certification program will come into fruition, and this phrase could be read in such a way that a biomass-derived fuel is not "always considered to have met the requirements in section 95852.1" until the certification program is in place. We believe ARB's intent is for any biomass-derived fuel that is adequately verified to continue to remain eligible for the compliance exemption, and because ARB has put rigorous verification requirements in place to do so and will further be developing a certification program for biomass-derived fuels. This phrase is unnecessary and could lead to groundless ineligibility of fuels. CERP urges ARB to delete this phrase. (CERP4)

Comment: Removing the renegotiation requirement does not impinge on the environmental rigor that California is striving to achieve, since the subsequent language requires that physical fuel be transferred within 90 days and that the verifier be able to trace back to the previously eligible contract. At the same time, it ensures that fuel providers have the flexibility to renegotiate their contract without being subject to a one year time limit; such a limit could be unrealistic in many cases given the levels of regulatory approvals that must be obtained in California. Contract renegotiations and approvals can be lengthy processes in California, and could take longer than one year, especially if they are contingent on approvals by regulatory bodies such as the California Public Utilities Commission (CPUC). Given this reality, requiring the contract to be "renegotiated within one year of contract expiration" places a significant burden on the fuel provider when the timeline of events may be beyond its control. Therefore, CERP urges ARB to remove the phrase "and remain in effect or have been renegotiated with the same California operator within one year of contract expiration." In addition, CERP urges ARB to modify section 95852.1.1(a)(4)to further clarify the "once in, always in" concept. Modify section 95852.1.1(a)(4) as follows:

> (4) ~~Once a certification program is in place,~~ a fuel which meets the requirements of sections 95852.1.1(a)(1) and 95852.1.1(a)(2) will always be considered to have met the requirements in section 95852.1. (CERP4)

Comment: EM urges ARB to modify section 95852.1.1(a)(4) to further simplify the "once in, always in" concept. This section states that "Once a certification program is in place, a fuel which meets the requirements of sections 95852.1.1(a)(1) and 95852.1.1(a)(2) will always be considered to have met the requirements in section 95852.1." The phrase "once a certification program is in place" should be deleted, since ARB requires annual verification of the biomass derived fuels prior to the implementation of a certification program. Moreover, it is not clear when a certification program will be in place and this phrase could be read in such a way that a biomass derived fuel is not "always considered to have met the requirements in section 95852.1" until the certification program is in place. We believe ARB's intent is for any biomass derived fuel which is adequately verified to continue to remain eligible for the compliance exemption, and since ARB has put rigorous verification requirements in place to do so, and will further be developing a certification program for biomass derived fuels, this phrase seems unnecessary. (EM)

Response: We deleted all of the text that was previously in section 95852.1.1(a)(4). We received several comments urging us to simplify the "once in, always in" concept. We require annual verification of the biomass-derived fuels prior to the implementation of a certification program. Our intent is for any adequately verified biomass-derived fuel to continue to remain eligible for the compliance exemption. Since we have rigorous verification requirements, and will further be developing a certification program for biomass-derived fuels, this provision is unnecessary.

E-33. (multiple comments)
Comment: EM appreciates that ARB intends for a biomass derived fuel that is eligible for the compliance exemption under section 95852.1.1 to remain eligible for the compliance exemption in future years of the program. We appreciate that ARB has not restricted the compliance exemption to “long term” contracts and will allow any contract which meets the January 1, 2012, contract date (which we believe should be extended to January 1, 2013) to be eligible as a biomass derived fuel. We urge ARB, however, to clarify the language that attempts to codify this grandfathering provision. In section 95852.1.1 (a)(1), the phrase starting with “and remain in effect or have been renegotiated with the same California operator within one year of contract expiration” is not necessary for the codification of this concept, and in fact could create added uncertainty in the market. We propose the deletion of this phrase. This deletion is consistent with section 95852.1.1 (a)(3), which states that “The fuel being provided under a contract dated after January 1, 2012, is for a fuel that was previously eligible under sections 95852.1.1(a)(1) or (2), and the verifier is able to track the fuel to the previously eligible contract;”. If a contract expires, the language in section 95852.1.1(a)(3) already requires that the verifier be able to ensure the fuel’s eligibility under a contract that was in effect beforehand. In addition, further language in section 95852.1.1(a)(1)(A) requires that physical transfer of the fuel must begin within 90 days after a signed contract, or if physical transfer of the fuel begins after 90 days, then the first date of physical fuel transfer is considered the contract signing date. In other words, the language in the other conditions already conveys that if a contract is in effect by January 1, 2012, the biomass derived fuel will be considered eligible, and if the contract is renegotiated, the verifier must be able to trace the quantity of eligible biomass derived fuel to the original contract in order for the compliance exemption to be retained. (EM)

Comment: ABC appreciates that ARB intends for a biomass derived fuel that is eligible for the compliance exemption under section 95852.1.1 to remain eligible for the compliance exemption in future years of the program. We support ARB’s decision to not restrict the compliance exemption to “long term” contracts and to allow any contract which meets the January 1, 2012 contract date (which we believe should be extended to January 1, 2013) to be eligible as a biomass derived fuel. We urge ARB, however, to clarify the language that attempts to codify this grandfathering provision. In particular, section 95852.1.1(a)(1) states that the contract for purchasing any biomass derived fuel must be in effect prior to January 1, 2012 and remain in effect or have been renegotiated with the same California operator within one year of contract expiration. The phrase starting with “and remain in effect or have been renegotiated…” is not necessary for the codification of this concept. In particular, section 95852.1.1(a)(3) states the fuel being provided under a contract dated after January 1, 2012 is for a fuel that was previously eligible under sections 95852.1.1(a)(1) or (2), and the verifier is able to track the fuel to the previously eligible contract. If a contract expires, the language in section 95852.1.1(a)(3) already requires that the verifier be able to ensure the fuel's eligibility under a contract that was in effect beforehand. In addition, section 95852.1.1(a)(1)(A) requires that physical transfer of the fuel must begin within 90 days after a signed contract, or if physical transfer of the fuel begins after 90 days, then the first date of physical fuel transfer is considered the contract signing date. The language in the other conditions already convey that if a contract is in effect by January 1, 2012, the biomass derived fuel will be considered eligible, and if the contract is renegotiated, the verifier must be able to trace the quantity of eligible biomass derived fuel to the original contract in order for the compliance exemption to be retained. Requiring the contract to be "renegotiated within one year of contract expiration" places a significant burden on the fuel provider when the timeline of events may be beyond their control. Removing this language does not impinge on the environmental rigor that California is striving to achieve, since the subsequent language requires that physical fuel be transferred within 90 days and that the verifier be able to track the previously eligible contract. It ensures that fuel providers have the flexibility to renegotiate their contract without being subject to a one year time limit when this might be unrealistic given the levels of regulatory approvals that must be obtained in California. Therefore, ABC urges ARB to remove the phrase "and remain in effect or have been renegotiated with the same California operator within one year of contract expiration." (ABC2)

Comment: Section 95852.1.1(a)(1) refers to "the same California operator." The word "operator" is confusing in this context. For example, it could be read to refer to the operator of the biofuel facility (e.g. a landfill). "Purchaser" is clearer and more to the point. Section 95852.1.1(a)(1)(A) should be amended for clarity. Sections (A) and (B) are alternatives, not cumulative requirements. Modify section 95852.1.1(a)(1) as follows:

> (1) The contract for purchasing any biomass-derived fuel must be executed~~in effect~~ prior to January 1, 2013~~2~~ and remain in effect or have been renegotiated with the same California purchaser~~operator~~ within one year of contract expiration. The delivery of the fuel under the contract must meet the following requirements:~~;~~
>
> > (A) Physical transfer of the fuel must begin no later than 90 days after the execution date of the~~a signed~~ contract; or~~and~~
> >
> > (B) If physical transfer of the fuel begins more than 90 days after the contract is signed then for the purposes of this provision the first date of physical fuel transfer shall be considered the contract signing date; (SCPPA7)

Comment: The phrase starting with "and remain in effect or have been renegotiated" is not necessary for the codification of this concept because section 95852.1.1 already contains a requirement that the verifier be able to demonstrate that the fuel was eligible under a contract that was in effect prior to January 1, 2012. Modify section 95852.1.1, (a)(3) as follows:

(3) The fuel being provided under a contract dated after January 1, 2012, is for a fuel that was previously eligible under sections 95852.1.1(a)(1) or (2), and the verifier is able to track the fuel to the previously eligible contract; (CERP4)

Comment: If ARB determines that the phrase “and remain in effect or have been renegotiated with the same California operator within one year of contract expiration” must remain in section 95852.1.1, CERP urges ARB to remove the requirement for the contract to be in effect “with the same California operator.” This requirement is needlessly cumbersome. CERP sees no reason why contracting with a different California operator after the original contract expiration should bar entities from involvement with the program. Further, this requirement will allow operators with existing contracts to have unfair monopoly purchasing power within California with regard to specific producers. Accordingly, we recommend deleting “with the same California operator” and substituting “with a California operator.” (CERP4)

Comment: If ARB is concerned that requiring the renegotiated contract with the same operator will prevent placeholder contracts from being put into place and inhibit a subsequent informal market in trading “shell” contracts, ARB has already put mechanisms in place that would discourage such practices. First, physical transfer of the fuel must take place within 90 days of the contract being signed. Second, ARB under its mandatory reporting requirements already requires that they be informed of all upstream title holders of the fuel. In addition, most renewable contracts already go through an approval process with CPUC, and eligible renewable facilities must register with CEC (which requires that the fuel provider / marketer, the fuel production site and the downstream combusting entity be identified). These additional checks (in addition to ARB’s own reporting requirements) serve to discourage placeholder contracts and subsequent “shell” contract trading. Indeed, existing solar, wind, and other renewable projects are not restricted to renegotiating with the same counterparty in order to be considered a fuel eligible for the compliance exemption. Since ARB has recognized that biomass derived fuels which can be verified as such have biogenic emissions in nature, treatment of this resource should be at parity with other renewable resources. From the perspective of preventing leakage and upholding the integrity of the Cap and Trade program, it is immaterial whether the contract is being renegotiated with the same (original) counterparty or with another California entity. From a biomass derived fuel provider’s perspective, being tied to the same counterparty gives the buyer an unfair market advantage and limits the formation of a robust market for biomass derived fuels. Indeed, allowing market participants the flexibility to contract for fuel with various end users based on their unique requirements is crucial for the development of a biomass derived fuels, and ultimately to the benefit of compliance entities and California residents. Removing the restriction that the contract must be renegotiated with the same operator has no impact on the environmental integrity of the Cap and Trade program and at the same time supports a market for biomass derived fuels. We therefore recommend changing “with the same California operator” and to “with a California operator.” (EM)

Comment: Contract renegotiations and approvals can be lengthy processes in California, and could take longer than one year, especially if they are contingent on approvals by regulatory bodies such as CPUC. Given this reality, requiring the contract to be "renegotiated within one year of contract expiration" in section 95852.1.1(a)(1) places a significant burden on the fuel provider when the timeline of events may be beyond their control. Removing this language does not impinge on the environmental rigor that California is striving to achieve, since the subsequent language requires that physical fuel be transferred within 90 days and that the verifier be able to track the previously eligible contract. At the same time, it ensures that fuel providers have the flexibility to renegotiate their contract without being subject to a one year time limit when this might be unrealistic given the levels of regulatory approvals that must be obtained in California. Modify section 95852.1.1(a)(1) as follows:

> (1) The contract for purchasing any biomass-derived fuel must be in effect prior to January 1, 2012 ~~and remain in effect or have been renegotiated with the same California operator within one year of contract expiration~~. The delivery of the fuel under the contract must meet the following requirements: (EM)

Comment: Section 95852.1.1(a)(2) refers to "new" production or recovery of biofuel. "New" should be defined in this context. The cut-off date for biofuel contracts is the appropriate date for determining whether production or recovery is "new." It may also be helpful to define "useful energy transfer." Modify section 95852.1.1(a)(2) as follows:

> (2) The fuel being provided under a contract dated after January 1, 2013~~2~~ must only be for an amount of fuel that is associated with:
>
> > (A) an increase in the biomass-derived fuel producer's capacity, where an increase is considered any amount over the average of the last three calendar years' production;~~,~~
> >
> > (B) new production on or after January 1, 2013; or
> >
> > (C) recovery of the fuel that, as of January 1, 2013, was ~~previously~~ being destroyed without producing useful energy transfer~~. Increased capacity is considered any amount over the average of the last three calendar years production~~; (SCPPA7)

Comment: Section 95852.1.1(a)(1) requires that the contract for purchasing any biomass-derived fuel must "remain in effect or have been renegotiated with the same California operator within one year of contract expiration." ABC believes this requirement for the contract to be renegotiated with the same California operator to be unnecessarily cumbersome. If ARB is concerned that requiring the renegotiated contract with the same operator will prevent placeholder contracts from being put into place and inhibit a subsequent informal market in trading "shell" contracts, there are already mechanisms in place that would discourage such practices. First, physical transfer of the fuel must take place within 90 days of the contract being signed. Second, ARB under its mandatory reporting requirements, already requires that they be informed of all upstream title holders of the fuel. In addition, most renewable contracts already go through an approval process with CPUC, and eligible renewable facilities must register with CEC (which requires that the fuel provider / marketer, the fuel production site and the downstream combusting entity be identified). These additional checks (in addition to ARB's own reporting requirements) serve to discourage placeholder contracts and subsequent "shell" contract trading. Indeed, existing solar, wind, and other renewable projects are not restricted to renegotiating with the same counterparty in order to be considered a fuel eligible for the compliance exemption. Since ARB has recognized that biomass derived fuels which can be verified as such have biogenic emissions in nature, treatment of this resource should be at parity with other renewable resources. From the perspective of preventing leakage and upholding the integrity of the cap and trade program, it is immaterial whether the contract is being renegotiated with the same (original) counterparty or with another California entity. From a biomass derived fuel provider's perspective, being tied to the same counterparty gives the buyer an unfair market advantage and limits the formation of a robust market for biomass derived fuels. Allowing market participants the flexibility to contract for fuel with various end users based on their unique requirements is crucial for the development of a biomass derived fuels, and ultimately to the benefit of compliance entities and California residents. Removing the restriction that the contract must be renegotiated with the same operator has no impact on the environmental integrity of the cap and trade program and supports a market for biomass derived fuels. Modify section 95852.1.1(a)(1) as follows:

> The contract for purchasing any biomass-derived fuel must be in effect prior to January 1, 2012, and remain in effect or have been renegotiated with ~~the same~~ a California operator within one year of contract expiration. The delivery of the fuel under the contract must meet the following requirements; (ABC2)

> **Response:** New section 95852.1.1(a)(1) specifies that the contract shuffling date for purchasing any biomass-derived fuel must be in effect prior to January 1, 2012, and remain in effect or have been renegotiated with the same California operator within one year of contract expiration. This section is necessary to prevent contract shuffling wherein contracts are being diverted to California by entities seeking to avoid a compliance obligation for fossil fuels. Contract shuffling could allow fossil emissions to increase in states where the biofuel was previously combusted, which could result in no net change in emissions and emissions leakage. We changed the January 1, 2012, date from the original date in the MRR of January 1, 2010, in response to stakeholder comments that we needed to allow time for contracts to go through the California Energy Commission (CEC) process for RPS certification. We believe any further extension of the eligibility date will result in contract shuffling where covered entities will replace existing fossil fuel contracts with biomass-derived fuel contracts that will not result in an actual reduction of fossil fuel GHG emissions to the atmosphere. AB 32 requires that we prevent emissions leakage and contract shuffling is a type of emissions leakage.
>
> We clarified the text to allow for exempt biogas that is sold to a capped entity in California to change to another capped entity in the state and still be exempt from a compliance obligation.

E-34. Comment: A few modifications to the existing draft language would further support the creation of a robust market for pipeline biogas resources within the State and provide a key compliance option to California operators while ultimately serving to reduce costs for California businesses and residents. Therefore, we urge ARB to consider the following:

- Extend the Contracting Deadline for Purchase of Biomass-Derived Fuel to January 1, 2013, from January 1, 2012
- Simplify the grandfathering concept for biomass derived fuel that is purchased before the start of the program
- Ensure biogas projects continue to receive offset credits for the destruction of methane
- Remove the requirement that a contract must remain in effect with the same California operator
- Include efficiency increases in the definition for increased capacity. (EM)

Response: New section 95852.1.1(a)(1) specifies that the contract shuffling date for purchasing any biomass-derived fuel must be in effect prior to January 1, 2012, and remain in effect or have been renegotiated with the same California operator within one year of contract expiration. This section is necessary to prevent contract shuffling wherein contracts are being diverted to California by entities seeking to avoid a compliance obligation for fossil fuels. Contract shuffling could allow fossil emissions to increase in states where the biofuel was previously combusted, which could result in no net change in emissions and emissions leakage. The January 1, 2012, date was changed from the original date in the MRR of January 1, 2010, in response to stakeholder comments that staff needed to allow time for contracts to go through the California Energy Commission (CEC) process for RPS certification. We believe any further extension of the eligibility date will result in contract shuffling where covered entities will replace existing fossil fuel contracts with biomass-derived fuel contracts that will not result in an actual reduction of fossil fuel GHG emissions to the atmosphere. AB 32 requires that we prevent emissions leakage, and contract shuffling is a type of emissions leakage.

Further, we changed the regulation to ensure that biogas projects continue to receive offset credits for the destruction of methane. We included this revision to clarify that an entity is allowed to receive offset credits while not incurring a compliance obligation subject to the limits of the regulation.

We clarified the text to allow for exempt biogas that is sold to a capped entity in California to change to another capped entity in the state and still be exempt from a compliance obligation.

E-35. (multiple comments)

Comment: In section 95852.1.1(a)(1), the required contracting date for the purchase of biomass-derived fuel within California was extended to January 1, 2012. This change acknowledged that facilities which were undergoing contract negotiations and awaiting approval from California regulatory bodies such as CPUC would benefit from the additional time to complete these processes. Subsequent to this extension, a major legislative change has since taken place which has further lengthened the negotiation and approval processes for contracts which were expected to conclude earlier. In particular, the California legislature passed SBX1-2 in mid-2011, creating three tiers of California eligible renewable energy, and requiring new CPUC dockets and CEC guidance on the treatment of renewable energy (including biomethane). The end result is that contract negotiations which began in 2010 or even earlier have been stymied by the uncertainty associated with the passage of this bill. Thus, we propose the extension of the January 1, 2012, deadline to coincide with the start of the compliance portion of the cap and trade program, and to give entities the opportunity to complete the lengthy regulatory approval processes that contracts in California must go through. Extending the contracting deadline to January 1, 2013, allows the impacts of SBX1-2 to be incorporated into the contracting process by biomethane buyers and fuel providers. The extension also ensures that existing projects, which are already subsisting on thin profit margins, are not penalized for circumstances beyond their control. The extension further coincides with the start of the compliance portion of the cap and trade program (2013), which ARB itself proposed because a number of key issues associated with the construction of the Cap and Trade program, were pending. (EM)

Comment: In section 95852.1.1(a)(1), the required contracting date for the purchase of biomass-derived fuel within California was extended to January 1, 2012. We urge ARB to consider extending the deadline by an additional year to coincide with the start of the compliance portion of the Cap and Trade program, and to give entities the opportunity to complete the lengthy regulatory approval processes that contracts in California must go through. In particular, the California legislature passed SBX1-2 in mid-2011, creating three tiers of California eligible renewable energy, and requiring new CPUC dockets and CEC guidance on the treatment of renewable energy (including biomethane). The end result is that contract negotiations which began in 2010 or even earlier have been stymied by the uncertainty associated with the passage of this bill. While the original extension envisioned that existing contracts would be able to complete receiving the necessary approvals by January 1, 2012, the impacts of SBX1-2 were likely not taken into consideration for contracts in the middle of the negotiation and regulatory approval process. Extending the contracting deadline to January 1, 2013 allows the impacts of SBX1-2 to be incorporated into the contracting process by biomethane buyers and fuel providers. The extension also ensures that existing projects, which are already subsisting on thin profit margins, are not penalized for circumstances beyond their control. The extension further coincides with the start of the compliance portion of the cap and trade program (2013), which ARB itself proposed because a number of key issues associated with the construction of the cap and trade program, were pending. (ABC2)

Comment: SCPPA appreciates the change in the cut-off date for biofuel contracts from January 1, 2010, to the previous start date of the Cap and Trade program, January 1, 2012. However, the start date of the Cap and Trade compliance obligations has now been moved to January 1, 2013. Furthermore, the current cut-off date of January 1, 2012, is fast approaching but entities attempting to enter into contracts for biofuel still have little certainty as to the regulatory requirements affecting biofuel contracts. Some large biomethane transactions that are currently being negotiated may not be able to be finalized and approved by the end of 2011. For these reasons, SCPPA respectfully requests the cut-off date for biofuel contracts to be extended to January 1, 2013. References to 2012 should be changed to 2013 throughout section 95852.1.1. (SCPPA7)

> **Response:** The contract shuffling date for purchasing any biomass-derived fuel must be in effect prior to January 1, 2012, and remain in effect or have been renegotiated with the same California operator within one year of contract expiration. This section is necessary to prevent contract shuffling through which contracts are being diverted to California by entities seeking to avoid a compliance obligation for fossil fuels.
>
> Contract shuffling could allow fossil emissions to increase in states where the biofuel was previously combusted, resulting in a potential no net change in emissions and emissions leakage. The January 1, 2012, date was changed from the original date in the MRR of January 1, 2010, in response to stakeholder comments that we need to allow time for contracts to go through the California Energy Commission (CEC) process for RPS certification. We believe any further extension of the eligibility date will result in contract shuffling where covered entities will replace existing fossil fuel contracts with biomass-derived fuel contracts that will not result in an actual reduction of fossil fuel GHG emissions to the atmosphere. AB 32 requires that we prevent emissions leakage and contract shuffling is a type of emissions leakage.
>
> Contract shuffling is designed to prevent emissions leakage. If a California entity receives biomethane that was being combusted in another state, the facility in the other state would have to replace their biomethane with natural gas, and their fossil emissions would go up, resulting in emissions leakage and no true global reduction in CO_2 emissions. What we do not want to do is create a perverse incentive for all biofuels to be combusted in California because we have the largest incentive, while all other states would see increases in their fossil emissions. Our intent is not to disincentivize biomethane, but instead to incentivize new sources, rather than just swapping existing sources from one state to another.

E-36. Comment: LADWP recommends that the provision for eligibility for biogas contracts in section 95851.1.1(a)(2) be stricken from the draft regulation until further vetting on resource shuffling takes place. Eligibility requirements of biogas contracts should align with the 33 percent RPS. ARB proposes that no emissions compliance obligation would apply to biogas contracts in effect prior to January 1, 2012 that meet specific requirements for delivery and verification. Biogas contracts executed after January 1, 2012 would carry an emissions compliance obligation equivalent to unspecified natural gas (943 lbs/MWh), unless they were the result of a biofuel producers increased capacity, new production, recovery, or if the biogas could be tracked to a previously eligible contract. LADWP requests that ARB eliminate the January 1, 2012 deadline altogether, so that the California Cap and Trade program is more closely aligned with the 33 percent RPS. At minimum, the deadline should be shifted to January 1, 2013 to align with the start date of the compliance obligations under the Cap and Trade program. Increasing renewables from 20 percent to 33 percent represents a total of 11.4 MMT in emission reductions statewide after deducting emission reductions associated with tradable renewable certificates (REC). The RPS includes specific eligibility guidelines for the injection and delivery of biomethane into natural gas pipelines, but does not impose contract eligibility deadlines. To the extent that ARB does not recognize emission reductions associated with biogas contracts used for compliance with the 33 percent RPS, ARB will not fully achieve the projected emission reductions (11.4 MMT) associated with this measure, and additional demand will be placed on the supply of allowances, driving up the cost of allowances for all market participants. Modify section 95851.1.1 as follows:

> ~~(a) Contracts for biogas and biomethane must meet one of the following criteria. Only the portion of the fuel that meets these criteria will be considered a biomass derived fuel and is not subject to a compliance obligation if the emissions are reported as biomass CO2 in an emissions data report that has received a positive or qualified positive emissions data-verification statement:~~
>
> > ~~(1) The contract for purchasing any-biomass derived fuel must be in effect prior to January 1, 2012 and remain in effect or have been renegotiated with the same California operator within one year of contract expiration;~~
> >
> > > ~~(A) Physical transfer of the fuel must begin no later than 90 days after a signed contract; and~~
> > >
> > > ~~(B) If physical transfer of the fuel begins morethan-90 days after the contract is signed then for the purposes of this provision the first date of physical fuel transfer shall be considered the contract signing date;~~
> >
> > ~~(2) The fuel being provided under a contract dated after January 1, 2012 must only be for an amount of fuel that is associated with an increase in the biomass-derived fuel producer's capacity, new production or recovery of the fuel that was previously destroyed without producing useful energy transfer, increased capacity is considered any amount over the average of the last three calendar years-production;~~
> >
> > ~~(3) The fuel being provided under a contract dated after January 1, 2012 is for a fuel that was previously eligible under (1) or (2) above, and the verifier is able to track the fuel to the previously eligible contract;~~
> >
> > ~~(4) Once a certification program is in place, a fuel which meets the requirements of sections 95852.1.1(a)(1) and 95852.1.1(a)(2) will always be considered to have met the requirements in section 95852.1; or~~

~~(5) If the biogas or biomethane is used at the site of production, and not transferred to another operator thus not requiring a contract, the operator must demonstrate one of the following:~~

~~(A) The fuel has been combusted in California prior to January 1,~~ 2013 ~~2012; or~~

~~(B) The fuel was not previously used to produce useful energy transfer.~~

~~(b) As part of a biomass derived fuel's eligibility to avoid a compliance obligation no party may sell, trade, give away, claim or otherwise dispose of any of the carbon credits, carbon benefits, carbon emissions reductions, carbon offsets or allowances, howsoever entitled, attributed to the fuel production that would prevent the resulting combustion from not having a compliance obligation. Generation of Renewable Energy Credits is allowable and will not prevent a biomass derived fuel that meets the requirements in this section from being exempt from a compliance obligation.~~ (LADWP4)

Response: We disagree with this comment. We added a provision to Eligibility Requirements for Biomass-Derived Fuels section 95852.1.1, to accommodate the time required for the CEC to certify new RPS projects. We have heard from stakeholders who are concerned that many operators will not want to risk taking delivery of any substantial volumes of biofuel until CEC certification is received. Purchasers have an incentive to submit certification applications to the CEC promptly, because certification, if granted, is backdated to the date the certification application was submitted. These modifications should also better reflect the way in which the CEC certifies facilities as RPS-eligible with respect to particular fuels.

Fuels

E-37. Comment: The build-out of the hydrogen transportation infrastructure should not be burdened by an early penalty imposed on the hydrogen produced for use as a transportation fuel. Transportation fuels are not covered under the cap and trade program until the second compliance period. Since hydrogen is a low-carbon fuel, the carbon footprint of its production is equivalent to a conventional fossil fuel's carbon footprint during use. As such, hydrogen used as a transportation fuel during the first compliance period should be exempt from a compliance obligation, consistent with the absence of a compliance obligation imposed on fossil fuel based transportation fuels during the first compliance period. The hydrogen fuel exemption would also be consistent with the lack of a compliance obligation for natural gas used as a transportation fuel during the first compliance period. This temporary exemption can be realized by CARB allowing a reduction in a hydrogen producer's overall compliance obligation proportional to the fraction of total production which is sold as a transportation fuel. Alternatively, CARB could make an allowance allocation equal to the emissions associated with the amount of such hydrogen produced and sold as transportation fuel. (APC2)

Response: We recognize the potential of hydrogen as a clean transportation fuel. However, we do not agree that it is appropriate to exclude it from a compliance obligation or to provide an explicit incentive for its use through free allocation. The purpose of allowance allocation is not to "pick winners" among the many greenhouse gas-reducing technologies that may become more widely used in response to the carbon price signal created by the cap-and-trade program.

In addition, we modified the regulation to allow for a different allocation to liquefied hydrogen production facilities in the future, if necessary. If, in the future, any carbon costs from purchased electricity are included in consideration of the product benchmark values, the high level of indirect emissions from liquefaction of the hydrogen would likely lead to a different benchmark value for liquefied hydrogen. The current framework could also allow for a change in the leakage risk classification for liquid hydrogen based on any new information that may arise as we continue to analyze leakage risk per the direction in Board Resolution 10-42.

E-38. Comment: CARB must continue to develop the necessary regulatory infrastructure to include transportation fuels and natural gas in the second compliance period starting in 2015. (EDF4)

Response: This comment falls outside the scope of the first 15-day changes to the regulation. We will continue to work on various aspects of transportation fuel inclusion with stakeholders.

E-39. Comment: ICCT recommends allowing fuel providers the flexibility to choose between requiring allowances to cover the carbon content of the fuel, as required for other liquid transportation fuels; or allowing the use of LCFS accounting tools to determine the GHG burden of the fuel in order to adjust the compliance obligation. (ICCT3)

Response: This comment falls outside the scope of the first 15-day changes to the regulation. We will continue to work on various aspects of transportation fuel inclusion with stakeholders.

E-40. Comment: The Regulation contains very little detail as to how emissions from transportation fuels will be treated and included in the Cap and Trade program, including the expected contribution to the State's emission reductions goals. There is also the potential for significant market distortions in the different treatment of allowance allocation and use of allowance revenue amongst the various sectors. This treatment must be made consistent. Our concerns with respect to the treatment of transportation fuel emissions center around the ability to acquire sufficient allowances to cover fuel emissions and the ability to recover costs for these allowances with any degree of certainty. Given the size of the compliance obligation for fuel providers and the billions of dollars of allowances that will need to be purchased in order to allow these facilities to continue to operate, it is difficult to envision how the current system design will allow for cost pass through and recovery in a way that does not result in significant disruptions to the fuels market. As the rules around the treatment of transportation fuels in the Cap and Trade program are developed, BP strongly urges CARB staff to consider use of a fee on transportation fuels linked to the price of carbon in the Cap and Trade system. We believe the updated FED was very insightful in its inclusion of this concept in its evaluation of alternatives and believe the merits of this approach warrants serious consideration. This design for the inclusion of transportation fuels was contained in the federal Kerry-Graham-Lieberman draft bill from early 2010. This approach brings many benefits in its simplicity, carbon price transparency, economic efficiency, energy security and environmental certainty. A linked fee approach to transportation fuel emissions would: 1) maintain a market-based price signal to consumers, 2) improve the transparency of that price signal for consumers, 3) eliminate the need to compensate refiners for unrecovered costs associated with consumer emissions, and 4) provide a mechanism for transitional relief to fuel consumers and funding of transportation-related technology and infrastructure investment. (BP2)

> **Response:** This comment falls outside the scope of the first 15-day changes to the regulation. We will continue to work on various aspects of transportation fuel inclusion with stakeholders.

E-41. Comment: Incorporate provisions to review the energy, environment and economic implications of including transportation fuels under the cap; and review the Regulations to ensure level playing field for all transportation fuels. These reviews should be completed by January 2014. Shell believes that different regulatory approaches to CO_2 reduction are suited for different sectors. While we believe that market mechanisms such as Cap and Trade work most effectively for power and large industrial facilities, for road transportation, we believe different measures that independently target the fuel supplier, the vehicle manufacturer and the driver work best. There are already two programs in place that are intended to reduce GHG from fuels—the federal Renewable Fuel Standard and the California Low Carbon Fuel Standard. Including transportation fuel in the Cap and Trade program will add another layer of regulation. Additionally, including transportation fuels in the cap, will nearly double the emissions subject to this Regulation. Shell believes that before imposing an additional layer of regulation, ARB should further evaluate the impacts of including emissions from fuels in the Cap and Trade program in 2035 on energy availability, the environment and economics. In addition, further review is necessary to ensure a level playing field for all transportation fuel, including a level playing field for electricity used for transportation fuel and fossil fuel used for transportation fuel. The review should be completed and presented to the Board by July 2013 to allow sufficient time to modify the Regulation as necessary and provide entities' with sufficient planning time. (SHELLOIL)

> **Response:** This comment falls outside the scope of the first 15-day changes to the regulation. We will continue to work on various aspects of transportation fuel inclusion with stakeholders.

E-42. Comment: CalChamber remains concerned about the impact of including transportation fuels under the cap beginning in 2015 and thus requests that the inclusion of these fuels be revisited. With no Western Climate Initiative (WCI) trading partners ready to link, California will be alone in the Cap and Trade program. A California-only fuels under the program should be further evaluated with all economic impacts taken into consideration, including cost and consideration for the fact that California is already implementing the Low Carbon Fuel Standard (LCFS). Given the importance of transportation on California's economy, and the significance of energy costs to nearly every resident and business in the state, it is imperative that CARB do a thorough analysis of the economic impact of CARB's current proposal to include fuels in a unilateral Cap and Trade program; making sure that costs are minimal and total benefits to California are maximized. (CALCHAMBER3)

> **Response:** This comment falls outside the scope of the first 15-day changes to the regulation, which did not modify whether fuels were under the cap beginning in 2015. Thus, no further response is required. However, we will continue to work on various aspects of transportation fuel inclusion with stakeholders.

Applicability

E-43. Comment: CARB has endeavored to mimic the mandatory reporting applicability and calculation methodology of the U.S. EPA Mandatory Reporting Rule in many ways. However, in one aspect of the reporting rule relevant to our operations in the state there appears to be a critical difference. When operational control is shared between entities, CARB's assignment of reporting (and hence compliance allowance retirement) obligation shifts to the entity holding the permit to operate from the relevant air pollution control authority. The U.S. EPA MRR does not have such a provision, making the obligation to report rest solely on the owner/operator of a facility. With the modifications proposed to ARB's MRR, particularly under section 95114(a) which now is identical to the U.S. EPA MRR language (Subpart P of 40 CFR Part 98 section 98.160(c)), some uncertainty as to the States' intent has been created. We seek confirmation that, notwithstanding the different interpretation by U.S. EPA, the responsibility for developing, submitting and certifying the GHG emissions data report under Article 2, section 95104 and, subsequently, the obligation to satisfy an emission compliance obligation under Article 5, section 95811(a), rests with the entity holding the permit to operate under the conditions described within the specific definitions of "Operational Control" under section 95102 and "Operator" under section 95802; and the regulatory primacy stated under section 95000.5(d)(4). (APC2)

> **Response:** No change was made to the regulation based on the comments. The definition of "operator" is the same under the MRR as it is in the cap-and-trade regulation. Therefore, any requirements under the cap-and-trade regulation for operators apply to the same people that qualify as operators under the MRR.

Section 95852

E-44. Comment: Rio Bravo leases operation of the oil field to a third party operator, and it is this third-party operator that is listed on the oil and gas permits. To ensure that the entity that actually faces a GHG compliance obligation (Rio Bravo) receives industrial assistance for the oil produced, CARB should clarify section 95852(h) so that the Operator not only includes the entity that is listed on the oil and gas permit, but the entity that owns the oilfield. (ACERIO)

> **Response:** Industrial assistance is provided to industrial production activities such as oil and gas extraction. An oil-producing operator has to register with ARB and report the amount of production to receive free allowances.

E-45. Comment: Carbon dioxide suppliers are effectively included "under the cap." In section 95812, Inclusion Thresholds for Covered Entities, CO_2 captured from production processes or from a CO_2 stream to utilize for geologic sequestration is counted toward the applicability threshold of 25,000 metric tons per year. In section 95852, Emission Categories Used to Calculate Compliance Obligations, a CO_2 supplier's compliance obligation is calculated as "the sum of CO_2 supplied for use in California or exported for the purposes of geologic sequestration, minus CO_2 verified to be geologically sequestered through use of a Board-approved carbon capture and geologic sequestration quantification methodology that ensures that the emission reductions are real, permanent, quantifiable, verifiable, and enforceable." This deducts permanently geologically sequestered CO_2 from the compliance obligation; but placing these entities under the cap means no compliance offsets from CCS will be possible. However, incentivizing voluntary CCS offsets could be a way to create real, additional, permanent, verifiable, and enforceable GHG reductions. If necessary, ARB could restrict this opportunity to CCS projects located outside California. GHG reductions from carbon capture and permanent storage, quantified and verified using an ARB-approved Compliance Offset Protocol for this project type, could provide additional supply of high-quality offsets for compliance by covered entities. ACR recommends ARB consider removing CO_2 suppliers as a sector from having a compliance obligation and incentivizing CCS as offsets. Alternately, ARB could leave CO_2 suppliers under the cap in California, but allow CCS projects located outside California to generate offsets under a new Compliance Offset Protocol. (MARTINN3)

> **Response:** This comments falls outside the scope of the first 15-day changes to the regulation, which did not change how geologically sequestered CO_2 is treated in terms of a compliance obligation. We will continue to evaluate the potential use of CCS and an appropriate crediting mechanism.

E-46. Comment: SMUD points out that section 95852 incorrectly includes items (9) through (12) under subpart (a). These categories of emissions are not combustion emissions associated with biomass fuels, and these sections should be renumbered to be part of subpart (b), fugitive emissions without a compliance obligation. In addition, in subpart (b), there appear to remain some duplicative sections covering the same emissions twice. For example, section 95852(b)(2) exempts fugitive emissions from a variety of categories at refineries, but these emissions are also excluded in (b) (9) and (10). A general review and elimination of duplication of section 95852 is in order for clarity. (SMUD3)

> **Response:** This comment appears to refer to section 95852.2. We deleted items (9) through (12) in section 95852.2(a). We substantially rewrote section 95852.2(b) to clarify these sections.

E-47. Comment: Section 95852.2 details a list of fuel types that do not have a compliance obligation. WSPA believes that by using a specific list of fuels, ARB is limiting innovation for new fuels. WSPA recommends that ARB add provisions that allow fuel providers to identify other fuels that could qualify to not have a compliance obligation. (WSPA3)

> **Response:** We disagree. We will retain the authority to determine which fuels have a compliance obligation and add others or provide exemptions from a compliance obligation after review of each fuel type and a public rulemaking process.

E-48. Comment: Include a process to add to the list of fuels without a compliance obligation. Modify section 95852.2 as follows:

> Emissions from the following source categories and fuel types count toward applicable reporting thresholds but do not count toward a covered entity's compliance obligation set forth in this article unless those emissions are reported as Other Biomass CO_2 under MRR. <u>The Executive Officer may add additional source categories meeting similar criteria.</u> Emissions without a compliance obligation include: (CCEEB3)

> **Response:** No such criteria are provided in the regulation; therefore, we did not add this language. We will evaluate new fuels for exemptions as part of future rulemaking and through a public process.

E-49. Comment: The changes to section 95852.2 appear very significant and may amount to a large amount of potential emissions. In particular, exclusion of landfill methane emissions may result in large additional amounts of GHGs. The rule now appears to entirely exclude any SF_6 emissions, even though SF_6 is still listed as a regulated pollutant. (SCAQMD4)

> **Response:** Section 95852.2 lists fuels without a compliance obligation. Landfills are not required to report and are not included under the cap; therefore, it made no sense to list their emissions. There are currently no sources that are subject to reporting and holding a compliance obligation for SF_6. Therefore, it was removed as part of general clarifications in the text. We reserve the right to regulate and attach a compliance obligation to SF_6 in the future.

E-50. Comment: PG&E supports the formatting revisions that ARB made to section 95852.2 in the regulation, but there is still a lack of clarity in this section as to how vented and fugitive emissions from natural gas systems are treated. Vented and fugitive emissions from natural gas systems will be reported to ARB in an indirect manner under Natural Gas Supplier Reporting in section 95122 of the Mandatory Reporting Rule (MRR) and the Cap and Trade compliance obligation for these emissions is based on section 95122. There should be additional language in section 95852.2(b) that states clearly that the vented and fugitive emissions reported separately in section 95153 of the MRR do not have an additional cap-and-trade compliance obligation. Additionally, PG&E notes that section 95852.2(b)(15), labeled as "other venting and fugitive emissions not specified in the quantification methods," is vague. PG&E recommends that the type of emissions that would be included in this category should be more precisely defined, or it should reference an applicable section of the MRR so that there is no confusion. (PGE4)

> **Response:** We agree. Regarding the first suggestion in this comment, we added new text in section 95852.2(b)(4) specifically referencing section 95153 of MRR. Regarding the text in section 95852.2(b)(15) that may be too vague, we deleted that text. We added more precise definitions throughout section 95852.2(b).

E-51. Comment: Section 95852.1 now largely repeats requirements that are already set out in other sections. This section could be deleted without affecting the requirements that apply to biomass-derived fuels. If it is not deleted, some changes should be made to this section for clarity and to reduce redundant wording. The reference to "source categories" in section 95852.1(a) is not relevant here. As the first paragraph of section 95852.1 indicates, this section only addresses biomass-derived fuels. Modify section 95852.1 as follows:

> An entity that has emissions from <u>combustion of</u> biomass-derived fuels is required to report and verify its emissions pursuant to MRR and has a compliance obligation for every metric ton of CO_2e emissions ~~from biomass-derived fuels that would result from combustion or oxidation of all biomass-derived fuel from sources identified below~~:
>
> > (a) <u>from combustion of</u> ~~Source categories or~~ fuel types that are not listed under section 95852.2; or
> > (b) <u>from combustion of</u>~~Emissions from~~ fuels that do not meet the requirements of section 95852.1.1, or
> > <u>(c)</u> ~~those emissions~~ that are reported as Other Biomass CO_2 under MRR. (SCPPA7)
>
> **Response:** We agree and modified the regulation accordingly.

E-52. Comment: CERP generally appreciates the modifications and clarifications that ARB has made respecting emissions without a compliance obligation. However, we respectfully recommend that ARB modify the requirements that apply to wood and wastes so that they track those already established by the California Energy

Commission (CEC). Tracking of sources of wood and wood wastes is extremely difficult for covered entities and for agencies that do not have special expertise. For example, electricity generators burning wood waste meeting the CEC's definition of biomass are not expected to have specific knowledge about the source of the wood being used in their operations. For this reason, enforcement of such requirements should be done with other agencies that already have oversight responsibilities of the harvesting of wood and wood wastes. Modify section 95852.2(a)(4) as follows:

(4) Wood and wastes <u>from timbering operations</u> ~~identified to follow all of the following practices:~~

~~(A) Harvested pursuant to an approved timber management plan prepared in accordance with the Z'berg Nejedly Forest Practice Act of 1973 or other locally or nationally approved plan;~~

~~(B) Harvested for the purpose of forest fire fuel reduction or forest stand improvement; and~~

~~(C) Do not transport or cause the transport of species known to harbor insect or disease nests outside zones of infestation or quarantine zones identified by the Department of Food and Agriculture and the Department of Forestry and Fire Protection, unless approved by these agencies.~~ (CERP4)

Response: We partially agree with this comment and modified section 95852.2(a)(4) by removing paragraph (C). We did not adopt the commenter's other suggestions, primarily because paragraphs (A) and (B) are needed in order to report GHG emissions under the MRR section 95103(j).

E-53. Comment: We have concern that the structure of the Regulation provides no protection against suppliers of natural gas including a cost for allowances within the price they seek for natural gas even though covered entities will have to ensure they have allowances that cover emissions associated with their combustion of natural gas. Section 95852 provides that suppliers of RBOB, distillate fuel oils, natural gas liquids, and blended fuels are required to account for allowances for combustion of these fuels by their downstream users and there is not a concern regarding double-regulation since the downstream users are not required to account for such allowances. In contrast, while natural gas suppliers are required to hold allowances that represent the natural gas that is used by downstream users who do not fall under the scheme, they are not required to hold allowances for entities that fall under the scheme (covered entities) since those covered entities will be required to hold such allowances. Our concern is that there will be (at best) confusion over this issue and (at worst) manipulation of this issue such that downstream users of natural gas who are covered entities will face both prices of natural gas that includes the cost for allowances (even though the provider does not have to obtain such allowances) while the covered entity must still obtain the allowances itself. We note that ARB added language at section 95852(c)(3) such that ARB will provide to the natural gas suppliers a list of all their customers that are covered entities - including information on the aggregate natural gas volumes and emissions calculated from the supplier's natural delivered to the covered entity. This is a helpful addition in that it may help natural gas providers to understand which of their downstream users already have to pay for their allowances; however, it doesn't provide any mechanism for avoiding (or addressing) the situation in which the natural gas provider still embeds the cost of allowances into the sale price for the covered entity (resulting in double-payment). We are seeking that ARB consider incorporation of a mechanism to address this concern. This could include a requirement of transparency on the part of the natural gas provider along with a mechanism to discount the amount of allowances the downstream user is required to obtain in order to avoid a double payment. (UNITEDAIRLINES2)

> **Response:** We did not make a change at this time. Natural gas suppliers are not subject to a compliance obligation until the second compliance period. We will evaluate the issue and propose any needed changes as part of a future rulemaking. It will be up to the discretion of the natural gas supplier on how best to determine carbon cost pass-through. The facilities subject to a compliance obligation for natural gas can reduce their natural gas usage, thus lowering their direct compliance obligation and the amount they pay for natural gas.

Issuance of Compliance Instruments

E-54. Comment: The Regulation should add needed detail about the format and information contained in the serial numbers that will aid participants and the market as this program is implemented and as it evolves beyond California's borders. The serial number's format should identify Vintage Year, Compliance Instrument Type (Allowance or Offset Credit), Jurisdiction (California), and also identify project type for Offset Credits. Modify section 95820(a)(2) as follows:

> (2) The Executive Officer shall assign each California GHG allowance a unique serial number that indicates the annual allowance budget from which the allowance originates. <u>The serial number's format shall identify Vintage Year, Compliance Instrument Type (Allowance or Offset Credit), Jurisdiction (California), and also identify project type for Offset Credits.</u> (PGE4)

> **Response:** We did not change the regulation based on the comments. The requested requirement is part of program implementation and does not need to be specified in the regulation.

E-55. Comment: The language in section 95820(c) should allow the Board, as well as the Executive Officer, to terminate or limit the authorization to emit represented by a compliance instrument. (SCAQMD4)

> **Response:** We did not change the regulation based on the comments. ARB has sole authority to issue, regulate, or approve the allowances or offsets used in the cap-and-trade program.

Covered Entities

E-56. (multiple comments)
Comment: Considering the potential costs for the sector, the seasonality of the operations, the margins for the products, and the fact that ultimate costs will be absorbed by the farming community with no outlet to recover these costs, we ask that the food processing sector be excluded as a capped sector. The sector will continue to achieve cost-effective GHG reductions without the unnecessary costs of the program. (CCGG2)

Comment: Discussions with ARB staff are ongoing regarding first point of process being integral to the farm. As such, vegetable and fruit processing operations may be justified as being designated an uncapped sector in conjunction with the Agriculture Sector. (CALFP3)

> **Response:** We did not change the regulation based on the comments. Board Resolution 11-32 directs the Executive Officer to initiate a study to analyze the ability of the agricultural industry, including food processors, to pass on regulatory costs to consumers. The Executive Officer will identify and propose regulatory amendments, as appropriate.

E-57. Comment: For their CHP plants, several UC campuses would likely fall below CARB's Cap and Trade compliance threshold. This means that those campuses would not have to bear a carbon cost for natural gas usage until 2015. Thus, despite the fact that CHP plants meet campus electrical and thermal needs more efficiently than separate heat and power generation, and despite the fact that CARB identified increased deployment of CHP as an important mitigation measure in its AB 32 Scoping Plan, the proposed Cap and Trade program effectively penalizes the University for being an early adopter of CHP. (UC3)

> **Response:** No changes were made to the regulation based on the comments. Board Resolution 11-32 directs the Executive Officer to coordinate with State universities and stakeholders to evaluate options for compliance and propose regulatory amendments, as appropriate.

Threshold for Compliance Obligation

E-58. Comment: The potential impact on meeting the overall 2020 emission reduction goal for facilities initially in the program or opting-in that subsequently go below the threshold for inclusion and drop out of the program should be assessed. Combustion emissions will be controlled by having the upstream fuel under the cap after 2015, but other GHGs would not be. This could potentially compromise the ability to meet the 2020 reduction target. Also, we assume that facilities must reenter the program if their emission threshold subsequently increases. (SCAQMD4)

Response: We agree that there will be a need to assess the cap-and-trade program. We anticipate that its coverage is one aspect we will periodically assess.

E-59. Comment: Having facilities move in and out of the program as their emissions fluctuate will add an unnecessary administrative burden. We recommend that once a facility is in the Cap and Trade program they remain in, even when their emissions drop below 25,000 MT CO_2e per year. (SCAQMD4)

Response: We did not make a change to the regulation based on the comments. We have provisions that balance the need to accommodate fluctuations in applicability based on changes in emissions and program administration. These provisions are in both the MRR and the cap-and-trade regulation.

Opt-in Entities

E-60. Comment: Further clarifications are necessary to provide better guidance to entities that are considering opting in to the Cap and Trade Program under section 95813. Subsection (b) states that the Executive Officer shall evaluate opt-in applications and designate approved applicants as opt-in covered entities. This subsection should be clarified that the Executive Officer must approve as an opt-in covered entity any entity that meets the qualification requirements in subsection (a). Subsection (d) states that an opt-in covered entity may be eligible to receive freely allocated allowances subject to subarticles (8) and (9). This subsection should be changed to confirm that any approved opt-in entity shall be eligible to receive freely allocated allowances if the entity has submitted appropriate emissions and production data. Subsection (f) states that an opt-in covered entity that wishes to opt-out of the Cap and Trade program must apply to the Executive Officer. This subsection should be clarified to confirm that any opt-in entity's request to opt-out must be approved as long as the entity is in compliance with all applicable requirements, including reporting and allowance surrender. Section 95813 should be generally clarified to inform candidates on the timing of both opting in and opting out. We suggest that entities submit the opt-in request no later than March 31 of the present year in order to participate in the present year, assuming the Executive Director can expeditiously approve the opt-in request. Similarly, we suggest that entities submit an opt-out application by March 31 of the current year in order to be removed from the program for that year. (JM)

Response: No changes were made to the regulation based on the comments. It is clear in the regulation that opt-in entities are subject to all requirements of the program once they agree to participate in the program.

General Requirements

E-61. Comment: The Utilities request deleting the language in section 95850(b) that requires that the number of allowances required for submission is rounded to the nearest ton and suggest the additional compliance obligation above the whole number is carried forward into the next compliance obligation. This process is similar to that used by the Western Renewable Energy Generation Information System (WREGIS) to generate and track renewable energy credits (REC). For example, if a generator has 10.3 MWh of generation for the month of February, the generator is issued a WREGIS certificate for 10 MWh, and the 0.3 is rolled over to the next months' generation, or March. This same concept can be applied to the cap-and-trade program, whereby a covered entity's compliance obligation above the whole number can be carried forward to their future compliance obligation. The end result will account for all emissions without adding to an entity's compliance obligation for a specific period, which is essentially what rounding to the nearest ton does. Modify section 95850(b) as follows:

> (b) An entity's compliance obligation is based on the emissions number for every metric ton of CO2e for which a positive or qualified positive emissions data verification statement is issued, ~~rounded to the nearest whole ton~~, or for which there are assigned emissions pursuant to MRR. (MID3)

> **Response:** We disagree with this suggestion. While the provisions of the regulations and this commenter's suggestion likely make only a trivial difference over the entire market, the suggestion in this comment is somewhat akin to allowing borrowing—contrary to our policy position—except it goes beyond that. It not only allows an emission from the current compliance period to be met with a compliance instrument (or fraction thereof) from a future compliance period, but also does not require that compliance instrument to be surrendered until the end of the following compliance period.

E-62. Comment: The provisions of section 95850 set forth the general requirements for covered entities under the Program, and begins in subsection (a) with a statement that each covered entity is subject to the MRR. While this may be true, covered entities will have different compliance obligations under the MRR, and it is important that their respective compliance obligations not be generalized. Accordingly, NCPA recommends that all references to compliance with the MRR be drafted to provide "compliance with applicable MRR provisions." (NCPA3)

> **Response:** No changes were made to the regulation based on the comments. We believe that the regulation is clear that not all emissions reported under the MRR may be subject to a compliance obligation under the cap-and-trade program.

E-63. Comment: The verification statement includes emissions that do not carry a compliance obligation. Only the metric tons associated with the portion of the verification statement that carries a compliance obligation should be applicable in sections 95850(b) and 95852(a) pursuant to Subarticle 2 of MRR. Modify sections 95850(b) and 95852(a) as follows:

(b) A covered entity's compliance obligation is based on the emissions ~~number~~ for every metric ton of covered emissions (CO2e) as calculated in Subarticle 2 of MRR for which a positive or qualified positive emissions data verification statement is issued, rounded to the nearest whole ton, or for which there are assigned emissions pursuant to MRR. A covered entity's compliance obligation excludes emissions that are reported as part of a verification statement but are subtracted from the calculation of covered emissions.

(a) Operators of Facilities.

(1) An operator of a facility covered under sections 958111(a) and 95812(b)(1) has a compliance obligation for every metric ton of covered emissions (CO2e) as quantified under subarticle 2 of MRR for which a positive or qualified positive verification statement is issued per section 95131(c)(5) of MRR or for which there are assigned emissions, both for process emissions and stationary combustion emissions. If ARB has assigned emissions for the sources subject to a compliance obligation under sections 95852 and 95852.1, the facility will have a compliance obligation equal to the value of every metric ton of CO2e assigned emissions. The entity's compliance obligation will be assessed at the facility level unless otherwise noted under section 95812(c). (LADWP4)

Response: We modified section 95850(b) to clarify that an entity's compliance obligation is based on the verified emissions that are subject to a compliance obligation, not all verified emissions. We also modified section 95852(a)(1) with the reference to the MRR. We did not use this commenter's suggested text for either modification, but we believe our modifications achieve the commenter's intent.

E-64. Comment: For section 95850(c), we recommend that the most recent records be available on-site and be required to be produced to the Executive Officer "on request." If you allow 20 days for the production of any records, it allows the source plenty of time to forge nonexistent records. Making a "surprise" demand provides for better enforceability. (SCAQMD4)

Response: No changes were made to the regulation based on the comments. These provisions are standard practice for ARB's enforcement practices.

E-65. Comment: CLFP supports the CARB recommendation to reduce the record keeping requirement from ten to seven years. (CALFP3)

Response: Thank you for your support. However, with the Second 15-Day Change Notice, we modified the requirement back to 10 years. We initially reduced the requirement to seven years to be more consistent with WCI Partner recommendations. After further evaluation of our program, we concluded it was necessary to have the more stringent 10-year requirement.

E-66. Comment: Section 95123 of CARB's proposed rules requires "carbon dioxide suppliers" to comply with Subpart PP of 40 CFR Part 98 in reporting CO_2 emissions to ARB. The proposed definition of "carbon dioxide supplier" at section 95802(a)(45) omits the following list of activities that are excluded from EPA's carbon dioxide supplier GHG reporting regulation in Subpart PP, at 40 CFR 98.420(b): storage of CO_2 above ground or in geologic formations; use of CO_2 in enhanced oil and gas recovery; transportation or distribution of CO_2; purification, compression, or processing of CO2; and on-site use of CO_2 captured on site. The carbon dioxide supplier activities excluded by Subpart PP are not designed to emit CO_2 to the atmosphere. For California carbon dioxide suppliers, the failure to exclude these activities creates a surrender obligation under sections 95851(a) and 95852(g) for CO_2 that is not emitted to the atmosphere by the supplier. It also would unnecessarily increase the administrative burden on California suppliers by requiring them to track and report emissions using two separate protocols for the same activities. Since there are no provisions in Subpart PP for calculating the quantity of CO_2 associated with the excluded activities, it is impossible for a carbon dioxide supplier to comply with the requirement of proposed section 95123 that carbon dioxide suppliers comply with Subpart PP. Without CARB specific provisions for calculating the quantity of CO_2 "emissions" associated with the activities excluded from Subpart PP, a California "carbon dioxide suppler" conducting those activities cannot determine the required reporting method or the amount of its surrender obligation. Sections 95802(a)(45), 95851(a) and/or 95852(g) should be amended to exclude the following activities: storage of CO_2 above ground or in geologic formations; use of CO_2 in enhanced oil and gas recovery; transportation or distribution of CO_2; purification, compression, or processing of CO_2; and on-site use of CO_2 captured on site. (OPC2)

> **Response:** We agree and modified section 95802(a)(45), now section 95802(a)(47), accordingly. We also modified section 95852(g) to update it with the modifications in section 95802(a)(47).

E-67. Comment: The proposed regulation does not address all aspects of the Program that pertain to the treatment of natural gas suppliers, and this omission could be detrimental to some covered entities, resulting in a double obligation. In section 95811(c), suppliers of natural gas are included as covered entities, and elsewhere in the proposed regulation, the various obligations of these entities are discussed. Most notably, the modified text in section 95852 regarding Emission Categories Used to Calculate Compliance Obligations, adds provisions for calculating emissions that are not included in the compliance obligation. Beginning in 2015, the scope of the Cap and Trade Program will also include first deliverers of natural gas. Since the first compliance period focuses on the electric and industrial sectors, there is still some time to work through the details associated with the 2015 compliance obligation for natural gas suppliers. The modified text includes new provisions that clarify how the compliance obligation will be determined for suppliers of natural gas. Newly added sections 95852(c)(1) through (c)(4) provide that suppliers of natural gas will not have a compliance obligation for the delivery of natural gas to covered entities, "thus leaving the remaining balance of CO_2e emissions . . . as the compliance obligation for the supplier of natural gas." Section 95982(c)(2) provides that "ARB shall calculate the metric tons CO_2e of GHG emissions for natural gas delivered to covered entities."

NCPA recommends that the regulation also include an allocation of allowances to covered entities in an amount equal to the amount of CO_2e of GHG emissions for natural gas delivered to covered entities to offset the emissions associated with the compliance obligation that will be borne by the covered entities for the delivered natural gas. This adjustment does not create any additional allowances, as the compliance obligation associated with the supply of natural gas will have increased by an equal amount to the covered entity's free allocation; yet as more fully explained here, this adjustment would eliminate the potential for double charging the covered entity for the carbon cost. In order to avoid a potential windfall for natural gas suppliers and a double compliance obligation for entities such as electric generation facilities, NCPA recommends that the provisions of section 95852(c), regarding the calculation of the compliance obligations for natural gas suppliers, be modified to allow for the allocation of allowances to [electric sector] covered entities to address the fact that the current market structure does not enable natural gas suppliers to distinguish between sales to covered and non-covered entities for purposes of pricing their product in the market. In order to address the issues raised herein, NCPA recommends that the following revisions sections 95852(c) and 95852(c)(2):
(c) Suppliers of Natural Gas. A supplier of natural gas covered under sections 95811(c) and 95812(d) has a compliance obligation for every metric ton CO_2e of GHG emissions that would result from full combustion or oxidation of all fuel delivered to end users in California contained in an emissions data report that has received a positive or qualified positive emissions data verification statement or assigned emissions~~, less the fuel that is delivered to covered entities,~~ as follows:
(2) ARB shall calculate the metric tons CO_2e of GHG emissions for natural gas delivered to covered entities, and shall allocate to the covered entities an equivalent number of allowances to offset these emissions. The emissions with a compliance obligation will be the CO_2e emissions that received a positive or qualified positive emissions data verification statement or the assigned emissions from natural gas delivered to the covered entity by the supplier of natural gas. (NCPA3)

> **Response:** We did not take this approach, as we prefer to keep calculation of compliance obligation separate from the calculation of allowance allocation.

E-68. Comment: A company should be able to aggregate its compliance instruments among facilities, as opposed to meeting its compliance obligation on a facility by facility basis. (CALFP3)

> **Response:** The regulation specifies that it is entities, not facilities, that have compliance obligations.

Triennial Compliance Obligation

E-69. Comment: The 3-year compliance period in section 95856(b)(2) is intended to "smooth" out fluctuations in emissions from year-to-year. Allowances should be fungible for all years within a 3-year compliance period. LADWP recommends that subparagraph (3) be added to clarify that allowances issued during the compliance period may be used for emissions from that same period for the final triennial compliance surrender. Modify section 95856(b)(2) as follows:

> (2) To fulfill any annual compliance obligation, a compliance instrument must be issued from an allowance budget year within or before the year for which the compliance obligation is calculated, unless:
>
> > (A) The allowance was purchased from the Allowance Price Containment Reserve pursuant to section 95913; or
> >
> > (B) The allowance is used to satisfy an excess emissions obligation.
>
> (3) To fulfill a Triennial Obligation, compliance instruments from any compliance year within a compliance period may be transferred to a covered entity's compliance account. (LADWP4)
>
> **Response:** We agree with this comment and modified the regulation accordingly. Our modification differs from the text suggested by this commenter, but we believe that the modifications achieve the commenter's intent.

E-70. (multiple comments)
Comment: In section 95853(a), the modified text includes language that addresses the circumstances under which an entity would incur a compliance obligation, and references all emissions contained in a verified report. However, since not all emissions that are reported and verified are actually used for purposes of computing an entity's compliance obligation, NCPA recommends that this section be revised to reference only the applicable emissions calculation set forth in section 95852. Modify section 95853(a) as follows:

> (a) A covered entity that exceeds the threshold in section 95812 in any of the three data years preceding the start of a compliance period is a covered entity for the entire compliance period. The covered entity's triennial compliance obligation in this situation is calculated as the total of the ~~verified~~ emissions ~~that received a positive of qualified positive emissions data verification statement, or were assigned emissions pursuant to section 95131 of MRR~~ calculated in accordance with section 95852 for all data years of the compliance period. (NCPA3)

Comment: The wording in sections 95853 and 95855 on the calculation of a covered entity's triennial or annual compliance obligation does not accurately describe the covered emissions for electric sector entities. Not all of the emissions that an electric sector entity must report will form part of its compliance obligation. For example, biofuel emissions must be reported and verified but do not lead to a compliance obligation.

section 95852 sets out the details of the calculation of covered emissions for each covered sector. This section should be referred to whenever an entity's compliance obligation is being calculated. Modify section 95853(a) as follows:

> A covered entity that exceeds the threshold in section 95812 in any of the three data years preceding the start of a compliance period is a covered entity for the entire compliance period. The covered entity's triennial compliance obligation in this situation is calculated as the total of the emissions ~~that received a positive or qualified positive emissions data verification statement, or were assigned emissions pursuant to section 95131 of MRR~~ calculated in accordance with section 95852 from all data years of the compliance period. (SCPPA6)

Comment: Section 95853 should reference section 95852 since not all of the emissions reported may be subject to a compliance obligation. For example, biomass emissions must be reported and verified, but may not lead to a compliance obligation. Modify section 95853(a) as follows:

(a) A covered entity that exceeds the threshold in Section 95812 in any of the three data years preceding the start of a compliance period is a covered entity for the entire compliance period. The covered entity's triennial compliance obligation in this situation is calculated as the total of the emissions calculated in accordance with Section 95852 that received a positive or qualified positive emissions data verification statement, or were assigned emissions pursuant to section 95131 of MRR from all data years of the compliance period. (SEMPRA3)

> **Response:** We agree with this comment and modified this section accordingly. Our modification differs from that suggested by these commenters but achieves the same objective.

E-71. Comment: The calculation of the triennial and annual compliance obligations in sections 95853 and 95855 does not accurately reflect the manner in which the compliance obligations are calculated pursuant to section 95852. The Joint Utilities recommend that these sections be revised to reference section 95852 directly. Modify sections 95853(a) and 95855(a) and (b) as follows:

> (a) A covered entity that exceeds the threshold in section 95812 in any of the three data years preceding the start of a compliance period is a covered entity for the entire compliance period. The covered entity's triennial compliance obligation in this situation is calculated as the total of the emissions calculated in accordance with section 95852 ~~that received a positive or qualified positive emissions data verification statement, or were assigned emissions pursuant to section 95131 of MRR~~ from all data years of the compliance period.
> (a) An entity has an annual compliance obligation for any year when the entity is a covered entity except for the conditions specified in sections 95853(d) and 95856(d)(3); and
> (b) The annual compliance obligation for a covered entity equals 30 percent of emissions ~~reported~~ from the previous data year ~~that received a positive or~~

~~qualified positive emissions data verification statement, or were assigned emissions pursuant to section 95131 of MRR~~ calculated in accordance with section 95852. (JOINTUTILITIES)

Response: We disagree that there is a need for sections 95853(a) and 95855(b) to reference section 95852 directly, but we did modify sections 95853(a) and 95855(b) for greater clarity. We did not modify section 95855(a) based on the comments. It is important to qualify which emissions will be used, to calculate the compliance obligation as received from the MRR.

Quantitative Usage Limit

E-72. (multiple comments)
Comment: PG&E appreciates the modifications ARB made to the Quantitative Usage Limit that clarified that the usage limit is calculated based on a complying entity's compliance obligation for a compliance period rather than an entity's annual compliance obligation. However, because analysts forecast that there will be an insufficient supply of offsets at the outset of the program PG&E requests that the eight percent usage limit apply to a complying entity's total compliance obligation from January 1, 2013 through the current compliance year. This will allow time for the offset market to develop projects while maintaining the current cap on the use of offsets. Modify section 95854(b) as follows:

(b) The total number of compliance instruments identified in section 95854(a) that each covered entity may surrender to fulfill the entity's compliance obligation ~~for a compliance period~~ must conform to the following limit:

O_O/S must be less than or equal to L_O

In which:
O_O = Total number of compliance instruments identified in section 95854(a) submitted since January 1, 2013 to fulfill the entity's total compliance obligation ~~for the compliance period~~ through the current compliance year.
S = Covered entity's total compliance obligation beginning January 1, 2013 through the current compliance year.
L_O = Quantitative usage limit on compliance instruments identified in section 95854(a), set at 0.08. (PGE4)

Comment: SDG&E appreciates the change to the offset limit contained in the 15-day Modifications to the Cap-and-Trade Program that expanded the offset limit to compliance periods. However, there is no reason to limit the carryover to a compliance period. Allowing the limit to apply cumulatively would provide more flexibility without changing the intent of the regulation to limit the use of offsets to eight percent of the compliance obligation. Modify section 95854(b) as follows:

(b) The total number of compliance instruments identified in section 95854(a) that each covered entity may surrender to fulfill the entity's compliance obligation ~~for a compliance period~~ must conform to the following limit:

O_O/S must be less than or equal to L_O In which:
O_O = Total number of compliance instruments identified in section 95854(a) submitted since January 1, 2013 to fulfill the entity's total compliance obligation ~~for the compliance period~~ through the current compliance year.
S = Covered entity's total compliance obligation beginning January 1, 2013 through the current compliance year.
LO = Quantitative usage limit on compliance instruments identified in section 95854(a), set at 0.08. (SEMPRA3)

Comment: A company should be allowed to carry over excess or unused offset capacity into the next compliance period. (CALFP3)

Response: We disagree with these comments. Our policy decision is to limit the offset usage for each entity to eight percent of each compliance period, irrespective of whether an entity used its maximum number of allowable offset credits in a previous compliance period.

Annual Compliance Obligation, Section 95855

E-73. Comment: PG&E sees no reason why entities are not allowed to annually surrender up to 100 percent of their Compliance Obligation. While the Annual Compliance Obligation is set at exactly 30 percent of annual obligation, entities should be allowed to surrender and have retired up to 100 percent of their annual obligation, if they choose to do so. Modify section 95855(b) as follows:

(b) The annual Compliance Obligation for a Covered Entity equals thirty 30 percent of positive or qualified positive GHG emissions reported from the previous data year that received a positive or qualified positive emissions data verification statement, or were assigned emissions pursuant to section 95131 of MRR. Entities have the option to surrender and have retired up to 100% of positive or qualified positive emissions data verification statement, or were assigned emissions pursuant to section 95131 of MRR. (PGE4)

Response: No changes were made to the regulation based on the comments. The 30 percent is the minimum, and entities may opt to put more in their compliance accounts and request those be retired by the Executive Officer.

E-74. (multiple comments)
Comment: Section 95855, which deals with the calculation of the annual compliance obligation should be revised to include a reference to the provisions of section 95856(d)(3) that was added to clarify the fact that there is no annual obligation in the last year of any compliance period. This section should also be revised to include a

reference to the covered emissions calculation set forth in section 95852, for the same reasons set forth above. Modify section 95855 as follows:

> (a) An entity has an annual compliance obligation for any year when the entity is a covered entity except for the conditions specified in sections 95853(d) and 95856(d)(3); and
> (b) The annual compliance obligation for a covered entity equals 30 percent of emissions ~~reported from the previous data year that received a positive or qualified positive emissions data verification statement, or were assigned emissions pursuant to section 95131 of MRR~~ calculated in accordance with section 95852 (NCPA3)

Comment: Section 95855(a) should be revised to include reference to section 95856(d)(3). Section 95855(a) refers to years in which an entity does not have an annual compliance obligation, and section 95856(d)(3) states that there is no annual compliance obligation in 2015, 2018, and 2021 for the preceding years, only a triennial compliance obligation. Modify section 95855 as follows:

> (a) An entity has an annual compliance obligation for any year when the entity is a covered entity except for the conditions specified in sections 95853(d) and 95856(d)(3); and
> (b) The annual compliance obligation for a covered entity equals 30 percent of emissions ~~reported~~ from the previous data year ~~that received a positive or qualified positive emissions data verification statement, or were assigned emissions pursuant to section 95131 of MRR~~calculated in accordance with section 95852. (SCPPA6)

> **Response:** We disagree that these sections need to be revised. We believe the change suggested for section 95855(a) is unnecessary. We believe our modification to section 95855(b) has achieved the commenter's intent.

E-75. Comment: Clarify in section 95855(b) that not all reported emissions carry a compliance obligation, but only those that are identified in section 95852. Modify section 95852(b) as follows:

> (b) The annual compliance obligation for a covered entity equals 30 percent of emissions ~~reported~~ from the previous data year ~~that received a positive or qualified positive emissions data verification statement, or were assigned emissions pursuant to section 95131 of MRR~~ calculated in accordance with section 95852. (LADWP4)

> **Response:** We agree and added clarifying text that only emissions with a compliance obligation are considered in calculating the annual compliance obligation.

E-76. Comment: Annual surrender obligations also greatly reduce the flexibility of a three-year compliance period. CARB staff have asserted that this design element is necessary in the event that certain compliance entities declare bankruptcy during a compliance period. We have never seen a case made that demonstrates that this assertion by staff warrants such a drastic solution that is so potentially harmful to the operation of the market and to other compliance entities—or that other means, such as bonding or credit rating tests cannot be used to satisfy staff's concern. Mitigation of this risk, to the extent it exists, should be targeted at those who actually present a risk. The annual surrender obligation, for all but those with a demonstrated risk of insolvency, should be removed in order to allow the full flexibility provided by a multi-year compliance period. (BP2)

> **Response:** We do not agree that the annual surrender obligation negates the flexibility of the three-year compliance period. We do not expect any prudent covered entity to go more than 70 percent short in its obligations each year, so the provision should have little impact. Many covered entities have indicated that their intent is to match the timing of compliance instrument purchases to their emissions as closely as possible. Finally, we expect that the auction reserve price, which escalates over time, will help prevent market prices from collapsing due to short-run oversupply conditions. This removes a major incentive for covered entities to be short in covering their emissions during the compliance period.

Timely Surrender, Section 95856

E-77. Comment: To maximize the flexibility associated with the three-year compliance period, ARB should allow complying entities to surrender allowances from any year within that compliance period. PG&E believes that additional revisions to section 95856(b)(2), regarding compliance instruments valid for surrender, are required to ensure that the flexibility associated with the three-year compliance period is retained. As ARB has recognized, a three-year compliance period is particularly important to ensure that the Cap and Trade market continues to run smoothly during any condition that may affect the power markets (for example, periods of low California snowpack that result in low hydroelectric energy production). As currently written, section 95856(b)(2) appears to require that each ton of emissions be covered by an allowance from the same or a prior budget year, so that higher emissions during a dry 2013 could not be covered by 2014 vintage allowances even though the surrender demonstration for the remaining 70 percent obligation that was accrued in 2013 is not until 2015. Modify section 95856(b)(2) as follows:

> (2) To fulfill any Compliance Obligation, a Compliance Instrument must be issued from an allowance budget year within or before the ~~year~~ <u>Compliance Period</u> for which the Compliance Obligation is calculated. (PGE4)
>
> **Response:** We modified section 95856(b)(2) to clarify that for an annual compliance obligation, an allowance from that vintage or earlier must be used. We also added clarifying language that for a triennial compliance obligation,

allowances with a vintage for the end of the compliance period or earlier may be used. We do not want to make any modifications that would result in borrowing vintages of allowances for compliance from the next vintage year.

E-78. Comment: PG&E supports the change from dual annual compliance deadlines to a single deadline of November 1st. PG&E supports the revised deadline to allow more time for covered entities to obtain compliance instruments and limit supply shocks to the market. (PGE4)

Response: Thank you for supporting this revision.

E-79. Comment: There is no reference to a specific subarticle in section 95856(b)(1). This is important to know as this section is referenced in the holding limit provisions in section 95920(c)(2). Modify section 95856(b)(1) as follows:

(b) Compliance Instruments Valid for Surrender.

(1) A compliance instrument listed in Subarticle <u>4 section 95820 and section 95821</u> may be used to satisfy a compliance obligation. (LADWP4)

Response: The commenter is incorrect. That section does reference Subarticle 4.

E-80. Comment: The Utilities urge CARB to clarify the treatment of excess compliance instruments in a compliance account that exceed the entity's compliance obligation in section 95856. The Utilities are unclear as to the process where, accidentally or due to circumstances varying from forecasts, a compliance entity transfers more compliance instruments into its Compliance Account than are required to meet a compliance obligation. Section 95831(a)(4)(B) states that once a compliance instrument is transferred into the Compliance Account it may not be removed by the entity, and section 95856(g)(1) states that the Executive Officer shall retire the compliance instruments surrendered once it has determined that the covered entity has met its compliance obligation. The Utilities request the language above to be included in section 95856(g)(1) clarifying that CARB would not retire any compliance instruments in excess of the compliance obligation unless specifically requested by the covered entity. In addition, the Utilities request that either the term "surrender" be defined within the regulation in a manner that is consistent with section 95856(c). Alternatively the term "transfer" could be used in place of "surrender" since the two terms appear to be used interchangeably and "transfer" is a defined term under section 95802(a)(268). Modify section 95856(g)(1) as follows:

(1) Retire the compliance instruments surrendered <u>provided, however, in the event the number of compliance instruments contained in a compliance account at the time of retirement exceeds the compliance obligation, the Executive Officer shall retain the excess instruments in the compliance account unless the entity requests the excess instruments be retired or returned to the entity's holding account</u>; and (MID3)

Response: No changes were made to the regulation based on the comments. The compliance account does not serve as a "savings" account. The proposed changes to could be used to circumvent the holding limit, which is essential for market integrity.

E-81. Comment: We strongly urge ARB to retain the prohibition on borrowing contained in section 95856. Allowing entities to submit future vintage year allowances for compliance at an earlier date encourages entities to delay undertaking the necessary planning and investment decisions to be compliant over the course of the program. Retaining a firm prohibition on borrowing is all the more essential given ARB's proposal to increase the advance auction from two to ten percent. Advance auctioning ten percent of future vintage year allowances will inject liquidity in the market early on at the expense of later budget years, when the cap is much larger. While we see merit in this approach, advance auctioning that amount of future vintage year allowances will become extremely problematic should the firm prohibition on borrowing be relaxed. (KUSTIN16)

Response: Thank you for the support.

E-82. (multiple comments)
Comment: Business fluctuations at the end of a compliance period are anticipated. These fluctuations could adversely impact the smooth operation of the market. CCEEB recommends that vintage allowances (i.e. borrowing from current year) be allowed to be used during the true-up period. This will provide a mechanism for the end of compliance truing-up that will increase market confidence. (CCEEB3)

Comment: The current Regulation only allows emissions banking in the Cap and Trade. CARB should allow borrowing allowances with some limits and standards. The ability to borrow will aid in reducing costs and allow companies to meet obligations without penalty for short periods of time. (CALFP3)

Response: We disagree. Our policy decision is not to allow borrowing during the true-up period.

E-83. (multiple comments)
Comment: Regarding section 95856(d)(1) and (2), the previous rule version had six weeks after the end of each year or compliance period to surrender compliance instruments. The proposed changes now give five or seven months, depending on when the facility submits its greenhouse emission reports. We have previously commented that a three-year compliance period makes it more difficult to find and enforce against situations where not enough emissions were reported and/or not enough compliance instruments were surrendered. Extending the deadline for surrendering compliance instruments for this long is not necessary. RECLAIM has a 60 day year-end compliance reconciliation period which works well. There will not be adequate incentive for a facility to retire compliance instruments in a timely fashion if

five or seven months are allowed. In addition, this length of time may encourage market speculation as a means by which to "time" coming into compliance. Compliance instruments can be surrendered before verification occurs, and then adjustments can be made, if verification results in a change to the reported emissions. (SCAQMD4)

Comment: In the 15-day changes, ARB proposes to extend the deadline to surrender compliance instruments from six weeks to five or seven months. We do not understand why such a long period of time is needed, and believe it will complicate enforcement later. We recommend that ARB retain the original language. (CAPCOA2)

> **Response:** We appreciate the commenters' concern with changing the deadline for the surrender of annual compliance obligations. However, we believe that this deadline strikes the appropriate balance between enforcement concerns and allowing entities sufficient time to meet all requirements and acquiring compliance instruments before meeting their annual compliance obligations.

E-84. Comment: In the previous version of the regulation, allowances issued in the year during which the compliance obligation is calculated were eligible to be used for compliance for emissions that accrued in the previous year. This provision was useful in that at the end of a compliance interval, it provided entities with the ability to use a small portion of allowances issued for the first year of the subsequent compliance period to cover emissions accrued in the previous year. We understand that the language of section 95856 was changed to clarify that all allowance vintages within a compliance period may be used for emissions accrued in that compliance period. However, this change also eliminated the end-of-compliance interval flexibility that was present in the previous version. Modify section 95856(b)(2) as follows:

> (2) To fulfill any compliance obligation, a compliance instrument must be issued from an allowance budget year within or before the year ~~for~~ during which the compliance obligation is calculated, unless:
>
> > (A) The allowance is from an annual budget year within the same compliance interval as the year for which the compliance obligation is calculated; or
> > (~~A~~B) The allowance was purchased from the Allowance Price Containment Reserve pursuant to section 95913; or
> > (~~B~~C) The allowance is used to satisfy an excess emissions obligation. (WPTF2)

> **Response:** We disagree. In our view, this would effectively allow borrowing to meet an annual compliance obligation. The three-year compliance periods are designed to allow flexibility, but we do not wish to extend that flexibility to annual compliance obligations. Given that annual compliance obligations are less than a third of an entity's emissions with a compliance obligation, it seems difficult to envision realistic scenarios when this constraint could pose undue financial hardship on complying entities.

E-85. Comment: Section 95856 delineates the protocols for timely surrender of compliance instruments for a compliance period. To fulfill the concept of having multiple year compliance periods, as well as to provide additional flexibility in the transition between compliance periods in certain circumstances, SMUD recommends specific changes to section 95856(b)(2). First, compliance instruments for any year during a compliance period should be eligible for surrender for any obligation in that compliance period. Otherwise, the Cap and Trade program inappropriately sets up a series of unexpected annual tranches within the expected compliance periods. Compliance periods are an appreciated mechanism to provide market flexibility to smooth out potential year by year conditions that can lead to a lack of balances between the compliance instruments needed in a year and the annual supply of those instruments. The annual compliance obligation is only 30 percent of verified emissions for the year, intended to ensure ongoing attention to compliance, not to establish an inflexible annual compliance structure. The annual obligation is well below the expected distribution of annual allowances, so allowing vintages within the compliance period to be used for compliance cannot disrupt the expected 'balance' between the need for and supply of compliance instruments on an annual basis. ARB can allow compliance flexibility among the years within a compliance period, establishing true compliance periods in the Cap and Trade program. Even then, however, and particularly with the initial two-year compliance period that results from the delay in the Cap and Trade, removing 2012 as part of the first compliance period, there may be adverse circumstances that invoke a need for additional flexibility as the market moves from one compliance period to another. SMUD does not support, in general, allowing borrowing between compliance periods, as we believe this may result in a lack of balance between the amount of compliance instruments available in early years and the amount needed for compliance, in effect causing delays in investments that may be needed to achieve compliance by 2020. However, adverse circumstances could cause allowance prices to spike in the last year of a compliance period, and then fall as a new compliance period affords additional flexibility. SMUD believes that a mechanism to smooth the change between the first and second compliance periods would be particularly beneficial to the market. Modify section 95856(b)(2) as follows:

> (2) To fulfill any compliance obligation, a compliance instrument must be issued from an allowance budget year within or before the ~~year~~ compliance period for which the compliance obligation is calculated, unless:
>
> (A) The allowance was purchased from the Allowance Price Containment Reserve pursuant to section 95913; ~~or~~
>
> (B) The allowance is used to satisfy an excess emissions obligation~~.~~; or
>
> (C) The compliance instrument is from vintage 2015 and is used for compliance for the first compliance period. (SMUD3)

Response: As explained in response to the previous comment, we disagree with the portion of this comment suggesting "year" be replaced with "compliance period." We also disagree with the second part of the comment suggesting creation of section 95856(b)(2)(C). We do not believe it is necessary or advisable to provide this extra flexibility for the first compliance period because it is just two years in duration.

E-86. Comment: SMUD appreciates the addition in section 95856(d)(3), which is intended to indicate that there is no annual compliance obligation in the same year as a triennial compliance obligation. SMUD recommends a slight language change for clarity. Modify section 95856(d)(3) as follows:

> (3) In years 2015, 2018, and 2021 there is no annual compliance obligation for the preceding year~~compliance period~~, only a triennial compliance obligation for the preceding compliance period. (SMUD3)

Response: We believe our modifications included with the first 15-day changes to the regulation are adequately clear.

