data set that might enable better risk management processes overall. For non-ODS projects, a process to review these projects’ Data Reports—analogous to the ARB early action process—by a second independent verifier could convey the same benefit and achieve the same result. Thus, the second verification provides assurance of the credit quality and an arbitrary delay provides no greater objective assurances regarding its environmental integrity. However, the marketplace will not consider the credit fully valid, and its marketability will be impaired for the length of that period of delay. In addition, it will likely offer the marketplace sufficient certainty to encourage

investment in offset projects, ensuring adequate supply of credits for use in controlling the costs of the program. (IETA4)

Comment: The Proposed Changes to section 95985(b) add a provision under which the period of time during which the offset credit is subject to invalidation ("invalidation period") can be shortened from eight years to three years if re-verification or subsequent verification by a different verifier takes place within the three years. Section 95985(b) should be revised further so that the invalidation period expires upon the date of the re-verification or subsequent verification. There is no reason to require that a second verification "sit" until the expiration of the three year period before lifting the shadow of invalidation. Nothing is gained from the passage of time. However, much is lost: the marketplace will not consider an offset credit to be fully valid, fungible, and marketable until the invalidation period has ended. In addition, some ambiguities in the drafting of the invalidation period should be addressed. For example, the phrase in section 95985(b)(1)(B) "may only be subject to invalidation within three Reporting Periods if a subsequent Offset Project Data Report for that offset project is verified..." is confusing, as it seems to indicate that invalidation may only occur if a subsequent report is verified. The numbering of section 95985(b) should also be revised, as there is a section (b)(1) but no (b)(2). Modify section 95985(b) as follows:

> (b) Timeframe for Invalidation. ARB may invalidate an ARB offset credit pursuant to this section ~~within the following timeframe~~ at any time until eight years after issuance if a determination is made pursuant to section 95985(f), unless one of the requirements is met:
>
> > ~~(1) Within eight years of issuance of an ARB offset credit unless one of the following requirements is met;~~
> >
> > > (~~A~~1) ~~An offset project developed under Compliance Offset Protocol Ozone Depleting Substances Projects, [DATE], may only be subject to invalidation within three years of issuance of an ARB offset credit i~~If the Offset Project Data Report for an offset project developed under Compliance Offset Protocol Ozone Depleting Substances Projects, [DATE], is re-verified pursuant to sections 95977 through 95978 by a different offset verification body ~~within those three years~~, the ARB offset credits issued pursuant to the Offset Project Data Report may not be invalidated after the date of the re-verification; or
> > >
> > > (~~B~~2) ~~An offset project developed under the protocols listed below, may only be subject to invalidation within three Reporting Periods i~~If a subsequent Offset Project Data Report for an~~that~~ offset project developed under the protocols listed below is verified pursuant to sections 95977 through 95978 by a different offset verification body and issued a Positive Offset or Qualified Positive Offset Verification Statement, ~~within three years of issuance of~~ the ARB o~~O~~ffset c~~C~~redits issued under the first Offset Project Data Report may not be invalidated after the date of the subsequent Offset Project Data

Report. This provision applies if an offset project is developed under one of the following Compliance Offset Protocols:~~;~~

(A)~~1.~~ Compliance Offset Protocol Livestock Projects, [DATE];

(B)~~2.~~ Compliance Offset Protocol Urban Forest Projects, [DATE]; and

(C)~~3.~~ Compliance Offset Protocol U.S. Forest Projects, [DATE]. (SCPPA8)

Response: We do not agree that ARB offset credits should no longer be invalidated in the event that a second verification is performed on the Offset Project Data Report. The minimum statute of limitations is three years if the Offset Project Data Report or a subsequent Offset Project Data Report, depending on project type, is verified by a different verifier within that time frame. If the offset project does not qualify under these requirements the default statute of limitations is eight years. We do not believe that any time period less than three years would provide sufficient time to detect all relevant new information or uncover any mistakes that verifiers may have missed or may have been unintentionally omitted.

M-56. Comment: The Climate Trust recommends ARB consider developing a fixed ton invalidation threshold for small scale projects for an overstatement of more than five percent under section 95985(c)(1). For a 5,000 ton per year project, an overstatement of 250 tons could trigger a costly review and re-verification process. Setting a minimum threshold of 1,000 tons provides small scale project developers flexibility, while still ensuring there is strong disincentive to overstating emission reductions in an Offset Project Data report. (TCT2)

Response: We did not make this change. The requirements for regulatory verification must be met to ensure that ARB offset credits meet the requirements in AB 32 that all offsets must be verifiable. ARB cannot allow offsets to be used for compliance if they are found to have been issued based on incorrect information, even if it is a very small amount of offsets.

M-57. Comment: IETA greatly appreciates that ARB has extended the period of time that a party has for replacement of invalidated credits from 30 days, then to 90 days, and now to six months. The procedures that are outlined in 95985(d) through (j) are quite involved and will need to be supported by the systems employed by ARB by the start of the program.

Response: Thank you for your support. We will be working to implement the program and all necessary systems once the regulation is finalized.

M-58. Comment: Rather than focusing on liability provisions, ARB rules could be directed towards ensuring offsets should be subject to rigorous verification and certification standards that would eliminate the need to invalidate credits to only the rarest of circumstances. ARB has included appropriate verification and subsequent certification standards to ensure that only quality credits enter the market. If ARB finds it necessary to retain the option of invalidation, a buffer account could be established for all credit categories, similar to the buffer account for forestry projects. Also, compliance entities would have more flexibility to meet the short replacement timeline if ARB allowed the 8 percent for offsets to be used across compliance periods and if a sufficiently large holding limit for allowances is established. The buyer liability approach set out in the draft rules could be more efficient at addressing the problem of invalidated credits. Under ARB's proposed rules, the holder or user of a credit is presumptively liable. If that party is no longer in business, ARB will require the Offset Project Operator or Authorized Project Designee to replace the invalidated ARB credits. The Trust recommends that the Authorized Project Designee be removed from this requirement. The Authorized Project Designee is defined in section 95802(a)(22) as "an entity authorized by an Offset Project Operator to act on behalf of the Offset Project Operator." There are many situations where the Authorized Project Designee only performs limited administration duties and has no influence or control over project outcomes. While ARB has asserted that the various entities can manage their risk through appropriate contracts, the reality is that the credits frequently go through a chain of ownership that would have to be unraveled in order to determine contractual liability upon invalidation. Many medium-sized organizations would avoid these open-ended risks and the market could be composed solely of contracts between large corporations able to bear such liability, thus creating inequity in the market and limiting credit diversity and market participation of medium-sized entities. (TCT2)

Response: This comment was submitted during the first 15-day changes to the regulation. We agreed and removed the Authorized Project Designee from being responsible for replacing invalidated ARB offset credits as part of the second 15-day changes.

We do not agree that we should eliminate buyer liability associated with the invalidation of ARB offset credits. Requiring the user to replace the invalidated offsets ensures that purchasers and users of offset credits do their due diligence in seeking out high-quality offset credits. We have clear enforcement authority over covered entities that will be using ARB offsets for compliance. If the covered entity replaces any invalidated offset credits, they may then take appropriate action through third-party contractual arrangements they may have established prior to purchase. These arrangements currently exist in the voluntary offset market, and we expect that as the offset market becomes more established, that additional mechanisms to deal with the risk of invalidation will also be established. In the event that the offset credit has not yet been used or retired, it will be canceled in the market tracking system and removed from any Holding or Compliance Accounts. These provisions in no way diminish ARB's authority to assess penalties under section 96014 on any offset project developer or verifier that has provided false information to ARB.

The regulation requires that offsets account for eight percent of an individual entity's emissions over a three-year period. We did not allow the carryover of unused offsets within this time frame to ensure that emission reductions are being achieved by capped sources throughout the life of the program. Keeping it to the compliance period allows some flexibility by giving three years to total emissions, but still requires that emission reductions are coming from within capped sectors in all years of the program.

M-59. Comment: Invalidating only the overstated portion of credits when reports overstate reductions by greater than 5 percent fails to create a strong disincentive to offsets developers from purposefully exaggerating the reductions from their projects. We suggest that CARB define a second higher percent threshold whereby overstatements of reductions by amounts over that threshold result in the invalidation of all of the credits generated by the project during that reporting cycle. (UCS8)

Response: The compliance offsets program as a whole is designed to disincentivize offset developers from purposefully exaggerating the reductions from their projects. We do not see this being a problem in the program and believe the invalidation mechanism may not need to be used due to the rigor of the offset provisions. In addition, the purpose of the invalidation mechanism is to ensure that the cap is made whole; therefore, invalidating additional valid offsets is unnecessary.

M-60. Comment: Section 95857(a)(2) (p. 112) states that if the ARB has invalidated offset credits, the compliance obligation for untimely surrender will not apply until 90 days after notice of the invalidation. However, in the revised offset invalidation section of the Regulation, specifically sections 95985(h)(1)(B) (p. 286) and (h)(2)(A) (p. 287), the relevant party is given six months to replace the invalidated offset credits. This longer period should be reflected in section 95857(a)(2) to eliminate the conflict. This change can be made without further 15-day public comment, as it is “nonsubstantial or solely grammatical in nature” for the purposes of section 11346.8(c) of the Government Code. Modify section 95857(a)(2) as follows:

(2) The compliance obligation for untimely surrender (“excess emissions”) will not apply to a covered entity or opt-in covered entity which is determined to have transferred insufficient instruments to meet the compliance obligations of section 95856 solely because of the invalidation of an ARB offset credit by the Executive Officer pursuant to section 95985 until <u>six months</u> ~~90 days~~ after notice of invalidation. (SCPPA8)

Response: We agree and clarified the language. This was a non-substantive change to the regulation.

Reversals in the Forest Sector

M-61. Comment: It is not explicit or clear that liability for submittal of credits to compensate for intentional reversals is limited to the Offset Project Operator, not other Forest Owners. We recommend this section be clarified by replacing “Forest Owner” and “forest owner” with “Offset Project Operator.” (BLUESOURCE3)

> **Response:** We do not agree that the Offset Project Operator should be liable for forest offset invalidations instead of the Forest Owners. We have enforcement authority over all forest owners under the regulation; however, identifying one party as the Offset Project Operator will be more administratively simple for both ARB and the forest owners when dealing with the various offset processes. At least one forest owner will be identified as the offset project operator. Forest owners have physical custody of the carbon stocks, and therefore should be liable for the offset projects. The Forest Owners can establish contractual arrangements among themselves for establishing specific responsibility for invalidated credits.

M-62. Comment: TWS seeks clarification of the mechanics and timing of contributions to the Forest Buffer Pool. Reading section 95983(a)(1) and (2) of the Cap-and-Trade Regulation along with section 7.2.2 and Appendix D of the Compliance Offset Protocol for U.S. Forest Projects (the Protocol), it is unclear whether a forest project makes contributions to the buffer pool only at the time of registry, whether that contribution may be adjusted in the future, or whether a project may be required to make contributions to the Forest Buffer Account after registration. Section 95983(a)(1) and (2) of the cap-and-trade refers to contributions at the time of registration being made in accordance with the Protocol. Section 7.2.2 of the Protocol notes that contributions are made to the Forest Buffer Pool according to a determination of reversal risk determined by requirements and methods in Appendix D of the Protocol. However, Appendix D notes that reversal risk of a forest project is dynamic and recalculated in every year the project undergoes verification. As identified in California’s April 2009, “Indicators of Climate Change in California” report, increased frequency of large wildfires and increased tree mortality are trends occurring in California forests. The risk of unintentional forest offset project reversals (or terminations) is real and may increase over time; and the offset credits in the Forest Buffer Pool are subject to the same unintentional reversals that threaten the permanence of the underlying forest offset projects (although, to the extent there is geographic diversity in the location of registered forest offset projects, that may provide some risk diversification for the Forest Buffer Pool). As the Cap-and-Trade Regulation is currently drafted, it appears that there is no mechanism for replenishing the Forest Buffer Pool after credits are retired to respond to unintentional reversals (and project terminations due to unintentional reversals). Relying on additional contributions to the Forest Buffer Pool from the registration of new forest projects may be an inadequate method of ensuring a Forest Buffer Pool capable of safeguarding the integrity of the emissions cap especially in the face of wildfires or tree mortality events that may affect multiple projects and result in project terminations. Furthermore, in the case of intentional reversals, if ARB is forced to retire credits from the Forest Buffer

Account and to commence an enforcement action, this also creates a risk that the Forest Buffer Account will be depleted and will not have sufficient credits to ensure the integrity of the emissions cap. It is unclear whether any recovery in an enforcement action could be applied to the purchase of replacement credits to replenish the Forest Buffer Account, and even if such replacement credits could be purchased pursuant to a successful enforcement action in an intentional reversal case, there are additional risks and uncertainties created by the disposition of the enforcement action (e.g. the length of time required to secure a successful outcome in an enforcement action, whether bankruptcy or statute of limitation issues may prevent a recovery sufficient to ensure the cap integrity, etc.) If the Forest Buffer Account is depleted and unable to help restore tons to the cap-and-trade program in the face of forest project reversals, then the integrity of the cap-and-trade program may be compromised. ARB could adopt a number of revisions that would help alleviate the risk of depleting the Forest Buffer Account. First, ARB could provide enhanced mechanisms for seeking new contributions to the Forest Buffer Account if the volume of credits in the Forest Buffer Pool falls below a certain percentage of outstanding forest offset credits; possible sources of such replenishment contributions are varied. For instance, the Cap-and-Trade Regulation could require that if the depletion scenario referenced in the preceding sentence occurs, then some or all of the contribution risk ratings in the Appendix D of the Protocol would be accelerated by a specified percentage. In addition to new projects being subject to the accelerated risk assessment, existing projects could also be made subject to a revised risk assessment and additional contribution assessment. For instance, the Cap-and-Trade Regulation could be revised to clarify that existing projects may need to make additional contributions to the Forest Buffer Pool after registration if a depletion scenario arises (which would be analogous to an increased insurance premium based on new information)—and those additional contributions could either come in the form of forest offset credits or other approved compliance instruments. Secondly, ARB could explore the possibility of either using enforcement proceeds associated with the cap-and-trade program to purchase replenishment credits for the Forest Buffer Pool or the possibility of requiring purchase of replenishment credits from defendants in successful intentional forest project reversal enforcement actions. Finally, to better safeguard against depletion, ARB may want to consider broadening the Forest Buffer Pool into a general Offset Buffer Pool and requiring all offset project types to make contributions to an Offset Buffer Pool (with non-sequestration offsets presumably making contributions at a lower rate than sequestration offsets to reflect any lower project risk rating). This broadening of the buffer pool has two potential benefits. First, risk in the buffer pool would be diversified across different types of offset types, but also the buffer pool would then be capable of further bolstering the integrity of the cap-and-trade program by providing a source of credits which ARB can use to make the program whole while pursuing any warranted enforcement actions related to non-sequestration project invalidations. (TWS2)

> **Response:** Forest offset projects must contribute to the Forest Buffer Account each time that the project is issued ARB offset credits in the percentage amount specified in Compliance Offset Protocol U.S. Forest Projects. The amount of offsets that must be contributed to the buffer account is calculated based on a

number of factors beyond just what is needed to account for unintentional reversals, including bankruptcy. We believe that, given the conservative accounting in determining the amount of offsets that must be contributed to the buffer account, no changes are needed in this area. Experience in the voluntary programs has not shown that the buffer pool was at risk for depletion. ARB will monitor this policy and recommend program adjustments as part of future rule-making, if needed.

Early Action

Early Action Operations

M-63. Comment: Section 95990(a) allows the Executive Officer to "qualify" an early action program for offset credits by executive order. However, there is no provision, either in section 95990 nor in subsection 95986(k) regarding ARB Approval of Offset Project Registries, to require an assessment of whether an early action program is consistent with AB 32 requirements. Thus, subsection 95990(a) would seem to allow the Executive Officer to unilaterally approve an early action program, without any assessment of its compliance with the requirements of AB 32 and without adoption by the ARB board. If this understanding is correct, this provision would violate the statutory requirement that the board adopt methodologies for offset credits. Health and Safety Code section 38571 ("The [ARB] board shall adopt methodologies for the quantification of voluntary greenhouse gas emission reductions.") (emphasis added). (CBD5)

> **Response:** We disagree that the requirements for approval of Early Action Offset Programs and early action offset credits in section 95990 do not meet the requirements of AB 32. First, Early Action Offset Programs must be approved as Offset Project Registries, and if they do not wish to act as an Offset Project Registry, we included specific provisions that these programs must meet in section 95990(a) to ensure the rigor of the program. The interpretation of the language by the commenter is not accurate. The regulation does not allow all credits issued by the Early Action Offset Program to be used in the program. Any early action offset credits that are allowed in the program must be issued by a program approved pursuant to section 95990(a), and must meet the rest of the lengthy requirements in section 95990—including that they be developed under protocols that are specifically listed in section 95990(c)(5). These project types have been approved by the Board as part of the cap-and-trade rulemaking and have undergone a programmatic environmental analysis as part of ARB's rulemaking process. In addition, the early action offset credits must meet the requirements for regulatory verification pursuant to section 95990(f) and must be issued by ARB after we review the verification assessment by an independent ARB-accredited verifier. We believe that given all of these requirements, any early action offset credits used in the program will meet the criteria in AB 32.

M-64. (multiple comments)
Comment: ARB has specified the timing for auctions in 2012 but has not provided any timelines for the registration of early action offset projects. A definitive timeline would help all parties to better plan and contract for offset deliveries and allow time to identify and resolve any bottlenecks in the approval process. (IETA4)

Comment: ARB has specified dated for when the first auctions will be created. ARB should consider specifying a date when the first compliance offsets can be created. (CIG3)

> **Response:** ARB has provided a role for Offset Project Registries (OPR) to perform some of the administrative functions of the offset process in the regulation. ARB plans to utilize OPRs in lieu of performing these duties itself in the short-term, and may choose to continue this throughout the program. ARB has not yet determined if and when it would itself perform these roles. Therefore, in the meantime all parties seeking to use Compliance Offset Protocols must go directly to an OPR to list their projects. ARB is in the process of developing the training for OPRs, and plans to approve OPRs sometime in 2012. In addition, we are in the process of developing the training for offset verifiers and plan to accredit offset verifiers in 2012 as well. Once these mechanisms are in place, ARB and registry offset credits can be issued.

Early Action Offset Supply and New Early Action Protocols

M-65. (multiple comments)
Comment: VCSA notes that, with the exception of the placeholder language in section 95990 regarding early action offsets, the modified draft rule still limits the number of offset protocols eligible for use in the California cap and trade program to the four project types already approved. Such a limitation places an unnecessary constraint on the market, stifling innovation, creating uncertainty among project developers and investors, and ultimately limiting the cost containment benefits that offsets offer to a cap and trade system. There exist a number of established carbon offset standards that have significant standing in the domestic and international carbon markets that stand as ready sources of protocols for ARB's consideration. ARB should initiate an open, transparent process for evaluating and approving protocols from established, high quality carbon offset standards prior to the 2013 implementation of the cap and trade program. (VCSA2)

Comment: VCSA is pleased to see that the criteria for approval of early action offset credits issued by early action offset programs in section 95990(c) now includes a place holder for GHG reductions or enhancements that result from the use of "additional early action offset project protocols" (i.e., protocols other than the four protocols already approved by ARB). Expanding the list of eligible protocols will encourage more projects to seek credit for early action and, as a consequence, will enhance liquidity and help contain the cost of compliance early in the program. This is especially important given the possibility that the supply of offset credits issued under the four approved protocols may not meet demand. However, the modified draft rule does not identify a mechanism for how additional protocols will be considered and added to the list of existing eligible early action methodologies. To truly facilitate the development of an adequate pool of early action credits, more clarity must be provided for how early action protocols can be brought forward for consideration and approval. Amend section 95990 to include a provision that describes a transparent process that ARB will employ to receive, evaluate and approve additional early action offset protocols. (VCSA2)

Comment: The phrase "offset quantification methodologies and relied on the most recent version thereof at the time of offset project submittal" in (c) (5) should be clarified. We see a potential issue from the language as proposed since it is not obvious that the most recent version refers to the time the project was first submitted to the voluntary registry, or the time at which the project is submitted to ARB for recognition as an early action credit. We presume that ARB intends, where there are multiple versions of an approved protocol, that the most recent version of the protocol is the one by which the offset project is to be quantified, not to an earlier version. The staff memorandum is clearer on this point, since it states "only the most current version of any protocol may be used at the time the project is initiated." We recommend that the "initiation" concept be included expressly in (c) (5). This intent further demonstrates that later versions of a recognized protocol are not to be applied to a project which was submitted under an earlier protocol. Of course, this is exactly the conclusion we urge ARB to reach with respect to ODS methodologies. One can trace the involvement of early actors from the CCX ODS protocol to the CAR ODS protocol. (GEAG2)

Comment: The CCX ODS Protocols 1.0 and 2.0 should be added to the list of approved methodologies in (c) (5) following (c) (5) (D). The CCX was the first voluntary registry to adopt an offset protocol for ODS materials. The CCX ODS Protocol resulted from a combination of environmental agencies, industrial sources, project developers, consultants, verification bodies and investors and represented the best thinking at the time with respect to offset credits for ODS destruction. Many of these same parties then became involved in the efforts by the Climate Action Reserve to develop its ODS protocol, now proposed to be recognized by ARB as a valid protocol for early action credits [see 95990 (c) (5) (C)]. By virtue of the way ODS projects are undertaken, only projects initiated in anticipation of the CAR Protocol, released on January 22, 2010, would qualify under the early action rules as proposed. This request thus represents the classic case for recognition of early action. It is critical that ARB recognize the principle that early reductions provide great value, and perhaps even greater value to the climate than reductions which are achieved later. If sources, developers and investors are uncertain that their early reductions, undertaken in good faith, voluntarily and using the most current scientific methodologies, will not be counted or not have value, that will substantially slow the pace of innovation and emission reductions. As is the case with almost any offset protocol, changes occur over time; indeed, if there were no need for improvement, Protocols would not likely be changed. But that does not detract from the environmental benefits of early action, particularly with respect to climate change issues. It is well accepted in the climate change science that earlier reductions provide greater value—by reducing emissions earlier—than later reductions of an identical quantity. Therefore, it would be unfair to make a rule whereby ODS offset credits issued under the CCX protocol have no value, destroying the expected value for the efforts and investments made simply because of the differences between the CCX ODS Protocols and those developed later by the Climate Action Reserve. Thus, both Version 1 and 2 of the CCX ODS Protocol were developed and then adopted following comments and reviews by a wide variety of stakeholders. (GEAG2)

> **Response:** In regard to additional early action offset protocols, this comment falls outside the scope of the second 15-day changes notice; therefore, no further response is required. Responses to similar comments can be found in this category under the 45-day comment responses.

Early Action Offset Project Transition

M-66. Comment: With regard to the buffer account for forestry projects, it appears the buffer is to be composed of the full vintage year of credits, not taking into account credits that were already retired. CERP seeks clarification on whether this was ARB's intent, and if so, why such reductions should not be taken into consideration in some way. The buffer based on full vintage years will increase the number of credits needed. CERP suggests that in the next rulemaking ARB should alter the regulations such that when determining the percentage of tons that must be added to the buffer account, ARB should subtract tons that have already been retired. (CERP5)

> **Response**: The buffer account will transition to ARB and apply to early action credits for which ARB issues offset credit and for the voluntary credits that do not transition over. For example, if there is a reversal for voluntary credits from the 2004 vintage year, the voluntary registry would notify ARB, and ARB would retire buffer credits from the pre-early action vintages to make the voluntary program whole. In discussions with the voluntary registry, it was decided that ARB would take all of the credits associated with a project that transitioned to ARB and would administer it for any pre-early action vintages as well.

M-67. Comment: CERP requests that ARB include a timeline when the infrastructure for such transitioning will be available in the Final Statement of Reasons. Put another way, we would like to know the earliest date a project could transition to a Compliance Offset Protocol. The addition of a timeline will give contracting parties a better ability to plan for the transition to compliance projects in their credit transactions. (CERP5)

> **Response:** Once ARB Compliance Offset Protocols are finalized in October 2011, project developers will be able to use them to quantify, monitor, and report their GHG reductions and GHG removal enhancements. In 2012, ARB will approve additional Offset Project Registries so that project developers can list and report their emissions with these registries. We will also accredit ARB offset verifiers in 2012 to verify GHG reductions and GHG removal enhancements from offset projects developed under Compliance Offset Protocols.

M-68. Comment: The rules for recalculating baselines for projects under CAR Forest Project Protocol v.2.1 upon transition to the ARB Offset Protocol are difficult to follow. For example, section 95990(k)(1)(D) states that "....Registry offset credits and ARB offset credits issued for the first Reporting Period after the early action offset project is listed pursuant to section 95975 using the Compliance Offset Protocol U.S. Forest Projects, [DATE], will only be for the increased carbon stocks beyond what was already issued early action offset credits in the last year before the early action offset project transitioned to a Compliance Offset Protocol pursuant to this section." It is unclear what happens to a project transitioning to a Compliance Offset Protocol pursuant to this section if there are fewer ARB credits available upon transition than were already issued as early action credits under the early action project baseline. Clarification of this and other baseline calculation issues are essential to enable Offset Project Operators to accurately evaluate the consequences of listing and/or transitioning their projects. (TCF3)

> **Response:** The language is to clarify that the first year a project transitions to the ARB Compliance Protocol and recalculates its baseline, the first time credits are issued by ARB under the Compliance Protocol, they do not overlap with any credits that were issued under the voluntary program under the previous baseline conditions. ARB will develop guidance documents as part of program implementation.

Transitioning Early Action Offset Credits to ARB Offset Credits

M-69. Comment: The process set out in the rules for transitioning early action credits to ARB verified offsets remains burdensome. Section 95990(d) could be modified to allow holders or owners of early action credits to register with ARB in addition to Offset Project Operators and Authorized Project Designee. Section 95990(k) could be modified to include a defined and sufficiently long period under which eligible early action projects can transition to ARB Compliance Offset Protocols. An unclear window of time creates the risk that otherwise credible projects may no longer supply the market. The Trust recommends ARB establish a definitive transition period in which eligible early action projects can make the transition to ARB. A sufficiently long and clearly communicated transition period, such as January 1, 2014 through December 31, 2015, will ensure flexibility as registries receive and implement ARB requirements. (TCT2)

> **Response:** We disagree that we should allow both project operators and holders to register with ARB for an individual offset project. The regulation is designed to incentivize early action offset project operators to transition their projects to ARB for administrative simplicity and enforceability reasons. While our preference is that the project operator bring the project into the compliance program, we recognize that some stakeholders have concerns that early action offset project operators will not do so, and they would therefore hold early action offset credits that could not come into the program even though they meet the requirements. For this reason, we added a back-up mechanism to allow the

individual holders of the credits to register with ARB and transition early action offset credits into ARB offset credits.

We believe that the new requirements provide sufficient time to transition to Compliance Offset Protocols. According to the regulation, the early action offset project may transition to a Compliance Offset Protocol any time before February 28, 2015, but must list or register with an Early Action Offset Program by January 1, 2014 (section 95990(c)(3)). We removed any requirements that restrict the earliest date that early action offset projects must transition to Compliance Offset Protocols. It is necessary for offset projects beginning February 28, 2015, to transition to Compliance Offset Protocols to ensure consistency in the program, and that all offset projects are following the rules of the regulation, including the rules in the Compliance Offset Protocols.