E-87. Comment: Section 95856(b) governs the compliance instruments valid for surrender in the Cap and Trade program. SCE recommends that ARB clarify the language to indicate that a compliance entity wishing to retire allowances may use any compliance instruments available at that time. As currently written, it is unclear whether compliance instruments from the last year of a compliance period may be used to fulfill a compliance obligation from the first year of that period. For example, there is confusion as to whether a compliance instrument issued in 2014 could be retired at the end of the compliance period (e.g., 2015) to satisfy a 2013 emissions obligation. Modify section 95856(b)(2) as follows:

> (2) To fulfill any compliance obligation, a compliance instrument must be issued from ~~an~~ any allowance budget year up to and including the year during which the compliance obligation is calculated and surrendered, unless; (SCE3)

Response: We do not believe there is confusion. This comment suggests inserts “up to and including” where the regulation has “within or before” (which this comment omits). We believe that both phrases are equally clear and have the same meaning.

E-88. Comment: Section 95856(b) should be revised to eliminate undue restrictions on the compliance instruments that may be used to meet a surrender obligation. Section 95856(b)(2) appears to allow entities to use for compliance only allowances issued in or before the year in which the relevant emissions were emitted. This is too restrictive and diminishes the value of having triennial rather than annual compliance periods. The flexibility associated with a three year compliance period should be retained. Additionally, entities should be permitted to use compliance instruments issued during the year in which the compliance obligation is calculated, i.e., the year immediately following the end of the compliance period. That would mitigate the potential for sellers of allowances to demand an extortionate price for vintage allowances when an entity gets past the end of a compliance period and finds that he does not have enough compliance instruments to cover his compliance obligation. To meet a compliance obligation, entities should be allowed to use allowances that were issued during the compliance period in which the emissions occurred, during any previous years, and during the year in which the surrender is due. For example, for the annual compliance obligation due in November 2014 for 30 percent of 2013 emissions, an entity should be able to use allowances issued in 2013 or 2014. For the triennial compliance obligation due in November 2018 for emissions in 2015, 2016, and 2017, an entity should be able to use allowances issued in 2013, 2014, 2015, 2016, 2017, and 2018. Modify section 95856(b)(2) as follows:

> (2) To fulfill any compliance obligation, a compliance instrument must be issued from any allowance budget year up to and including ~~within or before~~ the year in~~for~~ which the compliance obligation is calculated and surrendered, unless: ... (SCPPA6)
>
> **Response:** We disagree. As noted in the response to the previous comment, we do not see a difference between "up to and including" and "within or before." The recommendation to allow "and surrendered" would effectively allow borrowing from the current compliance period to meet the obligation from the past compliance period. Our policy decision is not to allow such borrowing.

E-89. Comment: The treatment and use of vintage allowances, combined with the aforementioned market rules greatly increase concerns around liquidity and market confidence—especially at the end of a compliance period. As written, a significant percentage of allowances will be unavailable for trading in closing months of a compliance period due to the compliance accounts, holding limits and annual surrender. In the months preceding final true-up, compliance entities will be aware of the fact that they must hold enough of the proper vintage allowances in order to meet their final true up (for this first compliance period, this will mean vintages 2013 and 2014). This will cause many compliance entities to conservatively bank the proper vintages, leading to little allowance availability, greatly reduced liquidity and a potential crisis in market confidence during the 2015 true-up period. These problems could be exacerbated by parties without a compliance obligation that bank and carry over allowances. During this time, compliance entities will have in hand 2015 vintage allowances, allocated early in 2015. Unfortunately, the Regulation as written prohibits use of these allowances for use in 2015 true-up for the 2012-2014 compliance period. In order to increase allowance availability, liquidity and market confidence, the Regulation should prohibit non-compliance entities from carrying allowances across compliance periods and should allow use of vintages that correspond to the year in which the surrender must be made—as well as earlier vintages. A simple change here could greatly increase flexibility, allowance availability and market confidence. Section 95856(b)(2) should read:

> To fulfill any compliance obligation, a compliance instrument must be issued from an allowance budget year within or before the year during which the compliance obligation is to be surrendered ~~calculated~~, unless: (BP2)

Response: As noted in the response to the previous comment, allowing allowances of the vintage year in which allowances are to be surrendered is effectively to allow borrowing. Our policy decision is not to allow such borrowing.

Untimely Surrender, Section 95857

E-90. Comment: The excess emissions obligation is four times the shortfall and must be satisfied by purchasing allowances from the auction or allowance reserve sale following the due date of the triennial compliance obligation. To protect against the inappropriate penalizing of covered entities meeting their obligations in a timely manner, ARB should not remove all of the allowances needed to satisfy the excess emissions obligation from the auction or price containment reserve. Instead, ARB should require the entity subject to the shortfall to obtain the allowances that it is short for meeting its compliance obligation (i.e. 1/4 of the excess emissions obligation), thereby maintaining the integrity of the "cap." On the other hand, the same entity should be required to meet the rest of the penalty (i.e. 3/4 of its excess emissions obligation) via a financial payment, based on the auction clearing price, yet disconnected from direct participation in an auction per se. Modify section 95857(b) as follows:

(b) Calculation of the Untimely Surrender Obligation.

(1) The quantity of excess emissions is the difference between the compliance obligation calculated pursuant to this section and any compliance instruments timely surrendered by the entity;

(2) The <u>value of an</u> entity's compliance obligation for untimely surrender is calculated as four times the entity's excess emissions;

(3) An entity's compliance obligation for untimely surrender may only be fulfilled with CA GHG allowances<u>,</u> or allowances issued by a GHG ETS pursuant to subarticle 12, <u>or through the financial penalty specified in subsection 95857(b)(5) below</u>; and

(4) The untimely surrender obligation is due within five days of the first auction or reserve sale conducted by ARB following the applicable surrender date, whichever is the latter, and for which the registration deadline has not passed when the untimely surrender obligation is assessed.

<u>(5) For each entity with an untimely surrender obligation, the entity shall enter the auction and procure 1/4 of the allowances needed to satisfy the untimely surrender obligation. In addition, 3/4 of the untimely surrender obligation will be paid to CARB in the form of a financial penalty equal to the auction clearing price and will be allocated to the Air Pollution Control Fund.</u> (IEPA2)

Response: This comment falls outside the scope of the first 15-day changes to the regulation, which did not consider whether an untimely surrender obligation should be met through extra allowances or a financial penalty. Moreover, this comment is based at least in part on a couple of faulty premises. First, the comment assumes that allowances will be available only via auction or the price containment reserve. We expect there will also be allowances available on the secondary market. Second, the comment cites the need for certain vintage allowances to be available in the price containment reserve. However, the regulation provides that allowances of any vintage from the price containment reserve may meet a compliance obligation. No further response is required.

E-91. Comment: The relationship between sections 95857, 95858, and the enforcement provisions of the Mandatory Reporting Regulation is not clear. It appears that an entity could be penalized twice for the same infraction. We recommend that ARB clarify the linkages between the Regulations, and make it clear that an entity is penalized only once for a legitimate violation. In section 95857(b)(1) the quantity of excess emissions is calculated and in (4) it states when the untimely surrender obligation is due. However, it appears this section is missing a notification step between the calculation and the time of the surrender. If the notification step needs to be added or is in another provision, we recommend that ARB clarify this in this subsection. In section 95857, the entity's compliance obligation for untimely surrender is calculated as four times the entity's excess emissions, and the consequence of not meeting that obligation is set out in new subsection (c). It includes in the calculation a reference to the number of violations under section 96014. In section 96014(b) it states that a separate violation can be for each day or portion thereof after the end of the Untimely Surrender Period that each required compliance instrument has not been surrendered. The impact of these new revisions to both sections appears to be excessive. (CACC2)

Response: We agree with the need for clarification, and we replaced the text previously in section 96014(b) with this new text: "A separate violation accrues every 45 days after the end of the Untimely Surrender Period for each required compliance instrument that has not been surrendered." We evaluated the language in this Regulation and the MRR and do not believe there is a new "layering" of penalties between the two regulations.

E-92. Comment: While the untimely surrender obligation will be calculated only once per annual and triennial obligation, violations are still accrued daily. In ARB's earlier discussion Draft, released July 7, 2011, this section had been edited to calculate violations per 45 day period. Those edits have been removed from the July 2011 proposed Modifications. SCE supports the discussion Draft language and recommends that ARB revert to the 45-day period calculation. (SCE3)

Response: We agree, and in the second 15-day changes to the regulation included new text in section 96014(b) implementing the 45-day calculation.

E-93. (multiple comments)
Comment: We recommend a shorter time period for the surrender of additional compliance instruments that are owed as a penalty for untimely surrender. Currently, with the extension in the original deadline to surrender, the penalty is not due until over a year after the compliance period ends. (CAPCOA2)

Comment: Making up excess emissions at a 4:1 ratio (section 95857) is a good deterrent. However, the rules are structured so that this is not due until five days after the next auction or reserve sale conducted by CARB. This presumes that these will be the only mechanisms for market participants to obtain compliance instruments and may introduce unnecessary delays in obtaining the make-up compliance instruments. We suggest that the excess emissions be due in 30 days, and then appropriate additional enforcement action can be taken for delays. (SCAQMD4)

Comment: Regarding section 95857(b)(4), an untimely surrender obligation is due within five days of the first auction or reserve sale conducted by ARB following the applicable surrender date, whichever is later. We recommend whichever is earlier, instead of later. (SCAQMD4)

> **Response:** We disagree, recognizing that the covered entities may need additional time to acquire allowances of a certain vintage, particularly if there is limited supply of such allowances in the secondary market.

E-94. Comment: NCPA submits that five days is still an insufficient amount of time for entities to complete the necessary administrative functions that will accompany the purchase and surrender of allowances, and that section 95857(b)(4) allow two weeks (or 10 business days) to complete the transaction. (NCPA3)

> **Response:** We disagree. We believe that five days is sufficient.

E-95. Comment: MSCG has argued that assessing a requirement to surrender incremental allowances in cases of untimely surrender is not good policy design, as it raises the compliance costs for non-offenders. ARB's proposal to transfer such incremental allowances to the Auction Holding Account instead of the Allowance Price Containment Account Reserve (section 95857(d)(1)), as previously proposed, effectively remedies this defect, and we commend the ARB for this change. (MSCG3)

> **Response:** Thank you for supporting this modification.

E-96. Comment: The provision in section 95857(c) appears to mean that if an entity with an untimely surrender obligation in fact satisfies that obligation, then it will not be subject to any additional civil or criminal penalties for the untimely submittal of its original compliance obligation. This provision may provide insufficient deterrence and may lead to a facility deliberately failing to comply in a timely manner while compliance instrument prices may be relatively high and postponing its obligations until later, when prices may be lower. In RECLAIM, we have seen prices drop dramatically after the conclusion of the reconciliation period. The price differential may be enough to make up for the obligation being multiplied by four times. We recommend retaining the ability to impose civil or criminal penalties for untimely surrender. (SCAQMD4)

Response: We believe that program design features address this issue. We have an auction reserve price that begins at $10 in the first year of the auction and escalates through 2020. We believe that this measure will deal with potential oversupply conditions and keep the market price above $10. Therefore, we are confident that any excess emissions obligation would result in at least a $30 per ton cost increase for the violator.

E-97. Comment: Staff supports the deletion of section 95857(c)(6) that would have precluded enforcement action if the untimely surrender obligation was not met in 30 days. CARB should retain discretion to handle such matters on a case-by-case basis. (SCAQMD4)

Response: Thank you for supporting this modification.

E-98. Comment: Sections 95831 and 95857 seem to conflict. The language in section 95831(b)(4) "allowances submitted to fulfill an entity's excess emissions obligation" refers to the three fourths portion of the untimely surrender obligation to be transferred to the Auction Holding Account pursuant to section 95857(d). Section 95857(d) has the same amount being deposited in a different place—the Auction Holding Account. This conflict can be resolved either of the following two ways depending on which account these allowances are directed to. The first would result in placing the three fourths portion in the Allowance Price Containment Reserve Account and the second would result in placing it in the Auction Holding Account. Modify section 95831(b)(4)(C) and 95857(d)(1)(A) as follows:

(C) Into which three fourths of the serial numbers of allowances submitted to fulfill an entity's untimely surrender ~~excess emissions~~ obligation pursuant to section 95857 (a) through (c) ~~(d~~) will be transferred; and

(A) Three fourths to the Allowance Price Containment Reserve ~~Auction Holding~~ Account; and

Or modify section 95831(b)(4)(C) and 95831(b)(2) as follows:

~~(C) Into which the serial numbers of allowances submitted to fulfill an entity's excess emissions obligation pursuant to section 95857(d) will be transferred; and~~

(D) Three fourths of allowances used to fulfill facilities' untimely surrender obligation pursuant to sections 95857(a) through (c), as described section 95857(d). (SCAQMD4)

Response: We agree and modified the regulation accordingly. We deleted the text in section 95831(b)(4)(C) and added a new section 95831(b)(2)(D).

E-99. Comment: Section 95831(b)(4)(C) provides for allowances “submitted to fulfill an entity’s excess emissions obligation pursuant to section 95857(d)” to be placed into the Allowance Price Containment Reserve Account. However, as a very welcome change from the Discussion Draft, section 95857(d)(1)(A) now provides for three fourths of those allowances to be transferred to the Auction Holding Account. Accordingly, Section 95831(b) should be revised as follows to reflect this change in the disposition of penalty allowances. Modify section 95831(b) as follows:

> (b) Accounts under the Control of the Executive Officer. The accounts administrator will create and maintain the following accounts under the control of the Executive Officer:
>
> > (2) A holding account to be known as the Auction Holding Account into which allowances are transferred to be sold at auction from: ...
> >
> > > (D) The Executive Officer pursuant to section 95857(d)(1)(A), being three fourths of the allowances submitted to fulfill an entity's excess emissions obligation.
> >
> > (4) A holding account to be known as the Allowance Price Containment Reserve Account:
> >
> > > (A) Into which the serial numbers of allowances allocated by ARB for auction that remain unsold at auction will be transferred;
> > > (B) Into which the serial numbers of allowances directly allocated to the Allowance Price Containment Reserve pursuant to section 95870(a) will be transferred; and
> > > ~~(C) Into which the serial numbers of allowances submitted to fulfill an entity's excess emissions obligation pursuant to section 95857(d) will be transferred; and~~
> > > (C~~D~~) From which the Executive Officer will authorize the withdrawal of allowances for sale to covered entities pursuant to section 95913. (SCPPA6)

> **Response:** We agree with this comment. We added text in a new section 95857(b)(2)(D) similar to that suggested in this comment. We deleted the text previously in section 95857(b)(4)(C).

E-100. Comment: SMUD points out that section 95831(b)(2)(B) should refer to 95921(f)(3) rather than 95921(e)(3). Modify section 95831(b)(2)(B) as follows:

> (B) The holding accounts of those entities for which allowances are being auctioned on consignment pursuant to section 95921(f~~e~~)(3). (SMUD3)

> **Response:** Section 95831(b)(2)(B) does refer to section 95921(f)(3).

E-101. Comment: HDPP supports the proposed modification to delay the commencement of the initial compliance obligation from 2012 to 2013. A delay of the compliance obligation to 2013 is needed to ensure that the Cap and Trade Rule is implemented properly without glitches that could adversely affect program participants, power markets, and the economy. It is also required to meet AB 32's mandate that any ARB regulations be designed "in a manner that minimizes costs and maximizes benefits for California's economy, improves and modernizes California's energy infrastructure and maintains electric system reliability, maximizes additional environmental and economic co-benefits for California, and complements the State's efforts to improve air quality" (Cal. Health & Safety Code, section 38501(h); see also sections 38560, 38661(a), 38562(a), 38562(b)(1)). (HDPP4)

Response: Thank you for supporting this modification.

E-102. Comment: SCE requests additional clarification on section 95857(b)(4), which addresses the due date of the untimely surrender obligation. In the current language, this obligation is due five days after "the first auction or reserve sale conducted by ARB following the applicable surrender date, whichever is the latter, and for which the registration deadline has not passed when the untimely surrender obligation is assessed." This language is confusing and should be clarified. SCE reads "the applicable surrender date" to be the annual or triennial compliance due date. As this deadline is now November 1 for all entities and all compliance obligations, it seems unnecessary to have this complex calculation. For instance, the provision could retain the exact same deadline outcome if it instead stated that the obligation is due "the 17th business day of the first month of the quarter" (or five days after the auction). SCE requests that ARB clarify these provisions to provide certainty to regulated parties. (SCE3)

Response: We acknowledge the commenter's concern for clarity. Since there is some possibility that the schedule of auctions could change to become more or less frequent, we left this provision in the regulation more general, so that it might more readily adapt to any future changes in the auction schedule. Our current text also allows complying entities more flexibility than the alternative suggested in this comment. We will also notify parties of specific dates based on the criteria in the Regulation if they are subject to these provisions.

E-103. Comment: SMUD appreciates the changes in the untimely surrender requirements included in the 15-day language. However, some additional changes would add clarity to how the untimely surrender requirement works, provide for a clear opportunity to procure and surrender the excess emissions requirement, and make clear exactly when a regulated party may have basic surrender violations subject to Health and Safety code penalties. Although not strictly a "penalty" provision, the operation of the untimely surrender obligations has significant interaction with the violation and penalty structure in the Cap and Trade program. First, SMUD notes that the term "within" in the regulation could be interpreted to be either before or after the events mentioned, and believes that the intent is "after." Second, SMUD suggests that a regulated party subject to untimely surrender be afforded the opportunity to procure allowances in both a regular auction or a reserve sale, not one or the other. In most circumstances, the first regular auction will present an opportunity to procure allowances at market prices, leaving it unnecessary to consider the higher priced allowances in the reserve sale. However, in the circumstance that allowances are not available in the auction or are not well-priced, the reserve sale would provide a final opportunity for compliance prior to being subject to penalties. Accessing both events may be intended by the "whichever is the latter" language, but SMUD believes the intent could be clarified. Finally, SMUD believes that ARB should clarify further what happens when an entity fails to surrender the untimely obligation as required, so that a double violation is not implied. Modify sections 95857(b)(4) and 95857(c)(2) as follows:

> (4) The untimely surrender obligation is due ~~within~~ five business days after the occurrence of the first auction ~~or~~and first reserve sale conducted by ARB following the applicable surrender date~~, whichever is the latter~~, and for which the registration deadline has not passed when the untimely surrender obligation is assessed.
> (2) If a portion of the untimely surrender obligation is not surrendered as required, the entity will have a new untimely surrender obligation (replacing the previous surrender obligation calculated under section 95857(b)(2)) equal to the amount of the previous untimely surrender obligation which was not satisfied by the deadline stated in section 95857(b)(4) upon which the number of violations will be calculated pursuant to section 96014. The new untimely surrender obligation is due immediately; and (SMUD3)
>
> **Response:** Thank you for supporting our previous modifications. We believe the test accurately and clearly reflects our policy. We also disagree with the need to change "five days" to "five business days."

E-104. (multiple comments)
Comment: In section 95857(c), the modified text adds new language regarding recalculation of the obligation for failure to submit the full amount. NCPA proposes revisions consistent with the Joint Utilities that clarifies the fact that this recalculation is a new obligation, and not in addition to the entity's original obligation. Modify section 95857(c) as follows:

> (c) If an entity with an untimely surrender obligation fails to satisfy the obligation pursuant to section 95857(b)(4), then:
>> (1) ARB will determine the number of violations pursuant to section 96014;
>> (2) If a portion of the untimely surrender obligation is not surrendered as required, the entity will have a new untimely surrender obligation (replacing the previous surrender obligation calculated under section 95857(b)(2)) equal to the amount of the previous untimely surrender obligation which was not satisfied by the deadline stated in section 95857(b)(4) upon which the number of violations will be calculated pursuant to section 96014. The new untimely surrender obligation is due immediately. (NCPA3)

Comment: Section 95857(c)(2) should be clarified to make it clear that the "new untimely surrender obligation" replaces and is not additional to the previous untimely surrender obligation. In addition, the purpose of section 95857(c)(3) is unclear. It states that the calculation of the untimely surrender obligation shall only apply once, but the preceding section (2) specifies a second, “new” surrender obligation. If the purpose of section (3) is to clarify that the “new” surrender obligation replaces the previous one, we suggest the following language. Modify section 95857(c) as follows:

> (c) If an entity with an untimely surrender obligation fails to satisfy the obligation pursuant to section 95857(b)(4), then:
>
> > (1) ARB will determine the number of violations pursuant to section 96014;
> >
> > (2) If a portion of the untimely surrender obligation is not surrendered as required, the entity will have a new untimely surrender obligation <u>(replacing the previous surrender obligation calculated under section 95857(b)(2))</u> equal to the amount of the previous untimely surrender obligation which was not satisfied by the deadline stated in section 95857(b)(4) upon which the number of violations will be calculated pursuant to section 96014. The new untimely surrender obligation is due immediately; and
> >
> > (3) The calculation of the untimely surrender obligation shall only apply once for each untimely surrender of compliance instruments per annual or triennial compliance obligation. (SCPPA6)

> **Response:** The modification suggested in these comments is the same as one of the suggestions in the previous comment. No further response is required.

E-105. (multiple comments)
Comment: We appreciate the changes staff made in section 95857(d)(1)(a) where three-fourths of allowances for an untimely surrender will be moved to the Auction Holding Account instead of the Allowance Price Containment Reserve. The change will ensure that compliant facilities will not be penalized by higher allowance prices due to allowances being removed from the auction and placed in the higher priced Reserve. (CCGG2)

Comment: SMUD appreciates the change in the 15-day language that allowances associated with the excess emissions obligation under the untimely surrender provisions (section 95857(d)) are now transferred to the Auction Holding Account rather than the Containment Reserve Account. (SMUD3)

Comment: SCE strongly supports the change in section 95857(d)(1)(a), which places excess emissions allowances paid as penalties back into the market through the next quarterly auction, rather than in the Allowance Reserve. Placing the penalty allowances into the Allowance Reserve would impose an additional marginal cost increase on the rest of the regulated community that had nothing to do with the original penalty. (SCE3)

> **Response:** Thank you for supporting this change.

E-106. Comment: Section 95857(c)(2) appears to be duplicative. If an entity fails to timely surrender allowances, then the penalties should be imposed on the amount that was not surrendered. This provision also refers to section 96104 which would apply a daily violation for each compliance instrument not surrendered by the end of the Untimely Surrender Period. Modify section 95857(c)(2) as follows:

> ~~(2) If a portion of the untimely surrender obligation is not surrendered as required, the entity will have a new untimely surrender obligation equal to the amount of the previous untimely surrender obligation which was not satisfied by the deadline stated in section 95857(b)(4) upon which the number of violations will be calculated pursuant to section 96014. The new untimely surrender obligation is due immediately; and~~ (LADWP4)
>
> **Response:** We disagree with the specific suggestion to delete the text in section 95857(c)(2), and do not believe it is duplicative. However, we believe we addressed the commenter's concern by changing the text in section 96104(b) from a new violation each day to a new violation every 45 days.

Under-Reporting, Section 95858

E-107. (multiple comments)
Comment: ARB has proposed to add a new section 95858 regarding compliance obligations for under-reported emissions in a previous compliance year. WSPA supports ARB's approach of requiring the surrender of additional compliance instruments only if the under-reporting exceeds five percent of the originally reported emissions. WSPA also believes that a facility's potential obligation to surrender compliance instruments for a previous compliance period should be subject to a reasonable time limit. (WSPA3)

Comment: We agree with the concept that allowance shortfalls resulting from under-reporting for previous compliance periods should be corrected by the surrender of additional allowances, to the extent that the shortfall exceeds five percent of the original compliance obligation. We request clarification to specify that penalties would not be imposed under the Cap and Trade rule if the additional allowances are surrendered in accordance with this section, and to add a five year limitations period so that covered entities are not liable for potential shortfalls in perpetuity. Modify section 95858 as follows:

> If, after an entity has surrendered its compliance instruments for a compliance period pursuant to section 95856, the Executive Officer determines, through an audit or other information, that the entity under-reported its emissions under MRR for any emissions sources that form the basis for the <u>entity's</u> compliance obligation, then the following shall apply:
>
> > (a) If <u>EMd - CO ≤ 0.05CO, then the entity is not required to take any further action.</u> ~~the difference between the emissions used to calculate the compliance obligation and subsequently used to calculate the number of compliance instruments surrendered pursuant to section 95856 and the emissions determined by the Executive Officer to be under-reported for the sum of those emissions is less than five percent, then the entity is not required to take any further action.~~

(b) If ~~the difference between the emissions used to calculate the compliance obligation and subsequently calculate the number of compliance instruments surrendered pursuant to section 95856 and the emissions determined by~~EMd CO > 0.05CO, then upon the receipt of notice from the Executive Officer ~~to be under-reported for the sum of those emissions is more than five percent, then~~ the entity must surrender additional compliance instruments for the previous compliance period in the following amount

Cla= Emd – CO – (CO * 0.05)

~~Where:~~

(c) Not later than six months from the date the entity receives notification from the Executive Officer that the entity must surrender additional compliance instruments due to under-reported emissions for a previous compliance period, the entity shall surrender the quantity of compliance instruments determined in accordance with subsection (b). The provisions of section 95857 shall not apply and the entity shall not be subject to penalties under this Article if the additional compliance instruments are surrendered during the six month period. The entity may use compliance instruments from subsequent compliance periods to meet this surrender obligation.

(d) For the purposes of this section: 'Cla' is the number of additional compliance instruments that must be surrendered to ARB ~~to cover under-reported emissions~~in accordance with this section; 'CO' is the ~~emissions number used to determine the~~quantity of compliance ~~obligation~~instruments surrendered pursuant to section 95856 ~~for any~~to meet the entity's compliance obligation for the previous compliance period; and 'EMd' is the ~~number of the~~entity's corrected total emissions for the previous compliance period, determined by the Executive Officer ~~for the sum of the emissions sources subject to a compliance obligation;~~.

~~(c) The entity will have six months from the time of notification by the Executive Officer to surrender additional compliance instruments for under reporting emissions under MRR as determined pursuant to this section. The provisions of section 95857 shall not apply during these six months. The entity may use compliance instruments from subsequent compliance periods to meet these requirements. The entity may only use CA GHG allowances or allowances issued by a GHG ETS approved pursuant to subarticle 12 to meet the requirements of this section.~~

(e) Any determination that an entity under-reported its emissions for a previous compliance period shall be made by the Executive Officer no later than five years from the deadline for submission to the Executive Officer of the verified emissions data report for that compliance year. (PGE4, WSPA3, CCEEB3)

Response: We agree at least in part with this comment. We added the term "entity's" in the first paragraph and we added the new text suggested in this comment for a new section 95858(e), except that our modification provided for a period of eight year instead of five years. We did not make the other modifications suggested in this comment as they did not seem necessary to clarify the intent.

E-108. Comment: New section 95858, "Compliance Obligation for Under-Reporting in a Previous Compliance Period," was added to address cases when the Executive Officer finds there has been under-reporting by an entity after it has submitted compliance instruments to meet its compliance obligation. CARB states that these provisions are necessary so entities with a compliance obligation know what action the Executive Officer will take in the event they are found to have under-reported their emissions. However, the language included in section 95856 states that the Executive Officer can determine through an audit or other information that an entity has under-reported its emissions. This lacks sufficient definition to ensure a regulated entity understands what information the Executive Officer will be basing their determination on to be able to conduct effective self-audits for the purpose of compliance demonstration. (VALERO2)

Response: We disagree. We believe the regulation provides sufficient definition. The MRR also contains the specific monitoring, reporting, and record retention requirements that could be the basis for a covered entity to develop a self-audit plan.

E-109. Comment: In the newly proposed section 95858, if a facility that has already surrendered its compliance obligation (in a previous compliance period) is discovered to have under-reported its emissions by less than five percent of its total emissions, there is no obligation to surrender additional compliance instruments to make up for the emissions difference. However, for the State's largest emitters between 3 and 4 million tons per year (three facilities), or between 4 and 5 million tons of emissions per year (three facilities), five percent underreporting may amount to 150,000 to 250,000 tons of CO_2e emissions. By comparison, 250,000 tons is more than the total emissions of about half of the proposed regulated stationary sources covered by the Cap and Trade program. A facility with 1 million tons of emissions (about 30 in all within California) would only have to under-report by roughly 2.5 percent to exceed the 25,000 metric ton threshold by which all other facilities become subject to the regulation. Since emissions verification is based on a targeted risk-based procedure and does not require each and every source of emissions at a covered facility to be validated, the derivation of a percentage value for the amount of emissions that is underreported at a facility cannot be deemed wholly accurate with regards to the facility emissions report as a whole. It strikes EDF as improper to assign a one-size-fits-all value to what constitutes acceptable under-reporting. EDF recommends CARB reexamine whether the five percent threshold in section 95858 is appropriate for California's largest facilities (such as those that emit greater than one million tons annually). The amount deemed to be underreported is likely to exceed 25,000 tons of CO_2e per year if the underreported percentage is only 2.5 percent, half of the proposed limit. Accordingly, EDF recommends CARB consider modifying section 95858 to apply the five percent limit to facilities with less than one million tons of emissions a year on average, and a

2.5 percent limit to facilities with greater than one million tons of annual emissions. (EDF4)

> **Response:** Five percent is the threshold for material misstatement in the MRR. Section 95858 uses that same threshold, as it would not make sense to have a smaller threshold in section 95858 than in the MRR.

E-110. Comment: We do not support having no compliance obligation for up to five percent under-reporting. If this is not changed we suggest the following. Because there is no violation unless the five percent threshold is exceeded, program participants will argue that the number of violations is limited to the number of compliance instruments which exceed five percent. The rule should make it clear that, once the five percent margin is exceeded, every compliance instrument, even those within the five percent margin, will be counted as the basis for a separate violation. (SCAQMD4)

> **Response:** We disagree. We believe the regulation was clear that the number of additional compliance instruments to be surrendered is only for those emissions exceeding the five percent margin. The provisions for under-reporting do not undermine the requirements for true, accurate, and complete reporting under the MRR.

E-111. Comment: In section 95858(a) we are concerned that the provision of a five percent "free" under-reporting will introduce a potentially significant failure of the market to reach its required goals. The Mandatory Reporting Rules also allow up to three percent of emissions (up to 20,000 MT CO_2e) to be considered "de minimus" with less rigorous reporting requirements, which also compounds this potential problem. (SCAQMD4)

> **Response:** We believe the concern for a “significant failure” is overstated. The five percent for material misstatement is a widely used threshold in other regulatory and voluntary GHG reporting programs. The de minimus threshold strives to strike a balance between accurate reporting and cost-effective reporting for smaller sources within a covered entity.

E-112. Comment: The formula in section 95858(b) does not represent an adequate deterrent against under-reporting. Under-reported emissions should also be made up at a 4:1 ratio, if a shortfall occurred, regardless of whether it was from under-reporting or not surrendering enough compliance instruments to cover reported emissions. Six months is also too long to make up the shortfall. This should be shortened or let to CARB discretion considering the amount of emissions due. (SCAQMD4)

> **Response:** We disagree. The penalty provisions under the MRR provide a very strong deterrent for under-reporting.

E-113. Comment: In section 95858(c) it is unclear why "subsequent" year compliance instruments are usable for correcting under-reporting, when they are not usable for the original obligation. This could encourage facilities to deliberately under-report emissions. At a minimum, we suggest that the "subsequent" years be limited to the year in which the under-reporting obligation is being satisfied. (SCAQMD4)

> **Response:** We disagree. We wish to provide entities more flexibility for addressing underreporting shortfalls, especially when they are ensuring the environmental integrity of the program after the compliance period has ended.

E-114. Comment: WPTF has previously raised concerns that the penalties for failure to surrender sufficient compliance instruments were overly punitive and would raise costs of allowances for other compliance entities. WPTF remains concerned that the modified regulation now provides for the possibility that CARB may audit an entity's data emission reports after those reports have been verified, to determine if emissions for a compliance period have been under-reported, and retroactively hold that entity responsible for surrendering additional compliance instruments to make up the deficiency. WPTF considers the provisions of this section to be completely inappropriate. Once a covered entity's emissions data report has been verified by an accredited verifier, the covered entity should be able to rely on that report and surrender compliance instruments based on it without a threat that a future audit will create an additional compliance obligation and the possibility of compliance penalties. This potential recalculation of the compliance obligation based on a separate audit is essentially subjecting capped entities to "double-jeopardy," and holding them responsible for errors by third-party verifiers. WPTF does not object to auditing of emission reports, but the goal of these audits should be to monitor the performance of verifiers. Any errors found in emission reports should factor into verifiers' ongoing accreditation, but should not result in consequences to the entities that have used that verifier. The entirety of section 95858 should be deleted. (WPTF2)

> **Response:** We disagree with this comment and believe section 95858 is essential to ensuring the program's environmental integrity.

F. CO-POLLUTANTS

F-1. ARB's public workshop notice states that, "Staff is also investigating ways to ensure that large industrial sources subject to the recently finalized Energy Efficiency and Co-Benefits Audit regulations be required to take all cost-effective action identified under those audits." It appears that ARB is now proposing to make implementation of the audit recommendations a requirement, subject to penalties, for facilities that are also subject to the Cap and Trade program. LADWP recommends that this separate, but very closely related and important regulation, be publicly vetted in a separate public comment period and workshop from this specific 15-Day Modified Text comment period. The draft regulation that is currently being publicly reviewed does not include any provisions that relate to the Energy Efficiency and Co-Benefits Audit regulation. LADWP recognizes the importance of ensuring that the ARB consider the potential for direct, indirect, and cumulative emission impacts from the Cap and-Trade program on communities that are already adversely impacted by air pollution. LADWP requests that ARB give full time and consideration to any amendments of the Energy Efficiency and Co-Benefits Audit regulation without the restrictions of this current 15-Day rulemaking comment period. (LADWP4)

> **Response:** Any changes made to the Energy Efficiency and Co-benefits Assessment Regulation for Large Stationary Sources, or to directly require GHG reductions at large industrial sources, will be made during a separate rulemaking process, and will have its own public comment period, as suggested by the commenter.

F-2. (multiple comments)
Comment: ARB should require an ongoing review and update of the co-pollutant emissions assessment included in the Initial Statement of Reasons, and should continue to work with the Department of Public Health in ongoing review and evaluation of the impacts of the Cap and Trade program. We understand that mitigation of environmental impacts resulting from the Cap and Trade rule is expected to rely on an adaptive management approach, which in turn will depend in part upon the information collected to assess impacts resulting from permitting offsets of ongoing emissions rather than modifications to reduce emissions at a given emitter. It is important that ARB include a regular review of the data it collects to determine what exposures are being perpetuated, if any at local and regional scales. These reviews should also include new scientific information, findings or methods that could enhance the analysis and understanding of the impacts of emissions on surrounding communities. In addition, these reviews should be accompanied by an opportunity for review and input by outside experts and members of the public. (SIERRACLUBCA5)

Comment: We recommend the identification of information about trading activity that can be monitored to indicate if an increase of emissions is likely to occur. That is, indicators of market or permit activity (both at 1 for the purpose of this letter, the “identified impact level” is the value of an indicator or metric that, when reached, means an impact has been observed and some adaptive action will be taken by CARB or other agency with jurisdiction. The macro-scale and at a localized neighborhood scale) that would lead the regulator to believe that emissions may be increasing in the near future (prior to those emissions actually increasing) both in environmental justice communities and non-environmental justice communities. (EDF5)

Comment: We recommend the identification of metrics that should be tracked that are necessary to understand whether deleterious impacts on public health are occurring, both in environmental justice communities and non-environmental justice communities. (EDF5)

Comment: We recommend the identification of steps that can be taken, established as a hierarchy of action, for preventative and responsive action planning for public health and air quality protection. Existing adaptive management strategies identified in the regulatory documents should be included in addition to new measures. Prioritizing strategies based on the degree of observed harm or impact level should be considered within this approach. (EDF5)

> **Response:** Although we anticipate that co-pollutant emissions would decrease under the cap-and-trade program, we are committed to monitoring the implementation of the regulation to identify and address any situations where the program results in an increase in criteria air pollutant or toxic emissions. In Resolution 11-32, the Board approved an adaptive management plan for the cap-and-trade program.
>
> At least once each compliance period, we would use information collected through the mandatory reporting regulation, the cap-and-trade regulation, and other sources of information to evaluate how individual facilities are complying with the cap-and-trade regulation. The public will have ample opportunity to comment on these assessments. At least once a compliance period we will update the Board on the adaptive management plan. Where necessary, we will consult with CDPH and outside experts. We do not believe that tracking specific public health outcomes will provide data that will be useful to the adaptive management plan because many health impacts are not observed until years after exposure occurs and due to the low levels of exposure anticipated it would be difficult to observe a significant association, and extremely challenging to establish causation.
>
> If adverse co-pollutant impacts are identified and can be attributed to the cap-and-trade regulation, we are committed to promptly developing and implementing appropriate responses through a public process, including consideration and approval by the Board as necessary.

F-3. (multiple comments)

Comment: One serious flaw is that ARB's rules allow some of California's biggest polluters to meet the vast majority of cumulative reductions from business-as-usual pollution reductions through 2020 through the purchase of carbon offset credits, which can come from outside California and eventually from outside the United States. Such offset loopholes deprive California of the environmental, economic, and public health co-benefits that a carbon cap purportedly provides. (FRIENDSOFEARTH3)

Comment: Research shows that out-of-state offsets will increase criteria pollution. (David Roland-Holst, “Carbon Emission Offsets and Criteria Pollutants: A California Assessment,” March, 2009, University of California, Berkeley.) Air pollution is worst in low-income communities and communities of color, such as the neighborhoods downwind from oil refineries in the LA area. We call upon ARB to eliminate out-of-state offsets and greatly reduce the allowed in-state offsets. It is embarrassing that over 85 percent of the GHG reductions could come from offsets. Relieve low-income communities and communities of color from this heavy burden. (EDLA)

Comment: Continued reliance on offsets undermines environmental integrity and endangers local communities. The current rulemaking package fails to ensure that activities undertaken to comply with the regulations do not disproportionately impact low-income communities. A University of California study looked at six types of air pollutants and found that under a scenario which allows 50 percent of offsets to be sourced out of state, California’s air pollution would actually increase in five out of six pollution categories. (FRIENDSOFEARTH2)

> **Response:** The commenters reference a University of California (UC) Berkeley study which they state demonstrates that allowing out-of-state offsets in the program would increase co-pollutant emissions in California. Contrary to the commenters’ concerns, the facilities’ ability to use offsets that originate outside of California will not cause an increase in co-pollution emissions in California. The UC Berkeley study found that if all facilities only purchased out-of-state offsets, then the potential co-pollutant benefits realized by a greenhouse gas cap-and-trade program would be less than if no offsets were allowed. This finding should not be misinterpreted to imply that out-of-state offsets would lead to an increase in co-pollutant emissions in California.
>
> Furthermore, as stated in the response to comments for the Staff Report, numerous studies have evaluated the potential for inequitable impacts from emissions trading programs on minority neighborhoods, racial and ethnic groups, and general community demographics, and found that trading did not have a disproportionate impact.
>
> The most effective way to reduce the impacts of co-pollution emissions in low-income and disadvantaged communities is to implement programs that target reductions in co-pollutant emissions directly. While a GHG-focused program would likely reduce co-pollutant emissions along with GHG emissions, it is not the most effective mechanism for decreasing exposure to co-pollutants.
>
> Although we anticipate that co-pollutant emissions would decrease under the cap-and-trade program, we are committed to monitoring the implementation of

the regulation to identify and address any situations where the program results in an increase in criteria air pollutant or toxic emissions. In Resolution 11-32, the Board approved an adaptive management plan for the cap-and-trade program.

At least once each compliance period, we would use information collected through the mandatory reporting regulation, the cap-and-trade regulation, and other sources of information to evaluate how individual facilities are complying with the cap-and-trade regulation. The public will have ample opportunity to comment on these assessments. At least once a compliance period, we will update the Board on the adaptive management plan. Where necessary and appropriate, we will consult with the local air district, CDPH, and outside experts. We do not believe that tracking specific public health outcomes will provide data that will be useful to the adaptive management plan because many health impacts are not observed until years after exposure occurs and due to the low levels of exposure anticipated it would be difficult to observe a significant association, and extremely challenging to establish causation.

If adverse co-pollutant impacts are identified and can be attributed to the cap-and-trade regulation, we are committed to promptly developing and implementing appropriate responses through a public process, including consideration and approval by the Board as necessary.

The program imposes a limit on the amount of offsets that an individual covered entity can use for compliance. All offsets used for compliance are real reductions, albeit outside the cap. Allowing a limited number of offsets into the program provides cost-containment benefits and ensures that some GHG emissions reductions occur within the sectors covered by the cap-and-trade program. The program includes provisions that would allow a maximum of 201 $MMTCO_2e$ of offsets through the year 2020. This limit will be enforced through a limit on the use of offsets by an individual entity equal to eight percent of its compliance obligation. It is highly unlikely that the eight percent offset usage limit could result in 85 percent of the reductions required under the cap coming from offsets. Combined with the Allowance Price Containment Reserve, the eight percent limit ensures that a majority of reductions from the program come from sources covered by the program at expected allowance prices, while use of the reserve will relax that constraint if prices rise.

F-4. (multiple comments)
Comment: We strongly urge your administration to prioritize policy options that uphold AB 32's requirements to avoid disproportionate impacts to low income communities; and to maximize environmental, economic and public health co-benefits for California. We are concerned that the carbon trading system approved by ARB will not deliver on those requirements. Studies show that cap-and-trade programs can create pollution “hot spots" in low-income communities of color, exacerbating the toxic burden borne by these communities. In Europe, carbon trading systems have also been plagued by

numerous trading scandals. The carbon trading program approved by ARB replicates many of the problems seen in the European model. (FRIENDSOFEARTH3)

Comment: We urge you to take alternative measures to implement California's most important global warming law, AB 32, that prioritize emissions reductions in communities impacted by toxic air contaminants and preserves social and environmental integrity. (FRIENDSOFEARTH3)

Response: The results of the Emissions Assessment indicate that co-pollutant emissions in California would likely decrease as a result of a cap-and-trade program. This would mainly be attributed to an increase in efficiency and a decrease in the combustion of fossil fuels. In addition, as stated in the responses to comments received during the 45-day comment period, numerous studies have evaluated the potential for inequitable co-pollutant impacts from emissions trading programs on impacted communities, and determined that either there were no impacts or that an emissions trading program could lead to co-pollutant benefits in impacted communities.

We disagree that the California cap-and-trade program "replicates many of the problems seen in the European model." We collaborated with international experts and academics to understand the European program, and to design the California program to avoid any of the issues related to over-allocation in the European program.

As stated in other responses, we evaluated the impacts of a cap-and-trade program to other alternatives when developing the Scoping Plan in 2008, the Staff Report for the cap-and-trade regulation, and again in the *Supplement to the AB 32 Scoping Plan Functional Equivalent Document* (Supplement), which was presented at the August 2011 Board meeting. Considering the objectives of AB 32, we determined that a cap-and-trade program was the preferable approach.

The State of California has the most stringent and successful air quality programs in the country. As described in the Emissions Assessment, our program has substantially improved the air quality in California. The cap-and-trade program will complement our existing air quality program and not impede or in any way alter existing requirements for criteria and toxic air pollutants. Moreover, through the Energy Efficiency and Co-benefits Assessment Regulation for Large Stationary Sources, we are currently collecting information on opportunities for further GHG and co-pollutant emission reductions. We are scheduled to receive these data by the end of 2011. We will initiate a process to ensure that large industrial sources subject to the regulation be required to take cost-effective actions identified under those audits. The audit results, due to ARB by the end of 2011, will inform the development of regulatory requirements that we intend to propose to the Board in 2012. We plan to initiate a separate public process in fall 2011 to discuss metrics and actions to implement this commitment.

However, we understand that situations could arise that might increase air pollution. To ensure that the concerns of the commenters are not realized, we have committed to developing an adaptive management program. At least once each compliance period, we would use information collected through the mandatory reporting regulation, the cap-and-trade regulation, and other sources of information to evaluate how individual facilities are complying with the cap-and-trade regulation. The public will have ample opportunity to comment on these assessments. At least once a compliance period we will update the Board on the adaptive management plan. Where necessary, we will consult with CDPH and outside experts. We do not believe that tracking specific public health outcomes will provide data that will be useful to the adaptive management plan because many health impacts are not observed until years after exposure occurs and due to the low levels of exposure anticipated it would be difficult to observe a significant association, and extremely challenging to establish causation.

If adverse co-pollutant impacts are identified and can be attributed to the cap-and-trade regulation, we are committed to promptly developing and implementing appropriate responses through a public process, including consideration and approval by the Board as necessary.

F-5. Comment: The original regulation failed to meet the criteria set out by AB 32 for market-based compliance mechanisms, and the modifications do not cure these defects. AB 32 requires that before the Board can adopt a market-based compliance mechanism, such as cap and trade, it must: 1) consider the potential for direct, indirect and cumulative emission impacts from these mechanisms, including localized impacts in communities that are already adversely affected by air pollution; 2) design any market-based compliance mechanism to prevent any increase in the emissions of toxic air contaminants or criteria air pollutants; and 3) maximize additional environmental and economic benefits for California, as appropriate. The proposed modifications do not remedy the fact that the Regulation threatens communities with more air pollution and fails to take the opportunity to generate green jobs in California and stimulate California's economy. ARB has still not adopted a methodology for identifying disproportionately impacted, low-income communities in California. Without a screening method it is impossible for ARB to evaluate whether this Regulation will have localized impacts in communities already adversely impacted by pollution. It is unacceptable to take a wait and see approach, when determining the impact of Cap and Trade on vulnerable communities. To comply with AB 32, ARB must identify and analyze all environmental justice communities in California before implementing any market-based mechanism, including this Regulation. The modifications do not correct the fact that the Regulation does not prevent localized or disproportionate impacts or reduce emissions. Due to the program's flexibility, ARB cannot predict where emission reductions will occur or if they will occur at all. Entities could easily buy credits and offsets and not reduce any emissions. ARB cannot rely on the Clean Air Act as a backstop to prevent increased co-pollutant impacts when new or modified major stationary sources (that are also facilities subject to the cap and trade regulation) increase hazardous air pollutant or criteria pollutant emissions in a community because section 112 (regulating HAPs) and New Source Review (as codified in Part D of Title I of the Clean Air Act) allow increases in emissions because MACT or BACT (LAER) do not require zero emissions. Rather, the Clean Air Act's MACT and BACT technology based emissions limits allow for increases. Moreover, under New Source Review, a major stationary source purchases offsets to mitigate the pollution not reduced by BACT under an almost identical scheme as cap and trade: the major source buys offsets from another source in the air basin and the local community gets stuck with the increase in criteria pollutant emissions. The California Clean Air Act likewise does not require zero emissions of toxic or criteria pollutant emissions for new or modified stationary sources. (CRPE4)

Comment: ARB's proposal exacerbates environmental injustice. Low income communities of color are concentrated near California refineries and disparately exposed to air pollutants emitted by refineries along with GHG as co-pollutants that are known to increase risks for health problems which are in fact observed at elevated levels in these communities. This disparate impacts and their exacerbation by the increase in GHG combustion products from refineries—perfect combustion resulting in only carbon dioxide and water being absent from the real world in which we must breathe—are well documented and beyond reasonable dispute. CBE details the evidence once again in our 28 July 2011 comments incorporated herein. ARB's own former advisors have done so as well. ARB again proposes allowing continued and even increased refinery emissions. ARB wrongly ignores this injustice. (CBE2)

> **Response:** These comments do not address proposed 15-day changes to the regulation and restate comments made during the initial 45-day comment period. See response to Comments F-1 and F-4 in the 45-day responses (Chapter III).

G. DEFINITIONS

G-1. Comment: In section 95802(a)(273), the definition of "Other biomass CO_2," the term "biomass CO_2 emissions" is used but this term is not defined. The general term "biomass derived fuel" should be used. It is important to specify "combustion" of the biomass-derived fuel, as some types of biomass-derived fuel (e.g. landfill gas), if not combusted, constitute a separate, uncovered category of GHG emissions. Modify section 95802(a)(273) as follows:
(273) "Other biomass-CO_2" means biomass CO_2 emissions from the combustion of biomass-derived fuels that will be required to hold a compliance obligation. (SCPPA7)

> **Response:** The definition for "Other biomass CO_2" has been deleted from the Regulation. Therefore, the comment is no longer applicable. However, we would like to note that section 95852(i) contains the requirement that a compliance obligation must be held for CO_2 emissions from the combustion of biomass-derived fuel.

G-2. Comment: Section 95802(a)(22) references ASTM D910-07a. The current ASTM Standard Specification for Aviation Gasoline is ASTM D910-11. (VALERO2)

> **Response:** The commenter is concerned that the most recent ASTM Standard Specification was not used in the definition of "Aviation gasoline." We agree and modified the definition to be consistent with specifications as stated in the MRR, section 95102(a.)

G-3. Comment: SMUD points out a slight error in the definition of electric distribution utility. Modify section 95802(a)(82) as follows:

> (82) "Electrical Distribution Utility(ies)" means an Investor Owned Utility (IOU) as defined in the Public Utilities Code sections ~~and~~ 216, and 218, or a local publicly owned electric utility (POU) as defined in Public Utilities Code section 224.3, or an Electrical Cooperative as defined in Public Utilities Code section 2776, that provides electricity to retail end users in California. (SMUD3)

G-4. Comment: SMUD points out a typographic error in the definition of voluntary renewable energy. Modify section 95802(a)(280) as follows:

> (280) "Voluntary Renewable Electricity" or 'VRE' means electricity produced or REC~~D~~s associated with a voluntary renewable electricity generator, and which will not be sold or used to meet any other mandatory requirements or voluntary program in California or any other jurisdiction. (SMUD3)

> **Response:** We appreciate the observation of these typographical errors and made the corrections noted by the commenter.

G-5. Comment: We appreciate and support the change to the definition of

"Greenhouse Gas" in section 95802(a)(115). The deletion of "hydrocarbons" from within the definition is appropriate. (WIRA3)

G-6. Comment: CARB's definition of Replacement Electricity, Section 95802(a)(237), provides an important linkage between the variable renewable resource output and the GHG attribute associated with energy imported into California. CARB's definition provides a reasoned compromise between opposing options on the treatment of imported power GHG emissions. The definition provides the market with flexibility in firming and shaping inherently variable renewable deliveries temporally from the host balancing authority, while retaining verifiable delivery from the renewable host balancing authority to California. This is a reasonable compromise that provides market flexibility while maintaining the integrity of emissions tracking and assignment. (SEMPRAGEN)

> **Response:** We appreciate the support. No response is required.

G-7. Comment: The term "consignee" is used in several places in the Regulation including section 95811(e)(3) with regard to Suppliers of LPG and in section 95852(e)(2) with regard to Suppliers of NGLs. The term "consignee", however, is not defined in the Regulation. To avoid confusion and the potential for inadvertent non-compliance, the Regulation must include a clear definition of "consignee" that addresses any and all uses of the term. Moreover, to ensure that a compliance obligation is not imposed multiple times if LGP/NGLs are resold within the State, the Regulation should also clearly state that the compliance obligation is not intended to apply more than once to the GHG emissions associated with any specific volume of LPG/NGLs. (BP2)

> **Response:** We agree and modified the regulation to stipulate that "consignee," as used in the cap-and-trade regulation, refers to the definition of "Consignee" in the MRR.

G-8. Comment: "Deforestation" is defined as "direct human-induced conversion of forested land to non-forested land." Without a specified definition of "forest," which is not provided in section 95802, this definition is incomplete. There are multiple definitions of "forest," both in the U.S. and internationally, usually focusing on thresholds for canopy cover, tree height, and minimum land area. There are, for example, the definition used by the United States under UNFCCC reporting requirements; U.N. Food and Agriculture Organization definitions used in periodic global and country-level inventories; the generalized definition used in the CDM program, which allows countries to select their own thresholds for canopy cover, tree height, and minimum land area; and others. Different definitions will have different implications for the types of deforestation (and afforestation/reforestation and improved forest management) project activities that will be included or excluded from eligibility. It is important for ARB to be explicit in this regard in order to ensure that the chosen "forest" definition does not unintentionally exclude desired activities or conflict with UNFCCC reporting by the United States government. ACR recommends providing an approved definition of "forest." Winrock and ACR would be happy to provide input in selecting or creating a definition. If ARB intends to rely on the "forest" definitions included in the ARB-adopted forestry and REDD protocols, this could be mentioned in the “deforestation” definition. (MARTINN3)

> **Response:** This comment is outside the scope of the 15-day changes to the regulation, and therefore does not require response. However, we would like to refer the commenter to the ARB Compliance Offset Protocol for Forest Projects, page 74, where “Forestland” is found in the Glossary of Terms, as this information may be helpful. The definition follows below.
>
> > *Forestland: Land that supports, or can support, at least 10 percent tree canopy cover and that allows for management of one or more forest resources, including timber, fish and wildlife, biodiversity, water quality, recreation, aesthetics and other public benefits.*

G-9. (multiple comments)
Comment: In many cases, the proposed modifications to the MRR and the Cap and Trade Rule define relationships in the industry of imported electricity according to the terms of a “written contract” (see sections 95102(a)(354),95102(a)(295), and 98502(a)(258). This is simply not consistent with the realities of the industry, which is fast-paced and highly dynamic, and thus would impose an inefficient and burdensome contract structure. For example, it is standard practice within the Western Systems Power Pool (WSPP) that all transactions with a delivery term of less than one week are verbally confirmed and do not require a written contract. Written contracts for such short-term transactions would be highly inefficient and costly to electricity purchasers. Powerex requests that ARB replace the terms “written contract” and “power contract” with the term “contract” throughout the MRR and Cap and Trade Rules, and that ARB define the term to include both written and verbal agreements. If it is ARB’s intent to disallow the use of non-written contracts under either the MRR or the Cap and Trade Rule, Powerex requests that ARB clearly define the term “contract” so that it is clear to regulated entities how they must structure agreements to meet the rules’ requirements. For example, Powerex suggests that ARB revise the MRR to allow regulated entities to enter into verbal contracts that are backed by written enabling agreements not specific to the particular transaction, subject to the verbal contract. (POWEREX)

Comment: The definition of “Specified Source” in section 95802(a)(258) requires a “written contract” in the absence of ownership to claim a facility as a specified source of electricity: “The electricity importer must have either full or partial ownership in the facility/unit or a written contract to procure electricity generated by that facility/unit.” However, in power trading, a binding sale and purchase agreement may be made orally with only a taped or recorded memorialization, for example by software such as Instant Messenger. ARB should develop a definition of “contract” so that covered entities can have certainty that their agreements for electricity from specified sources will be accepted by ARB. (SCPPA6)

> **Response:** It is not our intent to disallow the use of verbal contracts. We believe the accepted industry practice for the ability to make a binding sale based

on an oral agreement is typically first spelled out in an overall written agreement, with allowance for sub-agreements, which includes how those sub-agreements can be communicated and executed. These sub-agreements could include acceptable types of communication such as verbal communications, phone messages or emails. If this is not the case, and no overall written contract exists, then there is insufficient documentation for ARB to verify and accept the power transactions entered into via verbal or other communication.

G-10. (multiple comments)
Comment: The definition of power contract should match the definition in the MRR and should be used throughout the cap-and-trade regulation in the definition (258) specified sources. Add section 95802(a)(xxx) as follows:

> <u>(xxx) “Power contract” means a written document arranging for the procurement of electricity. Power contracts may be, but are not limited to, power purchase agreements, enabling agreements, and tariff provisions.</u> (SEMPRA3)

Comment: Section 95852(b)(3)(A) requires that that the first deliverers of the replacement electricity have a contract or ownership with the supplier of the replacement electricity. ARB should clarify the definition of the term “contract” and it should be consistent with industry standard usage of the term. That is, a contract for power specifies a delivery location, delivery time, delivery quantity, price and term. (PGE4)

> **Response:** The requirements for verification for determination of a valid contract are contained in the requirements for the MRR. Verification of a valid claim to electricity from a specified source requires (1) evidence of direct delivery defined pursuant to the MRR, section 95102(a), and (2) the reporting entity to meet the definition of a generation providing entity (GPE) pursuant to the MRR, section 95102(a), or have a written power contract, also defined pursuant to the MRR, section 95102(a). A valid claim may be corroborated during verification with additional information such as the location of the first POR relative to the specified facility, settlement data, invoices, matching e-Tags with metered generation when available, and other records allowed pursuant to the power contract, such as email and voice recordings.

G-11. Comment: The term “contract rights” should be clearly defined in the regulation. One criterion for claims of specified imports is that “the first deliverer must be the facility operator or have ownership or contract rights to electricity generated by the facility or unit claimed.” The term “contract rights” is vague and provides no certainty regarding the type of commercial arrangements would qualify. Without further definition as to the type of arrangements that would qualify, the eligibility of contracts for a facility-specific emission rate would be subject to interpretation by verifiers. This is not acceptable. (WPTF2)

Response: The term “contract rights” was used in reference to RPS, and the regulation was modified to clarify that we are referring to definitions in the MRR. During the mandatory reporting process, ARB staff is available to assist covered entities and verifiers with their questions.

G-12. Comment: ARB should modify the Cap and Trade Regulation and MRR to provide a new reporting category and corresponding definition appropriate to Metropolitan’s role and use of imported electricity. Add the definition of “Importer/Non-Marketer to section 95802(a) as follows:

Importer/Non-Marketer or Importer/NM means a utility or entity, such as a public water agency, that purchases electricity generated outside the state of California solely to serve its own load. An Importer/NM does not market this electricity for purposes of resale and does not serve electric retail customers or electric end users. Importers/NM will report under the provisions of MRR, but will not have a compliance obligation under the Cap and Trade Regulation. (MWDSC3)

Response: We did not make this change. It is our intent to attach a compliance obligation, and therefore a price signal, to products and processes that consume electricity in the State.

G-13. Comment: The Regulation includes a provision whereby ARB would look to the Offset Project Operator, Authorized Project Designee, and/or original holder of the Early Action offsets to replace any invalidated offsets if the forest owner or end-user is no longer "in business" (sections 95985(f) and 95990(1)). Please define "in business" and clarify what circumstances would trigger this action. (CE2CC)

Response: We agree and clarified in the regulation where the term “in business” was used, that it was “pursuant to section 95101(h)(2) of MRR.” New section 95985(h) details more clearly the circumstances that the commenter is concerned about.

G-14. Comment: There is no definition of “virgin oils” included in the definitions section. This makes it unclear what oils would qualify under section 95852.2(a)(5). Include a definition of "virgin oils" with an explanation for the rationale for excluding oils that are not "virgin." (CCGG2)

Response: We agree that there is no definition of “virgin oil” in the regulation, as staff believes that this term is self-explanatory in the context in which it occurs in 95852.2(5). In this context, virgin oil is “new,” non-recycled, and not previously processed oil “solely from virgin oils, including esters derived from virgin vegetable oils from corn, soybeans, sunflower seeds, cottonseeds, canola, cramble, rapeseeds, safflowers, flaxseeds, rice bran, mustard seeds, and camelina, and from animal fats.”

Additionally, the commenter is mistaken that oils that are “not ‘virgin’” are excluded, presumably from the covered entity’s compliance obligation as provided by section 95852.2. Section 95852.2(5)(b) clearly includes combustion emissions from two non-virgin oils; tallow and waste oils, as biofuel which are excluded from the covered entities’ compliance obligation.

G-15. Comment: How does CARB define the “transactional relationship” referenced in Appendix A? (DWR2)

Response: “Transactional relationship” is used in context with the discussion of allowance allocation to electricity entities. It means a direct selling and billing relationship between an entity selling electricity (typically a utility) and a retail end-user of electricity. Water utilities typically do not sell electricity to retail end-users and would not be eligible for allowance distribution under the criteria presented in the *Staff Proposal for Allocating Allowances to the Electric Sector*.

G-16. (multiple comments)
Comment: The definition of “Carbon Dioxide Supplier,” in section 95802(a)(45) should be clarified. Praxair was concerned that all entities involved in the industrial CO_2 gas supply chain would be subject to a Cap and Trade compliance obligation. Praxair appreciates staff’s informal clarification that regulating all entities in the supply chain was not CARB's intent. Praxair requests CARB modify Section 95802(a)(45) to remove entities that are not engaged in producing CO_2 from procuring emissions allowances, and reporting under the MRR (see Praxair's comments on the July 25,2011 version of the MRR). This clarification will also achieve greater consistency with the U.S. EPA reporting regulations and avoid concerns that multiple entities in the same supply chain would be regulated for the same activity. Modify section 95802(a)(45) as follows:

(d) This source category is focused on upstream supply. It does not cover:
(1) Storage of CO2 above ground or in geologic formations.
(2) Use of CO2 in enhanced oil and gas recovery.
(3) Transportation or distribution of CO2, unless such transport or distribution involves the import or export of bulk CO2.
(4) Purification, compression, or processing of CO2.
(5) Capture of CO2 rom a production process unit at an upstream facility under separate ownership and control:
(6) On-site use of CO2 captured on site. (PRAXAIR2)

Comment: The definition of “CO_2 supplier” should be clarified to be consistent with federal regulations and focus on upstream supply, so that downstream processors are not subject to redundant requirements in the same CO_2 supply chain. The industrial gas sector operates CO_2 plants that obtain certain refinery gas streams rich in CO_2 and purifies them into carbon dioxide from those streams for use which can be used in many products and processes like refrigeration, dry ice and carbonation. These plants typically do not produce the CO_2 that they process. If the industrial gases sector did not take and purify the refinery gas streams, they would be emitted at the refinery as a waste gas. ARB has consistently held that CO_2 generators should bear the reporting and compliance obligations for CO_2 that they produce. It has not been ARB's intent, and it would not be efficient or equitable, to subject redundant entities in the supply chain to redundant obligations with respect to the same CO_2. Therefore, ARB should ensure that the proposed rules do not impose compliance obligations for distribution-related activities that are unrelated to the production of CO_2 within the state. It is apparent that ARB intended to track the language of the federal definition. However, by omitting the clarifying language in section 95802(b), ARB's draft may unintentionally create ambiguity. ARB should include the following clarifying language, based on 40 C.F.R. section 98.420(b), in the definition of "CO_2 supplier" in both the Cap and Trade Rule and the MRR. This clarifying language should be included in the definitions and relevant sections of the Proposed 15 Day Modifications on Subchapter 10, Article 5, sections 95800-96022, Title 17, PageA-114 (A-10 and A-50) and the Proposed 15 Day Modifications on Subchapter 10 of the "Proposed Amendments to the Regulations for the Mandatory Reporting of Greenhouse Gas Emissions" (sections 95101 page 4, definitions page 16). Modify sections 95802(a)(245) and 95102(a)(59) as follows:

(A) A person or facility is not a Carbon Dioxide Supplier by virtue of performing any of the following activities:

(1) Storage of CO2 aboveground or in geologic formations;(2) Use of CO2 in enhanced oil and gas recovery;
(3) Transportation or distribution of CO2, unless such transport or distribution involves the import or export of bulk CO2;
(4) Purification, compression, or processing of CO2;
(5) Capture of CO2 from a production process unit at an upstream facility under separate ownership and control; and
(6) On-site use of CO2 captured on site. (IGPACC)

Response: We modified section 95802 to more closely align with the federal GHG reporting regulation's definition of a carbon dioxide supplier. In addition, this section was modified to clarify that the source category is focused on upstream supply, and that it does not include the listed activities and uses. Carbon dioxide used in carbon capture and geologic sequestration (CCGS) and carbon dioxide-enhanced oil recovery (CO_2-EOR) is excluded from the cap-and-trade regulation in a different way from how the federal GHG reporting regulation excludes it. Whereas the federal reporting regulation contains separate reporting categories for carbon dioxide suppliers, CCGS, and CO_2-EOR, ARB does not yet include these reporting categories within our MRR, though we signal in section 95852(g) that these activities and uses will be excluded from a compliance obligation through a to-be-developed quantification methodology.

G-17. Comment: The definition of "Permanent" requires that GHG reductions or removal enhancements are either not reversible, or that mechanisms are in place to replace any reversed GHG emission reductions or removal enhancements. ACR strongly agrees with this, and it is consistent with our own permanence requirements. However the definition goes on to require "that all credited reductions endure for a

period that is comparable to the atmospheric lifetime of an anthropogenic CO_2 emission." This definition is unclear, since no atmospheric lifetime is specified. No consensus exists, based on actual measured data, on the atmospheric lifetime of CO_2, but this is generally estimated at several hundred years. Since the estimated atmospheric lifetime of an anthropogenic CO_2 emission is far longer than any minimum offset project term currently being considered, we recommend that ARB delete that portion of the definition and focus on the issue important to the environmental integrity of ARB's Cap and Trade program, i.e. that GHG reductions or removal enhancements are either not reversible, or that mechanisms are in place to replace any reversed GHG emission reductions or removal enhancements. Modify section 95802(a)(186) as follows:
(186) "Permanent" means, in the context of offset credits, either that GHG reductions or GHG removal enhancements are not reversible, or when GHG reductions or GHG removal enhancements may be reversible, that mechanisms are in place to replace any reversed GHG emission reductions or GHG removal enhancements ~~to ensure that all credited reductions endure for a period that is comparable to the atmospheric lifetime of an anthropogenic CO2 emission~~. (MARTINN3)

> **Response:** To address the issues raised by the commenter, the definition of "permanent" was modified to read: "Permanent" means, in the context of offset credits, either that GHG reductions ~~or~~ and GHG removal enhancements are not reversible, or when GHG reductions ~~or~~ and GHG removal enhancements may be reversible, that mechanisms are in place to replace any reversed GHG emission reductions ~~or~~ and GHG removal enhancements to ensure that all credited reductions endure for ~~a period that is comparable to the atmospheric lifetime of an anthropogenic CO_2 emission~~ at least 100 years.

G-18. Comment: The definition of "Beneficial Holding" in section 95802(a)(27) as "the holding of a compliance instrument in the holding account by one entity in which another entity has an ownership interest" requires some revision. SCE (and other electrical distribution utilities) have signed a number of contracts with generators that require it to make generators "whole" for the GHG obligation that they incur when the utility dispatches their facilities in order to serve load. In other words, SCE has a contractual obligation to provide this counterparty either with physical allowances or an equivalent financial payment. However, while SCE is contractually responsible via either method for covering a generator's GHG obligation, there is no language in SCE's contracts with these generators that designate "ownership interest" of any of SCE's compliance instruments. The lack of ownership designation is significant because SCE's pro forma and existing contract language provides SCE the option of compensating generators for their GHG obligation (incurred as a result of dispatch) through financial settlement rather than compliance instruments. Tying "ownership" of a compliance instrument to a specific generator in a beneficial holding relationship would remove any flexibility that SCE would have to financially settle the GHG obligation. This flexibility is significant for allowing SCE to satisfy its contractual obligations at least cost, contributing to an efficient GHG market, and ensuring that electricity customers' rates are minimized. Without such flexibility, SCE's participation in any beneficial holding relationships would be severely restricted, limiting SCE’s ability to effectively manage its GHG contractual obligations at least cost, and potentially raising the cost of compliance for SCE and other parties. ARB should remove the concept of “ownership” of compliance instruments by a principal, and replace it with a “Beneficial Holding Account” for each registered agent. The allowances placed in the Beneficial Holding Account could, at any point, be transferred to a party with whom the agent has a “Long-Term Contract.” In order to ensure that these allowances are indeed used only to meet contractual GHG obligations, allowances could not be removed from this account for any other use. (SCE3)

> **Response:** We modified the definition of “Beneficial Holding” to mean the acquisition and holding of compliance instruments by a registered entity to be transferred to another registered entity under an agreement disclosed to ARB.

G-19. Comment: "Air Dried Ton of Paper" is defined as paper with 6 percent moisture content. The industry definition for Air Dried Ton is 10 percent moisture content. Temple-Inland believes that the proposed definition should be changed to reflect the industry standard and avoid potential inconsistencies with other reported production data generated by industry. Alternatively, a standard could be written based on "bone dry" or "oven dry" tons, both defined as 0 percent moisture content. Under either scenario, conversions will have to be made from the measured production rate which is termed scaled tons and defined as "machine dry" tons. The term "machine dry" is variable from mill to mill, grade to grade and even from time to time. (TI)

> **Response:** Since five paper and paper mills covered under the program produce products with different moisture content, we needed a common unit. We defined air-dried ton as product with 6 percent moisture content, to be consistent with European Union Emissions Training System. Staff believes that it is appropriate as far as we are applying common unit for all types of paper products covered by the program.

G-20. (multiple comments)
Comment: The use of the word “rent” in the definition of “Tolling Agreements” in section 95801(267) could create accounting impacts. Under Generally Accepted Accounting Principles (GAAP) accounting rules, a tolling agreement may or may not be a "lease." Use of the word "rent" implies that a tolling agreement is a lease, which might contradict the accounting rules. PacifiCorp recommends using a different word consistent with the concept of an energy conversion service. (PACIFICOR3)

Comment: The Regulation includes a definition for tolling agreement, but it is not a term that is found in the Regulation. LADWP recommends that this definition be deleted. Modify section 95802(a)(267) as follows:

> ~~(267) “Tolling Agreement” means an agreement whereby a party rents a power plant from the owner. The rent is generally in the form of a fixed monthly~~

~~payment plus a charge for every MW generated, generally referred to as a variable payment.~~ (LADWP4)

Response: We agree with the second commenter and deleted "Tolling Agreement" from the list of definitions in the regulation. Since it was deleted, the first comment is no longer applicable.

G-21. Comment: The definition of Renewable Energy Certificate "REC" should be changed. PacifiCorp recommends changing section 95801(239) from "REC means a certificate" to "REC includes a certificate;" a REC represents more than a certificate. A REC is a property right and should be consistent with other definitions used in the Renewable Portfolio Standard provisions. (PACIFICOR3)

Response: We are consistent with the renewable portfolio standards provisions and are using the definition derived from the California Energy Commission's Renewable Energy Program Overall Program Guidebook, Third Edition. *Renewable Energy Certificate (REC)* — as defined in Public Utilities Code Section 399.12, Subdivision (f)(1) to mean a certificate of proof, issued through the accounting system established by the Energy Commission pursuant to Section 399.13, that one unit of electricity was generated and delivered by an eligible renewable energy resource. As specified in Section 399.12, Subdivision (f)(2), a REC includes all renewable and environmental attributes associated with the production of electricity from an eligible renewable energy resource, except for an emissions reduction credit issued pursuant to Section 40709 of the Health and Safety Code and any credits or payments associated with the reduction of solid waste and treatment benefits created by the utilization of biomass or biogas fuels. As specified in Section 399.12, subdivision (f)(3), no electricity generated by an eligible renewable energy resource attributable to the use of nonrenewable fuels, beyond a de minimus quantity, as determined by the Energy Commission, shall result in the creation of a renewable energy credit. (see http://www.energy.ca.gov/2010publications/CEC-300-2010-008/CEC-300-2010-008-CMF.PDF)

G-22. Comment: Section 95802(a)(145) defines "Limited Use Holding Account" as meaning "an account in which allowances are placed after an entity qualifies for a direct allocation under section 95890(b)." However, section 95892(b)(2) permits Publicly Owned Utilities (POU) to direct the Executive Officer to place all or a portion of their directly allocated allowances in the POU's compliance account instead of its limited use holding account. Thus, the definition of "limited use holding account" should be revised. Modify section 95802(a)(145) as follows:

(145) "Limited Use Holding Account" means an account in which allowances are placed after an entity qualifies for a direct allocation under section 95890(b) unless the entity elects to have its directly allocated allowances deposited into its compliance account pursuant to section 95892(b)(2). Allowances placed in this account can only be removed for consignment to the auction pursuant to section 95831(a)(3). (SCPPA6)

Response: The definition of "limited use holding account" does not exclude allowances from being distributed directly into other accounts. It defines a type of account in which:

(A) The entity may not transfer compliance instruments from other accounts into the limited use holding account; and

(B) The entity may not transfer compliance instruments from the limited use holding account to any account other than the Auction Holding Account.

G-23. Comment: With the incorporation of the definition for "facility" into the revised MRR regulation, the proposed Cap and Trade Regulation now contains multiple and confusing references to the term "facility" as it applies to oil and gas production operations:

- The proposed Cap and Trade Regulation, section 95812(c)(4) states "The applicability threshold of oil and gas producers will be determined at the operating entity listed on the state well drilling permit or operating permit in accordance with section 95151(a)(1) of MRR. The applicability threshold for oil and gas producers is 25,000 metric tons or more of CO_2e per data year."

- In the amended MRR regulation, section 95151(a) refers to section 95150 for source categories and section 95101 for applicability. Section 95150 refers to federal regulations at 40CFR98.230(a)(1)-(a)(8). The citation at 40CFR98.238 defines onshore petroleum and natural gas production facility as "all equipment... in a single hydrocarbon basin."

- Finally, the proposed Cap and Trade Regulation section 95802(a)(95) defines "Facility" as "any physical property, plant, building, structure, source, or stationary equipment located on one or more contiguous or adjacent properties in actual physical contact or separated solely by a public roadway or other public right-of-way and under common ownership or common control, that emits or may emit any greenhouse gas."

WSPA believes that the proposed Regulation should provide clear language stating that the "single hydrocarbon basin" definition from the MRR is to be used only for establishing GHG reporting requirements, which is consistent with federal regulations. However, compliance obligations under the Cap and Trade Regulation should be limited to "facilities" that exceed the 25,000 tpy threshold, where "facility" is defined as contiguous or adjacent properties under common control as defined under section 95802(a)(95). WSPA recommends that the proposed regulations reflect that the scope of the Cap and Trade compliance obligation for oil and gas production apply only to facilities, as defined in section 95802(a)(95) for contiguous or adjacent properties that exceed the 25,000 ton threshold. (WSPA3)

Response: We did not make those changes. In section 95852, *Emission Categories Used to Calculate Compliance Obligations*, subsection (h) states that

> "Operators of the facilities specified in section 95101(e)(2)-(5) of MRR have a compliance obligation for every metric ton of CO_2e from the source types specified in section 95152(c)-(f) of MRR, except as specified in section 95852.2 of this article, that is contained in an emissions data report that has received a positive or qualified positive emissions data report, or for which emissions have been assigned." This subsection requires that the compliance obligation is based on the facility, as defined in the MRR, section 95101(e)(2)-(5). This treatment for the oil and gas production sector is also consistent with the U.S. EPA regulation.

G-24. Comment: The Modifications include a new definition of "Primary Refinery Product." This definition is key to the amount of allocations provided to an individual facility because it is embedded within the calculation details when determining free allocation amounts. WIRA urges that Residual Fuel Oil ought to be included in the definition of a Primary Refinery Product. Quoting from Appendix J-Allowance Allocation (p. J-41), dated October 28, 2010, "The simplest product output metric that can be conceived for the refining sector is the total product produced from each facility. Under such a "simple barrel" approach each refiner would report annual production of total barrels of major petroleum products such as gasoline, diesel, jet fuel and residual fuel oil to ARB." The inclusion of Residual Fuel Oil into the definition of Primary Refinery Product would be consistent with this original intent of the program. Additionally, its inclusion would not perceivably impact the program in aggregate due to the fact that only a very small quantity of Residual Fuel Oil is produced in California as a finished refinery product. The relative size of the allowances associated with Residual Fuel Oil production is on the order of 0.08 percent of the statewide cap. But even though it is small in the aggregate, to one WIRA member, Residual Fuel Oil is a substantial percentage of their finished product percentage and not including it would have Clerk of the Board significant negative consequences to their allowance level. By its very nature, Residual Fuel Oil is a "primary" refinery product being derived from the most elementary of refining processes: distillation. Container ships and other large oceangoing vessels use Residual Fuel Oil as their transportation fuel. No valid distinction can be made between Residual Fuel Oil and gasoline and diesel. All are transportation fuels. While many larger, more complex refiners have opted to install additional equipment for further processing Residual Fuel Oil into other petroleum products, doing so is just an option. This option to further process Residual Fuel Oil is not one that all refineries have exercised or can even consider, given the economically prohibitive costs and capital expenditures involved with adding necessary refining units. Specifically, WIRA's affected member has chosen a business model that sells this product directly into the market rather than to perform additional, energy- and emissions-intense processing techniques. Quoting from Appendix J-Allowance Allocation (p. J-21), dated October 28, 2010, "Basing free allocation to industrial covered entities on product benchmarks... provides entities the correct incentives to produce a given product in the cleanest (lowest GHG-emitting) way possible." To omit Residual Fuel Oil from the definition of Primary Refinery Products is in contradiction to this statement and, in fact, penalizes such a refiner for not having additional greenhouse gas emitting processes. In setting up this program CARB consistently pushed in the direction of a lower carbon economy without overtly picking winners and losers, but the exclusion of Residual Fuel Oil could easily be classified as such a decision. Therefore, WIRA strenuously urges that Residual Fuel Oil be included in the definition of Primary Refinery Product. (WIRA3)

> **Response:** We are not proposing any additions or deletions to the product types included in the "simple barrel" metric at this time. Beginning with the 2011 data year, ARB will collect detailed, third-party verified, refinery product data as part of the effort to monitor for emissions leakage in this sector. This data set would allow for future changes to product types in the metric as needed.

G-25. (multiple comments)
Comment: "Variable Renewable Resources" are defined as "run-of-river hydroelectric, solar, or wind energy that requires firming and shaping to meet load requirements" in section 95802(a)(272). This definition is flawed in that it states that such energy "requires firming and shaping to meet load requirements." Run-of-river hydroelectric, solar or wind energy may be firmed and shaped, but do not have to be. These eligible renewable resources can be dynamically scheduled into a California balancing authority area, or they can be scheduled in real time using firm transmission. SB x12 recognizes this by assigning energy so delivered to the first portfolio content category. In any case, firming and shaping are not necessary to meet load requirements. BP suggests that the definition of Variable Energy Resource be revised to state: "Variable energy resources means run-of-river hydroelectric, solar, or wind energy that may be firmed and shaped." (BP2)

Comment: The definition of "Variable Renewable Resources" should be deleted. The term appears in only two sections of the Regulation: section 95802(a)(237) defining "Replacement Electricity" and section 95852(b) regarding the calculation of the compliance obligation for replacement electricity. SCPPA recommends removing the word "variable." If ARB adopts SCPPA's recommendation, the term variable renewable resources will not appear anywhere in the Regulation. Accordingly, the definition of "Variable Renewable Resources" in section 95802(a)(272) would be surplus and should be deleted. (SCPPA6)

> **Response:** The term "variable renewable resources" was used in two places in the regulation that have been struck out, and there were not any references to the term "variable energy resources" in the regulation. Because of this, the comments are no longer applicable.

G-26. (multiple comments)
Comment: SMUD sees no need for the term "up to" to be included in the definition of compliance instrument, as there seems to be no case where a compliance instrument represents less than one metric ton of CO_2e. Modify section 95802(a)(52) as follows: (52) "Compliance Instrument" means an allowance, ARB offset credit or sector-based offset credit. Each compliance instrument can be used to fulfill a compliance obligation equivalent to ~~up to~~ one metric ton of CO_2e. (SMUD3)

Comment: Section 95922. Banking, Expiration, And Voluntary Retirement. “External GHG ETS” is a defined term in section 95802(94). Thus, this is a conforming change.

> (c)(3) ~~t~~<u>T</u>he instrument is retired by an approved external GHG ~~emissions trading system~~ <u>ETS</u>… (MID3)
>
> **Response:** No changes were made to the regulation based on the comments. These changes are not necessary to add any clarity to the intent of the regulation.

G-27. Comment: The definition for "operational control" should be expanded to include a counter party in a long-term PPA that has exclusive rights to 100 percent of the net electrical output from the facility. Certain performance provisions require Goal Line to operate a minimum number of hours per month in order to provide the needed power capacity (and earn essential, agreed capacity revenues) and to not be in breach of the PPA. By virtue of the PPA as authorized by CPUC, the buyer, SDG&E in this case, has operational control of the facility and should be the entity with the compliance responsibility under CARB's Cap and Trade program. Modify section 95802(a)(179) as follows:

> (179) "Operational control" for a facility subject to this article means the authority to introduce and implement operating, environmental, health, and safety policies. In any circumstance where this authority is shared among multiple entities, the entity holding the permit to operate from the local air pollution control district or air quality management district is considered to have operational control for purposes of this article <u>or, in the case of a facility with a long-term Power Purchase Agreement where the facility is precluded from selling any energy to any entity other than the counterparty, then the counterparty has operational control</u>. (GOALLINE)
>
> **Response:** No changes were made to the regulation based on the comments. The suggested edits are to address long-term contracts, and we have chosen to encourage the contracted parties to renegotiate the terms of the contracts.

G-28. Comment: Amend the current definition for “conversion technology,” which is technically inaccurate and practically infeasible to comply with. First, the current definition states “the technology does not use air or oxygen in the conversion process, except ambient air to maintain temperature control.” Existing gasification technologies known by the Bureau utilize limited supply of oxygen for the gasification of organic material to produce synthetic gas (syngas). Syngas is comprised of hydrogen and carbon monoxide and can be used to generate electricity or produce transportation fuels. Second, it also states that "the technology produces no discharges of air contaminants or emissions, including greenhouse gases." All conversion technologies, including biological and thermal technologies, produce air emissions during the biofuel generation process or when the syngas/biogas is used for electricity production.

Consequently, all "conversion technologies" produce air emissions and must instead be required to be equipped with the Best Available Control Technology to mitigate emissions, and to meet or exceed all applicable requirements set by the local, state, and federal agencies. (CLABS)

> **Response:** We agree with the commenter and removed the requirements in *95852.2., Emissions without a Compliance Obligation*, that conversion to a clean-burning fuel of municipal solid waste required that the technology does not use air or oxygen, and that the technology produce no air contaminants or emissions.

G-29. Comment: The definition of "Distillate Fuel No. 1" does not include jet fuel. However, because Distillate Fuel Oil No. 1 is defined with reference to the maximum distillation temperature (and the potential for jet fuel to fall into the range noted), we think it would be a helpful clarification to note that this definition excludes jet fuel. We saw such clarification was included for kerosene and we are seeking a similar edit. Modify section 95802(a)(71) as follows:

> (71) "Distillate Fuel No. 1" has a maximum distillation temperature of 550 F at the 90 percent recovery point and a minimum flash point of 100 F and includes fuels commonly known as Diesel Fuel No. 1 and Fuel Oil No. 1, but excludes kerosene <u>and kerosene-type jet fuel</u>. This fuel is further subdivided into categories of sulfur content: High Sulfur (greater than 500 ppm), Low Sulfur (less than or equal to 500 ppm and greater than 15 ppm), and Ultra Low Sulfur (less than or equal to 15 ppm). (UNITEDAIRLINES2)
>
> **Response:** We agree with the commenter and added the following definition for kerosene type jet fuel:
>
> "Kerosene-Type Jet Fuel" means a kerosene-based product used in commercial and military turbojet and turboprop aircraft. The product has a maximum distillation temperature of 400 °F at the 10 percent recovery point and a final maximum boiling point of 572 °F. Included are Jet A, Jet A–1, JP–5, and JP–8.
>
> Additionally, since kerosene-type jet fuel is defined as a "kerosene-based product", it is effectively excluded from the definition of "distillate fuel #1."