M-70. (multiple comments)

Comment: The registration, listing and issuance requirements in sections 95990(d), (e) and (h) seem to allow for a holder of early action offset credits to list, register and be issued ARB offset credits for a forestry project if the Early Action Project Developer does not list or register the project. This seems inconsistent with the summary accompanying the rules which states that: "New sections 95990(d)(1), (e)(1)(A), and (h)(5)(A) were added to clarify that Offset Project Operators or Authorized Project Designees for forest and urban forest offset projects that do not transition their early action offset projects to Compliance Offset Protocols must register with ARB for issuance of ARB offset credits. For these projects, the holders of the early action offset credits may not register, list, meet the attestation requirements, and seek issuance of ARB offset credits. Staff is requiring the project proponents to register in these cases to ensure that the CO_2 sequestered and credited by ARB remains sequestered and ARB has enforcement authority in the case of reversals from these projects." Holders of early action offsets from forestry projects should not independently be allowed to register or list an early action project or seek issuance of ARB offset credits. We recommend that the rules be clarified to conform to the statement in the summary. (TCF3)

Comment: PFT is concerned with the lack of clarity in section 95990(d) with regards to situations under which holders of credits from potential early action forest projects may list a forest project. Language in (d)(3) appears to indicate that only when a forest project operator transitions to the ARB Compliance protocol but has not registered the project for prior early action credits can a credit holder, as opposed to the project operator, list the same project for early action credits. However, there remain different interpretations of this sub-section in the project developer community. We request full clarification of the intent of this section as soon as possible, and request that credit holders not be given the ability to list forest projects under broadly defined circumstances, but only in the event that a project does transition to the compliance protocol, and has not listed the project for early action credits. (PFT4)

Response: We disagree that the holders of offsets from forest projects should not independently be allowed to seek issuance of ARB offset credits, and did not make this change. The regulation is designed to incentivize early action offset project operators to transition their projects to ARB for administrative simplicity and enforceability reasons and also seek issuance of early action offset credits for the purchasers and holders of those credits. If the project operator transitions the project to a Compliance Offset Protocol but does not want to seek early action offset credits, we believe the holders of the voluntary credits should be able to seek issuance, if the credits meet all of the requirements of section 95990. We encourage Offset Project Developers to work with the purchases of offset credits generated for their projects to transition them into ARB offset credits. The regulation is designed that if the project operator seeks issuance of early action offset credits, then the holders cannot. In this case, preference is given to the operator, for reasons mentioned above.

M-71. Comment: IETA still has concerns that the process for accrediting early action credits and transitioning them to ARB-certified offsets continues to be unreasonably burdensome. Specifically, New sections 95990(h)(6)(A), (B), and (C), still require the Offset Project Operator, Authorized Project Designee, or each holder of the early action credit seeking issuance of ARB offset credits to cumbersome processes for attestations. Again, while IETA understands these sections relate to ARB efforts to make early action offsets undergo consistent post-issuance provisions compared with compliance offset credits, holders of early action offsets cannot make the attestations outlined as these elements are beyond their control; and they will need to come under the purview of the original project verifier and ARB appointed verifier instead. IETA also notes ARB provided additional clarification to the provisions dealing with the conversion of forestry offsets to ARB early action offset credits. The newly modified draft rule, however, still does not identify a mechanism for how additional protocols will be considered and added to the list of existing eligible early action methodologies. To truly facilitate the development of an adequate pool of early action credits, IETA again suggests more clarity must be provided for how these early action protocols can be brought forward for consideration and approval. IETA recommends ARB amend section 95990 to include provisions for a transparent process that ARB will employ to consider, evaluate and approve additional early action offset protocols. (IETA4)

Response: We modified section 95990 to streamline the process for transitioning early action offset credits into ARB offset credits that can be used for compliance. This includes allowing holders/current owners of early action offset credits to transition them into the compliance program if the project developers do not do so in most cases. We did not eliminate the attestation requirements; however, we did make minor modifications to the wording of the attestations. These attestations are necessary to ensure ARB's enforcement authority and the integrity of the system.

In response to additional protocols this comment falls outside the scope of the second 15-day changes to the regulation; therefore, no further response is required. Responses to similar comments can be found in this category under the 45-day comment responses.

M-72. Comment: Section 95990(i)(1)(D)(3) states that ARB offset credits will be issued to the Offset Project Operator. This procedure creates three problems:

1. The Offset Project Operator cannot definitively establish which of its early action offsets are ineligible for ARB offset credits because they have been "retired, canceled . . . or used to meet any GHG mitigation requirements in any voluntary or regulatory system" as specified in section 95990(h)(7);
2. It puts the Offset Project Operator in the position of receiving and then transferring the ARB offset credits to the various holders of the early action offsets. Not only does this raise the issue of ownership and possession of the ARB offset credit, it also assumes that project developers are capable of competently and fairly administering the transfer; and
3. For early action projects developed under CAR Forest Project Protocol version 2.1, this section assesses the buffer contribution against the Offset Project Operator, thereby imposing a cost on the Offset Project Operator that should rightly be imposed on the holder if they want to receive an ARB offset credit. The holder of the early action offset got what it paid for—a CRT issued by CAR. If they want an ARB offset credit, they should cover the additional cost attendant to the buffer pool requirement.

These concerns can be readily addressed by having the "issuance" of an ARB offset credit consist of ARB posting the serial numbers of the accepted early action offsets in exchange for which ARB is prepared to issue an ARB offset credit. That way, each holder could then present their early action offsets and received its ARB offset credits after ARB deducts the appropriate buffer amount AND the holder attests that the early action offset has not been retired or used in another program. (TCF3)

Response: In regard to point 1, we do not believe that is necessary for the Offset Project Operator to make this distinction. We will only issue ARB offset credits for serial numbers of those early action offset credits that meet the requirements of this section. We will work with the Climate Action Reserve to determine which offset credits have already been retired.

In regard to points 2 and 3, we understand your concerns. We encourage offset project developers to work with holders of early action credits in good faith to transition their early action credits to the ARB program. We do not believe the buffer pool issue will be that significant as the voluntary program will release any contributions from the buffer pool in the voluntary program to ARB. We will work with stakeholders during implementation and, if needed, recommend changes as part of future rulemaking.

M-73. Comment: CERP suggests that ARB use the Final Statement of Reasons as a vehicle to clarify how the individual credit holder system will function. Some questions to be considered include:

- Will a number of different credit holders be able to submit paperwork?
- What if one verifier for one credit holder finds that it agrees with "reasonable assurances" that the initial verification was correct during the desk review, and another finds that a full verification should be required?
- How will ARB deal with discrepancies between paperwork generally?
- How will credits move between project developer and individual credit holder? (CERP5)

  Response: Each credit holder seeking issuance of ARB offset credits must submit the information required in section 95990(e)(2). If there is a discrepancy in the paperwork submitted, ARB will work with the holders and Early Action Offset Program to resolve the discrepancy. Our preference is that one regulatory verification will be performed for each Offset Project Data Report and that the Early Action Offset Program or the Offset Project Operator will facilitate this verification for all credit holders so that ARB only receives one verification opinion. On the last question, we will develop guidance documents as part of implementation or, if needed, recommend changes as part of a future rulemaking.

M-74. Comment: We believe the language in section 95990(d)(3) causes confusion in that project operators have until February 28th, 2015 to transfer their projects to the compliance protocol. The existing language seems to allow for the possibility of a credit holder listing a project prior to the forest project operator having made the final decision or actually taken the action to transition their project to the compliance protocol. We request that this sub-section be clarified to mean that the holder of potential early action credits cannot list the project until AFTER the project operator actually has transitioned to the compliance protocol. (PFT4)

> **Response**: We designed the program to incentivize and streamline the process for early action offset project operators to transition their projects to ARB. Early action offset credits may not be issued until the offset project lists with ARB, so that we can be certain of the decision to transition the project to a Compliance Offset Protocol.

M-75. Comment: ARB has introduced regulations that address the requirement that forestry owners register with ARB unless they are certain to be joining the compliance program. CERP understands that ARB must at all times have a continual link to a forestry project for permanence reasons, however notes that it is onerous for the entities involved in a forest project to be required to decide for certain in 2012 whether it is going to transition to a compliance protocol in 2015. (CERP5)

Response: We are unclear as to which 2012 deadline the commenter is referring. According to the regulation, the early action offset project may transition to a Compliance Offset Protocol any time before February 28, 2015, but must list or register with an Early Action Offset Program by January 1, 2014 (section 95990(c)(3)). We removed requirements that restrict the earliest date that early action offset projects must transition to Compliance Offset Protocols. Early action offset credits may not be issued until the offset project lists with ARB, so that we can be certain of the decision to transition the project to a Compliance Offset Protocol.

M-76. Comment: Many owners of early action forest projects will be unable to transition their projects to ARB. Large volumes of otherwise ARB-compliant offsets, registered under ARB-approved protocols and registered with ARB-approved Early Offset Programs, will therefore be excluded from the compliance market. This is because holders of these credits will be unable to independently apply for ARB Offset Credits under the terms of this section. This is an unnecessary constraint as any risks associated with these offsets can be mitigated by other means. We recommend that the holders of credits verified under ARB-approved Early Offset Programs should be issued ARB Offset credits subject to that holder's assumption of all responsibility for regulatory verification requirements, as well as future invalidations and reversals not compensated for by the Early Offset Program's risk mitigation approach. (BLUESOURCE3)

Response: We disagree that many forest offset projects will not be able to transition to Compliance Offset Protocols. We designed the program to incentivize and streamline the process for early action offset project operators to transition their projects to ARB. If the operator transitions to a Compliance Offset Protocol, the holders of early action offset credits will be able to bring them into the program.

M-77. Comment: Section 95990(h)(5)(A) removes the ability for a holder of forestry EAOCs to submit these to ARB to receive ARB offsets. There have been numerous transactions where forest owners have sold offsets to intermediaries that can no longer be used for compliance unless the forest owner signs the attestation. Since the transaction has already taken place, the forest owners are under no obligation to sign the attestation and the buyer cannot receive credit for early action which is one of the principles of the ARB process. We recommend that ARB allow holders of forestry EAOCs to submit these to ARB and receive ARB offsets without the forest owner signing the attestation. The holder should be held liable for replacing invalidated offsets. (FINITE2)

Response: Offset Project Operators or Authorized Project Designees for forest and urban forest offset projects that do not transition their early action offset projects to Compliance Offset Protocols must register with ARB for issuance of ARB offset credits. For these projects, the holders of the early action offset credits may not register, list, meet the attestation requirements, and seek issuance of ARB offset credits. We are requiring the project proponents to register in these cases, to ensure that the CO_2 sequestered and credited by ARB remains sequestered and that ARB has enforcement authority in the case of reversals from these projects. If the Offset Project Operators or Authorized Project Designees for forest and urban forest offset projects do transition their early action offset projects to a Compliance Offset Protocol, we are allowing the holders of these credits to take actions for these early action offset projects because there is no risk of reversal for those offset projects. If the forest or urban forest offset project is transitioning into the compliance offset program, ARB can monitor and address reversals in the future because the Offset Project Operator or Authorized Project Designee will be part of the compliance offset program.

M-78. Comment: In previous public comments, Evolution Markets advocated for regulatory changes to streamline the process for the conversion of early action offset credits (EACs) to ARB-issued offsets. Reducing the administrative burden and simplifying the conversion process will bring more offsets into the system in the early years of the program, where their cost containment benefits can be fully realized. ARB's most recent round of proposed changes take important steps to effect this streamlining of the system. These include:

1.) Holders of Allowances Permitted to Manage Conversion Process: New language proposed by ARB will allow the holders of EACs, in addition to project operators and authorized project designees, to register projects for conversion. This provides credit buyers the ability to manage the conversion process without relying solely on the project owner, and Evolution Markets supports this rule change.
2.) Streamlining of Desk Review: The desk review of EACs submitted for issuance as ARB offsets has been streamlined by requiring the verifier simply review the verification statement for issuance under an approved early action protocol and eliminates a threshold of a 3% material misstatement as a trigger for full re-verification. Evolution Markets believed that the 3% level would have created an unnecessarily large amount of reviews, which could impede the generation of an early supply of credits. The newly proposed process will maintain environmental integrity of the program, while ensuring a process for adequate offset supply.
3.) Create Accreditation Program for Project Verifiers As Soon As Possible: An important factor in ensuring a sufficient supply of early action credits for use in compliance will be the availability of verifiers. A lack of verifiers not only has the ability to restrict supply but introduces an element of uncertainty in the timing of credit supply that has corresponding price risk for compliance buyers of offsets. Evolution Markets has encouraged ARB in the past to create the accreditation program for project verifiers as soon as possible.

ARB has recognized this need, and staff has indicated that this program will begin in earnest at the conclusion of the rulemaking process. Evolution Markets continues to recommend ARB make the creation of the accreditation program for verifiers a priority upon the completion of this set of rule changes. Efforts to establish the accreditation program and initiate the accreditation process will allow holders of qualifying offsets to begin the process of conversion to ARB offset credits in advance of the onset of compliance obligations, ensuring a robust early supply of offsets to be used as a cost containment mechanism. (EVMKTS3)

> **Response:** Thank you for your support. The verifier and verification body accreditation program established in the MRR for purposes of emissions reporting will be expanded to include the accreditation of verifiers and verification bodies for offsets. We are in the process of developing the training for offset verifiers, and plan to accredit offset verifiers in 2012.

Regulatory Verification of Early Action Offset Credits

M-79. Comment: CERP again recommends that ARB change the regulations so that an original verification by an ARB-accredited body is adequate, provided that the body attests to the accuracy of its verification. (CERP5)

> **Response:** We did not make a change to the requirements for independent review. The commenter’s suggestion is contrary to the basic premise that an offset project be subject to an internal independent review, to ensure that the verification process and findings are appropriate for the offset project.

M-80. Comment: We urge ARB to go further to provide smaller-scale projects increased flexibility by, for example, not requiring smaller-scale early-action projects undergo a costly review and possible re-verification and setting the threshold for invalidation of emission reductions generated by these projects to a minimum of 1,250 (5 percent of 25,000)—avoiding a situation where a project has to undergo a full re-verification costing over $10,000 for a small number of emission reductions. Limiting the Statute of Limitations provisions further for projects generating less than 25,000 would also stimulate demand amongst buyers to support smaller-scale project and lower costs for project developers. (CIG3)

> **Response:** We modified section 95990(f) to clarify the requirements for regulatory verification of early action offset projects. New section 95990(f) includes new requirements for regulatory verification that is intended to streamline the process and minimize costs associated with converting the voluntary offsets into compliance offsets that can be used for compliance.
>
> AB 32 requires all offset credits used for compliance purposes to be subject to regulatory verification, and ARB cannot rely on a non-regulatory program to perform regulatory verification of offsets that will be used for compliance. AB 32 requires that all offset credits used for compliance be based on the result of regulatory verification.

M-81. Comment: For clarity, revise section 95990(f)(1)(B) as follows:

(B) "Review of the data checks conducted by the offset verification body for the Early Action Program to ensure they were calculated ~~correctly;~~ <u>in accordance with the applicable offset quantification methodology.</u> (TCF3)

Response: We will consider this request in a future rulemaking as we continue to evaluate how to make these provisions more clear.

Sector-Based Crediting

M-82. Comment: Sector based offsets should not be limited to the U.S., Canada and Mexico in section 95991. Modify section 95991 as follows:

Sector-based offset credits may be generated through reduced or avoided GHG emissions from within, or carbon removed and sequestered from the atmosphere by a specific sector in a particular jurisdiction. The Board may consider for acceptance compliance instruments issued from sector-based offset crediting programs that meet the requirements set forth in section 95994 and originate from developing countries or from subnational jurisdictions within those developing countries~~, except as specified in subarticle 13.~~ (CCEEB4)

Response: We did not make the suggested edit. This comment is premature, and is best addressed when ARB considers REDD credits.

Air District Comments Regarding Offsets

M-83. Comment: The regulation still contains restrictions that an organization cannot perform multiple roles. SCAQMD may wish to run an offset registry, but this is currently precluded in Section 95986, which has a requirement that to be an Offset Project Registry, it must be the organization's primary business. Further, an organization that runs a registry cannot perform many other functions related to offsets, such as run projects or verify offsets. As detailed in previous correspondence from CAPCOA, in the August 11, 2011 comment letter from SCAQMD and in briefing materials prepared by SCAQMD staff for Secretary Linda Adams (November 9, 2010) and Ms. Nichols (December 9, 2010), SCAQMD supports the previously requested language from CAPCOA. The following language will allow SCAQMD and other air districts to administer offset registries. Add section 95989 as follows:

<u>Section 95989. California air pollution control districts or air quality management districts Notwithstanding any other provision of this regulation, California air pollution control districts or air quality management districts may be approved for multiple roles, including verification for mandatory reporting or offsets, holding compliance instruments, implementing offset projects that are verified by a third party and approved by CARB, and running a Registry, provided the appropriate training, certification, or approvals are obtained from CARB. Decisions on such approval requests will be provided in a timely fashion.</u> (SCAQMD5)

Response: Air districts are able to participate in the cap-and-trade program, but they must meet the eligibility and conflict-of-interest requirements in the regulation for whichever role(s) they decide to take. The cap-and-trade regulation provides for distinct roles within the compliance offset program. The roles include project developers, offset verifiers, and approved offset project registries. There is a careful separation of roles for offset project developers, verifiers, and registries to keep in place a system of independent checks and balances throughout the whole offset system. This parsing of roles is consistent with international standards and best practices, as well as program elements developed within the Western Climate Initiative, and applies to all participants (private and non-private) that choose to be part of the compliance offset program.

In Resolution 11-32, the Board directed the Executive Officer to partner with the air quality management districts and air pollution control districts in the implementation of the cap-and-trade regulation, including, but not limited to, an evaluation of the impacts of the cap-and-trade program on industrial source greenhouse gas permitting and implementation of the Adaptive Management Plan. The Board further directed the Executive Officer to report back periodically to the Board on the nature and extent of this partnership with the first report due in the first quarter of calendar year 2012.

M-84. Comment: We commend the changes made to resolve the previous conflict of interest requirements preventing Air Districts to act as verifiers within their own jurisdiction and support CARB staff for their work on the development of this regulation. (SCAQMD5)

Response: Thank you for your support.

Tribal Lands

M-85. Comment: The definition of "Tribe" has been broadly expanded to include "any entity" created by a Tribe. This definition could mean virtually anything according to the definitions, and affects offsets protocols. This change is so broad that we can only imagine the potential effects, which are quite negative. We didn't see any evaluation supporting such a change. This is very troubling since there is a trend toward siting harmful entities on tribal lands, which are frequently contested by tribal members, but approved by tribal governments. CARB should not be in a position of encouraging use of tribal lands for potentially harmful activities. Many tribal members are fighting new and major pollution sources on tribal lands in the U.S. and are fighting their own tribal governments, which, like other local governments in the U.S., sometimes rubber-stamp heavy development projects without full review. The effect of CARB setting such broad definition changes listed above might even allow a nuclear power company to be considered a "Tribe" under this provision or allow "clean" coal projects. The added language on "any entity" should be struck entirely. (CBE3)

Response: ARB disagrees with the commenter that "any entity" should be struck and has not made this change. The commenter cites to "trends" without any factual support, so ARB is not able to more fully respond to the comment. ARB has sufficiently justified all changes made to the regulation and incorporated protocols. The word "Tribe" in the regulation only relates to offset projects under approved offset protocols. The commenter seems to be extrapolating this definition to imagined negative impacts from increasing industry around tribal areas, which is a concern that is broader than the context of the regulation or offsets. The added language was included to ensure that any limited waiver of sovereign immunity by a Tribe would include entities created by Tribes within the waiver—i.e., so an entity created by a federally-recognized Tribe would not be able to assert a sovereign immunity defense to any ARB action.

M-86. Comment: TWS appreciates the language ARB has added in the Forest Protocol and the Second 15-day Change Notice to clarify the eligibility of Tribal lands for reforestation and improved forest management programs. (TWS2)

Response: We appreciate the support.

Other Offset-Related Comments

M-87. Comment: Regulated entities should be allowed the flexibility of banking unused offsets on a year-to-year basis. (CALCHAMBER4)

Response: Section 95922(c) establishes that ARB offset credits do not expire unless retired or surrendered to meet a compliance obligation.

M-88. Comment: CERP seeks assurances that the new language in section 95971(b) will not override the critical principles in other parts of the regulation that: (1) revision of a Protocol shall not affect the validity of credits already issued under the original version of that Protocol; and (2) any offset project shall be subject to the version of a Compliance Offset Protocol in effect when its crediting period began for the duration of that crediting period. CERP requests that ARB clarify these principles in the Final Statement of Reasons. (CERP5)

Response: It is our intent that an update to a Compliance Offset Protocol will not affect the validity of credits issued under an earlier version, and that an offset project may continue to use the version of the Compliance Offset Protocol that was in effect when its crediting period began for the duration of that crediting period.

M-89. Comment: VCSA notes that section 95972(a)(9) of the modified draft regulation text has been redrafted to clarify "standardized methods." VCSA has recently issued for public comment draft requirements for two specific approaches for standardizing the determination of baselines and additionality. The two methods are performance methods and activity methods. Performance methods set performance benchmarks, or metrics, for determining additionality and/or the crediting baseline. Project activities that meet or exceed a pre-determined level of the performance metric (e.g., a given level of CO_2e emissions per unit of output) may be considered additional, provided they also meet other qualifying criteria). A performance benchmark can also serve as a baseline for crediting GHG emission reductions and removals. Activity methods use a positive list to pre-determine additionality for given classes of activities. Project activities may qualify for a positive list if they are not financially viable without carbon finance, have no revenue streams other than carbon finance, or have low rates of adoption in the marketplace. An activity that qualifies for a positive list is automatically deemed to be additional. The draft requirements are the product of a VCS-convened expert committee comprised of individuals representing a broad range of stakeholders knowledgeable in the effective functioning of GHG programs including methodology and project developers, environmental non-profit organizations, GHG program regulators, validation and verification bodies, and businesses. VCSA would be happy to schedule a briefing specifically for ARB staff to discuss the relevance and applicability of its work on standardized approaches to the California offset program design. (VCSA2)

> **Response:** We understand the methods for determining additionality and establishing baselines. We believe that the process and methods established in the regulation reflects the most accurate and efficient way to establish additionality. Our offsets program is designed to rely on standardized assessments of additionality established by ARB through a public process.

M-90. Comment: We recommend adding the words "and Review" to the title of section 95971 to reflect the addition made to that section. Modify section 95971 as follows:

> section 95971. Procedures for Approval <u>and Review</u> of Compliance Offset Protocols. (UCS8)

> **Response:** We did not make this change. We believe the intent of the provisions in this section are clear.

M-91. Comment: TWS continues to urge caution with respect to any further efforts to make federal lands eligible to generate offset projects for the California cap-and-trade program. As we noted, in our August 11, 2011, comment letter on the California Cap-and-Trade Regulation, any commitment of federal land agencies to manage for increased carbon sequestration, and especially participation of these agencies in private offset markets must be consistent with their broad public mission and fully protect other public benefits. A thorough public and scientific review is necessary to develop a cohesive national policy regarding the appropriateness of use of federal lands in any offset program. As an attachment to this letter, TWS submits for ARB's consideration a January 2010 letter from six national environmental organizations to the U.S. Department of Agriculture and the U.S. Department of the Interior, further outlining potential issues associated with offsets on federal lands. (TWS2)

Response: Federal lands are not eligible to participate in the offset program. We understand the challenges that are involved in applicability of the program to federal lands and will continue to monitor the issue. Any future decision to allow offset projects on federal lands would be part of a full rulemaking, including a stakeholder review process.

M-92. Comment: PG&E is concerned about reducing the percentage of sector-based credits allowed in the second compliance period. Reducing the use of sector-based offsets from 50 percent to 25 percent will put strain on an already limited market. PG&E's analysis shows that supply will only be approximately 60 percent of the allowed supply in the first compliance period, even if the pneumatic controllers, rice cultivation, and fertilizer management protocols are adopted early next year. PG&E expects more significant shortfalls in the second and third compliance periods, absent adoption of additional protocols. (PGE5)

Response: We recognize stakeholder concerns regarding offset supply. ARB is prohibited from adopting additional protocols as part of this cap-and-trade rulemaking. All offset protocols used in the compliance program must be adopted by the Board after undergoing a full regulatory process, including an ARB stakeholder process, in accordance with the Administrative Procedure Act, and an environmental review. We plan to look at further offset protocols for potential inclusion in the cap-and-trade program beginning in 2012. The details surrounding any new offset project types for which ARB adopts an offset protocol will be dealt with under that specific rulemaking, and modification will be made to the cap-and-trade regulation as needed.

We will continue to evaluate whether the four project types already approved for use in the program could be expanded to apply to projects located in the United States, U.S territories, Canada, and Mexico. Any changes to the already adopted protocols will be done as part of a separate rulemaking process to ensure that the GHG reductions and GHG removal enhancements being credited as offsets are real, additional, quantifiable, permanent, verifiable, and enforceable.

N. PROTOCOLS

Forestry Protocol

Clearcutting

N-1. Comment: CARB did not provide an analysis of the environmental impacts of clearcutting the forests providing offsets after 100 years. CARB should calculate the maximum emissions increase that could occur, and other environmental impacts that could occur with such clearcutting at the time of expiration at 100 years. (CBE3)

> **Response**: Any GHG reduction or removal for sequestered carbon that is issued an offset credit by ARB will need to be maintained for the period of 100 years. While the existing cap-and-trade program is initially set to continue through 2020, ARB has a designed a program that can and is expected to continue in operation well beyond that year. There is nothing provided by the commenter to substantiate that any sequestered carbon stocks would automatically be subject to clearcutting after the 100-year commitment has expired, and depending on the end fate of any harvested forest, some wood use, such as furniture, may continue to sequester that carbon.

100-Year Offset

N-2. Comment: The forest protocol requires landowners to continue to monitor, verify and replace all carbon lost through reversals for 100 years following the last issuance of credits. This requirement currently exists in the voluntary market and has regularly been cited as the primary reason impeding forest carbon project supplies. As such, ARB offset supply projections from the forest sector should expect severely limited forest carbon supplies in the compliance market if a more flexible permanence period is not possible. (TCT2)

> **Response:** We did not reduce the period for ensuring permanence. Ensuring permanence is essential to the environmental integrity of the entire cap-and-trade program. Because offsets allow for an equivalent quantity of GHG emissions within the capped sectors, the CO_2 stored in biological sinks resting from offset project activities must stay out of the atmosphere for a time period comparable to the emissions they are offsetting. If they do not, the net effect would be an increase in GHG emissions to the atmosphere. Scientific estimates of the atmospheric lifetime of anthropogenic CO_2 emissions are uncertain, as CO_2 is removed from the atmosphere by a number of processes that operate at different timescales. However, 100 years should really be viewed as a minimum time period for maintaining permanence because a fraction of anthropogenic CO_2 is expected to remain in the atmosphere well beyond 100 years as it is gradually removed through processes such as silicate weathering. The period of 100 years is frequently used in international climate change policy as a standard frame of reference for determining global warming potentials and setting GHG

emission reduction targets. Consequently, the use of 100 years to define the permanence of reductions is consistent with other programs.

Credit Calculations

N-3. Comment: While this version of the proposed ARB approach to measuring the global climate benefits of using wood waste for renewable energy continues to be in sync with other State, national, and international approaches (i.e. clear global benefits when produced as a by-product of sustainable forestry and a low-waste systems of using wood products rather than other energy-intensive products), this position appears to contradict one of the forest offset protocols authored by the non-governmental organization Climate Action Reserve (CAR). Continued reliance on the CAR formula will overestimate global climate benefits. By not considering the renewable energy generated by burning wood waste, the CAR formula effectively assumes all wood waste used for energy is a negative outcome from a global carbon cycle perspective. Unless the formulas used in CAR forest protocols are clarified and properly take into account emissions and benefits associated with wood products, there is the risk that overpriced and artificially inflated offsets will enter the system and later, need to be adjusted downwards.

Section 95852.2 clearly defines that the carbon dioxide emissions from energy produced from mill residues and post-consumer wood waste and wood and wood waste from regulated sustainable forestry operations, are "emissions without a compliance obligation." This approach is in sync with CEC, CPUC, U.S. EPA, and every country that signed the Kyoto Protocols. They all count wood residues used for energy as a climate benefit.

Further, in the Compliance Offset Protocol U.S. Forest Projects document (authored by a party that other than ARB (who is the responsible entity for representing the State of California), there are 13 references for details on how many pollution credits will be given to projects referring to 'the Forest Offset Protocol Resources section of ARB's website.' They all hotlink to http://www.climateactionreserve.org/how/protocols/adopted/forest/resources/.