G-30. Comment: The terms "located at a well pad" and "associated with a well pad" or "associated with wells" used in the definition of an "onshore petroleum and natural gas production facility" and in other places in the regulation are not clearly defined in either 40 CFR Part 98 Subpart W or in ARB's MRR rule. As a result, operators of onshore oil and gas production facilities are each making their own interpretations of how to define their facilities to report 2011 emissions. There will likely be different interpretations by different operators, resulting in inconsistencies. If this new reporting requirement brings new facilities into the cap-and-trade universe or significantly increases reported emissions from facilities already in the universe, how will that affect the initial allocation process and those facilities' ability to comply with the requirements of the cap-and-trade rule? (STEUBE)

> **Response:** The definition of which oil and gas production facilities are covered has been clarified in the MRR rule. We do not believe that capturing additional sources would significantly change the benchmarks set for this sector.

G-31. Comment: In section 95831(a)(5)(B), ARB uses the phrase “clearing entity.” PG&E requests that ARB make conforming changes to the definition of clearing entity in section 95802 to avoid potential confusion due to the multiple connotations of the term in the commodity trading industry. (PGE4)

> **Response:** We did not define the term “clearing entity” at this time. We believe that the requirements and responsibilities associated with these entities in the regulation provide sufficient clarity as to how the term is used.

H. ECONOMIC IMPACTS

H-1. Comment: PEB has a long term steam sales agreement with UC-B that expires in August 2017. The Regulations as currently proposed, effectively impose an unrecoverable cost upon PEB not contemplated by the authorizing legislation, because its steam sales contract does not explicitly contemplate recovery of the charges for GHG emissions arising from cogenerated steam and there is currently no other GHG cost recovery mechanism available to PEB. The intent of GHG programs generally is to transfer the cost of GHG generation to the end users/consumers who, in turn, will modify their behavior in such a manner as to cause a reduction in the generation of greenhouse gasses. That intention is entirely frustrated in the case of PEB, as these costs are stranded at PEB and no mechanism is available to PEB with which it might pass these costs on to the ultimate end user of the steam. If there is no recovery by PEB from UC-B, or otherwise, under the GHG program Regulations, then the intent of the GHG program is frustrated. PEB clearly becomes a stranded asset, bearing an unrecoverable economic cost, while UC-B, the actual consumer, is essentially provided an exemption from the cost of the GHG program in the absence of any effective incentive to modify its energy consumption behavior or reduce its carbon footprint. In fact, UC-B's thermal needs may increase over the next five years, thus locking PEB into an even greater steam load obligation and greater GHG losses—effectively a "downward spiral" for the project resulting directly from the cost of the proposed GHG Regulations. The PEB facility was developed in reliance upon California State and US Federal energy policies designed to encourage the development, financing, ownership and operation of energy efficient cogeneration facilities. Similar California policies created a variety of incentives for PG&E to purchase the generated electricity and for UC-B to purchase a reliable, cost effective and environmentally beneficial central source of steam. The proposed Cap and Trade Regulations, as contemplated by CARB, would undermine these policies and would effectively cause PEB to become an economically stranded asset whose contractual framework has been frustrated by an unreasonable regulatory cost that would be inequitable and whose disparate economic impact would cause unique harm to PEB. The financial impact of the GHG Regulations, as proposed (absent an end-user pass through), is of such material economic significance as to pose a potential threat to the mechanical reliability and continued predictable operation of this cogeneration facility. Further, these Regulations threaten PEB's underlying economic viability, posing a level of financial risk and uncertainty to lenders and equity investors not contemplated by PEB, or similarly situated projects, when originally structured and financed. An equitable solution, recognizing the serious problems facing PEB under the proposed GHG Regulations, will send a strong positive message to those parties contemplating new investments in the next generation of cogeneration facilities in California, to the effect that CARB recognizes the unique value and contribution of cogeneration technology in the reduction of greenhouse gasses, and will also signal CARB's affirmative support for such new investments. CARB should recognize PEB's situation and provide the needed case-by-case relief because the current "universal solution" does not apply to PEB's unique situation. This is clearly a transition issue and needs to be dealt with as such. Beyond 2017, any new contractual agreements for electricity or steam will include a mechanism for GHG recovery. PEB believes that

CARB should allocate free allowances, an exemption from the Regulations until 2017 or other comparable relief to PEB so that it is no longer a stranded asset and is held harmless from the current adverse impact of the proposed Regulations. (PEBI)

Response: Generators of electricity are not eligible for free allocation of emissions allowances because we believe that the cost of allowances can be passed on to the consumers of the electricity. Free allocation of emissions allowances is only for sectors at risk for emission leakage.

We realize that some electricity generators may have existing contracts that prevent them from fully passing through the carbon costs associated with the cap-and-trade program. We have closely examined this issue, but do not believe it is our role to renegotiate contracts for parties because of new environmental regulations. We encourage parties to resolve this issue on their own.

In Resolution 11-32, the Board directed the Executive Officer to monitor progress on bilateral negotiations between counterparties with existing contracts that do not have a mechanism for recovery of carbon costs associated with cap-and-trade for industries receiving free allowances pursuant to Section 95891, and to identify and propose a possible solution, if necessary. For fixed-price contracts between independent generators and investor-owned utilities, the Board further directed the Executive Officer to work with the California Public Utilities Commission to encourage resolution between contract counterparties.

H-2. (multiple comments)
Comment: To ensure GHG reductions are achieved while maintaining the competitiveness of California businesses and the health of the economy, it is critical for CARB to monitor key indicators of not only the GHG reductions that are occurring but also indicators of the health of California's economy. We urge CARB to identify and monitor these key indicators, so that any inadvertent problems that may occur can be corrected before significant damage is done to California economy or environment. (CALCHAMBER3)

Comment: This Regulation impacts a significant portion of California's businesses and consumers. It is imperative that the State monitor leading indicators that reflect the economic health of California. California must be positioned to identify any potential problems that may be inadvertently caused by this regulation, before they cause significant damage to the economy so that any regulatory structural problems can be corrected in a timely manner. CCEEB recommends that the ARB include provisions in the Cap and Trade Regulation to:

1. Monitor specific economic indicators, including the following Cap and Trade market elements:
   - o the price in the auctions,
   - o the functioning of secondary markets,
   - o adequacy of the Allowance Price Containment Reserve, detection of market manipulation,

- offset supply,
- evidence of contract shuffling,
- progress towards achieving the 2020 target, total cost of the program,
- jobs in manufacturing, vacancy rates,
- home sales,
- volume of trade through ports, Gross State Product,
- energy prices, and
- other indicators used by the Department of Finance to monitor the health of California's economy;

2. Establish formal reviews of the regulation at least once each compliance period; and
3. Develop and implement a more structured process and approach for evaluating the comparative cost-effectiveness of program measures, as well as the relative cost-effectiveness of those measures vis-a-vis the Cap and Trade program and identify any potential problems. (CCEEB3)

Response: The comments fall outside the scope of the first 15-day changes to the regulation. However, we agree that it is important to monitor the environmental and economic effects of the cap-and-trade program, and we will do so. We are contracting with a market monitoring firm who will review trading activity and establishing a market surveillance committee who will review and comment on the operations of the program. Contract shuffling, in the context of electricity, is specifically prohibited by the regulation.

H-3. Comment: While other regions have reconsidered their GHG policy responses, California has begun to implement policies aimed at achieving AB 32's 2020 GHG targets, with its Cap and Trade system scheduled for implementation in 2012, albeit with a "soft-start." As a result, California will begin its Cap and Trade system without the commensurate participation it had hoped to stimulate from neighboring political subdivisions and the federal government, which in turn will have major consequences likely resulting in a range of negative economic impacts on California businesses. (CIPA)

Response: The comment falls outside the scope of the first 15-day changes to the regulation. Please see responses to the 45-day comment period regarding potential for economic impacts of a California-only cap-and-trade program. However, we are actively working with WCI partners in an effort to establish a larger regional market.

H-4. Comment: CCEEB believes that because it is unlikely that California's program will be broadly linked with other state, federal or international programs in the early years, the combined effects of the cap slope and the allowance reserve deductions in the first and second compliance periods are likely to result in serious impacts to the economy. In the Functional Equivalency Document (FED) for the Cap and Trade, ARB reported 2010 emissions, which are far below projections made to justify the capped reductions. Since there are no linkages and there is a reduced need for emission reductions, CCEEB recommends that the cap slope be revised to reflect a smoother transition of 1 percent in 2013 and 2014, and 2 percent per year in the second compliance period. This creates a smoother transition and realistically addresses the potential that California's Cap and Trade program will operate without the possibility of broad linkage to other state or federal programs in the first 5 years. (CCEEB3)

> **Response**: We disagree that the emissions reduction trajectory should be changed because other partner jurisdictions are not ready to begin in 2012. Other jurisdictions may be ready to join by 2013. Also, the projections used to set the cap considered a decline in emissions in 2010, which are the same emissions used in the FED mentioned by the commenter. Furthermore, with the continued economic slowdown, free allocation of allowances in early years, and estimates of ample offset availability, it should not be problematic or excessively costly for program participants to meet early reduction requirements. Our economic analysis shows that program goals can be met without significant adverse impacts to business or the economy as a whole as a result of the program.

H-5. Comment: The proposed Regulations may have significant negative consequences to the fiber glass insulation industry in California. Because this Regulation would have serious deleterious impacts on the fiber glass insulation manufacturers in the State, it would also have an adverse impact on California’s economy. As noted below, the State of California has stated that increased energy efficiency in buildings has the greatest potential for reducing greenhouse gases. Insulation is the quickest, most economically feasible, and most proven means for achieving those reductions. Fiber glass insulation is the most widely-used insulating material in residential and commercial construction and retrofit applications. If California inhibits the manufacture of this material within the State, it will impair the ability of the State to meet its goal of greenhouse gas reduction and force those needs to be supplied by products made at fiber glass manufacturing facilities located elsewhere in the U.S., Canada, and Mexico. (NAIMA2)

> **Response**: The fiberglass sector will be receiving free allocation of allowances for the purposes of transition assistance and to prevent economic leakage. Further, the manner in which allowances are allocated (i.e., output-based) allows for any increases in production that will accompany the improvements in building efficiency that are expected as part of the cap-and-trade program.

H-6. Comment: We believe significant measures must be taken to minimize regressive economic effects on consumers of natural gas products (small businesses, residents, etc.) when they are included in the rule in the second compliance period. (EDF4)

> **Response**: We agree that methods for reducing the impact to consumers should be implemented when other fuels come under the cap in the second compliance period. In Board Resolution 10-42, the Board agreed that the potential uses of

allowance value that were recommended by the EAAC represent good uses of the allowance value. These included returning allowance value to households either through lump-sum rebates or through cuts or avoided increases in the State's individual income or sales tax rates. If allowance fraction is returned through tax rate cuts, a small fraction of the allowance value should be reserved to finance income transfers to low-income households, to avoid disproportionate economic impacts on such households. Please see Board Resolution 10-42 and the EAAC report for additional information. Furthermore, in Resolution 11-32 the Board directed the Executive Officer to develop recommendations for the appropriate use of auction revenue. The Board further directed that these recommendations should consider the Board's direction in Resolution 10-42.

H-7. Comment: Did CARB consider whether water users' electricity-bill rebates will compensate those users for the increased water rates? If so, what are the factual basis and standards used to make the determination that water users would be adequately compensated? (DWR2)

Response: The utilities have indicated that they will use allowance value for the benefit of their ratepayers. The allocation mechanism to Electrical Distribution Utilities on behalf of ratepayers should compensate all ratepayers for the costs of the program, provided that utilities are meeting their reduction requirements (e.g., 33 percent RPS) that were assumed as part of the cost burden analysis. Additional value is provided to utility ratepayers for early investment in energy efficiency and renewables. We believe this additional value is sufficient to compensate electricity ratepayers for the greenhouse gas costs in the electricity portion of water rates.

Nevertheless, in Resolution 11-32 the Board directed the Executive Officer to continue discussions with stakeholders to identify and propose, as necessary, during the initial implementation of the cap-and-trade program, potential amendments to the regulation regarding the distribution of allowance value associated with cap-and-trade compliance costs from using electricity to supply water, and the expected ability of allowance allocation and other measures to adequately address the incidence of these costs equitably across regions of the State.

I. ELECTRICITY

Allocation

Methodology

I-1. Comment: The University of California (UC) meets CARB's criteria for receiving an allocation of allowance value by having a direct transactional relationship with their end-use customers. Allocating allowance value to the University of California (UC) will further AB 32 goals, while reducing UC's compliance costs; helps ensure fair treatment for self-generators of electricity; and provides recognition for early adopters of CHP plants. Therefore UC proposes the following Cap and Trade compliance path:

- UC campuses that are directly regulated under Cap and Trade be required to submit a five-year plan to CARB that details anticipated investments in GHG abatement.
- Pending CARB's approval of these plans, regulated UC campuses will receive an allocation of allowances sufficient to cover 100 percent of their surrender obligation for the duration of the cap-and-trade program.
- In exchange for this free allocation, CARB will require regulated UC campuses to invest a sum commensurate with the market value of the freely allocated allowances in GHG abatement projects. (UC3)

Response: We freely allocated allowances only to emissions intensive and trade exposed (EITE) industry, for transition assistance and leakage prevention, and to electric distribution utilities, for the benefit of ratepayers. The University of California is neither an EITE nor an electric distribution utility. We did not allocate allowances to CHP facilities that have a direct transactional relationship with their end users. For the price signal from the cap-and-trade program to be effective, the cost of GHG emissions must be passed through to end users. We expect UC to pass through carbon costs to end users. Furthermore, electric distribution utilities are allocated allowances to benefit ratepayers; in part because electric distribution utilities have the obligation to purchase and generate electricity, incurring carbon costs directly or indirectly, and have other mandates to reduce GHGs. For example, unlike UC, electric distribution utilities must meet the 33 percent RPS. The University of California is in the same position as other entities, such as local governments and state agencies; some of whom generate their own power. Because they are neither EITEs nor electric distribution utilities, they do not receive allowances.

Nevertheless, in Resolution 11-32 the Board directed the Executive Officer to coordinate with the State universities and stakeholders to evaluate options for compliance, with amendments to the regulation as appropriate, including options of the use of auction revenue, and report back to the Board in summer of 2012.

I-2. Comment: Electricity generating facilities is not listed in table 8-1, nor in table 9-1, which include industry sectors eligible for direct allocation of GHG allowances. Please clarify whether this sector will have to purchase their total allowances through the auction process. (AP)

Response: Electricity generating facilities will need to purchase allowances through the auctions or on the secondary market.

I-3. Comment: For a POU that is a member of a JPA or that has a contractual relationship with a deliverer of electricity used to serve retail native load, LADWP recommends that a provision be added that allows a POU to transfer allowances directly from its compliance account to the compliance account of the JPA or deliverer of electricity. POUs need flexibility to move allowances to the entity that has the compliance obligation to surrender allowances associated with the emissions related to serving native load. This provision would not result in the transfer of allowances to cover emissions associated with wholesale electricity sales. Modify section 95831(a)(4)(B) as follows:

<u>(B) A Publicly Owned Electric Utility may transfer compliance instruments from its compliance account to the compliance account of a Joint Powers Agency in which the POU is a member to the compliance account of a deliverer of electricity or with which it has a power purchase agreement, pursuant to section 95892(b)(2) for electricity that serves retail load only.</u> (LADWP4)

Response: The language was modified in section 95892(b) to clarify that publicly owned utilities (POUs) and cooperatives may only ask for allocations to be placed into compliance accounts of facilities they (or a Joint Powers Agency with which they have a relationship) operate.

I-4. Comment: PG&E supports ARB's decision to allocate allowances to electric distribution utilities for protection of electricity customers. PG&E supports ARB's recognition of the "customer cost burden" principle, the inclusion of an "early action" element in the allocation methodology and allocation to electric distribution utilities for the protection of customers. First, PG&E believes that the costs of meeting electric sector GHG reduction goals will flow through commodity markets to customers, and, therefore, revenue from allowance auctions should be used to mitigate those increased customer costs. PG&E has consistently advocated for a return of allowance value, via utilities, solely for the benefit of customers. Second, PG&E believes additional "early action" allocation, above the expected cap-and-trade cost burden, recognizes customers' past investments in low-carbon resources and will help mitigate costs associated with AB 32 electric sector programmatic measures. (PGE4)

Response: We agree. Thank you for the comment.

I-5. (multiple comments)
Comment: CCSF supports an allowance allocation mechanism that recognizes and rewards those electric distribution utilities that already have significantly reduced GHG

emissions well before the adoption of AB 32. One example would be an allocation mechanism such as the ARB's "Emissions Efficiency Benchmark" used for other sectors, which allocates allowances based on an average of GHG emissions per unit of output and thus rewards entities that have historically operated with lower GHG emissions. Another example, also considered by the ARB, would transition over time from allocating allowances based on emissions to increasingly allocating allowances based on sales or throughput. This approach balances the rewarding of entities with historically low GHG emissions while providing a transition period for high-GHG entities to adjust their operations. (SFMAYOR3)

Comment: We note for the record our disappointment in ARB's proposed allocation of allowances among the state's electric utilities. ARB identified two broad policy objectives it set out to achieve (and reconcile) in developing an allocation methodology: to reward early action from utilities who invested in demand-side reductions and a relatively clean resource mix; and to offset the cost burden on customers of utilities who underinvested in efficiency and maintained a higher carbon-intensive resource mix. In December 2010, ARB proposed to allocate allowances based on three factors: early action (defined as qualifying renewable energy investments from 2007-2011), cumulative energy efficiency investments (also indicative of early action), and customer cost burden (a product of the emissions-intensity of each utility's resource mix). But the actual proposal reveals the methodology is largely a product of the third factor, as customer cost burden accounts for more than 90 percent of each utility's allowance allocation. We maintain that the allocation methodology should give significantly more weight to the other two factors, which would more effectively reward and encourage the transition to clean energy. We appreciate that the methodology has buy-in from the utilities, and recognize ARB's extensive work and collaboration in developing this approach. As proposed, however, we remain concerned that the allocation scheme disadvantages early movers on clean energy and sends the wrong signal for jurisdictions developing or contemplating the development of a carbon market. (KUSTIN16)

Comment: We are very opposed to the method proposed for allowance allocation to the utility sector. The actual proposal uses "customer cost burden" for more than 90 percent of each utility's allowance allocation. We request the customer cost burden factor should be no more than 10 percent of each utility's allowance allocation. One need for this shift is that LADWP calculates that the ARB allocation results in LADWP having absolutely no cost impact from AB 32 cap and trade, even while burning many, many tons of coal all the way to 2027. Surely, letting LADWP benefit from hanging on to coal is not what the legislature had in mind in passing AB 32. (EDLA)

> **Response:** We understand that other methods of allocation, such as a sales-based approach, would have greater advantage to those utilities that made early investments in less emissions-intensive resource mixes. However, we do not believe that it is necessary to disadvantage electric distribution utilities that have not made similarly aggressive investments, in order to establish the correct marginal incentive to reduce emissions. We believe that our method of allocation

achieves this objective; and further, that establishing the correct marginal incentive is by far the most important signal to send to other jurisdictions considering similar carbon pricing programs.

I-6. Comment: Section 95870(d) increases the allocation to electrical distribution utilities by approximately 10 percent. WSPA believes that the allocation to utilities be proportional based on emissions of the different sectors WSPA opposes this bigger proportion of the allowance budget going to the electrical distribution utilities at the expense of the industrial sectors. This makes the utility portion of allocation bigger than their portion of emissions (i.e. 59 percent of allocation vs. 56 percent of emissions) WSPA believes it is critical that all sectors are treated equitably and that all industry including the petroleum industry be provided the same recognition for energy efficiency and early reduction as is given to the electricity distribution utility sector. (WSPA3)

Response: We believe the dispensation of value to the electric sector is equitable and appropriately accounts for the emissions attributable to the electric sector. The purposes for allocating allowances to electric distribution utilities are fundamentally different than those for allocating allowances to the industrial sources. Accordingly, the method of apportioning that value is fundamentally different. With that said, we believe that the establishment of benchmarks in the industrial sector does adequately take into consideration factors such as energy efficiency, which are important for maintaining the incentive for entities to invest in cost-effective emissions reductions.

I-7. Comment: In section 95870(d), The Modified Text provides that the “allowances available for allocation to electrical distribution utilities shall be 97.7 million multiplied by the cap adjustment factor in Table 9.2 for each budget year 2013-2020.” NCPA supports this modification that takes into account 90 percent of the 9.67 MMT that is attributable to electricity from cogeneration facilities purchased by electricity distribution utilities. Including this amount in the allowances attributable to the electrical distribution utilities is appropriate, as independently verified by CARB staff using publicly available data. NCPA recommends that this section include a specific reference to Table 9-3. It is in this table that the actual percentage of allowances to be allocated to the electrical distribution utilities for 2013-2020 is set forth, yet Table 9-3 is not actually referenced in the body of the Proposed Regulation. (NCPA3)

Response: We believe that the changes made to section 95892(a) in the second 15-day changes to the regulation address the concern raised by the commenter.

I-8. Comment: Western understands that when determining a utility’s allocation of allowances, CARB will assume the RPS obligation in a utility’s resource mix even if that utility has not reported its RPS or is not under an RPS obligation. The assumed RPS obligation used by CARB will effectively reduce the amount of unspecified resources, and subsequently the allowances allocated to that utility. Western is not required to comply with California’s RPS. However, Western’s primary mission is to market the power generated from the Bureau of Reclamation's hydro generation facilities. The Sierra Nevada Region markets approximately 2,500 GWh annually to its end-use customers. On average, approximately 50 percent of that load is served with large hydro resources, a null greenhouse emitting resource. Western understands the goal under both the RPS and the Cap and Trade is to reduce greenhouse gas emissions. Western is already serving its load with an average of 50 percent greenhouse gas emission-free resources (well above the RPS requirements) and, therefore, should be allocated allowances based on its total reported unspecified resources. (WAPA2)

> **Response:** We believe that it is important to the integrity of the cap-and-trade program that all utilities have an incentive to continue to reduce their emissions intensity and that the customers of those utilities which have invested in costly renewables are adequately compensated for the actions taken on their behalf. Two important and related principles for the allocation to the electric sector were recognizing early actions made by individual utilities to reduce GHG emissions and the expectation that all electric distribution utilities would continue to aggressively reduce their emissions intensity in accordance with California's 33 percent RPS goals. As a means of binding all parties to this condition, the free allocation to each electric distribution utility was designed to decline by a factor reflecting this expected investment in eligible renewables. In this way, utilities that are already invested in renewables may be assured of a level playing field, because industrial, commercial, and residential consumers are not given an additional incentive to purchase power from utilities that do not comply with the RPS. No electric distribution utilities, except those for which incremental decrease in their emissions intensity is not practicable due to nearly complete reliance on zero GHG resources, were exempted from this method of allocation. While WAPA has historically relied on hydroelectric resources for a large share of its total end-use customer load, a greater investment in zero GHG resources is achievable. Further, without the assessment of the 33 percent RPS, we project that zero GHG resources will make up less than a majority or WAPA's resource mix in the future. Therefore, the standard allocation method was applied to WAPA.

I-9. Comment: The assumptions in the methodology for allocating allowances to utilities are clear that: 1) GHG costs will be incurred by fossil generators; 2) utility customers should see/incur such GHG costs; and 3) allocations are intended to cover these costs the utility pays to the generator. Yet, as currently written only the first will occur. This is clearly an inconsistency/error that must be fixed. Wellhead believes there is a very simple solution within the construct of the proposed regulations that is fully consistent with the proposed regulations and is consistent with the policy objective of making the cost of GHG emissions transparent. The solution 1) takes account of the fact that the free allocation methodology assumes all of the fossil generation in a utility's portfolio will have a GHG cost that is being passed through to its customers and 2) builds on the inclusion of a "beneficial holding relationship" in the proposed regulation. Further, the proposal encourages discussions that could lead to renegotiations before the program starts, improves the incentives for a successful outcome by providing clear guidance as to what CARB expects, and accounts in advance for the chance those discussions are not fruitful. Accordingly and to that end, Wellhead recommends adding a new subparagraph (4) to section 95834(a) of the proposed Regulations. This addition to the Regulations provides clear direction on a backstop approach to addressing the AB 32 contract problem while also eliminating the inconsistency/error in the proposed regulations free allowance allocation methodology. The result will support the clear objectives of AB 32 to reduce GHG emissions with regulations/programs that make the full cost of GHG emissions transparent to consumers. Modify section 95834(a) as follows:

> (4) In the event there is a long-term contract for the sale of electricity at wholesale to a distribution utility which:
>
> > i. does not directly or indirectly provide or refer to GHG costs either explicitly or through a CPUC authorized pricing basis that includes GHG costs;
> > ii. was fully executed before the final approval of AB 32 (September 27, 2006); and
> > iii. has not been renegotiated and approved by the appropriate regulatory authority as of January 1, 2012 to address GHG costs, then, a beneficial holding relationship is deemed to exist pursuant to section 95834(a)(1)(A) without further action. The electric distribution utility party to that long-term contract shall purchase and hold allowances for the eventual transfer to the other party to the long-term contract for the sole purpose of supplying that other party with compliance instruments to cover emissions resulting from deliveries under the long term power supply contract. (WEC2)

Response: We did not make this change. We believe that contract issues are best solved by the counterparties to those contracts. However, we understand that the CPUC will be discussing the treatment of generators who have long-term, fixed-price contracts with investor-owned utilities when the investor-owned utilities received allowances for expected carbon costs from this generation.

That said, in Resolution 11-32 the Board directed the Executive Officer to monitor progress on bilateral negotiations between counterparties with existing contracts that do not have a mechanism for recovery of carbon costs associated with cap-and-trade for industries receiving free allowances pursuant to Section 95891, and to identify and propose a possible solution, if necessary. For fixed-price contracts between independent generators and investor-owned utilities, the Board further directed the Executive Officer to work with the California Public Utilities Commission to encourage resolution between contract counterparties.

Accurate Accounting/Reporting

I-10. (multiple comments)

Comment: In section 95890 (page A409), ARB proposes that an EDU is eligible to receive a direct allocation of allowances "if it has complied with the requirements of the Mandatory Reporting Regulation (MRR) and has obtained a positive or qualified positive emissions data verification statement on its sales number for the prior year pursuant to MRR." While LADWP has every intention to comply with the requirements of MRR, it appears that this provision is vague and potentially unnecessarily punitive. If a covered entity has failed to comply with the emissions reporting requirements, penalty provisions are available to ARB within the MRR itself. ARB also has the ability to assign emissions to a covered entity in the absence of verified emissions. LADWP requests clarification as to the intent of this requirement to ensure that eligibility for a direct allocation cannot be obstructed by a minor or temporary setback associated with MRR verification, and that enforcement provisions for emissions verification are separated from the allocation rules. (LADWP4)

Comment: Section 95890 states that in order to be eligible for direct allocations an electrical distribution utility must have "complied with the requirements of the MRR" and "obtained a positive or qualified positive emissions data verification statement for the prior year pursuant to the MRR." These provisions should be removed. Table 9-3 entitled "Percentage of Electric Sector Allocation Allocated to Each Utility" identifies by name each utility that will receive a direct allocation of allowances. Being an electrical distribution utility as defined in section 95802(a)(82) and, as a result, being identified in Table 9-3 in itself establishes the eligibility of the utility to receive an allocation of allowances calculated in accordance with section 95870(d). Adding additional conditions that the utility must have "complied with the requirements of the MRR" and "obtained a positive or qualified positive emissions data verification statement for the prior year pursuant to the MRR" would expose the utility to a duplicative and harsh punishment—loss of its allocation of allowances—if it failed to meet those conditions.

The first requirement that the utility must have "complied with the requirements of the MRR" is vague. An entity could be deemed to be non-compliant with the MRR for a variety of reasons, including being late with reports, including inaccurate data in reports, or failure to retain records as required. The MRR already establishes penalties for these infractions. Imposing the additional penalty of denying the utility its allocation of allowances would add a duplicative and unduly disproportionate penalty to the penalties already established in the MRR.

The second requirement that the utility must have "obtained a positive or qualified positive emissions data verification statement for the prior year pursuant to the MRR" is more specific but equally problematic. While electrical distribution utilities expect to receive positive or qualified positive emission data verification statements without exception, the receipt of an adverse emission data verification statement cannot be ruled out. Section 95107 of the MRR establishes penalties for submitting verification reports late and for including inaccurate information in such reports. Again, the additional penalty of denying the utility its allocation would be duplicative and grossly disproportionate. It would be egregious to deny an allocation to a utility, forcing the utility to purchase allowances on the market to cover its compliance obligation. Imposing such a harsh as penalty would not be consistent with the goal of enabling each utility "to fully compensate their consumers for the costs associated with the cap-and-trade program." Compare the situation of having an adverse verification emissions report to the situation in which emissions are reported and verified accurately, but insufficient allowances are surrendered to cover them. In the latter case, an electrical distribution utility must surrender four compliance instruments for every one that is short under section 95857(b)(2) and may be subject to additional financial penalties under section 96014. In the former case, an entity could surrender compliance instruments to completely cover the emission obligation for a year with an adverse emissions statement and then forfeit an entire year's allocation of compliance instruments for the following year in addition to bearing penalties for inaccuracy or failure to report properly. This would be excessive and unfair. Utilities should not be required to have "complied with the requirements of the MRR" and "obtained a positive or qualified positive emissions data verification statement for the prior year pursuant to the MRR" to be eligible for the allocation provided to them in Table 9-3. Being named and provided an allocation in Table 9-3 should, in itself, establish each utility's eligibility for an allocation. Modify section 95890(b) as follows:

~~(b) Eligibility Requirements for Electrical Distribution Utilities. An electrical distribution utility shall be eligible for direct allocation of California GHG allowances if it has complied with the requirements of MRR and has obtained a positive or qualified positive emissions data verification statement for the prior year pursuant to MRR.~~ (SCPPA6)

Comment: Section 95890 on page 109 states that in order to be eligible for direct allocations an electrical distribution utility must have "… complied with the requirements of the MRR…" and "… achieved a positive or qualified positive emissions data verification statement for the prior year pursuant to the MRR." This provision appears to be a holdover from when ARB was considering an allocation mechanism that depended upon verified sales data and emissions data from prior years. In the 15-day language, the allocation to electric distribution utilities is determined up-front, and does not depend in any way on an entities reported emissions from the prior year, verified or otherwise. While compliance requires surrender of compliance instruments to cover verified emissions, or the amount assigned by the Executive Officer in the event of an adverse verification, this compliance is essentially independent going forward from the allowance allocation process. Section 95890(b) in effect represents a significant implied potential penalty and should be removed from the regulations. The requirement for "compliance with the MRR" is too vague. An entity could be deemed in non-compliance with the MRR for a variety of reasons, including being late with reports, including inaccurate data in reports, or failure to retain records as required. In each of these cases, the MRR already establishes penalty provisions. This requirement should be removed. The second requirement is more specific but equally problematic. While electrical distribution utilities expect to achieve positive emission data verification statements in general, the event of an adverse emission data verification statement cannot be ruled out. In such an event, it seems an egregious penalty to not provide direct allocations in the following year, forcing the electrical distribution utility to purchase allowances on the market to cover its compliance obligation. Such a penalty is not consistent with the goal of avoiding an undue compliance burden being placed on utility ratepayers. Section 95107 of the MRR already establishes penalties for submitting verification reports late and for including inaccurate information in such reports. Additional penalties for these violations are not necessary. This requirement should be removed. Compare the situation of having an adverse verification emissions report to the situation where emissions are reported and verified accurately, but insufficient allowances are surrendered to cover them. In the latter case, an electrical distribution utility must surrender four compliance instruments for every one that is short, and is subject to additional financial penalties. In the former case, an entity could surrender compliance instruments to completely cover the emission obligation for a year with an adverse emissions statement, and in effect be required to surrender an entire year's worth of compliance instruments in the following year, in addition to any penalties for inaccuracy or failure to report properly. This is clearly not a fair penalty. There is no reason to have an eligibility test for direct allocations that is related to compliance with the MRR or achievement of a positive or qualified positive emissions statement for the prior year. Whether one year's emissions are verified accurately or not, an electrical distribution utility still has a compliance obligation for the following year, and still has ratepayers subject to compliance costs without direct allocations. The best solution to this problem is to simply excise Section 95890(b) in entirety. Modify section 95890(b) as follows:

> ~~(b) Eligibility Requirements for Electrical Distribution Utilities. An electrical distribution utility shall be eligible for direct allocation of California GHG allowances if it has complied with the requirements of the MRR and has obtained a positive or qualified positive emissions data verification statement on its sales number for the prior year pursuant to the MRR.~~ (SMUD3)

Comment: Section 95890(b) states that in order to be eligible for direct allocations an electrical distribution utility must have "complied with the requirements of MRR" and "obtained a positive or qualified positive emissions data verification statement for the prior year pursuant to MRR." This provision should be removed now that ARB has decided to specify the allocations for electric distribution utilities for each year in Table 9-3 in section 95892. The purpose of this subsection was to update sales-based allocations with the latest data if the allocations were to transition to a sales-based allocation as recommended by the CPUC and the CEC. The decision in the 15-day modifications to not use sales or emissions as a basis means this subsection is not necessary and should be deleted. Modify section 95890(b) as follows:

> ~~(b) Eligibility Requirements for Electrical Distribution Utilities. An electrical distribution utility shall be eligible for direct allocation of California GHG allowances if it has complied with the requirements of MRR and has obtained a positive or qualified positive emissions data verification statement for the prior year pursuant to MRR.~~ (SEMPRA3)

Comment: Section 95890(b) would require electrical distribution utilities to comply with the MRR and have positive verification in the previous year in order to get free allowances each year. As discussed in Appendix A, an electrical distribution utility should be eligible to receive the allocation of allowances if they are listed in Table 9-3; accordingly, NCPA believes that section 95890(b) is unnecessary. For one thing, Appendix A of the Notice sets forth the requirements for electrical distribution utilities to qualify for allocation of allowances under the Program, and the qualification is not based on the amount of emissions reported under the MRR. Secondly, the MRR contains a wide range of reporting requirements; there is no single MRR rule that would apply to all electrical distribution utilities, and some electrical distribution utilities will be subject to different provisions of the MRR. Therefore, mandating compliance with the MRR is vague and could be ambiguous. Likewise, there are a number of reasons why an entity that is required to obtain verification does not have a positive verification in time to qualify for the subsequent year's allowance allocation. Further, if the goal here is to incentivize compliance with the MRR, the MRR and Cap-and-Trade regulation are each replete with remedies available to CARB should they feel that the electrical distribution utilities are not meeting their reporting obligations, in addition to the requirement to surrender allowances for underreported emissions. Accordingly, NCPA agrees with the recommendation of the Joint Utilities that section 95890(b) be stricken entirely. Modify section 95890(b) as follows:

> ~~(b) "An electrical distribution utility shall be eligible for direct allocation of California GHG allowances if it has complied with the requirements of the MRR and has obtained a positive or qualified positive emissions data verification statement on its sales number for the prior year pursuant to the MRR."~~ (NCPA3)

Comment: If ARB decides that a provision on eligibility for electrical distribution utilities should be retained in section 95890 to parallel the section on eligibility for industrial facilities in section 95890(a). Modify section 95890(b) as follows:

> (b) Eligibility Requirements for Electrical Distribution Utilities. An electrical distribution utility shall be eligible for direct allocation of California GHG allowances if it meets the definition of "Electrical Distribution Utility" in section 95802(a)(82).~~has complied with the requirements of the MRR and has obtained a positive or qualified positive emissions data verification statement on its sales number for the prior year pursuant to the MRR.~~ (SCPPA6)

> **Response:** We disagree. It is critical that utilities, like all other covered entities, comply with the MRR and accurately report GHG emissions. We believe that accurate accounting is necessary to a successful cap-and-trade program. If EDUs did not comply, we would not have the data needed to determine an EDU's compliance obligation. Further, like all entities receiving free allocation, free allocation must be made conditional on a positive verification of reported emissions. This provision is necessary to avoid the fulfillment of false claims on and mis-apportionment of allowance value.

I-11. Comment: If CARB determines that it is necessary to continue to reference the provisions of the MRR in conjunction with eligibility to receive an allowance allocation, NCPA recommends that the provisions of section 95890(b) be revised to provide a reference to the "applicable" MRR provisions. Modify section 95890(b) as follows:

> (b) An electrical distribution utility shall be eligible for direct allocation of California GHG allowances if it has complied with the <u>applicable</u> requirements of the MRR and has obtained a positive or qualified positive emissions data verification statement on its sales number for the prior year pursuant to the MRR. (NCPA3)
>
> **Response:** We did not modify the section as proposed. It is unnecessary to qualify the eligibility requirement in this way because entities are not required to comply with any provisions that do not apply to them.

Community Choice Aggregation and Cooperatives

I-12. Comment: How will Community Choice Aggregators (CCA) that come into existence after 2008 receive electric utility allocations? Table 9-3, page A-124, did not list Marin Clean Energy (MCE) as a recipient of allowances. MCE is a current example of a CCA, but other local governments are investigating the feasibility of CCA. If new CCAs come online, is there a method to provide allocations to them? They should be required to return the value to their ratepayers as well. (CARBONSHARE2)

> **Response:** Thank you for the comment. We believe that section 95892(d)(4) as amended in the second 15-day changes to the regulation addresses the concern raised by the commenter.

I-13. Comment: The Regulation should be further modified to add "electrical cooperatives" to the definition key at the bottom of Table 9-3, or to change the POU designation to "publicly owned utilities and electrical cooperatives." (NCPA3)

> **Response:** We agree. We added "electrical cooperatives" to the definitions.

Confidentiality of Data for Appendix A

I-14. (multiple comments)
Comment: NCPA seeks clarification from CARB regarding the tables included in the Revised Appendix A, and the correlation to Table 9-3 in the Regulation in order to ensure that all of the figures expressed in the document correctly represent the appropriate number of allowances to be allocated to each of the electrical distribution utilities. On July 27, CARB issued a Revised Appendix A. The tables and summaries in the Revised Appendix that correspond to Table 9-3 have been updated from what was provided on July 25. Before parties can comment on the specific numbers set forth in Table 9-3 (as opposed to the underlying methodology addressed in Appendix A), CARB must provide stakeholders with clarification regarding the finality of the tables. The

underlying spreadsheets that support the final figures should also be provided. Stakeholders should be able to submit comments and input to CARB on this matter once such clarification is provided. (NCPA3)

Comment: ARB indicates in Appendix A that staff has created an ARB allocation model based on the Joint Utilities' 2010 database. LADWP understands that ARB's allocation model is yet to be made publicly available for review and validation. It would be beneficial to have the ARB allocation model outputs validated to ensure that any unintended formula errors are identified and corrected. Additionally, LADWP recommends that the final allocation schedule, as corrected, be incorporated directly into the regulation in section 95892. (LADWP4)

> **Response:** We did not provide further detail regarding the dispensation of allowance value to the electric distribution utilities. Many of the data provided for this portion of the regulation were provided to us with the understanding that they are trade-sensitive and confidential. Similar to the allocation to EITE industry, we have determined that we cannot release these data.

Accounts, Distribution, and Allocation Timing for EDUs

I-15. (multiple comments)
Comment: Section 95870(d) states that the Executive Officer will place allocations in the "holding accounts" of each utility, on or before January 15 of each calendar year pursuant to section 95892. Several clarifications are needed here. First, Table 9-3 in the 15-day language includes the percentage amounts that take the overall electric sector allocation, 97.7 million metric tons times the adjustment factors in Table 9-2, as stated in section 95870(d), and allocate these annual amounts to each of the 57 electric distribution utilities identified in the table. However, no language in the Regulations themselves states that Table 9-3 is to be used in this manner, and this should be corrected for clarity. Second, the placement of allowances in the "holding accounts" of each eligible utility is inconsistent with section 95892, in which the Executive Officer is to place allowances in either the "limited use holding accounts" of each utility or, for POUs, in compliance accounts as designated in section 95892(b)(2). Per section 95892, no allowances are to be placed in a utility's "holding account." Third, it may be useful to specify with more certainty when allowances are to be placed in the appropriate accounts, for two reasons. With the delay of the Cap and Trade program until 2013, there is some uncertainty about when allowances will be distributed for utilities (and industrial regulated parties) prior to that year. With two advance auctions scheduled for the second half of 2012, the Regulations imply that at least for investor owned utilities the Executive Officer will place allowances in their limited use holding accounts at least six months prior to January 15, 2012. Presumably, industrial regulated parties would also be distributed allowances prior to the auctions, so that they have certainty about their need for allowances and can decide whether to and how to participate. While this early placement is allowed by the "on or before" language in the Regulations, greater certainty about how this will work would be useful. In addition, given the "or before" language in the Regulations, there is a degree of risk for POUs,

which are expected pursuant to section 95892(b)(2) to inform the Executive Officer "...at least 90 days prior…" to receiving a direct allocation of allowances how those allowances should be dispersed to the acceptable accounts. POUs may find themselves in inadvertent violation of the regulations if the Executive Officer decides to exercise the "or before" option and the POU no longer has 90 days with which to inform about proper placement. Finally, the term "eligible" would no longer be needed here, should ARB accept the proposed change to section 95890 above. Modify section 95870(d) as follows:

> (d) Allocation to Electrical Distribution Utilities. The Executive Officer will place an annual individual allocation in the ~~holding~~ appropriate accounts of each ~~eligible~~ electrical distribution utility on ~~or~~ before July 15, 2012, or first business day thereafter, for vintage 2013 allowances and January 15, or first business day thereafter, of each calendar year from 201~~3~~4-2020 pursuant to section 95892. Allowances ~~available for allocation~~ allocated to electrical distribution utilities shall be 97.7 million multiplied by the cap adjustment factor in Table ~~9.2~~ 9-2 for each budget year 2013-2020, multiplied by the utility allocation factors in Table 9-3 for each year. (SMUD3)

Comment: Section 95870(d) should be revised to correctly identify the accounts into which the Executive Officer will place the allowances that are allocated to electrical distribution utilities. Currently, the section incorrectly states that the Executive Director shall place the allowances that are allocated to electrical distribution utilities in the "holding account" of each utility. The section should be revised to state that the allowances shall be placed either in the utility's limited use holding account in accordance with section 95892(b)(1) or in the utility's compliance account in accordance with section 95892(b)(2). Additionally, section 95870(d) should be revised to provide that the allowances that are allocated to the electric sector each year shall be allocated among the electrical distribution utilities on the basis of the percentage allocation factors specified for each utility in Table 9-3. Currently, the section identifies the total amount of allowances that shall be available for allocation to the electrical distribution utility sector each year but does not take the next step of identifying how the allowances will be allocated among the electrical distribution utilities within the sector. Modify section 95870(d) as follows:

> (d) Allocation to Electrical Distribution Utilities. The Executive Officer will place an annual individual allocation either in each eligible electrical distribution utility's limited use holding account in accordance with section 95892(b)(1) or in its compliance account in accordance with section 95892(b)(2)~~in the holding account of each eligible electrical distribution utility~~ on or before January 15 of each calendar year from 2013-2020 pursuant to section 95892. Allowances available for allocation to electrical distribution utilities each budget year shall be 97.7 million metric tons multiplied by the cap adjustment factor in Table 9-2 for each budget year 2013-2020. The allowances allocated to each electrical distribution utility each budget year shall be the amount allocated to the electrical

distribution utilities for the budget year multiplied by the percentage allocation factors specified in Table 9-3. (SCPPA6)

Comment: Section 95870(d) states that electric distribution utilities will be allocated allowances on or before January 15th of each calendar year starting in 2013. ARB should provide an allowance allocation date for the initial auctions that will take place in the second half of 2012 (for 2013 allowances). In addition, PG&E proposes that allocation occurs at least prior to the date in which electric distribution utilities are required to consign allowances to the auction, prior to December 1st of each calendar year would suffice. (PGE4)

> **Response**: We updated section 95870(d). The Executive Officer will place allowances in limited use holding accounts. We updated the timing of allowance allocation activities in section 95870(a-d) in response to stakeholder comment. Allocation to accounts controlled by the Executive Officer will now occur immediately after the creation of these accounts. Allocation to electrical distribution utilities and industrial covered entities will now occur in November of the year prior to the allowance budget year being distributed. A special allocation of 2013 vintages to electrical distribution utilities is now planned in July 2012, to allow for consignment auctions by utilities of one-third (one-sixth at each of two auctions) of 2013 allowances in 2012.

I-16. Comment: Section 95892(b)(2) states that Publicly Owned Utilities must inform the Executive Officer in which accounts they want allowances for the vintage year to be placed, at least 90 days prior to receipt of the allowances. The Regulations allow POUs to request placement of allowances in their limited use holding accounts, their compliance accounts, or the compliance accounts of a "Joint Powers Agency in which the electrical distribution utility is a member and with which it has a power purchase agreement." There are two clarifications that would be beneficial here. First, unlike section 95892(b)(1), there is no language for the POUs or electrical cooperatives (note there is also a misspelling of the word "cooperative") that states that the Executive Officer shall place allowances in the accounts as previously informed by the POUs. Second, additional flexibility is necessary for situations in which a publicly owned utility is the sole procurer of power from several JPAs associated with specific power plants. In this situation, the POU is in effect operating and dispatching the facilities, and the amount of allowances needed for compliance by a specific JPA entity may vary significantly from one year to the next depending upon system conditions in the POU's territory. These system conditions are not well known in advance. For example, it is not known in advance whether a year will be particularly wet or dry or hot or cool, and these differing conditions can lead to large changes in the need to dispatch particular JPA associated units. Modify section 95892(b)(2) as follows:

> (2) Publicly Owned Electric Utilities or Electrical Cooperatives. At least 90 days prior to receiving a direct allocation of allowances, publicly owned electric utilities or Electrical Cooperatives will inform the Executive Officer of the share of their allowances that is to be placed: in the allowed accounts in 95892(b)(2)(A) and (B). Upon receiving the publicly owned utility or electrical cooperative's

information, the Executive Officer shall place allowances in the accounts as indicated.

(A) In the publicly owned electric utility's or Electrical Cooperative's compliance account or the compliance account of a Joint Powers Agency in which the electrical distribution utility is a member and with which it has a power purchase agreement; or

(B) In the publicly owned electric utility's or Electrical Cooperative's limited use holding account.

(C) With the approval of the Executive Officer, a publicly owned utility or electrical cooperative may move allowances in the compliance account of a Joint Powers Authority with which it alone has a power purchase agreement to the compliance account of another Joint Powers Authority with which it alone has a power purchase agreement prior to the surrender deadlines in Section 95856(d). (SMUD3)

Response: We corrected the typographical error in section 95892(b)(2). We also modified the language in sections 95892(b)(2)(A) and (B) in a way that we believe provides POUs with the flexibility requested. We did not make the change requested to insert section 95892(b)(2)(C) because entities will not have the ability to remove compliance instruments from compliance accounts. However, the revisions to section 95892(b)(2)(A) allow the POUs to request the Executive Officer to place directly allocated allowances into the compliance accounts of Joint Power Agencies. We believe that this change will give the POUs the flexibility they need without wholesale changes to the structure of the accounts system.

Calculation and Use of Allowance Value

I-17. Comment: CARB should clarify its intent in sections 95892(d) and (e) with regard to the use of the terms "auction value," "allowance value," and "monetary value." These terms are used interchangeably in some context, yet they have distinct meanings. This clarification is necessary because these sections place specific requirements on electrical distribution utilities, and the scope of the requirements must be clearly understood. (NCPA3)

Response: Thank you for the comment. Definitions are provided in the regulation to clarify the meaning of these terms. We believe the usage is consistent with definitional meanings.

I-18. Comment: Section 95892(a) requires that allowances allocated to Electrical Distribution Utilities must be used exclusively for retail ratepayers. WSPA recommends that the language be clarified to include industrial ratepayers in the retail ratepayers. Further WSPA recommends that Electrical Distribution Utilities also participate in the revenue distribution for other purposes such as to address the environmental justice requirements. (WSPA3)

Response: Thank you for the comment. We expect that some fraction of the value allocated to electric distribution utilities may be used for industrial customers. We are awaiting the conclusion of the CPUC proceeding on the use of allowance value before moving forward with any additional changes to our guidance on the use of allowance value.

I-19. (multiple comments)
Comment: Section 95892(e)(2) states that Publicly Owned Utilities must calculate the value of allowances placed into their compliance accounts directly, and report annually on the use of that allowance value. SMUD believes that the calculation of allowance value is vague, and should be clarified, and that ARB must clarify that the use of allowance value for retail compliance, as established in section 95892(b)(2). ARB can avoid differential calculation of 'allowance value' by the POUs in the state, each using a different averaging technique (e.g. – weighted differentially) by performing the calculation averaging the four quarterly auction prices itself, and providing the result to use. Modify section 95892(e)(2) as follows:

(e) Reporting on the Use of Auction Proceeds and Allowance Value. No later than June 30, 2013, and each calendar year thereafter, each electrical distribution utility shall submit a report to the Executive Officer describing the disposition of any auction proceeds and allowance value received in the prior calendar year. This report shall include:

(1) The monetary value of auction proceeds received by the electrical distribution utility;

(2) How the electrical distribution utility's disposition of such auction proceeds complies with the requirements of this section and the requirements of California Health and Safety Code sections 38500 et seq;

(3) The monetary value of allowances received by the electrical distribution utility which were deposited directly into its compliance account. ~~The~~ <u>ARB shall calculate the</u> value of these allowances ~~shall be quantified~~ based on the average market clearing price of the four quarterly auctions held in the same calendar year ~~that the~~ <u>of the vintage of the</u> allowances ~~are allocated~~; and

(4) How the electrical distribution utility's disposition of the monetary value of allowances, deposited directly into its compliance account, complies with the requirements of this section and the requirements of California Health and Safety Code sections 38500 et seq. <u>Use of allowance value for compliance associated with retail load of the publicly owned utilities complies with the requirements of this section.</u> (SMUD3)

Comment: The Utilities recommend striking section 95892(e)(4), as it does not provide any unknown or additional information to CARB, is not needed to monitor the use of allocated allowances, and creates unnecessary uncertainty and burden to a process that already creates significant administrative work. Allowances deposited into a compliance account may only be used in a single manner—to be retired to meet an entity's compliance obligation. Thus, no report is necessary to provide data regarding the purpose or use of such allowances or allowance value. Modify section 95892(e)(4) as follows:

> ~~(4) How the electrical distribution utility's disposition of the monetary value of allowances, deposited directly into its compliance account, complies with the requirements of this section and the requirements of California Health and Safety Code sections 38500 et seq.~~ (MID3)

Response: We did not strike the text as recommended by the commenter. This reporting is necessary to achieve a full picture of how all allowance value distributed to electrical distribution utilities is used. The flexibility to directly use freely allocated allowances to meet a compliance obligation is unique to the POUs. We desire a close accounting of how many allowances are used in this fashion so that we may better understand how this affects carbon pricing from these generators.

1-20. (multiple comments)
Comment: Section 95892(f) should be amended to address the situation of several SCPPA members who are members of the California Independent System Operator (CAISO). CAISO members are required to sell the electricity they generate or import into the CAISO's market and then bid the electricity back in a wash transaction in order to use the electricity they generate to serve their native load. Section 95892(f) as currently written would prohibit the SCPPA members of the CAISO from using directly allocated allowances that the Executive Officer places in their compliance accounts to meet the compliance obligation associated with the electricity they generate or import to serve their native load but which must be sold into the CAISO market and then bid back in a wash transaction. In order to permit the SCPPA members of the CAISO to use their directly allocated allowances to meet the compliance obligation associated with the electricity they generate or import to serve their native load, section 95892(f) should be revised. Modify section 95892(f) as follows:

> (f) Prohibited Use of Allocated Allowance Value. Use of the value of any allowance allocated to an electrical distribution utility, other than for the benefit of retail ratepayers consistent with the goals of AB32 is prohibited, including use of such allowances to meet compliance obligations for electricity sold into the California Independent System Operator markets <u>in excess of the electricity needed to meet the electrical distribution utility's native load in the same hour</u>. (SCPPA6)

Comment: The Utilities recommend striking section 95892(f) as it is duplicative of section 95892(a). Further, it is unclear as to the rationale for excluding the value of free allowances from being used for electricity sold into the California Independent System Operator (CAISO). While the Utilities understand that the CAISO has no compliance obligation under the Cap and Trade program, it would seem difficult, if not impossible, to manage and keep an accurate accounting of this distinction. In addition, the Utilities are concerned this exclusion could create a huge problem for entities that must sell into the

CAISO markets because they do not own transmission from their generation to their load. This clause would be harmful due to the nature of the CAISO markets (CAISO does not allow point to point energy deliveries, only imports/exports at various nodes). Any utility that owns remote generation and relies on the CAISO markets for energy delivery rather than utility-owned transmission would be penalized at the expense of their ratepayers who already pay significant CAISO costs. Modify section 95892(f) as follows:

> ~~(f) Prohibited Use of Allocated Allowance Value. Use of the value of any allowance allocated to an electrical distribution utility, other than for the benefit of retail ratepayers consistent with the goals of AB32 is prohibited, including use of such allowances to meet compliance obligations for electricity sold into the California Independent System Operator markets. (~~MID3)

Comment: IOUs must consign all allocated allowances and use that revenue for the benefit of customers and cannot use revenues for any other purpose. Modify section 95892(f) as follows:

> (f) Prohibited Use of Allocated Allowance Value. Use of the value of any allowance allocated to an electrical distribution utility, other than for the benefit of retail ratepayers consistent with the goals of AB 32 is prohibited~~, including use of such allowances to meet compliance obligations for electricity sold into the California Independent System Operation markets.~~ (PGE4)

Comment: The Proposed Regulation clearly expresses CARB's intent that the total value of the allowances allocated to electrical distribution utilities should be used for the benefit of customers and to further the objectives of AB 32. This requirement is further refined by the oversight of the California Public Utilities Commission IOUs or the local governing boards of POUs and electrical cooperatives (section 95892(a), (d), and (e)). Accordingly, section 95892(f), which places further restrictions on the use of the funds for California Independent System Operator (CAISO) transactions, should be stricken, as it fails to recognize the manner in which energy transactions through the CAISO BA work. For entities such as NCPA that have all of their transactions go through the CAISO BA, including self scheduled energy that is delivered directly to load, this prohibition would place an unreasonable constraint on utility operations. Due to the CAISO's rules for scheduling and bidding, tracking the various permutations of such transactions would be virtually impossible. The prohibition on using allowances to meet surrender obligations for sales into the CAISO appears to be intended to address the sale of excess energy. However, as drafted, it creates untenable restriction on utility operations and should be deleted. Pursuant to the provisions of section 95852(e), electrical distribution utilities will be providing detailed reports regarding the use of the allowance value. Those reports must reflect the beneficial use of the value, which will allow CARB to verify compliance with the provisions of the Regulation. The restriction in section 95852(f) does nothing to further the goals of the section 95852(a) and should be stricken from the Proposed Regulation. Modify section 95852(f) as follows:

~~(f) Prohibited Use of Allocated Allowance Value. Use of the value of any allowance allocated to an electrical distribution utility, other than for the benefit of retail ratepayers consistent with the goals of AB32 is prohibited, including use of such allowances to meet compliance obligations for electricity sold into the California Independent System Operator markets.~~ (NCPA3)

Response: 95892(d)(5), which was formerly 95892(f), imposes specific prohibitions on some uses of freely allocated allowances and auction proceeds. The intent of this language is to guarantee that all bids into the CAISO markets correctly include the generator's emissions cost in the generator's CAISO market bid price. Specifically, POUs that wish to transfer allowances to generators that sell into the CAISO market will have to purchase those allowances at the allowance auction or in the secondary market to ensure the transferred allowance is correctly valued and that freely allocated allowances are not used to suppress CAISO bid prices.

POUs are able to use their freely allocated allowances to directly meet the compliance obligation for generators that do not sell into the CAISO market. We understand some generators controlled by POUs may sell their electricity into the CAISO market, and then purchase it back out of the market to meet their load, due to transmission constraints. We do not consider this a special case. The POUs may not transfer freely allocated allowances to meet the compliance obligation of those generators involved in these wash transactions.

I-21. Comment: It is not clear how CARB intends to ensure achievement of the goal of minimizing leakage in the utility allowance allocation process. Neither the Regulation nor Resolution 10-42 expressly direct the CPUC or municipalities to ensure that the allowance allocation methodology protect EITE entities and thereby minimize leakage. CARB is fully within its jurisdiction to condition its provision of allowances to the utilities on treatment of EITE ratepayers in a way that will minimize leakage and also preclude any chance of double-recovery. The CPUC's role is clearly limited under Public Utilities Code section 701 to regulating California's public utilities. The goal of minimizing leakage through the protection of EITE entities, however, is unrelated to public utilities. It is a goal directed toward preventing shifts of manufacturing activity to facilities outside of the state and thereby creating emissions leakage. While it is possible that the CPUC will strive to limit leakage, this is not its traditional role. Accordingly, to ensure that electricity sector allowances are used in a manner that fulfills AB 32 objectives, CARB must condition its allowance allocation to the electricity sector on the use of allowance value to offset EITE indirect GHG compliance costs reflected in utility power rates. Moreover, the Regulations should clarify that if the auction value of the 97.7 MMT allowances is not used to offset EITE indirect costs, CARB will withhold allowances needed to cover EITE indirect costs from the electricity sector allowance allocation so that the allowances can be allocated to EITE customers directly by CARB. Modify section 95892(d)(3) as follows:

(3) Auction proceeds obtained by an electrical distribution utility shall be used exclusively for the benefit of retail ratepayers of each electrical distribution utility, consistent with the goals of AB 32, and may not be used for the benefit of entities or persons other than such ratepayers.

(A) Investor owned utilities shall ensure equal treatment of their own customers and customers of electricity service providers and community choice aggregators.

(B) To the extent that an electrical distribution utility uses auction proceeds to provide ratepayer rebates, it shall provide such rebates with regard to the fixed portion of ratepayers' bills or as a separate fixed credit or rebate.

(C) To the extent that an electrical distribution utility uses auction proceeds to provide ratepayer rebates, these rebates shall not be based solely on the quantity of electricity delivered to ratepayers from any period after January 1, 2012.

(D) Investor owned utilities shall use auction proceeds to offset the greenhouse gas compliance costs reflected in the rates charged to energy-intensive, trade-exposed customers consistent with the goal of AB 32 to limit emission leakage. (EPUC2)

Response: We did not make the change. However, we expect that some fraction of the value allocated to electric distribution utilities may be used for leakage prevention from industrial sources that purchase electricity from electric distribution utilities. We are awaiting the conclusion of the CPUC proceeding on the use of allowance value before moving forward with any additional changes to our guidance on the use of allowance value.

Beneficial Holding Relationships

I-22. Comment: PG&E appreciates that ARB has recognized the need to allow electrical distribution utilities to claim a beneficial holding relationship under certain circumstances. However, PG&E is concerned that the new language specifies that a beneficial holding relationship for electrical distribution utilities requires the contract for electricity be "long-term." Electrical distribution utilities should be able to serve as the agent in a beneficial holding relationship for any contract for the delivery of electricity, regardless of length. Further, as the electrical distribution utility may be serving as the agent acquiring and holding compliance instruments for multiple second registered entities, it would be preferable to allow each second registered entity to allocate a portion of its holding limit to the electrical distribution utility, and to allow the electrical distribution utility to aggregate any such allocated holding limits. Modify section 95834as follows:

(a) A B~~b~~eneficial H~~h~~olding relationship exists when:

(1) An E~~e~~ntity holds C~~c~~ompliance I~~i~~nstruments in its H~~h~~olding A~~a~~ccount that are owned by a S~~s~~econd R~~r~~egistered E~~e~~ntity. The E~~e~~ntity acquires, holds, and ~~disposes of~~ transfers the C~~c~~ompliance I~~i~~nstruments based on instructions from or

an agreement with the S~~s~~econd R~~r~~egistered E~~e~~ntity. There are two types of participants in a B~~b~~eneficial H~~h~~oldings relationship:

(A) The agent in the B~~b~~eneficial H~~h~~oldings relationship is the registered entity holding C~~c~~ompliance I~~i~~nstruments owned by another E~~e~~ntity or to be transferred to another E~~e~~ntity under an agreement disclosed to ARB.

(B) The principal in the B~~b~~eneficial H~~h~~oldings relationship is the registered entity that owns the Ccompliance Iinstruments held by an agent or to whom the C~~c~~ompliance I~~i~~nstruments will be transferred under an agreement disclosed to ARB.

(2) An E~~e~~lectrical D~~d~~istribution U~~u~~tility informs ARB that ~~it has established an agreement~~ its contract for delivery of electricity includes the option to serve as the agent in a B~~b~~eneficial H~~h~~olding relationship pursuant to section 95834(a)(1)(A) to purchase and hold A~~a~~llowances for the eventual transfer to a S~~s~~econd R~~r~~egistered E~~e~~ntity with whom it has ~~a long-term~~ the contract. ~~for the delivery of electricity for the sole purpose of supplying the second entity with compliance instruments to cover emissions resulting from satisfying the electricity contract.~~ These Allowances will be transferred to the Second Registered Entity's Compliance Account for the sole purpose of supplying the second entity with Compliance Instruments to cover emission obligations per the contract.

(A) This disclosure shall include the facility ID(s) associated with the contract and must be made to ARB prior to any such purchases~~, and must include the terms of the contract governing the eventual transfer~~. The disclosure shall also specify a percentage of the Second Registered Entity's Holding Limit as agreed upon by both parties that shall be allocated to the Electric Distribution Utility serving as the agent in the Beneficial Holdings relationship.

(B) An E~~e~~ntity serving as agent in this type of a B~~b~~eneficial H~~h~~olding relationship may not also serve as the agent in a B~~b~~eneficial H~~h~~olding relationship with an E~~e~~ntity with whom it does not have a ~~long-term~~ contract for the delivery of electricity. An Electrical Distribution Utility serving as an agent in a Beneficial Holding relationship shall be able to aggregate any Holding Limits allocated to it by Second Registered Entities. (PGE4)

Response: We reject the request to transfer a portion of one entity's holding limit to another as impractical, since there is otherwise no corporate association. To implement this recommendation would require an entirely new process. However, we revised the language in section 95834 to allow two entities to inform the Executive Officer that they intend to operate a beneficial holding relationship. Allowances held under such an arrangement will be counted toward the principal's holding limit. This approach serves the same function as the proposal made in the comment, without introducing a new procedure.

I-23. Comment: Calpine opposes the proposed Regulation's new "beneficial holding relationship" because it further exacerbates the competitive disadvantage between independent power producers and IOUs by providing that IOUs' holding of allowances for their long-term contract generators will count against the holding limit of the generator. Calpine is disappointed that CARB would provide the utilities so much flexibility to manage their carbon risk and abide by the auction purchase and holding limits, while providing no such flexibility to the generators who are actually subject to a compliance obligation. Modify sections 95834(a)(2) and 95920(h) as follows:

> (2) An electrical distribution utility and a second registered entity with whom it has a contract for the delivery of electricity informs ARB that it has they have established an agreement for the utility to serve as the agent in a beneficial holding relationship pursuant to section 95834(a)(1)(A) to purchase and hold allowances for the eventual transfer to ~~a~~ the second registered entity ~~with whom it has a contract for the delivery of electricity~~ for the sole purpose of supplying the second entity with compliance instruments to cover emissions resulting from satisfying the electricity contract.
>
> (A) This disclosure must be made to ARB prior to any such purchases, and must include the terms of the contract governing the eventual transfer and a statement by the utility confirming its intention to transfer to the second entity the required number of allowances needed to fulfill the second entity's compliance obligations under sections 95855 and 95856 prior to the time they are due.
>
> (h) The application of the holding limit will treat beneficial holding by an agent as part of the holding of the owner, provided that, in the case of an electric distribution utility beneficially holding allowances on behalf of a second registered entity pursuant to section 95834(a)(2), the electric distribution utility and second entity have informed ARB in the disclosure required by said section 95834(a)(2) of the number of allowances that will be held on the second entity's behalf. (CALPINE3)
>
> **Response:** We understand the basic problem identified in the comment. However, instead of the language proposed by the comment, we added new language that will require both parties to a beneficial holdings relationship to (1) inform the Executive Officer of the existence of the relationship, and (2) give each party the right to approve all transactions made pursuant to the relationship. We believe that the replacement language satisfies the commenter’s concern.

Holding Limit and Exemptions

I-24. Comment: Section 95920(d)(2) refers to a “limited exemption” from the Holding Limit. However, in fact the amount calculated in the “limited exemption” provision is added to and forms part of the Holding Limit, rather than being an exemption to it. For clarity, the wording should be changed from “exemption” to “addition” to reflect the intended operation of this section. In section 95920(d)(2), it appears that subsections (B) to (H) are intended to act as a cap on the limited addition set out in subsection (A). This should be specified. Section 95920(d)(2)(B) refers to the most recent verified report received as of June 1, 2012. This will be the report on 2010 emissions, as the 2011 report will not be verified until later in 2012. SCPPA understands that section

95920(d)(2)(C) will operate to provide that, in October 2013, the limited addition would be [2010 + 2012] emissions. In October 2014, it would be [2010 + 2012 + 2013] emissions. In October 2015, it would be [2010 + 2012 + 2013 + 2014] emissions. SCPPA further understands that section 95920(d)(2)(H) will operate to provide that on December 31, 2015, for example, the limited addition would be [2010 + 2012 + 2013 + 2014] – [2013 + 2014] = [2010 + 2012] emissions. If this understanding is not correct, section 95920(d) should be clarified. Modify section 95920(d) as follows:

> (d) The holding limit will be calculated for allowances qualifying pursuant to section 95920(c)(1) as the sum of (1) and (2) below:
>
> (1) The number given by the following formula:
> Holding Limit = 0.1*Base + 0.025*(Annual Allowance Budget – Base)
> In which:
> "Base" equals 25 million metric tons of CO_2e.
> "Annual Allowance Budget" is the number of allowances issued for the current budget year.
>
> (2) A Limited Addition to~~Exemption from~~ the Holding Limit~~, is~~ calculated as follows:
>
> (A) The limited addition~~exemption~~ is the number of allowances which are exempt from the holding limit calculation after they are transferred by a covered entity or an opt-in covered entity to its compliance account, subject to the limitations set out in sections 95920(d)(2)(B) to (H) inclusive.
>
> (B) On June 1, 2012, the limited addition~~exemption~~ will equal the amount of emissions contained in the~~annual emissions~~ most recent emissions data report that has received a positive or qualified positive emissions data verification statement.
>
> (C) Beginning in 2013 on October 1 of each year the limited addition~~exemption~~ will be increased by the amount of emissions contained in the most recent emissions data report that has received a positive or qualified positive emissions data verified statement during that year.
>
> (D) If for any year ARB has assigned emissions to an entity in the absence of a positive or qualified positive emissions data verification statement the calculation of the limited addition~~exemption~~ will use the assigned emissions.
>
> (E) For the first compliance period all reported emissions or assigned emissions used to calculate the limited addition~~exemption~~ will include only the emissions associated with the scope for the program during the first compliance period.
>
> (F) Beginning in 2015, all reported emissions or assigned emissions used to calculate the limited addition~~exemption~~ will include the emissions associated with the change in scope taking place in 2015.

(G) On January 1, 2015, the limited addition~~exemption~~ will be increased by the amount of emissions included in the emissions data report received during 2014 but not yet included in the limited addition~~exemption~~ pursuant to section 95920(d)(2)(E).
(H) On December 31 of the calendar year following the end of a compliance period, the limited addition~~exemption~~ will be reduced by the sum of the entity's compliance obligation over that compliance period. (SCPPA6)

Response: We believe the term "limited exemption" is clearer than the change proposed in the comment. The intent of the provision is to exempt from the holding limit the allowances that covered entities need to comply with the regulation. The exemption would allow covered entities to face the same requirements as non-covered entities after they have accumulated enough allowances to meet their obligations. The exemption is not unlimited. It is limited by the entity's historic emissions. Calling the provision an "addition" would imply that we are providing covered entities with an extra benefit not afforded to non-covered entities, when all we are trying to do is ensure that market rules reflect the extra constraint faced by covered entities.

I-25. Comment: Section 95920(g) on corporate association holding limits should be clarified. ARB should clarify whether this limit applies to future allowances (purchased at advance auctions) as well as allowances for current and previous compliance periods. Holding limits are calculated separately for those categories, according to section 95920(c). Section 95920(g)(1) refers to a holding limit applying to compliance instruments, but all other provisions of this section 95920 (other than section (b)(3), which should also be amended) refer to limits on the holding of allowances, not compliance instruments in general. There is no reason to apply a holding limit to offsets as there is already a surrender limit on offsets. Section 95920(g)(2) refers to a limited exemption as defined in section 95920(f). However, section 95920(f) does not define a limited exemption (or addition). It appears that the reference should be to section 95920(d) instead. It is also unclear how the limited exemption (or addition) would apply to the amount provided in section 95920(g)(1). Will the limited exemption/addition for each entity be added to the group holding limit calculated under section 95920(g)(1)? This should be clarified.
Modify section 95920(g) as follows:

(g) Application of the Corporate Association Disclosure to the Holding Limit.

(1) The total number of ~~compliance instruments~~allowances held by a group of entities with a disclosable corporate association pursuant to section 95833 in their holding accounts must sum to less than the holding limit pursuant to section 95920(e), plus the sum of the limited additions specified in section 95920(g)(2).

(2) The limited addition~~exemption~~ for each entity which is part of a corporate association is the same as defined in section 95920(d~~f~~). (SCPPA6)

Response: We agree with the comment on the use of the term "compliance instruments" versus "allowances" in the holding limit, and made the change to section 95920(f) as suggested. (Please note that the section has been renumbered from 95920(g)(1) to 95920(f)(1).)

We do not agree with the suggested revision to 95920(f)(2), (formerly 95920(g)(2).) We believe that the term "limited exemption" is clearer than the change proposed in the comment. The intent of the provision is to exempt from the holding limit the allowances that covered entities need to comply with the regulation. The exemption would allow covered entities to face the same requirements as non-covered entities after they have accumulated enough allowances to meet their obligations. The exemption is not unlimited. It is limited by the entity's historic emissions. Calling the provision an "addition" would imply that we are providing covered entities with an extra benefit not afforded to non-covered entities, when all we are trying to do is ensure that market rules reflect the extra constraint faced by covered entities.

Transportation Sector Electrification

I-26. Comment: Perhaps the largest potential for emissions reductions in the state in the long-term lies in electrification of the transportation sector. However, these reductions are by no means assured given the high costs of infrastructure investment that the electricity sector and customers will need to make, as well as the costs of the vehicles themselves. Given these up-front cost-barriers, significant incentives will likely be needed to induce the early adoption of electric vehicles needed to establish a rapidly growing, vibrant electric transportation sector. SMUD strongly encourages the ARB to consider that the reduction in compliance need that will arise in the transportation sector as liquid fuel transportation emissions are shifted to the electric sector imply an increase in electric sector compliance obligation that is not currently covered in the sector allowance allocation structure laid out in the 15-day language. ARB should ensure that the increased emissions obligations that result from increasing electric transportation loads do not create a cost burden on utility ratepayers, in contradiction to the rationale for providing allowances to electrical distribution utilities. The amount of allowances added to the electric sector allocation should cover the potential increased compliance obligation associated with producing electricity for transportation loads. Of course, the cap and trade program in this aspect needs to be coordinated with the Low Carbon Fuel Standard program. LCFS credits are expected to provide a valuation of the difference between the emissions from electricity generation for transportation and the reduction in liquid fuel emissions, and this value is expected to be traded in the LCFS marketplace. This calculation "nets out" the increased electricity sector emissions, so the LCFS credit value does not reflect this increased obligation in the electricity sector. ARB should reflect the increased electricity sector emissions, and corresponding reduced transportation sector emissions, by adjusting the allowance allocations for the electric sector commensurate with the growth in electric transportation load. This load growth is different from any other load growth, as it corresponds to less energy use and dramatically fewer emissions in the transportation sector, and is the only load growth strongly supported by the State's energy and transportation policies and by the ARB's own climate policies. The additional electric sector allowances would be calculated each year based upon the previous year's measured load for electric transportation, multiplied by the default emission factor in the electric allocation spreadsheet or the default emission factor established for unspecified power in the cap and trade program. Modify section 95870 as follows:

> <u>(f) Increased Allocation to Electrical Distribution Utilities For Electric Transportation Growth. The Executive Officer will place an additional annual individual allocation in the appropriate accounts of each electrical distribution utility on July 15 of each calendar year from 2013-2020, calculated as the amount of measured electric transportation load in the previous year, as reported by each electrical distribution utility, multiplied by the default emissions factor.</u> (SMUD3)
>
> **Response**: We did not make this change. However, in accordance with Board Resolution 10-42, we will monitor electrification of the transportation sector and recommend regulation adjustments to the Board as appropriate.

Miscellaneous

I-27. Comment: ARB proposes an option for publicly owned utilities (POU) that would allow them to directly surrender allowances to meet compliance without monetizing them through the auction. LADWP strongly supports this provision as it recognizes that a vertically integrated POU that acts as both the electric distribution utility and the generator would otherwise have to sell allocated allowances at auction only to repurchase them to surrender for emissions associated with serving native load. LADWP is committed to working with ARB to further refine reporting protocols for the use of allowance value. (LADWP4)

> **Response**: Thank you for the support. No further response is required.

Imported Electricity

General and Support

I-28. Comment: PacifiCorp supports ARB's proposed methodology to allocate allowances based on the distribution utilities' projected compliance burden. Though PacifiCorp continues to have significant reservations regarding the use of State-and/or regional-based allowance trading regimes as the principal means of reducing carbon emissions, the Company strongly supports ARB's adherence to an emissions-based allowance allocation methodology, as opposed to a sales-based approach. (PACIFICOR3)

> **Response:** We thank PacifiCorp for support of the allowance allocation methodology.

I-29. Comment: NextEra urges ARB to consider the comments submitted by IEP and WPTF. Specifically the comments related to imported power, energy efficiency audits, resource shuffling, replacement power with respect to balancing authorities, and holding accounts. (NEXTERAENERGY2)

> **Response**: We acknowledge the comment. Please refer to our responses directed to the relevant comments submitted by parties noted by the commenter.

I-30. Comment: WPTF anticipates that linkage of the California Cap and Trade Program to an external emissions trading system within the WECC would necessitate changes to California's annual allowance budget to account for electricity imports from the linked jurisdiction. WPTF recommends that CARB explicitly provide for this eventuality in the regulation. (WPTF2)

> **Response:** We agree that linkage could change the accounting of emissions from imported electricity. If ARB links with another jurisdiction, GHG emissions associated with its electricity would face a compliance obligation in that jurisdiction, and the emissions from that electricity would no longer be considered part of California's emissions. While we have not explicitly stated how linking will be handled with respect to electricity imports within this regulation, those details will be addressed during future regulatory processes. This will include an allowance budget adjustment to reflect the emissions responsibility of each trading program. We do expect electricity utilities' long-term resource plans to incorporate California policies such as divestiture of GHG-intensive electricity from out-of-state coal generation.

I-31. Comment: The term "contract rights" should be clearly defined in the regulation. One criterion for claims of specified imports is that "the first deliverer must be the facility operator or have ownership or contract rights to electricity generated by the facility or unit claimed." The term "contract rights" is vague and provides no certainty regarding the type of commercial arrangements would qualify. Without further definition as to the type of arrangements that would qualify, the eligibility of contracts for a facility-specific emission rate would be subject to interpretation by verifiers. This is not acceptable. (WPTF2)

> **Response:** To address this concern, we modified the criterion for claims of specified imports in renumbered section 95852(b)(3)(B) to state that the electricity importer "must be the facility operator or have right of ownership or a written power contract, as defined in MRR section 95102(a), to the amount of electricity claimed…."

I-32. Comment: The proposed regulation does not make clear whether an out-of-state facility will have a cap-and-trade compliance obligation when its total emissions exceed 25,000 MT, but it imports only part of its capacity, and the import into California accounts for less than 25,000 MT of GHG emissions associated with the importer's total capacity. ARB should clarify that the importer's compliance obligation applies to emissions associated with delivery of power into California. Modify section 95812(c)(2)(b) as follows:

(b) Electricity importers of specified sources of electricity. The applicability threshold for an electricity importer from specified sources is based on the total annual emissions of the electricity generating facility from which the imported electricity originated. The applicability threshold for an electricity importer from a specified source which emits 25,000 metric tons or more of CO_2e per year is zero metric tons. (IEPA2)

Response: While we did not make the requested modification, we modified 95812(c)(2)(B) and added paragraphs 95812(c)(2)(b)(i and ii) to make it clear that any import from an electricity facility that has total emissions that exceed 25,000 $MTCO_2e$ has a compliance obligation.

I-33. Comment: Also modify section 95852(b)(7) as follows:

(7) The compliance obligation (CO_2e covered) is calculated based on the emissions from electricity deliveries into California from jurisdictions that are not approved for linkage pursuant to subarticle 12:

(A) Emissions which result from specified electricity deliveries (CO_2e specified) will be assigned the facility emission factor, determined by ARB, for electricity deliveries meeting the requirements of section 95852(b)(2) through (5);

1. Specified deliveries meeting the requirements of section 95852(b)(2);
2. The adjustment for replacement electricity associated with the variable renewable electricity pursuant to section 95852(b)(3);
3. The specified electricity meeting direct delivery requirements pursuant to section 95852(b)(4); and
4. The specified electricity generated from the use of biomethane which meets the requirements pursuant to section 95852.2. (IEPA2)

Response: Instead of modifying section 95852(b)(7), we deleted that section and added new section 95852(b)(1), which now defines the compliance obligations for first deliverers. New section 95852(b)(1)(B) provides an equation that represents the compliance obligation for electricity importers and clarifies the compliance obligation for electricity deliveries into California.

Asset-Owning Supplier

I-34. Comment: ARB has proposed modifying the definition of “asset controlling supplier” in both the MRR and Cap and Trade Rule (see sections 95102(a)(17) and 95802(a)(13)). The modifications would remove from the definition two retail providers in California, PacifiCorp and Sierra Pacific Power Company, leaving only one entity listed in the definition: the Bonneville Power Administration (“BPA”). It is not clear from the definition why these two entities no longer qualify as “asset-controlling suppliers,” and why BPA does still qualify as an “asset-controlling supplier.” Powerex requests that ARB clarify the criteria applied when determining whether an entity meets the definition of an “asset-controlling supplier,” as well as provide transparency with respect to the assessment of the “asset-controlling supplier” intensity factor and clarify the process by which an entity is granted or assigned status as an “asset-controlling supplier.”

By removing PacifiCorp and Sierra Pacific Power Company from the definition of “asset controlling supplier” in section 95102(a)(17) of the MRR and section 95802(a)(13) of the Cap and Trade Rule, the definition has been changed from including a list of example “asset controlling suppliers” to stating that BPA is an asset-controlling supplier. While Powerex interprets this statement to mean that BPA is just one example of an asset controlling supplier, it could be read to require a modification to the definition every time ARB wants to recognize another asset-controlling supplier. To avoid having to modify a rule if and when ARB recognizes additional asset-controlling suppliers, Powerex recommends removing the second sentences of MRR section 95102(a)(17) and Cap and Trade Rule section 95802(a)(13), or revising those sentences to read: “Bonneville Power Administration (“BPA”) is one entity recognized by ARB as an asset-controlling supplier.” (POWEREX)

> **Response:** PacifiCorp is a multi-jurisdictional retail provider and is subject to the specific provisions of the MRR for such entities, rather than to the specific provisions for asset-controlling suppliers. We note that Powerex may request that we determine that it is an asset-controlling supplier, if Powerex controls assets and reports on all assets providing the same information needed to determine the EF of such a supplier. However, this is primarily a reporting function and will be addressed in the MRR FSOR if Powerex has also submitted these comments in that rulemaking. We understand the commenter’s concern and we will continue to monitor regulatory developments and propose any changes as needed.