It is clear that the ARB regulations put out for public comment are incorrect as this link is not to an ARB website but to a non-governmental site that has not been properly vetted through appropriate governmental channels and notification requirements. Upon close examination of the formulas, the site uses a very different approach than Article 5 with regard to accounting of climate benefits of wood wastes used for energy. This is important in California since we have no significant paper mills that use wood chips but do have a many wood-to-energy plants that generate renewable electricity. While there are many metrics used to measure wood (e.g. board feet, cubic feet, green tons, bone dry tons), the most recent survey of sawmills in California and other Pacific Coast states calculated that only one-half of the wood volume coming into the sawmill on log trucks leaves the sawmill as dimensional lumber (shown below in 'Table 3' from Keegan et al (2010)). National survey data of harvest sites and sawmills published in tables 39 and

42 in Forest Resources of the United States, 2007 (Smith 2009), also confirm that around one-half the initial total biomass from a harvested forest does not end up in dimensional lumber or products made from wood chips such as oriented strand board (OSB). A significant portion of the wood not going into dimensional lumber in California is used for energy.

Since only long lived wood products are considered as a climate benefit under the CAR formulas, all the wood waste used to generate renewable energy is essentially considered a negative outcome in the 'baseline harvest scenario' where wood waste is used for energy. The reduction of harvested wood used for energy is therefore credited as a climate benefit in the 'improved forest management (IFM) project' based on a 'with and without comparison.'

When measuring climate benefits under the 'with project' and 'without project' scenario, IFM projects form the basis for deciding how many pollution credits a project earns when sold through CAR. The CAR protocols continue to count all the carbon in wood residues used to generate energy as a 100 percent emission rather than as a true carbon benefit that can be measured by the avoided emissions from fossil fuel burning. This is a critical distinction between the CAR formulas and the proposed ARB regulations designed to govern the use of carbon credits in a reputable Cap and Trade program.

The CAR formula significantly inflates the apparent climate benefits of an IFM project since all the wood residues used for energy from the logging operation, the sawmill operation and post-consumer collection operations are considered as emissions rather than substitutions for fossil fuels. After the useful lifetime of wood products is over, much of the construction debris and wood is collected and burned to generate renewable energy in urban waste-to-energy plants. These benefits also appear to be ignored in the CAR accounting scheme. The net result of this accounting approach is that one ton of CAR-defined emission offset credits from an IFM project based on reduced levels of products should be discounted by the CO_2produced from the fossil fuels used to generate the renewable energy will not be generated from wood waste. If this distinction is not made and accounted for early in the verification process, there will be a net increase in global emissions for every IFM credit authorized. The fact that wood used for energy is not considered 'carbon neutral' by CAR could inflate the number of credits by 50 percent or more. This inflation factor will further flood and erode the "market" with over-valued credits, thus contributing to questions about the accounting controls over the carbon market economy.

The climate advantages of RPS-energy are well documented and are an integral part of State policy (California Energy Commission 2009) because they increase carbon sequestration of fossil fuels that can stay buried rather than be burned to generate energy for Californians. However, it appears that the accounting formulas buried deep inside the CAR forest offset protocols will end up allotting tradable carbon credits for projects that reduce historical and sustainable levels of renewable energy production. This may have been an unintended outcome of a fairly lengthy and complex protocol.

Since these regulations are authored by ARB rather than the non-governmental Climate Action Reserve, it would seem necessary for the calculations of the climate benefits related to wood waste used for energy to match those in “Article 5: California Cap on Greenhouse Gas Emissions and Market-Based Compliance Mechanisms” rather than rely on information and formulas posted on a website outside of the control of ARB. This will require more than pasting and copying the CAR webpages to ARB web pages, since the overarching ARB regulations define wood use for energy as essentially carbon neutral. (UCB3)

> **Response:** It is appropriate for the forest protocol to treat wood residues as “waste.” Any benefits created by the combustion of these residues at capped sectors as replacement of fossil fuels is accounted for appropriately under the MRR and exemptions in the regulation.

N-4. Comment: The quantification calculation (section 6.2.6) is done annually and does not take into account timing of harvest and would require secondary effects contributions from projects that over time increase harvest above average baseline carbon harvests and thus have no reduced harvesting secondary effects. Since a project that increases onsite carbon additionality and increases offsite storage of carbon in wood products is sequestering the maximum carbon dioxide, such a result (project) should not be discouraged. This methodology also applies the 20 percent multiplier to total onsite carbon harvested when the leakage effect is only applicable to the harvested wood products, since all other pools are required to be stable or increasing, this over-estimates the leakage effect. The required on-site stock maintenance or increase takes care of the carbon in the non-product portions of harvested trees at issue. An identical over-estimate occurs in the contribution to landfills for those projects that harvest more than baseline. See Appendix C in Section C.4. This calculation requires landfill deductions even though the project increases wood product production as compared to baseline. We believe further discussion of C.4 and section 95976 is warranted. (CFA3)

> **Response:** We understand the commenter’s concern about the quantification of secondary effects (emissions leakage) due to decreased harvest; however, the forest offset protocol adopted by ARB addresses this concern already with a change that was initially incorporated into version 3.2 of the Climate Action Reserve forest project protocol and subsequently into ARB’s protocol. In section 6.2.6, when secondary effects due to harvest are evaluated, the differences between actual and baseline harvest for the current and all previous years are summed. If the result is that actual harvest has exceeded baseline harvest over the life of the project, then the discount is not applied in the current reporting year. However, if the baseline harvest has exceeded actual harvest, then the deduction is applied in the current reporting year. The equation that addresses carbon in harvested wood products entering landfills functions in the same manner, by evaluating the summed difference between actual and baseline

carbon entering landfills over the project life before determining if the deduction will be applied in the current reporting year.

The application of the secondary effects deduction for reduced harvest to total onsite carbon harvested (rather than only the carbon entering wood products) is appropriate because the full effects of emissions leakage involves all the carbon in the harvested trees, and not just the wood products. The deduction for the secondary effects is only applied once, and we do not agree that the onsite carbon stock maintenance requirements account for the non-product portion of the emissions leakage.

Easement

N-5. (multiple comments)
Comment: The protocol requires Avoided Conversion projects use a Qualified Conservation Easement (or transfer to public ownership). For most if not all owners of forest projects with historic easements and start dates, it will be impossible to petition easement holders to bear the administrative and legal costs of evaluating potential new liabilities established by the addition of Qualification language, and then re-drafting, executing and registering the modified easement. As a result, credits from Avoided Conversion projects registered under Early Offset programs or with historic start dates will be almost entirely excluded from the AB32 compliance market. We recommend that ARB modify the definition of Avoided Conversion projects to those "preventing the conversion of forestland to a non-forest land use by dedicating the land to continuous forest cover through a conservation easement or transfer to public ownership," matching the definitions and requirements for Avoided Conversion projects of the Climate Action Reserve's Forest Project (FPP 3.1 & 3.2, Section 2.1.3). (BLUESOURCE3)

Comment: The protocol requires that while an IFM project may have a Qualified Conservation Easement, it is not required. However, Qualified Conservation Easements are required for avoided conversion projects. We assume there will be no landowners who will adopt a Qualified Conservation Easement under ARB due to the requirements. This is a minor issue for IFM projects since they will still be eligible for ARB offsets (although they will suffer a discount due to increased buffer pool contributions). However, the requirement for a QCE for an avoided conversion project will be a significant obstacle since projects without one will be ineligible. While it may be possible to include a QCE in a new conservation easement, it will be nearly impossible to have any historical easement modified to include the language required by ARB to be considered a Qualified Conservation Easement. We request that ARB allow avoided conversion projects with easements prior to February 28, 2015 to be allowed to register with ARB without a QCE and that any project already registered or listed be allowed to continue without amending its current easement. (FINITE2)

Response: We did not make a change, as the protocol is explicit in the types of rights provided to ARB in the conservation easement. We made modifications to terminate ARB's interest in the easement if the forest project has met its carbon commitments or been terminated. We believe the requirement for ARB inclusion in the conservation easement is essential to our ability to ensure permanence in the offset project.

N-6. Comment: In regards to section 3.5, Use of Qualified Conservation Easements, we would like to reiterate this point from our comments submitted on August 11th: We understand the need for ARB to have the ability to intervene in conservation easement issues that relate to carbon offset projects. However, we think that ARB having the same enforcement authority as the easement holder, and broadly defined to encompass all aspects of an easement, is overly broad and could create confusion about roles and responsibilities. We think it is more appropriate to 1) narrow ARB's scope of concern to provisions of easements that affect the integrity of offset projects, and 2) to clearly define the time at which it is appropriate for ARB to intervene in the execution and enforcement of the easement. We believe that requiring holders of qualified conservation easements for carbon offset projects be accredited by the Land Trust Accreditation Commission should provide a layer of assurance that easements will be properly executed and ARB should only have the right to intervene when such land trusts have demonstrably failed to enforce provisions of qualified easements that adversely affect carbon projects. We would like to work with ARB to craft acceptable language. (PFT4)

Response: While the commenter provides some specific cases on how and when ARB's interests could be limited in a conservation easement, we did not make the change. These requirements are written broadly, as we cannot anticipate all situations under which we may need to exercise enforcement authority or intervene to ensure that the permanence requirements of the offset project remain intact. No other commission can substitute for the regulatory enforcement duties of ARB in implementing its programs.

Early Action

N-7. Comment: The proposed modifications include some positive changes to require offset projects to transition to more recent versions of the Forest Offset Protocol in the future, and even to recalculate the project baseline at the time of transition. For example, "[a]t the time of transition the early action offset project must calculate its project baseline based according to all the provisions in Compliance Offset Protocol U.S. Forest Projects . . . ." However, the regulation continues to allow the registration of early action credits generated under earlier versions of the protocol with no evaluation of the additionality of those credits. "ARB shall accept early action offset credits from early action offset projects registered with Early Action Offset Programs approved pursuant to section 95990(a), if the early action offset credits meet the criteria set forth in this section." In fact, the only substantive requirement for registration of early action forest offset credits is the contribution to the buffer account; that account, of course, is intended to mitigate the risk of reversal, not non-additionality. See section 95990(c)(5)(D) ("Climate Action Reserve Forest Project Protocol versions 2.1 and 3.0 through 3.2, if the early action offset project contributes early action offset credits into a buffer account based on its reversal risk calculated according to the Compliance Offset Protocol U.S. Forest Projects, [DATE]."). It therefore appears that offset credits from forest projects registered as early actions using version 2.1 of the Forest Offset Protocol can continue to be registered through 2015 even if the forest project does not choose to transition to the compliance program. "Early action offset projects must transition to ARB Compliance Offset Protocols no later than February 28, 2015." Therefore, non-additional credits can continue to be registered, and indeed can continue to be generated through 2015, using the non-additional baseline requirements of Forest Offset Protocol version 2.1. (CBD5)

> **Response:** At the time of initial crediting in the voluntary program, the early action projects had to meet the additionality requirements of the voluntary offset protocol and the early action program. Once an early action offset project transitions to ARB, it must meet the additionality requirements of the Compliance Offset Protocol and regulation. We believe the early action credits that would be eligible to be issued ARB offset credit for the early action protocols are additional.

N-8. Comment: The intent behind the requirement in the Forest Protocol for voluntary projects to meet "all legal and contractual requirements to allow it to terminate its project relationship with the voluntary offset program" is confusing and could pose unintended consequences. As written, it would require an Early Action project that does not plan to transition (as allowed under sections 95990(d)(1) and (h)(5)(A)) to terminate its contracts with the Climate Action Reserve and with all parties to whom they have sold their credits. This language as written could eliminate Early Action projects in California from participating in the cap-and-trade program and conflicts with the language in section 95990. PG&E recommends that this language be modified as follows:

> "If the offset project was an offset project in a voluntary offset program, <u>other than the Climate Action Reserve,</u> the offset project can demonstrate it has met all legal and ~~contractual~~ <u>protocol</u> requirements to allow it to terminate its project relationship with the voluntary offset program and be listed using this compliance offset protocol." (PGE5)

> **Response:** The requirements in the Compliance Offset Forest Protocol only apply to projects that transition over to the compliance program. They do not apply to Early Action Projects. The commenter has erroneously applied compliance project requirements to Early Action Project requirements, which is not the intent.

Forest: General

N-9. Comment: Per section 6.2.1.1 (page 50 of the Compliance Offset Protocol for U.S. Forest Projects, Sept. 2011), a 'logical management unit' or 'LMU' must where even aged management is utilized, have a uniform distribution (by area) of 10-year age classes that extend to the normal rotation age (variation of any 10-year age class not to exceed 20 percent. This is an impossible test as most areas have histories which prevent this uniform distribution by age class and if there is any necessary test on age class distribution it is already included in the project requirements for Natural Forest Management under Section 3.8.2 and shown in Table 3.2. (CFA3)

> **Response:** We understand the concern that the definition of a Logical Management Unit (LMU) may not be readily applicable to all management situations. However, the forest protocol recognizes this possibility, and offers an alternative approach that is similarly conservative in evaluating whether carbon stocks within the project area are significantly different from the forest owner's broader management practices in the area. In situations where an LMU containing the project area cannot be identified, the protocol requires that an LMU instead be defined by all lands where the forest owner or its affiliate(s) either own in fee or hold timber rights within the same assessment area covered by the project boundary. This alternative definition should be readily applicable in the situation described by the commenter.

N-10. Comment: While very few pools would be affected by site prep, for early action projects this pre-site prep inventory cannot be measured (section 6.1.1). We suggest adding a professional estimate by an RPF based upon non-reforested areas nearby and including a specific requirement for the verifier to check this estimate for reasonableness. (CFA3)

> **Response:** The ARB Forest Offset Protocol requirement that carbon pools affected by site preparation activities must be conducted prior to any site preparation activities is contained in versions 3.0 through 3.2 of the CAR protocol, though the requirements are more detailed in version 3.2 and the ARB protocol. We are not aware of any early action reforestation projects under version 2.1 of the CAR protocol. Consequently, we do not see any barriers to transition for early action reforestation projects that followed the requirements in versions 3.0 through 3.2 of the CAR Forest Project Protocol and conducted inventories of carbon stocks prior to site preparation activities.

N-11. Comment: In section C.4, we believe the verifier could evaluate the project and determine if the project will actually harvest more than the baseline over the crediting period and correctly calculate these contributions. This decision can be reevaluated at each six year site visit and if needed be corrected in the inventory true-up process. (CFA3)

> **Response:** This comment falls outside the scope of the second 15-day changes to the regulation. Therefore, no response is required.

N-12. Comment: The default financial risk in section D.1 continues at 5 percent of all offset credits issued, which is far too high. There is no evidence of a 5 percent rate of financial failure for forest owners. The CAR Workgroup believed a 1 percent default financial risk for most projects and less than 2 percent for small non-capitalized projects was sufficient. We recommend ARB change the 5 percent to 2 percent and allow the verifier to consider forest owner capitalization and allow reduction to 1 percent. (CFA3)

> **Response:** This comment falls outside the scope of the second 15-day changes to the regulation. Therefore, no response is required.

N-13. Comment: We continue to believe the setting of a default for other Episodic Catastrophic Events is an error. The category is for places predominately outside of California. The verifier should provide the most appropriate value, if any. (CFA3)

> **Response:** The risk rating for episodic catastrophic events may cover a variety of risks not accounted for in other categories. At the outset of the cap-and-trade program, there are not sufficient data to determine if all the initial risk values used in determining the forest buffer account contribution have been calculated appropriately. However, in the absence of better risk data, we believe that it is important to err on the side of having the risk factors too high to ensure that there is a sufficient quantity of offset credits in the forest buffer account to cover any reversals in the early years. These risk ratings may be decreased or adjusted at a later time once more data are available on the rate of reversals due to various risks and the functioning of the forest buffer account. It is conceivable that these average risk ratings could be adjusted based on geography, eco-region, and other factors in the future, but it is not possible to conduct such an analysis at this time.

N-14. Comment: The provisions in sections 2.1.1, 2.1.2, and 2.1.3 of the forestry protocol are confusing and could inadvertently create problems for a wide swath of early action credits. It appears to require 100 percent of credits in a particular registry to transition, eliminating the possibly of selective transitioning according to need. CERP urges ARB remove such provisions from section 2.1.1, 2.1.2, and 2.1.3 of the Forestry protocol at this time, and add a process for credits from additional registries to be included in the compliance protocol as part of the next rulemaking, which is to take place next year. If ARB wishes to retain such language in the forestry protocol, it should at least modify the phrase “legal and contractual relationships” to state instead “legal and contractual obligations related to the offset credits in question” or make clear that such provisions do not apply to early action projects. (CERP5)

> **Response:** Those provisions only apply to projects that transfer over the compliance program. There is nothing in the protocols themselves about early action credits; therefore, those provisions do not apply to early action credits.

N-15. Comment: As we have stated in previous comment letters, the Compliance Offset Protocol U.S. Forest Projects (“Forest Offset Protocol”) contains provisions that fail to ensure compliance with the controlling additionality requirements of AB 32. Health and Safety Code section 38562(d)(2). The Forest Offset Protocol also is unlikely to ensure compliance with ARB’s proposed regulatory additionality requirements under Section 95973(a)(2)(A). In particular, as addressed in our previous comment letters, the

Forest Offset Protocol allows projects to include in the project baseline forest growth projected to occur under the business-as-usual scenario described by longterm management plans required for timber operations under the California Forest Practice Rules. Those flaws persist in the version of the Forest Offset Protocol currently before the Board; as a result, the protocol continues to fail the additionality test of AB 32. Additionality problems are even more serious in earlier versions of the Forest Offset Protocol, in which the business-as-usual baseline is allowed to reflect the regulatory minimum (i.e. maximum potential harvest levels), regardless of whether the project developer ever could or would have operated at that baseline. As a result, version 2.1 of the Forest Offset Protocol used in early action measures includes a definition of project baseline that facilitates and invites nonadditional credits to an even greater degree than the Forest Offset Protocol adopted by ARB as part of the cap-and-trade regulation. Yet ARB, in the current regulation, still proposes to allow credits generated under these prior versions of the protocol to be brought into the Cap-and-Trade compliance market as “early action” mechanisms. The result of this proposal will be the creation of a large number of demonstrably non-additional credits that will undermine the integrity of the compliance scheme as a whole and inhibit achievement of AB 32’s emissions reduction goals. (CBD5)

> **Response:** We agree with the importance of ensuring that all credited greenhouse gas emission reductions and removal enhancements from forest projects are additional. The performance standard tests in the protocol are designed to provide reasonable assurance that credited greenhouse gas reductions or removal enhancements meet the regulatory definition of additionality, which requires that greenhouse gas emission reductions or removals exceed any greenhouse gas reduction or removals otherwise required by law, regulation or legally binding mandate, and that they exceed any greenhouse gas reductions or removals that would otherwise occur in a conservative business-as-usual scenario.
>
> At the time of initial crediting in the voluntary program, the early action projects had to meet the additionality requirements of the voluntary offset protocol and the early action program. Once an early action offset project transitions to ARB, it must meet the additionality requirements of the Compliance Offset Protocol and regulation. We believe the early action credits that would be eligible to be issued ARB offset credit for the early action protocols are additional.

N-16. Comment: Section 95983 (page A-269) is intended to address the risk of reversal of forest projects. “The amount of ARB offset credits that must be placed in the Forest Buffer Account shall be determined as set forth in Compliance Offset Protocol U.S. Forest Projects.” That is, the contribution to the Forest Buffer Account is based on Appendix D, “Determination of a Forest Project’s Reversal Risk Rating,” at page 108 of the Forest Offset Protocol. However, the Forest Offset Protocol provides no calculations or rationale for the values attributed to the various reversal risks. For example, the risk of default due to overharvesting is set at 2 percent, with no explanation or citation. At best, the risk estimates appear to be based on general averages with no refinement for particular forest or project types. This also appears to be the case for the default risk due to forest fire. In this case, the general fire risk for a forest project is set at 4 percent, with risk reductions of 50 percent for projects with a “high level of fuel treatments,” approximately 33 percent risk reductions for projects with a “moderate level of fuel treatments,” and approximately 17 percent risk reductions for projects with a “low level of fuel treatments.” No explanation for these values and no definition of high, medium, and low fuel treatments are provided. Ultimately, this provision does not identify the risk of reversal specific to any forest project, and thus fails to address the liability that reversal of forest projects brings to the offset program as a whole. (CBD5)

> **Response:** We disagree that the calculations fail to address reversals. At the outset of the cap-and-trade program, there are not sufficient data to determine if all the initial risk values used in determining the forest buffer account contribution have been calculated appropriately. However, in the absence of better risk data and based on the principle of conservative accounting, we believe that it is important to err on the side of having the risk factors too high, to ensure that there is a sufficient quantity of offset credits in the forest buffer account to cover any reversals in the early years. These risk ratings may be decreased or adjusted at a later time, once more data is available on the actual rate of reversals due to various risks and the functioning of the forest buffer account.

N-17. Comment: The language in the second paragraph of section 2.2 stating that ultimately all forest owners are responsible for all project commitments creates confusion of responsibility. This language was removed from the definition section of the regulations (see above) but has not been fixed here. We recommend that the sentence be struck, and that one forest owner be allowed to be designated as having full responsibility for all project commitments. (PFT4)

> **Response:** While the forest owner designated as the Offset Project Operator will have the primary responsibility for managing the forest project in conformance with the protocol and the regulation, all forest owner(s) are ultimately responsible for all commitments associated with a forest offset project. In the instances where there are multiple forest owners, parties can use third-party contracts to establish an offset project developer and structure the liability for the involved forest owners.

N-18. Comment: The performance test for avoided conversion projects in section 3.1.2.3 includes a requirement that the slope of project areas where residential, commercial, or agricultural development is the anticipated converted land use cannot exceed 40 percent. It has come to our attention that there are areas in the Appalachian Mountains where residential development is legally permissible and regularly occurs in a manner that removes trees in areas that exceed 40 percent slope. Thus, the current language limits the ability of forest owners to use avoided conversion projects to prevent emissions from documentable business as usual situations. We recommend that this slope percent limitation be removed and replaced with the requirement to show that projects are eligible in areas where development is legally permissible and has been shown to occur in similar situations regardless of slope. (PFT4)

> **Response:** We acknowledge the comment, but any changes to the criteria that establish additionality through this performance test fall outside the scope of the second 15-day changes to the regulation. We will conduct periodic reviews and updates to this protocol, as appropriate, and we encourage the commenter to engage with us during a future update process for ARB consideration of this change.

Livestock Protocol

N-19. (multiple comments)
Comment: The livestock protocol could use the most up to date data available. The default values listed in the protocol are not consistent with the latest default values from the U.S. EPA's Inventory of Greenhouse Gas Emissions and Sinks. The protocol could be updated to reflect the latest data and clarify that project developers may use the latest publicly available EPA data even if it has not yet been added to an updated version of the protocol in order to anticipate future updates. (TCT2)

Comment: The defaults prescribed in the ARB Livestock Protocol for Volatile Solids and Livestock weight are out of date and are not consistent with the latest EPA reports. ARB should allow the use of the most recent versions of data, provided they are sourced from a recognized publication, in order to most accurately reflect emission reductions. (CIG3)

Comment: The weight of a lactating dairy cow has also changed from 604kg to 680kg (see as above but Table A-184, page A-222). ARB should clarify that Offset Project Operators are allowed to use the latest versions of the EPA-specified values. Not doing so may result in developers continually petitioning ARB and registries for variations to Protocols and/or verifiers continually seeking guidance from ARB. (CIG3)

> **Response:** The APA process requires our regulations to be very prescriptive. Any deviation from the protocols would be considered a noncompliance. We will update protocols with new data and emissions factors as part of periodic reviews and updates.

N-20. Comment: We applaud ARB in selecting offsets generated by using CAR Livestock Protocol as eligible to be used as early action offsets under the cap-and-trade program and for providing continuity to project developers by incorporating many of the aspects of the current CAR Livestock Protocols. (CIG3)

> **Response:** Thank you for your support.

ODS Protocol

N-21. Comment: The Ozone Depleting Substances (ODS) Protocol ignores the fact that new, more efficient technologies have been developed and deployed to capture and destroy ODS from refrigerators and their foam insulation. These technologies have become more cost-effective, and demand has grown to avoid ODS releases to the atmosphere. As a result, the traditional approaches of draining ODS from refrigerator compressors, storing non-economic captured ODS indefinitely, and landfilling the ODS laden foam have gradually become more unacceptable and non-competitive. This evidence establishes that the proposed business-as-usual baseline in the proposed ODS protocol is inaccurate and the ODS protocol would provide offsets for many non-additional projects that are already underway. These projects do not meet the AB 32 criteria for additionality. U.S. Department of Energy funding and other programs have played a role, as has the development of ODS capture and destruction technology in Europe. As a result, much of the ODS destruction that would receive offset credits under the protocol would not be additional to what would have occurred in the absence of the AB 32 program. (WILLIAMSZ3)

> **Response:** The documentation in the CAR ODS protocol provides the data and calculations supporting the <1.5 percent of recoverable U.S.-sourced ODS that are destroyed upon end-of-life. The original data source is ICF International (2009), *Destruction of ODS in the United States and Abroad*, prepared for the U.S. Environmental Protection Agency. Some ODS are destroyed today, but the data shows it is far from common practice. We believe the regulatory verification process and ARB's oversight of the offset program will provide for a rigorous offset issuance process. In the unlikely event that any fraud is found after issuance, ARB retains the authority to invalidate a fraudulent offset and require it to be replaced to maintain the environmental integrity of the program.

N-22. Comment: We disagree with the values ascribed to the GHG emissions of CFC-13 substitutes in the Protocol that would significantly impact the amount of GHG emissions associated with a potential CFC-13 project. The proposed values are inaccurate and would make any CFC-13 project economically non-viable. When CFC production ended, R-508 became the industry standard replacement for CFC-13. With growing concern over the global warming potentials of refrigerants, producers of ultralow temperature freezers have been phasing out use of R-508. This has already happened in Europe, and is now underway in the United States. As is the case across many sectors, there are additional, viable "third-generation" alternatives for CFC-13 that are in use which have not been submitted for SNAP review nor proposed by U.S. EPA for addition to the list of SNAP acceptable substitutes. For all of the CFC refrigerants, the CAR and ARB ODS Protocols include an estimated emission factor associated with the substitute refrigerants based on market penetration of various substitutes and the average charge size and leak rates. In the September draft protocol, the emission factor for CFC-13 substitutes is 7,144 lbC2OE / lbODS destroyed. To generate an updated emission factor for CFC-13 substitutes, EOS conducted market research via consultations with the manufacturers of ultra-low temperature freezers and reclaimers on the market penetration of CFC-13 alternatives. Our analysis found that typical R-13 charges in ultra-low temperature freezers are between 0.5 and 1.0 lbs. In other refrigerant applications, the charge size of hydrocarbons, HFCs and other CFC substitutes typically are half the charge size as the original ODS. Using this, we assume an average charge size of 0.5 lbs for CFC-13 substitutes. Based on the leak rates for commercial and industrial refrigeration equipment in the IPCC/TEAP report and the CAR working group survey, we conservatively assume a 15 percent leak rate. Based on the current market analysis, and the assumptions made above on replacement charge size and leak rate, the CFC-13 substitute emission factor is calculated as 1,141 lbC2OE /lbODS destroyed. This is approximately 16 percent of the substitute emission factor given in the September 2011 Protocol. (EOSC4)

> **Response:** We chose conservative values for the substitute and the related global warming potential (GWP). There is conflicting information on the market share of substitutes. Information from manufacturers and government entities indicted that the most common substitutes were R-23 (with a GWP of 11,700 according to the Second Assessment Report) or R-508 (with a slightly lower GWP). We chose the larger GWP value to be conservative, since no reliable market share information was available. This GWP combined with a 1-to-1 replacement charge size, and the leakage rate defined by California's Refrigerant Management Regulation provides the substitute factor used in the protocol.

N-23. Comment: ARB has proposed an average annual emission rate of 9 percent for CFC-13. We assume this is derived from a single data point in the database that ARB has compiled from SCAQMD Rule 1415 reporting. In that database, one facility reported an annual leak rate of 9.4 percent for CFC-13 equipment. We believe this is overly conservative, based on insufficient data. A survey conducted by the Climate Action Reserve ODS working group reported a range of annual leak rates for CFC-13 between 7 and 33 percent. The 2005 IPCC/TEAP Special Report on Safeguarding the Ozone Layer and Global Climate System listed an average leak rate for commercial refrigeration and industrial process refrigeration of 17 percent and 18 percent respectively. CFC-13 has been used in low temperature commercial and industrial applications, including ultra-low temperature laboratory freezers as well as larger units. Based on our work with refrigerant reclaimers and facility owners and operators, demand for CFC-13 remains in high demand to recharge high value older equipment. According to the companies who are servicing the equipment, these older units commonly leak because of their age and high-pressure requirements; in many cases 100 percent of the refrigerant charge is released. We believe a more accurate, and conservative leak rate for CFC-13 is 17 percent. (EOSC4)

> **Response:** The leakage rate value of 9 percent is based on compliance with California's Refrigerant Management Regulation, which requires leak detection and repair. The mix of CFC-13 uses covered by the regulation and those not covered is unknown; therefore, we chose to be conservative and apply the lower leakage rate of 9 percent to all CFC-13 uses.

Miscellaneous

Comment: Forestry offsets are notoriously unverifiable, and inherently provide no reduction in toxic and smog-forming co-pollutants. (CBE3)

> **Response:** We disagree that offsets are unverifiable. We believe the accounting, monitoring, and verification standards in the program will provide assurance that only real sequestered carbon is issued ARB offset credits. The role of offsets is to provide GHG reductions or sequestration, not to specifically address toxic or smog-forming co-pollutants.

Comment: The Urban Forestry Protocol appears to encourage planting non-native species, which can cause environmental harms, by introducing invasive species or species with high water needs, among others. For example, since the protocol bases offset credits on tree size and speed of growth without prohibiting non-natives, it could encourage planting inappropriate, invasive species such as eucalyptus in California, or other inappropriate species outside California. Moreover, while urban tree planting in general is a good thing, it cannot be considered remotely equivalent to reducing emissions from an oil refinery, and so does not offset that pollution. (CBE3)

> **Response:** The protocol contains a list of specific urban tree types that are eligible under the protocol. Each project developer will decide which types of trees to include in their project. These choices will be made based on several factors, such as climate, aesthetics, and maintenance. The aim of the protocol is to sequester carbon to offset GHG emissions from covered sources. In that aspect, planting a tree for carbon sequestration purposes is appropriate for addressing GHG emissions from a refinery.

Comment: ODC offsets assume that the State will not adopt any additional controls of ODCs, which is an obvious alternative. California could set standards requiring that instead of being used as offsets, ODCs in foam and refrigerators be destroyed, rather than recycled. (CBE3)

> **Response:** We discuss the philosophy of direct regulation and market based regulations in several spots of the FSOR. However, each protocol has a limited crediting period. This allows a review for regulatory additionality before any new projects can be issued credits. The adoption of an offset protocol does not prevent ARB from considered a direct regulation for those sources at a future date.

O. OPPOSITION AND SUPPORT

Opposition

O-1. Comment: Cap and trade is a horrible idea. Don't destroy California's economy. (FORMLETTER13)

> **Response:** This comment falls outside the scope of the second 15-day changes to the regulation, and no response is needed. However, as we explained in the 45-day changes to the regulation, we conducted a thorough evaluation of both the health and economic effects of the proposed program to ensure to the extent feasible that no disproportionate negative impact will occur. We have designed the cap-and-trade program to minimize the cost of implementation and compliance and to maximize the overall benefits.

Support

O-2. (multiple comments)
Comment: CERP believes that ARB has taken a number of positive steps in the latest round of revisions to its cap-and-trade regulations. Such changes will improve the workability of the program while maintaining a high level of environmental integrity. CERP commends ARB staff for its tireless work to implement the first in the nation cap-and-trade program while under significant time and staff constraints, and for its careful consideration of comments provided in response to earlier versions of the regulations. (CERP5)

Comment: WSPA reiterates its support for a market-based approach to industrial emissions in the implementation of AB 32. We continue to believe that a well-designed market based approach will be the most effective means to meet the Greenhouse Gas (GHG) reductions mandated by AB 32. (WSPA4)

> **Response**: We appreciate the support.

P. USE OF AUCTION PROCEEDS

P-1. Comment: Raising funds via an auction for reasons outside of administrative fee purposes is beyond CARB's regulatory authority. (CALCHAMBER4)

> **Response:** This comment falls outside the scope of the second 15-day changes to the regulation.

P-2. (multiple comments)
Comment: We disagree with ARB's decision to remove the provisions in the rule providing guidance to the electric IOUs on how to return auction revenue for the benefit of their retail customers. The provisions simply ensure that the IOUs' use of allowance value will not mute the carbon price signal embedded in retail rates or be tied exclusively to a utility customers' energy consumption. Maintaining the carbon price at the retail level is at the heart of ARB's allocation scheme for the utility sector and reflects the consensus recommendation of nearly every expert body that has examined the issue. Moreover, as designed, it is our view that the provisions would not unduly interfere with the California Public Utilities Commission's (CPUC) jurisdiction over rate setting. Although ARB's rationale to remove the provisions rests on questions of legal authority, we are concerned that stakeholders will attempt to construe ARB's decision as signaling a change of position from a policy perspective. Past CPUC decisions have called for ARB's judgment on this issue, and ARB's position will be significant in shaping the ultimate resolution for allocating allowance value from the electricity sector. Should ARB proceed with the proposed changes, we therefore ask that ARB reaffirm unequivocally its expert conclusion that "staff believes that any rebates to residential customers should be made as separate payments and not simply deducted from customer bills. The purpose of this restriction is to ensure the carbon price is reflected in residential electric rates" (emphasis added). (KUSTIN19)

Comment: We disagree with ARB's decision to remove the provisions in the rule providing guidance to the electric IOUs on how to return auction revenue for the benefit of their retail customers, Section 95892(d)(3) page 143 of the revised draft. We do not believe that the provisions would unduly interfere with the California Public Utilities Commission's (CPUC) jurisdiction over rate setting. (CPC7)

> **Response:** As the commenter notes, we removed the provisions regarding use of auction proceeds for allowances consigned by utilities based on ARB's lack of authority to appropriate funds. We acknowledge that electrical distribution utility proceeds from the sale of allowances at auction would most likely fall under limitations imposed by either the California Public Utilities Commission or by the governing bodies of publicly owned utilities, and that these entities have exclusive electricity ratemaking authority.
>
> Proper carbon pricing is the primary way in which the cap-and-trade program achieves emissions reductions. Compensation provided volumetrically (per megawatt-hour consumed) will not create the correct incentives for greenhouse

gas reduction. Volumetric return of allowance value eliminates incentives for greenhouse gas reduction strategies such as conservation of electricity, efficient combined heat and power, and distributed electrical generation.

When we determined that allowance value should be allocated to electrical distribution utilities on behalf of customers, we made this decision with the explicit understanding that value would not be used to skew carbon pricing or reduce incentives for greenhouse gas reductions. We retain the authority to revoke free allocation if it is used in a way that is counter to the statutory objectives of AB 32.

Our Economic and Allocation Advisory Committee (EAAC) recommended against allocating allowance value to electrical distribution utilities because the EAAC believed that preventing increases in electricity rates would be the likely outcome of this allocation approach.

Carbon price signals in electricity rates should reflect the emissions rate of the marginal generator dispatched into the power markets. In establishing the appropriate carbon price in rates, the CPUC and POU governing boards will need to account for the costs of other greenhouse gas-reducing policies, including the 33 percent renewable portfolio standard and the impact of these programs on electric rates.

We continue to believe that rebates to residential customers should be made as separate payments, and not simply deducted from consumer bills.

In Resolution 11-32, the Board directed the Executive Officer to work with the California Public Utilities Commission (CPUC) and publicly owned utilities to reflect the findings of the Board that the impact of the cap-and-trade regulation on electricity rates creates appropriate incentives to further the goals of AB 32. The Board also directed the Executive Officer to work with the CPUC and the publicly owned utilities to reflect the finding of the Board that if allowance value provided to the electric distribution utilities for ratepayer benefit is returned directly to customers, it is consistent with State efforts to promote energy efficiency and energy conservation.

P-3. Comment: CARB proposes to allocate allowances to EDUs based on the electricity consumption through their respective service franchises and then require these allowances to be auctioned with the proceeds being used for the benefit of the EDUs' ratepayers. Since no allocations will be made to the "industrial cogeneration/distribution" entities delivering electricity directly to their rate-paying customers, there is an unequal (one-sided) opportunity to offer benefits to the ratepayer which favors the EDU. This will provide an incentive for current (and future) consumers of industrial cogenerated power to switch to grid-delivered power—a result contrary to CARB's policy objective of incentivizing cogeneration power. To prevent this unequal treatment, CARB must either allocate allowances to industrial cogeneration/distribution entities in a manner consistent with the proposed allocation to EDUs under section 95892, or revise the proposed regulations to explicitly require that cogeneration power customers receive the same benefits under section 95892(d)(3) as other EDU retail ratepayers. CARB staff has stated that the intent of the allocations to EDUs is to mitigate the anticipated added “cost of carbon” imposed upon all electricity consumers, regardless of where the electricity consumer sources their power supply. In CARB’s words, EDUs would be required to share the benefit of their monetized allowance allocations with all consumers connected to the EDU’s system, even if the power consumer is not purchasing power through the EDU. That intent notwithstanding, there is conflicting language in the proposed rules that would appear, at a minimum, to not require, and at worst, to preclude the distribution of EDU allowance value to those electricity consumers supplied directly by an industrial CHP facility. Air Products requests CARB add clear language to the rule to explicitly require sharing of allowance value with CHP customers. Modify section 95892(d) as follows:

> (4) ~~Investor owned~~ <u>Electrical distribution</u> utilities shall ensure equal treatment of their own customers and customers of <u>cogeneration facilities</u>, electricity service providers and community choice aggregators <u>such that the distribution of auction proceeds does not create an incentive for customers to change electricity suppliers</u>.

Alternately, CARB could clarify intent by adding a definition of “electricity service provider” to explicitly include industrial cogeneration facilities supplying power directly to a ratepayer. Currently, there is no definition of “electricity service provider” under the cap and trade rule, relying instead on definitions within California Public Utility Commission (CPUC). Within the CPUC Code, there are confusing and potentially conflicting definitions which appear to exclude cogeneration facilities, highlighting the need for clarifying language to be added directly to the cap and trade rule. To eliminate the confusion associated with a CHP being designated an electric service provider under CPUC rules, Air Products recommends CARB add the necessary definitions directly into the cap and trade rule to clarify that all CHP electricity customers are eligible for the distribution of auction proceeds. (APC3)

> **Response:** We did not adopt the language suggested by the commenter. However, we agree that allowance value given to electricity distribution utilities on behalf of their customers should not be used to eliminate incentives for greenhouse gas-reduction strategies such as conservation of electricity, efficient combined heat and power, and distributed electrical generation.

P-4. Comment: SCE commends ARB for removing the fixed rebate language, as the change will help ensure a successful cap-and-trade program. SCE commends ARB for removing Sections 95892(d)(3)(B) and (C), which required the electrical distribution utilities to return any allowance values to customers through the use of a fixed rebate or credit, rather than based on the quantity of electricity delivered to ratepayers. Removing this language will ensure that the decision of how to allocate allowance value to customers will be appropriately addressed by the CPUC—the agency with plenary jurisdiction to do so.

Additionally, from a policy standpoint, the removal of this language is a step in the right direction towards ensuring a successful cap-and-trade program. A fixed rebate would otherwise result in sudden rate increases for some customers, while potentially creating an incentive for others to increase their electricity usage. This approach would not garner the needed public support for the cap-and-trade program. SCE has and will continue to argue at the CPUC that an allowance value return that is proportionate to the emissions reduction costs incurred by customers will prevent all California electricity customers from experiencing sudden rate increases. Given the importance of this issue to the success of the cap-and-trade program, SCE thanks ARB for ensuring that it is addressed in the appropriate proceeding and in the appropriate jurisdiction. (SCE4)

> **Response:** We agree that the CPUC has the sole ratemaking authority for investor-owned utilities. However, we note that if allowance value is used in a way that is counter to the achievement of AB 32's goals, we retain the authority to revoke freely allocated allowances awarded to utilities. We will continue to work with CPUC to ensure that use of value appropriately incentivizes reduced emissions through efficient generation of electricity and demand-side reductions in electricity use.
>
> We still believe that a fixed rebate for residential customers would assist in achieving the greenhouse gas reductions required by AB 32. We do not agree with the commenter that return of value proportionate to electricity use is the correct incentive to reduce emissions.
>
> In Resolution 11-32, the Board directed the Executive Officer to work with the CPUC and publicly owned utilities to reflect the findings of the Board that the impact of the cap-and-trade regulation on electricity rates creates appropriate incentives to further the goals of AB 32. The Board also directed the Executive Officer to work with the CPUC and the publicly owned utilities to reflect the finding of the Board that if allowance value provided to the electric distribution utilities for ratepayer benefit is returned directly to customers, it is consistent with State efforts to promote energy efficiency and energy conservation.

P-5. Comment: The use of electricity is a significant cost to industry in California. If CARB ignores the additional costs that will be imposed on both the refining and oil and gas sectors by increases in electricity costs due to the pass-through of carbon costs, these sectors will be competitively disadvantaged, resulting in carbon leakage. We are also concerned that grid purchases are completely covered and are not diluted by the CPUC rulemaking. We understand that ARB staff has agreed that direct allocations will be provided to industry after the CPUC acts on utility pass-through rules and before the start of the first compliance year, and strongly encourage that agency action. (CHEVRON4)

> **Response:** We recognize the importance of indirect carbon costs. We will continue to work with the CPUC to ensure that a level playing field is created between grid purchases and distributed generation. We will consider potential

direct allocations to industry as an expansion of the existing benchmarks in a future rulemaking if necessary to minimize leakage. The allowances for any additional direct allocations would need to come, at least in part, from the portion of allowances currently allocated to electrical distribution utilities on behalf of their industrial customers.

Response to Comments on the Functional Equivalent Document Prepared for the California Cap on GHG Emissions and Market-Based Compliance Mechanisms

Table of Contents

This page intentionally blank.

INTRODUCTION

To meet the requirements of the California Environmental Quality Act (CEQA) under ARB's Certified Regulatory Program, the California Air Resources Board (ARB) staff prepared and circulated for public review a Functional Equivalent Document (FED or environmental analysis) for the California Cap on GHG Emissions and Market-Based Compliance Mechanisms Regulation (Cap-and-Trade Regulation or Regulation). The FED was included as Appendix O to the Initial Statement of Reasons (Staff Report) prepared for the Regulation, and was circulated for public review and comment from October 28, 2010 to December 16, 2010. Two Notices of Public Availability of Modified Text and Availability of Additional Documents (15-Day Changes) were subsequently issued. The two sets of 15-Day Changes modified regulatory text to provide clarity and were largely administrative. Some of the regulatory modifications would result in the Regulation being more environmentally protective (offset provision and forest protocol). The modifications do not cause new or additional compliance responses by covered entities and do not affect the environmental impact analysis in the FED. Therefore, no revision to the FED analysis or recirculation of the FED is required. The ISOR entitled *Initial Statement of Reasons: Proposed Regulation to Implement the California Cap-and-Trade Program* and other rulemaking documents are available at ARB's rulemaking webpage at http://www.arb.ca.gov/regact/2010/capandtrade10/capandtrade10.htm.

This document presents ARB's written responses to comments on the FED that raise significant environmental issues and were received during the initial 45-day comment period, at the December 16, 2010 Board hearing, and during the comment periods for the two 15-Day Change Notices. In accordance with ARB's Certified Regulatory Program, the Board will consider the Response to FED Comments for approval prior to taking final action on the proposed Regulation.

Staff will also prepare written responses to *all* public comments received, not just FED comments, for purposes of the Administrative Procedure Act. The complete written responses to all comments will be included in the Final Statement of Reasons (FSOR) prepared for the rulemaking. Upon its completion, the FSOR will be made available in electronic form on the ARB rulemaking webpage at http://www.arb.ca.gov/regact/2010/capandtrade10/capandtrade10.htm.

Requirements for Responses to Comments

Responses to public comments are prepared in compliance with ARB's certified regulatory program, which states:

> *Public Resources Code (PRC) section 60007. Response to Environmental Assessment*
>
> *(a) If comments are received during the evaluation process which raise significant environmental issues associated with the proposed action, the staff shall summarize and respond to the comments either orally or in a supplemental written report. Prior to taking final action on any proposal for*

which significant environmental issues have been raised, the decision maker shall approve a written response to each such issue.

In CEQA, PRC section 21091 also provides direction regarding the consideration and response to public comments. While the provisions refer to environmental impact reports, proposed negative declarations, and mitigated negative declarations, rather than a FED, this section of CEQA contains useful information for preparation of a thorough and meaningful response to comments. PRC section 21091(d) states:

(1) The lead agency shall consider comments it receives … if those comments are received within the public review period.

(2) (A) With respect to the consideration of comments received …, the lead agency shall evaluate comments on environmental issues that are received from persons who have reviewed the draft and shall prepare a written response pursuant to subparagraph (B). The lead agency may also respond to comments that are received after the close of the public review period.

(B) The written response shall describe the disposition of each significant environmental issue that is raised by commenters. The responses shall be prepared consistent with section 15088 of Title 14 of the California Code of Regulations, as those regulations existed on June 1, 1993.

Title 14 CCR section 15088 of the State CEQA Guidelines contains useful information and guidance for preparation of a thorough and meaningful response to comments. It states, in relevant part, that specific comments and suggestions about the environmental analysis that are at variance from the lead agency's position must be addressed in detail with reasons why specific comments and suggestions were not accepted. Responses must reflect a good faith, reasoned analysis of the comments. Title 14 CCR section 15088 (a – c) states:

(a) The lead agency shall evaluate comments on environmental issues received from persons who reviewed the draft EIR and shall prepare a written response. The Lead Agency shall respond to comments received during the noticed comment period and any extensions and may respond to late comments.

(b) The lead agency shall provide a written proposed response to a public agency on comments made by that public agency at least 10 days prior to certifying an environmental impact report.

(c) The written response shall describe the disposition of significant environmental issues raised (e.g., revisions to the proposed project to mitigate anticipated impacts or objections). In particular, the major environmental issues raised when the Lead Agency's position is at variance with recommendations and objections raised in the comments must be addressed in detail giving reasons why specific comments and suggestions were not accepted. There must be good faith, reasoned analysis in

response. Conclusory statements unsupported by factual information will not suffice.

Comments Requiring Substantive Responses

Substantive responses are limited to comments that "raise significant environmental issues associated with the proposed action," as required by PRC section 60007(a). Therefore, responses specific to comments made on the Cap-and-Trade Regulation's environmental analysis are provided, consistent with the provisions of PRC section 60007. As explained above, other substantive comments are responded to in writing in the FSOR. Where a comment raises both an issue related to and issues not related to the FED, the FED-related comments are responded to in this document and the reader is referred to the non-FED responses in the FSOR.

Commenters

ARB received 19 comment letters that included comments on the FED, including comments from three public agencies. The list below identifies the commenters that submitted FED-related comments, and includes commenter information. The commenters are depicted identically to "Section III. A. List of Commenters" in the FSOR and the comment number corresponds with the comment number in the FSOR.

Location of Comment Letters on the ARB Website

All comment letters and attachments received on the proposed Cap-and-Trade Regulation are posted on the ARB website at the following link: http://www.arb.ca.gov/lispub/comm/bccommlog.php?listname=capandtrade10

To manually locate the comments on the ARB website:

- Go to www.arb.ca.gov
- Select "Climate Change Program" in the left column
- Under "Assembly Bill 32 Implementation and Other Activities", Select "Cap-and-Trade Program" on the activities tab
- Select "View All Public Comments" in the right column.

On the website, the comments are ordered by date received grouped by review period, i.e. 45-Day, first 15-Day changes (15-1), or second 15-Day changes (15-2).

COMMENTS AND RESPONSES

This section summarizes comments on the Draft FED and presents ARB's responses to those comments. The comments identified in this CEQA document are a subset of all comments received on the proposed Cap-and-Trade Regulation. Comments that do not pertain to the adequacy of the environmental analysis are addressed in the Final Statement of Reasons (FSOR) prepared as part of the rulemaking process.

In this Response to Comments document, individual comments are presented under the correspondence within which they were received, ordered alphabetically by COMMENT ID and identified as follows:

COMMENT ID: *This is the abbreviation used to identify the comment correspondence in which the individual comments are contained.*

Name:	*Person(s) submitting the comment*
Affiliation:	*Affiliation of the commenter(s)*
Written Testimony: M/D/Y	*Type of comment and date received*
45-Day Comment #: 123	*Comment period and unique comment number. The unique ID number corresponds to numbering in the FSOR.*

Comment: *Comments received under the COMMENT ID are presented individually as shown in this example, beginning with* ***Comment*** *on the first line.*

> **Response:** *Responses are presented following each comment. Responses are indented from the left margin.*

Comment: *All of the individual comments received under the COMMENT ID are presented as demonstrated in this example. This comment would be followed by subsequent comments from this commenter.*

> **Response:** *Responses are presented following each comment. Responses are indented from the left margin.*

BLUESOURCE

Name: Roger Williams
Affiliation: Blue Source
Written Testimony: 12/13/2010
45-Day Comment #: 660

Comment: The Forest Carbon Developers support ARB's draft market rules and the forest project protocol in general. However, we view the proposed rules as improperly restrictive in ways that make them arbitrary or unnecessarily burdensome and expensive. In these instances, the proposed Regulation does not constitute a reasonable and rational choice, and therefore should be revised consistent with the comments below in order to be legally valid and consistent with the mandate of AB 32 under the California Administrative Procedure Act (APA) and/or the California Environmental Quality Act (CEQA). (BLUESOURCE)

> **Response:** This comment summarizes the commenter's more detailed comments provided later in the letter. See responses prepared to the applicable BLUESOURCE comments.

Comment: As a matter of environmental policy and review, ARB has failed to consider that disqualifying early-mover projects will likely result in the abandonment of those projects, thus not only increasing greenhouse gas emissions but also losing the other societal benefits provided by forest conservation projects, such as habitat and watershed protection. Although ARB recognizes its duty under AB 32 to consider overall societal benefits, including reductions in other air pollutants and other benefits to the economy, environment and public health, the Agency has failed to justify why its arbitrary date restriction is defensible in light of AB 32's mandate or why an earlier start date is not an acceptable alternative.

APA requires ARB to prepare a description of reasonable alternatives to the proposed Regulation and the agency's reasons for rejecting those alternatives, and to determine in its final statement of reasons that no alternative considered by the agency would be more effective in carrying out the purpose for which the Regulation is proposed or would be as effective and less burdensome to affected private persons than the adopted regulation. Similarly, Health & Safety Code section 57005 requires ARB to evaluate the alternatives and consider whether there is a less costly alternative or combination of alternatives which would be equally as effective in achieving increments of environmental protection in a manner that ensures full compliance with statutory mandates within the same amount of time as the proposed regulatory requirements. APA also requires consideration of alternatives for reducing impact on small businesses, such as the Forest Carbon Developers. Although quantification protocols are exempt from APA pursuant to AB 32, HSC section 38571, the issues raised herein are related to non-quantification eligibility criteria, which are subject to APA strictures. ARB also failed to consider these alternatives in its CEQA functional equivalent document. (BLUESOURCE)

Response: The commenter suggests that disqualifying early-mover projects will likely result in the abandonment of those projects, thus not only increasing GHG emissions but also losing the other societal benefits provided by forest conservation projects, such as habitat and watershed protection.

We disagree that the proposed Regulation would result in the abandonment of early-mover projects. The Regulation includes a process for accepting offset credits from qualified existing offset projects into the ARB compliance offsets program. This not only recognizes and rewards these actions, it also helps create an initial supply of offset credits for the cap-and-trade program. We do not agree with accepting offsets from projects before 2005 because beginning in 2005, the Climate Action Reserve (CAR) and its predecessor, the California Climate Action Registry, began adopting voluntary GHG accounting protocols to encourage voluntary early action to reduce GHG emissions. To ensure the GHG reductions and GHG removal enhancements being used in the compliance program are real and additional, we chose to implement the January 1, 2005, date to correspond with the adoption of voluntary offset protocols as the eligible date for transition of early action offset credits to ARB offset credits.

That said, early action offset projects that began prior to January 1, 2005 are still allowed to come into the compliance program and receive early action offset credits for reductions that they achieve between January 1, 2005 and December 31, 2014. To clarify this point we added a new section, 95973(c), that allows a commencement date prior to December 31, 2006 for early action offset projects that transition to Compliance Offset Protocols pursuant to section 95990(k). Any reductions achieved before 2005 may still be traded and sold in the voluntary market but will not be recognized by ARB or allowed to be used for compliance.

In response to the commenter's second point, for projects developed under CAR protocols, we believe that January 1, 2005, is the appropriate date to credit the early voluntary GHG reductions and GHG removal enhancements because it reflects the timeframe in which the voluntary protocols were approved by CAR. If ARB decides to accept early action offset credits achieved under other protocols not developed by CAR, ARB will evaluate whether another date is appropriate for those credits and amend the Regulation if necessary.

In response to the commenter's third point, we added new section 95990(k) to clarify how early action offset projects transition to Compliance Offset Protocols. New section 95990(k)(2) clarifies that once an early action offset project transitions to a Compliance Offset Protocol it will begin an initial crediting period. The crediting period under the early action offset program does not count under the compliance offset program, so the early action offset project may transition any time before February 28, 2015, but must list or register with an Early Action Offset Program by January 1, 2014, (section 95990(c)(3)) to get early action offset credits. This provides a seamless transition process for early action offset projects and guarantees them a new crediting period. It is necessary for offset projects beginning February 28, 2015, to transition to Compliance Offset Protocols to ensure consistency in the program. It is also necessary that all offset projects are following the rules of the Regulation, including the rules in the Compliance Offset Protocols. We believe that this process will incentivize early action offset projects to transition to Compliance Offset Protocols, and that it will not penalize them.

Based on the preceding explanation, the Regulation would not result in the abandonment of early-mover projects, and as such would not increase GHG emissions that could occur as a result of such abandonment.

The commenter asserts that ARB failed to consider the alternatives required by the APA and HSC in its CEQA functional equivalent document. ARB examined a reasonable range of alternatives, as required under CEQA. The commenter is referred to the description of CEQA alternatives provided as a response to CRPE1. Non-CEQA aspects of this comment are addressed in the FSOR prepared in accordance with APA requirements.

Comment: ARB's requirement that forest owners commit to restricting land-use for 100 years following the issuance of the last offset credit has not been justified by ARB either as a matter of policy or science. In our experience, this arbitrary requirement has become in practice a major obstacle to implementing forest projects, since few landowners are willing to commit land to a certain use for such an extended period for uncertain economic returns. Thus, ARB's policy is deterring beneficial projects and reducing potential environmental and social benefits. Other forest protocols, such as those developed by ACR and VCS do not impose such an unjustified temporal restriction. ARB fails to adequately examine the scientific, policy and environmental bases for this extended requirement, and thus this requirement is contrary to the APA and CEQA. Rather than demanding that land use be restricted for 100 years, the landowner commitment should be commensurate with the length of the regulatory program, and any adjustment for early withdrawal from a commitment should be proportional to the remaining atmospheric benefit of sequestered carbon. We look forward to working with ARB to refine the rules in this respect. (BLUESOURCE)

Response: Ensuring permanence is essential to the environmental integrity of the entire cap-and-trade program. Because offsets allow for an equivalent quantity of GHG emissions within the capped sectors, the CO_2 stored in biological sinks resting from offset project activities must stay out of the atmosphere for a time period comparable to the emissions they are offsetting. If they do not, the net effect would be an increase in GHG emissions to the atmosphere. Scientific estimates of the atmospheric lifetime of anthropogenic CO_2 emissions are uncertain, as CO_2 is removed from the atmosphere by a number of processes that operate at different timescales. However, 100 years should be viewed as a minimum time period for maintaining permanence because a fraction of anthropogenic CO_2 is expected to remain in the atmosphere well beyond 100 years as it is gradually removed through processes such as silicate weathering. The period of 100 years is frequently used in international climate change policy as a standard frame of reference for determining global warming potentials and setting GHG emission reduction targets, and consequently the use of 100 years to define the permanence of reductions is consistent with other programs.