Imported Electricity

I-35. (multiple comments)
Comment: CARB’s July 25 Notice suggests that section 95852(b)(7) is needed to clarify the appropriate calculation for out-of-state resources. Since the calculation is already addressed in the MRR, NCPA suggests that CARB strike the detailed descriptions and reference rather to MRR section 95111(b)(5). Modify section 95852(b)(7) as follows:

(7) The compliance obligation for ~~(CO2e covered) is calculation based on the~~ emissions from electricity deliveries from jurisdictions that are not approved for linkage pursuant to subarticle 12 is calculated in accordance with MRR section 95111(b)(5).
~~(A) Emissions which result from specified electricity deliveries (CO2e specified) will be assigned the facility emission factor, determined by ARB, for electricity deliveries meeting the requirements of section 95852(b)(2) through (5);~~

~~1. Specified deliveries meeting the requirements of section 95852(b)(2);~~
~~2. The adjustment for replacement electricity associated with the variable renewable electricity pursuant to section 95852(b)(3);~~
~~3. The specified electricity meeting direct delivery requirements pursuant to section 95852(b)(4); and~~
~~4. The specified electricity generated from the use of biomethane which meets the requirements pursuant to section 95852.2.~~

~~(B) All deliveries of electricity not meeting the requirements of section 95852(b)(2) through (5) will have emissions calculated using the default emission factor for unspecified electricity pursuant to section 95111 of MRR (CO2e unspecified).~~
~~(C)Emissions resulting from qualified exports (CO2e qualified exports) will be subtracted from the compliance obligation pursuant to section 95852(b)(6).~~
~~Compliance Obligation in CO2ecovered =CO2especified+ CO2eunspecified - CO2equalified export~~ (NCPA3)

Comment: Section 95852(b)(7) determines the compliance obligation for electricity that is imported from unlinked jurisdictions. The section paraphrases the provisions of MRR section 95111(b)(5) but does not replicate those provisions. The use of paraphrases instead of the precise provisions of MRR section 95111(b)(5) could lead to confusion. Any summary paraphrasing is likely to be somewhat inaccurate. Instead of trying to paraphrase MRR section 95111(b)(5) in section 95852(b)(7), the section should be revised to refer to MRR section 95111(b)(5). Modify section 95852(b)(7) as follows:

(7) The compliance obligation for ~~(CO2e covered) is calculation based on the~~ emissions from electricity deliveries from jurisdictions that are not approved for linkage pursuant to subarticle 12 is calculated in accordance with MRR section 95111(b)(5).~~:~~

~~(A) Emissions which result from specified electricity deliveries (CO2e specified) will be assigned the facility emission factor, determined by ARB, for electricity deliveries meeting the requirements of section 95852(b)(2) through (5);~~

~~1. Specified deliveries meeting the requirements of section 95852(b)(2);~~

~~2. The adjustment for replacement electricity associated with the variable renewable electricity pursuant to section 95852(b)(3);~~

~~3. The specified electricity meeting direct delivery requirements pursuant to section 95852(b)(4); and~~

~~4. The specified electricity generated from the use of biomethane which meets the requirements pursuant to section 95852.2.~~

~~(B) All deliveries of electricity not meeting the requirements of section 95852(b)(2) through (5) will have emissions calculated using the default emission factor for unspecified electricity pursuant to section 95111 of MRR (CO2e unspecified).~~

~~(C) Emissions resulting from qualified exports (CO2e qualified exports) will be subtracted from the compliance obligation pursuant to section 95852(b)(6).~~

~~Compliance Obligation in CO2ecovered =CO2especified + CO2eunspecified - CO2equalified export~~ (SCPPA6)

Response: We agree with the need to clarify the compliance obligations for first deliverers of electricity, whether they are operators of an electricity generating facility in California or electricity importers. New section 95852(b)(1) now precisely states the compliance obligation and indicates which emissions are included and which emissions are not included. Those revisions allowed for the elimination of section 95852(b)(7) in its entirety. Although we did not make the exact changes suggested in the comment, we believe our modifications have met this concern. Furthermore, the modified language provides clear cross-references to the MRR as needed.

e-Tags and Title

I-36. (multiple comments)
Comment: Currently, the cap-and-trade definitions provide that the “electricity importer” is the purchasing and selling entity (“PSE”) on the physical path where the delivery point is in California. (95802(a)(84). However, instances may arise when the PSE on the e-tag does not correctly identify the entity that owns power as it crosses the State’s borders. E-tags were designed to address and track compliance with the Western Electricity Coordinating Council’s reliability standards, and do not necessarily track energy ownership. IEP seeks assurances that the entity with the compliance obligation is the entity that has title to the power as it crosses the state’s border. Currently, IEP is not aware of a single precise method or tool to reliably and definitively track the proper entity with title to the power as it is delivered across California’s political borders. It may be the case that this concern arises only in the context of transactions to the CAISO market delivered at out-of-state nodes. CARB should therefore work with the CAISO and stakeholders to identify the scope of potential transactions where this issue arises and develop an appropriate tool or methodology. (IEPA2)

Comment: PacifiCorp does not support the conclusion that the use of e-Tags proves ownership or identifies the importer of energy. E-Tags are tools designed to facilitate identification and communication of interchange transaction information between parties. E-Tags are not used to establish title to energy or transmission. Legal title to energy is established by parties through bilateral contracts. E-Tags are typically prepared by the purchaser as part of its performance of a contract, but it is not the mechanism through which parties intend to or establish or keep track of ownership or allocate risk of loss on change in title. California cannot legally impose a new legal standard of how title is transferred at electricity market delivery points outside of California, or what constitutes intent to create legal relations with respect to title transfer outside of California. In addition, e-Tag authorship and approval guidelines are driven by the NERC standards process, and there is currently no standard for the PSE field on the e-Tag to be monitored by approval entities for accuracy. Since there is also no process for correcting an errant PSE entry on a finalized tag (now used as proof of ownership), there is the possibility that the e-Tag may indeed not accurately represent the chain of title. While PacifiCorp understands the appeal of using a device like an e-Tag to track the ownership of an electric energy commodity when it passes the state boundary, it is an imprecise and inappropriate tool. A Balancing Authority could become subject to legal responsibilities simply because an e-Tag for a California purchaser identifies the Balancing Authority as the source on an e-Tag, even though the Balancing Authority had nothing to do with the creation of the e-Tag. The NERC e-Tag establishes the Balancing Authority, but does not identify the actual resource. PacifiCorp therefore recommends that ARB change the importer definition that states that NERC e-Tags identifies the title holder when power crosses the state border, and instead use the parties' contract to establish where title lies. (PACIFICOR3)

Comment: During ARB's July 15, 2011 Workshop, stakeholders noted potential Cap and Trade implementation issues that might arise due to differences between the CAISO's geographical footprint, which has delivery points that extend beyond the state's boundary and ARB's authority to impose compliance obligations. The Regulation proposes to establish an obligation on the party that holds title to electricity as it is imported across the state boundary, and PG&E supports this concept. The Regulation relies upon electricity "tags" to establish ownership or title. As stakeholders at the workshop noted, tags have historically served a different function than establishing ownership and also tags to some CAISO delivery points are still deliveries to points outside of California. Due to these concerns, PG&E urges ARB and CAISO to review both the Regulation and the CAISO's tariff to ensure that the proposed regulatory approach is accurate and could withstand potential legal challenges which would impede successful implementation of the program. (PGE4)

> **Response:** We worked with CAISO to review the regulation and CAISO's tariff to ensure the accuracy of the approach. First deliverers that import electricity are electricity importers. We modified and renumbered the definition of "electricity importer" (new section 958102(a)(87) to identify the importer as the PSE listed on the last segment of the e-Tag for electricity delivered between balancing authority areas, and to remove the reference to that entity's ownership or title to the

delivered electricity. This modification is discussed more fully in responses to second 15-day changes to the regulation.

With respect to PACIFICOR3's comment, we note that one of the purposes of e-Tags is to schedule delivery of electricity between balancing authority areas. The regulation places the compliance obligation on the first deliverer of electricity. For imported electricity, the e-Tag identifies the deliverer on each segment, and includes segments that begin outside of California and end in California. Therefore, we believe it is appropriate to use e-Tags to identify PSEs as first deliverers of imported electricity delivered between balancing authority areas, identified on the segment that crosses into California where the first point of receipt is outside California and the final point of delivery is inside California.

I-37. Comment: Consistent capitalization and the use of defined terms will more clearly define that the Cap and Trade policies are limited to electricity imported to serve California load. Revise the terms "Electricity importer", and "electricity importer" to be "Electricity Importer" throughout the regulations. Also, revise the terms "imported electricity" with "Imported electricity," and consider replacing "electricity" with "Electricity" throughout the Regulations. (VEA)

Response: We did not make the recommended revision. We understand that in other settings, such as the CAISO tariffs and operating rules, defined terms are capitalized. However, the regulation is clear, and defined terms need not be capitalized to have precisely defined meanings.

I-38. (multiple comments)
Comment: Powerex strongly encourages CARB to conduct a stakeholder workshop dedicated to the subject of imported electricity. Complex changes have been proposed under the 15-day rule modification process concerning resource shuffling, direct delivery of electricity, variable renewable resources, and replacement electricity. These changes will significantly alter the structure of reporting for electric power entities as well as the market for imported electricity. Such a workshop would enable ARB to clarify its intent with respect to the new concepts and for affected entities to provide further comments to help ensure that the programs function well. Since many of these issues are interwoven with both the Mandatory Reporting Rule and the Cap and Trade Rule, the workshop ideally would cover both rules as they address imported electricity. In view of the overall timing ARB's implementation of the AB 32 Scoping Plan, Powerex strongly encourages ARB to conduct such workshop as soon as possible, preferably prior to the release of the planned second package of 15-day rule modifications. (POWEREX)

Comment: LS Power encourages CAISO and CARB to conduct an open stakeholder process to discern a more appropriate mechanism to track title than e-tagging convention as it is applied to a sale into the CAISO market from out-of-state points of delivery. It is imperative that such an effort be open to public comment and the method that is eventually used not result in a unilateral alteration of commercial terms without the principle parties' consent. (LSPOWER)

> **Response:** We agree, and held a stakeholder workshop on August 26, 2011, prior to proposing the second 15-day changes to the regulation. In addition, CAISO staff participated in the Western Power Trading Forum meeting held on August 2, 2011, and explained that many electricity importers have not been using e-Tagging in accordance with the CAISO tariff. ARB staff participated as observers in that meeting. Please see our response to IEPA2 and PACIFICORP above regarding the issue of tracking title. We and CAISO are convinced that e-Tags are critical to tracking first deliveries of electricity into California. We have seen no evidence that our use of e-Tags to establish the identity of first deliverers would result in a "unilateral alteration of commercial terms."

I-39. Comment: The current definition of "electricity importers" in section 95802(a)(84), which assigns "electricity importer" status to a downstream purchaser within ARB's jurisdiction when the original purchasing-selling entity (PSE) is outside of ARB's regulatory authority could lead to unintended and unfair consequences and should be modified. Not only is the definition inconsistent with the fundamental principle that the Cap and Trade Regulation is source based, but it could also lead to California load being assessed GHG compliance costs twice for the same electricity imports. The electricity markets would be distorted and provide out-of-state importers with a financial windfall. Also, the California Independent Systems Operator (CAISO) has language in its Tariff that make it clear that sellers at out-of-state interties do indeed deliver the electricity into California. CAISO appears to believe that ARB would be able to rely on these provisions to conclude that the seller who imported electricity at an out-of-state point of delivery within CAISO is always the first deliverer in California. If so, the provision pushing the compliance obligation downstream in section 95802(a)(84) is unnecessary and should be deleted. Accordingly, ARB should revise its definition of electricity and reaffirm that it will consistently require the entity who imports the electricity into California to comply with the Cap and Trade program requirements, rather than the purchaser or recipient of that imported electricity. (SCE3)

> **Response:** We agree that the electricity importer is not a downstream purchaser. We modified the definition, now renumbered as section 95802(a)(87), by removing the last sentence.

I-40. Comment: Valley Electric requests that CARB explicitly recognize the intent to distinguish between load that sinks in the state of California versus that which does not by indicating that further information may be necessary. Modify sections 95802(a)(84) and 95802(a)(131) as follows:

> (84) "Electricity Importers" are marketers and retail providers that hold title to imported electricity. For electricity delivered between balancing authority areas, the entity that holds title to delivered electricity is identified on the NERC E-tag as the purchasing-selling entity (PSE) on the tag's physical path, with the point of

receipt located outside the state of California, and the point of delivery (as specified within the e-tag or through additional information as needed) located inside the state of California. Federal and state agencies are subject to the regulatory authority of ARB under this article, and include Western Area Power Administration (WAPA), Bonneville Power Administration (BPA) and California Department of Water Resources (DWR). When PSEs are not subject to the regulatory authority of ARB, the electricity importer is the immediate downstream purchaser or recipient that is subject to the regulatory authority of ARB.

(131) "Imported electricity" means electricity generated outside the state of California and delivered to serve load inside of California. Imported electricity includes electricity delivered from a point of receipt located outside the state of California, to the first point of delivery inside the state of California, having a final point of delivery in the state of California. Imported electricity includes electricity imported into the state of California over a multi-jurisdictional retail provider's transmission and distribution system, or electricity imported into California over a balancing authority's transmission and distribution system. Imported electricity includes electricity that is a result of cogeneration outside of California. Imported electricity does not include electricity wheeled through California, which is electricity that is delivered into the state of California with final point of delivery outside the state of California. (VEA)

Response: Although we did not make the specific modifications that Valley Electric suggests, we worked with Valley Electric and made other modifications to the two definitions in order to clearly distinguish between electricity serving load in California and electricity that Valley Electricity schedules into the CAISO market but uses to serve load outside of California. Valley Electric has confirmed to staff that their concern has been addressed.

I-41. (multiple comments)
Comment: Amend the definition for "Electricity Importer" so that it does not rely in all cases on the E-tag to designate ownership of the electricity at the time it crosses the California border when the transaction is a sale to a CAISO market (as opposed to a bilateral arrangement). Modify section 95802(a)(84) as follows:

"Electricity Importers" are marketers and retail providers that hold title to imported electricity. For electricity delivered between balancing authority areas, the entity that holds title to delivered electricity ~~is~~ may be identified on the NERC E-tag as the purchasing-selling entity (PSE) on the tag's physical path, with the point of receipt located outside the state of California, and the point of delivery located inside the state of California. Federal and state agencies are subject to the regulatory authority of ARB under this article, and include Western Area Power Administration (WAPA), Bonneville Power Administration (BPA) and California Department of Water Resources (DWR). When PSEs are not subject to the regulatory authority of ARB, including tribal nations, the electricity importer is the

> immediate downstream purchaser or recipient that is subject to the regulatory authority of ARB. (IEPA2)

Comment: CARB's reliance on e-tags as conclusive evidence of ownership to power as it crosses the California border within the proposed regulations definition of electricity importer is problematic. Under the proposed Cap and Trade Regulation, CARB will use e-tags for a purpose for which they were never designed. Imputing a legal ownership presumption to e-tags will place new uses and requirements that were not contemplated when the e-tagging concept was originally developed for reliability reasons. In addition, there will be instances when CARB misrepresents the nature of the property rights and associated liabilities (such as risk of loss) transferred at the delivery point through the commercial transaction. The result is that CARB may improperly assign a cap-and-trade compliance obligation to an entity that is not subject to California state jurisdiction because it did not own the power when it crossed the State border. This defect creates a risk of potential legal challenge on an interstate commerce clause claim. Avoiding this risk is necessary to provide certainty for regulated entities and credibility for the Cap and Trade market. To avoid these concerns, LS Power recommends that CARB amend the definition for "Electricity Importer" (section 95802(a)(84)), so that the definition does not rely on the e-tag to designate ownership of the electricity. LS Power is not aware of another approach that would definitively track the entity with title when the power crosses the State's political borders. Modify section 95802(a)(84) as follows:

> (84) "Electricity Importers" are marketers and retail providers that hold title to imported electricity. For electricity delivered between balancing authority areas, the entity that holds title to delivered electricity ~~is identified on the NERC E-tag as the purchasing-selling entity (PSE)~~ on the tag's physical path, with the point of receipt located outside the state of California, and the point of delivery located inside the state of California. Federal and state agencies are subject to the regulatory authority of ARB under this article, and include Western Area Power Administration (WAPA), Bonneville Power Administration (BPA) and California Department of Water Resources (DWR). When PSEs are not subject to the regulatory authority of ARB, including tribal nations, the electricity importer is the immediate downstream purchaser or recipient that is subject to the regulatory authority of ARB. (LSPOWER)

Comment: The sink-identifying information on e-tags may not distinguish between points of delivery within the CAISO BAA that are in or outside of California. Traditionally, e-tags used for energy deliveries to the CAISO have simply specified "CAISO" as the point of delivery. Without a further specification of the location of the energy deliveries, it will not be possible to implement the rules as stated in the July proposal. The e-tags used in the CAISO scheduling processes must be able to identify delivery points more specifically than simply "CAISO." E-tag points of delivery such as "CAISO – Valley NV" could provide the necessary specificity. Also, E-tags that specify only CAISO as a delivery point would have to be conjoined with other entity information that could be used to determine the quantity of electricity that was imported into the

CAISO for non-California load. For example, metering information collected by the CAISO could serve this purpose. (VEA)

Response: As discussed above, we modified the definition of PSE to remove the reference to title, because this regulation applies to first deliverers. We also modified requirements in section 95852(b) to clarify that ownership or contracts are also needed to clarify ownership of electricity generated at a specified source, or delivered from unspecified sources. We do not rely solely on e-Tags to provide evidence of ownership, contractual relationship, or delivery.

With respect to VEA's contention, the traditional designation of CAISO as the point of delivery is incorrect, and not compliant with the CAISO tariff, as explained by CAISO to stakeholders in several public meetings. E-Tags used in the CAISO system must identify a sink in California, except in extremely limited circumstances (e.g., when CAISO must procure emergence power for reliability).

I-42. Comment: In several locations in the MRR and in the Cap and Trade Regulations, the NERC E-Tag is identified as the element that will determine title to the power imported, and thus assigns the responsibility for any GHG liability that may accrue from that importation. This is an incorrect application of the E-Tag. Title is a matter of contract law, not a function of a reliability tool designed to track power transactions between BAAs. Moreover, CARB's definition of "PSE" is "the functional entity that purchases or sells, and takes title to, energy, capacity and reliability-related services." These are distinct product markets. An entity can contract for, and take title to, one or more of these products without taking title to all three. It is important to recognize that both CPUC and CEC rely upon E-Tags to audit RPS transactions, and to verify that WREGIS certificates are associated with imports by entities subject to RPS requirements over the appropriate time interval. This is a far different use of an E-Tag than its proposed use to determine title to power, and the presumption of responsibility for GHG liability. CARB should abandon the proposed use of e-tags as a proxy for assigning title to import transactions. (NAES)

Response: We modified the definition of "PSE" (now section 95802(a)(224)) removing the reference to title. The definition of PSE quoted above is that contained in NAESB Wholesale Electric Quadrant Electronic Tagging - Functional Specifications, Version 1.8.1. It was approved by the WEQ EC on October 27, 2009, and applies to electricity delivered between balancing areas throughout the United States. As discussed in the response to Comment I-36, we continue to use e-Tags to identify the first deliverer of electricity imported into California.

I-43. Comment: The use of e-Tags for identification of ownership may not be sufficient for all transactions. CARB's proposal to use the e-Tag as the evidence of ownership and title transfer may not work. There exist numerous injections points into the State of California, each with different physical and contractual elements. Seeking to use e-Tags as a standardized approach for identification of the entity that owns the energy when it crosses the California border is especially problematic for certain transactions where the title transfer location is a node outside of California. Potential inaccuracies may result from standard utilization of the e-Tag for designation of ownership. For example, deliveries at the California Oregon Border. The Southern Intertie segment, or the California Oregon Border (COB), consists of three 500 kV AC lines from the John Day Substation to COB. Deliveries to COB all commence with transmission title on the Southern Intertie with a Point of Receipt of John Day and a Point of Delivery to either Malin or Captain Jack. With Malin and Captain Jack residing in the state of Oregon and being a market-recognized trading hub for Northwest deliveries into California, this is the location at which title of energy transfers to the Purchase and Selling Entities (PSE) continuing deliveries to California. In this transaction, the e-Tag accurately identifies the entity who has title of the energy when is crosses the California border. Another inaccuracy may result from use of the e-Tag for designation of owners for deliveries at the Nevada Oregon Border. The Nevada Oregon Border (NOB) transmission segment is comprised of major transmission facilities consisting of a 1000 kV DC line between Celilo Substation and the Oregon-Nevada border. Deliveries to the Nevada Oregon Border all commence with transmission with a Point of Receipt of Big Eddy and a Point of Delivery to Sylmar. Unlike COB, NOB is a contractually defined geographical point in which the Bonneville Power Administration and the California ISO change ownership and is also considered the Point of Receipt in which the CAISO takes title of the energy. In this transaction, the e-Tag may not properly identify the entity with ownership of the energy at the time it crosses the California border. (IBERDROLA)

> **Response:** We modified this provision to remove the reference to title in the definition of “electricity importer”. We discuss this modification, including clarification regarding our use of e-Tags, more fully in responses to second 15-day changes.

I-44. Comment: Legal certainty is needed on who holds responsibility for electricity imports. WPTF is aware of concerns that have been raised about the ability of CARB to hold entities legally responsible for deliveries to the CAISO through interties outside the state boundary. Nevertheless, WPTF believes that holding the entity that bids and schedules power into California responsible for the carbon associated with these imports is the correct policy approach. This approach will ensure that the entity that receives payment for power delivery into California, and the carbon premium imbedded in the power price, will also have the carbon obligation for the associated emissions. This aligns the carbon obligation with the entity best able to control imported emissions and ensures equal treatment of all importers. The alternative that some stakeholders appear to be advocating is for the CAISO to determine the emissions associated with electricity delivered to external interties, acquire and retire allowances to cover these emissions, and to somehow pass these costs to load. Not only would this alternative be substantially more complicated to implement, but it would create a loophole where imports to California via CAISO external interties would receive a premium for carbon, because it will be reflected in California power prices, but no associated carbon obligation. This would be unfair to other importers, and create an incentive for imports through those points. For these reasons, WPTF opposes an outcome that would require the CAISO being held responsible for carbon. WPTF understands the legal considerations with respect to imports, and is not in a position to conduct a full legal analysis, other than to note that it is in the interest of all capped entities for the regulations with respect to imports to apply to all imports in a similar manner, and to avoid regulations that will provide perverse scheduling incentives. We support CARB's effort to work with the CAISO and the Department of Justice to develop the most legally and technically sound basis, consistent with the CAISO tariff, for an approach that holds the bidding/scheduling entity responsible for imports via the external interties. (WPTF2)

> **Response:** We appreciate WPTF's support of our approach, and agree that it will best provide equal treatment to all importers.

I-45. Comment: Section 95852(b) provides for the calculation of the compliance burden of first deliverers of electricity. The opening provision in the section should be revised as follows to make it clear that the compliance obligation will be calculated in accordance with all of the paragraphs of section 95852(b), not just the first paragraph. Modify section 95852(b) as follows:

> (b) First Deliverers of Electricity. A first deliverer of electricity covered under sections 95811(b) and 95812(c)(2) has a compliance obligation for every metric ton of CO_2e of emissions, subject to section<u>s</u> 95852(b)(1) <u>to (b)(7) inclusive</u>, from a source in California or in a jurisdiction where a GHG emissions trading system has not been approved for linkage by the Board pursuant to subarticle 12. And, where the thresholds set out in section 95812 have been reached and for which a positive or qualified positive emissions data verification statement is issued or there are assigned emissions. (SCPPA6)

> **Response:** We modified and renumbered section 95852(b), in part to provide more clarity about the calculation of the compliance obligation of first deliverers. We did not make the modification requested, but we met the concern by adding new section 95852(b)(1) to clarify compliance obligations. The new section clearly defines the obligation for first deliverers that are operators of electricity-generating facilities in California, and provides an equation that precisely describes the compliance obligation for first deliverers that are electricity importers.

I-46. Comment: It appears that section 95852(b) paraphrases the MRR sections that cover reported emissions from specified imported electricity. LADWP recommends clarifying the cross references to the MRR, including general requirements in section 95111(a)(4), calculations for specified facilities in section 95111(b)(2), and requirements for claims to specified sources of imported electricity and associated emissions in section 95111(g). LADWP recommends that subparagraph (D) be deleted since the MRR requires reporting of all fuel types under section 95111(g)(1)(L).

With regard to managing renewable resource imbalance, the CPUC and CEC are currently vetting how best to account for renewable resources, including the scenario when a resource produces more renewable energy than originally anticipated or scheduled. It appears that subparagraph (D) could be interpreted to preclude EDUs from receiving the emissions benefits associated with over-generation received from a renewable resource. This approach is incorrect insofar as the over-generation of a zero emitting specified renewable resource would still displace emitting fossil fuel generation, thereby avoiding GHG emissions. Under these circumstances, the quantity of non-emitting electricity delivered could exceed the amount under ownership or specified in a contract, and should not be assigned GHG emission penalties. Modify section 95852 (b)(2) as follows:

> (2) The following criteria must be met for <u>first deliverers for imported electricity from specified sources:</u> ~~electricity deliveries to calculate their compliance obligations based on an ARB facility-specific emission factor specified pursuant to MRR section 95111 less than-the-default emission factor for unspecified electricity specified pursuant to MMR section 95111:~~
>
> > (A) Electricity deliveries must <u>meet the requirements of</u> ~~be reported to ARB pursuant to~~ MRR section 95111(a)(4);
> > (B) <u>Claims for specified imported electricity must be calculated pursuant to MRR section 95111(b) and meet the requirements in MRR section 95111(g)</u> ~~The first deliverer must be the facility operator or have ownership or contract rights to electricity generated by the facility or unit claimed;~~
> > (C) First deliverers must report electricity from specified sources to ARB using the ARB specified source identification number assigned to the source pursuant to MRR; and
> > ~~(D) If there are other parties within the contract chain of custody, then the original source of generation and quantity of MWhs to be delivered under the original contract-must be identified within the entire contract chain. The quantity of electricity delivered, and for which an ARB facility-specific emission factor specified-pursuant to MRR section 95111 is claimed, cannot exceed the original amount under ownership or contract rights reported pursuant to section 95852(b)(2)(A).~~ (LADWP4)

Response: We agree that changes were needed to clarify the treatment of specified imported electricity. We modified new section 95852(b)(3) (previously paragraph (b)(2)) to more clearly state the requirements for claims for a compliance obligation for delivered electricity based on a specified source emission factor lower than the default emission factor. We no longer use specific references to several parts of MRR section 95111. The MRR's treatment of the reporting of electricity from specified sources is covered in sections 95111(a),(b),(c), and (g). We deleted old subparagraph 95852(2)(D) as requested. We did not make the exact changes suggested in the comment, but we believe our modifications have met the concerns noted.

As explained in the renewable electricity section of this FSOR, it is important that electricity importers have ownership or contract rights to procure electricity from a renewable resource if such electricity is allowed to be used in the calculation of the RPS adjustment pursuant to new section 95852(b)(4). If a first deliverer has such rights, it is not necessary that they always apply to a specific quantity of generated RPS electricity. Other information used in verification for the MRR ensures that only RPS electricity can be used to calculate the new RPS adjustment in modified section 95852(b)(4). These modifications to the treatment of renewable electricity should satisfy the commenter's concern regarding over-generation.

I-47. Comment: Section 95852(b)(2) contains criteria that must be met by importers who want to calculate their compliance obligation using facility-specific emission factor rather than the default emission factor. The section should be revised to make it clear rather than implied that the criteria apply to imports from a jurisdiction that is not linked to the California cap-and-trade program. Also, section 95852(b)(2)(D) should be revised to eliminate the requirement that when there is a chain of custody for the electricity from the specified source the importer must identify the amount that was to be delivered under the original contract with the facility. It would be difficult if not impossible for the importer to know the original *amount* in a complex chain of contracts unless the importer were a party to the original contract. Modify section 95852(b)(2) as follows:

(2) The following criteria must be met for first deliverers of electricity generated outside California in jurisdictions where a GHG emissions trading system has not been approved for linkage by the Board pursuant to subarticle 12~~deliveries~~ to calculate their compliance obligations based on an ARB facility specific emission factor specified pursuant to MRR section 95111 less than the default emission factor for unspecified electricity specified pursuant to MRR section 95111:

(A) Electricity deliveries must be reported to ARB pursuant to MRR section 95111;

(B) The first deliverer must be the facility operator or have ownership or contract rights to electricity generated by the facility or unit claimed;

(C) First deliverers must report electricity from specified sources to ARB using the ARB specified source identification number assigned to the source pursuant to MRR; and

(D) If there are other parties within the contract chain of custody, then the original source of generation~~ and quantity of MWhs to be delivered under the original contract~~ must be identified within the entire contract chain. The quantity of electricity delivered, and for which an ARB facility specific emission factor specified pursuant to MRR section 95111 is claimed, cannot exceed the ~~original~~ amount under ownership or contract rights reported pursuant to section 95852(b)(2)(A). (SCPPA6)

Response: We agree and made modifications to section 95852(b) based on stakeholder input to make it clear that the criteria used to calculate the compliance obligation using facility-specific emission factor rather than the default emission factor applies to electricity from a source in California or in a jurisdiction where a GHG emissions trading system has not been approved for linkage by the Board. Due to the extensive modifications that have been made, we did not make the exact changes suggested in the comment, nor do they appear in the same subsection; however, we believe our modifications have met the concerns noted by the commenter.

Also, we agree with the comment suggesting the elimination of the requirement that when there is a chain of custody for the electricity from the specified source the importer must identify the amount that was to be delivered under the original contract with the facility contained in section 95852(b)(2(D). That language has been eliminated.

Qualified Exports

I-48. Comment: SCE supports the treatment of qualified exports in sections 95802(218), 95852(b)(6), and 95852(b)(7), as it accurately addresses the complexities of electricity contracting and trading structures where power can be separately imported and exported within an hour. For compliance entities that must deal in these complex markets, this treatment of qualified exports will help to maintain fungible and efficient electricity markets and avoid undue compliance costs. SCE supports the one-hour time slot for netting qualified exports with imports, as it aligns well with current energy scheduling and marketing practices. (SCE3)

Response: Thank you for the comment. We appreciate the support.

I-49. Comment: ARB has not determined how compliance entities will be able to allocate their total qualified exports to their imports. Such allocation is important if a compliance entity will have imports in any given hour that have originated from a variety of specified and unspecified sources with different emissions factors. ARB should clarify how the emissions burden of qualified exports will be calculated. In section 95852(b)(7), this emissions burden is subtracted from specified and unspecified imports. However, ARB does not appear to have articulated how emissions for qualified exports will be calculated. ARB should be aware that the emissions rate for exports is often unknown. Exports, for purposes of this rule, will likely be sourced or purchased in California, but the specific source may be unknown. Current E-tag practices for exports often list a generic power source, such as “SP 15 System.” ARB has not stipulated what emissions rate should be used for this or other generic system power. Without an understanding of the emissions rate for system-sourced power exported from California, the qualified exports rule cannot be applied.

To address this situation, ARB needs to determine what emissions rate(s) it will use for qualified exports from unspecified sources. SCE believes that using a single “qualified export emissions rate" for all exports originating from California will lead to unintended consequences, including gaming opportunities and market changing behavior, especially if there is a difference between the default emissions factors for imports and exports. SCE suggests that ARB develop rules similar to those for default imports, such that unspecified exports that sink in BPA balancing authority receive an emissions rate of 0.0856 metric tons per MWh, while exports to other balancing authorities should receive an emissions rate of 0.428 metric tons per MWh. However, ARB should not use the intertie location as a proxy for the final power sink, as power that passes through a specific intertie does not necessarily sink in that region. In addition, ARB has not determined how compliance entities will be able to allocate their total qualified exports to their imports. Once again, such allocation is important if a compliance entity will have imports in any given hour that have originated from a variety of specified and unspecified sources with different emissions factors. In part due to the complexity of this issue, SCE recommends (as noted above) that ARB should take steps to analyze and model the implications of GHG regulations on power markets and power flows. Thorough modeling is necessary to inform ARB and other stakeholders what the impact ARB's cap-and-trade program could have on the power markets and WECC-wide power flows, and to help ARB preserve a functioning, efficient, and secure market. (SCE3)

Response: The commenter requests clarification on how qualified exports will be calculated. We modified section 95852(b)(5) to clarify the calculation of the new QE adjustment equivalent to the quantity, in MWh, of qualified exports, multiplied by an emission factor as specified. We agree that the emissions rate for exports may be unknown; in these cases, the default emission factor must be used, because the exporter cannot claim the export as originating at a specified source. We agreed that using a single emission factor ("rate") for qualified exports would not be appropriate. Under our new approach, during any hour for which an electricity importer claims qualified exports, the QE adjustment (which is a negative term in the compliance obligation equation) is calculated as the lower of the quantities of exports or imports, multiplied by the lowest emission factor of any export or import during the hour. For example, if an electricity importer imported 10 MWh of electricity with an emission factor of one $MTCO_2e$ per MWh, and exported 5 MWh of unspecified electricity (EF of 0.428), the QE adjustment would be five times 0.428, or 2.14 $MTCO_2e$.

We do not agree that the emission factor for qualified exports should depend on where the power is consumed ("sinks"). We believe that our approach will apply the proper emission factor (EF), and limit the potential for leakage. Because this and other imported electricity issues are complex, we plan to continue monitoring, analyzing, and modeling the effects of the regulation on the power market. If in the future we observe gaming or leakage, we will consider amending the regulation if necessary.

I-50. Comment: NERC E-tags are used only when electricity crosses between Balancing Authorities, which is not always aligned with imports and exports across the physical California border. LADWP recommends that the documentation requirement for NERC E-tags be stricken from this definition as verification can be handled through other types of documentation, such as contracts and settlement data. Additionally, it is unclear under the Mandatory Reporting Regulation (MRR) whether qualified exports are calculated hourly or annually. LADWP is concerned that reconciliation on an hourly basis for 8,760 hours in a calendar year will be administratively burdensome for the covered entity and the verification body. Modify section 95802(a)(218) as follows:

> (218) "Qualified Export" means emissions associated with electricity that is exported in the same hour as imported electricity and ~~documented by NERC E-tags~~. Only electricity exported within the same hour and by the same PSE as the imported electricity is a qualified export. It is not necessary for the imported and exported electricity to enter or leave California at the same intertie. ~~Emissions associated with qualified exports may be subtracted from the associated imports. Qualified exports shall not result in a negative compliance obligation for any hour.~~ (LADWP4)
>
> **Response:** We agree that e-Tags are required only for electricity crossing between balancing authorities. However, our definition of electricity importer, and our changes to section 95852(b), including references to the MRR, make it clear that other data, including contracts and settlement data, may be used as part of the documentation for imported electricity. After working closely with CAISO and with many stakeholders, we remain convinced that the e-Tag approach is best for designating the first deliverer when e-Tags are required, as they are for electricity that crosses between balancing authority areas.
>
> Based on these comments, and further discussion with CAISO and other stakeholders, we modified and renumbered the treatment of qualified exports as new section 95852(b)(5). We now include a QE (qualified exports) adjustment in the equation defining an electricity importer's compliance obligation. While we did not follow LADWP's suggestion for what EF to use for qualified exports, we did clarify how we modified the EF requirement for the QE adjustment. The EF that must be applied to qualified exports to calculate the QE adjustment is the lowest emission factor for any portion of the electricity claimed as either qualified exports, or the corresponding imports, during the hour in question. Therefore, we do not use a single QE emissions rate for all exports, and we believe that our approach will not lead to unintended consequences. New language in section 95852(b)(5) makes it clear how qualified exports are allocated against corresponding imports on an hourly basis, and the compliance obligation equation shows how the QE adjustment is made on an annual basis.

I-51. Comment: As currently written, section 95852(b) would seem to create a compliance obligation for emissions from all sources in linked jurisdictions, rather than emissions associated with imports from these sources. Modify section 95852(b) as follows:

(b) First Deliverers of Electricity. A first deliverer of electricity covered under sections 95811(b) and 95812(c)(2) has a compliance obligation for emissions, ~~subject to section 95852(b)(1)~~, from a source in California ~~or~~ and, subject to section 95852(b)(1), emissions associated with electricity imported into California from a jurisdiction where a GHG emissions trading system has not been approved for linkage by the Board pursuant to subarticle 12. And, where the thresholds set out in section 95812 have been reached and for which a positive or qualified positive emissions data verification statement is issued or there are assigned emissions. (WPTF2)

Response: We modified section 95852(b), including adding new section 95852(b)(1), which provides an equation for the calculation of the full compliance obligation for an electricity importer. The compliance obligation applies to first deliverers only for electricity that they deliver to California. The compliance obligation includes imported electricity reported pursuant to the MRR, and not emissions from all sources in linked jurisdictions, because first deliverers only report emissions for imports that they deliver to California.

I-52. Comment: A first deliverer's compliance obligation is for a subset of emissions that are reported and included in a positive or qualified positive verification statement. We recommend that section 95852(b) be modified to clarify that the compliance obligation is based on covered emissions identified in the MRR that carry a compliance obligation. LADWP also proposes that references to the resource shuffling provision be removed until further vetting. It appears that sections 95852(b)(2) through (7) are intended to clarify compliance obligations for first deliverers of electricity. LADWP recommends that these subsections be further clarified and aligned with the MRR. The MRR section 95111 includes several formulas for quantifying various types of emissions, but it appears there is no single "grand total" that can be pointed to in the MRR for first deliverers. It would be helpful for ARB to establish a clear cross reference from this Regulation to the emissions calculated in MRR that carry a compliance obligation. Modify section 95852(b) as follows:

(b) First Deliverers of Electricity. A first deliverer of electricity covered under sections 95811(b) and 95812(c)(2) has a compliance obligation for every metric ton of covered CO_2e emissions as calculated in Section 95111(b)(5) of MRR. ~~Subject to section 95852(b)(1) from a source in California or in a jurisdiction where a GHG emissions trading system has not been approved for linkage by the Board pursuant to subarticle 12.~~ And, where the thresholds set out in section 95812 have been reached and for which a positive or qualified positive emissions data verification statement is issued or there are assigned emissions. (LADWP4)

Response: We agree with the need to clarify this language, and made significant modifications to section 95852(b) to clarify the compliance obligations for first deliverers of electricity that are operators of an electricity generating facility in California and for electricity importers. New section 95852(b)(1) now precisely states the compliance obligations and indicates which emissions are included and which emissions are not included. The equation in that section clearly shows what reported emissions associated with imported electricity are included or excluded from the full compliance obligation. Although we did not make the exact changes suggested in the comment, we believe our modifications have met this concern. In addition, while we do not believe that the resource shuffling provision should be removed, we did make modifications recommended by the commenter and other stakeholders, and we held a technical workshop that included discussion of resource shuffling.

I-53. Comment: Section 95852(b) should reference not only subsection (b)(1), but subsections (b)(2) through (7) as well, as each of these subsections qualifies the calculation of the compliance obligation by referencing emissions that are not actually included. Modify section 95852(b) as follows:

(b) First Deliverers of Electricity. A first deliverer of electricity covered under sections 95811(b) and 95812(c)(2) has a compliance obligation for every metric ton of CO_2e of emissions, subject to section<u>s</u> 95852(b)(1) to <u>(b)(7) inclusive</u>, from a source in California or in a jurisdiction where a GHG emissions trading system has not been approved for linkage by the Board pursuant to subarticle 12. And, where the thresholds set out in section 95812 have been reached and for which a positive or qualified positive emissions data verification statement is issued or there are assigned emissions. (NCPA3)

Response: We agree that the regulation should more clearly state the calculation of compliance obligations, and we made significant modifications to section 95852(b) based on stakeholder input, to clarify the compliance obligations for first deliverers of electricity that are operators of an electricity generating facility in California and for electricity importers. New section 95852(b)(1) now precisely states the compliance obligations and indicates which emissions are included and which emissions are not included. The equation in the section calculates the "grand total" compliance obligation for an electricity importer. Although we did not use the exact language suggested in the comment, we believe our modifications have addressed the concern noted.

Direct Deliverer of Electricity

I-54. (multiple comments)
Comment: The definition of "direct delivery" should be as close as possible to the definition of category 1 resources in the recently passed RPS bill - SBX1 2. Modify section 95802(a)(68) as follows:
(68) "Direct Delivery of Electricity" means electricity that meets any of the following criteria:
(A) The facility has a first point of interconnection with a California balancing authority;
(B) The facility has a first point of interconnection with distribution facilities used to serve end users within a California balancing authority area;

(C) The electricity is scheduled for delivery from the specified source into a California balancing authority without replacement electricity from another source, except for that needed for hourly or interhourly balancing requirements; or
(D) There is an agreement to dynamically transfer electricity from the facility to a California balancing authority. (SMUD3)

Comment: The CPUC and CEC have commenced regulatory proceedings for the implementation of the 33 percent RPS as authorized under SBX1 2. In these proceedings, stakeholders are vetting the details for various definitions, including what does or does not constitute "direct delivery" of electricity. It would be appropriate for ARB to reference the CPUC and CEC as the entities that will ultimately establish the criteria for what constitutes "direct delivery of electricity" to ensure that treatment is consistent with the regulations that will implement SBX1 2. Modify section 95802(a)(68) as follows:

> (68) "Direct Delivery of Electricity" means electricity that meets Public Utility Code Sections 399.16(b)(1)(A) and 399.16(b)(1)(B) as interpreted by the California Public Utilities, Commission, and the California Energy Commission ~~any of the following criteria:~~
> ~~(A)The facility has a first point of interconnection with a California balancing authority;~~
> ~~(B) The facility has a first point of interconnection with distribution facilities used to serve end users within a California balancing authority area;~~
> ~~(C) The electricity is scheduled for delivery from the specified source into a California balancing authority without replacement electricity from another source; or~~
> ~~(D) There is an agreement to dynamically transfer electricity from the facility to a California balancing authority.~~ (LADWP4)

Response: The point of the modification recommended in the first comment above is to include what is often referred to as "firming and shaping" electricity to qualify as direct delivery when the electricity is "replacement electricity." By "category 1" the commenter is referring to section 399.16(b)(1)(A) of the Public Utilities Code. The recommended modification would not be the same as the PUC requirement for "category 1" electricity to qualify for the RPS; in fact, such electricity would not qualify for the RPS. However, we deleted the definition of "replacement electricity." We also modified the definition of "direct delivery of electricity" to refer to the MRR definition, in which the reference to replacement electricity is deleted. We also modified our approach to the treatment of RPS-eligible imported electricity such that replacement electricity is not required in order for RPS-eligible electricity to reduce the compliance obligation of a first deliver.

This regulation precedes the CPUC and CEC proceedings that will consider what kinds of delivery may or may not be needed for the RPS. We cannot refer to unknown future regulations. Furthermore, it is not clear that CPUC and CEC will define direct delivery; and if they do, it may not be the appropriate definition for use in this regulation.

Biomethane Section 95852(b)(5)

I-55. Comment: CCSF supports section 95852.2 establishing that there is no compliance obligation for CO_2 combustion emissions from high methane content biogas. According to the US EPA, methane is over 20 times more effective in trapping heat in the atmosphere than CO_2. Given the higher potency of methane in global warming effect and its higher short-term impact on climate change, CCSF urges ARB to include additional incentives to expand renewable electricity generation through biogas-fueled combined heat and power systems instead of the flaring digester gas. These incentives might include “first-in-line” benefits, the streamlining of offset protocols, more generous quantitative usage limits, or other mechanisms that would increase biogas capture from a variety of sources (e.g. wastewater treatment, agricultural activities, municipal compost facilities, and natural gas systems). The right incentives could spur the development of new methane/biogas capture technologies which have the greatest pound-for-pound impact on reducing the extent and pace of global climate change. (SFMAYOR3)

> **Response:** This comment does not pertain to the regulation, except in support of section 95852.2. We agree that the expansion of electricity generation using biogas should be encouraged, and if verified according to the provisions in this regulation, biogas is incentivized. However, the regulation is primarily designed to cap GHG emissions that do have a compliance obligation. Other state programs offer incentives for renewable electricity, including electricity from biogas consumption.

I-56. (multiple comments)
Comment: SMUD points out that sections 95852(b)(5) and 95852(b)(7)(a)(4) refer to Section 95852.2, while the correct reference should be 95852.1.1. Modify sections 95852(b)(5) and 95852(b)(7)(a)(4) as follows:

(5) Electricity generated from use of biomethane must comply with section <u>95852.1.1</u>~~95852.2~~, and must meet verification requirements for use of biomethane pursuant to MRR.
(4) The specified electricity generated from the use of biomethane which meets the requirements pursuant to section <u>95852.1.1</u>~~95852.2~~. (SMUD3)

Comment: Section 95852 sets out how each covered entity’s compliance obligations will be determined. It is important to clearly address liability relating to biomass-derived fuels. This section should clarify that, if the biomass-derived fuels meet the specified conditions, there is no compliance obligation for CO_2 emissions from the combustion of those fuels. Section 95852(b)(5) refers only to biomethane, but the more general term “biomass-derived fuel” should be used. We understand that a certification program will be developed under the MRR, as an alternative to verification. This should be recognized in the Cap and Trade Regulation too. Ideally, the term “certification” should be defined in both the MRR and the Cap and Trade Regulation. Modify section 95852(b)(5) as follows:

> (5) <u>There is no compliance obligation for CO2 emissions from e</u>~~E~~lectricity generated from use of biom<u>ass-derived fuels that</u>~~ethane must~~ comply with section 95852.2, and ~~must~~ meet verification<u> or certification</u> requirements for use of biom<u>ass-derived fuels</u>~~ethane~~ pursuant to MRR. (SCPPA7)
>
> **Response:** We deleted sections 95852(b)(5) and 95852(b)(7)(a)(4), so these comments are no longer relevant. We note that emissions from electricity generation that are emissions without a compliance obligation pursuant to sections 95852.1, 95852.1.1, and 95852.2, are not included in the compliance obligation for either electricity importers or California first deliverers. If emissions without a compliance obligation are emitted by a power plant from which electricity is imported, the emission factor for the power plant is calculated using only emissions that have a compliance factor. No part of an electricity importer’s compliance cost results from emissions without a compliance obligation.

Resource Shuffling

I-57. (multiple comments)
Comment: If not deleted, section 95852(b)(1) regarding resource shuffling should be revised. First, the conclusive statement that resource shuffling is “fraud” should be eliminated. Section 95852(b)(1) prohibits resource shuffling. The statement that resource shuffling is “fraud” adds nothing to the force or effect of the prohibition. However, as pointed out at the July 15, 2011, workshop on the Discussion Draft, “fraud” is a shrill term that suggests that the Board is biased and intemperate. The term is inappropriate and should be deleted. (SCPPA6)

Comment: SMUD believes that the 15 Day language covering Resource Shuffling in sections 95802 and 95852 has potential to significantly and negatively impact the current operation of electricity markets and distribution and transmission operations. Appearing without a workshop, other notice or public discussion, a long definition of “Resource Shuffling” has been added to the Regulation (section 95802(a)(245)) along with prohibitions against use of resource shuffling in section 95852(b), and addition of a requirement for a personal attestation that resource shuffling, as defined, has not occurred. There are several levels at which this set of newly introduced concepts and regulatory language is unworkable. Prior public discussion would certainly have disclosed this.

SMUD recommends that ARB hold a public workshop in the near future giving stakeholders the opportunity to discuss and provide input on the issue of the treatment of out-of-state renewable and other electricity resource purchases under the Cap and Trade and Mandatory Reporting Regulations. Additionally, various other portions of this and other regulations address specific issues associated with emission claims due to expiring coal contracts and out-of-state renewable energy contracts. For example, SB 1368 prevents California utilities from contracting with or extending long-term, baseload contracts for new or existing generation with emissions factors greater than 1,100 lbs/MWh. Legacy out-of-state nuclear and hydro are prevented from being contract shuffled via the MRR. Existing out of state eligible renewable energy sources that commenced operation prior to 2005 are ineligible for the State's RPS unless imported to California prior to 2010. It is unlikely that regulated parties would have incentives to engage in a type of resource shuffling with existing out of state renewable resources that will not provide eligibility for RPS compliance. For the most part, then, only existing natural gas fired resources are at issue.

Natural gas resources are marginal resources active in high volume in short and long term markets that have emissions profiles relatively close to and both above and below the current CARB defined default emissions factor. It would be impossible for a power purchaser in this market to predict the emissions consequence, beyond their own emissions liability, of any transaction. The counterfactual nature of the "Resource Shuffling" definition renders its application impractical. Faced with potential personal allegations of fraud for consequences beyond the contractual horizon and beyond control, contracting for resources would be negatively impacted. Liquidity in this market is essential to the normal operation of the electric transmission and distribution systems. This rulemaking has had much deliberation on the use and setting of a default emissions value for imported power. This long process has resulted in workable values and application within the regulation which define the emission obligation for imported power.

The new resource shuffling language, both in definition and regulatory application, defines emissions obligations and "acceptable" emissions reductions in a way that essentially ignores this good work and places stakeholders participating in normal electricity markets at risk of significant legal consequence for normal market actions that have unknown and essentially unknowable, but relatively minor, GHG emission consequences. SMUD suggests that the Cap and Trade regulatory language in this regard revert to the 45 Day language in the October 2010 Regulation, without reference to resource shuffling, as most transactions that are truly worrisome are already prohibited or greatly discouraged by existing law, and the remaining transactions are too indistinguishable from normal market transactions to clearly delineate without implications that will curtail normal market transactions and potentially affect the reliability of the electricity system. Modify section 95802(a)(245) as follows:

"Resource Shuffling" means any plan, scheme, or artifice to receive credit based on emissions reductions that have not occurred, involving the delivery of electricity to the California grid, for which:

(A) An emission factor below the default emission factor is reported by a first deliverer of electricity pursuant to MRR for a generation source that has not historically served California load (excluding new or expanded capacity). And, during the same interval(s), the same first deliverer of electricity knowingly and actively participated in transactions resulting in delivery of electricity from a source with higher emissions ~~was delivered~~ to serve load located outside

California and in a jurisdiction that is not linked with California's Cap-and-Trade Program; or
(B) The default emission factor or a lower emissions factor is reported pursuant to MRR, for electricity that replaces electricity with an emissions factor higher than the default emission factor that previously served load in California; except when the replaced electricity no longer serves California load as a result of compliance with the Emission Performance Standards adopted by the California Energy Commission and the California Public Utilities Commission pursuant to Senate Bill 1368 (Perata, Chapter 598, Statutes of 2006).

And modify section 95852(b)(1) as follows:

(1) Resource shuffling is prohibited~~,~~ and is a violation of this article ~~and is a form of fraud~~. ARB will not accept a claim that emissions attributed to electricity delivered to the California grid are at or below the default emissions factor for unspecified electricity specified pursuant to MRR July 2011 section 95111 if that delivery involves resource shuffling. The following attestations must be submitted to ARB annually in writing, by certified mail only:
(A) "I certify under penalty of perjury of the laws of the State of California that [facility or company name] has not engaged in the activity of resource shuffling to reduce compliance obligation for emissions, based on emission reductions that have not occurred as an active and knowing part of my transaction."
(B) "I understand I am participating in the Cap-and-Trade Program under title 17, California Code of Regulations, article 5, and by doing so, I am now subject to all regulatory requirements and enforcement mechanisms of this program and subject myself to the jurisdiction of California as the exclusive venue to resolve." (SMUD3)

Comment: It is unclear how a first deliverer would be able to know in advance whether a transaction involved resource shuffling. For example, under subparagraph (B) of the definition, "resource shuffling" would occur if a covered entity received a delivery of electricity to the California grid for which the default emission factor is reported and the electricity "replaces electricity with an emissions factor higher than the default emission factor that previously served load in California." Many wholesale transactions including daily or hourly trades involve the purchase of system power which would be assigned the default emission factor under the ARB's Regulation for the Mandatory Reporting of Greenhouse Gas Emissions (MRR). For a covered entity in California that has gas-fired or other generation resources that have an emissions factor that is higher than the emissions factor of system power, any one of those purchases of system power could result in the replacement of higher emissions factor electricity without the trader having any idea that a replacement would occur.

The ambiguity of the term "historically served California load" in subparagraph (A) of the definition would likewise make it difficult for covered entities to know if they were engaged in resource shuffling or not. Under subparagraph (A) of the definition, a covered entity would be guilty of resource shuffling if the entity took delivery of electricity from a power plant with a low emissions factor and the plant “has not historically served California load.” However, the term “historically served California load” is undefined in the regulation. If electricity purchasers do not know the meaning of the term, they may avoid any purchases from out-of-state power plants with low emission factors regardless of how much the plant has served California to be sure of avoiding a charge of resource shuffling. That could preclude purchases of otherwise available supply, distorting the wholesale market and potentially increasing prices to consumers. Subparagraph (B) of the definition [Resource Shuffling] could have another counterproductive consequence. A covered entity may desire to permanently retire a power plant that has an emissions factor that is higher than the default emissions factor and replace the output of the plant with unspecified system power. The consequence of retiring the high-emitting plant would be to reduce GHG emissions, but the retirement would be precluded by the fact that the replacement of the output of the plant with unspecified system power would be penalized as resource shuffling. Perversely, under subparagraph (B) the covered entity could avoid a resource shuffling charge if the covered entity replaced the output of the plant with electricity that has an emissions factor that is higher than the default emissions factor. The result could be higher net emissions after retiring the power plant in comparison to the prohibited retirement combined with replacement at the default emissions factor.

Even more perversely, subparagraph (B) would allow the plant to be retired and replaced with system power if the retirement were the result of the SB 1368 Emissions Performance Standard (EPS) being applied to the plant, effectively requiring the covered entity to continue operating the plant and emitting GHG at a higher level until shut-down is required under the EPS. The ultimate irony is that subparagraph (B) would apply even if the high emissions plant were fully retired and replaced with a new zero emissions renewable resource before retirement was required by the EPS. Subparagraph (A) contains an exception for deliveries of low emission electricity from “new or expanded” low emission resources, but there is no such exception in subparagraph (B). The definition of “Resource Shuffling” is replete with problems that could have substantial negative consequences. The definition and the related provisions should be deleted from the “15-day” Regulation and reserved for consideration in a separate proceeding in which the provisions can be refined to achieve the proper objectives of AB 32 without having so great a potential for negative outcomes. If the resource shuffling provisions are not deleted and held for future consideration, at bare minimum they should be revised. First, the first sentence of the definition should be revised to make it clear that the definition applies only to deliveries to the California grid from a jurisdiction that is not linked with the California Cap and Trade program.

The definition in section 95802(a)(245)(A) should be revised to refer to a new defined term, “historically consumed in California” and to make other changes to conform to the use of the new defined term. Modify section 95802(a)(245) as follows:
(245) “Resource Shuffling” means any plan, scheme, or artifice to receive credit based on emissions reductions that have not occurred, involving the delivery of electricity <u>generated outside California and in a jurisdiction where a GHG emissions trading</u>

system has not been approved for linkage by the Board pursuant to subarticle 12 to the California grid, for which:

(A) An emission factor below the default emission factor is reported pursuant to MRR for electricity generated at a generation source that is~~has~~ not electricity historically consumed in~~served~~ California, as defined in section 95802(a) ~~load~~ (excluding electricity from new or expanded capacity) (such electricity being "Relevant Electricity"). And, during the same interval(s), electricity with ~~higher~~ emissions equal to or higher than the default emission factor was delivered to serve load located outside California and in a jurisdiction that is not linked with California's Cap-and-Trade Program which was previously served by the Relevant Electricity now used to serve load in California.~~; or~~

The definition of the new defined term, "historically consumed in California," should be based on section 95111(g)(4)(A) of the Mandatory Reporting Regulation. SCPPA recommends the following definition of "historically consumed in California:" Modify section 95802 as follows

95802(a)(X) "Electricity Historically Consumed in California" means electricity from a specified source of electricity located outside California that was reported in a 2009 verified data report and either:

(A) The electricity is claimed for the current data year by the same electricity importer that imported electricity from that specified source in 2009, based on a written power contract or status as a generation providing entity (as defined in MRR) in effect prior to January 1, 2010, that remains in effect, or that has been renegotiated for the same facility or generating unit for up to the same share or quantity of net generation within 12 months following prior expiration; or

(B) The electricity is claimed for the current data year by a different electricity importer than the entity that imported electricity from that specified source in 2009, but at least the same share or quantity of net generation from that specified source was imported into California in 2009 (as reported in a 2009 verified data report). (SCPPA6)

Comment: The Cap and Trade Regulation must allow for ordinary grid operations which facilitate the delivery of renewable energy resources into the State of California. Under the current definition, of "resource shuffling," Iberdrola Renewables is concerned normal provision of balancing and operating reserves to enable the reliable import of renewable energy would be defined as "fraudulent," which it is not. The import of renewable energy into the State of California is an important component of California's renewable portfolio and necessary for California to meet its RPS requirements. Significant work has gone into the development of the California RPS requirements which will govern the portfolio content requirements. It is critical that the Cap and Trade Regulation be aligned with the RPS requirements to ensure effective and consistent delivery of reliable renewable energy into the State of California. (IBERDROLA)

Comment: The definition of resource shuffling should be revised to exclude situations where a covered entity either unknowingly engages in activities that resemble resource shuffling, or adjusts its portfolio for valid economic dispatch reasons. Modify section 95802(a)(245) as follows:

> (245) "Resource Shuffling" means any <u>intentional</u> plan, scheme, or artifice to receive credit based on emissions reductions that have not occurred, involving the delivery of electricity to the California grid, for which:
>
> (A) An emission factor below the default emission factor is reported pursuant to MRR76 for a generation source that has not historically served California load (excluding new or expanded capacity and grandfathered contracts). <u>New or expanded capacity is relative to capacity as of 01/01//2012.</u> And, during the same interval(s), <u>the same entity reporting the lower emissions delivers</u> electricity with higher emissions ~~was delivered~~ to serve load located outside California and in a jurisdiction that is not linked with California's Cap and Trade Program; or
>
> (B) The default emission factor or a lower emissions factor is reported pursuant to MRR, for electricity that replaces electricity with an emissions factor higher than the default emission factor that ~~previously~~ served load in California <u>prior to 01/01/2012</u>; except when:
>
> (1) the replaced electricity no longer serves California load as a result of compliance with the Emission Performance Standards
>
> (2) the contract with the resource was terminated prior to 01/01/2012.
>
> (SCE3)

Comment: The definition of resource shuffling and rules for specifying imports must be modified to be more consistent with wholesale energy markets. WPTF is concerned that the new provisions in the modified Regulation that characterize resource shuffling as a violation and a form of fraud, may result in electricity importers being subject to severe financial and potentially criminal consequences for events that are outside that entity's control. For instance, one of the conditions for resource shuffling, as defined, is that "during the same interval(s), electricity with higher emissions was delivered to serve load located outside California and in a jurisdiction that is not linked with California's cap and trade program." This condition is a direct result of economic dispatch, not resource shuffling.

Second, the definition for resource shuffling for low-emission resources should not apply to all generation, but should be limited to those resources which have the potential to undermine the environmental integrity of the cap and trade program—namely large hydro-electric and nuclear generation. Natural gas generation should not be considered a "shuffle-able‟ resource. Natural gas generation is dynamic throughout the WECC; it naturally moves from market to market depending on load and transmission conditions. Restrictions on claims to natural gas generation under the cap and trade program will inhibit normal market transactions and reduce the liquidity of the California power markets.

The requirement that a generation source has historically served load would have a particularly chilling effect. This provision would disadvantage natural gas resources that have chosen to sell through markets rather than bilateral contracts, as they could not meet the historic test for specifying imports into California. Conversely, resources that have historically imported into California under bilateral contracts would be forced to extend those contracts in order to maintain eligibility for a specified emission rate for their imports. As the California Independent System Operator continues to move toward competitive bid-based spot markets for energy and ancillary services, CARB should not be adopting regulations that disincentivize competitive market behavior.

WPTF recommends several changes to the modified regulation to address these concerns. First, the condition regarding electricity with higher emissions being delivered to serve load located outside California should be eliminated. Second, natural gas generation should be considered a "non-shuffle-able" resource. Third, the historic consumption should not be an eligibility requirement for specification of natural gas resources. Given the complexity of issues surrounding imported electricity, WPTF urges CARB to hold a technical workshop on these matters prior to finalization of the rule.

When an out-of-state resource serves load in California, by necessity another unit up the dispatch curve, usually with a higher emission rate, will necessarily serve the incremental load in the source jurisdiction. This is a normal and intended consequence of power markets, and completely out of the control of the importing entity. We recommend changing the requirements for attestation in recognition of the fact that resource shuffling is a consequence of the market, and not necessarily under an individual entity's control. (WPTF2)

Comment: The definition for resource shuffling for low-emission resources should not apply to all generation, but should be limited to those resources which have the potential to undermine the environmental integrity of the cap and trade program, namely large hydro-electric and nuclear generation. Natural gas generation should not be considered a "shuffle-able" resource. Natural gas generation is dynamic throughout the WECC. It naturally moves from market to market depending on load and transmission conditions. Restrictions on claims to natural gas generation under the cap and trade program will inhibit normal market transactions and reduce the liquidity of the California power markets. Modify section 95802(a)(245)(A) as follows:

> (A) An emission factor below the default emission factor is reported pursuant to MRR <u>for electricity generated at a hydroelectric facility over 30 MW, or a nuclear generating facility</u> ~~a generation source~~, that has not historically served California load (excluding new or expanded capacity). ~~And, during the same interval(s), electricity with higher emissions was delivered to serve load located outside California and in a jurisdiction that is not linked with California's Cap-and-Trade Program; or~~ (WPTF2)

Comment: The proposed Regulation's definition of "resource shuffling" is overly broad and could operate as a strong disincentive to future dispatch and contracting of highly efficient out-of-state resources with emissions lower than the default emissions rate for unspecified power. We recommend that CARB clarify that the prohibition on resource shuffling was not intended to apply to circumstances where existing facilities that have historically served California deliver more power to California in the future. Modify section 95802(a)(245)(A) as follows:

(A) An emission factor below the default emission factor is reported pursuant to MRR for a generation source that has not historically served California load (excluding new or expanded capacity~~. A~~and, during the same interval(s), electricity with higher emissions was delivered by the same covered entity or any entity with which it has a direct or indirect corporate association to serve load located outside California and in a jurisdiction that is not linked with California's Cap-and-Trade Program; provided, however, that nothing in this paragraph shall be deemed to prohibit reporting a lower than the default emissions factor pursuant to the MRR for increased deliveries of electricity to California, in MWh per year, from a generating source that has historically served California; or (CALPINE3)

Comment: SCE supports ARB's discouragement of resource shuffling, which is consistent with AB 32's direction that emissions reductions be "real." However, it is entirely possible that an entity may inadvertently commit resource shuffling, under the rules as currently written, without any fraudulent intent or scheme to receive an unearned emissions reduction. For example, a simple human error in reporting or interpretation of a rule could result in the appearance of resource shuffling. SCE agrees that truly fraudulent resource shuffling should be addressed, but notes that it will often be premature to immediately conclude that fraud is involved. ARB should be careful to not restrict an electricity deliverer's ability to procure the least-cost electricity (assuming the GHG costs are adequately incorporated into these prices). Modify section as follows:

95852(b)(1) Resource shuffling is prohibited~~,~~ and is a violation of this article ~~and is a form of fraud~~. ARB will not accept a claim that emissions attributed to electricity delivered to the California grid are at or below the default emissions factor for unspecified electricity specified pursuant to MRR section 95111 if that delivery involves resource shuffling. (SCE3)

Comment: NCPA has concerns regarding the ambiguity and confusion associated with the definition of resource shuffling, and joins with the recommendation of the Joint Utilities asking that CARB strike this definition unless and until a definition can be crafted that narrowly defines the malfeasance only, and does not adversely impact electricity operations statewide. For purposes of this section 95852(b)(1), intentionally under reporting or misreporting emissions in an attempt to obtain credit for emissions reductions that have not occurred should be prohibited. However, the consequences of violating this prohibition should encompass the same penalty processes as the rest of the Program. Modify section 95852(b)(1) as follows:

> Section 95852 (b)(1): Resource shuffling is prohibited, <u>and</u> is a violation of this article ~~and is a form of fraud. ARB will not accept a claim that emissions attributed to electricity delivered to the California grid are at or below the default emissions factor for unspecified electricity specified pursuant to MRR section 95111 if that delivery involves resource shuffling. The following attestations must be submitted to ARB annually in writing, by certified mail only:~~
>
> > ~~(A) "I certify under penalty of perjury of the laws of the State of California that facility or company name] has not engaged in the activity of resource shuffling to reduce compliance obligation for emissions, based on emission reductions that have not occurred."~~
> >
> > ~~(B) "I understand I am participating in the Cap-and-Trade Program under title 17, California Code of Regulations, article 5, and by doing so, I am now subject to all regulatory requirements and enforcement mechanisms of this program and subject myself to the jurisdiction of California as the exclusive venue to resolve."~~ (NCPA3)

Comment: Resource and contract shuffling enables covered entities to meet their compliance obligations without generating any net emissions reduction, and is therefore at odds with the objectives of the program. While we support ARB's intent to prohibit resource shuffling, we ask that ARB conduct a workshop to flesh out the details and consider the ramifications of implementing the provision and definition of resource shuffling provided in the draft rule. To be effective, it is critical that ARB's definition not create loopholes, send mixed incentives, or unduly inhibit covered entities' efforts to reduce the carbon intensity of their resource mix. We feel additional clarification is required to make that assessment.

One modification we recommend ARB make at this stage is to expand the exception for compliance with the Emission Performance Standard (EPS) adopted by the PUC and CEC pursuant to SB 1368. The current definition of resource shuffling excludes electricity no longer serving California load "as a result of" compliance with the EPS. We ask that ARB expand the current language to clarify that actions taken by covered entities to achieve early compliance with the EPS are similarly not prohibited as resource shuffling. (KUSTIN16)

Comment: The Joint Utilities agree that any artificial attempts to distort the actual emissions reductions achieved by a first deliverer of electricity should be prohibited. However, the 15-Day Language on resource shuffling has the potential to negatively impact the state's electric system distribution and transmission operations and should be subject to additional stakeholder discussions and review. The definition of Resource Shuffling in section 95802(a)(245) and its application in section 95852(b)(1) must be changed. (JOINTUTILITIES)

Comment: The regulation does not make clear whether an out-of-state power plant could fall within the definition of "resource shuffling" if the facility reported a portion of its output "historically serving" California, but then enters into a new contract for the remaining capacity. Thus, in addition to IEP's concern that the definition does not recognize an "intent to mislead," such a presumptive determination solely based on a historical contract ignores the situation of merchant facilities as well as assets coming off of term contracts that will require flexibility in entering new contracts. Reference to "fraud" should be deleted. Modify section 95852(b)(1) as follows:

> (1) Resource shuffling is prohibited and is a violation of this article. ~~and is a form of fraud.~~ ARB will not accept a claim that emissions attributed to electricity delivered to the California grid are at or below the default emissions factor for unspecified electricity specified pursuant to MRR section 95111 if that delivery involves resource shuffling, unless the resource has been registered as a specified import. The following attestations must be submitted to ARB annually in writing, by certified mail only:
>
> (A) "I certify under penalty of perjury of the laws of the State of California that [facility or company name] has not intentionally engaged in the activity of resource shuffling to reduce compliance obligation for emissions, based on emission reductions that have not occurred.
>
> (B) "I understand I am participating in the Cap-and-Trade Program under title 17, California Code of Regulations, Article 5, and by doing so, I am now subject to all regulatory requirements and enforcement mechanisms of this program and subject myself to the jurisdiction of California as provided in title 17, California Code of Regulations, article 5, as the exclusive venue to resolve dispute brought pursuant to this Article.
>
> IEPA recommended that the resource shuffling prohibition should append the words "unless the resource has been registered as a specified source" to the second sentence of section 95852(b)(2). This modification would render the prohibition against resource shuffling meaningless, since it would imply that an import was a specified source rather than an entity, and because electricity entities that are recognized as specified sources pursuant to MRR requirements could be used as part of a resource shuffling scheme if two or more entities colluded to launder the electricity.

The definition for resource shuffling should be clarified to exclude legitimate transactions and only apply to situations where an entity knowingly and intentionally misrepresents its emissions for purposes of avoiding the compliance obligation. Reference to "fraud" should be deleted. (IEPA2)

Comment: Modify section 95802(a)(245) as follows:

> (245) "Resource Shuffling" means any plan, scheme, or artifice to intentionally misstate or mislead regarding the ~~receive credit based on~~ emissions rate ~~reductions that have not occurred~~, involving the delivery of electricity to the California grid~~,~~ by an entity that has not already registered under the Mandatory Reporting Regulation as a specified importer for which:

(A) An emission factor below the default emission factor is reported pursuant to MRR for a generation source that has not ~~historically~~ served California load (excluding new or expanded capacity) ~~. A~~ and, during the same interval(s), electricity with higher emissions was delivered to serve load located within ~~outside~~ California ~~and in a jurisdiction that is not linked with California's Cap-and-Trade Program; or~~

~~(B)The default emission factor or a lower emissions factor is reported pursuant to MRR, for electricity that replaces electricity with an emissions factor higher than the default emission factor that previously served load in California; except when the replaced electricity no longer serves California load as a result of compliance with the Emission Performance Standards adopted by the California Energy Commission and the California Public Utilities Commission pursuant to Senate Bill 1368 (Perata, Chapter 598, Statutes of 2006).~~ (PACIFICOR3, IEPA2)

Comment: The resource shuffling provisions as proposed in the 15-day modifications are vague and overly broad, violate the intent of the cap-and-trade regulation, create the Commerce Clause issues, and contradict CPUC requirements of utilities to undertake least cost dispatch. While restrictions may be needed, it is important to draft such restrictions in a manner that does not treat legitimate electricity market transactions as a crime. Because such extensive changes are needed, we recommend that ARB follow-up with a stakeholder process, including a workshop and additional comments, to further refine the rules to meet the disparate concerns of market participants. The first change required is to modify the definition of resource shuffling to narrow it to three types of resource shuffling: 1) importing power from a low emitting resource in place of a higher emitting resource from the supplier's same portfolio of resources; 2) selling high emitting power from a facility owned or under long-term contract out-of-state and replacing it with low emitting or unspecified imported power; and 3) moving energy from high emitting specified resources around the WECC so that it origins cannot be traced and it is assigned the default emissions factor. A fourth type of transaction could be resource shuffling but cannot be prevented due to Commerce Clause issues: A single generation facility that is low emitting will gain a benefit by selling into the California market where it previously had not, while a coal facility may not economically dispatch into California because of its high GHG cost. This type of economic shuffling, and the resulting leakage, cannot be prevented due to the Commerce Clause. The Resource Shuffling definition should also make it clear that the importer of the electricity and not the buyer is the sole entity that is engaging in resource shuffling. Buyers of electricity, or facilitators of electricity transactions such as the CAISO, should not have to investigate every import transaction to see if the electricity source is properly reported. To do otherwise would destroy markets for electricity and require all transactions to be bilateral with specified resources to avoid transactions being deemed fraudulent by ARB. Additionally, the definition needs to be clarified to make it clear that resource shuffling only occurs as a result of intentionally underreporting. Finally, no attestations should be required since resource shuffling properly defined would be a misreporting of emissions and subject to enforcement pursuant to the MRR provisions on inaccurate reporting as well as Section 96014(c) of the Cap-and-Trade Regulation. The attestations serve no useful purpose, but do tend to raise the specter that perfectly valid conduct might be treated as inconsistent with the attestation. Further, as resource shuffling is currently defined in the 15-day modifications, it is not a fact, but a legal opinion, and therefore cannot be attested to. For example any sale of electricity from a facility other than coal existing in the WECC that did not deliver electricity to California in 2009 may be legally considered by the Cap-and-Trade Regulation as engaging in resource shuffling. A single facility, on the other hand, may rightly believe it is impossible for it to "resource shuffle" if it has no other resources. The following offers one way of potentially narrowing the definition of "resource shuffling," but it is not the only way of dealing with the issue. For example, restoration of the language regarding hydroelectricity, nuclear power, and high-emitting resources that was deleted in the 15-day modifications could also go a long way toward correcting part of the problem. Modify sections 95802(a)(245) and 95852(b)(1) as follows:

> (245) "Resource Shuffling" means ~~any plan, scheme, or artifice to receive credit based on emissions reductions that have not occurred, involving the delivery of electricity to the California grid, for which~~ intentionally underreporting emissions of imported electricity in any of the following ways and does not include transactions entered into for operational purposes as demonstrated according to the provisions in section 95111(b)(2) of the MRR:
>
> > (A) An emission factor below the default emission factor is reported pursuant to MRR for a generation ~~source~~ facility or unit of an asset-controlling supplier that has not historically served California load (excluding new or expanded facility or unit capacity). And, during the same interval(s), electricity from the same asset-controlling supplier with higher emissions was delivered to serve load located outside California and in a jurisdiction that is not linked with California's Cap-and-Trade Program; or
> >
> > (B) The default emission factor or a lower emissions factor is reported pursuant to MRR, for electricity that replaces electricity with an emissions factor higher than the default emission factor that ~~previously serve~~s~~d~~ load in California pursuant to an ownership interest or long-term contract; except when the ~~replaced~~ higher emitting electricity no longer serves California load as a result of compliance with the Emission Performance Standards adopted by the California Energy Commission and the California Public Utilities Commission pursuant to Senate Bill 1368 (Perata, Chapter 598, Statutes of 2006) ; or
> >
> > (C) Specified electricity with an emissions factor higher than the default emission factor is knowingly reported by the electricity importer as unspecified electricity.
>
> (1) Resource shuffling is prohibited, is a violation of this article ~~and is a form of fraud. ARB will not accept a claim that emissions attributed to electricity delivered to the California grid are at or below the default emissions factor for unspecified electricity specified pursuant to MRR section 95111 if that delivery~~

~~involves resource shuffling. The following attestations must be submitted to ARB annually in writing, by certified mail only:~~

~~(A) "I certify under penalty of perjury of the laws of the State of California that [facility or company name] has not engaged in the activity of resource shuffling to reduce compliance obligation for emissions, based on emission reductions that have not occurred."~~

~~(B) "I understand I am participating in the Cap-and-Trade Program under title 17, California Code of Regulations, article 5, and by doing so, I am now subject to all regulatory requirements and enforcement mechanisms of this program and subject myself to the jurisdiction of California as the exclusive venue to resolve."~~ (SEMPRA3)

Comment: In addition, section 95852(b)(1) provides that "resource shuffling" constitutes fraud. Fraud is a criminal violation that is imposed when there is intent to deceive or misrepresent the truth. Numerous parties have expressed concern about the lack of clarity regarding the definition, that they do not understand the definition, and that they do not know whether otherwise legitimate and routine transactions in today's interstate market could now become criminal actions under the proposed Cap and Trade regulation. LS Power requests that the Board remove this issue from the proposed regulations. This can be done by either deleting the reference to fraud in Section 95852(b)(1), or making it clear in the definition of Resource Shuffling at section 95802(a)(245) that the definition only applies when an entity intends to misrepresent the nature of imports that were actually made into California. (LSPOWER)

Comment: Section 95802(a)(245)(A) identifies a resource shuffling scenario, where electricity is delivered into the California grid for which "an emission factor below the default emission factor is reported…for a generation source that has not historically served California load (excluding new or expanded capacity)," and that "during the same interval(s), electricity with higher emissions was delivered to serve load" outside California's Cap and Trade program. It is unclear what ARB means by "new or expanded capacity." Compliance entities will need a reference date from which to calculate "new or expanded capacity," or they may unknowingly engage in activities that seem, under these rules, like resource shuffling. SCE recommends that ARB introduce such a date and clarify this rule. (SCE3)

Comment: In the definition for "resource shuffling" at section 95802(a)(245)(b), ARB uses the term "previously served load in California." This term is central to the meaning of the defined category and is not defined in the rule. If this clause is intended to have a meaning different from "historically served California load" in the first category, then Powerex requests that ARB explain the difference and clearly define both terms in the rule. If the two terms are meant to describe the same generation sources, then only one term should be used and clearly defined in the rule. (POWEREX)

Comment: In the proposed modifications to the Cap and Trade Rule, ARB broadly defines the term "resource shuffling" to include a "plan, scheme, or artifice to receive credit based on emissions reductions that have not occurred, including [sic] the delivery of electricity to the California grid." The definition goes on to more specifically define two distinct forms of resource shuffling (section 95802(a)(245)). Subsection (A) of the definition distinguishes between sources that have "not historically served California load" and those that have. This clause, however, is not defined in the Cap and Trade Rule. As the concept is central to the meaning of the defined category, Powerex requests that ARB define the term to clearly state what constitutes "historically serving California load" for purposes of identifying resource shuffling. (POWEREX)

Comment: Section 95802(a)(245)(A) is ambiguous and either unnecessary or likely to be ineffective at curbing resource shuffling. If electricity with an emission factor below the default is reported for a generation source that has not historically served California load, it is likely that electricity with higher emissions will have been delivered, during that same interval, outside California and unaffected by California's Cap and Trade Program. As written, therefore, the second sentence of subsection (A) does not narrow or clarify the subsection, and it could be deleted without changing the scope or meaning of the subsection. If ARB intended subsection (A) to be read as applying to a single entity i.e., applying to a situation where a single entity delivered electricity with higher emissions to a load outside California during the same interval as the specified import, then subsection (A) is unlikely to successfully restrict resource shuffling. It is possible that two entities could exchange electricity so that one has all of the electricity with a lower emission factor and the other has all of the electricity with a higher emission factor. The entity with the lower emission factor electricity then could send electricity below the default emission factor without delivering electricity with higher emissions to a load outside of California. Powerex recommends eliminating the second sentence of subsection (A) to prevent this kind of circumvention of the Cap and Trade Rule. (POWEREX)

Comment: Subparagraph (B) of the definition of "Resource Shuffling" should be deleted in its entirety. Subparagraph (B) would have the potential for consequences that are contrary to the purpose of AB 32. The subparagraph would have the potential to discourage a covered entity from permanently retiring a power plant before being required to do so under the EPS. The covered entity could only avoid a resource shuffling charge only by replacing the output of the retired plant with electricity within an emission factor higher than the default emissions factor. The subparagraph would discourage a covered entity from retiring a high emissions plant and replacing the plant with a renewable resource before retirement as required by the EPS. (SCPPA6)

Comment: Section 95802(a)(245)(B) outlines a resource shuffling scenario in which "electricity… replaces electricity with an emissions factor higher than the default emission factor that previously served load in California; except when the replaced electricity no longer serves California load as a result of compliance with the Emission Performance Standards" adopted pursuant to Senate Bill 1368. There is no reference date from which to calculate whether electricity had "previously" served load. In addition, this provision may penalize compliance entities for decisions made prior to the release of this revised Regulation. For example, if a compliance entity had decided before the beginning of the Cap and Trade program to fully divest itself of generation from a higher-emitting facility, it could be considered resource shuffling as currently defined under the draft rules. Moreover, this scenario restricts utilities from adjusting their portfolios for valid economic dispatch reasons. A number of factors contribute to this economic valuation, many of which could change over the coming years due to forces outside the control of ARB or any compliance entities. (SCE3)

Comment: The definition of resource shuffling is problematic as drafted, because it could be interpreted to prohibit standard and existing electric transactions that maximize the efficient use of the State's limited electric transmission system and interferes with economic dispatch of electric generation resources. The proposed definition goes far beyond Staff's stated intent of minimizing leakage and ensuring the integrity of the Cap-and-Trade Program. Like the Joint Utilities, NCPA believes that the proposed definition for resource shuffling (as well as the related provisions of section 95852(b)(1)) must be publicly vetted in order to ensure that Staff fully understands the implications of such a drastic revision to the Proposed Regulation and the significant ramifications it creates for electrical distribution utilities.

NCPA agrees that any "plan, scheme, or artifice to receive credit based on emissions reductions that have not occurred" should be prohibited. However, the proposed definition would penalize those that participate in legitimate transactions, and indeed, would impact not only existing utility and electricity market operations, but long standing contractual commitments as well. While the proposed definition acknowledges generation resources that have historically served California load, it provides no guidance on interpreting historical sales, nor does it acknowledge that certain contractual transactions that may not meet this exclusion are merely the result of existing agreements or efficient economic dispatch of generation resources. Clearly, this cannot be Staff's intent. Accordingly, NCPA urges Staff to delay any formal action regarding the concept of resource shuffling until after such time as Staff has had an opportunity to hold a public workshop on this important issue. (NCPA3)

> **Response:** Several commenters see resource shuffling as a problem that the regulation must address, and we thank these commenters for supporting our intent to prohibit resource shuffling. As defined in the regulation, "resource shuffling" means any plan, scheme, or artifice to receive credit based on emissions reductions that have not occurred, involving the delivery of electricity to the California grid.
>
> Based on the comments of SMUD, SCPPA, and many others, we made significant improvements in the second 15-day changes to the regulation to both the definition of resource shuffling, in section 95802(a)(245) (newly numbered as paragraph (251) of that section) and to the resource shuffling prohibition, section 95852(b)(1) (newly numbered as paragraph (2) of that section).
>
> We deleted the words "for which" in the definition and deleted paragraphs (251)(A and B) addressing the commenters' concerns regarding these paragraphs. We modified the prohibition against resource shuffling, removing

the words “and is a form of fraud” as requested. We also deleted the second sentence of section 95852(b)(2). Furthermore, we modified the attestations of 95852(b)(2)(A and B).

We do not believe that the resource shuffling provisions, as modified, will negatively impact the current operation of electricity markets or facility operations, or that the concepts or language as modified are unworkable. However, because this regulation puts a price on GHG emissions, we expect the regulation to influence electricity markets in California. Requiring allowances for GHG emissions from electricity generation is intended to create a level playing field based on consideration of GHG emissions for high-emitting generation resources compared to low- or zero-emitting resources.

As recommended by SMUD and others, we held a technical workshop on August 26 that included discussion of out-of-state renewable electricity, resource shuffling, and other aspects of imported electricity. We also continued informal discussions with stakeholders regarding the resource shuffling definition and the prohibition.

While SMUD is correct about what SB 1368 prevents, this does not preclude resource shuffling involving coal resources. Furthermore, the MRR does not prohibit resource shuffling, nor does it prevent “contract shuffling,” which, although essentially equivalent in meaning, is a phrase not defined in this regulation or in the MRR. Instead, the MRR only requires certain reporting about imported electricity from these sources. While we agree that regulated parties might not have incentives to engage in resource shuffling with existing out-of-state renewable resources, some parties may do so if it is not prohibited. For example, if a renewable facility is used in Oregon to meet an RPS requirement, and its electricity sinks, i.e., has a final point of delivery, in Oregon before this regulation takes effect, a marketer owning the electricity and RECs could enter a new contract with a third party to sell the electricity into California. This would likely be a form of resource shuffling. While such a scheme could theoretically be avoided by a multi-jurisdictional regulatory regime that assigned deemed emissions to “null power,” such a regime does not exist and is not under consideration for WCI. SMUD has not provided any reason to say that only existing natural gas-fired resources are at issue for resource shuffling.

In modified section 95802(a)(251), resource shuffling is defined as “any plan, scheme, or artifice to receive credit based on emissions reductions that have not occurred, involving the delivery of electricity to the California grid.”

Because resource shuffling is defined as a “plan, scheme, or artifice” unintentional conduct cannot result in resource shuffling. Therefore, an electricity importer need not be concerned with the “unknown and essentially unknowable” emissions consequences of the natural gas market transactions described.

There is no need to define resource shuffling as “intentional” or include that word in the prohibition because we believe that the legal meaning of the language in the definition makes such modification unnecessary. However, we agreed to some of the comments about the attestations required. As modified, the regulation now recognizes that the signer of the attestation is an agent of the facility or company for which the attestation is made, and we believe that this modification also meets the intent of most commenters’ requests regarding the attestations.