This requirement was evaluated in the FED. No adverse environmental effects were identified as resulting from this requirement and none are offered by the commenter. Therefore, ARB believes the impact analysis appropriately considers this issue and no changes to the FED are warranted. Non-CEQA aspects of this comment are addressed in the FSOR prepared for the Regulation in accordance with APA requirements.

CBD1

Name: Brian Nowicki and Kevin Bundy
Affiliation: Center for Biological Diversity
Written Testimony: 12/15/2010
45-Day Comment # 746

Comment: The Functional Equivalent Document ("FED") containing ARB's analysis of the environmental impacts of the proposed Regulation also fails to disclose, analyze, and propose mitigation for significant environmental impacts, and fails to adequately discuss a range of reasonable alternatives that could avoid these impacts. (CBD1)

> **Response:** The commenter is referred to the discussion of alternatives provided as a response to CRPE1. ARB examined a reasonable range of alternatives, as required under CEQA. At the programmatic level, the fundamental purpose of the alternatives analysis is to determine if other broad program approaches, such as direct regulation or adoption of a carbon fee, might achieve the project objectives and lessen or avoid the potential adverse environmental impacts attributed to the proposed project.
>
> The Forest Offset Protocol is a part of the proposed Cap-and-Trade Regulation. The alternatives do not focus on a single sector (such as food processing) or a single action (such as facility relocation), because this would be too narrowly defined to achieve the AB 32 GHG reduction goal. Development of the proposed Regulation is an ongoing process which reflects changes and suggestions received through public and stakeholder participation. In response to this specific concern, the commenter is directed to the revised regulation which reflects substantial changes to the general offset sections of the Regulation and the Forest Offset Protocol, increasing the stringency of the offset requirements, which should reduce concerns about potential adverse environmental impacts. Nonetheless, the FED takes the conservative approach in its post-mitigation significance conclusion and discloses, for CEQA compliance purposes, that some of the impacts associated with forestry operations are considered potentially significant and may be unavoidable. The commenter is referred to the discussion of adaptive management provided as a response to CBE1.

Comment: The proposed regulation fails to maximize environmental co-benefits to the extent feasible. Prior to adopting a Cap and Trade system under AB 32, ARB must, "to the extent feasible," maximize additional environmental benefits to California where it is appropriate to do so. Health and Safety Code section 38570(b)(3). By using the term "feasible," the Legislature signaled its intent to require ARB to demonstrate that all appropriate measures must be taken to maximize environmental benefits, unless those measures are shown to be impracticable.

AB 32 does not define the term "feasible." However, that term has a specific meaning under other statutes, including the California Environmental Quality Act—a meaning of which the Legislature was presumptively aware when it enacted AB 32. "Feasible" means “capable of being accomplished in a successful manner within a reasonable period of time, taking into account economic, environmental, social, and technological factors.” Pub. Res. Code section 21061.1. In the CEQA context, when a lead agency rejects an alternative as economically infeasible, it must support that determination with quantitative, comparative evidence that the alternative would be economically impracticable (not just more expensive). See, e.g., Save Round Valley Alliance v. County of Inyo, 157 Cal. App. 4th 1437, 1461-62 (2007) (holding that applicant’s inability to achieve “the same economic objectives” under a proposed alternative does not render the alternative economically infeasible); Uphold Our Heritage v. Town of Woodside, 147 Cal. App. 4th 587, 600 (2007) (requiring evidence that comparative marginal costs would be so great that a reasonably prudent property owner would not proceed with the project); Preservation Action Council v. City of San Jose, 141 Cal. App. 4th 1336, 1356-57 (2006) (holding that evidence of economic infeasibility must consist of facts, independent analysis, and meaningful detail, not just the assertions of an interested party). Nor may a lead agency conclude that mitigation measures are legally infeasible without an adequate basis. As the Supreme Court put it, “[a]n EIR that incorrectly disclaims the power and duty to mitigate identified environmental effects based on erroneous legal assumptions is not sufficient as an informative document.” City of Marina v. Bd. of Trustees, 39 Cal. 4th 341, 356 (2006).

The Legislature’s use of the term “feasible” in connection with environmental co-benefits thus imposes a specific burden on ARB—a burden that the ISOR and FED fail to meet. For many months, the Center and other organizations have identified specific, appropriate measures to ARB staff (such as, for example, measures to ensure that forest offset projects improve forest management rather than perpetuate environmentally destructive practices) that could enhance, and thus help maximize, environmental co-benefits. Many of those measures are discussed again throughout this letter. At no point, however, has ARB demonstrated the infeasibility, or even the inappropriateness, of any of these measures. The Cap and Trade regulation as proposed thus fails to comply with AB 32. (CBD1)

> **Response:** The commenter states that ARB has not demonstrated that specific measures suggested by the commenter and other groups that could help maximize environmental co-benefits (such as measures to ensure that forest offset projects improve forest management) are infeasible as required by Health and Safety Code (HSC) section 38570(b)(3). The provision cited directs ARB to: “to the extent feasible and in furtherance of achieving the statewide greenhouse gas emissions limit…maximize additional environmental benefits.” (HSC 38570(b)(3).). AB 32 does not include a specific definition of “feasible” or criteria that should be used to determine what constitutes “to the extent feasible.” AB 32 leaves the specifics of how to do so, including balancing a variety of competing concerns, up to ARB. During development of the Cap-and-Trade Regulation, ARB considered all of its statutory mandates under AB 32, including the requirement to consider measures to maximize additional environmental benefits based on evidence, including economic analysis, where appropriate “to the extent feasible and in furtherance of achieving the statewide greenhouse gas

emissions limit." The appropriate analyses are included within the ISOR for the Regulation. ARB does not interpret AB 32 to require ARB to make a formal infeasibility determination regarding specific measures suggested by the commenter and other groups.

Development of the proposed Cap-and-Trade Regulation included extensive economic analysis and the involvement of an Economic and Allocation Advisory Committee. The updated economic analysis supporting the development of the Regulation was prepared by ARB and released on March 24, 2010 (ARB 2010). Economic reasons were not cited for potential infeasibility of avoiding impacts from implementing the proposed Forest Offset Protocol. On pages 311 to 314 of the FED, ARB explains that significant adverse biological impacts are not expected from implementing the Forest Offset Protocol, because sustainable, long-term harvesting practices and natural forest management would be required and project sites would be subject to some silvicultural activities with or without a Forest Offset Protocol project. Nonetheless, the FED discloses the risk that some adverse impacts cannot be entirely eliminated and unanticipated adverse biological impacts could occur. ARB cannot speculate as to the location of such impacts, but has committed to implementing an adaptive management approach as a program design feature that affords adjustment to the Regulation if any unanticipated significant biological impacts occur. These limits are well defined in authorizing legislation for ARB's responsibilities, which do not include regulation of biological or other non-air related natural resources. This conservative assessment of the situation (i.e., tending to overstate impacts) is intended to fulfill ARB's disclosure duties under CEQA.

Non-CEQA aspects of this comment, such as APA or AB 32 requirements, are addressed in the FSOR prepared for the Regulation in accordance with APA requirements.

Comment: The FED fails to comply with the California Environmental Quality Act (CEQA), Public Resources Code section 21000 et seq., and the CEQA Guidelines, title 14, California Administrative Code, section 15000 et seq. ARB's program for adopting air quality regulations is a "certified regulatory program" for CEQA purposes. (CEQA Guidelines section 15251(d)). Accordingly, the FED must include a description of the proposed Regulation, along with alternatives and mitigation measures to minimize any significant adverse effect. Pub. Res. Code section 21080.5(d)(3); Schoen v. Dept. of Forestry, 58 Cal. App. 4th 556, 566-67 (1997). Although ARB's regulatory program is exempt from certain requirements generally applicable to environmental impact reports under CEQA, see Sierra Club v. Bd. of Forestry, 7 Cal. 4th 1215, 1229-30 (1994), the core procedural and substantive provisions of CEQA still apply. In particular, ARB may not approve a regulation if there are feasible mitigation measures or alternatives available that would lessen or avoid its significant environmental effects. See Pub. Res. Code sections 21002, 21002.1(b), 21081.

As a general matter, the FED is quick to disclaim any responsibility for implementation of measures to mitigate the potentially significant economic impacts of the cap-and-trade program. The FED repeatedly states that other agencies will be responsible for implementing those measures at the project level, see, e.g., FED at 130, but fails to demonstrate in each instance that ARB lacks any legal authority to implement mitigation at the program level. If ARB can feasibly take steps to mitigate any specific effects of this action, it must do so; it may not shift this responsibility to other agencies as a general rule. Cf. City of Marina, 39 Cal. 4th at 366-67.

The FED also relies as a general matter on impermissibly deferred mitigation in the form of "adaptive management." The FED acknowledges that the cap-and-trade program may create perverse incentives and lead to potentially significant environmental impacts. Rather than proposing measures to ameliorate those impacts as CEQA requires, however, the FED states that ARB will monitor a few limited sources of information and develop "appropriate" responses if some unidentified level of impact materializes at some point in the future. See FED at 43-51, 311-14. "Formulation of mitigation measures should not be deferred until some future time." CEQA Guidelines section 15126.4(a)(1)(B). If mitigation is deferred, CEQA requires a lead agency both to develop specific performance standards and to commit to specific mitigation actions that will be taken if those standards are not met. Id.; see also, e.g., Gray v. County of Madera, 167 Cal. App. 4th 1099, 1118-19 (2008); Endangered Habitats League v. County of Orange, 131 Cal. App. 4th 777, 793-94 (2005) (agency "goes too far" when it requires only that project proponent obtain a "report" and then comply with recommendations in the report). The FED's promises of "adaptive management" fail to meet these standards. Under the FED's "adaptive management" strategy, moreover, ARB would take unspecified "appropriate" actions only if future, unanticipated environmental consequences "interfere with or undermine" the objectives of the cap-and-trade program. See FED at 46, 47, 313. Notably, the "adaptive management" strategy does not commit ARB to taking "appropriate" action in the event that significant, unanticipated environmental impacts occur. The purpose of mitigation under CEQA is to reduce or avoid significant environmental impacts, not to advance the objectives of other legislative programs. Accordingly, the "adaptive management" strategy cannot be considered mitigation under CEQA because it does not respond to the impacts that CEQA was designed to avoid.

Finally, the adaptive management strategy is not designed to gather the information that would enable ARB to detect, much less respond to, unanticipated environmental impacts. In the air quality context, for example, ARB proposes to monitor greenhouse gas emissions from covered sources. FED at 46-47. A major concern with the cap-and-trade program, however, is that emissions trading will result in increased local concentrations of conventional and toxic pollutants; information on greenhouse gas emissions alone may not reveal whether such increases are occurring. The FED also proposes to "solicit information" from local air districts concerning new and modified permits, and to evaluate this information at least once per compliance period (i.e., once every three years). FED at 47, 51. This information, however, will not contain data on pollution increases that fall below permitting thresholds. Nor will this information capture pollution increases associated with increasing production to limits in existing permits. Nor will a triennial review disclose pollution increases in time to develop an "appropriate" response.

In sum, the FED's "adaptive management" strategy will not prevent significant environmental effects, and will not permit ARB to respond to unanticipated effects in a timely or effective manner. Absent specific performance standards, timely and rigorous monitoring of all relevant information, and particularized responses to triggering events, "adaptive management" remains little more than a smokescreen for inadequate analysis of environmental impacts. (CBD1)

Response: The commenter argues that ARB has the responsibility to require project-specific mitigation, and that the FED relies on deferred mitigation in the form of an adaptive management approach. Specifically, the commenter states that the adaptive management approach identified in the FED does not commit ARB to take appropriate action in the event significant impacts occur in the future.

The proposed cap-and-trade regulation would require GHG reductions on a statewide level, but would not stipulate specific improvements or compliance actions by individual regulated entities. As such, it is not possible to ascertain how individual entities may choose to comply. The environmental impact analysis prepared for the proposed Cap-and-Trade Regulation evaluates reasonably foreseeable compliance responses at the programmatic level, and does not speculate as to what actions may be undertaken by individual entities. The FED recognizes that most reasonably foreseeable compliance responses entail some level of onsite construction or installation activities that are traditionally subject to local regulations. ARB does not have the regulatory authority to require and/or permit facility-specific improvements. Local air pollution control districts and/or air quality management districts (air districts) have primary responsibility for adoption and implementation of stationary and area-wide source emission control measures. The FED accurately reflects that local governments, notably cities and counties, have land use and permitting authorities (CEQA lead agency authority, zoning ordinances and regulations, building codes, construction permits, etc.) that are applicable to facility-specific projects. Such projects may be undertaken as compliance responses and would be local improvements subject to project-level CEQA analysis and local permitting.

The FED identified ARB's commitment to an adaptive management approach to assess the effectiveness of the Regulation, and identify data trends that could indicate unanticipated or undesirable results, or a need for changes to ensure the Regulation is meeting its objectives. This monitoring and feedback approach is a fluid process that evolves in response to results observed over time. ARB staff is proposing that the Board adopt an adaptive management plan that lays out a framework for an adaptive management approach to monitor the potential for adverse impacts that could result from action taken to comply with the proposed Regulation. The plan will focus on the potential for localized air quality impacts and the potential for adverse forestry impacts resulting from the Forest Protocol.

The proposed adaptive management approach has certain attributes of mitigation, in that it can result in the reduction or elimination of potential adverse impacts for the proposed Cap-and-Trade Regulation. However, adaptive management is being proposed to be incorporated as an integral design feature of implementation of the proposed program. As such, the adaptive management approach is not "deferred mitigation." Furthermore, in the context of mitigation in CEQA, the courts have upheld project approvals where the formulation of precise mitigation is infeasible because the exact nature of potential impacts is not known at the time of project approval. Mitigation strategies have been upheld when the agency commits itself to eventually devising measures in accordance with specific performance criteria articulated at the time of project approval. (See *Sacramento Old City Assn. v. City Council* (1991) 229 Cal. App. 3d 1011, 1028-29.) By analogy, staff's proposed adaptive management plan describes ARB's commitment to a specific process, including an analysis of available data, triggers for further analyses to determine whether there are localized air quality impacts or adverse forestry impacts, and if impacts are identified, the process for devising specific mitigation measures. By analogy to mitigation strategies in CEQA, the adaptive management plan lays out ARB's performance standard for identifying and addressing these potential adverse impacts identified in the FED. If the proposed Cap-and-Trade Regulation is approved, this plan would be implemented based on direction from the Board.

Comment: The Forest Offset Protocol proposed in the Cap-and-Trade Regulation is nearly identical to the Forest Project Protocol prepared by the Climate Action Reserve. For example, as previously discussed, the Forest Offset Protocol continues to allow and incentivize even-aged management practices such as clear-cutting that imperil forest health, water quality, and biodiversity; continues to provide incentives for conversion of native forests to plantations; continues to contain loopholes that incentivize increased short-term logging (and associated GHG emissions); and continues to offer credits for non-additional forest management activities in a manner that could increase overall GHG emissions. The impacts associated with these incentives and loopholes have been detailed in a series of letters from the Center to both the Climate Action Reserve and ARB over the past year. The FED largely fails to address the specific impacts identified in this series of letters. Accordingly, the arguments raised in those letters apply with equal force to the Forest Offset Protocol proposed in connection with the cap-and-trade program. These letters are therefore attached and incorporated by reference.

The FED attempts to dismiss concerns that the Forest Offset Protocol will incentivize clear-cutting and conversion of native forests on the theory that such practices will not significantly increase carbon storage. FED at 304-05. The conclusion is dubious, and contradicted by the record of protocol development; throughout the Climate Action

Reserve's protocol development process, timberland owners and other prospective forest project proponents repeatedly insisted that clearcutting and conversion of mature, uneven-aged forests were necessary to maximize carbon sequestration. This conclusion also is purportedly based on a study of "several California forest types." Id. at 304. However, the Forest Offset Protocol applies not just in California, but throughout the continental United States. Thus the FED is devoid of any analysis as to whether the Forest Offset Protocol will incentivize clearcutting and conversion of native forests outside California. Indeed, the FED acknowledges that out-of-state projects may not be subject to the level of environmental analysis that would accompany California or federal projects. Id. at 306. The FED's conclusions that the Forest Offset Protocol will not incentivize clearcutting and conversion lack support.

Despite these conclusions, the FED acknowledges that the Forest Offset Protocol may significantly affect biological resources. FED at 313-14. The FED proposes that ARB mitigate these effects by implementing "adaptive management." As previously discussed, "adaptive management," as proposed in the FED, does not constitute effective or legally permissible mitigation for these foreseeable impacts.

In any event, it is unlikely that the adaptive management program proposed in the FED would allow ARB even to detect, much less ameliorate, the adverse consequences of the Forest Offset Protocol. The FED proposes to collect information only from annual project verification reports and from "periodic" solicitation of public and stakeholder comments. FED at 313. This information, however, will not reveal whether project proponents changed management strategies, in response to the availability of offset credits, in a manner destructive of biological or forest resources. At the very least, a more credible adaptive management program would need to collect a great deal of additional information concerning historical harvest practices at the ownership and landscape scale, changed management practices following enrollment of projects under the Forest Offset Protocol, and continuous monitoring of ecological indicators (including species population trends and water quality) on project lands. The program also would have to establish specific benchmarks or performance standards for example, a certain amount of natural forest converted to plantations, or a certain amount of uneven-aged forest converted to clearcut rotations that would trigger specific ameliorative responses. Absent adequate information, specific performance thresholds, and particularized responses, the FED's "adaptive management" program cannot function as a mitigation measure for the Forest Offset Protocol. (CBD1)

> **Response:** The FED fully analyzed the potential for adverse impacts resulting from the Forest Protocol. The Forest Offset Protocol would not allow any forest management activity that is not allowed by state, federal, or local laws and regulations. The Forest Offset Protocol includes environmental safeguards to help assure the environmental integrity of forest projects. These include requirements for projects to demonstrate sustainable long-term harvesting practices, limits on the size and location of even-aged management practices, and requirements for natural forest management that require all projects to utilize

management practices that promote and maintain native forests comprised of multiple ages and mixed native species at multiple landscape scales.

In accordance with these requirements, the Forest Offset Protocol is not expected to increase the size of even-aged harvested areas or to result in plantation forests. Furthermore, modeling forest growth, mortality, and harvesting over time indicate that it would be unlikely for a forest project to remain eligible (i.e., demonstrate a continued net reduction in carbon sequestration), if conversion to a single-species, single-aged plantation occurred (FED, page 304).

The cap-and-trade program is made up of many elements, must serve a large number of important objectives, and relies on the actions of a large number of participants operating in a complex market system. Therefore, unanticipated effects could occur over the life of the program. The Forest Offset Protocol in particular has been identified as potentially resulting in unexpected environmental effects on forest ecosystems and biological resources (e.g., creating incentives for less environmentally conservative management practices). Based on the available data and current law and policies that regulate forest activities, ARB concludes that substantial impacts from forest project-related impacts attributable to the proposed cap-and-trade program are unlikely. However, there is at least a possibility that some unintended impacts could occur. Accordingly, the FED takes the conservative approach in its post-mitigation significance conclusion and discloses, for CEQA compliance purposes, that some of the impacts associated with compliance responses and forestry operations are considered potentially significant and may be unavoidable.

See response to CBD1 regarding staff's proposed adaptive management plan to assess the effectiveness of the Protocol and ARB's commitment to a specific process for identifying data trends that could indicate unanticipated adverse results, triggers for further analyses to determine if impacts are result of the Protocol design, and if impacts are identified, the process for devising specific mitigation measures, such as changes to the Protocol.

Comment: The FED fails to disclose, analyze, and propose mitigation for impacts related to the biomass and biofuels exemption. Adoption of a regulation is a "project" for CEQA purposes, and the courts have recognized that CEQA requires analysis of environmental impacts associated with a regulation that creates incentives for particular actions. See Cal. Unions for Reliable Energy v. Mojave Desert Air Qual. Mgmt. Dist., 178 Cal. App. 4th 1225, 1244-45 (2009). The FED here completely fails to disclose, analyze, or propose mitigation for the reasonably foreseeable and likely significant effects of exempting all biomass and biofuels emissions from compliance obligations.

This exemption creates a strong incentive to burn biomass fuels in at least two ways. First, emissions from biomass and biofuels combustion do not give rise to any compliance obligation, and thus will not require purchase or retirement of allowances or offsets. This will encourage use of biogenic fuels wherever fuel-switching is cheaper than the purchase of allowances or offsets.

Second, the biomass and biofuels exemption leaves a number of facilities that already use these fuels outside the cap. Those facilities, however, could choose to “opt in” to the program for the purpose of obtaining allowances. See Proposed Reg. Section 95813. Emissions from those facilities would be evaluated against an “efficiency benchmark” based on natural gas combustion. ISOR at II-31. According to the ISOR, “if a facility used a cleaner fuel source, like biomass, or combusts the fuel more efficiently, it would be rewarded with more allowances relative to its actual emissions.” Id. (emphasis added). This not only assumes without any support that biomass combustion is “cleaner” than natural gas, but also creates a strong incentive for biomass-fueled facilities to “opt in” to the cap-and-trade program for the purpose of obtaining valuable allowances while at the same time escaping any compliance obligation. See Proposed Reg. Sections 95812(a), 95852.2. The proposed rules thus potentially create a double “freebie” for biomass combustion: an exemption from compliance obligations, coupled with a program for distributing free allowances for that same combustion that may be sold into the market and used to justify emissions at other facilities. This double “freebie” not only incentivizes biomass and biofuels use but also risks a form of allowance double-counting that could ultimately increase GHG emissions overall.

The FED fails to disclose, analyze, and propose mitigation for the foreseeable effects of these incentives. Indeed, the FED completely fails to discuss many of the foreseeable impacts of incentivizing “decarbonization” compliance pathways involving biomass and biofuels. The only oblique mention of such impacts is in the context of cement plants using old tires to fire kilns (a process by which the natural rubber portion of the tires could be “credited as biomass”). FED at 153. Other foreseeable compliance pathways involving biomass and biofuels combustion are simply not discussed. The FED similarly contains no analysis of the impacts of incentivizing these pathways on forest resources, biological resources, geology and soils, or water quality— even though creating an incentive for biomass usage will foreseeably increase biomass harvests. This is a glaring and unlawful omission.

Burning trash, tires, and wood in place of other fuels may increase local emissions of criteria and toxic pollutants. Large-scale replacement of other energy sources with biomass will also put increased pressure on forest ecosystems, with resultant impacts on biodiversity, water quality, and forest health. The potential for these impacts is well-documented; indeed, one recent study concludes that a wide-scale shift to woody biomass energy generation could eventually result in conversion of nearly all of the world’s unmanaged forests and much of its pastureland to energy plantations. Significant impacts associated with increased biomass usage may already be anticipated to result from renewable energy standards and a plethora of state and federal subsidies for biomass development. In this context, an exemption from compliance obligations for biomass emissions under the cap-and-trade program at the very least constitutes a considerable contribution to a cumulatively significant effect. The FED fails to consider this.

Finally, the FED fails to adequately address the effects of the biomass exemption on overall greenhouse gas emissions. The document concludes that switching to "less carbon- intensive" fuels will produce a "beneficial effect" in terms of greenhouse gas emissions. FED at 184. Yet the core assumption underlying this conclusion that biomass emissions are "carbon neutral" is both unstated and unsupportable. Accordingly, biomass and biofuels may not be "less carbon-intensive" than the fuels or energy sources they replace, especially over the time frame relevant to AB 32, and especially if the replaced sources come from other potentially more costly renewables like wind and solar. Absent a protocol for tracking the sources of biomass fuels, evaluating the carbon debts associated with particular fuel sources, and reaching a defensible conclusion as to the real carbon footprint of biomass, the FED cannot rationally conclude that the biomass exemption confers an environmental benefit. (CBD1)

> **Response:** The commenter states that the FED failed to analyze the impacts of and propose mitigation for the exemption of biomass and biofuels emissions from compliance obligations. ARB disagrees with the commenter. The Updated Economic Evaluation of California's Climate Change Scoping Plan, which includes a cap-and-trade program, used the ENERGY 2020 model to assess the potential changes in energy use, both type and volume, brought on by the proposed Cap-and-Trade Regulation. The model did not indicate that the use of biomass would increase in response to the proposed Cap-and-Trade Regulation, and accordingly such an increase was not identified as an impact in the FED. The explanation for why the proposed Regulation would not have an effect is that increased use of biomass is already incentivized by existing regulations such as the Renewables Portfolio Standards and the Low Carbon Fuel Standard. The Renewables Portfolio Standard (RPS) requires publicly owned utilities to obtain 33% of their energy from renewable resources, including biomass. Most utilities are challenged to achieve the renewable target despite the availability of biomass as a renewable fuel. Increased use of biomass for energy generation created by other state policies and initiatives, such as the Renewable Portfolio Standard, is discussed in the FED (see pages 351-352).

Comment: Under CEQA, the FED must consider a range of reasonable alternatives that would feasibly attain most of the objectives of the Cap-and-Trade Regulation while avoiding or substantially lessening its significant impacts, and must compare the relative merits of these alternatives. CEQA Guidelines Section 15126.6(a). The FED fails to consider any alternative formulations of the Forest Offset Protocol that could meet these standards.

The Center and numerous other organizations have proposed alternative formulations to ARB throughout the past year. For example, ARB could have considered a version of the Forest Offset Protocol that eliminated clearcutting and other forms of even-aged management. ARB also could have considered restricting the conversion of uneven-aged, native forests to fast-growing plantations, and could have considered the inclusion of additional carbon pools. Finally, ARB could have considered a version of the protocol that corrected additionality problems caused by the protocol's failure to incorporate long-term sustained yield plans into the project baseline. These alternatives, alone or in combination, would have advanced many of the core objectives of the cap-and-trade program. Had ARB considered these alternatives, it could have compared them, alone or in combination, to the proposed Forest Offset Protocol, and evaluated their feasibility.

The FED failed to do so. Instead, the FED purports to have rejected "Environmental Performance Standards" for all compliance protocols. FED at 370. According to the FED, such standards are infeasible because: (a) they are unnecessary, given the existence of strong environmental laws in California; (b) they would be difficult to apply outside of California due to differences in local law; (c) it would be impossible to create performance standards that work across a wide range of project locations and conditions; and (d) implementing standards would create an administrative burden affecting the functioning of the offset market.

The FED's rejection of Environmental Performance Standards is puzzling at best and disingenuous at worst given that similar environmental standards already have been incorporated into every protocol ARB has proposed for adoption. These standards, such as the natural forest management requirement for forest projects and the limitation on clearcut size, have been applied regardless of California or local law, regardless of differences in project locations and conditions, and regardless of administrative burden. ARB cannot rationally reject alternative formulations of these standards as "infeasible" when the factors supposedly rendering them infeasible are common to the proposed project as well.

In order to reject an alternative as infeasible, the FED must set forth adequate quantitative, comparative data to enable the public and decision-makers to reach a rational conclusion. See, e.g., Save Round Valley Alliance, 157 Cal. App. 4th at 1461-62; Uphold Our Heritage, 147 Cal. App. 4th at 600. The FED does not even identify the particular "Environmental Performance Standards" that it supposedly finds infeasible, much less present adequate data and analysis in support of its conclusions. Accordingly, the FED's approach is unlawful, and the document must be revised to include discussion of a range of reasonable alternatives to Forest Offset Protocol design—including the alternatives identified above and in prior communications with ARB—that could ameliorate environmental effects while furthering AB 32's objectives. (CBD1)

> **Response:** The commenter suggests that the FED did not include a reasonable range of alternatives and states that ARB did not evaluate any alternatives to the Forest Offset Protocol. ARB disagrees. ARB examined a reasonable range of alternatives as required by CEQA and ARB's Certified Regulatory Program (CRP). Refer to the response presented under CRPE1 regarding the reasonable

range of alternatives considered in the FED. As described on page 368-370 of the FED, ARB evaluated five (5) alternatives to the cap-and-trade program. At the programmatic level, the fundamental purpose of the alternatives analysis is to determine if other broad program approaches, such as direct regulation or adoption of a carbon fee, might achieve the project objectives and lessen or avoid the potential adverse environmental impacts attributed to the proposed project. The Forest Offset Protocol is a part of the proposed Cap-and-Trade Regulation. The alternatives do not focus on a single sector (such as food processing) or a single action (such as facility relocation), because this would be too narrowly defined to achieve the AB 32 GHG reduction goal. Development of the proposed Regulation is an ongoing process that reflects changes and suggestions received through public and stakeholder participation.