With regard to the SCPPA6 comment, we do not agree that a first deliverer would not know in advance if they engaged in a plan, scheme, or artifice to receive credit based on emissions reductions that have not occurred. First deliverers that enter into transactions without this intent are not engaging in resource shuffling. However, we note that it is not our intent to discourage any covered entity from retiring a high-emitting plant in California or out-of-state. We do not believe such early retirement could meet the definition of resource shuffling as modified. Furthermore, we encourage early compliance with the EPS. Such early compliance is not resource shuffling.

Finally, we note that there is much speculation about what might happen within electricity markets due to the prohibition of resource shuffling. While we believe that the regulation’s modified treatment of resource shuffling will not have negative effects on the market or system operations, we will continue to monitor its effects on the California electricity market before and after the regulation takes effect. We have already seen changes in how electricity is reported due to the mandatory reporting regulation and the expectation of the implementation of this regulation. We will also continue to work with stakeholders to ensure that the regulation is clear in its treatment of resource shuffling. If, in the future, we find that the regulation may create, or does create, undesirable or unintended effects, staff will consider asking the Board to modify the regulation, or will recommend other actions to prevent unintended negative consequences.

SCPPA6 recommends modifying the first sentence of the definition of resource shuffling. We do not agree that the definition should be limited such that it does not apply to electricity generated in a linked jurisdiction. We believe that some first deliverers could devise shuffling schemes that include electricity from a linked jurisdiction. For example, if an entity in a linked jurisdiction produced hydroelectricity and sold it to a marketer, the marketer could sell the hydroelectricity to a third party in an unlinked jurisdiction. If the third party owned high-emitting generation in the unlinked jurisdiction, and that generation had previously served California, the third party could now sell the hydroelectricity to California, and use the high emission electricity elsewhere. If the parties involved colluded in such a plan in order to reduce compliance obligations when there was not reduction in GHG emissions, such an “electricity laundering” plan could well be resource shuffling. Finally, because we deleted the phrase “electricity historically consumed in California" from the resource shuffling definition, there remains no reason to define it.

IBERDROLA is concerned that the provision of balancing and operating reserves to enable import of renewable energy would meet the definition of resource shuffling. We note that our treatment of RPS electricity, as modified, and discussed elsewhere, does not involve reducing the compliance obligation for GHG-emitting electricity imported for balancing and operations in support of renewable energy. Instead we provide a credit for most RPS electricity that is not directly delivered. Furthermore, even if we had not modified the regulation to include an RPS adjustment, we do not believe that normal provision of electricity for balancing or operations needs would fit the definition of resource shuffling.

We have already responded to the concerns raised in WPTF2's first and second paragraphs. We do not agree that natural gas generation cannot play a part in a resource shuffling plan, scheme, or artifice, because not all gas generation is dynamic throughout markets in the WECC; to the contrary, some natural gas generated electricity used by vertically integrated utilities to serve base load. When natural gas generation with an emission actor below the default emission factor is used for baseload by a utility in another jurisdiction, the regulation would provide an incentive for that utility to sell its relatively clean electricity for import into California, and purchase system electricity to serve its own load. While it is true that system electricity would likely cost more, if the differential cost was less than the carbon allowance cost per MWh, there is an opportunity for resource shuffling in which two or more parties share the economic gain resulting from shuffling.

Nonetheless, we have no intent to characterize, nor does the regulation as modified characterize, resource shuffling as the normal market transactions related to the purchasing, selling, and dispatch of natural gas generation that are not part of a plan, scheme, or artifice to receive credit based on emission reductions that have not occurred. We disagree that the resource shuffling prohibition should be resource-specific; for example, that it should be limited to large hydroelectric and nuclear generation. If natural gas generation is delivered to the California grid as part of a plan, scheme, or artifice to receive credit based on emission reductions that have not occurred, such shuffling should be prohibited.

Because we deleted section 95802(a)(251)(A and B), the regulation now makes no reference to whether or not a generation source has historically served load in California. We expect that the regulation as modified will not disincentivize competitive market behavior, and that it will appropriately minimize leakage that can occur through shuffling, while ensuring that compliance obligations for electricity delivered in California are equitable to importers and California generators. We do not agree that the modified definition and prohibition against resource shuffling will provide a disincentive to future dispatch and contracting of highly efficient out-of-state resources, because most dispatch and contracting for power from efficient resources is not resource shuffling.

WPTF2's fourth paragraph recommends three changes. The first has been discussed above and is no longer applicable due to our modifications. We disagree with the second recommended change because, as discussed above, natural gas generation can be part of a resource shuffling scheme. With regard to the third request, modified section 95852(b)(3) includes the requirements for specified sources, including natural gas sources, and historic consumption plays no role in the requirements. While the MRR previously had requirements for specified sources that considered historical consumption, the MRR was modified and information about historical consumption, while it must still be reported, is not used to determine whether a facility's electricity can be imported with claimed emissions that have been calculated with a specified source emission factor. We held a technical workshop to discuss resource shuffling and other issues regarding imported electricity on August 26 and modifications were made to the resource shuffling section and to parts of section 95852(b) to incorporate new informal input from stakeholders.

Finally, WPTF2 explains how generators are dispatched to serve incremental load in a source jurisdiction when an out-of-state resource serves California. We agree that this is a normal and intended consequence of market dispatch rules. However, this is clearly not an instance of resource shuffling as defined, because it is not a "plan, scheme, or artifice" to receive credit based on emissions reductions that have not occurred, involving the delivery of electricity to the California grid.

CALPINE3 comments that the definition in the first 15-day changes to the regulation could be a disincentive to future dispatch of efficient resources. We do not agree, because resource shuffling is defined as a plan, scheme or artifice to receive credit for GHG emissions reductions that did not occur. CALPINE3 also states that the definition "is overly broad." Again, we disagree. We believe the definition, as modified, is still specific to actions that are designed to reduce compliance obligation by manipulating the market in order to take advantage of differential electricity costs within California and other jurisdictions. We believe that deleted paragraphs (A) and (B) of the definition may have introduced ambiguity and unfounded concerns with respect to the remaining part of the definition. Many commenters failed to understand that the wording of the remaining part of the definition means that resource shuffling does not encompass unintentional conduct. We expect that with additional discussion and consideration of these provisions, commenters will gain a better understanding of resource shuffling. We expect that we will also continue to learn during this process. However, it may be difficult to understand all potential types of resource shuffling until they are either discussed or observed in practice. If during continued work with stakeholders, before and after the beginning of the first compliance period, we discover that this regulation would have negative unintended consequences, we will take appropriate steps to minimize or prevent such consequences, potentially including a initiating a new regulatory process to modify the regulation.

Nevertheless, in Resolution 11-32 the Board directed the Executive Officer to continue discussions with stakeholders to identify and propose, as necessary, during the initial implementation of the cap-and-trade program, potential amendments to the Regulation on the definition of Resource Shuffling to: (a) provide appropriate incentives for accelerated divestiture of high-emitting resources by recognizing that these divestitures can further the goals of AB 32, and (b) ensure that changes in reported emissions from imported electricity that serves California do not result merely in a shift of emissions within the Western Electricity Coordinating Council region, but instead reduces overall emissions.

I-58. Comment: The Board has proposed adding language to section 95852(b)(1) of the proposed California Cap on Greenhouse Gas Emissions and Market Based-Compliance Mechanisms that would prohibit first deliverers of electricity from engaging in resource shuffling by making such action a violation of the regulation and a form of fraud. The proposed Section 95852 would read, in relevant part, “Resource shuffling is prohibited, is a violation of this article, and is a form of fraud.” “Resource Shuffling” means

“Any plan, scheme, or artifice to receive credit based on emissions reductions that have not occurred, involving the delivery of electricity to the California grid, for which:
(A) An emission factor below the default emission factor is reported pursuant to MRR for a generation source that has not historically served California load (excluding new or expanded capacity). And, during the same interval(s), electricity with higher emissions was delivered to serve load located outside California and in a jurisdiction that is not linked with California’s Cap and Trade Program; or,
(B) The default emission factor or a lower emissions factor is reported pursuant to MRR, for electricity that replaces electricity with an emissions factor higher than the default emission factor that previously served load in California; except when the replaced electricity no longer serves California [sic] load as a result of compliance with the Emission Performance Standards adopted by the California Energy Commission and the California Public Utilities Commission pursuant to Senate Bill 1368 (Perata, Chapter 598, Statutes of 2006).”

Based on the plain reading of the proposal, CARB does not have authority to define resource shuffling as “fraud,” has proposed a vague definition of resource shuffling that does not give adequate notice to market participants of what activity would constitute fraud, and has not justified the benefits of its resource shuffling proposal against the burdens of complying with such a rule. First, CARB’s decision to define resource shuffling as “fraud” would create a wholly new violation, an action that is not clearly authorized under CARB’s enabling statutes. Agencies are only able to act in the manner prescribed to them by law. Valid administrative action must be within the scope of authority the legislature conferred to the agency, cannot be inconsistent with the agency's authorizing statutes, and must be reasonably necessary to affect the purpose of the applicable statute. Government Code, sections 11342.1, 11342.2; Agnew v. State Bd. of Equalization, 21 Cal.4th 310, 321-22 (1999); County of San Diego v. Bowen, 166 Cal.App.4th 501, 508 (Cal.App.4.Dist 2008); In re J.G., 159 Cal.App.4th 1056, 1066-67 (Cal.App.3 Dist. 2008). To the extent any departmental action exceeds the power delegated by the Legislature, the action is void. Kaiser Foundation Health Plan, Inc. v. Zingale, 99 Cal.App.4th 1018, 1027 (Cal.App.3.Dist. 2002). By proposing to make resource shuffling a violation of the cap and trade regulation and a form of fraud, CARB arguably would expand its power beyond that which is statutorily supported. Although CARB has cited to a number of sections in the Health and Safety Code as offering authority for its proposed language, including sections 38510, 38560, 38562, 38570, 38571, 38580, 39600 and 39601, none of the enumerated sections, nor any other section of the Health and Safety Code, provide any basis by which CARB can designate an action to be fraud or otherwise create a new violation and penalty. With these provisions, the Legislature empowered CARB to create a program to regulate greenhouse gas emissions, which includes setting standards regarding emissions, monitoring and reporting the resulting emissions. At no point in the Code did the Legislature authorize CARB to expose market participants to new civil or criminal fraud provisions triggered by a failure to adhere to California's emissions program. Reading in such an authorization would not constitute a permissible interpretation of the statute, but rather would amend the statute to broaden the scope of CARB's authority well beyond what the Legislature stated. CARB's proposed fraud language would establish a violation that is not supported by CARB's greenhouse gas authority, and thus should be removed from the final regulations. (MCSG3)

> **Response:** We renumbered the resource shuffling prohibition as new section 95852(b)(2), and we modified the section to delete the characterization of resource shuffling as fraud, rendering moot MCSG3's discussion of fraud in this comment.

I-59. Comment: In the 15-day changes document at section 95852(b)(1), CARB includes a provision against resource shuffling associated with out-of-state energy generation. Such resource shuffling is treated as a fraudulent action and may carry significant penalties. EDF agrees that resource shuffling may be a serious concern for California, both for out-of-state electricity and for natural gas (Phase II). If regulated entities are allowed to take actions that reduce compliance obligations in California and those actions are the sole result of shifting where the electricity is delivered, (without a change to the Western Interconnected Grid resource mix), the overall reductions achieved by the program may be compromised. Of course, the use of anti-shuffling provisions should be counterbalanced by the complexity it adds to the program and CARB's ability to monitor and enforce it. CARB must also evaluate, to the extent it has not already done so, the ability of this provision to affect electricity generation balancing and delivery in the Western Interconnected Grid and potential disincentives for in-state entities to divest long-term contracts with high-emitting energy generation. EDF recommends CARB release additional explanatory information, prior to rule adoption, specifying the types of activities covered (with hypothetical examples), how it would be enforced, and the level of oversight that is likely to be needed. Such information would be valuable for reducing the need for enforcement if it clears up ambiguities that exist among covered entities and would provide more public confidence about the operations of this new provision. (EDF4)

> **Response:** We modified the resource shuffling prohibition section (now new section 95852(b)(2)), and the definition of resource shuffling in section 95802(a). We will monitor and analyze electricity data reported pursuant to the MRR to determine if there is evidence of activity among covered entities that suggest that further consideration of the prohibition and attestations is necessary. In addition to making these modifications and monitoring electricity market data, we plan to work with stakeholders after the regulation is considered by the Board to ensure that stakeholders clearly understand the resource shuffling provisions, and to ensure there are not disincentives for in-state utilities or other entities to divest themselves of ownership or contracts for high-emitting generation.

I-60. Comment: Additionally, we suggest that entities be allowed to submit their attestations electronically in conjunction with annual emissions data reports. Modify section 95852(b)(1) as follows:

> (1) Resource shuffling is prohibited, is a violation of this article and is a form of fraud. ARB will not accept a claim that emissions attributed to electricity delivered to the California grid are at or below the default emissions factor for unspecified electricity specified pursuant to MRR section 95111 if that delivery involves resource shuffling. The following attestations must be submitted to ARB annually in writing, by certified mail ~~only~~ or electronically in conjunction with the annual emissions data report:
>
> > (A) "I certify under penalty of perjury of the laws of the State of California that [facility or company name] has not intentionally engaged in the activity of resource shuffling to reduce compliance obligation for emissions, ~~based on emission reductions that have not occurred~~. (WPTF2)

> **Response:** We disagree. A written attestation is required to ensure that each facility specifically acknowledges its obligations and actions. A "check the box" attestation would be insufficient for this purpose. Furthermore, by defining resource shuffling as "any plan, scheme, or artifice...." it is clear that intent is a necessary condition for an activity to meet the definition.

I-61. (multiple comments)
Comment: LADWP is concerned that this resource shuffling provision may create a disincentive for an early transition away from coal. LADWP requests that ARB study the issue further to determine the best approach. The inclusion of the resource shuffling provisions can impede LADWP's aggressive efforts to make an early transition away from coal. It is unclear from this resource shuffling provision how LADWP or other electricity importers with long-term take-or-pay power contracts for out-of-state coal generation are expected to undertake the expensive transition away from those

resources without a full recognition by ARB that such actions constitute emission reduction benefits for California's ratepayers. LADWP is not positioned to shut down or retire the out-of-state coal generation in which it has only a limited ownership interest, but it can take early action to reduce demand for this type of generation by investing in and procuring cleaner replacement power. The potential outcome would be to penalize LADWP for early coal divestiture. LADWP requests clarification in section 95802(a)(245)(B) that early action to divest of coal prior to when the Emissions Performance Standard (EPS) requires compliance would not be treated as resource shuffling. Without that clarification, the Regulation could be interpreted such that LADWP's early divestiture of Navajo Generating Station (Navajo) prior to 2019 may be considered resource shuffling. (LADWP4)

Comment: The resource shuffling provision is a new concept that should be further vetted. There are potential unintended consequences that may create a disincentive for early coal divestiture. LADWP requests that the ARB study this issue further to determine the best approach that would provide the appropriate incentives for early action, avoid legal infirmities, and ensure continued reliability of the electrical grid. Modify section 95802(a)(245) as follows:

> ~~(245) "Resource Shuffling" means any plan, scheme, or artifice to receive credit based on emissions reductions that have not occurred, involving the delivery of electricity to the California grid, for which:~~
> ~~(A) An emission factor below the default emission factor is reported pursuant to MRR for a generation source that has not historically served California load (excluding new or expanded capacity). And, during the same interval(s), electricity with higher emissions was delivered to serve load located outside California and in a jurisdiction that is not linked with California's Cap-and-Trade Program; or~~
> ~~(B) The default emission factor or a lower emissions factor is reported pursuant to MRR, for electricity that replaces electricity with an emissions factor higher than the default emission factor that previously served load in California; except when the replaced electricity no longer serves California load as a result of compliance with the Emission Performance Standards adopted by the California Energy Commission and the California Public Utilities Commission pursuant to Senate Bill 1368 (Perata, Chapter 598, Statutes of 2006).~~ (LADWP4)
>
> **Response:** Because resource shuffling could result in significant leakage, we did not delete the definition. However, we deleted paragraphs (A) and (B). We agree with LADWP that early action to reduce emissions is not resource shuffling. We modified section 95802(a)(245)(B) in part to meet this concern.

I-62. (multiple comments)
Comment: The resource shuffling attestations in section 95852(b)(1)(A) place the burden of proof on an individual person representing a first deliverer that is unreasonable, and for which compliance would be impossible, especially for a large utility. The attestations should be deleted. No individual person would have the full

knowledge required to know that the entity he or she represents did not engage in resource shuffling for each and every power transaction. For LADWP, there are approximately 1,000 NERC E-tags that are generated per day for scheduling electricity in and out of LADWP's Balancing Authority area. When combined with the account representative attestation, the annual resource shuffling attestations could be interpreted to apply personal penalties, including the possibility of fine or imprisonment. This is not workable. Modify section 95852(b)(1) as follows:

> ~~(1) Resource shuffling is prohibited, is a violation of this article and is a form of fraud. ARB will not accept a claim that emissions attributed to electricity delivered to the California grid are at or below the default emissions factor if that delivery involves resource shuffling. The following attestations must be submitted to ARB annually in writing, by certified mail only:~~
>
> > ~~(A) "I certify under penalty of perjury of the laws of the State of California that [facility or company name] has not engaged in the activity of resource shuffling to reduce compliance obligation for emissions, based on emission reductions that have not occurred."~~
> > ~~(B) "I understand I am participating in the Cap-and-Trade Program under title 17, California Code of Regulations, article 5, and by doing so, I am now subject to all regulatory requirements and enforcement mechanisms of this program and subject myself to the jurisdiction of California as the exclusive venue to resolve."~~ (LADWP4)

Comment: The certifications that are required by section 95852(b)(1) should be modified to recognize that the signatory, an individual, is certifying as agent for the covered entity and to avoid the absurdity of requiring the signatory to certify that the signatory himself or herself is participating in the cap-and-trade program. These certifications are not strictly necessary because certifications are required under the MRR for the whole of an entity's emissions report, as well as independent verification. Modify section 95852(b)(1) as follows:

> (1) Resource shuffling is prohibited, and is a violation of this article~~ and is a form of fraud~~. ARB will not accept a claim that emissions attributed to electricity delivered to the California grid are at or below the default emissions factor for unspecified electricity specified pursuant to MRR section 95111 if that delivery involves resource shuffling. The following attestations must be submitted to ARB annually in writing, by certified mail only:
>
> > (A) "I certify under penalty of perjury of the laws of the State of California that [facility or company name], for which I am an agent, has not knowingly engaged in the activity of resource shuffling to reduce compliance obligation for emissions, based on emission reductions that have not occurred."
> > (B) "I understand [facility or company name], for which I am an agent, is~~I am~~ participating in the Cap-and-Trade Program under title 17, California Code of Regulations, article 5, and by doing so, it is~~I am~~ now subject to all regulatory requirements and enforcement mechanisms of this program

> and subjects it~~my~~self to the jurisdiction of California as the exclusive venue to resolve disputes."

The Southern California Public Power Authority (SCPPA) recommends that the resource shuffling provisions in section 95802(a)(245) and section 95852(b)(1) be temporarily removed for further evaluation or, at minimum, revised. The complex issues that are raised by the new resource shuffling provisions cannot be fully assessed in the time allowed for "15-day" comments, even given that the concepts were broached in a "discussion draft" of the Regulation that was released on July 7, 2011, ("Discussion Draft"). Thus, SCPPA recommends that the resource shuffling provisions be temporarily removed from the Regulation until the full ramifications of the provisions can be evaluated. (SCPPA6)

> **Response:** We revised section 95852(b)(1) (now renumbered as (b)(2)) as requested, except that we did not add the word "knowingly" in paragraph A. Because resource shuffling is defined as a "plan, scheme, or artifice" we do not believe that a facility or company can unknowingly shuffle resources. We revised section 95802(a)(245) (now (a)(251)) to meet stakeholder concerns. We did not temporarily remove the resource shuffling provisions because these provisions are necessary to minimize leakage. While we did not delete the attestation requirements for the reasons discussed in a previous response, we modified the attestations based on SCPPA6's recommendation. New sections 95852(b)(2)(A and B) make it clear that the person making the attestation is doing so as an agent of the facility or company that is the first deliverer. We believe this modification should meet the commenter's concern.

I-63. (multiple comments)
Comment: LADWP urges ARB to temporarily remove resource shuffling provisions in sections 95802(a)(245) and 95852(b)(1) and seek public comment as part of a new 45-day comment period. It appears that resource shuffling is a provision that has been added for the first time to the Cap and Trade Regulation as part of the 15-Day Modified Text. LADWP is concerned that this resource shuffling provision needs to be further vetted with stakeholders in order to have a collective understanding of how it would be implemented. Vetting would also help to identify any potential unintended consequences. The inclusion of the resource shuffling provision does not necessarily coincide with the normal and emergency operations of the grid required by Federal Energy Regulatory Commission (FERC) reliability standards. From an operational perspective, it is unclear how a first deliverer would know in advance if and when it was engaged in resource shuffling.

California is one of fourteen Western states along with the provinces of Alberta and British Columbia and the northern portion of Baja California, Mexico that make up the Western Interconnection. The priority for grid operators is, first and foremost, coordinating and promoting bulk electric system reliability to avoid costly regional power outages that risk life and property. There are thousands of transactions that involve millions of North American Reliability Corporation (NERC) E-tags for movement of electricity in and out of California on an annual basis. Those transactions do not include consideration of the emissions attribute of electrons that are imported into California for the purposes of identifying resource shuffling.

Additionally, the resource shuffling provision does not take into consideration power emergencies. LADWP and other California EDUs have agreements with the Western Electricity Coordinating Council (WECC) to support other utilities within the Western interconnection in emergency situations to keep the electrical grid operating smoothly. Conversely, the practice of mutual assistance ensures that California EDUs may also receive assistance from utilities outside California in cases of emergency outages (fires, earthquakes, storms, heat waves). The resource shuffling provision does not appear to take into account the existing WECC agreements for mutual assistance and would impose heavy penalties on first deliverers. This approach would have the unintended consequence of compromising the reliability of the overall interstate grid. (LADWP4)

Comment: The definition of resource shuffling should be revised to exclude situations where a covered entity either unknowingly engages in activities that resemble resource shuffling, or adjusts its portfolio for valid economic dispatch reasons. Modify section 95802(a)(245) as follows:

> (245) “Resource Shuffling” means any intentional plan, scheme, or artifice to receive credit based on emissions reductions that have not occurred, involving the delivery of electricity to the California grid, for which:
>
> (A) An emission factor below the default emission factor is reported pursuant to MRR76 for a generation source that has not historically served California load (excluding new or expanded capacity and grandfathered contracts). New or expanded capacity is relative to capacity as of 01/01//2012. And, during the same interval(s), the same entity reporting the lower emissions delivers electricity with higher emissions ~~was delivered~~ to serve load located outside California and in a jurisdiction that is not linked with California’s Cap and Trade Program; or
>
> (B) The default emission factor or a lower emissions factor is reported pursuant to MRR, for electricity that replaces electricity with an emissions factor higher than the default emission factor that ~~previously~~ served load in California prior to 01/01/2012; except when:
> (1) the replaced electricity no longer serves California load as a result of compliance with the Emission Performance Standards
> (2) the contract with the resource was terminated prior to 01/01/2012. (SCE3)

Response: We did not remove the resource shuffling provisions because, as shown by several of the comments, resource shuffling can introduce significant leakage. Furthermore, the Board directed staff to address resource shuffling in Board Resolution 10-42: “BE IT FURTHER RESOLVED that staff will further develop requirements to ensure changes in reported emissions from imported electricity that serves California does not result merely in a shift of emissions within the Western Electricity Coordinating Council region, but reduces overall emissions." We believe that a prohibition on resource shuffling is necessary to preserve the environmental integrity of the regulation. The commenter appears to be concerned that common electricity transactions, which entities engage in with no intent to shuffle resources, could be considered resource shuffling. Normal transactions that result in unintended or unknowable changes in emissions levels that are not part of a "plan, scheme, or artifice to receive credit based on emissions reductions that have not occurred" are not resource shuffling as defined. In power emergencies, first deliverers may redirect electricity as needed for reliability. These kinds of changes are not resource shuffling as defined.

SCE3 suggested changes to the definition for Resource Shuffling. SCE3 states that the definition should be revised to "exclude situations where a covered entity either unknowingly engages in activities that resemble resource shuffling, or adjusts its portfolio for valid economic dispatch reasons." Although we do not agree with the specific changes that SCE suggested, we did modify the definition, and believe the changes we made will provide the same result as SCE's suggestion. In Section 95802(a), ARB revised the definition of "Resource Shuffling." We removed the term "fraud" and deleted language that might capture situations where the delivery of electricity is a result of legitimate and typical transactions due to economic reasons, or where there is no actual intent to circumvent this regulation.

In addition, in Resolution 11-32 the Board directed the Executive Officer to continue discussions with stakeholders to identify and propose, as necessary, during the initial implementation of the cap-and-trade program, potential amendments to the Regulation on the definition of Resource Shuffling to:
(a) provide appropriate incentives for accelerated divestiture of high-emitting resources by recognizing that these divestitures can further the goals of AB 32, and (b) ensure that changes in reported emissions from imported electricity that serves California do not result merely in a shift of emissions within the Western Electricity Coordinating Council region, but instead reduces overall emissions.

Legal

I-64. (multiple comments)
Comment: The definition of "Resource Shuffling" must be changed to avoid significant unintended consequences to the regional wholesale markets. PacifiCorp, as a MJRP, is regulated by six different state regulatory commissions and is equally subject to each state commission's laws and rulings. PacifiCorp operates in all six states under a Multi-State Process (MSP) utilized to allocate costs across the six state jurisdictions as well as to share the PacifiCorp system benefits across the six states. If resource attribution is changed within the MSP protocol, it could result in resources being delivered to California that have "not historically served California load," thus triggering the Resource

Shuffling provisions. PacifiCorp is concerned that by continuing to follow the orders of its six state utility commissions, the proposed ARB Regulation has the ability to include this required change as an allegation of criminal behavior. Further, maintaining normal system reliability functions, such as providing operating reserves and balancing services, which are typically from baseload resources, could result in an allegation of criminal behavior under the current Resource Shuffling prohibition. PacifiCorp does not believe it is ARB's intent to criminalize what are legitimate market and system operations behaviors. Therefore, PacifiCorp strongly recommends striking the language that refers to Resource Shuffling as fraud. Resource Shuffling should be subject to the same penalty and enforcement provisions as all the other prohibitions and requirements of the Regulation, and not singled out, especially in a vague manner with a significant possibility of unintended consequences. Further, PacifiCorp recommends explicit exclusions from the definition of Resource Shuffling for resource decisions made as part of a utility commission decision, for system maintenance and reliability decisions, and in reaction to force majeure events. Resource Shuffling does not exist when a utility allocates resources to a particular service territory pursuant to a decision of the California Public Utilities Commission or a regulatory commission of another state, for system maintenance and reliability decisions, or in reaction to force majeure events. Modify section 95852(b)(1) as follows:

> (1) Resource shuffling is prohibited and is a violation of this article. ~~and is a form of fraud.~~ ARB will not accept a claim that emissions attributed to electricity delivered to the California grid are at or below the default emissions factor for unspecified electricity specified pursuant to MRR section 95111 if that delivery involves resource shuffling, unless the resource has been registered as a specified import. The following attestations must be submitted to ARB annually in writing, by certified mail only:
>
> > (A) "I certify under penalty of perjury of the laws of the State of California that [facility or company name] has not intentionally engaged in the activity of resource shuffling to reduce compliance obligation for emissions, based on emission reductions that have not occurred.
>
> (B) "I understand I am participating in the Cap-and-Trade Program under title 17, California Code of Regulations, Article 5, and by doing so, I am now subject to all regulatory requirements and enforcement mechanisms of this program and subject myself to the jurisdiction of California as provided in title 17, California Code of Regulations, article 5, as the exclusive venue to resolve dispute brought pursuant to this Article.

(PACIFICOR3)

Comment: The concept of "resource shuffling," as defined in section 95802(245) of the Cap and Trade regulation, is so broad it would encompass and impede routine business activity taken by energy companies based on legitimate economic considerations and penalize individuals for actions that are outside of their knowledge or control. In the commercial world, energy portfolios are consistently updated and rebalanced for economic reasons. However, under the proposed regulation, reshuffling a portfolio as contracts expire in order to reflect new economic realities could conceivably constitute resource shuffling.

In another example, the proposed prohibition against resource shuffling could arguably require companies to understand the full sales history of each facility generating electricity and certify the use of that electricity when transacting. Ascertaining the entire providence of each resource is impracticable, and places an unduly high burden to investigate on commercial activity, especially when one considers the number of transactions routinely completed to serve load in California.

Does CARB expect a market participant importing power into California to undertake such a review with every trade? Would a market participant be subject to allegations of fraud if it conducted this research periodically rather than with each trade? Would market participants be liable for fraud if they relied on generator representations? If there were a violation for fraud, would charges be brought against an individual trader and/or an entire company? What types of penalties might apply? Would a counterparty to a trade be liable if a generator mischaracterized to the counterparty or CARB where it sent its power or the applicable emission factors reported? These examples highlight that CARB's proposed resource shuffling language does not meet the basic notice requirements because it fails to provide any real details as to how a company or individual may or may not act or how the rule will be enforced.

Moreover, the suggested language is indefinite and confusing in a highly significant way. It offers no guidance as to either the type of fraud, criminal or civil, that resource shuffling would constitute or the resulting consequences of a violation. These failures conflict with the requirement to provide adequate notice, which figures prominently in establishing the validity of civil and criminal regulations. In the criminal context, a regulation will be held unconstitutionally vague if it fails to give a person of ordinary intelligence a reasonable opportunity to know what is prohibited, so that he may act accordingly. Similarly, a regulation must provide sufficiently definite standards of application to prevent arbitrary and discriminatory enforcement.

CARB's creation of a fraud penalty arguably fails these notice tests. It neither gives a covered entity a reasonable opportunity to know what is prohibited nor provides definite standards of application. The lack of specificity in CARB's proposed language creates ambiguity as to what would constitute resource shuffling, while also leaving open the possibility that criminal sanctions would result from a violation. Even if the regulation proposes civil rather than criminal liability, notice remains a critical component of the administrative rulemaking process. Economic and civil regulations may be subject to a less strict vagueness test than criminal regulations; however, the criminal test is still informative. This is particularly true because the proposed cap and trade regulation characterizes resource shuffling as a form of fraud with unknown but potentially stringent consequences. As such, a civil fraud violation could be considered quasi-criminal in nature, warranting a relatively strict vagueness test. Even if the regulation is merely civil in nature, notice remains critical to the civil administrative process for rulemaking in California. Individuals must have notice as to what a regulation commands and prohibits.

Yet CARB's proposed language with respect to resource shuffling would make it difficult to pinpoint whether any specific conduct clearly falls within its definition. Moreover, no common knowledge or understanding exists within the energy community about what constitutes resource shuffling. Cranston, 40 Cal. 3d at 764. As such, even under a weaker notice standard, the Board's regulation is vague enough to limit the ability of a company or individual to reasonably understand its limits, and, as a result, the language violates due process. Finally, the proposed resource shuffling language poses a number of additional burdens on market participants without clear benefit.

For instance, as currently written, the regulation arguably could require a resource owner to continue to use its resource in a specific manner going forward based on how that resource was used in the past, regardless of whether that use was to source electricity in California or not. This is not only an unconstitutional restraint of inter-state commerce, but it also places an unreasonably high burden on business to have to ascertain the providence of the resource. Performing such diligence would be difficult, and it is unclear that the proper historical information even exists to verify compliance with such a limitation. For example, how far back would market participants have to go to ascertain a resource's past use? Would every wholesale and retail sale have to be evaluated? Would NERC tags have to be used to verify flow? What about for sales before NERC tagging was required? Would any due diligence requirement apply equally to spot and long-term contracts? What repercussions would there be if a plant responds to a reliability instruction from a balancing authority that forces the plant to diverge from its past use? The sparse resource shuffling language currently proposed leaves too many questions open. CARB's proposed language also does not accomplish its apparent aim.

CARB seems to be attempting to regulate trading to prevent individuals from purposely circumventing the cap-and-trade emissions requirements in California by shifting the accounting for emissions outside the region. However, without objective guidance on how the agency will determine the intent behind an action that might have attributes that look like shuffling, the current regulation could unreasonably burden legal conduct. Indeed, a large swath of potential trading activity could conceivably fall within the scope of resource shuffling, and yet the proposed regulation is not adequately tailored to distinguish between activities where the involved parties did not intend to circumvent the regulations but rather are merely reacting to, and contracting to address, economic realities. In such situations, where the intent of traders is to act efficiently and economically in the market, they should not be subject to even a threat of penalties for resource shuffling.

The legal issues highlighted above indicate that CARB needs to strike the shuffling provision. If CARB continues to believe that resource shuffling is an issue and can demonstrate that it has legal authority to address it, including as to out-of-state resources, CARB should revise and re-propose the resource shuffling regulation to more clearly meet the Board's aims and to provide those subject to the rule with more clarity on the requirements. (MSCG3)

Response: We are familiar with the complex regulatory regime under which PacifiCorp operates, and we understand that the MSP process could result in changes in resource attribution as a result of an agreement between the six state commissions. We believe that changes in resource decisions made for system maintenance and reliability or in reaction to force majeure would not be a plan, scheme, or artifice to receive credit based on emission reductions that have not occurred. While it is theoretically possible for a utility commission to be part of a resource shuffling plan, scheme, or artifice, we consider such an event to be extremely improbable. We believe that the modifications made to the regulation should meet PacifiCorp's concern.

MSCG3 believes that the resource shuffling provisions are too broad, and states that under the provisions "reshuffling a portfolio as contracts expire in order to reflect new economic realities could conceivably constitute resource shuffling." We agree, but only insofar as such reshuffling falls within the regulatory definition of resource shuffling. We do not agree that the regulation would "require companies to understand the full sales history of each facility generating electricity and certify the use of that electricity when transacting." We believe that a party should know the immediate provenance of its resources (whether unspecified or specified) used to supply power for import to California. A party need not know where unspecified power purchased on the market comes from.

MSCG3's third paragraph asks many rhetorical questions. Some are now moot because we removed reference to fraud, and others are now moot to the extent that parties understand the legal meaning of "plan, scheme, or artifice."

Most of MSCG3's fourth to seventh paragraphs are moot, because we have removed the reference to fraud in the regulation. MSCG3 asserts that the prohibited conduct in the regulation is unconstitutionally indefinite. We note that the regulation is not creating a criminal offense. The regulation does clearly specify that resource shuffling is a particular plan, scheme, or artifice to receive credit based on emissions reductions that have not occurred. It does not specify in any way the manner in which a resource owner should use that resource, and therefore does not restrain interstate trade, as MSCG has asserted. There is also clear benefit to the burdens on the market created by our attempt to ensure that GHG emission reductions induced by this regulation are real.

We did not strike the resource shuffling provisions, as recommended in the last paragraph of the comment. However, we plan to continue to engage with stakeholders on this issue, to clarify the meaning and intent of the final regulatory languages. If, while engaging with stakeholders there are significant unintended consequences or problems with our current approach, staff will recommend to the Board ways to prevent them, including possible new rulemaking to further modify the regulation.

I-65. Comment: Section 95852 prohibits "resource shuffling." While LS Power agrees with the general goal of discouraging importers from misrepresenting their GHG emissions, in practice, the resource shuffling provisions are impractical. There are many instances in wholesale markets where a purchasing entity will not know where its power will be coming from. In addition, the regulation applies to all regulated entities, when there are clearly entities that have not engaged in resource shuffling. Specifically, the regulations should allow for an upfront determination that a specified importer is not engaged in resource shuffling where CARB has issued a specified emissions factor for a particular facility that is applied to output sold into the CAISO or other California markets. (LS Power)

Response: We appreciate the commenter's agreement with the goal of discouraging the misrepresentation of GHG emissions, but disagree that resource shuffling provisions, as modified, are impractical. It is true that a purchasing entity does not know "where its power will be coming from" when it is from unspecified sources. But some resource shuffling can involve substituting unspecified power for power from high-emission facilities. Even if an importer delivers electricity into California from a source for which ARB has issued a specified emissions factor, it is possible to use such electricity in a plan, scheme, or artifice to shuffle resources, and we believe such activity must be prohibited.

I-66. Comment: The relationship between the Cap and Trade Rule's definition of "resource shuffling" and section 95111(g)(4) of the Mandatory Reporting Rule is unclear. Reading the Cap and Trade Rule's proposed definition of resource shuffling in conjunction with the proposed modifications to the MRR, it appears that ARB may have intended to narrow what constitutes resource shuffling activities via the proposed changes to MRR section 95111(g)(4). That section, describing five categories of "specified sources," parallels subsection (A) of the Cap and Trade Rule's resource shuffling definition by differentiating sources of electricity historically consumed in California from new sources of electricity and existing sources with additional capacity (sections 95111(g)(4)(A), 95111(g)(4)(D), and 95111(g)(4)(E). If ARB intended to reference all or any part of MRR section 95111(g)(4) as sources and activities excluded from the Cap and Trade Rule's definition of resource shuffling, then Powerex requests that this be clarified by making the reference explicit. (POWEREX)

Response: The MRR requires first deliverers to report whether delivered electricity from a specified source falls into a category that is clearly not likely to be resource shuffling. However, we are aware of other circumstances in which electricity that does not fall into one of the categories could be part of a plan, scheme, or artifice that intentionally resulted in resource shuffling. We believe that the prohibition of resource shuffling stands effectively without reference to MRR section 95111(g)(4).

I-67. Comment: The definition of Resource Shuffling implies a requirement of intent, but its usage in this section suggests that it could apply more broadly, resulting in an inadvertent violation of the regulation. For this reason, further discussion and clarification of Resource Shuffling is required. (PGE4)

> **Response:** The specific language of the definition requires a plan, scheme, or artifice, meaning that there is no inadvertent resource shuffling. We removed additional language from the definitions that might have been ambiguous as to the breadth of the definition.

I-68. Comment: In the course of serving its load at lowest cost, an in-state utility may carry out a transaction known as a "wheel-through" in which electricity is imported into the California Independent System Operator "CAISO" Control Area at one import location and concurrently exported outside of the Control Area at another export location in the same hour of delivery. In this case, it is assumed that the utility would claim zero compliance obligation if the amount imported and exported were the same. However, it is also possible for an in-state utility to carry out two 25 MW import transactions for a given hour at Location A and only one 25 MW export at Location B in that same hour. If one of the 25 MW imports was from a renewable resource with a zero compliance obligation, and the other 25 MW import was from a natural gas resource, which of these two imports would the utility be required to assign to the 25 MW export for the wheel-through? Under current business practices, it makes no difference and either resource may be paired with the import. From an economic perspective under ARB's proposed regulations, it would make sense for the utility to define the wheel-through based on the natural gas resource in order to have no compliance obligation for the transaction. However, it is unclear if under the current Regulation this could be considered to be Resource Shuffling by specifying the natural gas resource for the wheel-through transaction rather than the renewable resource, although either would be a permissible business practice. (PGE4)

> **Response:** The MRR defines "electricity wheeled through California" in part as follows: "'Electricity wheeled through California' is documented on a single NERC e-Tag showing the first point of receipt located outside the State of California, an intermediate point of delivery located inside the State of California, and the final point of delivery located outside the State of California." With this precise definition, we can identify which, if any, of the two 25 MW imports is wheeled. PG&E does not provide sufficient information to determine if there is a wheel in this case. The MRR contains the reporting requirement for wheels, imports, and exports. Furthermore, this regulation allows for a QE adjustment for qualified exports. The export transaction may be used in the calculation of the QE adjustment pursuant to section 95852(b) as modified. If an electricity importer reports correctly pursuant to the MRR as modified, and has no intent to participate in a plan, scheme, or artifice to receive undue credit for GHG emissions reductions, there will be no resource shuffling.

I-69. Comment: The Utilities agree that an intentional act to commit resource shuffling purely to game the Cap and Trade market and avoid an emissions obligation should be discouraged. There are numerous provisions in statute that either prohibit the delivery of high emitting GHG resources (SB 1368) or encourage the delivery of zero emitting GHG resources (SBx12). Thus, it is unnecessary to include sections 95802(a)(245)(A) and (B), and the Utilities recommend their deletion. Further, the term “interval” is undefined and could lead to an unnecessary penalty determination. Due to transmission constraints, curtailments, and the general nature of power trading, there can be times when a higher emissions resource is sold off in place of a lower emissions resource. These activities can be “historical”, or done on a real-time basis. The Utilities additionally recommend this concept be further explored through a series of workshops and discussions. Modify section 95802(a)(245) as follows:

> (245) “Resource Shuffling” means any intentional plan, or scheme, ~~or artifice~~ to receive credit based on emissions reductions that have not occurred~~.~~, ~~involving the delivery of electricity to the California grid, for which:~~
>
> ~~(A) An emission factor below the default emission factor is reported pursuant to MRR for a generation source that has not historically served California load (excluding new or expanded capacity). And, during the same interval(s), electricity with higher emissions was delivered to serve load located outside California and in a jurisdiction that is not linked with California’s Cap-and-Trade Program; or~~
> ~~(B) The default emission factor or a lower emissions factor is reported pursuant to MRR, for electricity that replaces electricity with an emissions factor higher than the default emission factor that previously served load in California; except when the replaced electricity no longer serves California load as a result of compliance with the Emission Performance Standards adopted by the California Energy Commission and the California Public Utilities Commission pursuant to Senate Bill 1368 (Perata, Chapter 598, Statutes of 2006).~~
>
> Modify section 95852(b)(1) (1) Resource shuffling is prohibited, is a violation of this article and is a form of fraud. ~~ARB will not accept a claim that emissions attributed to electricity delivered to the California grid are at or below the default emissions factor for unspecified electricity specified pursuant to MRR July 2011 section 95111 if that delivery involves resource shuffling. The following attestations must be submitted to ARB annually in writing, by certified mail only.~~ (MID3)

Response: We deleted sections 95802(a)(245)(A) and (B) as recommended, but we did not delete the words “or artifice,” as no reason has been proposed to do so. The resource shuffling sections as modified will not prohibit standard and existing electric transactions that are not part of a resource shuffling plan, scheme, or artifice. As requested by the commenters, we held a workshop August 26, 2011, in which resource shuffling and other issues concerning imported electricity were vetted. We have no intent to prohibit legitimate transactions that do not involve resource shuffling. We appreciate the commenter's recognition of the need to prohibit resource shuffling.

While we deleted the second sentence of section 95852(b)(1) as requested by MID3, we did not delete the requirement for attestations, for reasons explained in other responses.

Finally, we understand that the commenters and other stakeholders continue to have concerns about resource shuffling. We are committed to continuing to monitor and analyze reported data to determine whether there is evidence that further consideration should be given to these requirements. We plan to continue listening to stakeholder concerns about these provisions, and if we determine that the regulations provisions are not fully adequate based on new information provided, or based on observed changes in the market, we will ask the Board to consider modifying the regulation.

Replacement Electricity

I-70. (multiple comments)
Comment: The definition of "Replacement Electricity" restricts the ability to use replacement electricity in connection with out-of-state resources that are "Variable Renewable Resources." As written, this definition appears to exclude all non-variable renewable resources, such as biomass facilities, that may be procured from out-of-state resources in order to meet the RPS. Excluding these resources from the ability to utilize the replacement electricity provisions of the Regulation will mean that these out-of-state resources will have to meet a more stringent and costly delivery requirement under the RPS in order to avoid incurring GHG emission reduction costs on electricity purchases that would otherwise qualify for a zero emission rate, creating an unnecessary and unwarranted "value" arbitrage for out-of-state resources. To remedy this problem, the ability to claim the zero emissions rate for replacement electricity should be applicable to all out-of-state renewable resources that are used to meet the RPS. The reference to "variable" should be deleted from the definition. (CNE)

Comment: The definition of "Replacement Electricity" restricts Replacement Electricity to being energy that replaces renewable energy that meets the narrow definition of "Variable Renewable Resources," which excludes many sources of renewable energy such as small hydroelectric projects at impoundments, geothermal projects, biomass projects, and biogas combustion. The production of renewable energy from those excluded sources may vary over time even though the sources may not be traditionally classified as variable or intermittent. Although those excluded renewable resources may have relatively stable output given current technologies, the purchaser may need to obtain replacement energy to accommodate transmission constraints or to shape the renewable energy, for example, to meet seasonal load requirements. Thus, the definition of "Replacement Electricity" should be broadened by deleting the word "variable" from the definition and severing any tie to the restrictive definition of "Variable Renewable Resources" in section 95802(a)(272). (SCPPA6)

Comment: NCPA, in addition to several other entities, including the Joint Utilities, has proposed that the definition of replacement electricity in section 95802(a) be revised to strike the last sentence constraining the location of the resources and the reference to variable resources. Replacement electricity, as that definition is proposed to be revised, is an important tool associated with renewable generation arrangements. This tool, however, should not necessarily be restricted to “variable” resources. The provisions of this section should also be revised to acknowledge the broader range of ownership arrangements utilized in these kinds of transactions (as the Legislature did in Senate Bill X1 2). Modify section 95852(b)(3) as follows:

> (3) Replacement electricity that substitutes for electricity from a <u>variable</u> renewable resource qualifies for the ARB facility specific emission factor specified pursuant to MRR section 95111 of the <u>variable</u> renewable resource under the following conditions:
>
> > (A) First deliverers of replacement electricity have a contract, or ownership relationship, with the supplier of the replacement electricity, in addition to a contract <u>or ownership rights to electricity generated by</u> with the variable renewable resource; and (NCPA3)

Comment: LADWP recommends that ARB not limit this provision to replacement electricity for variable renewables only. Modify section 95852(b)(3) as follows:

> (3) Replacement electricity that substitutes for electricity from a ~~variable~~ renewable resource qualifies for the ARB facility specific emission factor specified pursuant to MRR section 95111 of the ~~variable~~ renewable resource under the following conditions:
>
> > (A) First deliverers of replacement electricity have a contract, or ownership relationship, with the supplier of the replacement electricity, in addition to a contract with <u>a supplier of</u> the variable renewable resource; and
> >
> > (B) The amount of the reported replacement electricity does not exceed the amount for the reported annual ~~variable~~ renewable resource. (LADWP4)

Comment: Section 95852(b)(3)(A), requiring first deliverers of replacement electricity to have a contract or an ownership relationship with the supplier of the replacement electricity, is confusing and may be unnecessary. Nearly all commercial transactions involve a contract; even electricity transactions conducted over the telephone are done so with an underlying enabling agreement. SCE urges ARB to clarify what would constitute a contract in order to satisfy this requirement or delete the requirement entirely. To clarify the term “contract,” SCE recommends that ARB allow for considerable flexibility in defining “firming and shaping” contracts. If an entity must have a “long-term” contract with the supplier of the replacement electricity, this would effectively require entities such as SCE to outsource the firming and shaping of out of state renewables to third-party service providers at a sizable cost. Because it is typically more efficient and cost-effective for SCE to self-manage these activities, SCE currently does so for its out-of-state renewable generation. Therefore, ARB’s contractual restriction could significantly increase costs to California electricity customers. SCE recommends that ARB revise its language in order to allow utilities the flexibility to manage out-of-state renewable firming and shaping in the most efficient and cost-effective manner possible, or delete the provision entirely, especially for grandfathered projects. (SCE3)

Comment: The proposed definition of "replacement electricity" reflects a fundamental misunderstanding of the function of firming and shaping and must be modified to reflect the zero net replacement energy result of the firming and shaping function. As proposed, this definition unduly constrains the resources available to compliance entities for firming and shaping their renewable energy contracts for delivery into California. Such practices are not only commonplace with regard to renewable contracts, but contemplated by the Legislature and regulators for purposes of the RPS. However, the proposed restriction would require that replacement electricity be sourced from the same balancing authority of the underlying renewable resource. NCPA supports the deletion of this entire sentence, as do the Joint Utilities, as inclusion of this limited definition negates the efficacy of RPS-eligible contracts, increases Cap and Trade Program compliance costs, and is contrary to the RPS goals of the State, all without meeting any of the AB 32 policy objectives. This attempt to disassociate the RPS-eligible generation resource from the electricity delivered into California creates an additional compliance obligation for covered entities that are first deliverers of electricity, and could further result in confusion regarding the treatment of unbundled renewable energy credits associated with that generation.

Comment: We request that the definition of Replacement Electricity be amended to remove the requirement that the replacement electricity come from a source in the same balancing authority area as the renewable energy being firmed and shaped. That requirement does not advance the goal of reducing greenhouse gas emissions. It would have no discernable effect on the amount of greenhouse gas emitted from sources used to firm and shape variable energy resources. Imposing such a requirement could increase the costs of firming and shaping (F&S) transactions, and thereby increase California electricity rates without providing any benefit to the California ratepayers. (BP2, PGE4)

Comment: CARB should amend the definition of "Replacement Electricity" in sections 95102(a)(336) and 95802(a)(237). The current definition requires that Replacement Electricity must originate in the same BAA as the Variable Renewable Resource it is associated with. Because the demand for renewable resource energy in California exceeds the supply of renewable resources in the State, most load serving entities are obliged to import renewable energy and renewable energy products into California to meet RPS mandates. This necessitates the use of F&S contracts for the procurement of variable renewable resource energy so that a firm product can be delivered to serve the ultimate customer load. Providers of "Replacement Electricity" and the host BAA in the western electricity market use a variety of resources throughout the region. There is no reason why the portfolio of resources eligible to provide "Replacement Electricity" in an F&S deal must be limited to a single BAA. This restricts the options for F&S

contracting, and will result in increased wholesale prices and costs to California retail electric customers without any economic or regulatory justification for this restrictive policy. Noble Solutions is cognizant of CARB's concern about transactions in which a GHG-producing resource "supports" the import of an intermittent zero-emissions renewable resource. However, every MWh of zero-emissions renewable energy, regardless of where it physically sinks, displaces a MWh of energy produced by the least efficient resource in the dispatch stack of the host BAA. It is virtually always a GHG reduction whenever zero-emissions renewable resources are operating. For California to impose a GHG charge on "Replacement Electricity" imported in connection with an F&S arrangement is equivalent to charging a California importer a penalty for reducing GHG emissions in another jurisdiction. (NAES)

Comment: The proposed definition of "replacement electricity" in section 95802(a)(237) and applied in section 95852(b)(3) requires that the first point of receipt on the NERC E-tag for replacement electricity be located in the same Balancing Authority (BA) as the renewable resource. This is a needless complication that serves no purpose in ensuring GHG reductions, facilitating tracking and verification of the renewable resources, or furthering the state's RPS and GHG reduction goals. The proposed definition reflects a fundamental misunderstanding of the function of firming and shaping and must be modified to reflect the zero net replacement energy result of the firming and shaping function.

As drafted, the provisions of section 95802(a)(237) as applied in section 95852(b) severely hinder the ability of compliance entities to meet these dual objectives. M-S-R believes that the proposed definition is not intended to be so restrictive as to negate the economic and environmental value created by entities' RPS contracts that involve renewable resources and firmed and shaped resources located in different balancing authorities, or to rely on E-tags for a purpose for which they were not intended. Maintaining this strict requirement provides no real benefits to the State, and pits two State policies against each other. M-S-R urges CARB to closely review the ramifications of this restriction and delete the entire last sentence of the proposed definition. Modify section 95802(a)(237) as follows:

(237) "Replacement Electricity" means electricity delivered to a first point of delivery in California to replace electricity from ~~variable~~ renewable resources in order to meet hourly load requirements. The electricity generated by the ~~variable~~ renewable energy facility and purchased by the first deliverer is not required to meet direct delivery requirements. ~~The physical location of the variable renewable energy facility busbar and the first point of receipt on the NERC E-tag for the replacement electricity must be located in the same Balancing Authority Area~~. (MSR, IEPA4)

Comment: The definition of "replacement electricity" in section 95802(a)(237) should be modified to remove the word "variable" throughout the definition. Limiting the definition of replacement electricity to association with variable renewable resources is inconsistent with the RPS, which currently allows substitute energy to be associated with renewables whenever there is a need for such energy, regardless of the intermittent or non-intermittent nature of the renewable resource. Using “firming and shaping”, or substitute electricity, to effectively bring the energy from renewables into California and use the transmission network most efficiently to do so is most often needed for intermittent resources such as wind power. However, there are circumstances where the underlying electricity from a baseload resource cannot always or easily be transmitted directly from the source into California, and substitute energy is used in those cases for compliance with the RPS. There is no reason why this kind of “firming”—using substitute energy to bring firm baseload power to the State, should not be considered to have zero or reduced GHG for the associated energy delivered, as the action is functionally equivalent to the firming and shaping necessary for intermittent resources. With the removal of the word “variable” in the definition of Replacement Electricity, there is no longer a need for a definition of “Variable Renewable Resource.” Even if there were yet a need for the definition, it is restrictive in mentioning just three renewable resources—wind, solar, and run-of-the-river hydro. Other renewable resources may be considered variable at times. The definition should simply be stricken. (SMUD3)

Comment: Remove restriction to “variable” resources of zero or reduced GHG treatment of replacement electricity. There should be no restriction in the regulations of associating the emission factor of the underlying renewable resource solely to cases involving variable renewable resources. Modify sections 95852(b)(3) and 95852(b)(4) as follows:

> (3) Replacement electricity that substitutes for electricity from a ~~variable~~ renewable resource qualifies for the ARB facility specific emission factor specified pursuant to MRR section 95111 of the ~~variable~~ renewable resource under the following conditions:
>
> (A) First deliverers of replacement electricity have a contract, or ownership relationship, with the supplier of the replacement electricity, in addition to a contract with the ~~variable~~ renewable resource; and
>
> (B) The amount of the reported replacement electricity does not exceed the amount for the reported annual ~~variable~~ renewable resource.
>
> (C) Replacement electricity with an emission factor greater than the default emission factor for unspecified electricity specified pursuant to MRR section 95111 is not eligible to receive an emission factor of zero metric tons CO_2e/MWh. For contracts that use replacement electricity for which the emission factor is greater than the default emission factor for unspecified electricity, the difference between the emission factor from the replacement electricity and the default emission factor for unspecified electricity will be used to calculate emissions with a compliance obligation.
>
> (4) Claims to resources with zero direct emissions, emissions without a compliance obligation, or emissions calculated using a lower emissions factor than the default emissions factor for unspecified electricity specified pursuant to MRR section 95111~~, including renewable resources other than variable renewable resources must demonstrate~~, pursuant to MRR, direct delivery of electricity as defined in section 95802. (SMUD3)

Comment: Section 95802(a)(237) provides that the first point of receipt for renewable energy and any replacement electricity used to firm the delivery must come from within the same balancing authority. LS Power urges CARB to remove this restriction because it will limit the ability of existing renewable transactions to avoid cap-and-trade compliance obligations even though the transaction is consistent with the policies adopted pursuant to the 20 percent RPS laws. Moreover, the definition may be impracticable when it is applied to actual transactions. Many transactions with out-of-state renewables do not identify the source or the balancing authority area for the ancillary and firming services needed to support the renewable generation. Thus, there could be renewable transactions that will face significant GHG compliance costs simply because their contract does not specify the location of the ancillary and firming services. To avoid the unintended implications of this structure, LS Power requests that the Board remove the requirement that replacement power come from the same balancing authority as the source of the renewable transaction. (LSPOWER)

Comment: There is no need for replacement electricity to be sourced from the same balancing authority of the underlying renewable resource. RPS allows firming and shaping resources to be procured and associated with renewable procurement as necessary without consideration of the location of these resources. Entities are free to procure the least cost firming and shaping energy on the market, or to supply firming and shaping from their own resources. Since the default emission rate is the same for any unspecified electricity imported, and is the calculated reduction in GHG emissions allowed for replacement electricity, it does not matter from an emissions perspective which balancing authority the replacement power comes from. A dynamic scheduling agreement approved by CAISO implies that any firming and shaping necessary for an intermittent renewable resource will occur within CAISO, not from the balancing authority in which the resource is located. Tracking replacement energy is a matter of contracts and tags, and is not any more or less complicated when the replacement energy comes from the same balancing authority or another. Modify sections 95802(a)(237) as follows:

(237) "Replacement Electricity" means electricity delivered to a first point of delivery in California to replace electricity from ~~variable~~ renewable resources in order to meet hourly load requirements. ~~The electricity generated by the variable renewable energy facility and purchased by the first deliverer is not required to meet direct delivery requirements. The physical location of the variable renewable energy facility busbar and the first point of receipt on the NERC E-tag for the replacement electricity must be located in the same Balancing Authority Area.~~ (CNE, SMUD3)

Comment: Proposed Regulation should be drafted in a manner that recognizes the fact that if the underlying contractual agreements that utilize replacement electricity (without an intra-balancing authority restriction) are deemed RPS eligible, they should not have a competing compliance obligation under the Cap and Trade Program. Maintaining the strict requirement that the renewable and firmed resources remain within the same balancing authority provides no real benefits to the State, and pits two State policies against each other. Modify section 95902(a)(237) as follows:

(237) “Replacement Electricity” means electricity delivered to a first point of delivery in California to replace electricity from ~~variable~~ renewable resources in order to meet hourly load requirements. The electricity generated by the ~~variable~~ renewable energy facility and purchased by the first deliverer is not required to meet direct delivery requirements. ~~The physical location of the variable renewable energy facility busbar and the first point of receipt on the NERC E-tag for the replacement electricity must be located in the same Balancing Authority Area.~~ (NCPA3)

Comment: The rules for replacement electricity should not apply to renewable contracts executed before the Cap and Trade Regulations are adopted. SCE requests that existing contracts with out-of-state variable renewable generators be “grandfathered,” with all replacement electricity products associated with these facilities automatically counted as zero emissions regardless of how, when, or from where SCE contracts for the replacement electricity. Doing so would recognize the decisions and often long-term commitments made to variable renewable resources across the West prior to ARB’s implementation of the Cap and Trade. It also recognizes that when these contracts were signed, additional costs to customers for GHG treatment of replacement electricity services were not contemplated. Furthermore, renewable generators, who are reducing WECC-wide emissions, would not exist except for the power purchase agreements and long-term financial commitments that SCE and its customers have made. Applying new rules to these contracts would significantly affect the value of existing renewable resources. SCE and other early supporters of renewable resources across the West should not be penalized for proactively undertaking renewable procurement pursuant to the RPS and other state goals. Accordingly, ARB should provide for a limited carve-out to the Cap and Trade rules for the subset of renewable resources that are outside of California and which were executed prior to adoption of these Regulations. That limited set of resources should be allowed to count replacement electricity with a facility-specific emissions factor tied to the renewable resource for the life of the contract, regardless of how, when, or from where such replacement electricity is procured. (SCE3)

Comment: LADWP supports the Joint Utilities position that the definition of replacement electricity should not result in a compliance obligation for renewable resources that meet all the State’s requirements under SBX1 2. This would create an unnecessary cost burden for LADWP’s ratepayers, especially for existing renewable energy contracts that do not include requirements for sourcing replacement power from the same Balancing Authority as the renewable being replaced. LADWP also recommends that the definition of “replacement electricity" be revised to strike the requirement that such resources being replaced be variable. There are instances when transmission outages may warrant replacement of non-variable renewable resources. Modify section 95802(a)(237) as follows:

> (237) "Replacement Electricity” means electricity delivered to a first point of delivery in California to replace electricity from ~~variable~~ renewable resources in order to meet hourly load requirements. The electricity generated by the ~~variable~~

renewable energy facility and purchased by the first deliverer is not required to meet direct delivery requirements. The physical location of the variable renewable energy facility busbar and the first point of receipt on the NERC E-tag for the replacement electricity must be located in the Western Electricity Coordinating Council ~~same Balancing Authority Area~~. (LADWP4)

Comment: The Utilities disagree with the proposal to require that replacement electricity be sourced from the same balancing authority area. There is a disconnect between the firming and shaping requirements for RPS eligible resources as defined in the California Energy Commission's RPS Guidebook and in the MRR. The Utilities and many other California retail providers have contracted for out-of-state wind resources using firming and shaping agreements and would be harmed by the inconsistencies between the State's renewable and GHG policies. Due to the nature of firming and shaping agreements and the inherent lack of transmission, this provision would severely restrict California's electricity providers from the ability to import renewable power from out-of-state. This requirement could exacerbate an already constrained transmission environment between California and the Pacific Northwest. California's utilities will likely incur significant financial impacts from this provision. Utilities will be forced to select among very costly alternatives. CARB staff has indicated that this new definition stems from AB 32 legislation, which requires they must "account for greenhouse gas emissions from all electricity consumed in the State." The Utilities believe that the intent of this section in the statute was not to exclude renewable generation purchased by California's electrical customers. Nor do the Utilities believe it was the intent of the CARB Board to include such a provision that punishes the growth of variable renewable resources when it adopted the Scoping Plan. The Scoping Plan relies on a 33 percent Renewable Electricity Standard (RES) in order to reach the overall GHG reduction goals in AB 32. Absent the recommended revision to the 15-day language, the 21.3 MMT CO_2e of reductions expected from the renewable energy mandates would no longer be valid. Limitations on the use of firmed and shaped products as proposed in both the Cap and Trade and MRR proposed Regulations would be inconsistent with the Scoping Plan and would create a barrier to achieving the relied upon reductions. The Utilities again assert that this provision is a conflict of California State policies. Modify sections 95802(a)(237), 95802(a)(272), and 95852(b)(3) as follows:

(237) "Replacement electricity" means electricity delivered to a first point of delivery in California to replace electricity from ~~variable~~ renewable resources in order to meet hourly load requirements. The electricity generated by the ~~variable~~ renewable energy facility and purchased by the first deliverer is not required to meet direct delivery requirements. ~~The physical location of the variable renewable energy facility busbar and the first point of receipt on the NERC E-tag for the replacement electricity must be located in the same balancing authority area.~~

~~(272) "Variable Renewable Resource" means run-of-river hydroelectric, solar, or wind energy that requires firming and shaping to meet load requirements.~~

(3) Replacement electricity that substitutes for electricity from a ~~variable~~ renewable resource qualifies for the ARB facility specific emission factor specified pursuant to MRR section 95111 of the variable renewable resource under the following conditions:
(A) First deliverers of replacement electricity have a contract, or ownership relationship, with the supplier of the replacement electricity, in addition to a contract with the variable renewable resource; and
(B) The amount of the reported replacement electricity does not exceed the amount for the reported annual variable renewable resource.
~~(C) Replacement electricity with an emission factor greater than the default emission factor for unspecified electricity specified pursuant to MRR section 95111 is not eligible to receive an emission factor of zero metric tons CO2e/MWh. For contracts that use replacement electricity for which the emission factor is greater than the default emission factor for unspecified electricity, the difference between the emission factor from the replacement electricity and the default emission factor for unspecified electricity will be used to calculate emissions with a compliance obligation.~~ (MID3)

Comment: The last sentence of the definition for "Replacement Electricity" should be deleted. There should be no requirement for the replacement electricity to come from the same Balancing Authority Area as the renewable energy. The restriction would unreasonably reduce the flexibility that utilities require to cost effectively obtain renewable energy and will unnecessarily drive up the cost of meeting policy objectives. For example, when the import of renewable electricity from the Bonneville Power Administration Balancing Area in the Pacific Northwest is inhibited by transmission constraints, the acquiring utility should be allowed to use replacement energy from another Balancing Authority. Modify section 95802(a)(237) as follows:

(237) "Replacement Electricity" means electricity delivered to a first point of delivery in California to replace electricity from ~~variable~~ renewable resources in order to meet hourly load requirements. The electricity generated by the ~~variable~~ renewable energy facility and purchased by the first deliverer is not required to meet direct delivery requirements. ~~The physical location of the variable renewable energy facility busbar and the first point of receipt on the NERC E-tag for the replacement electricity must be located in the same Balancing Authority Area.~~ (SCPPA6)

Comment: CARB should remove the restriction in the definition for Replacement Electricity that requires replacement electricity and the renewable energy to be generated in the same balancing authority area. Link the CARB definition of "replacement energy" to the concepts that will emerge from the CPUC and CEC 33 percent RPS proceedings. Modify section 95802(a)(237) as follows:

"Replacement Electricity" means electricity delivered to a first point of delivery in California to replace electricity from variable renewable resources in order to meet hourly load requirements. The electricity generated by the variable renewable energy facility and purchased by the first deliverer is not required to meet direct delivery requirements. ~~The physical location of the variable renewable energy facility busbar and the first point of receipt on the NERC E-tag for the replacement electricity must be located in the same Balancing Authority Area.~~ (IEPA2)

Comment: Replacement electricity should not be restricted to the same balancing authority (section 95802(a)(237)). ARB includes provisions for replacement electricity associated with variable renewables including a requirement that it originate from within the same Balancing Authority. It is assumed that ARB intends to assign default emissions (943 lbs/MWh) to replacement electricity that does not meet this requirement. LADWP has existing contracts for firming and shaping of variable renewables that do not stipulate that the replacement electricity originate from the same Balancing Authority as the renewable resource. As such, these contracts for replacement power may be assigned emissions equivalent to the default emission factor for unspecified natural gas, rather that the emission factor of the renewable resource it is replacing. ARB should provide regulatory relief for such existing contracts and not penalize utilities with legal contracts that do not contemplate these regulatory burdens. Replacement electricity is, for the most part, unspecified and can come from anywhere within the WECC region under the 33 percent RPS. It is problematic for existing firming and shaping contracts that do not include this requirement, as well as for future contracts to the extent that adequate transmission is not available from the same Balancing Authority, such as in the Pacific Northwest region. LADWP is concerned that firming and shaping entities would not support a contract requirement to provide replacement' electricity from within the same Balancing Authority, because compliance may be physically impossible. It could have the unintended consequence of increasing the costs for firming and shaping services. This provision is not a requirement for the 33 percent RPS from an operational perspective. ARB should not distinguish between unspecified power that comes from one Balancing Authority or another, as the same default emission factor is applied to all unspecified power. It appears that there is no added emission benefit or environmental integrity from requiring that it come from the same Balancing Authority. Such requirement should not limit or preclude development of renewable resources. (LADWP4)

Comment: Powerex believes it unreasonable as well as impractical that ARB has limited the benefits of this proposal by requiring importers have “a contract, or ownership relationship, with the supplier of the replacement electricity” and a “contract with the variable renewable resource” in section 95852(b)(3)(A). The supply of replacement electricity is part of a complex supply chain that exists to provide electricity from variable renewable resources. Delivering a steady and reliable stream of renewable energy to a particular customer requires firming (i.e., leveling out variations in the supply of electricity occurring inside an hour) and shaping (i.e., leveling out hour-to-hour variations in the supply) at various stages in the supply chain. All of this firming and shaping comprises the “replacement energy” for the variable renewable resource. The result of this complex supply stream is that the first deliverer of replacement electricity into California may not have direct contractual relationship with the specific variable renewal resource and will often not have a direct contractual relationship with the entities that provided either upstream firming and or upstream shaping services.

As section 95852(b)(3) is currently drafted, without these direct contractual relationships, first deliverers of electricity will not be able to use the variable resource emission factor. To avoid this unnecessary limitation, Powerex encourages ARB to revise section 95852(b)(3)(A) to allow first deliverers of electricity to use the variable resource emission factor if they have "a contract with, contractual claim to, or ownership relationship with the supplier of the replacement electricity, in addition to a contract with or a contractual claim to the output of the variable renewable resource." By including the clause "contractual claim to," the rule will capture the situations where a first importer has purchased electricity that originated from a variable renewable resource and has already been firmed and/or shaped by an entity that is not a party to the transaction that occurs immediately before delivery into California. (POWEREX)

Comment: Section 95852(b)(3)(A) requires that that the first deliverers of the replacement electricity have a contract or ownership with the supplier of the replacement electricity. ARB should clarify the definition of the term "contract" and it should be consistent with industry standard usage of the term. That is, a contract for power specifies a delivery location, delivery time, delivery quantity, price and term. (PGE4)

Comment: BP requests that section 95852(b)(3), defining when Replacement Electricity can be assigned the same emissions factor as the variable energy resource it is firming and shaping, be amended to remove extraneous requirements. First, that section now requires that the "first deliverer" either enter into the firming and shaping contract, or have an ownership arrangement with the source providing the Replacement Electricity. As explained, in many cases the generator will be the party to enter into the firming and shaping contract, although it may not be the first deliverer. However, parties to firming and shaping transactions should be given the flexibility to have a party other than the "first deliverer" enter into the firming and shaping contract. (BP2)

Comment: Modify sections 95802(a)(237) and (272) as follows:
(237) "Replacement Electricity" means electricity delivered to a first point of delivery in California to replace electricity from ~~variable~~ renewable resources in order to meet hourly load requirements. The electricity generated by the ~~variable~~ renewable energy facility and purchased by the first deliverer is not required to meet direct delivery requirements. ~~The physical location of the variable renewable energy facility busbar and the first point of receipt on the NERC E-tag for the replacement electricity must be located in the same Balancing Authority Area.~~

~~(272) "Variable Renewable Resource" means run-of-river hydroelectric, solar, or wind energy that requires firming and shaping to meet load requirements.~~
(JOINTUTILITIES, NCPA3)

Comment: Section 95852(b)(3) contains provisions governing the calculation of the compliance obligation for replacement electricity. For the reasons discussed above regarding the definition of "replacement electricity" in section 95802(a)(145), the restriction to electricity from a “variable” renewable resource should be eliminated because replacement energy may be required to substitute for deliveries from renewable resources such as small hydroelectric projects at impoundments, geothermal projects, biomass projects, and biogas combustion even though those resources are not usually considered to be intermittent. Modify section 95852(b)(3) as follows:

> (3) Replacement electricity that substitutes for electricity from a ~~variable~~ renewable resource qualifies for the ARB facility specific emission factor specified pursuant to MRR section 95111 of the ~~variable~~ renewable resource under the following conditions:
>
> > (A) First deliverers of replacement electricity have a contract, or ownership relationship, with the supplier of the replacement electricity, in addition to ~~a~~ contract <u>or ownership rights to electricity generated by</u> ~~with~~ the ~~variable~~ renewable resource; and
> >
> > (B) The amount of the reported replacement electricity does not exceed the amount for the reported annual ~~variable~~ renewable resource.
> >
> > (C) Replacement electricity with an emission factor greater than the default emission factor for unspecified electricity specified pursuant to MRR section 95111 is not eligible to receive an emission factor of zero metric tons CO_2e/MWh. For contracts that use replacement electricity for which the emission factor is greater than the default emission factor for unspecified electricity, the difference between the emission factor from the replacement electricity and the default emission factor for unspecified electricity will be used to calculate emissions with a compliance obligation. (SCPPA6)

Comment: As currently drafted, section 95852(b)(3)(A) appears to apply only to situations where the first deliverer of replacement electricity (i.e. an Investor Owned Utility) purchases directly from the developer. There is no reason to restrict the market in this manner. Frequently, the commercial reality is that the developer sells the renewable energy and RECs to a firming and shaping party directly who then redelivers energy and RECs to a first deliverer of replacement electricity at the California border. This improves liquidity and is verifiable in the same manner via WREGIS and the NERC e-tag. Modify section 95852(b)(3)(A) as follows:

> (A) First deliverers of replacement electricity have a contract, or ownership relationship, with the supplier of the replacement electricity~~, in addition to a~~ <u>and either the first deliverer of replacement electricity or the supplier of the replacement electricity has a</u> contract with the variable renewable resource; and (MCSG3)

Comment: Pursuant to section 95852(b)(3), Replacement Electricity can claim the same specific emission factor as the variable renewable resource, if the following conditions are met:

1. First deliverers of replacement electricity have a contact, or ownership relationship, with the supplier of the replacement electricity, in addition to a contract with the variable renewable resource; and
2. The amount of reported replacement electricity does not exceed the amount for the reported annual variable renewable resource.
3. Section 95852(b)(3) further specifies that Replacement Electricity with an emission factor greater than the default emission factor for unspecified electricity specified pursuant to Mandatory Reporting Regulation section 95111 is not eligible to receive an emission factor of zero metric tons CO_2e/MWh. For contracts that use Replacement Electricity for which the emission factor is greater than the default emission factor for unspecified electricity, the difference between the emission factor from the Replacement Electricity and the default emission factor for unspecified electricity will be used to calculate emissions with a compliance obligation.

SBx1 2 does specify which party must enter into the firming and shaping arrangement, and does not require the firming and shaping energy to come from the same balancing authority area as the renewable energy being firmed and shaped. Furthermore, the Regulation would in some cases assign an emission factor greater than the variable energy resource to the Replacement Electricity, even though that electricity would count as RPS-eligible under SBx1 2. Doing so would inhibit the development of renewable resources located out-of-state, leading to an increase in the costs of complying with the new 33 percent RPS mandate, and potentially even putting achievement of that goal at risk. (BP2)

> **Response:** The 25 comments above request in various ways that we modify our approach to replacement electricity and to the consideration of RPS-eligible electricity's value in reducing an electricity importer's compliance obligation. Many recommend that we relax the requirement that replacement electricity originate in the balancing authority area (BAA) in which the associated renewable resource is located. Commenters also recommend that we extend the use of replacement electricity to renewable resources that are not variable.
>
> We agree, and we made significant modifications to section 95852(b) regarding the treatment of electricity from renewable resources, and the role of RPS eligible electricity in reducing the compliance obligation of an electricity importer. We deleted section 95802(a)(237), the definition of "replacement electricity." Our new approach relies on an RPS adjustment, which is the subject of new section 95852(b)(4). The RPS adjustment is a quantity of emissions calculated as the product of the default emission actor and the MWh of electricity generated at an "eligible renewable energy resource" (as newly defined), and meeting the requirements of new section 95852(b)(4).

Before making these modifications, we took an approach in which certain delivered quantities of electricity from non-renewable resources (replacement electricity) would be deemed to have an emission factor of an associated variable renewable resource. With the modifications, the regulation now allows for an adjustment in an electricity importer's total compliance obligation based on the amount of RPS-eligible electricity procured or imported that is not directly delivered to California. If RPS-eligible electricity is directly delivered, it receives its actual emission factor, which in many cases is zero.

Our new approach means that we need not consider "firming and shaping" electricity. It also means that the compliance obligation of an electricity importer may be reduced based on the importer's electricity procured from an eligible renewable energy resource, regardless of whether the resource is variable (or intermittent.) Furthermore, because the RPS adjustment is now a term that is subtracted out of the total compliance obligation equation for importers, there is no connection to any electricity that replaces renewable electricity. This means that there is no longer a requirement that replacement electricity originate in a particular BAA.

In considering electricity from renewable resources, we sought a balance between recognizing the value of investments in renewable electricity under the RPS mandate and our need to ensure compatibility with WCI partners when California links with other jurisdictions. We also sought to limit the potential for leakage or "double-counting" of the fact that renewable electricity may be generated with zero, or very low, GHG emissions.

Initially we believed that the correct balance required that replacement electricity be allowed only for variable renewable resources, and that replacement electricity come from generators located in the same BAA as the renewable resource. Through informal discussions and consideration of comments, we came to the conclusion that these restrictions would not necessarily eliminate double-counting and would not necessarily facilitate compatibility with linked jurisdictions more so than our modified approach.

We had initially considered replacement electricity only for variable resources, which, due to intermittency, cannot be directly delivered because they cannot be scheduled across balancing authorities, except in a few limited cases. However, other renewable resources cannot always be scheduled into California due to transmission constraints or other factors. We realized that there would be greater equity for utilities and other electricity importers if the non-variable RPS-eligible electricity could be considered in determining an importer's compliance obligation. To facilitate linkage, and minimize double-counting opportunities, we added new section 95852(b)(4)(E). This new section disallows an RPS adjustment for electricity generated at an eligible renewable energy resource in a linked jurisdiction. We believe that the modifications to sections

95802 and 95852 have met the concerns expressed in the comments above, and have rendered moot their specific proposals for modifications to the regulation.

I-71. Comment: Powerex supports ARB's proposal to allow regulated entities to use the variable resources emission factor for replacement electricity in section 95852(b)(3). Powerex supports the proposed requirement that the volume of replacement electricity not exceed variable generation capacity and that the importer account for emissions differences if the replacement electricity's emissions exceed the default rate. Under the proposed definition of "replacement electricity" (section 95802(a)(237)) in the Cap and Trade Rule, "[t]he electricity generated by the variable renewable energy facility and purchased by the first deliverer is not required to meet direct delivery requirements." Powerex supports this proposal. Due to the unique difficulties in distributing electricity from variable renewable resources, this electricity should be exempt from the Cap and Trade Rule's "direct delivery of electricity" requirements, as that term is defined in section 95802(a)(68). (POWEREX)

Response: We appreciate the commenter's support regarding volumes of replacement electricity. However, within our new approach, we allow both variable and non-variable RPS-eligible electricity to be used in the calculation of the new RPS adjustment. As discussed above, there are difficulties in directly delivering electricity other than that generated at intermittent or variable resources, and we believe that it is equitable to allow both variable and non-variable electricity from RPS-eligible resources to be part of the RPS adjustment.

I-72. (multiple comments)
Comment: The Regulation refers to energy from an intermittent renewable energy facility as "Replacement Electricity," defining it as "electricity delivered to a first point of delivery in California to replace electricity from variable renewable resources in order to meet hourly load requirements" in section 95802(a)(237). The definition further requires that "[t]he physical location of the variable renewable energy facility busbar and the first point of receipt on the NERC E-tag for the replacement electricity must be located in the same balancing authority area." It appears that Replacement Electricity is intended by the CARB to refer to energy that is used to firm and shape a Variable Renewable Resource. However, firmed and shaped energy is not provided in order to "meet hourly load requirements." BP therefore proposes that the first line of the definition be revised to state: "Replacement electricity means electricity delivered to a first point of delivery in California to firm and shape electricity from variable renewable resources." (BP2)

Comment: SCE requests clarification on section 95802(a)(237), requiring that replacement electricity be used to "meet hourly load requirements," as it is currently unclear how this provision is to be monitored or applied. All electricity transactions, including imports, are conducted to meet the customers' hourly load requirements. ARB staff indicated that out-of-state variable renewable electricity generation and its replacement electricity, if any, could be accounted for over the course of one year. SCE strongly supports this annual true-up period, as it fits well with the current operational paradigm used to firm and shape renewable electricity as well as maintains consistency of the treatment of variable renewable resources under the RPS. (SCE3)

> **Response:** Because we deleted old section 95802(a)(237) and modified the regulation's approach to electricity from RPS-eligible generators, these comments are no longer applicable.

I-73. Comment: We recommend that ARB insert "Replacement electricity" as a new category in section 95852.2(a). Replacement electricity is not distinguished from regular market purchases. The compliance obligation should net out the emissions from unspecified imports that are actually replacement power for imported renewables. Modify section 95852.2(a) as follows:

> <u>(a)(13) Replacement electricity pursuant to section 95852(b)(3).</u> (LADWP4)

> **Response:** We did not make this modification. The modifications to section 95852 allow for subtracting the product of the default emission factor and the MWh of certain RPS eligible electricity from an electricity importer's compliance obligation. We believe that these changes have the same effect on the compliance obligation as netting out emissions from unspecified imports that replace renewable electricity. Furthermore, the term "replacement electricity" has been deleted in revisions to the regulation for the reasons previously described.

I-74. Comment: CARB staff has stated that an intra-balancing authority requirement [for replacement electricity and associated variable renewable electricity] is necessary in order to facilitate tracking and verification of these agreements. M-S-R notes that this reliance on the veracity of an E-tag to verify and confirm the source of electricity is misplaced. Rather, these arrangements are already tracked through the Mandatory Reporting Regulation (MRR) in a manner that accurately documents the renewable resource. Accordingly, the simplest solution to resolve the tension that this definition would create between the RPS and GHG reduction goals is, to strike the last sentence of the proposed definition in both the Cap and Trade Regulation and the MRR, and utilize the provisions of the MRR reporting and verification process to confirm these deliveries.

Placing a restriction on "Replacement Electricity" such that it must come from the same BA as where the renewable energy facility is located implies that the source of generation on a NERC E-tag represents a contract between the first deliverer and this source, where in fact, no contract actually exists. This restriction would likely result in market inefficiencies, driving up the cost of electricity and creating potentially higher emissions on a WECC-wide basis. M-S-R understands that CARB must be able to account for electricity delivered into California and verify these transactions without needless administrative burdens. However, this objective is better met by utilizing the current reporting and monitoring practices already utilized by compliance entities with regard to renewable contracts, rather than creating artificial constraints, such as the intra-balancing authority restriction set forth in the proposed definition of replacement electricity. M-S-R (and each of its members) uses the provisions established in the MRR which have proven to be sufficient for purposes of this true-up and verification. The data used to complete this true-up and verification process is already developed by either the facility operator or the shaping and firming entity, and contains the information that CARB needs to verify renewable resource deliveries, where the NERC E-tags do not. Therefore, M-S-R maintains that CARB's objectives are better served by utilizing the existing process in the MRR, rather than looking to NERC E-tags and relying on arbitrary geographical boundary limitations.

If the underlying contractual agreements are deemed RPS eligible, they should not have a competing compliance obligation under the Cap and Trade program. The inclusion of this restriction would preclude entities from being able to maximize their renewable energy contracts, and would result in an added compliance burden associated with renewable energy contracts that were the result of legislative mandates to *increase* renewable energy production. (MSR, NCPA3)

> **Response:** Because these comments concern replacement electricity, they are in large part rendered moot by our modifications to section 95852, discussed in previous responses. However, we do not agree that e-Tags are not useful as part of the process of verifying and confirming sources of electricity. Some e-Tags identify actual generation sources that generate electricity delivered in real time to California, and thus serve to determine source.
>
> In addition, MSR refers to provisions in the MRR for true-up and verification. We do not believe that there are true-up provisions in the MRR. While it is true that our now discarded use of the concept of replacement electricity required comparing renewable generation to replacement electricity, our new methodology for calculating an RPS adjustment requires no true-up. Notwithstanding the fact that NERC e-Tags are not needed for calculation of the RPS adjustment, they are important tools for verification within the MRR, and such verification is needed for accurate calculation of compliance obligations pursuant to this regulation.