The commenter is referred to the 15-Day revisions to the Regulation that increase the stringency of the offset provisions and Forest Offset Protocol requirements. Examples of proposed revisions include:

- Offset Project Operators or Authorized Project Designees must submit to California's jurisdiction to resolve disputes regardless of the physical location of the offset project.
- Additional attestations are required when an offset project is listed.
- The Offset Project Operator or Authorized Project Designee must disclose any offset credits issued for the same project for any other purposes in any other program.
- An offset verification team must review listing information submitted by the Offset Project Operator or Authorized Project Designee.
- A verification body must submit verification reports to Offset Project Registries with the Offset Verification Statement.
- Revision to the Compliance Offset Protocol U.S. Forest Projects disallows the use of Qualified Positive Offset Verification Statements because, for forest projects, ARB must ensure all protocol requirements are met, including sustainable harvesting requirements.
- Provisions have been added to deter forest project owners from terminating their offset projects early given permanence requirements that require the sequestration of carbon for 100 years. The Offset Project Operator or Authorized Project Designee must replace any reversed tons calculated pursuant to Compliance Offset Protocol, U.S. Forest Projects to ARB within 90 calendar days. If the Offset Project Operator or Authorized Project Designee does not replace the ARB offsets within the 90 days and ARB offset credits are retired from the Forest Buffer Account, ARB will assess penalties.

With regard to consideration of Environmental Performance Standards, the commenter recommends their use for the Forest Offset Protocol and expresses concern regarding ARB's conclusion that they would be infeasible as applied to the Cap-and-Trade Regulation. The FED explains on page 370 why the use of

Environmental Performance Standards is not feasible. The reasons are both practical (i.e., inability to cover the spectrum of potential sites and circumstances for Forest Offset projects) and legal (i.e., the potential for California-defined environmental standards to be inconsistent with the laws and regulations of other jurisdictions). Further, in California, defining Environmental Performance Standards is not necessary because criteria are established by existing environmental protection laws and regulations.

It is reasonable to expect adequate protection of environmental resources that are outside of the regular purview of ARB by relying on other applicable environmental laws and regulations within California and in other jurisdictions. Protection of other types of natural resources is best pursued by the agencies with jurisdiction over those resources, such as the Department of Fish and Game for California's wildlife. To attempt to create a separate set of standards specially applied to one type of forest activity (i.e., a forest offset project) could involve conflicts and inconsistencies with established regulatory programs, unnecessarily complicating forest management and resource protection.

ARB recognizes the importance of avoiding significant effects when implementing regulatory actions. To this end, see response to CBD1 regarding adaptive management.

Written Testimony: 8/11/2011
First 15-Day Changes Comment #: 1120

Comment: We understand that ARB expects the mitigation of environmental impacts resulting from the Cap and Trade Regulation to consist primarily of an adaptive management program, which in turn will largely rely on the information collected pursuant to the Mandatory Reporting Rule. As we stated in our comments to the Cap and Trade Regulation and associated FED, such an approach constitutes impermissibly deferred mitigation under CEQA. If mitigation is deferred, CEQA requires a lead agency both to develop specific performance standards and to commit to specific mitigation actions that will be taken if those standards are not met. As proposed in the proposed modifications, the Cap and Trade Regulation still lacks legally required performance standards and commitments to specific mitigation actions. Indeed, without these benchmarks and performance standards, it is impossible to determine even what information must be collected. Neither the Cap and Trade Regulation nor the Mandatory Reporting Rule identifies benchmarks that would trigger actions to mitigate environmental impacts, nor do they commit ARB to taking action in the event that significant, unanticipated environmental impacts occur.

In sum, absent specific performance standards, timely and rigorous monitoring of all relevant information, and particularized commitments to respond in specified ways to triggering events, the “adaptive management” approach described by ARB will not prevent significant environmental effects, and will not permit ARB to respond to unanticipated effects in a timely or effective manner. As a result, ARB’s proposed adaptive management approach to mitigation violates CEQA. The rule, as proposed in the proposed modifications, also represents a failure to comply with Board direction. In their resolution accompanying the approval of the Cap and Trade Regulation in December 2010, the Board directed the Executive Officer to: “Determine whether there are feasible alternatives or mitigation measures that could be implemented to reduce or eliminate any potential adverse environmental impacts…” and to adopt “any modifications that are necessary to ensure that all feasible mitigation measures or feasible alternatives that would substantially reduce any significant adverse environmental impacts have been incorporated into the final action…” The additional reporting requirements in the 15-Day changes for the Mandatory Reporting Rule require the collection of basic information about the mass of forest biomass material and the harvest permit under which it was collected. However, with respect to environmental impacts to forests, this falls far short of satisfying the above directives by the Board or establishing specific performance standards. (CBD4)

Response: See response to CBD1 regarding the proposed adaptive management approach and why it does not constitute “deferred mitigation.”

Second 15-Day Comment #: 2093

Comment: The proposed modifications eliminate section 95852.2(a)(4)(c), which had required that wood and wood waste materials to be combusted as biomass fuel "not transport or cause the transport of species known to harbor insect or disease nests outside zones of infestation…" (Page A-103.) The notice offers this explanation: "Section 95852.2(a)(4)(C) was removed in response to comments received from stakeholders who claimed that tracking and enforcement of sources of wood and wood wastes is extremely difficult for energy generators." However, there is a high probability that commercial timber land owners—who may not be able to harvest trees killed by bark beetles and disease for lumber or other durable wood products—would welcome the opportunity to sell those trees to biomass energy generators. To the extent that it makes harvest and transportation of these trees economical, the biomass fuel market is likely to become a significant driver of the harvest of trees killed by insects and disease. The elimination of this requirement openly invites the transport of infected and infested materials. This creates a substantial threat to California's forest resources and represents bad public policy. Purchasers of biomass fuels in large quantities—such as owners and operators of biomass power plants can be expected for sound business reasons to enter into contracts with fuel suppliers such as large timber corporations and the United States Forest Service. Those contracts easily could specify that the operators will not accept fuels if doing so would require the transport of infested and diseased materials. Relieving a few "stakeholders" of this purported burden cannot outweigh ARB's responsibility, as an agency required to uphold the public trust, to ensure that its actions do not threaten California's forests as a whole by exposing them to transportation of insects and disease. (CBD5)

Response: The commenter indicates that the removal of Section 95852.2(a)(4)(C) would invite transport of infected and infested materials, thereby possibly resulting in a new environmental impact. ARB disagrees. The California Department of Forestry has oversight of the harvesting of wood and wood wastes, and is required to identify species known to harbor insect or disease nests and approve transportation.
PRC, Ch.10, Article 5, is dedicated to Forest Insect and Plant Disease Control. State laws authorizing the control of forest pests, including Sections 4712-4718, 4799.08-4799.12, and the Federal Forest Pest Control Act (Public Law 110), allows broad administrative discretion in the use of public funds to detect and control forest pests on lands of all ownerships.

PRC Section 4715 allows the Department of Forestry and Fire Protection, in accordance with policy established by the Board of Forestry, to enter into agreements with any owner and with any agency of government, including the federal government, for the purpose of controlling or eradicating forest insects or plant diseases damaging or threatening destruction to timber or forest growth, and it may make expenditures for that purpose.

> PRC Section 4716 grants the following authority to the Director of the Department of Forestry and Fire Protection.
>
> > (a) Whenever the director determines that there exists an area that is infested or infected with insect pests or plant diseases injurious to timber or forest growth and that the infestation or infection is of such a character as to be a menace to the timber or timberlands of adjacent owners, the director, with the approval of the board [Board of Forestry], may declare the existence of a zone of infestation or infection, and describe and fix its boundaries.
> >
> > (b) If the director declares the existence of a zone of infestation or infection pursuant to subdivision (a), the department or its agents may go upon state and private lands within the zone of infestation or infection and shall cause the infestation or infection to be eradicated or controlled in a manner that is approved by the board.

Further, Forest Practice Rules 917.9, 937.9, 957.9, 957.10, 957.11. “Prevention Practices” contain guidelines that address the buildup of destructive insect populations or the spread of disease, hazard reduction and treatment alternatives.

Notwithstanding the protection of regulatory restrictions on the potential transport of invested plant or woody materials, the economics of biomass power plants would preclude transport of materials far from the plant or woody fuel source. Fuel costs are critical to the economic viability of biomass power plants and transportation costs can be the largest component of the cost of fuel. As a result, the “fuel shed” of a biomass power plant must be a limited distance from the plant. Prior environmental investigations have found that within 50 miles, the transport of biomass fuel can still be viable and beyond that distance, the transport begins to be economically infeasible. Therefore, if any material were to carry an infestation, the environmental effect would be minimized by the economic limitations of the cost of fuel transport. Once at the plant, the fuel would be combusted and the risk of spreading an infestation would be eliminated. Recognizing the regulatory protections and the limited distance of fuel transport, any potential for environmental effects from infested plant or woody materials would be less than significant.

45-Day Comment #: 762

Comment: Large California NOx, CO, and other co-pollutant reductions can be achieved if an alternative is adopted requiring direct control measures using methods known by CARB (e.g. for boilers and heaters). These co-pollutants otherwise cause large cumulative impacts in impacted communities. Similarly, CARB should evaluate other co-pollutants including PM2.5 and toxics which feasible direct controls would achieve. AB 32 requires addressing the co-pollutants issues, but the proposed cap-and-trade regulation and Scoping Plan do not. (CBE1)

> **Response:** In developing the Scoping Plan in 2008, the Staff Report for the Cap-and-Trade Regulation, and again in the *Supplement to the AB 32 Scoping Plan Functional Equivalent Document* (Supplement), which was presented at the August 2011 Board meeting, we evaluated the air quality impacts of a direct regulation compared to a cap-and-trade program. The proposed Cap-and-Trade Regulation is designed to reduce GHG emissions and is not directly applicable to other pollutants. However, criteria pollutants and toxic air contaminants are generally expected to decline as a result of GHG reduction measures. Consequently, the proposed Cap-and-Trade Regulation would not contribute to a cumulative increase in co-pollutants. FED page 343.
>
> The proposed Cap-and-Trade Regulation has the distinct advantage of imposing an enforceable cap on emissions—making it the most likely method to successfully meet the AB 32 goal of capping emissions at 1990 levels by 2020. As described on page IV-3 of the proposed Cap-and-Trade Regulation Staff Report, direct regulations for emission sources do not provide the same assurance of reductions as those offered by a cap-and-trade program.
>
> The proposed Cap-and-Trade Regulation and the source specific alternative share challenges. If a cap-and-trade program is not adopted, ARB would instead have to adopt numerous source-specific regulations on many different types of sources. Before ARB adopts a regulation on a source category, staff must spend considerable time investigating the category to determine what level of emissions control is cost effective and technologically feasible. Some sectors may not be regulated at all because, after investigation, staff determines that emission standards are not cost-effective or technologically feasible, or that the potential emission reductions are so small that regulation is not justified.
>
> In addition, it takes considerable time to develop each individual regulation. This means that some sources will be regulated first; others will be regulated later—perhaps much later if the category presents difficult technical issues.

Even if regulations are ultimately determined to be feasible and are adopted, the delay in adoption, and the potentially long lead times necessary for some sources where feasibility is an issue would mean that emission reductions at certain sources will likely occur much later than at other sources. It is, therefore, very difficult to predict at this time (i.e., before staff has done the necessary technical work) both where emission reductions will occur and when they will occur. Some sources or source categories near environmental justice communities may remain unregulated, or may achieve emission reductions much later than if the source had instead been regulated under the cap-and-trade program.

Another reason why uncertainty is a characteristic of regulatory systems relying on source-specific regulations is that each source-specific regulation can be designed in different ways. Different levels of emission controls can be specified, and source-specific regulations often have exemptions for certain types of sources that cannot comply with a specified standard. Many regulations also have compliance flexibility features that allow such options as the use of averaging or even the use of offsets to meet some compliance obligations. Because of these exemptions or compliance flexibility features, there is no guarantee that uniform reductions at each individual source will occur. Different impacts to neighboring communities could, therefore, result from the Regulation, as compared to a regulation without such flexibility.

Exemptions or compliance flexibility that may be included in any source-specific regulation may be superficially appealing but present serious downsides. One reason that exemptions may be included in a source-specific regulation is that not all individual sources can achieve the same level of emission reductions due to various factors such as the source's age or use of particular types of equipment. If a standard is set that all facilities can meet (e.g., in order to satisfy the requirements of technological feasibility and cost-effectiveness set forth in AB 32) the emission standards may have to be set much less stringently in order to meet these requirements. If carefully targeted exemptions or less stringent standards are instead allowed for certain types of facilities, the standards on the remaining sources may be able to be set much more stringently. Such a regulatory structure may be necessary in order to achieve the maximum feasible emission reductions (another requirement of AB 32) from the source category as a whole. The same rationale may also justify the inclusion of flexibility options in a source-specific regulation.

Comment: A highly preferable alternative proposal would have been a thorough evaluation of Reasonably Available Control Measures necessary to meet CARB's requirements under AB 32 for maximum reductions, to reduce smog in non-attainment zones, and toxics in overburdened heavily industrial areas. The following sections identify specific sources that should have been considered. For example, additional reductions could be achieved from:

(1) Requiring In-State reductions from industrial boilers and heaters, which CARB has already identified.

(2) Removing industrial exemptions for methane from smog regulations.

(3) Requiring implementation of specific refinery by refinery measures identified in the industrial energy efficiency audits.

(4) Limiting emissions and conversion to processing Heavier Crude at oil refineries (which is not cancelled out by adding polluting ethanol to gasoline).

(5) Requiring oil refineries to switch fossil fuel electricity use to clean alternative energy sources (since oil refineries use significant electricity). (CBE1)

Response: See the response to CRPE1 regarding the reasonable range of alternatives considered in the FED. See response to comment CBE1 regarding consideration of source-specific reduction alternative, above. The commenter offers a range of source-specific GHG reduction measures that could be implemented by ARB. These measures have been considered in the context of evaluating the Additional Source-Specific Command-and-Control Regulations Alternative (see page 387-390 of the FED).

ARB examined a reasonable range of alternatives as required under CEQA. The array of source-specific measures recommended in the comment presents a scenario of additional regulatory actions. ARB staff believes that most of the measures suggested by the commenter are not feasible and the remaining measures, while they have some reduction potential, may be substantially inflated relative to what a regulatory approach might actually cost-effectively achieve.

ARB has adopted an energy efficiency and co-benefits audit regulation. The audit results from this regulation are due at the end of 2011. ARB staff has committed to evaluate opportunities to achieve facility-specific cost-effective emission reduction opportunities that will result in GHG and co-pollutant benefits and require these reductions under a regulatory program. Staff does not believe that mandated improvements of this type are administratively feasible under a regulation at this time due to the lack of data on specific reductions that can be achieved.

Comment: Boiler and Heater NOx and CO Co-pollutant emissions are large and if directly controlled would yield large local health benefits. AB 32 requires ARB to design the program to prevent any increase in emissions of toxic air contaminants or criteria pollutants. It also requires it to consider the overall societal benefits of reducing other air pollutants and benefits to the environment and public health. Yet the draft regulation demonstrates that reductions could have been achieved to substantially reduce co-pollutant emissions but was rejected.

CARB provided two spreadsheets calculating available measures for reducing CO_2 emissions from industrial boilers and heaters, which are major pollution sources. Measures include replacing old boilers of low or medium efficiency, optimizing combustion, improving insulation maintenance, etc. (listed below and in the attached spreadsheets). CARB identified how much energy would be saved for each of these measures in MMBTU (million British Thermal Units). CARB provided these reduction opportunity calculations not because these are being directly mandated, but to show possible ways that industrial sources could reduce, but are nevertheless allowed to buy their way out of under Cap and Trade. There was no showing that these reductions would not have been cost-effective. Regardless, the CARB list underscores the availability of measures for direct control. If these controls were implemented locally instead of traded, they would not only result in the CO_2 emissions reductions identified by CARB, but would also result in very substantial co-pollutant reductions. CARB should have considered such an alternative project to address co-pollutant impacts.

It is a simple matter to calculate the co-pollutants associated with the energy savings identified in the boiler and heater spreadsheets. For example, standard AP42 emission factors for NOx and CO are available, based on natural gas combustion. This will generally underestimate emissions because more polluting fuels are often used by these boilers and heaters, but applying the natural gas factors provides a conservative estimation, and still comes out to large emissions. The result, in tons per day, is provided below. The detailed tables are attached as an appendix. The full spreadsheets are separately attached. (CBE1)

> **Response:** See response to CRPE1 regarding the reasonable range of alternatives considered in the FED. See response to CBE1 regarding consideration of source-specific reduction alternative.
>
> The commenter suggests that a greater reduction of co-pollutant emissions could be achieved through the direct regulatory control of boiler and heater emissions. ARB examined a reasonable range of alternatives as required under CEQA, including the adoption of direct regulatory controls. While direct regulation offers some reduction potential, the estimated reductions presented by the commenter may be substantially inflated relative to what a rule approach might achieve. The commenter draws on material prepared by ARB staff for the proposed cap-and-trade rulemaking (Appendix F) and contends that the conceptual emission reductions that might be obtained with these measures could be required as a direct regulation. Staff is currently evaluating how facility-specific cost-effective emission reduction opportunities identified by energy efficiency and co-benefits audits due by the end of 2011 could be required under a regulatory program. The commenter is assuming the results of a broad analysis or audits are applicable over a diverse set of sources requiring widespread efficiency

improvements. Staff does not believe that mandated improvements of this type are administratively feasible under a regulation at this time. The commenter also rightfully notes the uncertainty in estimates of emission reductions possible from these types of measures due to potential overlapping of estimated reduction opportunities (such as replacing or improving boilers).

Further, although boiler and heater source-specific reduction measures could achieve substantial GHG reductions, for the reasons described in response CBE1 above, both a source-specific regulatory program and a cap-and-trade program can have a similar result in the real world, but it depends on the many details of how the regulations are designed. The FED indicates that at this time ARB cannot predict in which sectors and what geographic locations the emission reductions would occur under the source-specific alternative. However, it does indicate that emission limits applied to specific regulated entities and facilities could provide more certainty regarding the location of GHG emission reductions, which could be an environmental advantage of this alternative. In comparing the Additional Source-Specific Command-and-Control Regulations Alternative with the Cap-and Trade program, ARB determined that the source-specific alternative (see page 395 of the FED) would result in the low likelihood or no likelihood of achieving the project objectives for five objectives (i.e., equitable distribution, cost-effectiveness, minimize leakage, establish a declining cap, and linkage with partners), whereas the proposed Cap-and-Trade Regulation would have a high likelihood for achieving all objectives. For these reasons, and for other supporting economic and feasibility reasons included in the Initial Statement of Reasons, ARB has rejected this alternative as not being environmentally superior to the proposed action.

First 15-Day Changes Comment #: 1166

Comment: Some of the amendments to the proposed Regulation would cause more severe and significant environmental effects than those disclosed by the draft FED, and warrant revision of the FED. ARB failed to revise and recirculate the environmental document to disclose the impacts of the amendments. Given the likely significant environmental impacts from the substantial changes to the proposed Regulation, ARB should revise and recirculate the FED before adopting any amendments to the proposed Cap and Trade Regulation.

CEQA requires that the agency prepare a response to comments before adopting a final EIR or FED. This final action is due in October 2011. Yet, at the same time, the Board has directed the Executive Officer to report back to the Board in July 2011 on the "finalization of the allowance allocation system", "implementation of a market tracking system", "implementation of an auction system", and "implementation of an offset tracking system." At the same time comments are being taken, and before the final FED is prepared, ARB will be actively preparing markets for Cap and Trade. As such, the Board has adopted a Cap and Trade Regulation before completing CEQA.

The process is further aggravated because the Board in its December resolution also directed the Executive Officer to "modify" several aspects of the Regulation, and never mentioned considering the environmental consequences of the changes. The Board has not considered CEQA or environmental consequences at all in deciding whether or not to approve this project. The Executive Officer alone will review the FED comments, which are based on the pre-amendment regulations. The Executive Officer should at least have the benefit of comments on the completed draft EIR, one that reflects the true project and its impacts.

During the comment period for the Scoping Plan alternatives, ARB also released amendments to the Cap and Trade Regulation for public comment. ARB's decision to create an overlapping comment process also undermines public participation and ARB's ability to genuinely consider the project's significant impacts. It is not possible to fully comment on both documents at once. ARB's insistence on thrusting this Regulation forward without ensuring that it will avoid significant impacts casts serious doubt on the process as a whole and CARB's willingness to hear from all but a select few "stakeholders" whose opinions are solicited. (CBE4)

> **Response:** The commenter expresses an opinion that the Board has adopted the Cap-and-Trade Regulation before completing CEQA, that the Board has not considered CEQA or the environmental consequences of the proposed 15-Day changes, and that ARB's decision to create an overlapping comment process undermines public participation. The commenter suggests that the FED should

be revised and recirculated before adopting any amendments to the proposed Cap-and-Trade Regulation.

The commenter suggests that ARB has not considered the environmental effects of the proposed changes directed by the Board in its December 2010 resolution. This is not correct. Following a public hearing held on December 16, 2010, the Board adopted Resolution 10-42, which directed staff to make a number of modifications to the proposed Regulation. On July 25, 2011, the first Notice of Public Availability of Modified Text and Availability of Additional Documents (First 15-Day Change Notice) was issued. The public comment period for the First 15-Day Change Notice ended on August 11, 2011. On September 12, 2011, additional modifications to the regulatory text were proposed in a Second Notice of Public Availability of Modified Text and Additional Documents and Information (Second 15-Day Change Notice).

The commenter offers no evidence to support the contention that the analysis in the FED warrants revision and recirculation. ARB staff reviewed the 15-Day changes and determined that the changes would not result in new impacts or change the level of significance of already identified impacts, and therefore does not require revision or recirculation of the FED. (See also response to CPRE4.)

ARB concurrently complies with APA and CEQA requirements through its CRP. ARB typically has multiple regulatory proposals underway on parallel time frames and complies with the environmental review requirements for all of them. ARB has complied with the requirements of its CRP for the preparation and circulation of the FED and preparation of these written responses to comments.

With regard to adoption of the proposed Cap-and-Trade Regulation, ARB disagrees with the commenter. The Board has not taken final action to adopt the proposed Regulation prior to completion of the environmental process. The Board is scheduled to consider the responses to comments on the FED at the October 20, 2011 hearing prior to taking final action on the Regulation.

Comment: ARB's revisions to tables 8-1 and 9-1 of sections 95870 and 95891 would cause more severe and significant environmental effects than those disclosed by the draft FED. These changes revise the timing and amount of refinery emissions which ARB proposes to "allocate" for free (proposes not to control) in ARB's proposed equation given in section 95891. As ARB's own AB 32 program documentation acknowledges, oil refineries are the largest industrial emitter in its program. (CBE4)

Response: As noted by the commenter, the 15-Day changes provide additional detail on industry benchmarking and allowance allocations. The modifications are consistent with anticipated and ongoing refinement of the proposed Regulation and do not substantially alter the magnitude of potential environmental impacts or the suggested level of significance presented in the Draft FED. Benchmarking is a process to estimate representative emission factors by sector, and provide a baseline for allowance allocation. The referenced 15-Day changes simply incorporate benchmark values that were not available when the Draft FED was prepared. The provision of free allowances is proposed to minimize potential leakage in exposed sectors, and was addressed in the Draft FED on pages 9 and 40:

> "Staff proposes to create a gradual transition into the program through the design of the allocation system. ARB will rely primarily on free allocation at the start of the program to minimize near-term costs to California consumers and businesses and to minimize emissions leakage. The allocation design will reward those who have invested in energy efficiency and GHG emission reductions and will encourage continued investment in clean and efficient technologies in the future."

A common misconception is that the provision of free allowances discourages a covered entity from implementing measures to reduce emissions. In fact, the provision of free allocations does not result in fewer improvements being implemented by covered facilities. Although an entity could simply return allowances at the close of a compliance period, if the value of the allowances exceeds the cost of improvements, free allowances provide opportunities for entities to implement compliance actions at reduced cost.

Comment: ARB added section 95852(a)(2) to the proposed cap and trade regulation. This new section appears to exempt oil refineries from including the major greenhouse gas emissions from combustion of fuels, including natural gas liquids. Natural gas can be stored as liquid natural gas, which is later burned as natural gas. This exemption would cause significant air pollution impacts and exacerbate pollution hotspots by taking one of the largest sources of combustion emissions at refineries completely out of any compliance requirement.

Response: The proposed change does not exempt these fuels from regulatory compliance. In 2015, the compliance requirement for these fuels simply changes from the facility combusting the fuel to the facility/operator providing the fuel. Refineries both provide the fuel and combust the fuel, and as such would continue to be responsible for compliance after 2015.

Written Testimony: 8/11/2011
First 15-Day Changes Comment #: 1134

Comment: In currently pending litigation, a California State trial court found that the analysis of the alternatives identified in the FED was not sufficient for informed decision-making and public review under CEQA. Under the abuse of discretion review taking place, a Supplement was prepared to provide an expanded analysis of the five project alternatives discussed in Section V of the 2008 Scoping Plan FED. Based on Alternative 5 of the Supplement, CARB has met all of the objectives and the emissions targets of AB 32. One need only eliminate Cap and Trade from that mix because the emissions reduction yield from Cap and Trade was always a "plug" number. It was a number to plug in to get to the evolving target, a catch all buffer in case actual reductions didn't materialize as projected. Cap and Trade's inclusion was a sop to business and lip service to those who believe that credit trading was the foundation for a "green economy." More importantly, a Combined Strategies alternative that does not include Cap and Trade also does not constitute a No Project designation, which is a political non-starter. (CIPA)

> **Response:** The commenter urges ARB to consider Alternative 5 from the Scoping Plan FED Supplement (which was a combination of strategies including a cap-and-trade program), but eliminate the Cap-and-Trade Regulation to reduce emissions and meet AB 32 goals. No specific comments on the adequacy of the environmental analysis prepared for the Cap-and-Trade Regulation were raised. The commenter is referred to the response below, and no further response is required.

Comment: The largest single impediment to the rational policy decision to jettison Cap and Trade and instead rely on the established mix of combined strategies and measures is CARB's desire to construct the mix of measures in such a fashion that the target reductions are skewed higher than necessary to meet AB 32 goals because of a desire to put California on a path to meet the long-term 2050 goal of reducing California's GHG emissions to 80 percent below 1990 levels because CARB believes this trajectory is consistent with the reductions that are needed globally to help stabilize the climate. CIPA argues that this scale is unachievable at the state level and that this policy horizon is too long for rational development of midterm solutions and is in practical effect the enemy of the good. (CIPA)

> **Response:** The commenter urges ARB to consider eliminating the Cap-and-Trade Regulation and instead consider a mix of measures to reduce emissions and meet AB 32 goals and expresses the opinion that some of the reduction levels are overstated, because of ARB's perceived desire to attain 2050 goals, rather than just 2020 goals. No specific comments on the adequacy

of the environmental analysis were raised; therefore, no further response is required.

If approved, the Cap-and-Trade Regulation would be a single regulation in a suite of GHG reduction measures implemented by ARB to reduce GHG emissions. The list of Ongoing, Approved and Foreseeable Measures is available on the ARB website at:

http://www.arb.ca.gov/cc/inventory/data/tables/reductions_from_scoping_plan_measures_2010-10-28.pdf

These measures alone do not achieve the reductions necessary to reach the AB 32 target in 2020. If the Cap-and-Trade Regulation is approved, it would achieve the additional reductions necessary to reach the target. Further, ARB is continuing to evaluate additional regulatory measures that could be implemented to reduce emissions from specific sources. Most additional measures have not reached a level of development that they can be counted towards achieving the 2020 target with a reasonable level of confidence.