I-75. Comment: The requirement in section 95802(a)(237) that replacement electricity originate in the same balancing area, is not aligned with system physical needs or commercial practices. "Firming and shaping" is designed to ensure that an equivalent amount of power delivered into the grid by a renewable resource, and contractually owned by a California LSE, is ultimately physically delivered into the state of California. In some cases, such power will be directly delivered via source to sink scheduling. However, "firming and shaping" services are designed to deliver the same power when such a straightforward "real-time" scheduling approach is not feasible. Potential problems firming and shaping is designed to resolve include transmission congestion between the source and sink Balancing Authority (BA), intermittency of the renewable resource when a firm delivery commitment is needed to ensure load is served, and timing mismatches between generation and load. Firming and shaping deals are designed so that all energy from a contracted, out-of-state renewable resource is disposed of somewhere when it is generated. This must occur even if the energy is not needed in or unable to reach California due to transmission congestion or other reasons. Firming and shaping deals also ensure that an equal amount of energy to the amount generated is physically delivered to a California BA when it can be utilized. Therefore, over time the same amount of energy generated by a contracted renewable resource is ultimately delivered into California. Such a delivery may not be simultaneous, and it may not originate from the same source BA. Renewable energy paid for by California LSEs is injected into the grid outside of California, and is traded for an equal amount of power from unspecified sources delivered into California. Both California law and regulation explicitly contemplate this type of arrangement and deem it (subject to some volumetric limits) to meet requirements for renewable procurement under the RPS statutes. Given these physical realities, and the underlying purpose of "firming and shaping," we believe that replacement electricity, as a practical matter, will hardly ever originate from the same BA as the underlying renewable energy source. Therefore, if the intent of creating a category of energy for reporting purposes called Replacement Energy is to facilitate firming and shaping arrangements in furtherance of State RPS policy, the currently proposed definition, which restricts Replacement Energy to that which originates in the same BA, will not serve that objective. MSCG strongly recommends that the last sentence of the definition be removed. (MSCG3)

> **Response:** As discussed above, we modified our approach and no longer use the concept of replacement electricity. We note that "firming and shaping" appears to have no agreed-upon meaning in the electricity sector, based on various opinions from stakeholders involved in this regulatory process. This regulation relies on tracking direct delivery of imported electricity from source to first point of delivery in California, except that the compliance obligation for an electricity importer may be adjusted for certain RPS-eligible electricity and for certain qualified exports. There is no need to consider the concept of "firming and shaping" for the purposes of this regulation.

I-76. Comment: The definition of "replacement electricity" requires that the physical location of the variable renewable energy facility busbar and the first point of receipt on the NERC E-tag for the replacement energy must be located in the same balancing authority area. SCE recommends that ARB remove this requirement because it is unmanageable from an operational perspective. First, the balancing authorities in which these renewable resources are located may not have the volume of replacement electricity sources necessary to accommodate the need for managing such generation. This may be due to local balancing authority needs if dispatchable resources are needed to support local system load and cannot be exported. Also, many renewable resources are concentrated in a few balancing authorities. This will create an increased demand for "replacement electricity" on top of local balancing needs. Second, the physical transmission path availability from renewable resource balancing authorities into California is limited. Third, most electricity products that are currently traded in the western power markets do not identify the ultimate source of electricity (nor the balancing authority) at the time of the transaction. Requiring the source to be located in the same balancing authority would force market participants to create new, "non-standard" products that specify a balancing authority in its terms. This would bifurcate the common electricity products currently being traded, which may reduce market liquidity and lead to more expensive transactions and rates. Fourth, E-tags are created after the fact. The conventions for specifying the source of electricity on an E-tag are less defined than for other E-tagging conventions. (SCE3)

> **Response:** We deleted the definition of "replacement electricity" to meet this concern. We note that while many or most electricity products currently traded may be forms of electricity from unspecified sources ("for which a source is not identified"), it is necessary to identify generation resources in order to determine the compliance obligation for electricity that is eligible for a specified source emission factor.

I-77. Comment: The definition of "Replacement Electricity" and "Variable Renewable Resource" in the Regulation, and the treatment of energy from Variable Renewable Resources, as defined, is inconsistent with the treatment of these types of transactions in Senate Bill SBx12, and would impose different and additional requirements on firming and shaping transactions than those currently imposed by the California Public Utilities Commission (CPUC) and California Energy Commission (CEC). Below are proposed changes to the proposed regulations that would make the Regulation consistent with SBx1 2 and thus avoid requiring renewable generators to comply with different or additional requirements than those contemplated in SB x1 2. The structure of a firming and shaping transaction depends on a number of factors, including the location of the generator, the purchasing utility, and the firming and shaping party.

However, a basic transaction to firm and shape intermittent energy for delivery to the California Independent System Operator (CAISO) can be described as follows: the eligible renewable generator would enter into a firming and shaping agreement with a third party who would agree to purchase all of the electricity delivered by the intermittent facility as and when generated. The generator would retain the RECs associated with the electricity. The intermittent energy would be measured across an agreed-upon measuring period, which might in some agreements distinguish between energy generated off peak and energy generated on peak. During an agreed-upon re-delivery period, the firming and shaping party would sell and schedule the energy to the seller at a California balancing authority area as a firmed and shaped flat block product that eliminates variability (e.g., as firm energy in 25 MW blocks). The seller would cause the shaped and firmed electricity and the RECs generated by the eligible renewable generator to be delivered to the purchasing utility. For example, assume a wind facility delivers 6,000 MWh intermittently during the course of a measuring period. The shaping and firming party would accept the electricity generated during this period and commit to schedule it into the CAISO during a later re-delivery period, with the 6,000 MWh to be scheduled in flat blocks. In this example, the firming and shaping party could be a party with load (for example, a utility) that would physically absorb the intermittent energy into its system and thereafter re-deliver it during the re-delivery period.

Alternatively, and much more likely in the current market, it could be a company with a trading desk willing to buy seller's intermittent energy as delivered to the facility's interconnection point, sell it into the market and then later acquire electricity and schedule it into the CAISO as a flat and firm product. The measurement period, re-delivery period, shape of re-delivered product, point or points of re-delivery and fee to be paid to the firming and shaping party for the service, among other matters, are not standardized and are subject to negotiations among the utility, the seller and the shaping and firming party. The energy scheduled and delivered to the CAISO in such a transaction is "firm" in the sense that the obligation to deliver it is not unit contingent and can only be excused in very unusual cases of uncontrollable force. It is "shaped" in the sense that it is converted from a variable, intermittent resource with pre-schedule and intra-hour variability into a blocked flat and firm energy product scheduled and delivered to CAISO.

Though firmed and shaped transactions are subject to procurement limits in SBx1 2 there are clear benefits provided by firmed and shaped transactions. Firmed and shaped transactions allow for the more efficient use of the transmission system, as the firmed and shaped product requires less transmission capacity to schedule into a California balancing authority. The resulting reduction in transmission costs can mean lower procurement costs for utilities and their ratepayers. California's electric utility customers would therefore be the ultimate beneficiaries of any resulting reduction in transmission costs. Firmed and shaped transactions also provide additional, incremental energy to California. Nor are the environmental benefits of the renewable generation lost as a result of firming and shaping the output. Even if the product delivered to California is generated by a source other than an eligible renewable energy resource, those deliveries must be equal to generation from the eligible renewable energy resource. At the time the eligible renewable energy resource generates the energy that will later be firmed and shaped, it will replace other sources of generation. In the WECC, the generation is most likely offsetting fossil-fuel fired generation, including coal. In fact, depending on the generation mix where the renewable facility is located, it may reduce greenhouse gas and other hazardous emissions by a greater amount than a facility located in California. Given the nature of greenhouse gas emissions, reductions do not have to occur in California to provide benefits to Californians. (BP2)

> **Response:** The regulation does not consider "firming and shaping," and the single definition that used this phrase (section 95802(a)(272)) has been deleted. Instead, our regulatory approach for the compliance obligation for imported electricity is to track the delivery and ownership or contractual right to electricity from specified sources, and to track electricity from unspecified sources. Due to the modifications in section 95802 and 95852, and the response above to multiple comments on replacement electricity and the treatment of RPS electricity, no additional response is needed.

I-78. Comment: E-tags are designed to track total electrons and therefore do not accurately reflect the contract between the utilities, the renewable generation source, and the source of the replacement electricity. Similarly, a first deliverer who buys power on an electronic exchange such as the Intercontinental Exchange (ICE), at the California Oregon Border, is entering into a purchase of unspecified power from a third party. This third party may have multiple generation resources or none at all and is simply purchasing the energy from someone else. When a first deliverer is contracting for this power they are not contracting for electricity from a specific generation source with a specified emissions output, yet a NERC E-tag must be created to facilitate the BA's management of its net interchange. This NERC E-tag may ultimately be sourced to a coal-fired electric generation facility in Montana, a hydroelectric generation facility in British Columbia, or any number of other resources. Hence, it is highly likely that the actual NERC E-tags generated for the transaction does not accurately represent the source of the generation included in the contract entered into between the first deliverer and the third party.

Placing a restriction on replacement electricity such that it must come from the same BA as the variable renewable energy facility implies that the source generation on a NERC E-tag represents a contract between the first deliverer and this source generation where no such contract exists. This restriction would likely result in market inefficiencies, increasing the cost of electricity and potentially the level of GHG emissions on a WECC-wide basis. Because the E-tags do not necessarily reflect that actual contractual arrangements entailed in the firmed and shaped agreements, the "sources" of electricity included therein would not be accurate, which impacts the emissions factor used to calculate the compliance obligation; an incorrect E-tag can result in considerable added costs. (NCPA3)

> **Response:** In the first paragraph of the above comment, the commenter states that, for certain transactions involving unspecified electricity, it is likely that the e-Tags do not accurately represent the source of generation included in the contract entered into between a first deliverer and a third party. We agree. However, e-Tags are useful to track the delivery of generation between points. The points may include the busbars (first connection) of electricity generating facilities. Some e-Tags demonstrate the origin of electricity at a generation source. A combination of e-Tag information and ownership or contract information is needed for a claim of electricity from a specified source, as set forth in modified section 95852(b)(3) (previously (b)(2)).
>
> We deleted the definition of "replacement electricity," and there are no requirements regarding variable renewable energy and balancing authority origination in the new section 95852(b)(4) that sets forth requirements for the RPS adjustment. These changes render much of this comment moot. However, we do not agree with all of the commenter's characterizations of e-Tags.

I-79. Comment: The current language on replacement electricity raises a number of potential concerns in what is a complicated and evolving area. With that in mind, we strongly recommend the ARB consider a workshop on this issue involving CPUC staff and interested parties to ensure consistency among renewable resources and the Renewable Portfolio Standard (RPS) regulation, and to avoid double counting the environmental attributes of Renewable Energy Credits (REC). (KUSTIN16)

> **Response:** We deleted all language on replacement electricity, and took a new approach to renewable resources eligible for the RPS, as discussed above. We discussed renewable resources in a technical workshop with stakeholders on August 26, 2011, following many hours of discussions between ARB, CPUC, and CEC staff on this issue.

I-80. Comment: CCEEB recommends that ARB provide that resources eligible under the Renewable Electricity Standard (RES) or Renewable Portfolio Standard (RPS) are credited as zero GHG to ensure that the RES, RPS, Cap and Trade, and Mandatory Reporting Regulations are consistent and achieve GHG reductions in the most cost-effective manner. (CCEEB3)

> **Response:** Not all RPS-eligible resources are zero-GHG resources, because some burn fossil fuels. Because this regulation generally imposes a compliance obligation on emissions, and does not generally apply to non-GHG emitting sources as does the RPS, its purpose is very different from that of the RPS, and it would not be reasonable to try to make the RPS and this regulation completely consistent. However, we modified section 95852(b) to allow the subtraction of an RPS adjustment for certain electricity generated from renewable resources but not delivered for consumption in California.

I-81. Comment: Section 95852b(3)(C) states that replacement electricity with an emission factor greater than the default emission factor for unspecified electricity is not eligible to receive an emission factor of zero. Consistent with previous discussions between ARB and stakeholders, we would propose that replacement power procured consistent with the definition for "Unspecified Source of Electricity" be assessed the emissions factor of the underlying renewable resource, which would be zero. Replacement electricity procured consistent with the definition of "Specified Source of Electricity" would be assessed an emission factor, as follows: 1) If replacement electricity is imported in the form of "Specified Source of Electricity," then it would be reported as a specified import, but it would only be assessed an emission obligation amounting to the positive difference between the emission rate of the specified import and the unspecified rate of .428 metric tons per MWh (i.e. (emission obligation of specified import as measured in metric tons per MWh) minus (.428 metric tons per MWh)). To the extent that the specified import has an emissions rate of less than .428 metric tons per MWh, then the specified import would be assessed an emission obligation of the underlying renewable resource, which would be zero. This description would resolve the inconsistency between the MRR and CNT with respect to the treatment of replacement electricity. (PGE4)

> **Response:** Because we no longer use the framework of replacement electricity,

these recommended changes are not needed. We have required the use of the default emission factor for calculating the RPS adjustment of new section 95852(b)(4), which replaces the "replacement electricity" language.

I-82. Comment: Remove restriction to "variable" resources of zero or reduced GHG treatment of replacement electricity. Consistent with the recommendations above regarding treatment of replacement electricity associated with renewable procurement, there should be no restriction in the regulations of associating the emission factor of the underlying renewable resource solely to cases involving variable renewable resources. Modify sections 95852(b)(3) as follows:
(3) Replacement electricity that substitutes for electricity from a ~~variable~~ renewable resource qualifies for the ARB facility specific emission factor specified pursuant to MRR section 95111 of the ~~variable~~ renewable resource under the following conditions:

(A) First deliverers of replacement electricity have a contract, or ownership relationship, with the supplier of the replacement electricity, in addition to a contract with the ~~variable~~ renewable resource; and

(B) The amount of the reported replacement electricity does not exceed the amount for the reported annual ~~variable~~ renewable resource.

(C) Replacement electricity with an emission factor greater than the default emission factor for unspecified electricity specified pursuant to MRR section 95111 is not eligible to receive an emission factor of zero metric tons CO_2e/MWh. For contracts that use replacement electricity for which the emission factor is greater than the default emission factor for unspecified electricity, the difference between the emission factor from the replacement electricity and the default emission factor for unspecified electricity will be used to calculate emissions with a compliance obligation. (SMUD3)

Response: As discussed above, we modified sections 95852(b)(3) and deleted the definition of "replacement electricity" to address these concerns.

I-83. (multiple comments)
Comment: Section 95852(b)(4) addresses claims to resources that have zero direct emissions. The section should be revised as follows, to conform to the elimination (discussed above) of the distinction between "variable" renewable resources and renewable resources that are not generally considered to be "variable." Modify section 95852(b)(4) as follows:

(4) Claims to resources with zero direct emissions, emissions without a compliance obligation, or emissions calculated using a lower emissions factor than the default emissions factor for unspecified electricity specified pursuant to MRR section 95111~~,~~ ~~including renewable resources other than variable renewable resources~~ must demonstrate, pursuant to MRR, direct delivery of electricity as defined in section 95802. (SCPPA6)

Comment: Section 95852(b)(4) states that only variable renewable resources would be exempt from direct delivery requirements. We would propose instead that all renewable resources would be exempt from direct delivery requirements. (PGE4)

> **Response:** We deleted the section, rendering these comments moot. The purpose served by the deleted section is now served by the requirements for claims of electricity with a specified source emission factor (section 95852(b)(3)), as modified. Electricity from sources with zero emissions is essentially a subcategory of electricity from specified sources.

I-84. Comment: Replacement Electricity should always be assigned the emissions factor of the Variable Energy Resource if that Replacement Electricity would qualify as RPS-eligible energy under SBx1 2. We suggest that CARB, rather than attempting to impose its own requirements regarding firming and shaping transactions, which run the risk of being inconsistent with the California Energy Commission's and the California Public Utilities Commission's interpretations of SBx1 2, simply defer to the CPUC and CEC to delineate what types of firming and shaping transactions qualify as the delivery of renewable energy. Otherwise, imposing unnecessary additional requirements or inconsistent requirements will increase the costs of achieving California's renewable energy goals, and will ultimately hurt the California ratepayer. Amending section 95852(b)(3) as suggested would ensure that the three agencies are consistent in their treatment of firmed and shaped energy. Furthermore, we note that although the proposed amendment would eliminate the requirement that the Replacement Electricity not exceed the generation from the variable renewable resource on an annual basis, CEC already applies the same requirement to firmed and shaped transactions that are RPS-eligible. Modify section 95852(b)(3) as follows:

> (3) Replacement electricity that substitutes for electricity from a variable renewable resource qualifies for the ARB facility specific emission factor specified pursuant to MRR section 95111 of the variable renewable resource <u>if that electricity qualifies as firmed and shaped energy pursuant to Public Utilities Code Section 399.16(b)(2) and the California Public Utilities Commission and California Energy Commission regulations implementing that Section</u>. ~~under the following conditions:~~ (BP2)

> **Response:** We have neither imposed, nor tried to impose, requirements for firming and shaping, which we believe are not precisely defined terms in California regulations, and which may or may not be defined in the future for other purposes. We deleted all reference to replacement electricity, rendering this comment moot.

RECs and RPS, including VRE

I-85. (multiple comments)
Comment: REMA proposes that ARB insert some simple additional language to prevent the double counting of emissions associated with electricity imports from out-of-state renewable facilities into California. In addition to the voluntary market for

renewable energy, many western states have mandated renewable portfolio standards (RPS) in order to capture and claim the greenhouse gas and other environmental benefits associated with renewable energy. The renewable energy attributes (including the GHG emission benefits) are contained and conveyed with the REC.

To maintain the integrity of both the voluntary and compliance markets, only the party owning the REC can claim the environmental benefits. When electricity generated by a renewable facility is sold separately from the associated environmental attributes, or RECs, it is no longer allowed to be claimed as renewable or as containing any of the environmental benefits. To do otherwise is double counting. As written, section 95852(b)(2)(B) would allow electricity imports from renewable energy facilities to be treated as emissions free without accounting for the necessary environmental attributes. This constitutes double counting and would severely weaken GHG reduction efforts within the state, region, and voluntary markets.

There are several scenarios in which the electricity imports from specified renewable sources could produce double counting: 1) A renewable energy generator outside of California exports power to California where it is claimed as zero emissions under ARB's Cap and Trade program, while the generator simultaneously sells the associated RECs into the voluntary market or RPS markets outside California; 2) An out-of-state entity purchases bundled electricity (environment attributes and underlying power), and then proceeds to sell the RECs into the voluntary market or RPS markets outside California, while selling the underlying electricity to California as zero emissions for Cap and Trade purposes; 3) A California entity purchases imported bundled electricity (environment attributes and underlying power), and then proceeds to sell the RECs into the voluntary market or RPS markets outside California, while retaining and reporting the underlying electricity as zero emissions for Cap and Trade program compliance. To prevent double counting of emissions claims, REMA recommends that ARB insert the following language as new paragraph section 95852(b)(5). This language prevents double counting and does not conflict with the draft regulation's definitions, does not create new processes, and does not conflict with California statutes. Modify section 95852(b) as follows:

> <u>(5) To report imported electricity from a specified source of renewable energy, the electricity importer must own all property rights to the emissions, or lack of emissions, associated with the imported electricity.</u> (REMA2)

Comment: We believe that section 95852(b) of the draft Regulations could enable the double counting of GHG emissions reductions and therefore undermine GHG emissions reduction goals in the Northwest. We are concerned that it would subvert the legal definitions of RECs adopted by Northwest states, which require all environmental attributes, including GHG emissions reductions, to be transferred with the REC. The aforementioned double counting could be avoided through the adoption of a simple subparagraph following section 95852(b). We recommend that a new section be created as 95852(b)(5) to specify that double counting of GHG emissions reductions is not permitted, while not conflicting with the intent or administration of the regulations or introducing a new compliance mechanism. Due to its heavy reliance on terms already defined in the draft Regulations, the new subparagraph should be a seamless addition. Renumber subsequent subparagraphs accordingly and add new section 95852(b)(5) as follows:

> <u>(5) To report imported electricity from a specified source of renewable energy, the electricity importer must own all property rights to the emissions, or lack of emissions, with the imported electricity.</u> (RNPBEF)

Comment: While sections 95852(b)(3) and 95852(b)(4) require first deliverers to show contract, ownership, or delivery of the underlying electricity from a renewable resource, which then allows them to have no compliance obligation for their import, there is currently no requirement for ownership of the renewable energy certificate (REC) alongside that electricity. As currently written, it is possible for renewable energy facilities outside of California to sell their RECs to meet another state's renewable portfolio standard (RPS), or into the voluntary renewable energy market, and for the underlying electricity to be delivered into California and treated as emissions-free. This results in double counting, as both the entity purchasing the REC and the first deliverer in California are benefiting from the claim of zero-emissions energy from the same MWh of renewable generation.

CPUC defines RECs as embodying all environmental attributes. We strongly recommend that CARB not codify language that directly conflicts with CPUC definitions, and the contractual expectations of REC owners. Enabling the underlying electricity to carry the zero emissions benefit would threaten renewable energy markets wherein RECs are defined as containing all environmental attributes of renewable energy generation. Furthermore, it is possible that entities that have already purchased the zero emissions attributes in the form of RECs will challenge CARB's actions. Further litigation would be likely in order to determine who has title to the zero-emissions attributes. Implementation of this section would make RECs from facilities selling the underlying electricity into California ineligible for Green-e Energy. This would introduce risk into the voluntary market and greatly hinder its growth. This policy would also potentially cause other states to re-evaluate their own successful renewable energy programs and standards. CRS strongly recommends requiring that first deliverers show ownership of the REC in order to claim emissions without a compliance obligation from a renewable resource, or the specific emissions factor of a renewable resource. Sections 95852(b)(3) and 95852(b)(4) should include language stating that "ownership of a REC" be added alongside the other criteria for first deliverers to claim zero emissions. Should CARB be resistant to including this language, a second best solution is to insert the following as a new section 95852(b)(5): "To report imported electricity from a specified source of renewable energy, the electricity importer must own all property rights to the emissions, or lack of emissions, associated with the imported electricity." This will help ensure that multiple claims are not made for the same renewable energy generation, prevent double counting, aid in the continued growth of both voluntary and compliance renewable energy markets in the U.S., as well as guarantee that Californians are actually receiving the zero emissions energy they expect under the Cap and Trade program rules. (CRS2)

Comment: As written, section 95852(b) would allow the double counting of the emissions characteristics if the electricity from an out-of-state renewable energy generator was imported into California and specified as zero-emissions under ARB's Cap and Trade program while, at the same time, the REC associated with the electricity was sold into the voluntary market or a RPS market outside of California. Both the party importing the REC-less electricity, and the party owning the REC would be claiming the same MWh of electricity as zero or reduced emission electricity. This double counting would undermine the environmental integrity of ARB's program and that of the renewable energy market. This potential for two claims on the environmental attributes associated with one megawatt-hour (MWh) is concerning for 3Degrees. We strongly believe that the proposed Regulation should protect against these double claims on emissions characteristics. 3Degrees acknowledges that there are technical difficulties in implementing some proposals to track and assign emissions to null power, but we believe there is simple solution that avoids these difficulties. To protect against double counting, 3Degrees strongly urges ARB to insert the following language as new subparagraph (b)(5) in section 95852. This new language offers protection to non-California RPS and voluntary renewable energy markets, conforms to existing definitions in the proposed Regulation, does not create a new compliance instrument, does not conflict with current California RPS statute, and does not require that ARB create new systems or processes. Modify section 95852(b) as follows:

> (5) To report imported electricity from a specified source of renewable energy, the electricity importer must own all property rights to the emissions, or lack of emissions, associated with the imported electricity. (3DEGREES2)

Comment: SMUD understands that WCI has recommended abandoning the renewable energy tracking system WREGIS for the purposes of tracking purchases of renewable energy under a First Jurisdictional Deliverer framework. SMUD, and other stakeholders in the electricity sector have pushed back against this arbitrary decision given the harm that it does to REC markets, impacting both the cost-effectiveness of the RPS and the credibility of the voluntary renewable energy market. SMUD strongly encourages the ARB to fully vet this topic before making a final decision. The decision reverses legal definitions of Renewable Energy Credits set forth in the Public Utilities Code, and relied on in energy contracts by dozens of entities. It throws into question the underlying value of the RECs tracked by WREGIS, effectively voiding the WREGIS definition, thereby creating further confusion about legal claims that can be made regarding contracts involving this commodity.

The reasoning offered by the WCI decision, primarily the administrative burden of tracking REC ownership and claims made by purchasers of null power, ignores the new administrative burden that is created for the reporters of these transactions, who now have the very tool that was created to track renewable energy claims taken away, leaving them in a predicament of relying on vague language in a reporting regulation to base long term contracts on. The decision calls into question the claims that are made in the voluntary renewable energy markets around the benefits that are embedded in RECs, thereby undermining the value of this market perhaps in a bigger way than the decision of whether or not to create a set-aside.

In addition to fully capturing stakeholder input on this important topic, ARB should consider the cost implications of adopting this policy on RECs. The use of RECs for RPS compliance was intended to help reduce the need for building high cost and difficult to permit transmission for renewable energy, as well as to make tracking of renewable claims easier. By requiring entities to purchase both the energy and the REC in order to receive the specific emission signature of the renewable resource, the ARB is effectively eliminating, or greatly limiting the viability of, using unbundled REC's for RPS compliance. This policy is not only inconsistent with the RPS but will either increase costs under the RPS or increase costs under the cap and trade program as entities opt to purchase RECs and are required to come up with additional allowances. Considering the RPS is one of the most expensive policies under the full set of AB 32 policies, and was expected to result in substantial reductions in the scoping plan, the ARB should give strong consideration to policy decisions which either inflate its cost or reduce its effectiveness in contributing to statewide emissions reductions.

Specific changes to the cap and trade regulation would be to recognize that all State recognized renewable energy resources procured for the RPS should be exempt from a compliance burden associated with their purchase. Modify section 95852.2 and 95852(b)(2)(D)as follows:

> <u>(g) Reserved for future consideration of treatment of combustion emissions associated with power delivered along with RECs.</u>
>
> (D) If there are other parties within the contract chain of custody, then the original source of generation and quantity of MWhs to be delivered under the original contract must be identified within the entire contract chain. <u>RECs in the form of WREGIS certificates are sufficient to meet this documentation requirement.</u> The quantity of electricity delivered, and for which an ARB facility specific emission factor specified pursuant to MRR section 95111 is claimed, cannot exceed the original amount under ownership or contract rights reported pursuant to section 95852(b)(2)(A). (SMUD3)
>
> **Response:** While we reject the commenters' assertions about what a REC includes for reasons put forth below, we understand that many individuals and entities believe that RECs represent a reduction in GHG emissions. We agree that double-counting is very likely to occur if RECs are sold separately from electricity delivered from a renewable resource and the REC is not accounted for. We agree with the commenters that in order to claim electricity from a specified source when it is an eligible renewable resource and RECs have been created to represent that the electricity came from a renewable resource, it is critical that such RECs should not also be used in other programs to claim

a reduction in GHG emissions. Therefore, we modified section 95852(b)(2) by adding paragraph 95852(b)(2)(D) to require that RECs, if created, must be retired for electricity for which a specified source claim is made.

To further clarify the issue of RECs, we first explain why we do not agree that RECs can be used to reliably prevent double-counting. Then we document the fact that, in California, RECs do not have a “GHG emissions attribute” once a cap is in place. We also explain why electricity from which a REC is separated cannot be said to have GHG emissions without a regional “null power” tracking system. Finally, we respond to additional specific points of the comments above.

REMA asserts: “When electricity generated by a renewable facility is sold separately from the associated environmental attributes, or RECs, it is no longer allowed to be claimed as renewable or as containing any of the environmental benefits. To do otherwise is double counting.”

We agree. However, the electricity does not acquire GHG emissions because RECs were separated. RECs and the WREGIS tracking system for RECs can ensure that RECs are not used in more than one jurisdiction’s RPS, provided all programs and generators participate in WREGIS. Regardless of any claims made or not made by any entity, double-counting of a GHG emissions attribute can easily occur even if RECs are retired because electricity from a GHG-free generation source is, in actual fact, generated without any GHG emissions.

For example, assume that a Walmart store in Oregon purchases electricity from a wind generator in Oregon for which the wind generator makes no claims of any kind. Walmart officials can claim, truthfully, that they are purchasing electricity that had no GHGs emitted in its generation. However, if a California utility purchased an REC from the wind generator, and if REC had an attribute of reducing GHG emissions, then a California utility could purchase and retire the RECs and claim to have reduced GHG emissions. Even if the WREGIS system requires the generator to agree to make no claims about the environmental attributes of the electricity, Walmart would be correct in claiming that there were no GHG emissions created during generation at the wind source. The reason this is so is that, the non-emission of GHGs is not an attribute, but the lack of an attribute. If a California utility were to use an REC from the wind generator in a capped jurisdiction to make a claim about reduced GHG emissions, that would be double-counting. This is true because if the wind generator is in a capped jurisdiction, it has no compliance obligation and does not reduce emissions in that jurisdiction.

The only way to ensure that there is no double-counting when RECs are separated from electricity is to have a multi-jurisdictional regulatory program that would assign GHG emissions to “null power,” which is the common name for electricity from a renewable resource from which RECs have been separated. Because there is no regime that assigns emissions to renewable electricity (null power) and tracks the electricity to the point of consumption, and requires the end-user to make not claims, it is impossible to prevent some double-counting when RECs are used.

We are evaluating whether to use WREGIS as a system to track renewable electricity. Most importantly, ARB needs to be assured that WREGIS or any system used to track renewable electricity is as thorough and rigorous as the reporting and verification requirements included in the MRR and used for determining compliance obligations under this regulation.

Many commenters share a common misunderstanding of the value of RECs as set forth in law or in regulatory proceedings. Much of the consideration of RECs in California has taken place in CPUC proceedings.

Some commenters assert that RECs contain environmental attributes, including "GHG emission benefits." Other commenters agree with the CPUC that RECs contain an "avoided emissions" attribute. Some claim that legal definitions of RECs adopted by Northwest states require all environmental attributes, including GHG emissions reductions, to be transferred with the REC. 3DEGREES provided many definitions from other states and programs, and many include "avoided emissions." However, renewable electricity may or may not result in avoided emissions. Regardless of definitions in other states, California and WREGIS definitions of RECs do not include "GHG emission benefits." And in California, because there is now a cap on GHG emissions, although renewable electricity may help to meet the cap, it cannot be said to truly avoid emissions because emitters as a group will emit up to the cap.

On page 105, Appendix M to the staff report (the joint CPUC-CEC recommendation to ARB) states:

"In anticipation that tradable RECs may be authorized in the future, the Public Utilities Commission stated recently in D.08-08-028 that,

> '[O]nce a REC is used for RPS compliance (either before or after a GHG cap is imposed), the REC cannot also be used as a GHG emissions offset. In addition, once a GHG cap is imposed, RPS-eligible generation subject to a cap never avoids emissions. The "avoided emissions" will continue to be included in the REC, but the avoided emissions will be zero; the balancing GHG emissions value of the null power will therefore also be zero. Thus—assuming that ARB adopts this analysis—our characterization of the REC will not require any RPS-eligible generation with zero GHG emissions to need allowances when delivered to the California grid [footnote omitted]. (D.08-08-028, mimeo. at p. 24.)"

We agree with the CPUC that, once a GHG cap is imposed, RPS-eligible generation subject to a cap never avoids emissions (unless allowances are retired such as the case with the voluntary renewable electricity set-aside). We also agree that RPS-eligible generation with zero emissions will not need allowances if it is actually delivered in real time to the grid.

Furthermore, the CPUC is on record in the footnote omitted above that even though avoided emissions are part of a WREGIS Certificate, that does not mean that avoided emissions, if they have a positive or zero value, can be used in a GHG regulatory program. CPUC was anticipating the fact that whatever value—negative, positive, or zero, for an avoided emissions attribute— it was up to WCI (regionally) and ARB (in California) to determine how such value might be treated.

We note that generation of renewable electricity may or may not result in avoided emissions greater than zero, as explained by CPUC above.

Finally, California recognizes the use of WREGIS certificates. WREGIS's web page shows a definition for their certificates, and the commenters are in error about what the definition is.

I-86. Comment: Although PG&E appreciates ARB's intent to address utility concerns regarding the treatment of renewable electricity, the new provisions, as currently drafted, would prevent PG&E from being able to count existing out-of-state RPS-eligible contracts as zero GHG and would limit our ability to count future out-of-state contracts which we are allowed to pursue under the existing 33 percent legislation as zero GHG. California utility customers should receive credit for the zero-GHG attributes purchased through renewable contracts and should not be required to pay twice for GHG reduction benefits. (PGE4)

Response: It is clear from the previous response that there are no transferable "zero-GHG attributes" associated with renewable electricity. We note that the CPUC, which regulates PG&E, has made it clear that once a GHG cap is imposed, RPS eligible generation subject to a cap never avoids emissions.[8]

There is nothing in the regulation "that would prevent PG&E from being able to count existing out-of-state RPS-eligible contracts as zero GHG" although generally contracts are not considered to have, or not have, emissions of any kind. However, as discussed in our response regarding replacement electricity, we modified section 95852(b) and allow for an RPS adjustment that

[8]Op. cit., Appendix M to the Staff Report, page 105.

essentially gives first deliverers credit against their compliance obligation for RPS electricity procured.

Voluntary Renewable Energy

I-87. Comment: SCE supports ARB's decision to use allowances retired in the amounts matching emissions reductions due to voluntary renewable energy procurement for retirement and not direct them to alternative uses. (SCE3)

Response: We thank SCE for their support.

I-88. Comment: Any allowances in the Voluntary Renewable Electricity Reserve Account that are not retired on behalf of voluntary renewable energy procurement should be returned to the market via the quarterly state auction in a timely manner. SCE recommends that any year that the number of current year vintage allowances in the Voluntary Renewable Electricity Reserve Account exceeds the number of allowances retired under this program, these excess allowances should be returned to market through the next quarterly auction. (SCE3)

Response: We do not agree that unused allowances should be returned to the market via quarterly auction. Allowances will be deposited into the Voluntary Renewable Electricity Reserve account and will remain in the account until participants request allowance retirement for contributions of eligible renewable electricity according to section 95841.1. Considering the current rate of growth of the voluntary market, it is our expectation that participants will request that all allowances be retired.

I-89. Comment: Section 95870(c) designates percentages that, when applied to allowance budgets for years 2013-2020, would determine the quantity of allowances transferred to the Voluntary Renewable Electricity Reserve. PG&E believes that because allowances transferred to the Voluntary Renewable Electricity Reserve would no longer be available to greater market participants, the reduction in allowance supply to the market by adding a Voluntary Renewable Electricity Reserve has the potential to increase allowance prices and compliance costs. Therefore, PG&E only supports set asides that achieve actual reductions. (PGE4)

Response: Once the cap is in place, the only mechanism for creating reductions in emissions from voluntary renewable electricity (VRE) is the retirement of allowances, thus reducing the cap. We agree that allowance retirement should be only for actual reductions in emissions from contributions to the electricity grid from VRE purchases. Allowances will be deposited according to section 95870(c) and will remain in the account until a retirement request, with the accompanying required information, is received. Allowances will only be retired when VRE participants demonstrate, pursuant to modified section 95841.1, that renewable electricity meeting the section's requirements was generated during the year for which allowances will be retired. This is a transitional program. Currently, with no cap, voluntary renewable energy projects reduce GHG emissions and help meet the electricity demand, obviating the need for system electricity.

I-90. Comment: The proposed VRE set-aside modifications in section 95870 place a cap on the total allowances allocated to the VRE set-aside for each compliance period. REMA urges ARB not to adopt a pre-determined cap and to allow budget adjustment to be determined by demonstrated demand. An inflexible cap would place an artificial ceiling on the growth of the voluntary market for renewable energy, while an annual adjustment would provide flexibility and encourage additional demand for VRE purchases. ARB has recognized that voluntary demand for renewable energy helps reduce greenhouse gas emissions, and an annual adjustment would ensure that renewable energy supported by the voluntary market in fact reduce emissions by retiring allowances.

However, should ARB decide to maintain its proposed VRE allowance cap, REMA strongly recommends that section 95870(c) ("Disposition of Allowances") be revised to allow allowances to roll-over into future years whenever VRE set-aside allowance supply exceeds demand. This, at the very least, will create a slim buffer to allow for VRE market growth in the succeeding years. Also, REMA recommends the cap be subject to periodic review and adjustment prior to the start of each compliance period, or that an automatic review be triggered whenever demand exceeds the cap for two consecutive years. Several RGGI states have adopted a similar provision. (REMA2)

Response: We acknowledge REMA's concern; however, there is no need to roll allowances over because the allowances will remain in the account until we receive a request to retire them in accordance to the requirements contained in section 95841.1. We estimated the contributions from the voluntary sector as well as the market growth from 2007 through 2009. Our analysis indicates that allowances allocated for VRE should meet market demand, at current growth rates, at least for the initial years of the regulation. We view the account as a type of transitional assistance to help the voluntary market transition to a GHG constrained market. As discussed above, we expect, with decreased costs for renewable electricity over time and increasing carbon costs for electricity generated from GHG emitting resources, the VRE market will not need set-asides. Owners of buildings and businesses, and those wishing to voluntarily reduce GHG emissions and support the voluntary market, will continue to make these purchases, which will transition to reflect the carbon cost. The voluntary market will eventually need to purchase allowances and retire allowances to continue to make the GHG reduction claim. The allowance cost should be included with the sale of the VRE, if purchasers wish to claim their renewable electricity reduces GHG emissions.

I-91. Comment: The Utilities continue to have concerns with the inclusion of a VRE component at the outset of the Cap and Trade program as such component will, by design, remove compliance instruments from the market leaving fewer allowances available for covered entities, which in effect reduces the cap below the goal set by AB 32. The Utilities are also concerned that the VRE market will act in direct competition with the 33 percent RPS market, constraining all electric distribution utilities in their effort to meet their compliance obligations under both the RPS and the cap and trade programs. This would increase the overall costs of compliance and the compliance burden for covered entities. The Utilities recommend the following changes in an effort to minimize the impact from such a program. Modify section 95870 (c) as follows:

> (c) Recognition of Voluntary Renewable Electricity Emissions Reductions. On December 15, 2012, the Executive Officer shall transfer allowances to the Voluntary Renewable Electricity Reserve Account, as follows:
>
> (1) 0.~~5~~10 percent of the allowances from budget years 2013-20~~14~~20; ~~and~~
>
> ~~(2) 0.25 percent of the allowances from budget years 2015-2020.~~ (MID3)

> **Response:** We do not agree with the modifications proposed by MID. The purpose of the voluntary renewable electricity component is to ensure emission reductions for voluntary renewable electricity generation that reduces the need for system electricity after the cap is in place. This is a transitional program. Ultimately we expect renewable electricity and other low GHG-emitting generation to become the best economic choice for many businesses and homeowners as carbon costs rise. This renewable electricity reduces the electric load that must be served by electric utilities, which means the utilities will have less need for allowances. If allowances were not taken out of circulation for renewable energy that is voluntary, there would be a surplus of allowances in circulation for emissions that did not occur. If allowances were not retired, quite the opposite would happen to allowance prices than what MID describes. Surplus allowances would put downward pressure on allowance prices, reducing the incentive to reduce emissions.

I-92. Comment: CARB should outline what will happen if the number of allowances requested for retirement exceeds the size of the set aside specified in section 95870(c). The preferable solution would be to follow the RGGI Model Rule, and "true up" allowances at the end of each compliance period. In this scenario, a predetermined amount of allowances are taken out of circulation at the beginning of the compliance period. At the end of the period, if the number of allowances requested for the voluntary market exceeds the set aside amount, then the appropriate number of allowances are taken out of circulation in the subsequent compliance period. Having a truing up mechanism reduces the risk that there will not be enough allowances for all voluntary sales in a given year. This provides more market certainty and aids in the growth of renewable energy capacity in California. If it is not possible to exceed the amount prescribed in section 95870(c), the second best solution is to roll over any excess allowances from the set aside at the end of each year such that they can be used in the event the set aside is oversubscribed in future years. Regardless of the approach taken, CARB should specify what happens if the set aside is oversubscribed, and what happens with potential excess allowances, so that there is certainty to all market participants. (CRS2)

> **Response:** We acknowledge that most RGGI states allow a true-up of allowances for voluntary renewable electricity at the end of each compliance period. However, our emissions trading scheme is more comprehensive than RGGI's, and our initial rollout will provide transitional assistance to the industrial sectors to address leakage. Our program will also initially allocate allowances to the utilities for AB 32-related purposes. As such, we have a limited supply of allowances for each of the compliance periods. We estimated the demand growth of the VRE market, and we expect the number of allowances to be equivalent to this expected demand under current growth rates. Once the account has been depleted then the program will cease; however, as discussed above, we believe the voluntary market for renewable electricity will continue to thrive, as renewable self-generation becomes an increasingly attractive economic choice, which will reduce the cost of renewable electricity.

I-93. Comment: Section 95831(b)(6) creates a Voluntary Renewable Electricity Reserve Account to set aside allowances that may be retired to account for voluntary renewable electricity. Section 95841.1 explains the program requirements and calculations for voluntary renewable electricity. SCE maintains that in order to qualify for the retirement of allowances from the Voluntary Renewable Electricity Reserve Account, the voluntary renewable energy procurement must satisfy the same rules as utilities in order to show mandatory renewable energy purchases as zero emission. ARB has indicated that any renewable generation must be California RPS-eligible. SCE encourages ARB to clarify that any voluntary renewable energy purchase must satisfy the same rules as the compliance market to be recognized as zero emissions under the Cap and Trade program. (SCE3)

> **Response:** We modified section 95841.1 to clarify and add new requirements for electricity eligible for the VRE program. The VRE program requires all electricity to be directly delivered to the California grid, and to meet the requirements of either the RPS or the CEC's *Guidelines for California's Solar Electric Incentive Programs.* As such, the requirements for the VRE sector are more stringent than those for the RPS delivery requirements.

I-94. Comment: SMUD has long supported the concept of a set-aside of allowances for the voluntary renewable market, where those allowances are retired as voluntary renewable procurement occurs. However, the restriction in the provisions to only renewable energy that is "directly delivered" to California is inconsistent with the practice in voluntary renewable markets and is unnecessary in the cap and trade program. Allowances should be retired, ensuring GHG reductions in California, regardless of whether or not renewable electricity was directly delivered to California or is associated with replacement power delivered to California consistent with the allowed flexibility in the RPS and the voluntary renewable market. Modify section 95841.1(a) as follows:

(a) Program Requirements: The end-user, or VRE participant acting on behalf of the end-user, must meet the requirements of this section. Generation must be new and not have served load prior to July 1, 2005. Allowance retirement for purposes of voluntary renewable electricity will begin in 2013 for 2012 generation. ~~Eligible renewable electricity, or renewable electricity associated with RECs, must provide direct delivery of electricity to California.~~ (SMUD3)

Response: We do not agree. If electricity is not directly delivered, then other electricity, often from fossil generation, would be delivered. Retirement of allowances within the California program needs to occur for direct reduction in emissions for electricity that is sent to the California grid.

I-95. Comment: While SMUD commends the inclusion of a provision in Section 95841(b)(3) for aggregation of smaller resources (less than or equal to 200 kW), SMUD notes that such resources may not have an RPS generator identification number, particularly since voluntary renewable resources are not part of the RPS. SMUD contends that there is no reason for requiring a specific identification number for these resources. (SMUD3)

Response: We agree, and we included an option for participants in 95841.1(b). If the generator is not registered as RPS eligible by the CEC, then the participant may refer to the design and installation requirements contained in the California Energy Commission's *Guidelines for California's Solar Electric Incentive Programs,* third edition, June 2010. Participants will need to submit evidence that they met the installation and verification requirements in these guidelines by providing documentation that they received their incentive.

I-96. Comment: Section 95841.1(b)(1)(A) refers to the requirements of "…section 95841.1(b) (3) or (4), as applicable;" but there is no section 95841(b)(4). SMUD believes that the proper reference should be for subparts (2) or (3) as applicable. Modify section 95841.1(b)(1)(A) as follows:

(A) Report to ARB the quantity of renewable electricity in MWhs, and/or the number of RECs generated during the previous year from an eligible renewable electricity generator that meets the requirements of section 95841.1(b)(2~~3~~) or (3~~4~~), as applicable; (SMUD3)

Response: We acknowledge the typographical error and in section 95841.1(b)(1)(A) we corrected the references to sections 95841.1(b)(2) and (3), as applicable.

I-97. (multiple comments)
Comment: Sections 95481.1(b)(2)(D) and 95481.1(b)(3)(E) require "REC retirement reports" to be submitted by voluntary renewable energy participants seeking allowance

retirement. The term REC retirement report is not defined within the regulations and CRS seeks more detail on what such a report encompasses. (CRS2)

Comment: Section 95841(b)(2)(D) and Section 95841(b)(3)(E) refer to a "REC retirement report", but this report is never defined. If this simply refers to the report required by Section 95841 in general, there is no need for these subsections. Modify sections 95841(b)(2) and 95841(b)(3) as follows:

> (2) VRE Participants seeking allowance retirement for renewable electricity generation from an eligible facility > 200 KW nameplate capacity must submit the following with the report required in this section:
>
> > (A) Provide the RPS generator identification number, as determined by the California Energy Commission;
> > (B) MWhs of renewable electricity generated; and
> > (C) Number of RECs, as applicable; ~~and~~
> > ~~(D) REC retirement report.~~
>
> (3) VRE participants seeking allowance retirement for renewable electricity generating from an eligible facility ≤ 200 KW nameplate capacity must submit the following with the report required in this section:
>
> > (A) Application must be for retirement of more than an equivalent of 150 metric tons CO_2e. Applicants may aggregate eligible systems to meet this threshold requirement, but must submit only one application under one entity;
> > (B) Provide the RPS generator identification number, as determined by the California Energy Commission;
> > (C) MWhs of renewable electricity generated; and
> > (D) Number of RECs, as applicable; ~~and~~
> > ~~(E) REC retirement report.~~ (SMUD3)

Response: It is our intent to use terms accepted by the industry. We understand that most of the VRE industry, as well as western states with RPS mandates, use WREGIS to track RECs, and we expect that the WREGIS REC retirement report will be used by most VRE participants. However, for very small generators the cost of registering with WREGIS, or other costs associated with creating RECs, could be prohibitive. We included an option for participants to submit "tracking system data," which is another industry accepted name for data documenting REC retirement and/or renewable electricity generation. We made modifications to section 95841.1(b)(1), (b)(2) and (b)(3) to allow tracking system data as an alternative to a REC retirement report or proof of purchase or sale.

I-98. Comment: SMUD appreciates and supports the addition of specific voluntary renewable provisions in the 15-day language. The purpose of the voluntary set-aside is to assure that renewable generation used to meet voluntary market demand actually results in reductions of greenhouse gases beyond those already required by the cap once a cap and trade program is put in place. The application of this set-aside to renewable projects has been restricted to those projects that are located in the State, or that dynamically transfer their energy into the State, and that have been installed after January 1, 2005. Given that ARB set the cap based on emissions expected to occur in the State in 2012, the application of the set-aside to projects installed between 2005 and 2012 is not necessary. Such application would potentially create a doubling of the apparent reductions of those projects. Because the projects that were installed in this time-period are already displacing emissions, ARB has already effectively set aside and retired the allowances that would have otherwise been associated with these through its cap-setting process. Had the renewables not been installed, the cap would be higher.

So, the renewable projects are already displacing greenhouse gases, and even if they were to go away at some future date, their impact is locked in by virtue of their having impacted the cap at the time it was set. The only renewables that require a voluntary set-aside would be those renewables that were brought online after the cap was set that were then sold to the voluntary market. These renewables would not affect the cap trajectory without a set-aside. Adopting such a policy would also allow for more new renewables to be brought online for the voluntary market, rather than creating a situation where existing renewables were claiming much of the set-aside when it was not necessary. Such a decision would only negatively impact existing renewable projects if Green-e chose to require that they hold set-asides, however such a decision is unnecessary, the existing renewable are already displacing fossil generation and the cap setting process assures that they will in perpetuity. Modify section 95841.1(a) as follows:

> (a) Program Requirements: The end-user, or VRE participant acting on behalf of the end-user, must meet the requirements of this section. Generation must be new and not have served load prior to ~~July 1, 2005~~January 1, 2012. Allowance retirement for purposes of voluntary renewable electricity will begin in 2013 for 2012 generation. Eligible renewable electricity, or renewable electricity associated with RECs, must provide direct delivery of electricity to California. (SMUD3)
>
> **Response:** We do not agree with the proposed on-line date. The July 2005 date coincides with the release of Governor Schwarzenegger's Executive Order S-3-05, which established the climate change emission-reduction targets for California. In addition, we want to ensure that the generation that is supplying the voluntary sector and results in allowance retirement is efficient and representative of technology approved by the CEC. This date ensures this intent. In addition, to be eligible for the RPS, out-of-state facilities must have come on-line in 2005 or later.

I-99. Comment: Section 95841.1 requires that a renewable energy credit must be retired prior to the retirement of an allowance from the Voluntary Renewable Electricity Reserve account. Based on discussion at ARB's July 15 public workshop, PG&E understands that the percentages in section 95870(c) are based on projections, derived from historic data, on demand for Voluntary Renewable Electricity Credits. Therefore, it is possible that the quantity of allowances in the Voluntary Renewable Electricity Reserve Account could exceed the quantity of RECs retired per section 95841.1, leaving a balance in the account. In the event that allowances in the Voluntary Renewable Electricity Reserve are not retired at the end of each compliance period, PG&E requests that ARB return those unused allowances to the total pool of allowances available to market participants. (PGE4)

> **Response:** This issue was addressed in the response above to SCE3. The unused allowances will not be placed into any other account. They will remain in the VRE reserve account. At the commencement of the second compliance period any unused allowances will remain in the account, and additional allowances will be placed into the account each year. Once the account has been depleted it will be closed.

I-100. Comment: The Board should keep in mind that it is through the addition of more renewables that the State will actually reduce carbon emissions in the electricity sector. Limiting the term of the VRE set-aside through section 95870 sends a poor market signal for the investment in renewable generation. Should ARB maintain its set-aside time limit (proposed currently as 2020), it should undertake a general stakeholder review process in the future to examine the market evidence and determine whether a sunset on the set-aside is indeed merited or if an adjustment is more appropriate. Finally, if ARB decides to end the VRE set-aside, it should be careful to base the sunset on the date of project installation, not on the date of the RECs or output. Renewable developers who make investment decisions based on a set of assumptions about market support should not have the rug pulled out from under them. That kind of risk will deter new investment. (REMA2)

> **Response:** We acknowledge the concern regarding sending a market signal for the continued investment in renewable generation. However, the program allows for a limited number of allowances available for voluntary renewable generation during a transition period. In the long-term, we expect that the carbon price signal in electricity from GHG-emitting generation will encourage investment in low- and zero-GHG emission electricity, including renewable electricity. We also note that VRE market participants can choose to register as a voluntarily associated entity, purchase allowances, and retire them, to ensure continued emission reductions for renewable electricity in a capped jurisdiction.

I-101. (multiple comments)
Comment: REMA recommends that any shortage of allowances in the VRE set-aside for a given year be remedied by increasing the next year's ex-ante adjustment by the amount of the shortage, and immediately (in the new year) retiring allowances commensurate with the shortage. Consumer-led growth of the renewable energy sector should be reflected in a true-up that recognizes the voluntary market's progression. If this cannot be done, then REMA recommends that ARB embrace a policy prohibiting the release of any excess allowances in the set-aside account, and instead carrying

them forward to be used in any year when voluntary demand exceeds the ex-ante adjustment for that year. This issue is critical because it will be impossible to ensure that a purchase is meaningful if it is uncertain that it will result in the retirement of equivalent allowances. Purchasers must know that they are going to get what they intended to buy. In the event that demand for the voluntary set-aside exceeds the year's allowances and neither the program cap nor the two-way true up is revised, REMA recommends that allowances are distributed and retired equally amongst program participants. (REMA2)

Comment: As stated in previous comments, 3Degrees urges ARB not to adopt a pre-determined cap and to allow the budget adjustment to be determined solely by the ex-ante estimate of need based on demonstrated demand (section 95831(b)(6) Voluntary Renewable Electricity Reserve Account). This will send a clear market signal and promote the continuing future growth of voluntary renewable energy purchases. Should ARB decide to pursue a cap on the number of allowances that can be placed in the holding account, 3Degrees strongly recommends that the cap be subject to annual review and adjustment rather than at the start of each compliance period, or that an automatic review be triggered whenever demand exceeds the cap for two years in succession. (3DEGREES2)

Comment: 3Degrees urges ARB not to adopt a pre-determined cap and to allow the budget adjustment to be determined solely by the ex-ante estimate of need based on demonstrated demand. Should ARB decide to cap the number of allowances that can be retired each year, 3Degrees strongly recommends that the language in section 95841.1(c) be amended such that in the case that demand for VRE allowances exceeds supply in a given year, ARB should distribute and retire VRE allowances distribution equally among qualifying MWhs and/or RECs. As written, the proposed regulation is unclear on this point. In the case of demand for VRE allowances for not equaling supply, then ARB should roll over excess allowances into future compliance years. This, at the very least, will create a slim buffer to allow for VRE market growth in the succeeding years. (3DEGREES2)

> **Response:** The regulation contains no provision for an "ex-ante adjustment" or for increasing the allowances allocated to the VRE Reserve Account above the percentages set forth in Section 95870(c). This is because we expect the market to grow sufficiently and meet the quantity allocated to the VRE Reserve Account. As discussed above, this is a transitional program. In the long term, we expect the carbon price signal to provide support for electricity generation that has zero- or low-GHG emissions.

I-102. Comment: REMA recommends several clarifications to the set-aside's REC retirement, allocation, and program provisions that would improve upon the proposed draft language and match the environmental commodity industry's best practices. First, REMA's suggestions would modify ARB's descriptions of RECs to align more clearly with industry standards. Second, the recommendations would clarify the role of voluntarily retired RECs in the set-aside program. Finally, REMA recommends that VRE set-aside participant regulatory responsibilities be limited to the set-aside program only. Extending overall Cap and Trade responsibilities to parties only participating in the set-aside could impose overly burdensome compliance obligations, limiting private participation. Modify sections 95841.1(a), (b)(2)(B), (b)(2)(C), (b)(1)(E)(2), and (c) as follows:

(a) Program Requirements: The end-user, or VRE participant acting on behalf of the end-user, must meet the requirements of this section. Generation must be new and not have served load prior to July 1, 2005. Allowance retirement for purposes of voluntary renewable electricity will begin in 2014 for 2013 generation. RECs associated with renewable electricity, or eligible renewable electricity, must provide direct delivery of electricity to California.

(B) MWhs of renewable electricity generated designated for VRE retirement;
(C) Number of RECs designated for VRE retirement, as applicable;
(2) Attest, in writing, to ARB as follows: “I understand I am voluntarily participating in the California Greenhouse Gas Cap-and-Trade Program under title 17, Cal. Code of Regs. article 5, and by doing so, I am now subject to all regulatory requirements and enforcement mechanisms of this voluntary renewable energy set-aside program and subject myself to the jurisdiction of California as the exclusive venue to resolve any and all disputes.”
(c) “Number of MT CO_2e” rounded up to the nearest whole ton, is the number of allowances to be retired from the Voluntary Renewable Electricity Reserve Account; (REMA2)

Response: It is our intent to require direct delivery of the electricity. We clarified in section 95841.1(b)(2) and (3) to report just the megawatt-hours and RECs designated for use toward the allowance retirement, not all electricity or RECs generated by the facility. We clarified in section 95841.1(b)(1) that the attestations apply to the requirements of the VRE program, rather than the entire regulation. We do not agree the tons should be rounded up but rather rounded down. This will preserve the allowances available for other participants to request allowance retirement.

I-103. Comment: Section 95841.1 Voluntary Renewable Electricity (b)(1)(A) Report to ARB the quantity of renewable electricity in MWhs, and/or the number of RECs generated during the previous year from ~~an eligible~~ renewable electricity ~~generator~~ generation that meets the requirements of section 94841.1(b)(~~3~~2) or (~~4~~3), as applicable.

The Utilities continue to believe that the goals of AB 32 would be better served by deferring the initiation of a voluntary renewable electricity (VRE) market until both the 33 percent RPS and the Cap and Trade programs have had time to develop. The Utilities are concerned that this VRE market will act in direct competition with the 33 percent RPS market, constraining all electric distribution utilities in their effort to comply with their compliance obligations under both the RPS and the Cap and Trade. The above suggested corrections are necessary to ensure that this section of the RPR is internally consistent. First, section 94841.1(b) does not include any subsection (4).

By the context of the section the Utilities believe the references were intended to be covered as indicated. The referenced subsections use the term "renewable electricity generation from an eligible facility." The Utilities provide this mark up to avoid the confusion created by inconsistent terminology. Moreover, the RPS does not include any definition of eligible renewable electricity generator. Modify section 95841.1(b)(1)(A) as follows:

> (A) Report to ARB the quantity of renewable electricity in MWhs, and/or the number of RECs generated during the previous year from ~~an eligible~~ renewable electricity ~~generator~~ generation that meets the requirements of section 94841.1(b)(~~3~~2) or (~~4~~3), as applicable. (MID3)

> **Response:** We corrected the references in section 95841.1(b). We do not agree with this proposed change regarding eligibility. We believe the generation should meet certain eligibility requirements. These requirements ensure that the generation is actually occurring and that the generator has met certain requirements established by the CEC.

I-104. Comment: The Utilities provide the following typographical correction.

(b)(3) VRE Participants seeking allowance retirement for renewable electricity ~~generating~~ generation from an eligible facility… (MID3)

> **Response:** We thank the Utilities and corrected the typographical error.

I-105. Comment: Given ARB's recent elimination of the allowance distribution and compliance obligation for 2012, 3Degrees recommends that ARB modify section 95841.1(a) as follows:

> (a) Program Requirements: The end-user, or VRE participant acting on behalf of the end user, must meet the requirements of this section. Generation must be new and not have served load prior to July 1, 2005. Allowance retirement for purposes of voluntary renewable electricity will begin in ~~2013~~ 2014 for ~~2012~~ 2013 generation. Eligible renewable electricity, or renewable electricity associated with RECs, must provide direct delivery of electricity to California. (3DEGREES2)

> **Response:** We agree and incorporated this change into section 95841.1(a).

I-106. (multiple comments)

Comment: It appears there is an incorrect reference in section 95841.1. To allow for the use of industry standard renewable energy tracking systems and reporting documentation, 3Degrees suggests amending sections 95841.1 (b)(1)(C) and (b)(1)(D). The attestation is unclear on what is meant by "any claims for electricity", leaving room for unwanted interpretation. 3Degrees recommends amending the attestation. Sections 95841.1(b)(2)(A) and (b)(3)(B) are slightly unclear what exact piece of information ARB is seeking. 3Degrees suggests amending the language. The requirements in sections 95841.1(b)(2)(B), (b)(2)(C), (b)(3)(C), and (b)(3)(D) could be interpreted as requiring the VRE participant to submit information on the total MWhs and RECs generated by the facility, as opposed to just the MWhs or RECs for which the VRE participant is seeking allowance retirement. As it is often impossible for a REC purchaser to know total generation if the purchaser bought the REC from an entity other than the generator, 3Degrees believes ARB's intent is to require only the latter. 3Degrees recommends ARB clarify its intent by appending the sentences. Modify section 95841.1(b) as follows:

(b) Reporting Requirements. The end-user, or the VRE participant acting on behalf of the end-user, requesting allowance retirement for eligible generation must meet the following requirements for the period in which allowance retirement is being requested:
(1) By July 1 of each year, provide a written request for allowance retirement for the previous year's generation or REC purchases. Request must be accompanied by the requirements below:

(A) Report to ARB the quantity of renewable electricity in MWhs, and/or the number of RECs generated during the previous year from an eligible renewable electricity generator that meets the requirements of section 95841.1(b)(~~3~~ 2) or (~~4~~ 3), as applicable;
(B) Generator of the renewable electricity or RECs must be certified as RPS eligible by the California Energy Commission;
(C) Contract or settlement, or renewable energy tracking system data for the purchase of the electricity or RECs associated with the generation of the electricity;
(D) Contract or settlement or renewable energy tracking system data for sale of the electricity or RECs associated with the generation of the electricity to the end-user or entity purchasing on behalf of the end-user; and
(E) Attestations:

1. Attest, in writing, to ARB as follows: "I certify under penalty of perjury of the laws of the State of California that I have not authorized use of, or sold, any renewable electricity credits or any claims to the emissions, or lack of emissions for electricity for which I am seeking ARB allowance retirement, in any other voluntary or mandatory program."

(2) VRE Participants seeking allowance retirement for renewable electricity generation from an eligible facility > 200 KW nameplate capacity must submit the following with the report required in this section:

(A) Provide the generator's RPS ~~generator~~ certification identification number, as determined by the California Energy Commission;
(B) MWhs of renewable electricity generated for which the VRE participant is seeking allowance retirement;
(C) Number of RECs, as applicable for which the VRE participant is seeking allowance retirement; and
(D) REC retirement report.

(3) VRE participants seeking allowance retirement for renewable electricity generating from an eligible facility ≤ 200 KW nameplate capacity must submit the following with the report required in this section:

(A) Application must be for retirement of more than an equivalent of 150 metric tons CO_2e. Applicants may aggregate eligible systems to meet this threshold requirement, but must submit only one application under one entity;

(B) Provide the generator's RPS ~~generator~~ certification identification number, as determined by the California Energy Commission;

(C) MWhs of renewable electricity generated for which the VRE participant is seeking allowance retirement;

(D) Number of RECs, as applicable for which the VRE participant is seeking allowance retirement; and

(E) REC retirement report. (3DEGREES2)

Comment: Section 95841.1(d) introduces a potential voluntary renewable electricity tracking system as a way to show that the requirements of 95841.1(b) are met. WREGIS, an existing renewable energy tracking system, could be used as opposed to creating a separate tracking system specifically for the voluntary market. WREGIS is currently used by CEC, as well as other state programs, to verify REC ownership for RPS compliance. WREGIS can incorporate a function in which the certificates can be retired into accounts specifically for the voluntary renewable energy set aside. This would cost considerably less than developing an entirely new tracking system, and provide the same functionality needed for the set aside. Although the use of a tracking system will help meet a majority of the requirements of 95841.1(b) more efficiently and effectively, the tracking system should not be used in lieu of all requirements. The reporting requirements in Section 95841.1(b)(1)(D), regarding the contract or settlement data for the sale of the electricity or RECs, should still be required as this information cannot be reported in a tracking system.

Section 95841.1(b)(1)(D) requires requests for allowance retirement to be accompanied by "contract or settlement data for sale of the electricity or RECs associated with the generation of the electricity to the end-user or entity purchasing on behalf of the end-user." CRS requests feedback on what level of data is needed for reporting purposes, and whether the data submitted by market participants will have to be vetted by a third party. Many renewable energy marketers have a large number of customers and hence a great deal of contracts. Requiring the reporting of data on each individual contract would be time-consuming and cumbersome to both the party seeking allowance retirement and to CARB staff. Furthermore, many utilities offer green pricing programs where an official contract is not available, as the voluntary purchase of renewable electricity or RECs is simply a line item on a utility bill. In lieu of reporting all individual contracts, market participants should be able to submit aggregated sales records containing the total quantity of renewable electricity or RECs sold into the voluntary market, so long as the data is supported by an independent audit. The auditor should sample all individual contracts and sales records to confirm that the information reported is accurate. Furthermore, should CARB require the reporting of individual records, CRS recommends that names of customers not be disclosed on any publicly available documents. This ensures privacy for the renewable electricity and REC purchasers, and eases the concerns of competitive suppliers of losing their purchasers to other market sellers. (CRS2)

Comment: Incorporating tracking system data in ARB's reporting requirements, both for direct retirement of RECs and retirements on behalf of an end user, would encourage the set-aside's efficient operation and oversight. The use of a tracking system, like the Western Renewable Energy Generation Information System (WREGIS), enables easy and accurate REC retirement reporting, reducing the verification workload for ARB staff and the need for private companies and individuals to adopt new systems to participate in the state's GHG reduction efforts. REMA recommends that ARB revise the VRE set-aside reporting requirements to allow for the use of existing reporting pathways. Modify sections 95841.1(b)(1)(D), (b)(2)(D), and (b)(3)(E) as follows:

(D) Contract, settlement, or tracking system data for sale of the electricity or RECs associated with the generation of the electricity to the end-user or entity purchasing on behalf of the end-user; and

(D) REC retirement report or tracking system data.

(E) REC retirement report or tracking system data. (REMA2)

> **Response:** The commenters above request changes to the requirements for documenting purchase and sale of renewable electricity and RECs, which are needed to prevent, to the extent possible, the double-counting of a zero-GHG emission attribute of the renewable energy. We agree to add "tracking system data" as requested, to sections now renumbered as sections 95841.1(b)(1)(D), (b)(1)(E), (b)(2)(D), and (b)(3)(D) because some eligible VRE electricity is not associated with an REC. For example, an entity may install a 10 KW photovoltaic system but not register with WREGIS or another REC-creating program due to cost, but the generation is still voluntary renewable electricity to meet the requirement contained in section 95841.1(b).
>
> We agree with the 3DEGREES2 comment regarding the first attestation and modified section 95841.1(b)(1)(E) (now F) as requested. We also modified sections 95841.1(b)(2)(A) and (b)(3)(B) as requested to clarify that we are seeking the CEC's RPS certification ID number. In addition, we modified old sections 95841.1(b)(2)(B), (b)(2)(C), (b)(3)(C), and (b)(3)(D) to clarify that participants must report electricity generated and designated for VRE retirement, and RECs designated for VRE retirement as applicable, meeting the intent of 3DEGREES2 requested modification.
>
> CRS2 comments that WREGIS could be used for tracking RECs in the voluntary market. We appreciate this suggestion and allow REC retirement reports from WREGIS to be used to verify REC retirement. We do not agree that information about contract or settlement data on sales of electricity cannot be reported in a tracking system. For example, a utility may use a tracking system that could

provide data for electricity sold to customers as part of a "Green Energy" program.

CRS2 also asks about the level of data needed for reporting data associated with the sale of electricity or associated emissions. It is important to have verifiable data on all sales of electricity and RECs to prevent double-counting. By adding tracking system data as an alternative for documenting sales, we believe we met the commenter's concern. We note that all required reports and data are subject to ARB verification.

I-107. Comment: Section 95841.1(a) requires that voluntary renewable electricity be generated from facilities that came online after July 1, 2005. The voluntary renewable energy market is a national market with an established 15-year rolling online date. By disallowing California facilities with online dates prior to 2005 to qualify for the voluntary renewable energy set aside, many generators based in California would be excluded from participating in this national market. Section 95841.1 already prescribes eligibility criteria for generation that can qualify for allowance retirement as requiring the generators be certified as RPS eligible by CEC. CRS suggests not setting an arbitrary new date that puts California capacity at a competitive disadvantage compared to the rest of the U.S. If CARB moves forward with the 2005 date, REC providers both in California and nationally would turn to out-of-state RECs for their green power products, and the role of California generators in this market would be diminished. This would particularly impact California utilities that offer their customers green electricity, as they tend to own their own generation capacity or buy renewable energy generated within the state. (CRS2)

Response: We do not agree with the proposed on-line date. The July 2005 date coincides with the release of Governor Schwarzenegger's Executive Order S-3-05, which established the climate change emission-reduction targets for California. In addition, we want to ensure that the generation that is supplying the voluntary sector and that results in allowance retirement is efficient and representative of technology approved by the CEC. This date ensures this intent. In addition, to be eligible for the RPS, out-of-state facilities must have come on-line in 2005 or later.

I-108. Comment: Section 95841.1(b)(1)(E)(1) requires voluntary renewable energy market participants to attest that they "have not authorized use of, or sold, any renewable electricity credits or any claims for electricity… in any other voluntary or mandatory program" for which they are seeking allowance retirement. Such an attestation is unsuitable for the voluntary renewable energy market, as claims to zero-emissions electricity are precisely what REC and renewable electricity providers are selling to their customers. Ownership of a REC or renewable electricity entitles the purchaser to make statements surrounding their emissions-free electricity use. It is also commonplace and encouraged for these purchasers to participate in other programs. As currently written, the attestation in this section suggests that the voluntary renewable energy participant is the entity making the claim, whereas most of the time this is not the case. Rather, the voluntary renewable energy market participant is selling the claim to the end-user, or renewable energy purchaser, and seeking allowance retirement on their behalf. CRS understands the intent of this language is to prevent the double counting of renewable energy, and not retire allowances on behalf of renewable energy that is being double sold. However, as currently written, market participants would have difficulty signing such an attestation. CRS recommends changing the attestation to clarify that the renewable energy or REC end user is allowed to make a claim and participate in voluntary programs that recognize renewable energy purchasing. One suggestion is to insert “to any party other than the renewable energy purchaser” after “claims of electricity” in the section in question. With this modification, the attestation would read “I certify under penalty of perjury of the laws of the State of California that I have not authorized use of, or sold, any claims for electricity to any party other than the renewable energy purchaser for which I am seeking ARB allowance retirement, in any other voluntary or mandatory program.” (CRS2)

> **Response:** The change recommended to section 95841.1(b)(1)(E)(1) would defeat the purpose of that section. For example, if a marketer sold claims or an REC to an end user, that end user could then use the REC in another jurisdiction, or sell the REC to a third party for use in another jurisdiction. If an REC or other claim is used to retire allowances, it must not be used in any other program to prohibit, to the extent possible, double-counting.

I-109. Comment: Sections 95481.1(b)(2)(D) and 95481.1(b)(3)(E) require "REC retirement reports" to be submitted by voluntary renewable energy participants seeking allowance retirement. While electronic tracking systems are the preferred means for showing REC retirement, they can be cost-prohibitive to generators below a certain size. CRS recommends that for generators below 10 MW, an attestation be allowed in lieu of a retirement report from a tracking system. This attestation should state that the market participant has ownership of the renewable energy generation, and that they have not sold the renewable energy attributes separately to other customers or used it to make other renewable energy claims. (CRS2)

> **Response:** We do not agree with CRS that systems below 10 MW should rely solely on an attestation to demonstrate a REC has been retired. If an REC is created for a megawatt-hour of renewable electricity, it must be retired so that it cannot be used to support a claim in another program. We added an option to submit tracking system data that should address the cost concern for smaller systems. This has been included in modifications to sections 95841.1(b)(1), (b)(2) and (b)(3).

I-110. Comment: Section 95841.1(c) requires use of the default emission factor for unspecified power when calculating the amount of allowances to be retired for the voluntary set aside. A more widely accepted rate for determining the equivalent emissions avoided from renewable energy generation is use of the non-baseload output emission rate, employed by the U.S. EPA Green Power Partnership and by

Green-e Energy. The Regional Greenhouse Gas Initiative (RGGI) also recommends using the marginal rate of electricity generation when available to calculate the amount of allowances to retire on behalf of the voluntary renewable energy market. The default emission factor recommended by CARB is closer to a system average, which does not take into account the true effects of renewable energy generation on the grid, which generally is to back down plants operating on the margin. Since it is more accurate, the number of allowances to be retired on behalf of voluntary renewable energy would ideally be calculated using the non-baseload output emission rate.

To avoid double counting, imports of underlying electricity of renewable energy generation that has been stripped of its RECs would be assigned the emissions equivalent to the non-baseload output emission rate. CRS realizes that it is more likely that if imports of renewable energy generation absent RECs were to be assigned emissions as unspecified power, they would be assigned the default emissions rate. Thus, for consistency, CRS finds it sufficient that the default emission rate is also used for calculating the number of allowances to retire for the voluntary set aside. (CRS2)

> **Response:** We acknowledge CRS identification of the use of emission rates used in other programs such as the U.S. EPA's Green Power Partnership, which uses eGrid for applicable emission rates. In the future, we will consider the use of non-baseload output emission rates as determined by the eGRID data and propose changes, if needed. We are evaluating the underlying data used by eGRID and the implications of using the four emission rates calculated for the subregions identified for the WECC. We do not anticipate the need to assign any default factor to power that has been stripped of its REC. We included requirements into sections 95841.1 and 95852(b) to ensure there is no double-counting of emission attributes, and therefore no need to assign an emission factor to the null power.

I-111. Comment: The ARB proposal includes a "voluntary renewable energy program" (Proposed section 95841.1) that will retire GHG allowances (up to a cap) to reflect the GHG-reducing effect of consumers voluntarily purchasing renewable energy in excess of what is required under California's Renewables Portfolio Standard (RPS) statutes. Properly structured, this provision supports electric distribution utilities, CCAs, energy service providers and other entities that provide electricity supplies that exceed state mandates for renewable content. CCSF supports this proposal, but notes some inconsistencies in the proposal as written. For example, although described in the 15-day notice as promoting the use of voluntary "renewable energy, (i.e. energy that "is not the subject of a mandate") the definitions section of the proposal ((section 95802(a)(280)) defines "Voluntary Renewable Electricity" as renewable energy "which will not be used to meet any other mandatory requirements or voluntary program." CCSF recommends that ARB continue to work with stakeholders, such as end-users and entities acting on their behalf, to ensure that the implementing Regulations work together with existing and proposed RPS regulations and reporting protocols. CCSF looks forward to working further with ARB on this program. (SFMAYOR3)

Response: We acknowledge CCSF's support of the voluntary renewable electricity budget adjustment. We include the requirement that the eligible renewable electricity for which an allowance will be retired is not claimed within any other program to prevent the double-counting of zero-emission electricity, or the double-counting of the "lack of emissions" attributed to this electricity. The regulation contains direct and explicit language that is more precise than the notice, and provides a clear definition.

I-112. (multiple comments)
Comment: LADWP supports voluntary renewable energy (VRE). However, it is unclear whether the amount of allowances set-aside is consistent with forecasts for participation in VRE. LADWP recommends that ARB retain the option for the Executive Officer to transfer unused allowances under extreme circumstances when the supply of compliance instruments is severely depleted. Modify section 95831(b)(6) as follows:

(6) Reserve account for Voluntary Renewable Energy Allowance Electricity Set-Aside Account. A holding account to be known as the Voluntary Renewable' Electricity Reserve Account, which will be closed when it is depleted of the following originally allocated allowances:

(A) Into which the Executive Officer will transfer allowances allocated pursuant to section 95870(c); and

(B) From which the Executive Officer may retire allowances pursuant to section 95841.1.

<u>(C) From which the Executive Officer may transfer allowances to the Auction Holding Account if it is determined 1) the Allowance Containment Reserve has been depleted, and 2) participation by VRE participants is less than the original forecast.</u> (LADWP4)

Comment: The Modified Text provides, for the first time, definitions and explanations regarding that aspect of the Cap and Trade Program that will allow entities to voluntarily retire GHG compliance instruments associated to the production of renewable electricity not used to meet the requirements of any other state programs (see sections 95802(a)(279), 95802(a)(280), and 95802(a)(281)). NCPA strongly encourages CARB to include provisions within this section for annual review of the set-aside amounts. It is a laudable goal for entities to seek out renewable electricity contracts in excess of the statewide mandate, and seek to purchase and retire GHG allowances associated with that renewable electricity. However, those worthy objectives do not come without a cost, one that is likely to be felt by all California electricity customers. That is because as the statewide mandate for renewable electricity increases, so does the demand for such renewable resources. Those that are financially able to acquire the renewable resources will drive up the price, at the expense of the utilities that are constrained by legislation to acquire the resources in a cost-effective manner. Furthermore, even when the number of allowances that are set-aside for retirement of voluntary renewable electricity is small, the action results in fewer allowances being available to entities that need them to meet a mandatory compliance obligation. When considered collectively, the number of allowances that can be set-aside or removed from the market for voluntary retirement has a cumulative impact on all compliance entities. Therefore, NCPA urges staff to revise these provisions to reduce the total number of allowances that are set aside for the VRE program, and to mandate an annual review of the set aside to determine the impact the program is having, if any, on the availability and cost of allowances for compliance entities. Modify sections 95870(c) and 95841.1(f) as follows:

> (c) Recognition of Voluntary Renewable Electricity Emissions Reductions. On December 15, 2012, the Executive Officer shall transfer allowances to the Voluntary Renewable Electricity Reserve Account, as follows:
>
> > ~~(1) 0.5~~ 0.25 percent of the allowances from budget years 2013-~~2014; and~~
> > ~~(2) 0.25 percent of the allowances from budget years 2015-~~2020.

<u>(f) Beginning on January 1, 2014, and annually thereafter, the Executive NCPA Officer Staff shall conduct a review of the this section 95841.1 to determine its impact on the availability and cost of allowances in the auctions during the preceding year, and if it is determined that the provisions of this section have adversely impacted the ability of compliance entities to meet their compliance obligations under the Program, the Executive Officer shall recommend to the Board corrective actions necessary to address the adverse impacts.</u> (NCPA3)

> **Response:** We do not agree. The number of allowances placed into the VRE account is based on the demand for voluntary renewable electricity at the same growth rate for the years 2006 through 2008. We expect supply to meet the demand, and as a consequence it is possibly more likely there will be an insufficient number of allowances to cover all requests for this transitional program.

I-113. (multiple comments)
Comment: CRS is pleased to see the inclusion of a set aside for the voluntary renewable energy market, and commends CARB for allowing voluntary purchasers of renewable energy to continue to reduce GHG emissions. This provision will further stimulate renewable energy growth in California, thus promoting job creation and reducing GHG emissions beyond the level set by the cap. (CRS2)

Comment: We would like to add our support for the Cap and Trade programs provision for voluntary renewable energy markets. Providing an accounting mechanism for voluntary renewable energy within the cap and trade program is critical to the future viability of this market. (NEXTERAENERGY2)

> **Response:** We thank the commenters for their support of the VRE program.

I-114. Comment: Small renewable energy generation, whether hosted by a single residential/commercial entity or a collection of entities, will aid the State's GHG reduction goals. However, the requirements for ≤ 200 kW nameplate capacity described in section 95841.1(b)(3) risk deterring small-scale participation. The minimum allowance application level of 150 $MTCO_2e$ is too high for most residential and small commercial entities to meet alone, and REMA believes the likelihood of aggregation among disparate entities is low. Decreasing the threshold below 150 $MTCO_2e$ (to a to-be-determined limit) should increase residential and small commercial access to allowances. REMA recommends that ARB, in conference with small-scale renewable generation partners, propose a more realistic and attainable $MTCO_2e$ limit. (REMA2)

> **Response:** We agree and removed the requirement to aggregate from section 95841.1(b)(3). We will still allow aggregation, if applicants choose to do so, but it is no longer a requirement.

I-115. Comment: CAPCOA recommends that Voluntary Renewable Electricity Allowances (VREA) should be preferably awarded to those projects which are "additional" and would not have happened under baseline business as usual conditions without the GHG value of the allowance. The VREA pool should be large enough and have sufficient flexibility to stimulate "additional" renewable energy projects. This may need to be more than the 0.5 percent proposed allotment. (CAPCOA2)

> **Response:** We disagree with CAPCOA in that the allowances should be awarded to projects that are "additional" and would not have happened under baseline BAU conditions without the GHG value of the allowances. No value will be transferred by the voluntary renewable electricity budget adjustment. We will retire the allowances based upon applicants providing required information on contributions of eligible generation. As long as a cap is in place and these generators are providing electricity for the voluntary market, then these contributions are helping to meet the cap. In order for this market to continue to make the marketing claim that the electricity "reduces GHGs" the allowances must be retired. We estimated the demand for 2007 through 2009 and are including a sufficient number of allowances to cover the expected demand at current growth rates. Once the program has been fully subscribed, then the voluntary market will need to register in our program as a voluntarily associated entity, and must purchase and retire allowances to continue to make their claim that the voluntary contributions reduce GHGs in California.

I-116. (multiple comments)
Comment: The definition of "Voluntary Renewable Electricity" in section 95802(a)(280) contains a reference to renewable energy certificates (REC) being applied towards mandatory and voluntary programs in California. REMA recommends that ARB clarify the definition by removing the reference to "voluntary programs," as it may create confusion and appear to prevent voluntary renewable energy purchasers from participating in recognition programs and other voluntary programs, such as the U.S. Environmental Protection Agency's (EPA) Green Power Partnership program. (REMA2)

Comment: In section 95802(a)(280), the first clause of the definition for "Voluntary Renewable Electricity" is slightly confusing and refers to RECs as REDs. Also, the use of "voluntary program" in this context creates some confusion. Renewable electricity and RECs purchases are reported by voluntary consumers in voluntary recognition programs, such as the U.S. Environmental Protection Agency's Green Power Partnership. As written, this definition would appear to prohibit this sort of activity. Modify section 95802(a)(207) as follows:

(207) "Voluntary Renewable Electricity" or 'VRE' means electricity ~~produced or REDs associated with~~ or RECs associated with electricity, produced by a voluntary renewable electricity generator, and which ~~will~~ has not and will not be sold or used to meet any other mandatory requirements ~~or voluntary program~~ in California or any other jurisdiction. (3DEGREES2)

> **Response:** We agree with 3DEGREES and corrected the typographical error in the definition for "Voluntary Renewable Electricity." We agree with 3DEGREES that participants should be allowed to participate in other voluntary recognition programs. See the response above to REMA2.
>
> We agree that we do not want to prevent participants from being able to participate in other voluntary recognition programs so long as it is the same entity that holds the right to the claim. It is not our intent to have allowances retired from this program and have the participant also make GHG emission-reduction claims in other programs for the same reductions already claimed in our program. We modified the definition in section 95802, but we point out to the commenter that no other claims may be made for the lack of emissions, and this is ensured by the attestations and retirement reports and tracking system data that must be submitted with the application and are subject to verification by ARB.