Comment: In CIPA comments on the Supplement to the AB 32 Scoping Plan Functional Equivalent Document, dated July 28, 2011, we noted that the FED Supplement fails to provide an accurate baseline because the GHG reductions attributable to other programs are underestimated or omitted and the effects of the economic recession on statewide GHG emissions have been underestimated. Specifically, we argued that the FED Supplement does not include the GHG reductions associated with two measures that CARB has already adopted or is adopting, namely the Commercial Recycling Measure and the Energy Efficiency And Co-Benefits Assessment. Moreover, we pointed out that the FED Supplement does not include any of the GHG reduction programs that CARB has proposed but not yet adopted. CARB has estimated that the GHG reductions attributable to those measures total 68 MMT exceeding the 22 MMT shortfall. Yet, CARB provides no analysis in the FED Supplement as to the foreseeability of these measures or the likely effect those measures will have on achieving the AB 32 target.

Insofar as the FED Supplement ignores GHG reduction programs implemented or under development by the federal government and other state agencies such as the California Public Utilities Commission, we noted that the baseline has been skewed. Even though CARB states in the FED Supplement that it has updated the environmental baseline to account for events subsequent to the original FED prepared for the Proposed Project, CARB has not included these programs in its updated baseline. As a result, CARB's updated baseline is inflated and overstates any shortfall in achieving the AB 32 target. Indeed, proper accounting for these omitted programs could exceed the 22 MMT shortfall estimated in the Supplemental FED. Although the FED Supplement states that it has updated the environmental baseline by accounting for the effects of the recent economic recession on statewide GHG emissions, there is no explanation, let alone any quantitative analysis, as to how CARB accounted for those recessionary effects. Indeed, the only information provided in the FED Supplement on this issue is a conclusory statement that CARB relied on the energy demand forecast provided in the

2009 “IEPR” prepared by the California Energy Commission (CEC). Yet, in findings issued in March 2011 – before the publication of the FED Supplement – the CEC acknowledged that its 2009 forecast substantially under predicted the depth and duration of the recession. Accordingly, CARB’s baseline of GHG emissions is significantly overstated. CIPA asserts, again, that CARB has met all of the AB 32 objectives and the emissions targets through Alternative 5 of the Supplement- Variation of the Combined Strategies or Measures. One need only eliminate Cap and Trade from that mix to arrive at a Combined Strategies Alternative that satisfies AB 32. (CIPA)

> **Response:** The commenter urges ARB again to consider Alternative 5 of the Supplement to the Scoping Plan FED with elimination of the Cap-and-Trade Regulation. The commenter did not submit specific comments on the environmental analysis conducted for the Cap-and-Trade Regulation in the FED, therefore, no further response is required.

Comment: Do not be afraid to accept that CARB has met all of the AB 32 objectives and the emissions targets through Alternative 5 of the Supplement- Variation of the Combined Strategies or Measures. One need only eliminate cap and trade from that mix to arrive at a Combined Strategies Alternative that satisfies AB 32 and avoids the pitfalls that await an ill-defined market plan and does not suffer the credibility gap of a take no action alternative. We urge you to embrace adaptation as a policy response, fully count the Combined Measures and Strategies taken to date and jettison the dangerous California only Cap and Trade rule. (CIPA)

> **Response:** Refer to response to preceding CIPA comment.

Written Testimony: 12/14/2010
45-Day Comment #: 693

Comment: The Board should not adopt the proposed cap and trade rule. ARB has not conducted a proper foundational analysis to justify this choice of a market mechanism, and ARB has not analyzed a reasonable range of alternatives in accordance with the California Environmental Quality Act ("CEQA"). (CRPE1)

> **Response:** The commenter asserts that ARB has not analyzed a reasonable range of alternatives in accordance with CEQA, but provides no specificity. It is not possible to respond to this general comment, other than to reiterate that the FED complies with all applicable CEQA requirements, including analysis of alternatives.
>
> ARB held a Scoping Meeting for the Cap-and-Trade FED on August 23, 2010 to solicit public input on environmental impacts and the range of project alternatives to be evaluated. The FED considered five alternatives to the project. See Chapter 6.0, "Alternatives Analysis," of the FED, including a range of market and non-market approaches to GHG reduction. Alternatives consisted of five different cap-and-trade program designs, carbon fee, direct regulation approach, and the no-project alternative. This represents the spectrum of GHG reduction strategies used by states, provinces, and nations. In accordance with the substantive requirements of CEQA, the alternatives analyzed in the FED represent a "reasonable range" that could potentially feasibly attain most of the basic project objectives while having the potential to reduce or eliminate significant environmental effects. Generally, a range of alternatives analyzed in an environmental document is governed by the "rule of reason," requiring evaluation of those alternatives "necessary to permit a reasoned choice" (See Title 14 CCR section 15126[f]). The initial screening of potential alternatives had to at least potentially meet the objectives, and alternatives were included only after consideration of their potential feasibility based on technical, legal, and regulatory grounds. The five alternatives covered a range of policy level alternatives sufficient to permit a reasoned choice.

Comment: ARB'S analysis of alternatives to the proposed Regulation violates the California Environmental Quality Act. AB 32 requires "the state board to adopt greenhouse gas emission limits and emission reduction measures by regulation," which triggers the CEQA requirement for an Environmental Impact Report (EIR). As a certified regulatory program, ARB discussed possible impacts in the form of a Functional Equivalent Document (FED) in lieu of an Environmental Impact Report, pursuant to Public Resources Code section 21080.5.

ARB failed to adequately analyze project alternatives in the Functional Equivalent Document. Under CEQA, ARB must examine a reasonable range of alternatives to the proposed project that feasibly meet most of the project's basic objectives while avoiding or substantially reducing the significant effects of the project. The selection of alternatives should foster informed decision making and public participation. CEQA also makes clear that the purpose of the alternatives analysis is to focus on alternatives that are capable of "avoiding or significantly lessening any significant effects of the project, even if those alternatives would impede to some degree the attainment of the project objectives, or would be more costly." In evaluating alternatives, ARB must include "sufficient information about each alternative to allow meaningful evaluation, analysis and comparison with the proposed project."

For purposes of developing and evaluating the proposed project and alternatives, ARB derived the following objectives from AB 32:

- Achieve technologically feasible and cost-effective aggregate reductions;
- Distribute allowances equitably;
- Avoid disproportionate impacts;
- Credit early action;
- Complement existing air standards;
- Be cost-effective;
- Consider a wide range of public benefits;
- Minimize administrative burden;
- Minimize leakage;
- Weigh relative emissions;
- Achieve real emission reductions;
- Achieve reductions over existing regulation;
- Complement direct measures;
- Consider emissions impacts;
- Prevent increases in other emissions;
- Maximize co-benefits;
- Avoid duplication;
- Establish declining cap;
- Reduce fossil fuel use;
- Link with partners;
- Design enforceable, amendable program; and
- Ensure emissions reductions.

Having articulated these objectives (notably, without regard to their accuracy, and to the statutory requirements in AB 32), ARB then presented a cursory, circular and results-oriented description of five alternatives to the proposed plan. The five alternatives ARB identified were:

(1) No project. This Alternative comprises the bulk of the alternatives analysis. The section generally describes sector by sector the business as usual impacts compared to the proposed Cap-and-Trade Regulation;

(2) Implement only additional source-specific command-and-control regulations. This alternative purports to consider implementation of source-specific emission limits by regulation. However, in its Executive Summary, ARB demonstrates its preference for cap and trade above all other forms of controls with an unsubstantiated conclusion that direct regulations cannot provide the same assurances for reductions that a cap and trade program because of an uncertainty in emissions reductions caused by the diverse nature of many industrial processes and a lack of data. This conclusion is not only nonsensical to justify the inclusion of these same diverse and data-poor industrial processes in a cap and trade program (under which all reductions must be real, permanent, quantifiable, verifiable, and enforceable) but is unsubstantiated, based only on the excuse that ARB does not have the data to properly regulate these industries. In its analysis, ARB acknowledges that command-and-control regulations “can take several forms.”

    However, instead of performing a meaningful analysis of any of the forms possible, ARB “assumed that only regulated emission limits would be implemented” on sources (as opposed to technology). As such, ARB failed to identify and analyze the specific command-and-control regulations which would be appropriate here. Instead ARB summarily states that the specifics necessary to conduct such analyses “would depend on the information that is learned in the future during the regulatory development process.” And yet, prior to initiating any “regulatory development process,” ARB identifies five objectives with which source-specific emission limits would not be likely to achieve in Table 6-1 on “Comparative Likelihood That Alternatives Achieve Project Objectives.”

    Table 6-1 ranks on a scale of high, medium, and low the likelihood that each alterative considered would be likely to achieve each of the 22 objectives ARB identified. Here, each of the “no or low likelihood to achieve objective” ratings received by the source-specific command-and-control regulation alternative pertained to objectives that were either not applicable to source-specific command-and-control regulations or not analyzed. First, stated objective two is to distribute allowances equitably. Under a source-specific emissions limit program there are no allowances to distribute and thus the objective is inapplicable here. However, the underlying intent of the specified objective appears is to ensure equitable treatment of entities. In this case that purpose is served in that there is an equitable distribution of zero allowances. Stated objective five is to complement existing air standards. While Table 6-1 rates source-specific emissions limits as low here, nowhere else in the FED is the issue addressed. In fact, the brief program description on page 388 discusses how this alternative would “likely focus primarily on the industrial sector because the transportation, electricity and natural gas sectors are already extensively addressed." Given this cursory analysis, it appears that source-specific regulations would in fact be designed to complement existing air standards.

Stated objective nine is to "minimize leakage." However, in the objectives section ARB specifically notes that "command-and-control regulations can be designed to minimize or avoid leakage." No further explanation as to how leakage is caused, or could be minimize under this alternative, other than to say that administrative burdens may increase, is provided. Stated objective 18 is to establish a declining cap. This objective is either inapplicable, as source-specific emission limits envision no cap to begin with, or it is fulfilled by analogy. The intent of the objective is to "cover 85 percent of the state's GHG emissions in furtherance of California's mandate to reduce GHG emissions to 1990 levels by 2020." Since there is no "cap" in source-specific regulations, the objective of a "declining cap" is not applicable. However, the intent of the objective is to continually lower emission levels and this intent could be fulfilled through a source specific regulatory scheme. In fact, the U.S. EPA regularly writes mobile source emission regulations (source- specific command-and-control regulations) that increase in stringency over time.

Lastly, stated objective 20 is to link with other Western Climate Initiative (WCI) partners to create a regional market system. While Table 6-1 concludes there is no or a low likelihood of achieving this objective, there is no elucidating discussion as to why it is not possible. Generally, command-and-control regulations do not envision a market system; however, no aspect of such a program precludes regulatory schemes from linking together partners in some way. In failing to fully envision, consider, and describe how source-specific emission limits could operate in California, ARB has not included sufficient information on source-specific emission limits "to allow meaningful evaluation, analysis and comparison with the proposed project." ARB preemptively rejects this alternative as "challenging," but acknowledges that "the certainty about avoiding localized increases in emissions could be an environmental advantage of this alternative." This is a key advantage for environmental justice communities, and does not allow ARB to so quickly dismiss it in favor of a cap and trade program;

(3) Carbon fee. ARB describes implementation of a carbon fee as similar to cap and trade in that both programs place a price on GHG emissions, which thereby provides an incentive for businesses and individuals to reduce their emissions. Similarities between the two programs include "reporting, monitoring, verification of covered entities' GHG emissions." ARB states that the main difference between the programs is that implementing a carbon fee "provides price certainty for the covered entities" but lacks emission certainty. ARB's analysis of a carbon fee is fundamentally flawed in again failing to envision and analyze how the program would actually work. Thus, it fails to meet CEQA's requirement for "sufficient information about each alternative to allow meaningful evaluation, analysis and comparison with the proposed project." Instead of developing a real alternative, ARB focuses on

elements of the proposed cap and trade program which have already been developed and then unfairly compares the developed proposal with the mere title “carbon fee” absent a more developed program which would allow for a more reasoned analysis. For example, ARB acknowledges that the efficiency of a carbon fee could be enhanced by pairing it with “complementary approaches, such as performance standards,” yet it “assume[s] that only a carbon fee would be implemented.” Also, ARB states that to avoid passing costs on to consumers, a system of offsets could be used, but it fails to consider the alternative with such a system and instead criticizes a carbon fee as passing costs onto consumers. Additionally, ARB finds that the potential for leakage is increased with a carbon fee as opposed to a cap and trade system, but fails to consider how to tailor fee levels to market influences, while at the same time stating that it can be done. In ARB’s “Comparative Likelihood That Alternatives Achieve Project Objectives,” Table 6-1, four objectives are identified as having a “no or low likelihood to achieve objective.”

Stated objective six, to be cost-effective, is identified as not likely to be achieved. Nowhere in ARB’s discussion of a carbon fee is cost effectiveness directly discussed. In fact, ARB notes so many potential similarities between cap and trade and a carbon fee, without mention of the apparent cost ineffectiveness associated with a carbon fee that one can only speculate as to how cap and trade has a high likelihood of cost effectiveness while a carbon fee has a low likelihood of cost effectiveness. ARB ranks implementation of a carbon fee as unlikely to minimize leakage, in stated objective nine. However, ARB’s incomplete analysis failed to consider a carbon fee program that provides opportunities to tailor the fee level to market influences, while at the same time acknowledging that such mechanisms are possible and that they could decrease the potential for leakage. Without conducting an analysis that fully considers what the likely implementation of a carbon fee program would include, ARB’s conclusion is preemptive and arbitrary.

ARB’s stated objective 18 is to establish a declining cap. This objective is either inapplicable, as this implementation of a carbon fee envisions no cap to begin with, or it is fulfilled by analogy. The intent of the objective is to “cover 85 percent of the state’s GHG emissions in furtherance of California’s mandate to reduce GHG emissions to 1990 levels by 2020.” Since there is no “cap” in this vision of a carbon fee, the objective of a “declining cap” is not applicable. However, the intent of the objective is to continually lower emission levels and this intent could be fulfilled through increasing the carbon fee.

Lastly, stated objective 20 is to link with other WCI partners to create a regional market system. While Table 6-1 concludes there to be no or a low likelihood of achieving this objective, there is no elucidating discussion as to why is it not possible for WCI partners to also adopt a carbon fee. In failing to fully envision, consider, and describe how a carbon fee could operate in California, ARB has failed to provide sufficient information allow a meaningful evaluation of a carbon fee;

(4) California cap and trade program linked with a Federal cap and trade program. ARB discusses the possibility of linking the proposed California cap and trade program to a Federal cap and trade program in the alternatives analysis sections of both the Initial Statement of Reasons and the Functional Equivalent Document. However, linking a California cap and trade program to a non-existent Federal program is not an alternative at all. In fact, it is not an alternative for two reasons. First, an alternative must be an alternative to the proposed program. Here, the proposed program is cap and trade. The alternative discussed is the exact same cap and trade program but with a Federal partner. Ergo cap and trade is not an alternative program to cap and trade, regardless of what partnerships are formed.

Secondly, an alternative that has "no prospect in the near term," contains no detail whatsoever, has envisioned no mechanisms for implementation, enforcement, etc., is not a reasonable alternative. Thus, any linkage between a California cap and trade program and a Federal cap and trade program ought to have been discussed as an alternative cap and trade design feature and not under the guise of a legitimate cap and trade program alternative; and

(5) Alternatives to specific cap and trade program design features. ARB discusses five design features possibly applicable to the proposed cap and trade program. Conspicuously absent from the alternatives analysis is an alternative that geographically limits offsets. (CRPE1)

Response: See response to CRPE1 regarding the reasonable range of alternatives considered in the FED. The FED evaluated a range of market and non-market approaches to GHG reduction. Alternatives consisted of five different cap-and-trade program designs, carbon fee, direct regulation approach, and the no-project alternative. This represents the spectrum of GHG reduction strategies used by states, provinces, and nations.

With regard to comments on the Additional Source-Specific Command-and-Control Regulation Alternative, the commenter disagrees with the conclusions and reasoning presented in the FED, and suggests that additional detail and rationale is required to describe why certain conclusions presented in Table 6-1 were drawn by ARB. The FED provides on pages 387 to 390 a balanced and adequate discussion of the source-specific, direct regulation approach to reducing GHG emissions. It addresses cost, effectiveness, leakage, and local impact issues, and recognizes that it could have some environmental advantage of avoiding any lingering uncertainty about potential for emissions to increase locally. It describes potential environmental impacts being generally similar to the Cap-and-Trade Regulation because the compliance responses would be comparable (i.e., primarily onsite emissions reductions actions). See also CBE1 response. The potential disadvantages of high compliance costs (because of the lack of a market approach that can find the most cost-effective strategies) and the potential for leakage are noted. The additional detail sought by the commenter is not necessary for an informed consideration of the source-specific, command-and-control approach.

The commenter expresses concern about the ranking of the source-specific, command-and-control approach as not likely to fulfill the objective of linking with other WCI-partner programs. It is important to note that the primary reason for linkage would be to provide for connection of market-based approaches to broaden opportunities for emissions reductions, trading of allowances, or development of offset projects. The direct regulation approach, like the source-specific, command-and-control regulation, is not facilitated by linking with other jurisdictions, which is why its ranking for this objective was low likelihood in Table 6-1.

The commenter criticizes the analysis of the carbon fee alternative and recommends consideration of several variations of the design of a carbon fee program. The FED sought to define a reasonable carbon fee strategy, which is discussed on pages 390 to 393 of the document. Certainly, a wide range of potential design features and concepts could be considered within a carbon fee program. It is not necessary or feasible to evaluate many design variations of a carbon fee strategy to understand its environmental impacts. Because it assigns a price to carbon, the compliance responses and, therefore, the environmental impacts of a carbon fee approach would be similar to cap-and-trade, as noted on page 392 of the FED. The potential for differences is also discussed, in terms of the achievement of project objectives and certain possibilities for environmental effects.

Related to achievement of project objectives, the commenter criticizes the rankings in Table 6-1 for several alternatives and declares that some low likelihood rankings should be “inapplicable” instead (i.e., not ranked for that objective). This change would disguise a potential shortcoming of an alternative. The table compares how well each objective is achieved. If an objective is considered inapplicable for an alternative, it is not fulfilling that objective, and the table shows it as a low likelihood of achieving that objective. Also, the substantiation of the rankings is based on information in the descriptions of alternatives and subsections specifically devoted to consideration of objectives (see subsection a under the Impact Discussion of each alternative). Consequently, the analysis of the carbon fee alternative is adequate for purposes of CEQA.

The commenter indicates that linkage with a Federal program should not have been dismissed from more detailed evaluation. ARB disagrees, recognizing that there is no Federal program, nor the prospect of one because of the lack of Congressional action at this time. Therefore, it would be too speculative to attempt to predict the character and content of a Federal program. Consequently, it is appropriate to not discuss it in further detail.

Finally, the commenter noted that a cap-and-trade design option of geographic limits for offset projects should have been considered. No other detail is provided regarding the commenter's goal for including such a design variation. The success of offsets depends, in part, on allowing for the market sufficient capacity to respond to the opportunity to develop offset projects and offer credits. Constraining the market geographically would also limit market opportunities, so it could hinder an offset program's effectiveness. Because it is not clear what perceived environmental advantage the commenter is seeking to derive from geographic limits, no further response can be provided.

Comment: ARB failed to adequately analyze a range of project alternatives in the Functional Equivalent Document. ARB did not satisfy the CEQA requirement to examine a reasonable range of alternatives. Under CEQA, ARB must examine a reasonable range of alternatives to the proposed project that feasibly meet most of the project's basic objectives while avoiding or substantially reducing the significant effects of the project. CEQA does not supply the number of alternatives that are necessary for a meaningful analysis to take place, but it makes clear that a rule of reason governs requiring the EIR document to set forth "those alternatives necessary to permit a reasoned choice." In the ISOR, ARB purports to analyze four alternatives. In reality, only two alternatives are presented. The "no project" alternative is not a real option in this case given the statutory obligation provided in AB 32. Second, linking a California cap and trade program to a non-existent Federal cap and trade program is not a reasonable alternative for the reasons stated above (see section IV.A.). Lastly, presenting program design features which do not alter the program itself is not a project alternative. For these reasons, a mere two alternatives were considered in the FED. Given the size and implication of a statewide cap and trade program, as well as the broad range of possible avenues to attain the achievement of AB 32, the rule of reason dictates that a reasonable range of alternatives exceed two. Therefore, ARB has failed to satisfy CEQA's requirement to examine a range of reasonable alternatives to the project. (CRPE1)

Response: ARB disagrees with the commenter's assertion that it did not evaluate a reasonable range of alternatives in the FED. The alternatives presented in the FED were selected to evaluate a range of plausible actions that could achieve project objectives. The basis for the selection of the FED's alternatives included:

- A no project alternative is standard in ARB alternatives analyses, and is called for by the CEQA guidelines,
- Consideration of other ways to achieve project objectives is a sound basis for formulation of alternatives, e.g. cap-and-dividend, cap-and-fee, or carbon fee,
- Consideration of public and stakeholder input. ARB held a scoping meeting for the FED (August 23, 2010) for this purpose,
- Alternatives based on ARB's experience and research, and,

- Direct regulations and a carbon fee are the most often cited alternatives to the proposed Cap-and-Trade Regulation, so they were evaluated as alternatives in the FED.

The commenter offers no evidence why the alternatives analysis provided in the FED is not adequate, therefore, no further response is necessary.

Comment: The analysis of offsets produced by manure digesters violates CEQA. The FED finds no impact on air quality and no cumulative impact on air quality from implementation of the Compliance Offset Protocol for Manure Digesters. The FED concedes that engines combusting digester gas emit criteria and toxic emissions. However, the FED assumes that all offset generating projects would be subject to Clean Air Act requirements and local land use decisions that would fully mitigate the criteria and toxic emissions. The FED fails to demonstrate that to be the case, or to require air pollution controls as a condition of receiving offsets. For the same reason, the FED has failed to adequately analyze the emissions of criteria and toxic air pollutants from offsets produced at dairy digesters when there is no reasonable basis to conclude that all such projects would be reduced to a less than significant level (there is no substantial evidence supporting this assumption). (CRPE1)

Response: The commenter states that the FED failed to demonstrate that air quality impacts of offset generating projects would be fully mitigated to a less-than-significant level. The commenter mistakenly states that the FED assumes that all digester facilities would not be subject to Clean Air Act (CAA) requirements. In fact, the Livestock Offset Protocol specifically describes that in order for a livestock digester project to qualify for the offset, it must be implemented in accordance, as required by law, with all applicable federal, state, and local regulations and regulatory oversight requirements. The FED identified (see page 240) that these regulations included federal, state, and local construction and operational air quality permits; CAA and the California CAA; local land use entitlements including environmental (CEQA/NEPA) review; and dust abatement plans for facilities located in PM nonattainment areas. Where a facility would result in a net increase in criteria pollutant (or precursor) emissions in an extreme nonattainment area, it would not be permitted by the local air district. Based on all of these requirements, ARB concluded that the Livestock Offset Protocol would not conflict with adopted air quality plans, violate Ambient Air Quality Standards, and/or result in cumulatively significant increases in criteria pollutants. The commenter offers no other evidence to dispute this conclusion; therefore, no further response is necessary.

Comment: Conclusion. For the reasons set forth above, the Board should not adopt the proposed cap and trade regulation. Instead, the undersigned organizations are asking the Board to consider the impact of the Superior Court's ruling in the pending Scoping Plan challenge, to prepare a proper foundational analysis for whether cap and trade is the maximum feasible and cost-effective reduction, to adopt more appropriate direct regulations and market-based compliance mechanisms than a cap and trade rule, and meaningfully analyze a reasonable range of alternatives in accordance with CEQA.

The Board should seize this opportunity to set California on a path that protects vulnerable communities, fosters green jobs, and stimulates a path to a green economy for California. (CRPE1)

> **Response:** This comment summarizes the commenter's previous comments. See previous responses to CRPE comments.

Written Testimony: 8/11/2011
First 15-Day Comment #: 1110

Comment: The modified Cap and Trade Regulation released on July 7, 2011 is different enough from the version that the Functional Equivalent Document was based upon that it must be recirculated and go through another EIR process before it can be approved in accordance with CEQA. CEQA does not allow the Board to delegate the review of an EIR to the Executive Officer. Because of the failure to complete environmental review before approving the project as well as the substantial modifications to the rule that require recirculation, the full Board must complete the legally-required environmental review process before approving this rule. (CRPE4)

Response: ARB disagrees that the FED must be revised and recirculated. Although the regulation has been amended in several respects, the cap on emissions has remained the same and the method of allocation of allowances has not appreciably changed. ARB staff reviewed 15-Day changes to the regulation language and determined that the proposed changes would not result in new impacts or substantially change the type or significance of impacts disclosed in the FED. Therefore, no revisions were required to the FED. No significant new information was added to the FED and the FED was not changed in a way that deprives the public of a meaningful opportunity to comment upon a substantial adverse environmental effect of the project, or a feasible way to mitigate or avoid such an effect. The public was provided opportunity to comment on the environmental analysis during the initial 45-day public comment period, as well as two subsequent 15-Day comment periods associated with proposed revisions of the Regulation language. Therefore, the requirements that would trigger revision or recirculation of the FED did not occur.

ARB also disagrees that it approved the project in advance of the 15-Day changes or prior to completion of the environmental process. The Board has not taken final action to adopt the proposed Regulation. The Board is scheduled to consider for approval the written responses to comments on the FED at the October 20, 2011 hearing prior to taking final action on the Regulation.

DWR

Name: Veronica Hicks
Affiliation: California Department of Water Resources
Written Testimony: 12/15/2010
45-Day Comment #: 728

Comment: The environmental impacts of imposing a surrender obligation on DWR were not evaluated. If DWR is required to surrender compliance instruments, it will need to pass these costs on to its water contractors, who in turn will pass the costs on to the end-users of water. An analysis should be conducted to determine the environmental impacts of this regulation. Water is integral to the agricultural sector and important for environmental needs. As reported in the California Water Plan, Update 2009:

> "California is facing one of the most significant water crises in its history- one that is hitting hard because it has many aspects and consequences. Reduced water supplies and a growing population are worsening the effects of a multi-year drought. Climate change is reducing our snowpack storage and increasing the frequency and intensity of floods. Court decisions and new regulations have resulted in the reduction of water deliveries from the Delta by about 20 to 30 percent. Key fish species continue to decline. In some areas of the state, our ecosystems and quality of underground and surface waters are unhealthy. The current global financial crisis will make it even more difficult to invest in solutions. We must act now to provide integrated, reliable, sustainable, and secure water resources and management systems for our health, economy, and ecosystems".

The regulation imposes an additional burden on DWR and California's water users without acknowledging this water crisis or evaluating the impact of this burden under all existing circumstances. (DWR)

Response: The commenter states that the FED does not evaluate the environmental effects of imposing a surrender obligation on DWR and suggests that the additional costs associated with a surrender obligation would result in environmental impacts that were not evaluated in the FED; however, the commenter is not specific as to what those impacts may be.

CEQA does not require discussion of economic changes unless the economic change would result in a physical effect on the environment (see CCR section 15064[e]). The commenter does not provide specifics as to how the economic impacts of the proposed Regulation would cause adverse physical environmental effects. Therefore, it is not possible to meaningfully respond to this general comment, other than to state that we believe the FED adequately evaluates the environmental effects of the proposed project in programmatic analysis in accordance with its CRP.

Higher prices would be expected to increase water conservation and improve the efficiency of water use, which could be considered beneficial effects. Non-CEQA aspects of this comment are addressed in the FSOR prepared in accordance with APA requirements.