Combined Heat and Power (CHP)

Incentives and Inequity Between Sources Above and Below 25,000 $MTCO_2e$/year

I-117. (multiple comments)
Comment: Due to the design of California's Cap and Trade Regulation, the treatment of CHP facilities under the Regulation is not immediately obvious, which has resulted in confusion among owners and operators of facilities trying to interpret how the regulation impacts their operations. The Regulation includes in the list of "covered entities" operators of facilities with a cogeneration process, but allocates allowances based upon industrial sectors and leakage risk, not specifically the facility processes. A CHP facility may provide the thermal and retail electricity at one of these industrial sites, or at a commercial or institutional location that has not been identified as being at risk of leakage. Consequently the economic impact of the regulation, as currently designed, may affect operators of CHP facilities differently, based upon a range of circumstances. As a result of allocating allowances to the industrial sector, and not the load, the regulations may discourage installation of CHP at some locations. Some CCC members are concerned that the complexity of the regulation and the requirement to

participate in auctions will result in costly administrative overhead and uncertainty, particularly for some of the smaller CHP operators who are required to participate.

BE IT FURTHER RESOLVED that the Board directs the Executive Officer to review the treatment of combined heat and power facilities in the cap-and-trade program to ensure that appropriate incentives are being provided for increased use of efficient combined heat and power.

The CCC is concerned that not only does the modified Regulation not, "ensure appropriate incentives," but it in fact penalizes some early adopters of CHP. The treatment of CHP facilities under the regulation is an issue of significant importance as CCC members evaluate the regulatory landscape of California, and consider their options under the CHP Program Settlement Agreement. These options include whether to continue operations in California and seek new contracts for existing facilities, sign contract amendments adopting an energy payment calculation based on perceived exposure to GHG risk, repower existing facilities, and develop new projects. It has been our hope that the new CHP State Program, which is a result of the Settlement, and is structured around the ARB Scoping Plan CHP Emissions Reduction Measure, will encourage investment in upgrading facilities and spur the development of new facilities. Our fear is that the Regulation, as currently designed, does the opposite. (CACC2)

Comment: The AB 32 Cap and Trade program as currently constituted inhibits the development of new CHP. Whether a facility is benchmarked in terms of tonnes of CO_2 emissions/ton of output or tonnes of CO_2 emissions/energy used (MMBtu), the facility's emissions and compliance obligation would increase with the installation of a new CHP plant without a concomitant increase in either production or energy use. However, CHP installation results in more efficient production of the energy consumed by the facility and a net reduction in societal greenhouse gas emissions. IEA respectfully requests that ARB place a high priority on adopting positive incentive measures that can be used to meets the board's stated program goals and promote CHP in the following ways:

- Support for the Self-Generation Incentive Program (SGIP).
- Free allowances to cover carbon emissions from CHP installations.
- Credit mechanisms both for early, ongoing and future actions related to CHP.
- Exemption from a compliance obligation for facilities whose CO_2e emissions would not exceed the 25,000 tonnes/year threshold but for the existence, expansion or new installation of a CHP plant.

We urge CARB to further explore these options and to closely coordinate with the Public Utilities Commission on the potential to set aside allowances for CHP operators for the net greenhouse gas emissions reductions on the California grid resulting in a power production offset by the CHP installation. (INDENVASSOC2)

Comment: A commercial/industrial customer should not be bumped over the Cap and Trade threshold of 25,000 $MTCO_2e$ because of clean onsite CHP. A four to five MW CHP system can trigger the 25,000 $MTCO_2e$ threshold even if there are no other GHG emission sources onsite. As most sites will already have some level of natural gas use, the threshold could be reached with CHP systems much smaller than four MW. CHP, through its greater than 60 percent efficiency and displacement of base-load natural gas generation, reduces total systems emissions, a positive societal benefit. However, the host's direct emissions will increase from power production on-site and, as a result, its carbon cost exposure. The owner of an existing system may choose to shut down its system. We understand the Industrial Environmental Association will provide specific examples of this occurrence. For customers considering new CHP, the cost exposure would be a deterrent to installing such clean, efficient systems because of the cost and complexity of obtaining carbon allowances and the extra scrutiny, monitoring and reporting that will be required. CHP is rightfully recognized as a cost-effective tool to meet GHG reduction goals and one that also contributes to increasing system efficiency, reliability and resiliency. We strongly recommend that CARB further study a "but-for" CHP case where such customers are exempt from Cap and Trade, or are able to receive free allowances. (CACDGC2)

Comment: Section 95811 identifies the entities to which the Regulation applies, and section 95812 describes the inclusion thresholds for covered entities. For the operator of a cogeneration facility, the applicability threshold is 25,000 metric tons or more of CO_2e per data year. For a CHP facility the total emissions can consist of the emissions associated with three separate products:

(i) Wholesale electricity,
(ii) Thermal energy, and
(iii) Retail electricity.

Collectively, if the emissions from all three energy products exceed the 25,000 metric tons, then the CHP facility is included under both the Mandatory Reporting Regulations and the Cap and Trade Regulation. The Regulation also states that at the start of the second compliance period in 2015, the natural gas sector will be covered by the Regulation. This means that those facilities that combust natural gas, but are currently below the applicability threshold, will face costs beginning in 2015 for the associated emissions because suppliers of natural gas will have a compliance obligation in the second compliance period. Consequently, in the first compliance period, except in the case of a facility that is an opt-in covered entity pursuant to section 95813, facilities that use boilers instead of CHP, for which total emissions associated with the facility are less than the 25,000 metric ton threshold, have no compliance obligation. However, a CHP facility where the emissions associated with the thermal energy are less than 25,000 metric tons, does have a compliance obligation in the first compliance period. This unequal treatment highlights the issue CCC and many other CHP advocates raised with the regulatory agencies when development of the Cap and Trade Regulation first began. Even though the installation and operation of efficient CHP results in less overall emissions than compared to the alternative, i.e. a standalone boiler and electricity from the grid, the CHP facility is responsible for more onsite emissions than just the boiler, and consequently will end up with a greater compliance obligation, if the policy rules are not carefully designed. In this situation an early adopter of CHP is actually penalized for using CHP instead of a boiler because the CHP facility bears a compliance obligation in 2013 and 2014, while the site with the boiler does not. In order to ensure equal treatment, the CCC recommends that where onsite CHP results in emissions greater than the applicable threshold as compared to using a boiler to provide steam needs, and the total emissions of the facility, but for CHP would be less than the 25,000 metric tons threshold, the emissions associated with the steam should be exempt from the facility's compliance obligation until the second compliance period when natural gas is included in the Cap and Trade program. An indirect consequence of this exemption for the first compliance period may be the resolution of some portion of legacy steam agreements. ARB staff should review their database of legacy steam agreements applying this proposed threshold exemption, which is approximately 376,923 MMBtu of steam in an 80 percent efficient boiler. Modify section 95812 as follows:

> (c) The requirements apply as follows:
>
> > (1) Operators of Facilities. The applicability threshold for a facility is 25,000 metric tons or more of CO_2e per data year. <u>In the case of a cogeneration facility where the emissions associated with the useful thermal energy are below the threshold of 25,000 metric tons of CO2e per data year, and in the absence of the cogeneration facility there would be no compliance obligation, the emissions attributable to the thermal energy from that facility will not be included in the covered entity's compliance obligation in years2013 and 2014.</u> (CACC2)

> **Response:** We disagree and believe the price signal created by the program incentivizes high-efficiency steam and electricity generation technology such as CHP. We understand the inequity between facilities emitting less than 25,000 $MTCO_2$e and those emitting greater than 25,000 $MTCO_2$e, but this inequity will only exist in the first compliance period: 2013 and 2014. Beginning in 2015, all fuels will be included in the cap-and-trade program, and all facilities will then share a similar price signal.

Existing Contracts

I-118. Comment: The design of the Cap and Trade Regulation is predicated on the assumption that carbon costs will be borne by the end user / consumer through appropriate pricing of the "product" produced by covered entities, but this will not be the case where contractual agreements do not contain a cost recovery provision. The CCC recognizes that there are several types of legacy contracts that do not provide for GHG cost recovery. There may be more, but those brought to our attention include,

1. Power Purchase Agreement (PPA) between generator and utility,
2. Steam (and in some cases retail electricity) agreement, between a CHP facility and thermal host,
3. Tolling agreement between a generator and a utility,
4. Agreement between a generator and a marketer selling power into the electricity market.

Our specific issue concerns CHP projects with agreements in #2 above. In most cases, these agreements run in parallel with the facility's utility PPA, and consequently were signed many years prior to the passage of AB 32. Under the Regulation, the Operators of such CHP facilities face stranded costs in terms of the emissions associated with the thermal, and in some cases retail electricity production of the facility, until the expiration of these agreements. This issue is not limited to CHP in industrial sectors that may be receiving an allocation of free allowances based on product or energy use benchmarks. Legacy contracts also exist in non-leakage exposed sectors, for example, universities and prisons, and the Buyer of the CHP energy is not a covered entity under the Regulation. These and other CHP facilities were developed in the 1980s in response to federal and State energy policies designed to encourage increased installation and operation of CHP. New state regulations should not be structured in such a way as to undermine those existing contracts as this will send the wrong signal to investors considering new development of efficient CHP, and modification to existing facilities. There does not appear to be a universal solution that will resolve this problem. However, this may be a transition issue. When the commercial agreement between Buyer and Seller expires, surely any new agreement will include carbon cost recovery provisions. A significant number of CHP QF PPAs will be expiring in the next five years, which seems to imply the pool of affected projects with this specific legacy contract issue may reduce in size in the near future. The CCC recommends that ARB staff continue to evaluate each legacy contract on a case by case basis and provide some sort of special treatment. This may involve an allocation of free allowances, or perhaps an exemption from the Regulation for a period of time. The reference point for staff in considering solutions should be Resolution 10-42, i.e. the Regulation should include appropriate incentives for increased use of efficient combined heat and power. Leaving these facilities to face stranded costs will be a disincentive to continued operation, particularly at those sites where owners were previously planning to make considerable investment to repower their existing facilities. (CACC2)

> **Response:** We realize that a portion of generators and industrial steam producers have reported that some existing contracts do not include provisions that would allow full pass-through of carbon costs associated with cap-and-trade. We closely examined this issue, but do not believe it is the role of the regulator to negotiate contracts for parties engaged in an agreement, nor will we treat entities differently who do have negotiated contracts. In several cases, we are aware and encouraged by knowledge of parties that are in the process of, or already have, negotiated new contracts to resolve this issue. We believe that bilateral contract negotiations provide the best resolution to this issue.

Inequity of Grid and Direct Access

I-119. (multiple comments)
Comment: Most electricity consumed in the state is distributed through EDUs. A small portion of the state's electricity consumption occurs by ratepayers who obtain their electricity directly from a producer without going through an EDU. This is often an industrial electricity consumer obtaining power from a co-located but independent industrial cogeneration facility. CARB proposes to allocate allowances to EDUs based on the electricity consumption through their respective service franchises and then require these allowances to be auctioned with the proceeds being used for the benefit of their ratepayers. Since no allocations will be made to the "industrial cogeneration/distribution" entities delivering electricity directly to their rate-paying customers, there is an unequal (one-sided) opportunity to offer benefits to the ratepayer which favors the EDU. This will provide an incentive for current (and future) consumers of industrial cogenerated power to switch to grid-delivered power, a result contrary to CARB's policy objective of incentivizing cogeneration power. To prevent this unequal treatment, CARB must either allocate allowances to industrial cogeneration/distribution entities in a manner consistent with the proposed allocation to EDUs under section 95892, or revise the proposed regulations to require that cogeneration power customers receive the same benefits under section 95892(d)(3) as other EDU retail ratepayers. Providing allowance allocations where industrial cogeneration facilities directly deliver power to their customers is consistent with the "Criteria for Receiving Allowances as Part of the Electricity Sector Allocation" described in Appendix A of the 15-Day Modification package. Such industrial cogeneration power suppliers serve end-use customer's electricity load and receive payment for that load representing the same transactional relationship existing between EDUs and retail ratepayers. Allocation of allowances to qualifying industrial cogeneration facilities could be accomplished by classifying such electricity providers as a separate type of "distribution utility" and make allowance allocations to them consistent with the methodology described in Appendix A of the 15-Day Modification package. This includes employing the appropriate factors for the cost burden imposed upon ratepayers (footnote 10 of Appendix A). Allowances allocated in this manner would require comparable treatment to those allocated to EDUs —placement into a Limited Use Holding Account, sold at auction and benefit returned to the cogenerator's retail ratepayers consistent with section 95892(d)(3). Alternatively, the language of section 95892(d)(3) should be revised to clarify the industrial power customers of cogeneration facilities must receive "equal treatment" to EDU's own customers, just as "electricity service providers" and "community choice aggregators" are required to be treated equally to EDU customers. (APC2)

Comment: Free allowances ("Staff Proposal" for Allocating Allowances to the Electric Sector) could compromise CHP if offsetting GHG emissions at the CHP site and at the central power plant are not taken into account. The cost for natural gas directly consumed by CHP end users, including that for onsite CHP will carry a GHG charge (either directly or through the purchase of allowances). This will create a financial penalty for the CHP user relative to the avoided retail electric rate. The Staff Proposal appears to indicate that the financial penalty will be avoided: "Cost burden is expected to result from emissions costs associated with fossil, QF, and non-emitting resources priced at market being passed from generators and marketers to utility customers. …each utility can expect to be able to fully compensate their customers for the costs associated with the cap and trade program that are expected to be passed to customers" (section on Cost Burden). CCDC urges the Board to: recognize the offsets achieved by CHP for the avoided emissions from central station fossil plants; make clear that CHP be granted allowances equivalent to that provided to the utilities for fossil generation on a CO_2 per MWh basis, and transmit these findings to the PUC who we understand have been asked to address this issue in a rulemaking. (CACDGC2)

Comment: ARB should fairly allocate allowances for Combined Heat and Power (CHP) electricity production not distributed through an electrical distribution utility (EDU). ARB proposes to allocate allowances to EDUs based on the electricity consumption through their respective service franchises, and then require these allowances to be auctioned, with the proceeds being used for the benefit of their ratepayers. Since no allocation will be made to the "industrial cogeneration/distribution" entities delivering electricity directly to their rate paying customers, there is an unequal (one-sided) opportunity to offer benefits to the ratepayer which favors the EDU. This will provide an incentive for current (and future) consumers of industrial cogenerated power to switch to grid-delivered power—a result contrary to the Air Resources Board policy objective of incentivizing cogeneration of power. To prevent this unequal treatment, ARB must allocate allowances to industrial cogeneration/distribution entities in a manner consistent with the proposed allocation to EDUs under section 95892. Allocation of allowances to qualifying industrial cogeneration providers could be accomplished by classifying such electricity providers as a separate type of "distribution utility," make allowance allocations to them consistent with the methodology described in Appendix A of the 15-Day Modification package. This includes employing the appropriate factors for the cost burden imposed upon ratepayers (footnote 10 of Appendix A). Allowances allocated in this manner would require comparable treatment to those allocated to EDUs —placement into a Limited Use Holding Account, sold at auction, and benefit returned to their retail ratepayers consistent with section 95892(d)(2). (IGPACC)

Response: We agree that there should be equal treatment for both those that purchase electricity from the grid and those that purchase electricity from a local generator. To clarify, electricity utilities are allocated allowances to cover part of the total cost burden that AB 32 Scoping Plan measures add to the costs ultimately born by ratepayers. These costs include the relatively high costs of the 33 percent renewable portfolio standard, which is a cost that standalone generators are not subject to. Nonetheless, we are seeking equal treatment for those end users that bear the cost of the cap-and-trade program from indirect sources.

Currently, the California Public Utilities Commission (CPUC) proceeding is addressing utility costs and revenue issues associated with greenhouse gas emissions. Once the CPUC proceeding has concluded and we have determined to what degree facilities face the indirect carbon costs from purchased power that we expect will be embedded in utility rates, we will revisit this issue.

Contracts and Inequity of Grid and Direct Access

I-120. (multiple comments)
Comment: Although the AB32 Scoping Plan clearly acknowledged the benefits of efficient combined heat and power, and the ARB, in its December 16, 2010 Resolution 10-42, recommended that "treatment of combined heat and power facilities in the cap-and-trade program" be reviewed "to ensure that appropriate incentives are being provided for increased use of efficient combined heat and power.", there appears to be disparate treatment of CHP facilities with respect to allocation of allowances. We have legacy steam and electricity contracts, with both our industrial host and with the local utility. ARB has commented in workshops and other forums that it expects parties in a bilateral contract to work out the details of cost recovery between themselves. Although we are pursuing this approach with our industrial host, it still remains that the regulation, as crafted, may treat CHP facilities differently based on their ownership and which sectors they are included in. In our particular case, feeding a petroleum refinery, the refinery would be included in the list of industrial processes granted allowances based on being "Energy Intensive Trade-Exposed". If the refinery owned its cogeneration facility the GHG emissions from the cogeneration facility would be included in the total GHG emissions of the refinery. As it is now, the third-party cogeneration facility's GHG emissions are reported separately, and the facility is not allocated any allowances for providing electricity and useful thermal energy to the industrial process. We request that our specific case be evaluated with respect to allocation of allowances as a way of leveling the playing field for third-party owned CHP facilities. One obvious solution is to consider the power and thermal energy from a third-party cogeneration facility under the same sector rules as the end user, in this specific case petroleum refining. Alternatively, a recognized method for allowing pass-through of GHG costs to the final end user of the energy could have the same result. (MCLP)

Comment: The proposed 15-Day modifications fail to treat all obligated entities equally in regards to access to GHG compliance instruments. All independent power producers (IPP) are required to obtain their allowances via an auction. No free allowances are to be allocated, irrespective of the market/trade exposure faced by the individual generator. For a small subset of IPPs operating under existing, long-term contracts, currently no viable mechanisms exist within their contract structures to recover the cost of the GHG allowances they are obligated to obtain under the C&T program. This limited set of IPPs and combined-heat and power facilities ("CHP") operate under long term contracts. In order to avoid discriminatory impacts on the other 2 types of existing contracts without a reasonable means of cost recovery, IEP recommends inserting a new section in the regulation to deal with each of these transactions. IEP proposes the following addition, a new section 95871:

<u>This section applies to (1) electric wholesale CHP Facilities, without a means for GHG cost recovery, under a Long-Term Contract to a thermal host; and, (2) Electric</u>

wholesale generators, without a means for GHG cost recovery, under a Long-Term Contract with a Marketer.

a. CHP Facilities, without a means for GHG cost recovery, operating under a Long-Term Contract with a thermal host facility: In the event there is a Long-Term Contract for the sale of thermal energy which:

(1) does not directly or indirectly provide or refer to GHG costs; (2) was fully executed before the final approval of AB 32 (September 27, 2006); (3) has not been renegotiated as of January 1, 2012 to address GHG costs; and, (4) the CHP Facility has provided an annual attestation, backed by reporting data and a commercially binding agreement between the CHP Facility and the thermal host, that the agreement between the CHP Facility and the thermal host does not contemplate any compliance obligation by the thermal host, then:

i. The thermal host becomes the responsible entity for the GHG compliance costs associated with that contract until either (a) the contract term expires; or (b) the contract is renegotiated.
ii. The CHP Facility is relieved of its GHG compliance obligation associated with the emissions from that contract until (a) the contract term expires; or, (b) the contract is renegotiated between counterparties.

b. Electric wholesale generators, without a means for GHG cost recovery, under Long-Term Contract with a Marketer: In the event there is a Long-Term Contract for the sale of electricity at wholesale which:

(1) does not directly or indirectly provide or refer to GHG costs explicitly or alternatively through a CPUC approved contract or a CPUC authorized pricing basis that includes GHG costs; (2) was fully executed before the final approval of AB 32 (September 27, 2006); (3) has not been renegotiated as of January 1, 2012 to address GHG costs; and, (4) the electric wholesale generator has provided an annual attestation that there is a commercially binding agreement between the electric wholesale generator and the marketer, that does not contemplate any compliance obligation by the marketer, then:

i. The marketer in the transaction shall become the first deliverer, with a compliance obligation to CARB for the GHG allowance costs associated with that particular contract until either (a) the contract term expires; or, (b) the contract is renegotiated.
ii. The electric generator is relieved of its GHG compliance obligation associated with the emissions from that contract, until (a) the contract term expires; or, (b) the contract is renegotiated between counterparties. (IEPA2)

Response: We realize that a portion of generators and industrial steam producers have reported that some existing contracts do not include provisions that would allow full pass-through of carbon costs associated with the cap-and-trade program. We closely examined this issue, but do not believe it is the role of the regulator to negotiate contracts for parties engaged in an agreement, nor will we treat entities differently who do have negotiated contracts. In several cases, we are aware and encouraged by knowledge of parties that are in the process of, or already have, negotiated new contracts to resolve this issue. We believe that bilateral contract negotiations provide the best resolution to this issue.

As a result, in Resolution 11-32 the Board directed the Executive Officer to monitor progress on bilateral negotiations between counterparties with existing contracts that do not have a mechanism for recovery of carbon costs associated with cap-and-trade for industries receiving free allowances pursuant to Section 95891, and to identify and propose a possible solution, if necessary. For fixed-price contracts between independent generators and investor-owned utilities, the Board further directed the Executive Officer to work with the California Public Utilities Commission to encourage resolution between contract counterparties.

Additionally, we agree that there should be equal treatment for both those that purchase electricity from the grid and those that purchase electricity from a local generator. We are seeking equal treatment for those end users that bear the cost of the cap-and-trade program from indirect sources.

Currently, the CPUC proceeding is addressing utility costs and revenue issues associated with greenhouse gas emissions. Once the CPUC proceeding has concluded, and we have determined to what degree facilities face the indirect carbon costs from purchased power that we expect will be embedded in utility rates, we will revisit this issue and seek a more equitable solution.

CHP Heat Rate

I-121. Comment: Appendix B explains that "[i]n the development of the product benchmarks, adjustment factors were used to account for the carbon costs embedded in energy flows as shown in Table A." Presumably, these factors were used to assign CHP emissions to thermal and electric energy products to adjust emissions in or out of the numerator of a facility's emissions intensity. For example, if a facility that has an onsite CHP plant exports power to a utility or third party, the facility's MRR would be adjusted to remove emissions associated with those exports. While CARB may have chosen appropriate values to use for each product, it is not clear how the values were used. One approach is to use a residual method. For example, thermal emissions from a facility could be determined residually by taking the CHP facility's total emissions and subtracting electricity emissions, calculated using the power adjustment factor (0.421 MT/MWh). Alternatively, electricity emissions could be determined residually by taking the facility's total emissions and subtracting thermal emissions, calculated using the heat factor (0.0663 MT/MMBtu). The second approach is to use the two adopted factors together to create a proportional assignment of emissions in a manner similar to the California Climate Action Registry (CCAR) methodology. Under this methodology, electricity emissions are determined as follows:

ETO – (((OTH/.8)/(OTH/.8+ (OE/.42)) * ETO)
Where:

ETO = CHP Facility's Total Emissions
OTH = CHP Thermal Output in MMBtu
OE = CHP Electrical Output in MMBtu

EPUC recommends that CARB employ its adopted factors using the CCAR methodology, which offers the most moderate results among the options. There may be an inclination as a result of the CHP Settlement to use the power adjustment factor (8125 Btu/kWh or 0.431 MT/MWh) in a thermal residual calculation. CARB should avoid this result for three reasons. First, the heat rate employed in the CHP Settlement of 8125 Btu/kWh was intended to reflect an "avoided" heat rate, not an actual CHP heat rate. Second, the 8125 Btu/kWh factor is relevant under the CHP settlement only through mid-2014. Using a factor that is relevant for only 18 months of an 8 year program does not seem balanced. Third, the electric residual method using 8125 Btu/kWh can result in distorted thermal efficiencies. For example, assuming a CHP with a simple cycle heat rate of 11,600 Btu/kWh and a 1.5 heat to power ratio, the residual electric method at 8125 Btu/kWh would allocate only 30 percent of the total emissions to steam. This compares with a thermal allocation of 49 percent under the 80 percent boiler residual method, 41 percent under the traditional CCAR method (using 42 percent efficiency) and 60 percent under the CPUC's output method. For these reasons, EPUC recommends employing the adopted heat and power adjustment factors in the CCAR methodology for purposes of splitting thermal and electric emissions from a CHP facility. (CAC, EPUC2)

> **Response:** We believe allocation to the industrial sector should be designed to create a smooth transition into the program in the near term and to avoid leakage in the long term. Therefore, allocation should be based on expected carbon costs in energy prices rather than any division of emissions for each individual CHP facility between co-produced heat and power. Following this logic, we employ a factor for heat purchased or sold and a factor for power sold selected to represent the carbon costs that will be incorporated into the markets for heat and power. The carbon price embedded in the price of electricity is assumed to be set by a marginal generator with a heat rate of 8,125 Btu/kWh which equates to an emissions factor of 0.431 ton CO_2e/MWh. For the market for heat the reference is assumed to be a natural gas fired boiler which produces steam with an emissions rate of 0.06244 ton CO_2e/MMBtu of steam.

Compliance Obligation of Sales and Inequity of Grid and Direct Access

I-122. Comment: Treatment of Cogeneration and Electricity in Benchmarks - The GHG emissions that are incorporated into the benchmarks for oil and gas and refining and for all sectors should include the emissions for the net power and heat consumed and sold. Some of the power from these facilities is consumed onsite and some is exported. Only the power consumed onsite should be charged against the facility emissions in the benchmark calculation. Furthermore, in order to ensure that there is even treatment of operators with cogeneration facilities compared to net purchasers of electricity and heat, indirect emissions from imported power from the grid and heat from other facilities should also be included in the benchmark calculation. Otherwise, ARB would be creating an incentive for companies to favor purchasing power from the grid and/or outsourcing thermal purchases because it does not count against their benchmark performance. To address these changes in the oil and gas production benchmark, a calculation supporting this approach was provided to ARB as part of the WSPA oil and gas thermal and non-thermal benchmark proposal. To address these concerns in the WSPA refinery benchmark proposal the only change would be to subtract the emissions from the sale of power because the EII takes electricity and cogeneration into account in the calculation of the EII. Under the proposed regulation, it would be appropriate for oil and gas producers to receive, at a minimum, the allowances for indirect electricity use directly (as opposed to the provision of those allowances to the distributors). To address concerns that double counting could occur, ARB could deduct these allowances for imported electricity from the utility sector. (CHEVRON3)

> **Response:** We agree that there should be equal treatment for both those that purchase electricity from the grid and those that purchase electricity from a local generator. We are seeking equal treatment for those end users that bear the cost of the cap-and-trade program from indirect sources.
>
> Currently, the CPUC proceeding is addressing utility costs and revenue issues associated with greenhouse gas emissions. Once the CPUC proceeding has concluded and we have determined to what degree facilities face the indirect carbon costs from purchased power that we expect will be embedded in utility rates, we will revisit this.
>
> Similar to other generation facilities, we recognize that CHP facilities hold a compliance obligation for emissions associated with electricity generation that is exported. We expect that this sale of electricity will allow efficient generators to recover their carbon costs for these sales.

Energy-Intensive Trade-Exposed Industries Benchmarks' Effect on CHP

I-123. (multiple comments)
Comment: Appendix B to the July 25, 2011, Revised Regulation proposes to exclude from the product benchmark calculation indirect emissions associated with "power purchased." The proposal appears to be based on the concern that reflecting indirect emissions would compensate an EITE facility for these emissions through the benchmark. Consequently, if grid power users receive benchmark compensation and utility compensation for indirect emissions, they could receive double recovery for the same emissions costs. CARB's concerns are misplaced. While complications arise from separate treatment of direct and indirect emissions in allowance allocation, these issues do not need to be solved in the benchmark calculation. The primary goal should be first to get an accurate benchmark that reflects all emissions arising from the facility's

production. If necessary, depending on the outcome of the CPUC's allocation process, adjustments can then be made to the benchmark award to prevent double recovery. Moreover, the exclusion of indirect grid power emissions from the benchmark calculation would turn the State's goal of supporting CHP operation and development on its head, incentivizing purchased power over the continued operation and development of CHP. For these reasons, EPUC recommends that all emissions, whether direct or indirect, be included in the calculation of a product benchmark. Once the benchmark is established, CARB can then address the potential for duplicative compensation through the adjustment of benchmark allocations. The aim of the product benchmark should be to determine the emissions intensity of producing a unit of output. The true emissions intensity is a function of both direct, on-site emissions and indirect emissions for energy consumed in production. Exclusion of indirect emissions thus leads to a distortion of a facility's and a sector's emissions intensity. CARB has expressed clear support for the continued operation of existing and development of new CHP generation. The Scoping Plan estimates that reliance on CHP can generate 6.7 $MMTCO_2e$ in emissions reductions. Resolution 10-42 calls for appropriate incentives to increase reliance on CHP. If indirect emissions are excluded from product benchmark calculations, the effect will be to depress the benchmark to a level that fails to reflect the full scope of electricity GHG emissions resulting from a unit of output. Depressing the benchmark in this way will affect grid purchasers and self-generators differently. A grid power purchaser under this scenario could receive full compensation for its electricity emissions even with a depressed benchmark because its benchmark award will be separately supplemented with a utility allowance value allocation. A CHP self-generator, in contrast, can look only to its benchmark award to cover its emissions costs. If the benchmark is artificially depressed by the exclusion of certain electricity emissions, a CHP self-generator is highly unlikely to receive sufficient coverage of its electricity-related emissions. The natural effect will be to drive self-generators and their steam hosts toward a combination of boilers and grid power and away from CHP. Not only will this limit efficiency and reliability, it will put additional strain on the electricity supply and transmission system. For this reason, the product benchmark proposal runs contrary to the Scoping Plan and Resolution 10-42, which seek to encourage retention of existing and addition of new CHP facilities. A variety of solutions could be applied to the problem created for CHP by excluding indirect electricity emissions from the product benchmark. Only one solution, however, would achieve all of CARB's goals: including indirect GHG emissions in the product benchmark calculation. Indirect emissions from grid electricity purchases would be incorporated into the benchmark at the rate of 0.431 MT for each MWh of grid electricity consumed by a customer during the baseline period, ensuring that both imports and exports are accounted for using the same proxy. Under this approach, the benchmark would most accurately reflect the sector's GHG emissions intensity. The benchmark could then be used to determine allowance allocations to all facilities, regardless of their electricity supply sources. The direct/indirect distinction would arise through an adjustment of the allowance award to reflect compensation received by a facility directly from the electric utility for indirect emissions. CARB may be tempted to assume that a correct "price signal" for grid power would also solve this problem. This approach, however, would leave EITE grid power users burdened with the full cost of indirect GHG emissions and would run contrary to

CARB's objectives of avoiding leakage. By definition, EITE entities cannot recoup GHG costs from their product markets due to the significant potential for leakage. Declining to allocate the allowance value out of the desire to ensure a price signal could also run contrary to the goal of mitigating the AB 32 rate impact on utility customers. Finally, it would do nothing to correct the accuracy of the benchmark as a measure of emissions intensity. For these reasons, CARB should make clear that all electricity-related emissions will be included in calculating a product benchmark. (CAC, EPUC2)

Comment: CARB's revised Regulations fail to include indirect emissions associated with the use of electricity used in a manufacturing operation from the calculation of the Product Benchmark. (See Appendix B to the July 25, 2011 revised Regulations.) In addition to CLECA's concerns that such failure will risk causing EITE customers not to have full coverage of their new Cap and Trade costs, this approach unnecessarily and improperly sends a very discouraging signal to customers who might be interested in new CHP in California. CARB's logic is that indirect costs associated with electricity use will somehow be compensated by the utilities using their allowance auction proceeds. As we have discussed, CPUC may have different ideas about the disposition of such proceeds. But, even if the auction proceeds were used to provide rebates or bill reductions to customers in relation to their electric use, this approach fails to acknowledge that some customers currently self-provide or would like to self-provide all or a portion of their electrical requirements through CHP or other renewable technologies. Consider a situation in which an industrial customer, whether EITE or not, is currently a full bundled utility customer but would like to install CHP or a renewable technology to meet 50 percent of its electric requirements two years hence. Assuming that the allowance auction proceeds are actually used to provide bill reductions to the customer based on its utility electric purchases, a decision to install CHP or a renewable technology to meet 50 percent of its requirements would mean a loss of 50 percent of the auction proceeds. This will create a powerful disincentive to the installation of new CHP or renewable power and it will run directly counter to the CARB's own endorsement of the goal of achieving nearly 7 million tons of GHG reductions through the increased use of CHP. While the CARB, in Resolution 10-42, calls for incentives to encourage CHP, its regulations will act to discourage CHP. This can be readily solved by the CARB including indirect emissions in the product output benchmark for each industry. CLECA strongly urges the CARB to make this change. (CLECA)

Comment: The current regulatory scheme will discourage new CHP, not only by excluding indirect emissions in benchmarking, but by failing to address the treatment of allowances when a facility shifts from grid power to self-generation. Assuming the CPUC implements the AB 32 goal of minimizing leakage, an EITE entity purchasing grid power will receive allowance value directly from its distribution utility to offset the GHG compliance costs embedded in electricity rates. If the EITE then decides to invest in additional CHP capacity, it will be responsible for increased direct GHG compliance costs and will lose its share of allowance value from the utility. Not only could it lose the existing allowance value from the utility, it would likely not receive an increase in allowances through benchmarking, since the benchmark award once set will vary only with product output. As a result, the EITE entity's share of allocated allowance value will decrease even though it will face increased direct emission compliance costs. This is antithetical to encouraging new CHP development. To avoid this CHP disincentive, CARB should require electric utilities to continue providing EITE ratepayers a share of allowance value once they leave utility service. This approach makes sense in light of CARB's approach to allocation of allowances to utilities. If the customer's load was a part of the 2008 usage CARB employed to calculate the 97.7 MMT electric utility allocation, it should take a proportional share of that allocation with it as it leaves the utility system. Two other approaches could be used. First, designing a product benchmark that both includes indirect emissions and adjusts for direct compensation of grid users by their utility could mitigate some of the impact. Second, a methodology that provides a CHP adder to the applicable industrial benchmark could provide mitigation. However, without a shift of allowances from the utility sector to the relevant EITE industrial sector, these approaches would result in short-changing the CHP developer and provide an undue windfall to the electricity sector. Modify section 95892(d)(3) as follows:

> <u>(3) Investor owned utilities shall continue to provide an energy-intensive, trade-exposed customer a share of auction proceeds to offset the greenhouse gas compliance costs based on historic usage if the customer leaves the system to be served by combined heat and power.</u> (CAC, EPUC2)
>
> **Response:** We believe that an appropriate carbon price needs to be embedded in all power prices to create the right incentives to encourage CHP at EITE industries. In establishing the appropriate carbon price in rates, the CPUC and the governing boards of POUs may need to account for other greenhouse gas-reducing policies, including the 33 percent renewable portfolio standard and the impact of these programs on electric rates. To the degree that EITEs face unrecoverable indirect carbon costs from purchased power, we could potentially amend the product benchmarks to incorporate additional compensation, if needed to help minimize leakage. This approach might require the electrical distribution utility allowance allocations to be reduced commensurately to maintain the level of the overall cap, as well as to prevent double-compensation for EITE indirect emissions costs and/or ratepayer windfalls. We continue to work with the CPUC, CEC, and publicly owned utilities to address these issues and ensure that proper carbon pricing occurs. We will revisit this issue once the CPUC's proceeding addressing utility costs and revenue issues (R.11-03-012) associated with greenhouse gas emissions concludes.

Definition

I-124. Comment: The revised Regulation modifies the definition of "cogeneration." The revision creates an ambiguity in the definition and fails to ensure alignment with the current California regulatory framework that defines and governs cogeneration.

The revised Regulation defines cogeneration in a manner that requires "onsite generation." The use of the term "onsite," which is not defined in the Regulation, creates an ambiguity. The ambiguity arises from the fact that some facilities use cogeneration thermal or electric energy that is not produced on their site, but delivered "over the fence", on the site of another entity. Public Utilities Code (PUC) section 218 permits "over-the-fence" transactions when electricity is delivered by the generator for: (1) Its own use or the use of its tenants, and (2) The use of or sale to not more than two other corporations or persons solely for use on the real property on which the electricity is generated or on real property immediately adjacent thereto. The use of the term "onsite" in the current cogeneration definition could be interpreted to exclude these over-the-fence transactions that are currently permitted. We request ARB eliminate any ambiguity that could adversely impact the current regulatory framework governing cogeneration. Modify section 95802(a)(47) as follows:

(47) "Cogeneration" means an integrated system that produces electric energy and useful thermal energy for industrial, commercial, or heating and cooling purposes, through the sequential or simultaneous use of the original fuel energy. Cogeneration must involve onsite <u>the </u>generation of electricity and useful thermal energy and some form of waste heat recovery. (EPUC2, CAC)

> **Response**: Electricity and thermal energy produced by "over the fence" cogeneration units that are outside of the facility boundary must be reported by the thermal host or electricity end-user facility as "electricity purchased or acquired." As long as the cogeneration facility and the thermal host/electricity end-user facility draw their facility boundaries correctly, there is no ambiguity. Although we do not think the word "onsite" has the effects that the stakeholder is concerned about, the removal of the word "onsite" from this definition does not have any effects on rule applicability and source categorization. The clarification was made so that an operator of a facility that purchases heat or steam from a separate "over-the-fence" facility is not required to indicate that he has a cogeneration unit at his facility. The operator of the "over-the-fence" unit would report as a separate cogeneration facility.

Miscellaneous

I-125 Comment: Treatment of cogeneration in the Cap and Trade regulation penalizes SMUD ratepayers for operating electrical generation facilities as co-generators of electricity for supply to SMUD's electrical grid while also supplying steam to nearby industrial facilities. The specifics of such arrangements at three of SMUD's major electrical generation facilities clearly have energy, environmental and community use benefits, and there are GHG savings for combined production of electricity and steam relative to their otherwise separate production. However, there is nonetheless a marginal additional natural gas use requirement at those facilities needed to supply steam for industrial use. Information to be provided under Mandatory Reporting Regulation (MRR) section 95112 allows for separating the GHG emissions associated with generation of electricity from those associated with supply of industrial heat.

However, separate reporting of the two functional emissions is no longer required as part of the MRR and the cap and trade program 15-day language imposes on SMUD and our ratepayers an obligation to provide allowances for all the emissions emitted from the power plant stack, including those calculated as belonging to supply of the industrial heat. None of the facilities that SMUD sells steam to will be a Covered Entity under the Cap and Trade Regulation, and existing steam sales contracts do not allow for charges for reimbursement to SMUD for allowances obligated by the emissions fairly attributable to the industrial faculties. Without regulatory relief, SMUD's ratepayers will be forced to bear a significant cost burden and three otherwise environmentally beneficial energy arrangements will be forced to carry an unintended economic burden imposed by regulation; an economic burden that penalizes more efficient use of energy and cleaner overall resources in our community. Unfortunately unless SMUD ratepayers obtain relief either through an increased allocation of allowances or a reduction in the cogenerator allowance obligation, the combined 330MW of existing cogeneration will have another economic reason to revert to production of electricity only. SMUD recommends the ARB allocate a small portion of the industrial allowances to cover emissions associated with provision of steam to these industrial customers. While these arrangements are not common in California, they are no less beneficial than arrangements in which the industrial source owns the generating source and exports electricity to the wholesale market. Given their value is the same, their treatment should be equivalent, so as not to discourage continuation of the arrangements with these facilities or prevent similar future arrangements from being plausible. Considering the efficiency benefits from being able to develop cogeneration using combined cycle technology, ARB should certainly be encouraging this type of arrangement if it wishes to achieve its goals for efficient cogeneration in California. Modify section 95852 as follows:

> (8) An operator of a facility covered under sections 95811(b) and 95812(c)(2) that is a cogeneration facility in normal operation prior to 2011 and which sells process heat, under contracts entered prior to 2011, to facilities that are not covered entities shall have a compliance obligation (CO2e $_{\text{covered}}$) that reduces the total reported facility emissions by an amount attributable to combustion emissions for production of the process heat. Partition of GHG emissions attributable to electricity and process heat production shall be calculated using the efficiency method and verified information reported under MRR section 95112. (SMUD3)

> **Response:** We believe the allocation to SMUD as an electrical distribution utility is already sufficient to cover ratepayer costs associated with the issues raised in the comment. We desire all sellers of heat to attempt to recover carbon costs in the price of the steam sold. This will create an incentive for conservation of steam energy. Facilities with direct emissions less than 25,000 metric tons CO_2e/year, but that face carbon costs from purchase steam, may opt-in to the cap-and-trade program to become eligible for free allocation to help reduce these costs and minimize leakage risk.

I-126. Comment: ARB has proposed a complicated scheme of providing free allowances to utilities to offset increased costs they will bear from electricity generation facilities like cogeneration plants. Unfortunately, this puts a significant and unnecessary administrative burden on electricity generation facilities like cogeneration, who now must determine the allowances they will need, track and participate in auctions, determine what costs can be past on the utility, and assess if this mechanism provided adequate reimbursement for them to keep their operation going. These represent real administrative actions and costs these facilities must bear. Today, nobody performs these actions at these facilities, adding a new layer costs to an industry with low margins. We propose that ARB provide allowances directly to the electricity generating facilities like cogeneration. By doing so, these facilities will know what allowances they will receive; costs will be minimized by removing the entity in the middle (utility) without changing the number of allowances distributed; and facilities will have greater clarity of their needs and costs under the proposed cap and trade regulation. Helping us minimize the costs of this regulation will allow us to continue providing efficient electrical generation to the State of California. This is something that we hope the ARB can seriously consider and engage in further discussion with groups like the California Cogeneration Council and the utilities. (GPI3)

> **Response:** We acknowledge that compliance with the regulation will have administrative costs (acquiring allowances and offsets, reporting requirements, and recordkeeping) in addition to direct compliance costs. Allowances are provided to utilities to compensate ratepayers for the compliance cost burden of the program, and to industrial producers to minimize leakage. We did not modify the regulation to include direct allocation to cogeneration to recover administrative overhead associated with cap-and-trade program compliance.

I-127. Comment: CARB should consider CHP impact from assistance factors reductions in the second compliance period. In the second compliance period, when assistance factors are dropped for some sectors and direct emissions coverage is reduced, CHP GHG emissions for serving on-site load will not be fully covered. If grid power purchases continue to receive coverage, incentives again will be strongly tilted toward grid power. It will be important for CARB to address the issue of CHP disincentives in advance of the second compliance period to prevent impairment of the Scoping Plan's goal of maintaining and expanding the state's CHP fleet. (EPUC2)

> **Response:** We disagree that the assistance factor will create issues for incentives for self-generation vs. grid purchases of power. The commenter is making an assumption about the type of compensation that will be given in electric rates. Currently, a CPUC proceeding is addressing utility costs and revenue issues associated with greenhouse gas emissions. Once the CPUC proceeding has concluded and we have determined to what degree facilities face the indirect carbon costs from utility rates, we will revisit this issue.

Long-Term Contracts

General

I-128. Comment: ARB's proposed definition of "Long-Term Contract" as one entered into before January 1, 2006 with a term of "five years or more" raises a number of serious issues. Under the current Long-Term Procurement Plan approved by the CPUC, SCE is only permitted to procure products for a term of up to five years (excluding renewables and/or combined heat and power (CHP) contracts). This definition would exclude most if not all of SCE's existing and future power agreements with generators that would require allowances in the Cap and Trade program from participating in any beneficial holding relationships. ARB should modify the definition to procure products for a term of one year or more. This period is consistent with that used in SCE's solicitations, but will exclude short-term and spot contracts for the delivery of electricity.
Modify section 95802(a)(150) as follows:

> "Long-Term Contract" means a contract for delivery of electricity entered into before January 1, 2006 for the term of ~~five years or more~~ one year or more. (SCE3)
>
> **Response:** We understand that the CPUC disallows longer-term contracts for SCE. According to the commenter, these contracts will expire January 1, 2011. Therefore, we did not modify section 95802(a)(150) with the proposed changes.

I-129. Comment: For a small subset of IPPs operating under existing, long-term contracts, currently no viable mechanisms exist within their contract structures to recover the cost of the GHG allowances they are obligated to obtain under the C&T program. IEP recommends that the definition for "Long-Term Contract" should be amended to reflect the date AB 32 was chaptered: September 27, 2006. Modify section 95802(a)(150) as follows:

> "Long-Term Contract" means a contract for the delivery of electricity or thermal energy entered into before January 1, September 27, 2006 for the term of five years or more. (IEPA2)
>
> **Response:** The definition for long-term contract was included to address beneficial holding relationships in section 95834. We are not proposing to use this date for any other purpose. We did not modify section 95802(a)(150) with the proposed changes.

I-130. (multiple comments)
Comment: ARB should clarify its definition of a “long-term contract” and its relationship to the beneficial holding section. It is unclear from the draft language whether an electrical distribution utility can only enter into a beneficial holding relationship when SCE has entered into a long-term contract with that entity. SCE requests that ARB clarify that language, which states that an agent in a beneficial holding relationship “may not also serve as the agent” in another without a long-term contract. This can be read to say that an agent may enter into one beneficial holding relationship without a long-term contract, but cannot enter into more than one such relationship. (SCE3)

Comment: There is a second relatively minor issue that Wellhead understands is already understood by CARB. That is the "beneficial holding relationship" provisions should be available to all long term contracts, not just those executed at an earlier time. This is a useful mechanism and there are recently negotiated/executed contracts that would benefit from its administrative simplicity. The change to the Regulations to fix this issue is to simply remove the date limitation in the definition of Long-Term Contract. (WEC2)

Comment: Long-term contracts are not restricted to just to those that existed prior to January 1, 2006. This should be deleted from the definition for clarity. If there is reason to limit the provision for Beneficial Holdings to long-term contracts in place prior to a specific date, then that date should be included in the section of the Regulation where it is applied. In this case, section 95834(2)(A) makes reference to “long-term contracts” as it relates to an electrical distribution utility's beneficial holding relationship with a provider of electricity. Modify section 95802(a)(150) as follows:

> (150) “Long-Term Contract" means a contract for the delivery of electricity entered into ~~before January 1, 2006~~ for the term of five years or more. (LADWP4)
>
> **Response:** The language referencing long-term contracts in section 95834 was removed because the language unintentionally allowed only the utility to declare the existence of the beneficial holding relationship. The modified language requires confirmation by both the principal and agent before the beneficial holding relationship can exist. The definition for “long-term contract” was included to address beneficial holding relationships in section 95834. We are not proposing to use the date included in the regulation for any other purpose.

Long-Term Contracts (Non-CHP)

I-131. (multiple comments)
Comment: Nothing in our long-term power purchase agreement (PPA) provides for the pass through of costs associated with the Cap and Trade Program. Therefore, Goal Line is exposed to unrecoverable costs under the currently proposed regulatory language in the Cap and Trade program. The PPA, which remains in effect through February of 2025 spans all three compliance periods and has specific provisions that

prevent Goal Line from selling any of its electrical output to any entity other than SDG&E. We believe it is likely that Goal Line will need relief on a case-by-case basis from ARB. (GOALLINE)

Comment: The 15-Day modifications fail to address the problem faced by generators with long-term contracts that do not allow for recovery of GHG allowance costs. Staff believes that bilateral contract negotiations would provide the best resolution of this issue. Should contract renegotiation not be possible in all cases, staff will continue discussions with counterparties to consider how this issue should be resolved in the regulation. Calpine is encouraged by staff's intention to continue evaluating how this issue should be resolved in the final Regulation. Calpine is also encouraged by the inclusion of a definition of "long-term contract" in the 15-Day Modifications, which addresses contracts for the sales of steam (section 95802(a)(150). This could provide a starting-point for resolving this issue in the final Regulation. However, Calpine disagrees with the staff's suggestion that this problem can be resolved through bilateral negotiations in all cases. Pursuant to the Board's instructions in Resolution 10-42, staff cannot rely upon the speculative assumption that all contracts will be renegotiated, but must publish proposed 15-day changes that address this issue at the earliest opportunity. Calpine believes that the best way to address this problem is through a direct allocation of emissions allowances to generators subject to long-term contracts that provide no mechanism for recovery of allowance costs. This would provide transitional assistance until such time as the existing contract expires or is substantively amended, as reflected by the specific language we proposed in our December 2010 comments. However, we are open to working with CARB staff on other solutions, such as attestation requirements that would preclude covered entities or opt-in covered entities from receiving any free allocation for industry assistance per section 95891, unless the entity affirms that it does not purchase power or steam from another covered entity (other than an electrical distribution utility) and, where it does, both the industrial facility and its provider of electricity and steam certify that they have appropriately allocated responsibility for any costs attributable to GHGs between themselves. (CALPINE3)

Comment: The proposed Regulation is silent on the treatment of existing, long-term contracts that have no reasonable means of recovery of GHG allowance costs. As a result, all Independent Power Producers (IPP) are required to purchase 100 percent of their allowances or offsets, and presumably recover these costs from their power purchase and sale agreements. The universe of IPPs includes a relatively small but important number of IPPs who entered into power purchase and sale agreements prior to enactment of AB 32, and thus could not contemplate the recovery of these unknown future costs. These facilities are facing new, variable operating costs of compliance for which they have no reasonable means of recovery. In contrast, the utilities and industrial entities that are required to participate in Cap and Trade are provided with the vast bulk of their allowances at no cost even when they have a reasonable means of market-based and/or rate-based recovery. Furthermore, in those circumstances when a Utility Owned Generator (UOG) enters into an auction to purchase allowances to meet its compliance obligation, the expenditures it makes as an electric generator revert back on a dollar-for-dollar basis to the same utility in its function as a load-serving entity. The result is that a utility and the utilities' retail customers are indifferent to the costs associated with an UOG's operations. Unfortunately, this is not the case for the IPPs that will be competing with the UOG, as they cannot rate-base their allowance or offset purchases in such circumstances and cannot recover their costs from the market place. We recommend that all electric generators be given a comparable means of cost recovery of their compliance obligation. The Regulations should allow IPPs to make use of an expanded Beneficiary Holding Account or the Cap and Trade program should allocate allowances directly to this limited set of IPPs in a non-discriminatory manner, comparable to the treatment afforded utility-owned generation plants. (WM3)

Comment: Wellhead remains very concerned that the proposed cap-and-trade regulations are unfair to, and create problems for, power sales contracts entered into before AB 32 was signed into law when such contracts do not have any mechanism available for recovery of GHG costs (hereinafter "Pre-AB 32 Contracts"). The failure to address this matter creates multiple problems, and not just for the generator. Foremost, without addressing this issue, the allocation of allowances to utilities is fundamentally flawed because it gives allowances based on costs that will not be incurred by the utility. Second, not only will the generator be without any ability to recover its costs, but behaviors in contradiction of the state's GHG emission reduction goals are rewarded because the buyer will be economically benefit by running the facility more because it does not incur the GHG costs. Hence, CARB's policy intentions for GHG costs to be directly considered in the economic dispatch of generating resources and for ratepayers to see the carbon price signal of generation purchased by a utility will be undermined. It is therefore disappointing that the proposed regulations do not address the issue, based apparently on the hope by CARB, as indicated in the staff summary, that Pre-AB 32 Contracts will be renegotiated.

While bilateral negotiations could possibly solve the problems in some instances, relying on renegotiation does not make good public policy as a primary strategy, particularly without clear guidance and a backstop alternative, as we propose below. Under the proposed regulation, Pre-AB 32 Contracts will be the only fossil fueled power purchase options for which the distribution utility does not incur carbon costs, and in the case of tolling agreements where a utility can call on or effectively run the generator without incurring such cost the utility will have an incentive not to renegotiate the Pre-AB 32 Contract. Moreover, the result of this built-in utility incentive to run such a generator more than would be the case if it did confront appropriate carbon costs will be increased GHG production, is contrary to AB 32's primary policy objective. Thus, relying on parties to renegotiate contracts is unlikely to resolve the Pre-AB 32 Contract concern in addition to being cumbersome and expensive from a transactional perspective. Even if CARB had authority to mandate renegotiation, which we doubt, such an approach would still require CARB to revisit its decision allocating allowances to the electric utilities and/or use allowances allocated to its set-aside at some future date if renegotiations are unsuccessful. CARB should act decisively to avoid the uncertainty, controversy and delay that will result by failing to address the issue at the outset. Most importantly, not addressing the issue is clearly inconsistent with the allocation of free allowances to distribution utilities. In the allocation methodology, CARB explicitly notes that there will be a cost burden resulting from GHG compliance costs associated with fossil generation being passed from suppliers (whether purchased under contract or produced from utility owned generation) to utility customers. Allowances CARB provides to a distribution utility are intended to result in full compensation for GHG compliance costs that are expected to be passed through to consumers. The determination of how many free allowances a utility receives assumes all of its fossil based generation has a GHG cost. Pre-AB 32 Contracts were included in the utilities' S-2 Filings, which are the basis for estimating the utilities' costs associated with the Cap and Trade program. However, Pre-AB 32 Contracts will be a source of fossil fueled power for which the utility does not incur GHG compliance costs under the proposed regulations. Hence, unless the regulations require the utility to provide Pre-AB 32 Contract suppliers with allowances associated with the power they take under the Pre-AB 32 Contracts (which would be the most logical, best and simplest solution), the Regulations will freely allocate allowances to distribution utilities for GHG costs that will not be incurred by them. (WEC2)

Comment: Forward term contracts at fixed prices should receive free allowances. Section 95811 requires generators and importers of electricity into California to account for the CO_2 emissions associated with their power production and imports. Shell understands the need to include emissions from the power sector under the Cap and Trade program. However, for generators located within, or connected to the California Grid that entered forward term contracts at fixed prices, this requirement will create an economic loss that was not accounted for at the time the transaction was executed. To address these losses, staff has included a recommendation in the “Notice of Public Availability of Modified Text and Availability of Additional Documents" that bilateral contract negotiations would provide the best resolution. Shell respectfully disagrees and requests that CARB reconsider this recommendation. The number of free allowances associated with the outstanding contracts that could and should be distributed to the contract holders is minimal. However, the economic impacts are significant. Directing bilateral parties to renegotiate when there is no incentive for the advantaged party to so do virtually guarantees the disadvantaged party will be penalized. Shell urges ARB to provide free allowances to those entities that entered fixed price long-term contracts and have no ability to recover the cost of carbon. (SHELLOIL)

Comment: The issue of stranded cost recovery has come up repeatedly throughout the development of the regulation. The inability of a facility to recover an added cost due to a pre-existing contract presents some unfair market conditions for certain electricity generating facilities. NextEra supports the comments submitted by IEP and WPTF on this topic. Although the obvious fix to this issue lays in the renegotiation of contracts and power purchase agreements, this may not be an option for some parties involved. In order to address this issue fairly, ARB must incent both parties to renegotiate the contracts. NextEra urges ARB staff provide some assurance that this issue will be addressed in this rule. (NEXTERAENERGY2)

Comment: Panoche, like a number of other California independent power producers with long-term power purchase agreements—long-term contract generators (LTCG)—entered into power purchase agreements with utilities before AB 32 was enacted or the regulation of GHGs was under consideration by the State of California. Under many of these contracts, the power generation rates and price structures are specified and fixed. Additionally, the contract terms do not allow for price modifications arising from changes in environmental regulatory policy. Accordingly, unlike with other sources, such as merchant generators or traditional public utilities, Panoche cannot reduce contractually required output nor pass through new environmental compliance costs resulting from the implementation of AB 32. We understand, as expressed in the Initial Notice of Availability, the July 15 stakeholder meeting, and the Notice of Public Availability of Modified Text, that CARB staff would prefer that LTCGs and their customers work together to resolve this issue. Knowing of this preference, we have reached out to PG&E in an effort to address the matter. Unfortunately, we have not been able to obtain a satisfactory resolution. Without relief, the new costs associated with AB 32 compliance will have a substantial negative impact on the financial viability of our facility as well as a limited number of other LTCGs. These facilities should not be penalized for contracts entered into at a time when the regulation of GHGs was not contemplated. Rather, we urge the Board to provide a suitable framework for resolving this issue so as avoid impairing the financial viability of pre-existing contracts. We would suggest the Board consider granting allowances to LTCGs with pre-AB 32 power purchase agreements under limited circumstances, including allowances being granted only during the remaining term of a pre-AB 32 contract. In addition, the Board could require in the regulation that it be demonstrated to the satisfaction of the CARB Executive Officer that a LTCG cannot reasonably expect to recover the costs of allowances needed to meet its cap-and-trade compliance obligations under its pre-AB 32 contract. To encourage negotiations between affected LTCGs and utilities, the Board should also consider providing that the parties engage in good-faith, bilateral negotiations to resolve the issue of cost of compliance during 2012, before compliance obligations commence on January 1, 2013. If the parties have not come to a mutually-agreeable resolution at that time, the regulation should provide that LTCGs are granted allowances under the outlined terms. Precedence for this type of solution can be found under the Clean Air Act, particularly in the Acid Rain Program and in some of the RGGI program states. (PEC)

Comment: An allowance set-aside should be added to section 95870 to provide for direct allocation of allowances to independent generators with the inability to renegotiate long-term contracts without provisions for carbon pass through. (WPTF2)

Comment: ARB should consider, on a case-by-case basis, the need for adjustment to allowance allocations to firms operating under long-term contracts. ARB previously recognized that there may be a need to accommodate parties in the electric power generation industry subject to long-term contracts, noting in Appendix J to the proposed Cap and Trade Rule that it would further “evaluate…whether some specific contracts may require special treatment” [App. J, p. J-16, note 15 (Oct. 28, 2010 draft)]. ARB should provide similar case-by-case adjustments for hydrogen producers. Both the

Waxman-Markey and Kerry-Boxer federal bills allocated allowances to parties who would be unable to pass on compliance costs under long-term supply contracts. ARB should protect parties to long-term contracts by extending the 100 percent allocation provided for the first compliance period until the end of the contract term. (IGPACC)

Comment: Our predominant concern focuses on the lack of assistance for generators with long-term contracts that do not provide for full pass-through of carbon costs. CARB staff has suggested that bilateral contract negotiations would be the preferred method to handle this issue. However, for contracts with a non-IOU as the purchaser of power for the contract there is no pressure on the purchaser to renegotiate, particularly if the purchaser has an advantage over the market pricing. Therefore, we believe that CARB needs to directly address in the regulation how to assist the independent power producers that cannot pass through carbon costs in existing contracts. Other sectors, including utilities and industrial entities, are provided a direct allocation of allowances. Independent power producers should have at least equal treatment. Other solutions that redirect the obligation for carbon cost to the purchaser of power in these contracts could also accomplish the goal. Regardless of the final methodology, it is essential that CARB address the existence of these contracts and the financial burden they place on the power producers involved in them. Without equal treatment for the independent power producers, it would appear as if the implementation of AB 32 discriminates against a limited subset of generators. (BANKS)

Comment: Section 95890 should be modified to include requirements for direct allocation of allowances to independent generators with the inability to renegotiate long-term contracts without provisions for pass-through of carbon costs. The allocation should be limited to emissions incurred under the terms of the contract, and should be moved directly to the generator’s compliance account. (WPTF2)

> **Response:** Contracts that were entered into between generators and purchasers of electricity and/or steam, or between first deliverers and generators, were entered into under various negotiations regarding, among other items, environmental costs, or costs for fuel. Negotiated agreements between the parties reflect risks taken and borne by each party. For this reason, we believe that it is not our position or responsibility to make all parties whole within the regulation for contracts that are based on a fixed price and do not include a cost pass-through provision. However, we do not want to set up a scenario where parties that will receive allowances through direct allocation could realize windfall profits. We encourage parties to continue to either renegotiate their contracts, and/or generators to continue to evaluate opportunities to reduce GHG emissions by using alternative fuel options, or changes in operations. In addition, we continue to work closely with the CPUC to address the contracts that are within their purview, either under the Long Term Planning or the GHG Cost Revenue proceedings. We continue to urge stakeholders with the types of contracts described in the comment by Panoche involving an investor-owned utility to become a party to the CPUC proceedings.

To this end, in Resolution 11-32 the Board directed the Executive Officer to monitor progress on bilateral negotiations between counterparties with existing contracts that do not have a mechanism for recovery of carbon costs associated with cap-and-trade for industries receiving free allowances pursuant to Section 95891, and to identify and propose a possible solution, if necessary. For fixed-price contracts between independent generators and investor-owned utilities, the Board further directed the Executive Officer to work with the CPUC to encourage resolution between contract counterparties.

I-132. Comment: CARB's proposed GHG regulations and policies conflict with previously implemented policies favoring plants like ACE and the Rio Bravo Plants. The new cap-and-trade regulations, being developed in furtherance of present-day environmental goals, should not be structured so as to undermine those existing contracts encouraged by prior state policy and environmental goals, because doing so will increase the already high level of uncertainty in the California energy markets and reduce incentives for new investment precisely at the time it is needed most. (ACERIO)

Response: The ACE and Rio Bravo plants, as the commenter indicates, are plants that are considered Qualified Facilities (QFs). These plants combust fuels that result in GHG emissions that exceed acceptable rates agreed upon through the CHP settlement. At one time, these plants were considered alternative fuels, and were constructed in response to energy policies applicable approximately twenty years ago. AB 32 implements a goal for a reduction in emissions by the year 2020. The settlement acts as an additional incentive for these plants to make modifications to meet future GHG emission-reduction goals.

I-133. Comment: Transitional assistance to cogeneration facilities for conversion to low carbon intensity fuel technologies is beneficial to the State's economy. CARB should develop a transitional mechanism for high-carbon solid fueled facilities so that they can undertake the substantial investments necessary to change fuel types. Such a mechanism is entirely consistent with programmatic goals of CARB's AB 32 implementation given that the state's overarching policy is to achieve overall carbon emissions reductions by 2020 with minimal economic dislocations. (ACERIO)

Response: We do not agree that the regulation should include a transitional mechanism for these high-emitting fuels. We worked closely with stakeholders to discuss potential resolutions to the situation where generators are using high-emitting fuels. There are opportunities for other programs to assist these generators with plant modifications. For example, some stakeholders have indicated they will switch to fuels that will result in electricity that is eligible for Renewable Energy Credits. This decision reduces their compliance obligation in the cap-and-trade program and provides for an additional funding source to support fuel-switching.

I-134. Comment: The current draft Regulations do not provide any resolution to those entities with existing power sales contracts that do not allow recovery of GHG costs.

CARB has stated that it would address this issue and suggested it would provide special treatment to facilities unable to contractually pass through these costs. Despite these reassurances, the current Regulations provide no recourse for facilities in these existing contracts. Instead, at the July 15, 2011 workshop, CARB staff recommended that affected parties renegotiate the terms to these agreements. The absence of direction in the Regulation fails to recognize that, without express guidance, entities lack the bargaining power to bring contractual counter-parties to the negotiating table. As one party noted at the July 15, 2011 workshop, until CARB demands a change to these contracts, even the investor-owned utilities believe they lack the authority needed to discuss new terms. While CARB may prefer that contracting parties renegotiate and resolve these issues without administrative intervention, a statement of intent—at a minimum—may help parties who otherwise will be left to bear the full compliance costs of AB 32 regulations with no recourse but to terminate their contract. To assist those facilities with existing contracts not allowing pass-through of GHG compliance costs, the following intent language should be included in CARB's board resolution:

> <u>WHEREAS there are parties with existing contracts which do not allow pass-through of GHG compliance costs, and the implementation of the cap-and-trade program may impose additional costs on parties beyond those that would have been imposed prior to implementation of AB 32;</u>
>
> <u>BE IT FURTHER RESOLVED that the Board intends for parties in existing contracts that do not allow pass-through of GHG compliance costs to renegotiate the terms of these contracts to ensure cost pass-through</u>. (EPUC2)
>
> **Response:** We acknowledge EPUC2's request to include language into the resolution and agree that renegotiation may be the appropriate resolution in most cases. We acknowledged the intent of the commenter's language in the first 15-day changes to the regulation.
>
> In response to this and similar concerns raised by other commenters, in Resolution 11-32 the Board directed the Executive Officer to monitor progress on bilateral negotiations between counterparties with existing contracts that do not have a mechanism for recovery of carbon costs associated with cap-and-trade for industries receiving free allowances pursuant to Section 95891, and to identify and propose a possible solution, if necessary. For fixed-price contracts between independent generators and investor-owned utilities, the Board further directed the Executive Officer to work with the CPUC to encourage resolution between contract counterparties.

Water

I-135. Comment: What is the basis for an allocation of allowances to the Western Area Power Administration? What are the potential benefits and dis-benefits to consumers and program integrity referenced in Appendix A as justification for not allocating allowances to DWR, and on what basis did CARB make these findings? (DWR2)

Response: The regulation does not contain a provision to allocate allowances to WAPA. For the program to work as designed, the cost of carbon must be passed on to the consumer. Sectors that have been identified for allowance allocation have a direct relationship to the consumer that will bear the cost.

I-136. Comment: Why does Appendix A conclude that DWR does not maintain a direct relationship with the end-use consumer, when DWR is the end-use consumer of electricity used by the SWP? (DWR2)

Response: We believe that it is important to capture the emissions associated with water distribution. There are opportunities for reductions in the emissions associated with this activity, and the emissions are not insignificant. The role of water distribution entities (DWR and MWD) in the economic value chain between producers of electricity and end-use consumers of water services is most closely associated with electricity marketers, and their treatment under the regulation is consistent. We believe that it would be inappropriate to provide direct allocations to water distribution utilities for the benefit of end-use customers, because they do not have a direct relationship that would facilitate the return of value in a way that would maintain the marginal incentive of end-use customers to reduce emissions. Further, the emissions associated with water distribution are included in the share of value returned to end-use customers through the electric distribution utilities. We performed an analysis of the distortion created by returning value through electric distribution utilities as opposed to water distribution utilities, and we found the effect to be insignificant.

Nevertheless, in Resolution 11-32 the Board directed the Executive Officer to continue discussions with stakeholders to identify and propose, as necessary, during the initial implementation of the cap-and-trade program, potential amendments to the Regulation regarding the distribution of allowance value associated with cap-and-trade compliance costs from using electricity to supply water, and the expected ability of allowance allocation and other measures to adequately address the incidence of these costs equitably across regions of the State.

I-137. Comment: What is the basis for CARB's conclusion, in Appendix A, that DWR is not well positioned to provide water users with direct compensation?
What standard did CARB use to make the determination that "it is not appropriate to include" DWR in the allocation to the electricity sector (Appendix A)?
Why does CARB state that if DWR used the allowance value, a deterioration of the emissions price signal would result? What is the factual basis for this determination?
Why does CARB state that if DWR received allowances, it would result in lost value for water users?

How does CARB calculate and measure the projected "lost value" to water users if DWR were allocated allowances attributable to the SWP pump-load?
Why did CARB reject DWR's proposal for using allowance value for purposes in furtherance of AB 32 goals (such as renewable energy, energy efficiency and water use efficiency), similar to the electricity distributors' programs currently under development at the California Public Utilities Commission?
What is the basis for the conclusion that the allocation of allowances, attributable to DWR's electricity use, to the IOU's and POU's will result in cost relief to users of the water that DWR delivers?
Why are all electricity-sector emissions allowances, including those attributable to DWR's power use in support of State Water Project, allocated only to investor-owned utilities (IOU) and publicly owned utilities (POU)? (DWR2)

> **Response:** We answered these questions, in the responses to Comments G-115, H-7, I-8, I-41, I-135, and I-136 above and in K-8 and K-9 below.

I-138. Comment: What is the reason CARB did not implement the allowance set-aside for water suppliers as envisioned in the Scoping Plan? (DWR2)

> **Response:** We responded to this comment above, in our responses to Comments I-135 and I-136.

I-139. Comment: If ARB does not exempt Metropolitan from the Cap and Trade Program, then ARB should develop a compliance strategy or memorandum of understanding for Metropolitan as a consumer of wholesale electricity that integrates the imported energy issue into a comprehensive water sector program that includes measures identified in the AB 32 Scoping Plan, such as energy efficiency and renewable energy projects; and defer Metropolitan/water sector measures until 2014 or 2015, after the Cap and Trade Program is implemented. (MWDSC3)

> **Response:** We believe that a comprehensive water-sector program described by the commenter is necessary to meet the 2020 GHG emission reduction target, and to meet other statewide energy/water-related efficiency goals.
> We disagree that Metropolitan's commitment to implement programs suggested in their comment would be a substitute for Metropolitan's inclusion in the first compliance period. We fully expect the water utilities to include these programs in their long-term planning to meet the emission reduction targets, and to meet other statewide energy/water-related efficiency goals.
>
> Nevertheless, in Resolution 11-32 the Board directed the Executive Officer to continue discussions with stakeholders to identify and propose, as necessary, during the initial implementation of the cap-and-trade program, potential amendments to the regulation regarding the distribution of allowance value associated with cap-and-trade compliance costs from using electricity to supply water, and the expected ability of allowance allocation and other measures to

adequately address the incidence of these costs equitably across regions of the State.

I-140. Comment: Metropolitan is a public water supply agency providing a critical public service and is not an electric utility. Metropolitan does not provide electrical service to any load other than its CRA pumping plants. Metropolitan is unique in all of these aspects, and is not comparable to utilities in the electric sector. We strongly believe that Metropolitan should not be included in a Cap and Trade Program that is designed and structured for the electric and industrial sectors. For these reasons, Metropolitan should be exempted from the Cap and Trade Program and its associated compliance obligations, and removed from the category of marketer under the MRR (section 95102(a)(229)) and in the Cap and Trade Regulation (section 95802(a)(153)). Under these definitions, a marketer is defined as "a purchasing/selling entity that takes title to wholesale electricity and is not a retail provider." (MWDSC3)

Response: We do not agree that Metropolitan should be exempt from the program. We responded to this issue in the responses above to Comments I-135 and I-136.

I-141. Comment: The Cap and Trade regulatory scheme is not viable or feasible for a public water supply agency, such as Metropolitan because it is not a marketer of electricity, does not purchase power for resale or for a profit, will receive no cost mitigation for its member agencies (ratepayers), should not be compelled to participate in the carbon market against for-profit market participants as a public agency, the compliance obligation to acquire and surrender allowances will result in highly volatile costs to Metropolitan, Metropolitan's emissions from its imported electricity are already below its 1990 levels, and Metropolitan's role is as a consumer of electricity because of the variability of Metropolitan's energy imports for the CRA and the anticipated increase in the auction price of allowances. (MWDSC3)

Response: We believe Metropolitan is best suited to pass the cost along to member agencies in the same way that Metropolitan is currently passing along the cost for imported electricity.

I-142. Comment: If ARB does not make changes to exclude Metropolitan from the Cap and Trade Program, or defer its compliance until comprehensive water sector specific measures are adopted, the only equitable alternative is to allocate free allowances to Metropolitan as a wholesale utility. Wholesale utilities are essential public services, and like retail electric utilities, they serve a critical public purpose. We believe that it is inappropriate for ARB to deny publicly-owned providers of a critical public resource the same price relief for their customers that the electric sector will enjoy. (MWDSC3)

Response: We do not agree Metropolitan should receive a free allocation of allowances. We responded to this comment above in our responses to Comments I-135 and I-136.

I-143. Comment: The proposed staff approach would treat Metropolitan as a water wholesaler with regards to duties imposed on the water sector, as an electric retailer with regards to Cap and Trade requirements and deny the assistance afforded to electric retailers through free allowances. In our view, this is an inequitable approach. Appendix A (revised July 27, 2011) to the Cap and Trade Regulation provides a paragraph that enumerates ARB's rationale for deciding not to provide free allowances to Metropolitan. Metropolitan disagrees with ARB's decision and the reasoning behind the decision, and considers the way that the decision was communicated to us, i.e. via an Appendix to the Cap and Trade Regulation as inappropriate. We urge the ARB to recognize that a "one size fits all approach" may not work for both Metropolitan and DWR. (MWDSC3)

> **Response:** We responded to this comment in our responses above to Comments I-135, I-136, and I-137.

I-144. Comment: ARB should include water wholesaler in the list of source categories in the Cap and Trade Regulation entitled Emissions without a Compliance Obligation. Modify section 95852.2(b) as follows:

> <u>(18) Importer/Non-Marketer (NM) that purchases electricity generated outside the state of California solely to serve its own load. Importers/NMs that are wholesale water agencies will develop an alternative compliance strategy outside of the Cap and Trade compliance obligation. ARB will work with the wholesale water agencies to develop and implement this plan in 2014-2015.</u> (MWDSC3)

> **Response:** We do not agree that water wholesalers should be included in the list of source categories in section 95852.2(b). We believe it is important to include the emissions associated with all electricity in the program. We responded to this comment in the response above to Comment I-136.

I-145. Comment: The Regulation as currently proposed by ARB staff is inequitable to SWP water consumers, and fails to meet ARB's goals of mitigating rate shock to the end-user. It also raises concern over the SWP consumers' particular exposure to the risk of market failure. Equity can be achieved, along with ARB's goals for the Regulation, by allocating free emissions allowances to the SWC contractors in proportion to their energy charges from the SWP. Modify section 95890 as follows:

> <u>(c) All provisions of this Article applicable to a publicly-owned Electric Distribution Utility shall be applicable to the Contractors of the State Water Project pumping load reported under article 2, section 95111(e), title 17, Greenhouse Gas Emissions Data Report. Where these Contractors are not Water Distribution Utilities, the Allocation provided to the individual Contractor shall be held in trust for its member water distribution utilities.</u> (SWC3)

Response: We do not agree with the comment requesting allowance allocation to the State Water Contract contractors in proportion to their energy charges. It is important that the cost be passed along to the end-user, in order to realize the program's goals.

Nevertheless, in Resolution 11-32 the Board directed the Executive Officer to continue discussions with stakeholders to identify and propose, as necessary, during the initial implementation of the cap-and-trade program, potential amendments to the regulation regarding the distribution of allowance value associated with cap-and-trade compliance costs from using electricity to supply water, and the expected ability of allowance allocation and other measures to adequately address the incidence of these costs equitably across regions of the State.

I-146. Comment: As defined in the proposed regulation, DWR is a First deliverer of electricity because it is expressly deemed an Electricity importer. DWR has complied with the Mandatory Reporting Regulation and has reported in prior years to the same extent as a retail electricity provider. The associated emissions from DWR's imported electricity from specified sources exceed the threshold of 25,000 metric tons CO_2 per year. DWR also purchases power on the CAISO market and its operating costs will be impacted by the carbon cost associated with those purchases. Question has been raised as to whether CARB has jurisdiction over DWR as a state agency, but this comment letter does not take a position on that issue. DWR is considered a Covered Entity by virtue of its activities in the electricity sector. Because of its integration in the electric market, if CARB has the appropriate authority, then it is difficult to see how DWR could be excluded from regulations covering the electric sector. (SWC3)

Response: We agree with the assumption that we have jurisdiction and have appropriate authority to implement this regulation and include DWR.

Miscellaneous

I-147. Comment: Before launching the Cap and Trade market, ARB must analyze the effect of import and export emissions rates on regional electricity markets. ARB should not go forward without a detailed analysis of the possible market changing effects of such default emissions factors. Because emissions factors do not exist today, may vary by location, and may vary depending on whether the delivery is an import or export, the power market's responses to these new economic signals could cause significant changes in power flows and market conditions throughout the Western Electricity Coordinating Council (WECC). In addition, transmission congestion, locational market prices, and the economics of existing or potentially new transmission will be affected. SCE recommends that ARB work with an experienced consultant to model the impacts of its default emissions factors on the power system and Western power markets before finalizing the Cap and Trade market design. (SCE3)

Response: The default emission factor is set pursuant to the MRR. We will continue to work closely with the CEC, CPUC, CAISO, and stakeholders to evaluate the default emission factor to see if it closely approximates the emission rate of the generator that is on the margin. We will monitor changes to reported information pursuant to the MRR and will analyze whether changes are warranted in the future.

I-148. Comment: ARB should clarify how the Cap and Trade Rule's resource shuffling prohibition applies to "Asset-Controlling Suppliers." The term "Asset-Controlling Supplier" is defined in section 95802(a)(13) of the Cap and Trade Rule, and is used in a handful of provisions in the rule. It is not clear how the proposed new prohibition on resource shuffling would apply to asset-controlling suppliers, especially if any of the provisions in section 95111(g)(4) of the MRR are, as discussed above in section I.A.2, intended to function as exemptions to the prohibition on resource shuffling. While electricity procured from an asset-controlling supplier expressly qualifies as a "specified source," see section 95802(a)(258), it is not clear how the concepts of "electricity historically consumed in California" and the "80 percent of net generation" requirement that now are proposed in section 95111(g)(4)(A) of the MRR would apply to asset-controlling suppliers. To prevent resource shuffling by or through asset-controlling suppliers, Powerex encourages ARB to clarify the rule to make it clear that the prohibition applies equally to asset-controlling suppliers and any other electricity generating facility or importer. Additional clarity also should be provided in section 95111(g)(4)(A) of the MRR by making the requirements apply to individual facilities and systems of facilities owned or operated by asset-controlling suppliers. (POWEREX)

Response: Asset-controlling suppliers deliver electricity from sources that have been committed to serve California load. The regulation applies to asset-controlling suppliers in the same way that it applies to other first deliverers of specified sources. Asset-controlling suppliers will need to sign annual attestations and are subject to the same reporting and verification requirements pursuant to the MRR as other covered entities.

I-149. Comment: Rather than requiring electrical distribution utilities to "comply with the requirements of MRR" and obtain a positive verification before being allocated allowances, CARB should utilize the enforcement provisions set forth in the Regulation and in the Mandatory Reporting Regulation to address compliance with reporting requirements, and not restrict the eligibility of the electrical distribution utilities to be allocated allowances to be used for their ratepayers' benefit. A utility should be eligible to receive allocated allowances if it is identified in Table 9-3. The Joint Utilities recommend that the eligibility requirements for an annual allocation of allowances to electrical distribution utilities in section 95890(b) be stricken. Modify section 95890(b) as follows:

~~(b) Eligibility Requirements for Electrical Distribution Utilities. An electrical distribution utility shall be eligible for direct allocation of California GHG allowances if it has complied with the requirements of MRR and has obtained a~~

~~positive or qualified positive emissions data verification statement for the prior year pursuant to MRR~~. (JOINTUTILITIES)

Response: We do not agree with the JOINTUTILITIES. We need to be assured that the covered entity that is eligible to receive free allowance and is obligated to report under the MRR has reported accurately, the report was verified, and they have followed the requirements set forth in the MRR, which apply to all covered entities.

I-150. Comment: The proposed regulation currently requires all IOUs (including any MJRPs) to place all of their allowances directly into the auction. In contrast, POUs would be able to directly use their allowances to meet their own compliance obligation and place the remainder into the auction. For the purposes of these Regulations, MJRPs are more akin to POUs insofar as a MJRP is a vertically-integrated entity operating its own Balancing Authority Area. Furthermore, the MJRP is subject to regulatory jurisdiction by entities other than the California Public Utility Commission (CPUC), and are therefore subject to a different set of resource planning requirements than are the other California IOUs. Accordingly, to accommodate these structural distinctions and avoid direct conflict with its regulatory mandates under other jurisdictions, the MJRP should be given the same compliance flexibility as are the POUs. Doing so will significantly reduce transaction costs associated with an auction which will directly benefit PacifiCorp's customers in California. While PacifiCorp recognizes that it may be the desire of the ARB to send a price signal associated with greenhouse gas emissions, in the case of PacifiCorp, imposing the same requirements on a MJRP as a IOU by requiring PacifiCorp to sell all its allocated allowances and purchase them at auction where its customer base is less than 50,000 customers, more than one-third of whom are eligible for low-income assistance, poses a high and disproportionate burden on PacifiCorp’s customers which is unlikely to appropriately reflect the cost of greenhouse gases. These compliance costs will be higher than those incurred by the IOUs on a per customer basis and any price signal will be out shadowed by the high transaction costs inherent in being a small participant in a large market. (PACIFICOR3).

Response: Although PacifiCorp is an MJRP, it is not similar to POUs, because it does not have an elected or appointed governing body to direct the use of revenue. It is important that the CPUC ensures that PacifiCorp use revenue from the auction to further the AB 32 goals. PacifiCorp will need to purchase allowances like all other privately owned utilities. The market will determine carbon cost; these costs should be passed on to ratepayers. Once the costs are passed on to ratepayers, MJRP, like other IOUs, can seek CPUC approval for either compensating ratepayers, buying allowances, meeting the RPS, or other activities that benefit ratepayers.

Other Electricity-Related Comments

I-151. Comment: Sections 95852(b)(2) through 95852(b)(7) of the Cap-and-Trade regulation should not incorporate the language specific to mandatory reporting, but should instead incorporate it by reference. The approach that the regulations have used have created confusion by attempting to paraphrase the MRR, using language different from that used in the MRR, and created internal inconsistency by, on occasion, summarizing the MRR incorrectly—the language in section 95852 does not exactly match the MRR. Examples include the formula in section 95852(b)(7)(C) being different than the formula in section 95111(b)(5) in leaving out deductions for replacement electricity, and emissions from a specified source with emissions exceeding the default emissions factor are counted in section 95852(b)(7)(B) at the default emissions rate while being counted at the actual specified emissions rate in section 95111(b)(2) of the MRR. Section 95852(b) should be changed to incorporate the MRR by reference as much as possible to avoid confusion in compliance obligation. Lastly, section 95852(b) appears to include sources in California, so a calculation method for in-state resources should be included for completeness. Modify section 95852(b) as follows:

> (2) The following criteria must be met ~~for~~ by first deliverers of electricity deliveries to calculate their compliance obligations for imported electricity from specified facilities or units in jurisdictions that are not approved for linkage pursuant to subarticle 12 and which do not involve replacement electricity: ~~based on an ARB facility specific emission factor specified pursuant to MRR section 95111 less than the default emission factor for unspecified electricity specified pursuant to MRR section 95111:~~
>
> > (A) Electricity deliveries must meet the requirements of ~~be reported to ARB pursuant to~~ MRR section 95111(a)(4);
> >
> > (B) ~~The first deliverer must be the facility operator or have ownership or contract rights to electricity generated by the facility or unit claimed;~~ Electricity deliveries must meet the requirements of direct delivery of electricity as defined in MRR section 95102(a); and
> >
> > (C) First deliverers must ~~report electricity~~ calculate emissions from ~~specified sources to ARB using the ARB specified source identification number assigned to the source~~ in accordance with ~~pursuant to~~ MRR section 95111(b)(2).~~; and~~
> >
> > ~~(D) If there are other parties within the contract chain of custody, then the original source of generation and quantity of MWhs to be delivered under the original contract must be identified within the entire contract chain. The quantity of electricity delivered, and for which an ARB facility specific emission factor specified pursuant to MRR section 95111 is claimed, cannot exceed the original amount under ownership or contract rights reported pursuant to section 95852(b)(2)(A).~~
>
> (3) Replacement electricity that substitutes for electricity from a variable renewable resource qualifies for the ARB specific emission factor ~~specified pursuant to MRR section 95111 of the variable renewable resource~~ under the following conditions:

(A) Replacement electricity must meet the requirements of MRR section 95111(a) ~~First deliverers of replacement electricity have a contract, or ownership relationship, with the supplier of the replacement electricity, in addition to a contract with the variable renewable resource~~;

(B) The amount of the reported replacement electricity does not exceed the amount for the reported annual variable renewable resource; and

(C) The rReplacement electricity ~~with an~~ emission factors are calculated in accordance with ~~greater than the default emission factor for unspecified electricity specified pursuant to~~ MRR sections 95111(b)(1) through 95111(b)(5). ~~is not eligible to receive an emission factor of zero metric tons CO2e/MWh. For contracts that use replacement electricity for which the emission factor is greater than the default emission factor for unspecified electricity, the difference between the emission factor from the replacement electricity and the default emission factor for unspecified electricity will be used to calculate emissions with a compliance obligation.~~

~~(4) Claims to resources with zero direct emissions, emissions without a compliance obligation, or emissions calculated using a lower emissions factor than the default emissions factor for unspecified electricity specified pursuant to MRR section 95111, including renewable resources other than variable renewable resources must demonstrate, pursuant to MRR, direct delivery of electricity as defined in section 95802.~~

(4~~5~~) Electricity generated from use of biomethane must comply with section 95852.2, and must meet verification requirements for use of biomethane pursuant to MRR.