DWR2

Name: Veronica Hicks
Affiliation: Department of Water Resources
Written Testimony: 8/11/2011
First 15-Day Changes Comment #: 1107

Comment: Did CARB conduct any analysis on the impact of the Regulation on different classes of water users (e.g. urban, agricultural, and environmental)? (DWR2)

> **Response:** The FED provides the environmental analysis of impacts related to compliance responses of covered entities. ARB considered the potential impacts of the proposed Regulation.
>
> Water users would not be subject to the proposed Cap-and-Trade Regulation except to that water purveyors that generate electricity, such as DWR, would be subject to the electrical generation sections of the proposed Regulation. The proposed the Cap-and-Trade Regulation would not regulate the availability, distribution, or use of water. Any impacts to water users that might occur would be the result of secondary price changes associated with electrical generation. A detailed environmental analysis of potential impacts to water users is not necessary under CEQA.
>
> A substantial proportion of the energy consumed in California is used for conveyance and treatment of water, and energy use represents the primary nexus between the proposed Cap-and-Trade Regulation and water. Energy providers (electricity generation and fuel providers) that would be subject to the Cap-and-Trade Regulation may pass increased costs to customers, including customers that use energy to convey and treat water. The proposed market-based program would allow covered entities to seek the least expensive manner of compliance and thus minimize costs. Further, increased costs may result in more efficient use of water. The FED appropriately provides a programmatic level environmental analysis. No direct adverse environmental impacts to water users are expected to result from this activity. The evaluation of indirect environmental impacts that might affect individual classes of water users (most of whom are not regulated entities) resulting from economic changes and the presumed actions of individual water purveyors is beyond the scope of a programmatic analysis and are too speculative to evaluate in the FED.

Comment: Did CARB conduct an analysis identifying the economic and environmental impacts of this regulation, specifically based on impacts to water uses? More specifically, did CARB analyze the impacts on agricultural water users, who may have a disproportionately high level of water use compared to their electricity use? (DWR2)

> **Response:** The commenter questions whether the FED evaluates the economic and environmental effects of the Regulation on water users. Refer to the

response to the preceding comment. Non-CEQA aspects of this comment are addressed in the FSOR prepared in accordance with APA requirements.

Comment: Did CARB consider the economic and environmental impacts such as land use changes and crop-shifting that could result from this regulation's possibly larger impact on agriculture, particularly in light of the assertion by federal power providers that they are not obligated to comply with this regulation, and the resulting incentives which would encourage additional water use on lands entitled to receive federal water deliveries? (DWR2)

Response: Agriculture activities are not directly regulated under the Cap-and-Trade Regulation. Potential indirect impacts to agriculture would be economic, consisting of secondary price changes. CEQA does not require discussion of economic changes unless the economic change would result in a physical effect on the environment (see CCR section 15064[e]). The expected outcome of possible incremental increases in the price of water would be increased water conservation and more efficient use of water, which could be considered beneficial effects. Further environmental analysis is not necessary.

Federal water is allocated based on water rights and not price. The proposed regulation would not change water rights nor would it alter the price of water provided by federal agencies.

ARB prepared the Updated Economic Evaluation of California's Climate Change Scoping Plan, which includes a cap-and-trade program. That evaluation used the ENERGY 2020 model to assess the potential changes in energy use, both type and volume, brought on by the proposed Cap-and-Trade Regulation. The model did not indicate that the use of biomass would increase in response to the proposed Cap-and-Trade Regulation, and consequently crop switching to increase the production of fuel crops or other changes in land use would not be expected. Table 27 of the report demonstrates that potential economic impacts to agriculture from AB 32 climate policies would be comparable to those in other sectors of the economy. Consequently, a detailed analysis of potential economic impacts to agriculture is not warranted. The FED appropriately provides a programmatic level environmental analysis.

DWR3

Name: Veronica Hicks
Affiliation: Department of Water Resources
Written Testimony: 9/27/2011
Second 15-Day Changes Comment #: 2064

Comment: DWR references comments from their earlier comment letters, and asserts that the environmental and economic impacts on DWR and water users have not been addressed.

Response: Refer to responses to DWR and DWR2.

This page intentionally blank.

FRIENDSOFEARTH2

Name, Affiliation: Kate Horner, Friends of the Earth US; Rolf Skar, Greenpeace; Victor Menotti, International Forum on Globalization; Bill Barclay, Rainforest Action Network
Written Testimony: 8/11/2011
15-Day Changes Comment #: 1175

Comment: It is inappropriate for the ARB to move ahead with amendments to, or approval of, these regulations. The ongoing litigation by environmental justice groups under the California Environmental Quality Act raises legitimate concerns regarding the harm of implementing a cap and trade program on California's environment and vulnerable, overburdened communities across the state. As noted by plaintiffs in the case and as we note below, the original regulation failed to meet the criteria set out by AB 32 for market-based compliance mechanisms, and the modifications do not cure these defects. In general, we find that the amendments offered as part of the 15-Day Rulemaking Package do not ensure either environmental or financial market integrity within the proposed cap and trade rules. The ARB should take this opportunity to perform a meaningful and comprehensive alternatives analysis rather than moving forward with the same program at issue in the litigation. (FRIENDSOFEARTH2)

Response: The commenter suggests that because of ongoing litigation on the Scoping Plan, it is inappropriate for ARB to proceed with consideration of the Cap-and Trade Regulation. The commenter further suggests that ARB should prepare a comprehensive alternatives analysis. The commenter references a lawsuit filed against ARB on the Scoping Plan FED. In response to that lawsuit, ARB prepared and circulated the Supplement to the AB 32 Scoping Plan FED (June 13, 2011), which was considered and approved by the Board prior to taking action to re-approve the Scoping Plan on August 24, 2011. The Scoping Plan is a valid approved plan, within which the proposed Cap-and-Trade Regulation is a recommended measure.

The 2008 Scoping Plan outlines the State's strategy to reduce GHG emissions to 1990 levels by 2020, as required by the Global Warming Solutions Act of 2006 (AB 32; Núñez, Chapter 488, Statutes of 2006). A "scoping plan" is required by one provision of AB 32 (Health and Safety Code (HSC) section 38561), and ARB's adoption of GHG reduction measures is authorized under a separate provision (HSC section 38562). It is not required that a particular measure be encompassed in a scoping plan in order for ARB to pursue such a measure as a proposed regulation.

In the Cap-and-Trade FED, ARB evaluated five alternatives to the Cap-and-Trade Regulation, including several iterations of the cap-and-trade program design. The alternatives analysis provides a comparative evaluation of environmental impacts of each alternative (see pp. 365 to 395 of the FED). ARB made a good faith effort to provide a comprehensive analysis of the comparative environmental effects and achievement of project objectives for each of the alternatives. No specific inadequacies of the alternatives analysis were provided by the commenter; therefore, no further response is necessary.

HDDP2

Name: Bradley K. Heisey
Affiliation: High Desert Power Project
Written Testimony: 12/14/2010
45-Day Comment #: 617

Comment: Based on the HDPP situation, ARB's CEQA review of the proposed Cap-and-Trade Regulation is deficient with respect to 2012 if ARB adopts it as proposed. ARB has not determined the economic or environmental effects of requiring "locked-in" generators like HDPP to purchase 100 percent of their GHG allowances through the proposed auctions at the outset of the program in 2012, with the resulting potential loss of relatively low emitting MWh of energy production in California and replacement by higher GHG emitting electrical generators from the outset of the cap-and-trade program in 2012. (HDPP2)

> **Response:** The commenter suggests that the economic and environmental impacts of requiring “locked-in” generators (i.e., locked into electricity rates by contract) to purchase allowances at auction was not analyzed in the FED.
>
> The first compliance period is now proposed to begin January 2013, a year later than originally proposed. If the Board approves, the Regulation this modification resolves the concern expressed by the commenter.
>
> With regard to environmental impacts, the commenter suggests that the Cap-and-Trade Regulation as proposed would force HDPP (a private utility) to shut down or limit operations in 2012. The concern appears to be the perception that HDPP would be economically penalized for having to purchase GHG allowances without being able to pass the costs of the allowances along to its customers because it is currently operating under a fixed price contract through December 2012 and cannot change the prices to reflect the increased costs of the GHG allowances. The commenter suggests, although the reasoning behind the suggestion is not clear, that higher GHG-emitting electrical generators would replace the lower GHG-emitting electrical generation provided by HDPP in the event of such a shutdown.
>
> The FED provides a comprehensive environmental analysis of the proposed Cap-and-Trade Regulation, including the potential for leakage of emissions outside of California as a result of the cost of allowances and the environmental effects of potential offsets, which are intended to help reduce allowance prices. It is too speculative to suggest that significant or substantially greater environmental impacts would occur as a result of an individual locked-in generator not being able to pass along the GHG allowance costs to their customers. There are many economic, regulatory, and environmental factors to consider. It is not feasible to predict the possibility of closing a power plant (versus other potential compliance responses) because of the cost of allowances. Further, even if electrical generation by lower GHG-emitting

generators would cease or be replaced by higher-emitting GHG generators for 2012, implementation of the overall cap-and-trade program over its 20-year time horizon would result in substantially less GHG emissions compared to baseline conditions, because the declining cap controls overall emissions. This was described as an environmental benefit on page 105 of the FED.

NCPA3

Name: Susie Berlin
Affiliation; McCarthy & Berlin, P.C. for Northern California Power Agency
Written Testimony: 8/11/2011
First 15-Day Changes Comment #: 1176

Comment: NCPA urges CARB to work with local air quality districts as those agencies undertake CEQA reviews of proposed geothermal projects to ensure that the local air districts apply the same metrics for evaluating a project's impact as CARB does when measuring that impact for compliance with the Cap and Trade Regulation. All of the State's environmental objectives are best served by a uniform and comprehensive approach to the treatment of GHG emissions from geothermal facilities. (NCPA3)

> **Response:** ARB concurs that the State's environmental objectives are best served by a uniform and comprehensive approach to the treatment of GHG emissions, including those from geothermal facilities. ARB will continue to work with the local air districts. Local air districts have discretionary authority in preparation of their environmental analyses and determination of significance of impacts, including GHG impacts.

NRDC4

Name: Alex Jackson
Affiliation: Natural Resources Defense Council
Written Comment: 12/16/2010
45-Day Comment #: 958

Comment: NRDC believes that the FED is a careful and thorough review of the potential environmental impacts of the cap and trade regulation, in particular in its choice of alternatives to examine. We are also pleased that ARB chose to include adaptive management not as mitigation but rather as part of the program design with respect to forest offset projects and local air quality impacts (FED at 45-47). This use of adaptive management adds legitimacy to the FED in these two areas that have been the subject of much public comment and concern. Moreover, to its credit, ARB is not attempting to take credit for adaptive management as mitigation for recognized, potential negative impacts to air quality or forestry practices. (NRDC4)

> **Response:** This comment supports the alternative analysis and the adaptive management approach. No further response is necessary.

This page intentionally blank.

PCAPCD2

Name: Thomas Christofk
Affiliation: Placer County Air Pollution Control District
Written Testimony: 8/11/2011
15-Day Comment #: 1051

Comment: CEQA should be explicitly distinguished within the regulation because it is not a law that in and of itself imposes reductions requirements. Public Resources Code section 21004 states that "a public agency may exercise only those requirements or implied powers provided by law other than [CEQA]." We recommend that the regulation recognize that offset credits used by a facility for the compliance obligation under the CARB Cap and Trade Regulation should be a part of any CEQA analysis that may be required for that same facility. Offset credits should be taken into account either early on within the setting of the baseline for a project, or as mitigation. The recognition of the purchase of offset credits within the CEQA process is not 'double dipping' because CEQA only requires that a project discloses its impacts. It does not independently provide the legal authority to impose any legal obligation. (PCAPCD2)

> **Response:** The commenter recommends that the regulation recognize that offset credits used by a facility should be part of any CEQA analysis required for that facility, and that offset credits should be identified in the setting of a CEQA document as an existing condition, or as mitigation in the impact analysis. This comment addresses the future treatment of offsets under local CEQA analyses, but does not challenge the adequacy of the environmental analysis prepared for the proposed Cap-and-Trade Regulation. Nonetheless, this document appeared to be a logical location to identify the comment and respond accordingly.
>
> The proposed Cap-and-Trade Regulation establishes criteria for GHG offsets to be used as a compliance mechanism in a market-based reduction program. Offset credits are included in the regulation essentially as cost-containment mechanisms. Under the proposed Cap-and-Trade Regulation, offsets do not mitigate for increased emissions, but rather provide an option to defer expensive onsite improvements during a specified reporting period for covered entities.
>
> The proposed Regulation does not provide for any other use of offset credits, supersede any other air quality regulation that might require GHG reductions, or alleviate the requirement for a lead agency to fully comply with CEQA. ARB rejects commenter's suggestion that the Regulation be amended to allow the use of offsets for CEQA mitigation purposes by lead agencies. Staff does not believe that ARB has the authority to make determinations regarding CEQA mitigation requirements for projects for which it is not the lead agency, e.g. projects that fall within the authority of local permitting authorities. Lead agencies are responsible for determining the baselines for GHG emissions for their respective projects that are subject to CEQA, and for determining the level of significance for impacts. The recognition of offsets in any capacity in a project-specific CEQA analysis is at the discretion of the lead agency and permitting authorities, notably local air

districts for CEQA air quality analyses. ARB staff is not aware of any existing mechanism in the CEQA statute or Guidelines that allows the purchase of an offset credit under the cap-and-trade program as mitigation for projects subject to CEQA.

The environmental impacts of <u>developing</u> a specific offset project consistent with a protocol may need to comply with CEQA. The protocol requires compliance with all other applicable federal and state laws and regulations. The environmental impacts of the offset protocols have been programmatically evaluated in the FED. For example, the Urban Forest Protocol identifies that facilities that pursue this offset could result in increased urban tree plantings the installation of which would result in environmental impacts (e.g., dusts, noise, etc.).

Written Testimony: 12/16/10
45-Day Review Comment #: 983

Comment: There has not been appropriate outreach to the public or full disclosure telling the people what AB 32 really is, what it is linked to, and how all of the other links will accumulatively impact us. Knowing these many links exist, were they included in the DEIR and FEID? (SACREB)

> **Response:** ARB conducted over 30 workshops and public meetings related to the Cap-and-Trade Regulation, including a Scoping Meeting for the FED, available at the following website:
>
> http://www.arb.ca.gov/cc/capandtrade/meetings/meetings.htm#archive.
>
> ARB provides an assortment of AB 32 and Climate Change fact sheets that can be downloaded from the ARB website, and has web pages that are developed for specific audiences such as, general public, small business, local government, students and teachers. The FED was noticed in a 45 day Notice of Proposed Regulatory Action posted on ARB's website, noticed and circulated through the State Clearinghouse for agency review and comment, and publicly noticed in major newspapers in northern and southern California.

USFLAW

Name: Alice Kaswan
Affiliation: University of San Francisco School of Law
Written Testimony: 12/10/2010
45-Day Comment #: 486

Comment: Alternative Rejected by Staff – Implement Only Additional Source-Specific Command-and-Control Regulations. CARB staff rejected the alternative of replacing the cap-and-trade program with a direct regulatory program for industrial sources. The Staff Report presents a number of convincing arguments for why regulation should not replace a cap-and-trade program, but did not address the value of complementing the cap-and-trade program with limited and targeted regulatory efforts where appropriate. The Staff Report expresses concerns about the cost-effectiveness of regulation if applied to all industries. But if regulation were used to complement cap-and-trade only where appropriate, CARB could take cost-effectiveness into account in deciding whether to impose regulations. In determining cost-effectiveness, it is also important for CARB to consider not only the costs of regulation to the relevant industry, but also the economic benefits of enhanced emissions reductions.

The Staff Report also observes that regulations would be difficult to draft given the lack of data on effective emission reduction mechanisms and the variation among facilities. However, CARB is requiring energy audits at industrial facilities, a process that includes an assessment of associated co-pollutant impacts. While current data may be insufficient, the audits could provide a much stronger basis for identifying cost-effective energy efficiency mechanisms that could be required at industrial facilities, and that could achieve both GHG and co-pollutant reductions.

CARB staff may be assuming that facilities will adopt cost-effective reduction strategies in response to the price signal created by the cap-and-trade program, without the need for command-and-control regulations. But industrial investment decisions are complex. Inertia, uncertainty about future carbon markets, concerns about short-term capital expenditures, and other factors could impede otherwise cost-effective investment in emission reductions. If price signals do not end up prompting cost-effective measures with significant co-pollutant benefits, then CARB should retain the authority to require appropriate measures.

In addition, if CARB identifies cost-effective GHG emission reduction measures with particularly significant co-pollutant benefits, then it would be consistent with AB 32's goals to require those measures rather than relying upon the vagaries of the market to incentivize them. Co-pollutant benefits could be particularly significant either because GHG reductions lead to a large reduction in associated co-pollutants, and/or because the industries to be regulated are located in especially polluted areas. (USF-LAW)

> **Response:** See response to CRPE1 regarding the reasonable range of alternatives considered in the FED and source-specific alternative response.

ARB believes that it has provided a reasonable range of alternatives for evaluation under the FED.

It is also important to note that ARB always retains the ability to pursue additional regulations. In fact, ARB is currently collecting information on opportunities for further GHG and co-pollutant emission reductions through the Energy Efficiency and Co-benefits Assessment Regulation for Large Stationary Sources. ARB is scheduled to receive these data by the end of 2011. Staff would then initiate a process to ensure that large industrial sources subject to the regulation be required to take all cost-effective and technically feasible actions identified under those audits. The audit results, due to ARB by the end of 2011, will inform the development of regulatory requirements staff intends to propose to the Board in 2012. Staff plans to initiate a separate public process in Fall 2011 to discuss metrics and actions to implement this commitment.

Also see the response to CBE1 regarding ARB's plans to implement an adaptive management plan.

Comment: In all provisions relating to the burning of biomass and biofuels, CARB should carefully assess associated co-pollutant and other environmental implications. For example, if biomass-derived fuel sources do not have to account for their GHG emissions, the rule could create incentives to use biomass that have incidental adverse environmental consequences. (USFLAW)

Response: The increased use of biomass is already incentivized by existing regulations such as the Renewables Portfolio Standards and the Low Carbon Fuel Standard. The Renewables Portfolio Standard (RPS) requires public owned utilities to obtain 33% of their energy from renewable resources. Most utilities are challenged to achieve the renewable target despite the availability of biomass as a renewable fuel.

ARB used the ENERGY 2020 model to assess the potential changes in energy use, both type and volume, brought on by the proposed Cap-and-Trade Regulation. The model did not indicate that the use of biomass would increase in response to the proposed Cap-and-Trade Regulation. Further, the proposed Cap-and-Trade Regulation would not supersede other air quality regulations. Combustion of biomass is subject to local permitting and emission control requirements.

ARB proposes to monitor the use of biomass as part of our monitoring and oversight of the implementation of the Cap-and-Trade Regulation.

Written Testimony: 8/11/2011
First 15-Day Changes Comment #: 1062

Comment: It is presumptuous of CARB to continue development of a cap and trade regulation when the alternatives discussed in the Supplement to the AB 32 Scoping Plan Functional Equivalent Document (FED) have not been fully vetted. With the FED public comment period closing on July 28, 2011, CARB has not had sufficient time to consider all comments and respond appropriately. From a general perspective, the FED was a hastily prepared document lacking in critical details that draws upon a foregone conclusion that California must have a cap and trade regulation to meet the goals of AB 32. Resolution 10-42 (approved at a December 16, 2010 Board Hearing to consider adoption of the proposed Cap and Trade program), requires the Executive Officer to report on the progress being made on implementing the Cap and Trade program, provided the Cap and Trade program is approved. In the absence of a complete review of comments submitted in response to the FED and making a formal determination that other alternatives are not feasible or appropriate, it appears premature to continue the Cap and Trade rulemaking process. (VALERO2)

> **Response:** ARB prepared and circulated the Supplement to the AB 32 Scoping Plan FED (June 13, 2011). At a public hearing on August 24, 2011,the Board, after consideration of the alternatives analysis in the Supplement, public comment and staff's written responses to comments, voted to re-approve the Scoping Plan.

Comment: Valero strongly urges ARB to complete the regulatory development process prior to adoption, including full consideration of comments and alternatives presented in the FED, so that all impacts can be thoroughly reviewed as an entire package by the impacted parties. Valero believes that, if ARB presents a complete regulatory package, the impact to the economy, industry and consumers would be minimized. (VALERO2)

> **Response:** The commenter urges ARB to complete the regulatory process prior to adoption of the project, including full consideration of comments and alternatives presented in the FED. ARB has put forward a good-faith effort in preparing the FED for the Cap-and-Trade Regulation that was circulated for public review and comment, and staff has prepared written responses to comments on the FED in this document. The Board is scheduled to consider the FED, comments on the FED, staff's written responses to those comments, prior to taking final action on the proposed Regulation at a public hearing on October 20, 2011.

This page intentionally blank.

EVALUATION OF REGULATORY (PROJECT) CHANGES

The Draft FED was included as Appendix O to the Staff Report prepared for the Regulation, and was circulated for public review and comment from October 28, 2010 to December 16, 2010. Since circulation of the FED, the Regulation language was modified, and two Notices of Public Availability of Modified Text and Availability of Additional Documents were issued.

The first 15-Day Change clarifies and revises the Regulation language to allow California's cap-and-trade program to better align with rulemaking efforts in other Western Climate Initiative (WCI) jurisdictions. These changes allow for future linkage that supports a broader, regional cap-and-trade program, provides more cost containment benefits to California-covered entities, and ensures greater reductions in regional emissions of greenhouse gases to the atmosphere. Staff also modified the Regulation language to begin the first compliance obligation in 2013. The allocation, auction, trading, and other activities will begin in 2012 before the start of the compliance obligation and the first compliance period. The 15-Day Change language provides that three-fourths of the "excess emissions" will be placed into the auction holding account, and not in the price containment reserve. Staff added flexibility to the statutes of limitations for invalidation of ARB offset credits, and added an equation to calculate how a compliance obligation would be assessed for electricity providers. The notice of the first 15-Day change can be found at:
http://www.arb.ca.gov/regact/2010/capandtrade10/2nd15daynotice.

The second 15-Day Change modifies or clarifies numerous sections of the Regulation, including those sections that apply to roles and responsibilities of covered entities, accounting and tracking, ensuring confidentiality and security of account representatives, and other key program design elements. The second notice can be found at: http://www.arb.ca.gov/regact/2010/capandtrade10/2nd15daynotice.pdf.

In addition, the general offset provision was modified to be more stringent, and the four Compliance Offset Protocols analyzed in the Draft FED were modified. These changes generally resulted in the protocols to be more environmentally protective. The Urban Forest Projects Protocol was modified to require an urban forester to be involved in the review of the project and offset project data report. The Livestock Projects protocol was modified to allow some mechanical flexibility, and thermo couplers for flares have been expanded to include engines, as well as adjustments to metered biogas flow data were replaced by a more conservative method to ensure rigorous accounting. The Ozone Depleting Substances Protocol was modified to include CFC-13 as an eligible gas into the methodology based on information from U.S. Environmental Protection Agency, and others. The U.S. Forest Project Protocol was modified to be more stringent by incorporating administrative, procedural, and legal provisions identified earlier in this document.

ARB staff reviewed the regulatory language modifications and evaluated whether they warranted any revisions to the environmental analysis in the FED, e.g. to reflect any new impacts or levels of significance of identified impacts. Staff has determined that the modifications consist largely of administrative and program design modifications that would not change the results or findings of the environmental analysis in the FED. Therefore, revision of the environmental analysis or recirculation the FED for further public review and comment is not required.

ATTACHMENT C: ACRONYMS

AAQS	Ambient Air Quality Standards
ACR	American Carbon Registry
AF	Assistance Factor
ANSI	American National Standards Institute
APA	Administrative Procedure Act
API	American Petroleum Institute
ARB	California Air Resources Board
ARR	Auction Revenue Rights
ASTM	American Society for Testing and Materials
BACT	Best Available Control Technology
BOF	Board of Forestry and Fire Protection
CAA	Federal Clean Air Act
CAISO	California Independent System Operator
CAPCOA	California Air Pollution Control Officers Association
CAR	Climate Action Reserve
CBF	Community Benefits Fund
CCA	Coalition for Clean Air
CCAA	California Clean Air Act of 1988
CCGS	carbon capture and geologic sequestration
CCR	California Code of Regulations
CCS	carbon capture and sequestration
CDM	Clean Development Mechanism
CDPH	California Department of Public Health
CEC	California Energy Commission
CEE	customer energy efficiency
CEQA	California Environmental Quality Act
CFTC	Commodity Futures Trading Commission
CO_2	carbon dioxide
CO2e	carbon dioxide equivalent
CO_2-EOR	carbon dioxide-enhanced oil recovery
CHP	combined heat and power
CPUC	California Public Utilities Commission
CRA	Colorado River Aqueduct
CRT	Climate Reserve Tonne
CWB	Carbon Weighted Barrel
CWT	CO_2 Weighted Tonne
DoD	U.S. Department of Defense
DOE	U.S. Department of Energy
DOJ	Department of Justice
EAAC	Economic and Allocation Advisory Committee
EDU	Electrical Distribution Utilities
EE	energy efficiency
EEB	Emissions Efficiency Benchmark
EEI	Edison Electric Institute

EII	Solomon Energy Intensity Index
EIR	Environmental Impact Report
EJ	Environmental Justice
EJAC	Environmental Justice Advisory Committee
EJSM	Environmental Justice Screening Method
EPA	U.S. Environmental Protection Agency
ETS	Emissions Trading Scheme
EU ETS	European Union Emissions Trading System
FERC	Federal Energy Regulatory Commission
FPIC	Free Prior and Informed Consent
FSOR	Final Statement of Reasons
GAO	Government Accountability Office
GCF	Governor’s Climate and Forests Task Force
GFHP	gas-fired heat pump
GHG	greenhouse gas
GIS	geographic information system
HCP	Habitat Conservation Plan
HDPP	High Desert Power Project
HIA	Health Impact Assessment
HRA	Health Risk Assessment
IA	Implementation Agreement
IAF	International Accreditation Forum
IOU	investor-owned utility
IPCC	Intergovernmental Panel on Climate Change
IPP	independent power producer
ISO	International Organization for Standardization
ISOR	Initial Statement of Reasons
ITC	International Trade Commission
JPA	Joint Powers Agency
JUG	Joint Utilities Group
kW	kilowatts
LADWP	Los Angeles Department of Water and Power
LCFS	Low Carbon Fuel Standard
LDC	local distribution company
LMU	logical management unit
LTO	Licensed Timber Operator
LNG	liquefied natural gas
MJRP	Multi-Jurisdictional Retail Providers
mmBtu	millions of British thermal units
MMT	million metric tons
MRR	Mandatory Reporting of Greenhouse Gas Emissions Regulation
MRV	measurement, reporting and verification
$MTCO_2e$	metric ton of carbon dioxide equivalent
MTS	market tracking system
MWh	megawatt-hour
NAICS	North American Industry Classification System

NAAQS	National Ambient Air Quality Standards
NCCP	Natural Community Conservation Plans
NEPA	National Environmental Policy Act
NERC	North American Electric Reliability Corporation
NGL	Natural Gas Liquids
NOV	Notice of Violation
NOx	oxides of nitrogen
NREL	National Renewable Energy Laboratory
NSR	New Source Review
NYDEC	New York Department of Environmental Conservation
OAL	The California Office of Administrative Law
ODS	ozone depleting substance
OPR	Offset Project Registries
PDR	Preliminary Review Draft
POU	publicly owned utility
PSE	purchasing-selling entity
QE	qualified export
QF	qualified facility
NYSE	New York Stock Exchange
REC	Renewable Energy Credit
RECLAIM	Regional Clean Air Incentives Market Program
REDD	Reducing Emissions from Deforestation and Forest Degradation
RES	Renewable Electricity Standard
RGGI	Regional Greenhouse Gas Initiative
ROG	reactive organic gases
RPF	Registered Professional Forester
RPS	Renewable Portfolio Standard
SEC	Securities and Exchange Commission
RUS	Rural Utility Service
SFPUC	San Francisco Public Utilities Commission
SHA	Safe Harbor Agreement
SIP	State Implementation Plan
SMR	steam methane reformer
SMUD	Sacramento Municipal Utility District
SO_2	sulfur dioxide
SQL	structured query language
SRAC	Short Run Avoided Cost
TAD	through air drying technology
TE	trade exposure
TEAP	United Nations Technical and Economic Assessment Panel
TG	teragram
THP	timber harvest plan or timber harvesting permit
TREC	Tradable Renewable Energy Credit
VAE	voluntarily associated entity
VCS	Voluntary Carbon Standard
VOC	volatile organic compound

VRE	Voluntary Renewable Electricity
WAPA	Western Area Power Administration
WCI	Western Climate Initiative
WECC	Western Electricity Coordinating Council
WREGIS	Western Renewable Energy Generation Information System
WSSP	Western Systems Power Pool