(5~~6~~) Qualified Exports. Emissions from qualified exports claimed by a first deliverer may be subtracted from the first deliverer's compliance obligation for imported electricity in accordance with MRR section 95111(b)(5) only if the electricity meets the definition of qualified export in MRR section 95102(a). ~~is exchanged within the same hour and by the same PSE. It is not necessary for the electricity to enter or leave California at the same intertie. Qualified exports shall not result in a negative compliance obligation for any hour.~~

(6~~7~~) The compliance obligation for first delivers for ~~(CO2e covered) is calculation based on the~~ emissions from electricity deliveries from jurisdictions that are not approved for linkage pursuant to subarticle 12 is to be calculated in accordance with MRR section 95111(b)(5).

~~A) Emissions which result from specified electricity deliveries (CO2e specified) will be assigned the facility emission factor, determined by ARB, for electricity deliveries meeting the requirements of section 95852(b)(2) through (5);~~

~~1. Specified deliveries meeting the requirements of section 95852(b)(2);~~

~~2. The adjustment for replacement electricity associated with the variable renewable electricity pursuant to section 95852(b)(3);~~

~~3. The specified electricity meeting direct delivery requirements pursuant to section 95852(b)(4); and~~

~~4. The specified electricity generated from the use of biomethane which meets the requirements pursuant to section 95852.2.~~

~~(B) All deliveries of electricity not meeting the requirements of section 95852(b)(2) through (5) will have emissions calculated using the default emission factor for unspecified electricity pursuant to section 95111 of MRR (CO2e unspecified).~~

~~(C) Emissions resulting from qualified exports (CO2e qualified exports) will be subtracted from the compliance obligation pursuant to section 95852(b)(6). Compliance Obligation in CO2e covered=CO2e specified + CO2e unspecified-CO2e qualified export~~

(7) The compliance obligation for electric generation and cogeneration facilities or units within California for emissions from electricity generated is to be calculated in accordance with MRR section 95112. (SEMPRA3)

Response: Sections 95852(b)(2) through 95852(b)(7) were modified extensively in the Second 15-day Change Notice. The formula to determine which reported emissions result in a compliance obligation are now clarified and contained in the cap-and-trade regulation. Specific details pertaining to reporting requirements for each portion of the formula remain in the MRR. We believe the text is now consistent with the MRR.

I-152. Comment: ARB's proposed 15-day modifications of the cap-and-trade regulation are flawed by 1) allowing replacement power only for variable renewable resources, and 2) requiring the replacement power to be from the same balancing authority. The potential problems of double-counting should not drive the ARB cap-and-trade regulation to conflict to State law; double-counting can be addressed at the time of linking. If the requirement is for tracking purposes, it is unclear how replacement power from the same balancing area is any easier to track than power from any other balancing authority. The WREGIS system already exists to track RPS-eligible renewable energy and replacement electricity throughout the WECC. There are three workable changes ARB should consider to comply with State law concerning renewables and to be consistent with the Scoping Plan that assigns GHG reductions to all renewable energy. First, the best alternative would be to eliminate the requirements that 1) replacement electricity apply only to variable renewable resources and instead apply to all renewable resources, and 2) replacement electricity be from the same balancing authority as the renewable resource. This approach would allow for the rebundling of RECs with any imports already approved by the CEC and CPUC. In addition, it would allow for future projects, including transactions using unbundled RECs, that may be consistent with the restrictions of the RPS program as modified by SB x1 2. This would result in replacement electricity being treated as having zero emissions, to reflect the fact that the underlying renewable is resulting in a backing down of emissions elsewhere in the region. Commensurate with this structure, renewable power that is sold without RECs becomes “null power” and like unspecified power imported to California should be assigned a default GHG emission rate for compliance obligation purposes. This approach would be consistent with the contractual terms of existing contracts, section 399.12, and expectations of the parties who signed the contracts. A second approach would be to "grandfather" contracts entered into prior to the start of the cap-and-trade program and add more flexibility to ARB's approach requiring replacement electricity to be from the same balancing authority. With grandfathering, the regulation would state that for contracts entered into before the start of the cap-and-trade program, replacement power could be used consistent with CEC and CPUC approved rebundling. Such contracts would be supplied to ARB and for that list of contracts, the replacement power would not be required to be from the same balancing authority, but from a source or sources approved by the CEC and/or CPUC. For grandfathered contracts, this would result in replacement electricity being treated as having zero emissions, to reflect the fact that the underlying renewable is resulting in a backing down of emissions elsewhere in the region. The electricity from the renewable resource without the green attributes would be assigned the default rate and could not be used as a specified zero GHG resource. A third approach would be an adjustment to other elements of the cap-and-trade regulation and would not require significant changes to the definition of replacement electricity except to deal with small balancing authorities. The approach would adjust the annual allowance budgets for Calendar Years 2013-2020 in section 95841 to account for the zero GHG renewable resources that are not being counted as zero GHG under the cap-and-trade program. In the cap-and-trade regulation adopted by ARB in December 2010, the annual allowance budgets were dramatically reduced to account for emissions in covered sectors that were not covered by the cap-and-trade regulation. This approach would reverse the process and account for reduced GHG emissions of the out-of-state renewables that were not being counted in the cap-and-trade program. The adjustment to the program cap would take place annually based on the prior year energy production by the renewable resources that are not being counted as zero GHG. The second part would be to provide the allowances to the electricity importer for that replacement electricity that is not counted as zero GHG under the cap-and-trade program. Once the prior year production of renewable energy not counted as zero GHG is determined, ARB would place the allowances into the importers' holding accounts. This approach is also "second best" since it is complicated and relies on lagged data. Modify sections 95802(a)(237), 95841, and 95780(f) and (g) as follows:

> (237) "Replacement electricity" means electricity delivered to a first point of delivery in California <u>in accordance with State Renewable Portfolio Standards</u> to replace electricity from ~~variable~~ <u>RPS-eligible</u> renewable resources in order to meet hourly load requirements. The electricity generated by the ~~variable~~ renewable energy facility and purchased by the first deliverer is not required to meet direct delivery requirements. ~~The physical location of the variable renewable energy facility busbar and the first point of receipt on the NERC E-tag for the replacement electricity must be located in the same balancing authority area.~~

Or

> (237) "Replacement electricity" means electricity delivered to a first point of delivery in California to replace electricity from ~~variable~~ <u>RPS-eligible</u> renewable

resources in order to meet hourly load requirements. The electricity generated by the ~~variable~~ renewable energy facility and purchased by the first deliverer is not required to meet direct delivery requirements. The physical location of the ~~variable~~ renewable energy facility busbar and the first point of receipt on the NERC E-tag for the replacement electricity must be located in the same balancing authority area, or if a balancing authority is small, an adjacent balancing authority, for RPS contracts signed after the start of the cap-and-trade program. For RPS contracts signed prior to the start of the cap-and-trade program, replacement electricity must be delivered to California in accordance with the State Renewable Portfolio Standards.

Or

(237) “Replacement electricity” means electricity delivered to a first point of delivery in California to replace electricity from ~~variable~~ RPS-eligible renewable resources in order to meet hourly load requirements. The electricity generated by the ~~variable~~ renewable energy facility and purchased by the first deliverer is not required to meet direct delivery requirements. The physical location of the ~~variable~~ renewable energy facility busbar and the first point of receipt on the NERC E-tag for the replacement electricity must be located in the same balancing authority area, or if the balancing authority is small, an adjacent balancing authority.

And add to section 95841:

The annual allowance budgets shown in Table 6-1 will be adjusted upward in each compliance year for the energy from renewable resources developed and approved pursuant to the State’s RPS program that do not have replacement electricity meeting the requirements of section 95802 and do not affect the compliance obligations in section 95852. The amount of energy will be based on the positive or qualified positive emissions data verification statement for the year for which the compliance obligation is calculated.

And

(f) Allocation to Electricity Importers for RPS-eligible Renewable Energy Requiring Allowance Surrender

(1) The Executive Officer will place an annual individual allocation in the holding account of each eligible entity on or before the surrender dates for compliance for each calendar year 2013-2020.

(2) The total amount of allowances shall be calculated consistent with the adjustment to the program cap in section 95841

(g~~f~~) Auction Proceeds for AB 32 Statutory Objectives. All remaining allowances not allocated for uses specified in sections 95870(a) through (f~~e~~) will be designated for sale at auction. The proceeds from the sale of these allowances will be deposited into the Air Pollution Control Fund and will be available for appropriation by the Legislature for the purposes designated in California Health and Safety Code Sections 38500 et seq. (SEMPRA3)

Response: We agree and we made significant modifications to section 95852(b) regarding the treatment of electricity from renewable resources and the role of RPS eligible electricity in reducing the compliance obligation of an electricity importer. We deleted section 95802(a)(237), the definition of “replacement electricity.” Our new approach relies on an RPS adjustment which is the subject of new section 95852(b)(4). The RPS adjustment is a quantity of emissions calculated as the product of the default emission actor and the megawatt-hours of electricity generated at an “eligible renewable energy resource” (as newly defined), and meeting the requirements of new section 95852(b)(4).

Before making these modifications, we took an approach in which certain delivered quantities of electricity from non-renewable resources (replacement electricity) would be deemed to have an emission factor of an associated variable renewable resource. With the modifications, the regulation now allows for an adjustment in an electricity importer’s total compliance obligation based on the amount of RPS-eligible electricity procured or imported that is not directly delivered to California. If RPS eligible electricity is directly delivered, it receives its actual emission factor, which in many cases is zero.

Our new approach means that we need not consider “firming and shaping” electricity. It also means that the compliance obligation of an electricity importer may be reduced based on the importer’s electricity procured from an eligible renewable energy resource, regardless of whether the resource is variable (or intermittent.) Furthermore, because the RPS adjustment is now a term that is subtracted out of the total compliance obligation equation for importers, there is no connection to any electricity that replaces renewable electricity. This means there is no longer a requirement that replacement electricity originate in a particular balancing authority.

In considering electricity from renewable resources, we sought a balance between recognizing the value of investments in renewable electricity under the RPS mandate and our need to ensure compatibility with WCI partners when California links with other jurisdictions. We also sought to limit the potential for leakage or “double-counting” of the fact that renewable electricity may be generated with zero, or very low, GHG emissions.

Initially we believed that the correct balance required that replacement electricity be allowed only for variable renewable resources, and that replacement electricity come from generators located in the same BAA as the renewable resource. Through informal discussions as well as consideration of comments, we came to the conclusion that these restrictions would not necessarily consider utility investment in RPS eligible electricity and would not necessarily facilitate compatibility with linked jurisdictions more so than our modified approach.

We had initially considered replacement electricity only for variable resources, which, due to intermittency, cannot be directly delivered because they cannot be scheduled across BAAs, except in a few limited cases. However, other renewable resources cannot always be scheduled into California due to transmission constraints or other factors. We realized that there would be greater equity for utilities and other electricity importers if the non-variable RPS-eligible electricity could also reduce an importer's compliance obligation. To facilitate linkage, and minimize double-counting opportunities, we added new section 95852(b)(4)(E). This new section disallows an RPS adjustment for electricity generated at an eligible renewable energy resource in a linked jurisdiction. We believe that the modifications to sections 95802 and 95852 have met the concerns expressed in the comments above, and have rendered moot their specific proposals for modifications to the regulation.

I-153. Comment: If ARB chooses not to make any changes to its cap-and-trade and mandatory reporting regulations regarding replacement electricity, then Table 9-3 is incorrect since it has as an underlying assumption that all renewable electricity that complies with the State's 33 percent RPS has zero GHG emissions. Under the 15-day modifications, 1.2 million MWhs of wind energy per year that SDG&E has contracted for would have a compliance burden. Under the compliance burden approach outlined in Appendix A to the 15-day modifications, SDG&E should be provided free allowances for this electricity. SDG&E cannot provide proposed modifications to Table 9-3 since it does know what replacement electricity of other electric distribution utilities is not counted as zero GHG electricity. (SEMPRA3)

Response: We removed the definition for "Replacement electricity" and we included a provision, 95852(b)(4), to recognize RPS-eligible electricity. Eligible RPS electricity can reduce the first deliverer's compliance obligation, pursuant to the requirements contained in section 95852(b)(4).

I-154. Comment: Section 95814(a) lists types of entities that "may qualify as voluntary associated entities" including "an entity that does not meet the requirements of sections 95811 and 95813 that intends to purchase, hold, sell, or voluntarily retire compliance instruments." The Eight Utilities fall squarely within the definition of section 95814(a)(1). Pursuant to the regulation, they plan to apply to the Executive Director for approval as VAEs, due to the importance of the allowance allocation process. However, the Eight Utilities recommend that ARB add the following underlined language in order to provide greater clarity for these entities which are directly affected by this regulation. Based on the Eight Utilities' review of the proposed regulations, all EDUs registering as VAEs would be subject to the proposed regulations involving entity registration, allowance allocations, allowance consignment, the use of allowance value, and annual reporting. Modify section 95814(a)(4) as follows:

(4) An Electric Distribution Utility that receives an annual allocation of allowances pursuant to section 95870(d) but does not meet the requirements

of sections 95811 and 95813. (EIGHTUTILITIES)

Response: We agree that some Electric Distribution Utilities may not meet the definitions of sections 95811 and do not need to become opt-in covered entities pursuant to 95813 in order to purchase, hold, sell, or voluntarily retire compliance instruments. However, we do not believe that the additional text proposed by the commenter is appropriate because some EDUs are in fact covered entities due to also acting as first deliverers of electricity.

J. ENFORCEMENT

Penalties

Clarification Needed

J-1. (multiple comments)
Comment: It is not clear in section 96014(c) that it is a violation when someone intentionally misleads the ARB in terms of the actions listed in (1) through (4), as compared to the situation when simply a mistake has been made. Modify section 96014(c) as follows:

> (c) It is a violation to submit any record, information or report required by this article that <u>knowingly</u>: (CACC2)

Comment: Section 96014(c) added a new enforcement provision to the Cap and Trade Regulations to identify violations of a more egregious nature. However, it would be best to clarify this section by adding the word “knowingly” in the lead sentence such that it reads. Modify section 96014(c) as follows:

> (c) It is a violation to submit any record, information or report required by this article that <u>knowingly</u>: (UNITEDAIRLINES2)

Comment: CARB states in the 15-day Notice that Section 96014(c) was added "to clarify that any act of deception in working with ARB will subject an entity to additional penalties." Specifically, Section 96014(c)(2) refers to any submission that "[m]akes any false, fictitious or fraudulent statement or representation," and Section 96014(c)(4) refers to any submission that "[o]mits material facts from a submittal or record." CSCME respectfully submits that the term "knowingly" should be added to both of these provisions to ensure that each provision addresses deceptive rather than inadvertent acts. (CSCME4)

Comment: CARB states in the 15-day Notice that it modified Section 96014(b) to clarify that entities will not accrue daily violations for failing to surrender a compliance instrument on the required day until at least forty-five days have passed, in order to "allow greater time to obtain the compliance instruments and thus maintain stability of the market." CSCME agrees that this clarification is reasonable. (CSCME4)

> **Response:** We did not implement this change. The Health and Safety Code contains different maximum penalty amounts for violations that occurred under various mental states, including strict liability, negligence, knowing acts, and intentional acts. See Health and Safety Code sections 42400-42402.3.

Provide Flexibility

J-2. (multiple comments)
Comment: Section 96013 retains the reference to the penalty provisions in Health and Safety Code section 38580. These provisions provide a menu of criminal and civil penalties that can range from fines of $1,000 to $1,000,000, and up to a year in county jail or state prison. These fines are between 200 to 100,000 times expected allowances prices. Such excessive penalties are not necessary and will not serve to deter bad actors. SCE recommends that ARB develop a more reasonable fine structure. (SCE3)

Comment: With respect to penalties and violations, as specified in sections 96013 and 96014, WSPA believes that the degree of culpability should be an express component in determining penalty amounts, and that determining penalties on a "per ton per day" basis would result in potential penalties that are exponentially high in relation to any harm. WSPA proposes that ARB revise sections 95858, 96013 and 96014 as shown in Attachment F, to incorporate the concepts summarized above and to provide additional clarity in section 95858. (WSPA3)

> **Response:** We revised the penalty structure to provide that penalties for unsurrendered allowances accrue every 45 days, rather than having them accrue daily. This provides flexibility to the compliance entity to obtain additional allowances either through an auction or purchase of allowances through the allowance price containment reserve, and also reduces the potential liability for compliance entities.

J-3. Comment: NCPA is concerned that the calculation of a separate violation for each single compliance instrument is excessive, especially given the other provisions in the regulation that address noncompliance, including the requirement to surrender four times the amount of an unmet compliance obligation. Accordingly, NCPA joins with the Joint Utilities in urging CARB to address violations of the compliance obligation in a realistic manner and consider each 1,000 instruments (or portion thereof) a single violation. Additionally, NCPA urges the revisions to section 96014(b) addressed in the Notice to be reincorporated into the revised regulation; that is the modification that provides that violations accrue every 45 days, rather than on a daily basis for compliance instruments that remain unsurrendered. Modify section 96014 as follows:

> (a) If an covered entity fails to surrender a sufficient number of compliance instruments to meet its compliance obligation as specified in sections 95856 or 95857, and the procedures in 95857(c) have been exhausted, there is a separate violation of this article for each 1,000 required compliance instruments, or portion thereof, that have~~s~~ not been surrendered, or otherwise obtained by the Executive Officer under 95857(c).
> (b) There is a separate violation for each day or portion thereof after the compliance date that each required compliance instrument has not been surrendered. There is a separate violation for each 45-day period or portion thereof after date determined pursuant to section 95857(b)(4~~) the end of the~~

~~Untimely Surrender Period~~ that each 1,000 required compliance instruments, or portion thereof, have~~s~~ not been surrendered. (NCPA3)

Response: We did not bundle the allowances into 1,000 allowance units for purposes of determining penalties. One metric ton of CO_2e is the basic unit for both reporting under the MRR and for compliance or trading under the cap-and-trade regulation. It is therefore an appropriate unit by which to count violations under both rules. Moreover, Health and Safety Code section 38580(b)(3) authorizes ARB to define penalties on a per-unit basis, proportional to the conduct, rather than defining violations purely in terms of days. We revised the penalty structure to provide that penalties for unsurrendered allowances accrue every 45 days, rather than having them accrue daily. This provides flexibility to the compliance entity to obtain additional allowances either through an auction or purchase of allowances through the allowance price containment reserve, and also reduces the potential liability for compliance entities.

J-4. Comment: Penalties to entities failing to meet their compliance obligation should not remove additional allowances from the market even if the removal is temporary. NextEra agrees with the magnitude of the penalty that would be imposed on an entity that fails to meet their compliance obligation in a “timely manner.” The 4 to 1 multiplier is an effective deterrent and is appropriate in this type of situation. However, NextEra would urge ARB to change the mechanism for implementing the penalty. We are not implying the shortfall in the compliance obligation should be satisfied with anything but the correct amount of allowances. One allowance should be surrendered for each ton of GHG emitted to cover the shortfall. We feel the penalty portion of the enforcement should be collected in the form of a monetary payment rather than the temporary surrender of additional allowances. The removal of the additional allowances to satisfy the penalty has potentially unintended consequences. The removal of allowances not needed to meet a compliance obligation could place an additional burden on all market participants, not just the entity responsible for the infraction. The resulting increase in the scarcity of allowances could result in an increase to allowance prices. A monetary penalty has the desired effect on the offending entity without causing potential hardship on the rest of the allowance market. (NEXTERAENERGY2)

Response: The additional allowances are not a penalty. Rather, they ensure environmental integrity of the regulation as an additional incentive to ensure compliance with the regulation’s surrender obligations. The allowances surrendered pursuant to section 95857 will be returned to the Auction Holding account for sale at a future auction, thus reducing the likelihood that the additional surrender obligation will adversely impact the market.

Layering of Penalties

J-5. Comment: We do not believe that it would be appropriate for covered entities to be subject to duplicative or overlapping penalties. The program’s market-oriented penalty structure (e.g., the 4:1 allowance or offset relinquishment under applicable circumstances) should suffice to ensure effective program operation. As drafted, the program still creates overlapping jeopardy for covered entities by subjecting them potentially to a number of daily, or per-compliance-instrument (i.e., per ton), penalties. The language also does not sufficiently protect covered entities that are working in good faith with qualified verifiers. We appreciate that the staff has considered selective use of language that could limit more serious penalties to the more significant scenarios in which fraud or other bad intent is present. However, this language does not yet displace other penalties. We believe that such differentiation among penalty types is very important so as not unduly to punish good actors. We suggest that the staff continue to work with interested stakeholders to identify different penalty scenarios and to insert clarifying language into the relevant sections to ensure that covered entities are not subject to overlapping penalties. (CCC2)

> **Response:** ARB has modified the enforcement provisions in the cap-and-trade regulation to address the concern of overlapping penalties across both the MRR and the cap-and-trade regulation. As modified, violations for under-reported tons and failures to measure in the manner required by the MRR will be dealt with solely under the MRR enforcement provisions. In terms of the cap-and-trade regulation, once a covered entity reports its emissions under the MRR, those emissions are then verified, and the covered entity receives either a positive, qualified positive, or adverse emissions verification statement. In the event of either a positive or qualified positive verification statement, the entity's cap-and-trade compliance obligation is equal to one allowance for each ton emitted. If a covered entity receives an adverse verification statement under the MRR, ARB will calculate and assign the covered entity's emissions level pursuant to section 95131(c)(5) of the MRR, and that level will become the covered entity's cap-and-trade compliance obligation. In either instance, if the covered entity is found (either in the current year or in a later year) to have under-reported its emissions, the penalty for the under-reporting will be wholly contained in the MRR—without the possibility of overlapping cap-and-trade penalties. On the other hand, failure to surrender sufficient compliance instruments, based on either an assigned emissions level or on a positive or qualified positive emissions level, will be subject to the penalty contained in the cap-and-trade regulation.
>
> In addition, we revised the penalty structure to provide that penalties for unsurrendered allowances accrue every 45 days, rather than having them accrue daily. This provides flexibility to the compliance entity to obtain additional allowances either through an auction or purchase of allowances through the allowance price containment reserve, and also reduces the potential liability for compliance entities.

J-6. Comment: In evaluating the proposed enforcement provisions, PG&E takes the position that potential liability should be adequate to assure compliance, but should not be so high that the liability would exceed any possible environmental harm. Given the high rates of compliance with local air district regulations governing emissions from stationary sources, it makes sense that the potential liability for violations of the MRR and Cap and Trade rules should be in generally the same range as the existing penalty exposure for violations of air district rules. The level of detail required by the MRR and Cap and Trade rules, coupled with the complexity of modern power plants, and the quantity of GHG emissions (measured in metric tons of CO_2e), creates extremely large numbers of potential violations, which would lead to unreasonably high potential liability if not addressed appropriately in the Regulations. For that reason, PG&E appreciates ARB's elimination of the "per ton, per day" potential penalties that were included in earlier versions of the enforcement language. PG&E also supports ARB's amendments to section 95857(d) stating that three fourths of the allowances surrendered as a penalty for untimely surrender are transferred to the Auction Holding Account. (PGE4)

> **Response:** This comment does not request any additional modification to the regulatory language. We appreciate the commenter's support for modifications already made. Regarding the portion of the comment discussing overlapping between the MRR and the cap-and-trade regulation, see the response to Comment J-5.

Allow More Time to Purchase Allowances

J-7. Comment: SMUD appreciates the changes to the proposed penalty structures for the Cap and Trade program that are captured in the 15-day language. In particular, allowing an effective 'grace period' while the untimely surrender process is dealing with a shortfall of surrendered emissions, prior to establishing daily penalties for each compliance instrument remaining short helps to ensure a reasonable and effective penalty structure for the cap and trade program. (SMUD3)

> **Response:** This comment does not request any additional modification to the regulatory language. We appreciate the commenter's support for modifications already made.

Ensure Strong Penalties

J-8. Comment: We recommend the language in section 96014 be expanded to recognize other types of violations beyond failure to submit sufficient compliance instruments, and submittal of false documentation. Other potential violations include, but are not limited to, failure to register, failure to comply with requests for information, failure to retire Offsets, etc. The rule should provide enforcement authority over failure to comply with any requirements of the program unless specifically exempted. (CAPCOA2)

> **Response:** We note that the violations specified in section 96014(c) are in addition to other violations of the regulation (see section 96014(d)). Moreover, Health and Safety Code section 38580 authorizes ARB to enforce against any violation of any regulation. This statutory provision authorizes ARB to enforce against any failure to comply with any requirement of the program, and the specifically defined violations in section 96014 do not limit this statutory authority.

J-9. Comment: In the 15-day changes, ARB has revised section 96014 in ways that we believe substantially undermines the enforceability of the program, and is likely to compromise the ultimate objective of reducing emissions. Specifically, Days of Violation. We strongly recommend you reinstate the deleted language that specified that "each day or portion thereof in which any other violation of this Article occurs is a separate offense." Further, at a minimum, the counting of violation days should begin as soon as the compliance target is exceeded, not delayed until five days after the reporting period ends. Ideally, the number of days of violation should be the number of days in the compliance period subject to reduction according to the proof presented by the entity. For example, if an entity has submitted data in year Y, and surrenders insufficient compliance instruments on November 1 in year Y+1 (as required in 95856(d)), the violation should be counted based on the number of days in the compliance period for which the surrendered instruments were insufficient. (CAPCOA3)

> **Response:** We believe that the statutory authority in Health and Safety Code section 38580 authorizes ARB to enforce against any failure to comply with any requirement of the program, and the specifically defined violations in section 96014 do not limit this statutory authority. Regarding the portion of the comment seeking reinsertion of number of days of violation, we believe that the revisions providing that penalties for unsurrendered allowances accrue every 45 days, instead of having them accrue daily, provide a sufficient deterrent while simultaneously providing flexibility to the compliance entity to obtain additional allowances, either through an auction or by purchasing them through the allowance price containment reserve. Therefore, we did not make the suggested modifications.

J-10. Comment: As currently proposed, section 96014 recognizes only two types of violations: failing to submit sufficient compliance instruments, and submitting any false document or one omitting a material fact. There are potentially many other violations of the program that should be subject to penalty. For example: participating in the program without having registered with CARB, failure to provide records requested by CARB, failure to comply with the six-year rotation requirement; failure to retire offsets used as CARB offsets, etc. CARB needs to maintain the ability for civil and criminal prosecution of any violation of the program. (SCAQMD4)

> **Response:** We believe that the statutory authority in Health and Safety Code section 38580 authorizes ARB to enforce against any failure to comply with any requirement of the program, and the specifically defined violations in section 96014 do not limit this statutory authority.

J-11. Comment: We are concerned that the emphasis on deliberate, intentional, fraudulent reporting dilutes the impact of the strict liability offense of simply submitting an inaccurate report. Our experience has shown that most Cap and Trade violations will be based on inaccurate and/or untimely reporting. It is extremely difficult to establish that the inaccurate reports were the product of fraud or trickery. It is imperative that the program participants know that inaccurate and untimely reporting may be subject to the highest penalties authorized by law. (SCAQMD4)

> **Response:** Inclusion of section 96014(c) does not remove the underlying strict liability nature of the enforcement provisions in the cap-and-trade regulation. Moreover, violations that occur through inaccurate and/or untimely reporting of GHG emissions will be dealt with under the MRR. Violations for under-reported tons and failures to measure in the manner required by the MRR will be dealt with solely under the MRR enforcement provisions. In terms of the cap-and-trade regulation, once a covered entity reports its emissions under the MRR, those emissions are then verified, and the covered entity receives either a positive, qualified positive, or adverse emissions verification statement. In the event of either a positive or qualified positive verification statement, the entity's cap-and-trade compliance obligation is equal to one allowance for each ton emitted. If a covered entity receives an adverse verification statement under the MRR, ARB will calculate and assign the covered entity's emissions level pursuant to section 95131(c)(5) of the MRR, and that level will become the covered entity's cap-and-trade compliance obligation. In either instance, if the covered entity is found (either in the current year or in a later year) to have under-reported its emissions, the penalty for the under-reporting will be wholly contained in the MRR—without the possibility of overlapping cap-and-trade penalties. On the other hand, failure to surrender sufficient compliance instruments, based on either an assigned emissions level or on a positive or qualified positive emissions level, will be subject to the penalty contained in the cap-and-trade regulation.

J-12. Comment: Section 96014 has been modified to delete the catch-all requirement that "each day or potion thereof in which any other violation of this Article occurs is a separate offense." We strongly recommend this language be reinstated. (SCAQMD4)

> **Response:** This language was revised in the second 15-day changes to the regulation to reflect that penalties will accrue every 45 days, instead of daily. We believe that the statutory authority in Health and Safety Code section 38580 authorizes ARB to enforce against any failure to comply with any requirement of the program, and the specifically defined violations in section 96014 do not limit this statutory authority.

J-13. Comment: We urge ARB to retain the robust penalty provisions in the draft Regulation to safeguard the environmental integrity of the program. Employing an allowance multiplier sends a clear, transparent signal to market participants that noncompliance will never be in their economic interest. We are not persuaded by suggestions from other stakeholders that requiring violators to submit excess allowances as part of their untimely surrender obligation penalizes all participants—by removing allowances from the market and driving up allowance prices—and should therefore be eliminated. ARB's focus should remain on designing a program that sends the strongest possible signal to encourage compliance. Eliminating the automatic penalty provision in section 95857(b)(2) will push all of the enforcement decisions into the murkier waters of administrative penalties, which will introduce uncertainty and require significantly more time and resources on the part of ARB. Moreover, ARB's revised approach to allocating excess allowances eliminates any residual concern related to the automatic penalty provision. By making excess allowances submitted by noncompliant entities available at a subsequent auction, ARB will retain the strong deterrent of a multiplier while guarding against any unwanted pressure on allowance prices. (KUSTIN16)

> **Response:** We believe that we designed the cap-and-trade regulation to provide for sufficient deterrence to non-compliance, and that the penalty provisions are both robust and protective of the integrity of the program. See also the responses to Comments J-10, J-11 and J-12. It is unclear what the commenter means by referring to "administrative penalties." As provided in Health and Safety Code section 38580(b)(2):
>
> > "Any violation of any rule, regulation, order, emission limitation, emissions reduction measure, or other measure adopted by the state board pursuant to this division shall be deemed to result in an emission of an air contaminant for the purposes of the penalty provisions of Article 3 (commencing with Section 42400) of Chapter 4 of Part 4 of, and Chapter 1.5 (commencing with Section 43025) of Part 5 of, Division 26."
>
> As such, there is no provision in the cap-and-trade regulation for administrative penalties.

J-14. Comment: NextEra agrees with ARB's position on intentional misrepresentation of data associated with an offset project. Any intentional misrepresentation of an offset project's GHG mitigation should be dealt with harshly. Also any attempt to acquire an offset credit after a renewable energy credit has been sold for the same power generation must not be permitted. These actions have real financial and environmental implications. Any such actions undermine the integrity of the program and the offset system. It also provides an unfair economic advantage to those committing the act. We agree with ARB and other stakeholders that strict penalties and legal action is warranted in those situations. (NEXTERAENERGY2)

> **Response:** The comment does not request any specific changes. We appreciate the commenter's support and agree that enforcing the requirements of the regulation is critical to ensuring the integrity of the cap-and-trade and compliance offset programs.

J-15. Comment: The rule establishes a separate day of violation for each day after the reporting period. In many cases, this will result in a relatively small number of days of violation. The Health and Safety Code is based on actual days of violation (as opposed to pounds of pollution or numbers of compliance instruments), so this provision is of critical importance. If an enforcement action is taken to court, the extent to which actual days of violation can be established will be persuasive to a judge. Accordingly, in order to ensure adequate deterrent value in cases which may be based on negligent or intentional conduct, we recommend that the rule provide that a separate day of violation is established for each day of the applicable compliance period unless the program participant can establish compliance for each of those days. The violations continue until final compliance is achieved. This will provide an adequate number of days of violation to deter future misconduct at the facility and throughout the regulated community. (SCAQMD4)

> **Response:** We believe that the statutory authority in Health and Safety Code section 38580 authorizes ARB to enforce against any failure to comply with any requirement of the program, and the specifically defined violations in section 96014 do not limit this statutory authority. Regarding the portion of the comment seeking reinsertion of number of days of violation, Health and Safety Code section 38580(b)(3) authorizes ARB to define penalties on a per-unit basis, proportional to the conduct, rather than defining violations purely in terms of days. As such, we believe that the revisions providing that penalties for unsurrendered allowances accrue every 45 days, instead of having them accrue daily, provide a sufficient deterrent while simultaneously providing flexibility to the compliance entity to obtain additional allowances, or by purchasing them through the allowance price containment reserve. We did not make the suggested modifications.

Consideration of Circumstances

J-16. Comment: CARB's revision to Section 96013 requires it to "consider all relevant circumstances, including the criteria in Health and Safety Code section 42403(b)" in determining any penalty amount for failing to surrender the appropriate number of compliance instruments in a timely manner. This minor clarification is appropriate, because it highlights the need for CARB to consider circumstances in determining a penalty amount. Factors mentioned in HSC Section 42403(b) include the extent of any harm caused, the nature and persistence of a violation, the frequency of past violations, and the financial burden to the defendant. Explicit reference to consideration of such factors helps ensure consistency of the AB 32 program with other environmental programs. (CSCME4)

> **Response:** This comment does not request any modifications. We appreciate the commenter’s support for this program.

J-17. Comment: Modify section 96013 as follows:

Penalties may be assessed pursuant to Health and Safety Code section 38580 for any violation of this article as specified in section 96014. In determining any penalty amount, ARB shall consider all relevant circumstances, including the criteria in Health and Safety Code section 42403(b), <u>and the degree of culpability for the violation</u>. (CCEEB3)

Response: We did not make the requested modification. Under Health and Safety Code section 42403(b), which is explicitly referenced in section 96013 of the modified cap-and-trade regulation, ARB must consider intent or its absence when seeking any penalty amount. As such, the requested modification is unnecessary.

Penalty of Perjury

J-18. Comment: Sections 95832(a) and (d) impose penalties of perjury on any Authorized Account Representative for any inaccurate statement. Subjecting these individuals to penalties of perjury under California law is an excessive individual burden for a person acting in his/her role as a company employee. These provisions should be deleted. (WPTF2)

Response: The responsibility placed on covered entities by the requirements of the cap-and-trade regulation includes submittal of complete and accurate information. We believe that the certification statements are a necessary component of ensuring that such information is true, complete, and accurate. Moreover, we note that such certification language is common in other regulatory programs, including the MRR and the U.S. EPA Greenhouse Gas Reporting Rule. Therefore, we did not delete the provision.

J-19. Comment: The proposed Regulation would require that designated representatives and certain others attest to the accuracy of filings made with ARB "under penalty of perjury of the laws of the State of California." PG&E recommends that this language be modified to certify the accuracy of filings "under penalty of law." ARB has provided no justification for its proposed requirement other than the circular reasoning that "addition [of the perjury language] is necessary to ensure that all information submitted is true and complete under penalty of perjury," and has not provided any information to show that inaccurate submittals are being made in other programs. The requirement to sign under penalty of perjury is unnecessary in light of provisions in the Health and Safety Code and elsewhere in these Regulations that penalize submission of inaccurate or incomplete information (see, Health and Safety Code subsection 42402.4; proposed regulations sections 95107 and 96014). Moreover, no stationary source air quality program PG&E is aware of, including the federal Clean Air Act Acid Rain program, Title V operating permit program, SCAQMD RECLAIM program, and numerous air district regulations, requires that submissions be made under penalty of perjury. (PGE4)

Response: The responsibility placed on covered entities by the requirements of the cap-and-trade regulation includes submittal of complete and accurate information. We believe that the certification statements are a necessary component of ensuring that such information is true, complete, and accurate. Moreover, we note that such certification language is common in other regulatory programs, including the MRR and the U.S. EPA Greenhouse Gas Reporting Rule.

Expand Penalties for Material Misstatement

J-20. Comment: PG&E appreciates ARB's recognition in section 95858 that penalties for unreported emissions should account for the five percent error margin specified in the definition of "material misstatement," and encourages ARB to extend that concept to the other enforcement sections. (PGE4)

Response: It is unclear from the comment in which manner the commenter is requesting the regulation be amended. We do appreciate the commenter's support for the modifications in section 95858.

Enforcement

Untimely Surrender/Excess Emissions

J-21. Comment: Modify section 96014 as follows:

(a) If an entity fails to surrender a sufficient number of compliance instruments to meet its compliance obligation as specified in sections 95856 or 95857, and the procedures in 95857(c) have been exhausted, there is a separate violation of this article for each 1000 required compliance instruments that ~~has~~ ~~have~~ not been surrendered, or otherwise obtained by the Executive Officer under 95857(c).
~~(b) There is a separate violation for each day or potion thereof after the end of the Untimely Surrender Period that each required compliance instrument has not been surrendered.~~
(~~c~~b) It is a violation to submit any record, information or repot required by this article that:

(1) Falsifies, conceals, or covers up by any trick, scheme or device a material fact;
(2) Makes any false, fictitious or fraudulent statement or representation;
(3) Makes or uses any false writing or document knowing the same to contain any false, fictitious or fraudulent statement or entry; or
(4) Omits material facts from a submittal or record.

(dc) The violations stated in section 96014(~~c~~b) are in addition to an entity's obligations under other provisions of this article requiring submissions to ARB to be true, accurate and complete. A submission may be considered a violation of section 96014(b) or of the obligations referenced in this section 96014(c), but not both. (CCEEB3)

Response: Regarding the commenter's requested modification to section 96014(b), we modified that provision to provide that, rather than having penalties for unsurrendered allowances accrue daily, penalties accrue every 45 days. This provides flexibility to the compliance entity to obtain additional allowances, either through an auction or by purchasing them through the allowance price containment reserve. It also reduces the potential liability for compliance entities. We did not make the requested modification to section 96014(d), which would unnecessarily limit ARB's ability to pursue enforcement actions, should we deem it necessary depending on all relevant circumstances.

J-22. Comment: Modify section 95857 as follows

~~(3) An entity's compliance obligation for untimely surrender may only be fulfilled with CA GHG allowances or allowances issued by a GHG ETS pursuant to subarticle 12; and~~

(~~4~~ 3) The untimely surrender obligation is due within five days of the first auction or reserve sale conducted by ARB following the applicable surrender date, whichever is the latter, and for which the registration deadline has not passed when the untimely surrender obligation is assessed. (CCEEB3)

Response: We modified section 95857 to reflect the intent similar to that proposed by the commenter. Covered entities can now use offsets and allowances to meet their untimely surrender as long as the entity does not violate the offset quantitative usage limit.

J-23. Comment: Section 96014(a) provides for a separate violation for each compliance instrument that is not surrendered. The basic penalty amount per violation under Health and Safety Code section 40402(b) is up to $10,000. At this amount, potential penalties when each ton is a violation are 200 to 1,000 times higher than expected allowance prices. There is no need for such extreme penalties, but the prospect of them has market impacts. Using each 1,000 instruments as way to limit the number of violations yields maximum penalties equivalent to expected allowance prices, and these are sufficient on top of the 4-1 excess surrender requirement in section 95857. Section 96014(a) contains a reference to section 95856, but that section is not relevant. If compliance instruments are not surrendered in accordance with section 95856, then section 95857(b) will apply, not section 96014. Section 96014 will apply only if compliance instruments remain outstanding under section 95857(c) (the "new untimely surrender obligation"). Section 96014(a) also contains some wording that SCPPA requested in response to an earlier version of the regulation—specifically referring to section 95857(c). This wording is no longer necessary as section 95857(c) has since been significantly amended. Modify section 96014(a) as follows :

(a) If an entity fails to surrender a sufficient number of compliance instruments to meet its compliance obligation as specified in section~~s~~ ~~95856 o~~r 95857, ~~and the procedures in 95857(c) have been exhausted,~~ there is a separate violation of this article for each 1,000 required compliance instruments, or portion thereof, that have~~s~~ not been surrendered~~, or otherwise obtained by the Executive Officer under 95857(c)~~. (SCPPA6)

Response: We did not bundle the allowances into 1,000 allowance units for purposes of determining penalties. One metric ton of CO_2e is the basic unit for both reporting under the MRR and for compliance or trading under the cap-and-trade regulation. It is therefore an appropriate unit by which to count violations under both rules. Moreover, Health and Safety Code section 38580(b)(3) authorizes ARB to define penalties on a per-unit basis, proportional to the conduct, rather than defining violations purely in terms of days. Moreover, we revised the penalty structure to provide that penalties for unsurrendered allowances accrue every 45 days, rather than having them accrue daily. This provides flexibility to the compliance entity to obtain additional allowances either through an auction or purchase of allowances through the allowance price containment reserve, and also reduces the potential liability for compliance entities.

J-24. Comment: Section 96014(b) should be amended. Instead of daily penalties, a 45-day period was included in section 96014(b) of the Discussion Draft. It is also referred to in the ARB's summary of the 15-day changes: "The section was also clarified to allow the violation to accrue every 45 days instead of each day the compliance instrument remained unsurrendered" (Page 41, section FFFF). The 45-day period should be included in the regulation to avoid unduly onerous penalties. In addition, section 96014(b) refers to the "Untimely Surrender Period." However, this term is not defined and is not used elsewhere in the regulation. This term should be replaced with a reference to the relevant section of the regulation. Also, there is no need for such extreme penalties. Using each 1,000 instruments as way to limit the number of violations yields maximum penalties equivalent to expected allowance prices, and these are sufficient on top of the 4-1 excess surrender requirement in section 95857. Modify section 96014(b) as follows:

(b) There is a separate violation for each 45-day period or portion thereof after the date determined pursuant to section 95857(b)(4)~~end of the Untimely Surrender Period~~ that each required 1,000 compliance instruments, or portion thereof, have~~s~~ not been surrendered. (SCPPA6)

Response: We modified section 96014(b) to provide that, rather than having penalties for unsurrendered allowances accrue daily, penalties accrue every 45 days. This provides flexibility to the compliance entity to obtain additional allowances, either through an auction or by purchasing allowances through the allowance price containment reserve. It also reduces the potential liability for compliance entities. However, we did not bundle the allowances into 1,000 allowance units for purposes of determining penalties. One metric ton of CO_2e is the basic unit for both reporting under the MRR and for compliance or trading under the cap-and-trade regulation. It is therefore an appropriate unit by which to count violations under both rules. Moreover, Health and Safety Code section 38580(b)(3) authorizes ARB to define penalties on a per-unit basis, proportional to the conduct, rather than defining violations purely in terms of days.

J-25. Comment: The Joint Utilities believe that provisions regarding consequences for non-performance should be both clear and concise, and should not be so onerous that an inadvertent or minor violation would result in the diversion of essential resources away from meeting the core goals of the Regulations. The Joint Utilities suggest that section 95857(c) be revised to further clarify that the untimely surrender obligation modifies the entity's original compliance obligation and does not create an additional obligation. The provisions of section 96014 should be changed in several respects, including a return to the 45-day period for accruing a violation as set forth in the July Discussion Draft and referenced in the Notice of 15-Day Revisions. Modify sections 95857(c) and 96014(a) and (b) as follows:

> 95857 (c) If an entity with an untimely surrender obligation fails to satisfy the obligation pursuant to section 95857(b)(4), then:
>
> > (1) ARB will determine the number of violations pursuant to section 96014;
> > (2) If a portion of the untimely surrender obligation is not surrendered as required, the entity will have a new untimely surrender obligation (replacing the previous surrender obligation calculated under section 95857(b)(2)) equal to the amount of the previous untimely surrender obligation which was not satisfied by the deadline stated in section 95857(b)(4) upon which the number of violations will be calculated pursuant to section 96014. The new untimely surrender obligation is due immediately; and
> > (3) The calculation of the untimely surrender obligation shall only apply once for each untimely surrender of compliance instruments per annual or triennial compliance obligation.
>
> 96014(a) If an entity fails to surrender a sufficient number of compliance instruments to meet its compliance obligation as specified in section~~s 95856 or~~ 95857, ~~and the procedures in 95857(c) have been exhausted,~~ there is a separate violation of this article for each 1,000 required compliance instruments, or portion thereof, that have~~s~~ not been surrendered~~, or otherwise obtained by the Executive Officer under 95857(c)~~.
> (b) There is a separate violation for each 45-day period or portion thereof after the date determined pursuant to section 95857(b)(4)~~end of the Untimely Surrender Period~~ that each required 1,000 compliance instruments, or portion thereof, have~~s~~ not been surrendered. (JOINTUTILITIES)

Response: We did not bundle the allowances into 1,000 allowance units for purposes of determining penalties. One metric ton of CO_2e is the basic unit for both reporting under the MRR and for compliance or trading under the cap-and-trade regulation. It is therefore an appropriate unit by which to count violations under both rules. Moreover, Health and Safety Code section 38580(b)(3) authorizes ARB to define penalties on a per-unit basis, proportional to the conduct, rather than defining violations purely in terms of days. Moreover, we revised the penalty structure to provide that penalties for unsurrendered allowances accrue every 45 days, rather than having them accrue daily. This provides flexibility to the compliance entity to obtain additional allowances, either through an auction or by purchasing them through the allowance price containment reserve. It also reduces the potential liability for compliance entities. It is ARB's intent that the "new obligation," as stated by the commenter, would replace the previous obligation.

J-26. Comment: Violations should be defined in units of 1,000 compliance instruments and 45-day period for additional violations should be re-included. Section 96014 describes the violation procedures for the Cap and Trade program, establishing the amount of violations that a regulated party may be subject to if insufficient compliance instruments are surrendered to cover the compliance obligation that remains after the untimely surrender obligation process. Several changes are beneficial in this section. First, SMUD believes that removing the reference to section 95856 here clarifies the basic violation as occurring only after untimely surrender has been dealt with, and renders moot the added language "… the procedures in 95857(c) have been exhausted…" The 15-day language states that when the requirements of section 95856 are not met, section 95857 is invoked, and it is only if the requirements of that section are not met that there is a violation. Section 96014 should clearly reflect this sequence for clarity. In addition, the term "Untimely Surrender Period" appears to refer back to section 95857(b)(4), but is not defined nor used elsewhere. It is best here to just refer to the date established by section 95857(b)(4). Second, SMUD continues to believe that with a basic penalty amount per violation under Health and Safety Code section 40402(b) of "up to $10,000", the potential penalties when each on is a violation remain egregious at 200 to 1000 times higher than expected allowance prices. There is no need for such extreme penalties, but the prospect of them has market impacts. Using each 1,000 instruments as way to limit the number of violations yields maximum penalties equivalent to expected allowance prices, and these are sufficient on top of the 4-1 excess surrender requirement established in section 95857. Third, section 96014(b) of the Discussion Draft of the Cap and Trade Regulation (released 07/07/11) included a reference to a 45-day period for violation accrual, rather than the daily accrual or multiplication that was proposed in the December 2010 Proposed Regulation Order. This 45-day period was also referred to in the ARB summary of the 15-day changes: "The section was also clarified to allow the violation to accrue every 45 days instead of each day the compliance instrument remained unsurrendered." (Page 41, section FFFF). It would appear that the intent was to continue to include the 45-day period in the 15-day language, and SMUD supports that inclusion. Modify section 96014 as follows:

(a) If an entity fails to surrender a sufficient number of compliance instruments to meet its compliance obligation as specified in sections ~~95856 or~~ 95857, ~~and the procedures in 95857(c) have been exhausted~~,there is a separate violation of this article for each <u>1,000</u> required compliance instrument<u>s, or portion thereof,</u> that ha<u>ve</u>~~s~~ not been surrendered, or otherwise obtained by the Executive Officer under 95857(c).

(b) There is a separate violation for each <u>45-</u>day <u>period</u> or portion thereof after the <u>date determined pursuant to section 95857(b)(4)</u>~~end of the Untimely~~

~~Surrender Period~~ that each required 1,000 compliance instruments, or portion thereof, haves~~s~~ not been surrendered. (SMUD3)

Response: We did not bundle the allowances into 1,000 allowance units for purposes of determining penalties. One metric ton of CO_2e is the basic unit for both reporting under the MRR and for compliance or trading under the cap-and-trade regulation. It is therefore an appropriate unit by which to count violations under both rules. Moreover, Health and Safety Code section 38580(b)(3) authorizes ARB to define penalties on a per-unit basis, proportional to the conduct, rather than defining violations purely in terms of days. Moreover, We revised the penalty structure to provide that penalties for unsurrendered allowances accrue every 45 days, rather than having them accrue daily. This provides flexibility to the compliance entity to obtain additional allowances, either through an auction or by purchasing them through the allowance price containment reserve. It also reduces the potential liability for compliance entities.

J-27. Comment: We support ARB's proposed amendments to section 96014(a) to specify that there is no violation for failure to surrender a sufficient quantity of compliance instruments unless the untimely surrender requirements of section 95857 are not met. However, we believe that a "per ton" penalty is inappropriately high, and should instead be one violation per 1000 tons, as suggested earlier. As written, section 96014(a) and (b) appear to impose penalties twice for the same shortfall in allowance surrender, except that the penalty in (b) is "per ton, per day." We suggest that ARB either delete (b), or clarify (b) to impose only a "per day" penalty for allowance surrender after the end of the untimely surrender period (with the "per 1000 tons") penalty applied once pursuant to (a). Section 96014(c) appears redundant and unnecessary, since the violations specified there would already be considered violations under the general obligations referenced in (d). We recommend that ARB either delete (c), or revise (d) to state that a submission may be considered a violation under (c) or under (d), but not both. Modify section 96014as follows:

(a) If an entity fails to surrender a sufficient number of compliance instruments to meet its compliance obligation as specified in sections 95856 or 95857, and the procedures in 95857(c) have been exhausted, there is a separate violation of this article for each 1000 required compliance ~~instrument~~instruments that ~~has~~have not been surrendered, or otherwise obtained by the Executive Officer under 95857(c).
~~(a) There is a separate violation for each day or portion thereof after the end of the Untimely Surrender Period that each required compliance instrument has not been surrendered.~~
(~~c~~b) It is a violation to submit any record, information or report required by this article that:

(1) Falsifies, conceals, or covers up by any trick, scheme or device a material fact;
(2) Makes any false, fictitious or fraudulent statement or representation;

(3) Makes or uses any false writing or document knowing the same to contain any false, fictitious or fraudulent statement or entry; or

(4) Omits material facts from a submittal or record.

(~~d~~c) The violations stated in section 96014(~~c~~b) are in addition to an entity's obligations under other provisions of this article requiring submissions to ARB to be true, accurate and complete. A submission may be considered a violation of section 96014(b) or of the obligations referenced in this section 96014(c), but not both. (PGE4, WSPA3)

Response: We did not bundle the allowances into 1,000 allowance units for purposes of determining penalties. One metric ton of CO_2e is the basic unit for both reporting under the MRR and for compliance or trading under the cap-and-trade regulation. It is therefore an appropriate unit by which to count violations under both rules. Moreover, Health and Safety Code section 38580(b)(3) authorizes ARB to define penalties on a per-unit basis, proportional to the conduct, rather than defining violations purely in terms of days. Moreover, we revised the penalty structure to provide that penalties for unsurrendered allowances accrue every 45 days, rather than having them accrue daily. This provides flexibility to the compliance entity to obtain additional allowances, either through an auction or by purchasing them through the allowance price containment reserve. It also reduces the potential liability for compliance entities. We did not make the requested modification to section 96014(d), which would unnecessarily limit ARB's ability to pursue enforcement actions, should we deem it necessary depending on all relevant circumstances.

J-28. Comment: Sections 95857 and 95858 discuss the enforcement provisions associated with the "Untimely Surrender of Compliance Instruments" and "Compliance Obligations for Under-Reporting." The relationship between these two provisions isn't well articulated in the Regulation. In addition, it appears that these provisions, along with the enforcement provisions under the Monitoring and Reporting Rule in section 95107(b) could result in double enforcement. Another concern is that while section 95858 provides for a notification from ARB when there has been under-reporting, there doesn't appear to be the same notification in section 95957. This is particularly of concern since section 95857(b)(l) appears to provide a short window to obtain the necessary additional allowances before a penalty of four times the missing allowances is required. (UNITEDAIRLINES2)

Response: We believe that the cross-references between sections 95857, 95858, and 96014 are sufficiently clear. Regarding the commenter's concern with layering of penalties between the MRR and the cap-and-trade regulation, we note that violations for under-reported tons and failures to measure in the manner required by the MRR will be dealt with solely under the MRR enforcement provisions. In terms of the cap-and-trade regulation, once a covered entity reports its emissions under the MRR, those emissions are then verified, and the covered entity receives either a positive, qualified positive, or adverse emissions verification statement. In the event of either a positive or qualified positive verification statement, the entity's cap-and-trade compliance obligation is equal to one allowance for each ton emitted. If a covered entity receives an adverse verification statement under the MRR, ARB will calculate and assign the covered entity's emissions level pursuant to section 95131(c)(5) of the MRR, and that level will become the covered entity's cap-and-trade compliance obligation. In either instance, if the covered entity is found (either in the current year or in a later year) to have under-reported its emissions, the penalty for the under-reporting will be wholly contained in the MRR—without the possibility of overlapping cap-and-trade penalties. On the other hand, failure to surrender sufficient compliance instruments, based on either an assigned emissions level or on a positive or qualified positive emissions level, will be subject to the penalty contained in the cap-and-trade regulation. Finally, we reiterate that the additional surrender obligation is not a penalty, per se. Rather, it is an additional incentive to ensure compliance with the regulation's surrender obligations.

Conflict Resolution

J-29. (multiple comments)
Comment: Currently, CARB's EO retains sole authority of program implementation of both the Cap and Trade and Mandatory Reporting Regulations, including determining whether regulated parties have complied with regulations and setting the penalties for such program violations. These important decisions will be made unilaterally without a public process and will have an impact on California businesses. It is important for these regulated entities to have a fair and transparent process by which to appeal a decision. CalChamber supports the adoption of a formal autonomous dispute resolution process that would enable facilities to challenge and resolve disagreements prior to potential enforcement actions through an equal process for all parties involved in any dispute. We believe this program should use an unbiased mechanism to resolve disputes, variances and penalty disagreements with the EO. Without a fair, independent process, an entity's options are limited. Currently, an entity's only recourse is to challenge the decision in court, which requires significant resources and time. Lawsuits are not only costly but rarely solve the underlying problem. We are proponents of a transparent process that helps reduce money and time spent defending lawsuits so that regulated entities can instead focus their time and efforts on job creation and economic stimulation. Without a fair and transparent dispute resolution process, issues that could be resolved relatively quickly could become time-consuming litigation that could hinder the goals of AB 32. (CALCHAMBER3)

Comment: Currently, the Cap and Trade and Mandatory Reporting Regulations give CARB's Executive Officer sole authority on program implementation, including determining whether regulated parties have complied with the Regulations and to determine penalties. Absent costly and time consuming litigation, there is currently no independent administrative option for stationary source facilities to challenge the Executive Officer's decisions that could not be resolved. CLFP believes the Executive Officer should not have the final decision on such a comprehensive program as AB 32, and instead it would be in both CARB's and the regulated industry's best interest that a formal, autonomous dispute resolution process should be established in order to provide independent decision making with equity for all parties involved in any dispute. This program should use an unbiased mechanism to resolve disputes, variances and penalty disagreements with the Executive Officer. Without such a program, issues that could be resolved relatively quickly could become time-consuming litigation which could hinder the goals of AB 32. (CALFP3)

Comment: Currently the cap-and-trade and mandatory reporting regulations give CARB's Executive Officer sole authority on program implementation, including determining whether regulated parties have complied with regulations and to determine penalties. The AB 32 IG believes the Executive Officer should not have the final decision on such a comprehensive program as AB 32, and instead it would be in both CARB's and the regulated industry's best interest that a formal, autonomous dispute resolution process should be established in order to provide independent decision making with equity for all parties involved in any dispute. This program should use an unbiased mechanism to resolve disputes, variances and penalty disagreements with the Executive Officer. (AB32IG2)

Comment: We strongly recommend that the Board direct staff to develop regulations for the operation of an independent administrative dispute resolution body. The sole purpose of this entity would be to adjudicate efficiently and fairly those factual, legal and jurisdictional disputes that inevitably will arise in the implementation of the AB 32 program. The absence of such an expert administrative dispute resolution body will not prevent controversy from arising. Indeed, in the absence of such an entity, aggrieved parties will simply take their disputes to courts of law. We strongly believe that an independent dispute resolution entity nested within the ARB can provide a fair and efficient means of adjudicating most disputes, thus assuring the smooth operation of the program and minimizing time delays, uncertainties and compliance costs. While there are a variety of disputes that could arise under the program, among the first will be disputes regarding actual emissions from covered entities (including staff decisions regarding "assigned emissions"). These may arise as the ARB staff attempts to apply different emission factors or missing data assumptions to covered entity operations. Another area of potential dispute may be whether offsets have properly been verified and, if so, what level of emission reductions they represent. There are innumerable situations under such a comprehensive regulatory program in which such factual, legal and jurisdiction disputes will arise. (CCC2)

Comment: Continue to work with stakeholder to provide a consistent mechanism to provide variances and resolve disputes. This Regulation and the other AB 32 regulations will apply to many facilities that have not previously been subject to ARB's regulations. These Regulations also provide significant discretionary authority to the Executive Officer. Shell is committed to our goal of full compliance with environmental regulations. However, we believe there will be situations where legitimate differences in interpretations and assessment of circumstances may require variances to address compliance issues that arise that are beyond the control of the entities or dispute resolution, which are best handled by an independent reviewer. Shell recognizes that

ARB currently disagrees with this position but requests that ARB continue to work with stakeholders to provide a consistent mechanism to resolve this issue. (SHELLOIL)

Response: The Executive Officer does not unilaterally "set" penalties. Health and Safety Code section 38580 provides ARB with enforcement authority over AB 32 regulations, including the authority to define the violations. This authority does not extend to assessing, imposing, or determining final penalty amounts. The governing statutes allow ARB to *seek* penalties in an administrative or judicial proceeding. In many of its enforcement actions, ARB and the entity from whom ARB is seeking penalties will reach a mutual settlement agreement, including an agreed upon penalty amount. ARB may seek penalties in an administrative or judicial action, in which the ultimate penalty amount is determined by a neutral judge, based on the statutory penalty structure. In no instance is ARB or its Executive Officer able to unilaterally assign a penalty amount on a violator.

Additionally, we note that the creation of a dispute resolution process is outside and beyond the scope of these regulatory amendments. Notwithstanding this, we disagree with the underlying premise of the commenter's suggestion; namely that there is no fair, independent, autonomous method of resolving these disputes. As the commenter acknowledges, the existing recourse is to challenge a decision in court. That process is well established and understood by regulated entities, the public, and ARB. Inventing a new, additional dispute resolution process, whether that would be through the creation of a hearing board or an administrative hearing, will not necessarily reduce the time or expense of resolving such disputes. In fact, and contrary to the claimed rationale of the commenter, ARB believes such additional process may actually increase the time and expense of resolving these matters, since parties could still ultimately end up back in court. Including an additional dispute resolution process would give rise to delay that could have broad market impacts. As such, ARB does not agree that including such a process would be appropriate.

Regarding variances, we do not believe the "variance" process used by the local air districts is necessary for the MRR or cap-and-trade regulations, and believe that it could disrupt the market features of the cap-and-trade regulation, which relies on the emissions data reports from the MRR. Unlike the future emissions addressed by local air district variance processes, the emissions at issue in the MRR and the cap-and-trade program have already occurred and been reported to ARB. As such, no "variance" is required, and as such, the formal variance process used by the air districts would be inappropriate for the MRR. In addition, instead of a formal variance process, the MRR includes a process by which a facility may petition for an interim data collection method under certain circumstances that would otherwise result in loss of data for unforeseen reasons. The MRR also contains a petition process for when a reporting entity and its verifier do not agree on the quality of the emissions data report.

ARB Jurisdiction

J-30. Comment: We strongly recommend that ARB retain the ability to enforce against negligent actions, and strict liability for errors and omissions, etc. While we agree that severe penalties should apply to knowing and intentional violations, intent can be very difficult to establish, and it is important for the integrity of the program that lesser violations be subject to enforcement action, and penalty amounts up to the limits prescribed in the Health and Safety Code. ARB always retains the ability to use its enforcement discretion, should it feel that the facts do not warrant those penalty levels. (CAPCOA2)

> **Response:** While the comment does not refer to any specific modifications to the cap-and-trade regulation, we appreciate and agree with the commenter's recommendation. Existing statutes provide for different penalties based on different mental states; namely, strict liability, negligence, knowledge, and intent.

J-31. Comment: In all places where the rules refer to the enforcement authority of the State of California, or to the authority of the Executive Officer of the ARB, it should be noted that such authority is conferred on any agent officially designated or recognized as having such authority, or authorized by law to enforce these rules. (CAPCOA2)

> **Response:** ARB believes that it has drafted the enforcement provisions consistently with the authority granted to us by AB 32. As such, we did not make the requested change.

J-32. Comment: Under proposed modified section 95921, ARB creates rules relating to the conduct of trading in compliance instruments. In effect, ARB grants the Executive Officer the ability to reverse transactions that violate, in part, holding limits specified in section 95920. We understand the need for ARB to develop an enforcement mechanism for these rules. However, IETA is concerned that the mechanism outlined in section 95921 provides ARB an unprecedented enforcement power, which ultimately could be detrimental to trading liquidity and the ability for entities to hedge price risk and comply with carbon reduction targets at the lowest possible cost. Reversing commercial transactions between counterparties creates a host of contractual and compliance issues. A fundamental tenet of a properly functioning market is that commercial contracts between counterparties cannot be unwound. An obligation to sell allowances to another counterparty must be met, and once the transfer of allowances and cash has taken place counterparties cannot be expected to reverse this transaction. To create the possibility of a transaction reversal would introduce an unacceptable measure of risk to carbon transactions. Sellers would be exposed to undue price risk in the interim between the transaction and the transfer, and a reversal might present market risk that impedes implementation of hedging strategies. Furthermore, such reversals may create a daisy chain of violations of holding limit provisions. In the instance of ARB reversing a transaction, the buyer of allowances will return the allowances to the seller. The seller may have sold the allowances to ensure it did not violate its own holding limits, and the return of allowances from the reversed transaction might then put the seller over its holding limit. This would, in turn, generate another series of reversals that would impact still other counterparties. Importantly, a seller will have no insight into the holdings of the buyer, and therefore should not be responsible for returning cash to the buyer and taking back allowances in instances where the seller is over the proposed holding limit. IETA, instead, suggests ARB consider enforcement provisions for Holding Limits in which the responsibility rests solely on the entity in violation of these provisions. IETA encourages ARB to consider such enforcement that does use market transactions (or reversal thereof) as the mechanism for compliance. (IETA3)

> **Response:** The essence of the regulation is that ARB's approval is required before a contract can be fully executed, i.e., the owner of the allowance does not have the ability to transfer allowances. In effect, the contract is not approved until ARB is satisfied that the transfer meets all of the regulation’s requirements, thus there is no reversing of commercial transactions contemplated by the regulation. ARB has no interest in upsetting the commercial market by unwinding completed contracts (where there has been no fraud on the regulatory regime), and it requires complete transparency of allowance movement via the regulations. The comment raises an example for the necessity of the regulation: the seller cannot know whether the holding limits would be violated by a proposed contract. The regulation provides ARB with notice of all allowance transactions before they are completed, so that the holding limit can be enforced. The comment proposes after-transaction attempts to enforce its regulations—prevention of violations is preferable both for the market and the regulator.

Jurisdiction of California

J-33. Comment: Section 96022 is duplicative to Section 96010. The Utilities recommend deleting this section all together since jurisdiction is fully covered in greater detail in section 96010. Modify section 96022 as follows:

> ~~Any party that participates in the Cap and Trade Program is subject to the jurisdiction of the State of California~~. (MID3)

> **Response:** We understand the commenter’s concern, and we will continue to discuss this issue with stakeholders and propose any changes as needed.

J-34. Comment: Section 90622 has been modified to attempt to ensure that all program participants are subject to the jurisdiction of California. Similar language is included in a number of places where the participant is required to certify that he or she consents to that jurisdiction. We suggest that the language in section 96022 and other certification sections be broadened to ensure that participants are subject to (1) service of process in California (by requiring them to designate a registered agent for service of process); (2) choice of law (i.e. disputes will be governed by California law); and (3) jurisdiction and venue in California (may prefer that for out-of-state participants, venue will be in Sacramento). Language accomplishing these three purposes is contained in SCAQMD's RECLAIM Rule, which may be adapted for this purpose. Please see

SCAQMD Rule 2007(e)(2)(J) for example. (SCAQMD4)

Response: We do not believe that the requirements stated by the commenter are appropriate at this time. Sections 96022 and 96010 both require that any entity participating in the cap-and-trade program submit to the jurisdiction of California. If obtaining service of process becomes problematic, we are prepared to amend the regulation at a later time.

J-35. Comment: Certifications currently state, "I certify under penalty of perjury under the laws of the State of California… is true, accurate, and complete." To be consistent with certifications made under the CAA for other programs, the language should be modified to state, "I certify under penalty of perjury under the laws of the State of California… is, to the best of my knowledge, true, accurate, and complete." (VALERO2)

Response: We understand the commenters concern, and we will continue to discuss this issue with stakeholders and propose any changes as needed.

Miscellaneous

J-36. Comment: It is critical that ARB's decision to begin enforcement in 2013 not lead to any delay in the launch or operation of the program. (KUSTIN16)

Response: The comment does not request any modifications. However, we do not believe the decision to begin enforcement in 2013 will lead to any delay in the launch or operation of the program.

J-37. Comment: The Utilities support the clarification of the penalty amount determination provided for in Subarticle 15. Unfortunately, the Utilities continue to have concerns with the way violations are calculated in section 96014. (MID3)

Response: The comment does not request any modifications. We responded to specific concerns and requested modifications throughout the other responses to comments related to the enforcement provisions.

Support

J-38. Comment: We support and appreciate ARB's revision of section 96014, which specifies what constitutes a violation under the rule and triggers the penalty provisions in the Health and Safety Code. The previous iteration of the rule left some ambiguity on what conduct, short of a covered entity failing to meet its compliance obligation, constituted a "violation" and thereby authorized ARB to pursue administrative penalties as an enforcement mechanism. ARB's retooled approach in section 96014(c) eliminates any uncertainty and will help encourage compliance from all entities who participate in every aspect of the program. (KUSTIN16)

Response: The comment does not request any modifications. We appreciate the commenter's support for this program.

J-39. Comment: EDF supports the proposed improvements to the regulatory enforcement and oversight provisions. These expanded provisions in the 15-day change document create significant new safeguards by ensuring that CARB has enough information at its disposal to pursue violations with civil penalties, seek out additional reductions (replacement credits) as needed, and ensure the regulation works without fraud or manipulation. With the incorporation of a regimented enforcement tracking system and market manipulation oversight board, CARB and its appointed officers will have enough information to be able to detect and ameliorate fraudulent transactions that may occur within the credit trading market prior to credits being surrendered for compliance. Such provisions also serve as a strong deterrent to fraud and malfeasance. EDF strongly supports these proposed improvements. (EDF4)

Response: The comment does not request any modifications. We appreciate the commenter's support for this program.

J-40. Comment: As revised below, we support ARB's proposed amendments to reference violations as specified in section 96014 and to reference the statutory penalty factors specified in Health and Safety Code Section 42403(b):

(b) Penalties may be assessed pursuant to Health and Safety Code section 38580 for any violation of this article as specified in section 96014. In determining any penalty amount, ARB shall consider all relevant circumstances, including the criteria in Health and Safety Code Section 42403(b)<u>, and the degree of culpability for the violation.</u> (PGE4, WSPA3)

Response: We did not make the requested modification. Under Health and Safety Code section 42403(b), which is explicitly referenced in section 96013 of the modified cap-and-trade regulation, ARB must consider intent or its absence when seeking any penalty amount. As such, the requested modification is unnecessary.

K. LEGAL

Authority to Raise Revenue

K-1. Comment: Some question has arisen about the legality of section 95892(a) with regard to CARB's ability to issue guidance or regulation on how allowance proceeds can or should be used. Although EDF leaves that answer to the agency and the legislature, we observe that the text of AB 32 supports the Regulation's current language, wherein under AB 32 CARB shall "adopt regulations governing how market-based compliance mechanisms may be used by regulated entities subject to greenhouse gas emission limits … to achieve compliance with their greenhouse gas emissions limits." (EDF4)

> **Response:** We thank the commenter for the support of ARB's regulations.

Comment Period

K-2. Comment: NAIMA's comments have been largely ignored. The public comment process seems to have been a mere formality without any of the extensive dialogue and exchange of information between NAIMA and CARB resulting in modifications to CARB's regulatory proposal that accommodates manufacturers struggling to do business in California. (NAIMA2)

> **Response:** We did receive and review the comments submitted by NAIMA. We held over 40 workshops during the development of this regulation and provided many opportunities for stakeholders to provide input. The specific topics within those comments are being addressed as part of the Final Statement of Reasons within the respective subject matter areas.

General

K-3. Comment: We have not seen any response to our prior December 13, 2010, comment on the fatal flaws of the greenhouse gas offset program and protocols, or our July 30 and August 1, 2008, comments on the flaws of Cap and Trade with offsets as an approach to addressing greenhouse gases. Not only did CARB fail to respond in writing to our comments, but CARB also failed to respond in writing to other commenters who described the flaws of offsets and their potential to undermine the integrity of the AB 32 program. The San Francisco Superior Court decision dated March 18, 2011, states that CARB is required to respond to comments prior to making a decision. We do not believe it is legal for CARB to move forward with adopting or approving the offset program and/or protocols until our comments have been presented to the Board and responded to in writing. See Superior Court Decision at p.33, citing California Code of Regulations, Title 17, section 60007(a). (WILLIAMSZ2)

> **Response:** The Administrative Procedure Act (APA) requires ARB to respond to all written comments received during any open comment periods in the Final

Statement of Reasons. However, it is not required by the APA that these responses be sent to the commenter making the comment, nor is it required that the responses be completed at the time of the Board hearing. ARB is required to respond to comments related to its CEQA analysis (Appendix O of the Initial Statement of Reasons) prior to adoption of the regulation. ARB circulated the *Response to Comments on the Functional Equivalent Document Prepared for the California Cap on GHG Emissions and Market-Based Compliance Mechanisms* prior to the Board's hearing on October 20, 2011, and considered those responses prior to adopting the regulation. The court order cited by the commenter is stayed pending appeal.

Dispute Resolution Process

K-4. Comment: CCEEB recommends that ARB establish an independent administrative dispute resolution process that will provide a fair, efficient, and predictable process available to all individual facilities. This will reduce the money and time spent defending lawsuits and in informal negotiations. It will also increase the transparency of the appeal process as all interested stakeholders can weigh-in during a hearing. The proposed dispute resolution process could be modeled after existing air pollution hearing processes for disputes at individual facilities that occur under local air district rules. (CCEEB3)

Response: As noted previously in responses to 45-day comments, ARB did not implement this recommendation. Whether a covered entity surrenders sufficient allowances is not a question that lends itself to an administrative dispute resolution.

Does Not Meet AB 32 Requirements

K-5. Comment: The proposed program and protocols do not meet the requirements for greenhouse gas offsets in AB 32. The proposed regulation provides admissions of uncertainty and unenforceability. For example, the statement at page 9, (35) "Business-as-Usual Scenario" means the set of conditions reasonably expected to occur within the offsets project boundary in the absence of the financial incentives provided by offset credits, taking into account all current laws and regulations, as well as current economic and technological trends. "Reasonably expected to occur" in this context is speculative and subjective and cannot be part of an enforceable standard." In addition, offset credits are to be provided for many activities that have already occurred as part of "early action." Further, actions that are admittedly part of business as usual, such as activities that are "significantly better than average" are defined as "additional" for purposes of the offset protocols. (See Staff Reports for three of the proposed Offset Protocols dated October 28, 2010; page 5 of the Manure Digesters Protocol, p.6 of Ozone Depleting Substances, p. 5 Urban Forests Protocol). These flaws and others discussed in our December 13, 2010, comment will be a system that claims reductions based on activities that cannot be verified to be additional to what would have happened in the absence of the offset payments. This in turn will result in false accounting and a false sense of security that the problem is being successfully addressed. The program will also fail to correct the incentives that keep greenhouse gas emissions at dangerous, unsustainable levels, thereby locking in additional climate degradation. Therefore, offsets should not be part of the AB 32 program to reduce greenhouse gas emissions. (WILLIAMSZ2)

> **Response:** This comment does not address proposed 15-day changes to the regulation. Furthermore, as each offset protocol is developed, we will set conditions and criteria that ensure that the resulting offset credits meet the AB 32 criteria through conservative and well-quantified methods.

K-6. Comment: Did CARB determine that the proposed regulation's treatment of DWR and its water customers is equitable as required by AB 32? If so, what is the basis for that determination? (DWR2)

> **Response:** AB 32 requires that GHG reductions be achieved through cost-effective methods for the largest GHG emitters for the State of California. By implementing a market-based program, certain commodities will have a carbon price to incent changes in behavior to reduce the associated GHG emissions. DWR is provided equal treatment under the program as other sectors that provide goods, with similar potential leakage, and ability for cost pass-through to end users. To that extent, the DWR customers are treated equitably as customers of any other products from sectors with similar leakage and cost pass-through circumstances.

K-7. Comment: Did CARB determine that the proposed regulation's treatment of DWR and its water customers will achieve reductions in greenhouse gas emissions that are real, permanent and quantifiable, as required by AB 32? If so, what is the basis for that determination? (DWR2)

> **Response:** These specific criteria apply to GHG reductions used for compliance from voluntary action such as offsets. The rigorous reporting and verification requirements for DWR will ensure that any changes in emissions are quantifiable and real.

K-8. Comment: Did CARB determine that the proposed regulation's treatment of DWR and its water customers is a cost-effective method for achieving greenhouse gas emissions reduction, as required by AB 32? If so, what is the basis for that determination? (DWR2)

> **Response:** All regulations developed by ARB must undergo a cost analysis with findings published in the Staff Report. Furthermore, the Scoping Plan FED identified a cap-and-trade program as the best strategy to meet the AB 32 GHG emissions reduction targets in a cost-effective manner.

K-9. Comment: The proposed 15-day modifications negatively impact California's economy. The modifications do not remedy the Regulation's failure to capitalize on the opportunity to create well-paying green jobs in California and fuel a green economic revolution. The Regulation forgoes the economic and public health benefits from in-state reductions, favors out-of-state reductions from virtually unlimited offsets, and creates a vastly complicated and unproven mechanism—cap and trade—that will likely fail to deliver on AB 32 ultimate goal of reducing GHG emissions in a thoughtful and equitable manner by 2020. Questions about the efficacy, fairness, and economic soundness of this Cap and Trade Regulation have been posed by various organizations, including the Legislature, and the modifications do not address any of these questions. (CRPE4)

> **Response:** This comment does not address proposed 15-day changes to the regulation; rather, it reiterates comments made during the initial 45-day comment period. No response is required. However, we have addressed all public comments as part of this FSOR.

K-10. Comment: ARB should halt development and implementation of this modified Cap and Trade Regulation until questions about the appropriateness of a cap and trade system to meet all the requirements of AB 32 can be answered. (CRPE4)

> **Response:** This comment does not address proposed 15-day changes to the regulation; rather, it reiterates comments made during the initial 45-day comment period. No response is required. We believe the cap-and-trade program is designed to meet all of the requirements under AB 32 to help California reach its GHG emission reduction targets.

K-11. Comment: The modified regulation continues to fail to achieve maximum environmental and economic benefits for California, as required by AB 32. Under the modifications, compliance with the program doesn't begin until 2013. Since the "cap" begins at a business as usual amount, there are no reductions required that year. Offsets and free allowances provide no economic benefits for California. Under the Regulation, entities can use out of state offsets to meet their emission reduction requirements. This sends green jobs, and the environmental benefit of the reductions, out of the state of California. In addition, agricultural emissions, a major greenhouse gas contributor, are still not regulated. Nothing in the modifications changes these fundamental flaws in the Regulation. (CRPE4)

> **Response:** The cap-and-trade regulation is one of several strategies designed to achieve AB 32 mandates. Taken together, these strategies do achieve the environmental and economic benefits for California as required under AB 32. This comment does not address 15-day changes to the regulation; rather it reiterates comments made during the initial 45-day comment period. No further response is required.

Environmental Justice

K-12. Comment: The proposed 15-day modifications do not remedy the regulation's violation of AB 32 to avoid disproportionate impacts on low-income communities and communities of color. ARB's quest to reduce greenhouse gas (GHG) emissions and to build upon California's tradition of environmental leadership both nationally and internationally should not come at the expense of these communities. The Regulation continues to accept and promote the disparate and discriminatory treatment of the most vulnerable communities in our State. (CRPE4)

> **Response:** This comment does not address proposed 15-day changes to the regulation; rather, it reiterates comments made during the initial comment period. No response is required. However, we maintain the regulation is non-discriminatory and does not promote disparate treatment of any population in the State.

Consideration of Alternatives

K-13. Comment: ARB continues along two irreconcilable tracts by working on the Supplemental Functional Equivalent Document for alternatives to the Scoping Plan while also continuing to develop and modify the Cap and Trade Regulation. It is impossible to perform a meaningful and good-faith alternatives analysis that will inform the Board's decision making, when ARB simultaneously develops and implements the very plan for which it is supposedly reviewing alternatives. This basic fact, which seems to escape ARB, is obvious to the Superior Court, the Legislative Analyst's Office (LAO), and the public. The LAO recommended that the Legislature direct ARB to halt work on the Regulation until ARB completed and presented to the Legislature an analysis of alternatives to Cap and Trade. Continuing to develop this Regulation while, at the same time, claiming to analyze potential alternatives is disingenuous. ARB should not continue modifying and developing this Regulation until it performs a good faith and meaningful analysis of alternatives. Given that the modifications seek to push the compliance obligation back to 2013, ARB has no excuse as to why it can't stop and review alternatives that will get better reductions, enhance California's economy, and fairly reduce greenhouse gases and co-pollutants across all California communities. (CRPE4)

> **Response:** This comment does not address proposed 15-day changes to the regulation; rather, it reiterates comments made during the initial 45-day comment period. ARB has performed a meaningful and good faith analysis of alternatives to the Scoping Plan, while continuing its work on the development of the proposed cap-and-trade regulation. At the August 24, 2011, Board hearing, the Board reviewed ARB's Supplement to the FED for the Scoping Plan, which provided an expanded analysis of alternatives. After reviewing the Supplement and the public comment on the Supplement and responses to those comments, the Board determined that the Proposed Scoping Plan presented the best alternative.

In relation to the pending litigation, ARB applied for and the Court of Appeal granted a stay of the Superior Court order the commenter references. Further, the California Supreme Court has since denied a petition to review the Court of Appeal's stay.

Finally, the Board considered the 15-day changes to the proposed cap-and-trade regulation, as well as the comments on the Cap-and-Trade FED (Appendix O) and ARB's responses to those comments, and approved the cap-and-trade regulation at its meeting on October 20, 2011.

K-14. Comment: ARB should not continue to develop, modify, or implement the Cap and Trade Regulation. The undersigned organizations ask ARB to halt all work on the Regulation until a meaningful alternatives analysis can to be done and the Board can decide whether Cap and Trade is the best way to achieve maximum reductions, while boosting California's green economy and being mindful of California's already over-burdened communities. If ARB refuses to discontinue developing the Cap and Trade Regulation, then it must recirculate the FED and have the final language of the Regulation go back to the Board for review, response to comments, and final decision. (CRPE4)

Response: See the previous response.

Violates CEQA

K-15. Comment: ARB's process violates CEQA. On December 16, 2010, the Board passed Resolution 10-42 to approve the Cap and Trade Regulation. The Board did not respond to public comment before it approved and instead directed the Executive Officer to evaluate and prepare responses. While final adoption is delegated to the Executive Officer, the Board has approved the Regulation without seeing the final "adopted" Regulation unless the Executive Officer determines it is warranted. Since the Board's adoption in December 2010, there have been five workshops to discuss various components of the Cap and Trade Regulation. The current modifications are supposed to address some of the public's concerns voiced during these workshops, and include modifications adopted in the December Resolution. The Resolution allows the Executive Officer to modify the Regulation that was before the Board in December 2010 within his discretion, without limits, and without requiring the Board to review the final regulation before it is approved. The Executive Officer, who is not a public official, reviews and responds to public comments on the modifications and determines whether the Regulation should be presented to the Board for further consideration. Given the complexity and the enormous impact and reach of the modified rule, the Board, not the Executive Officer, must review, respond to comments, and make a final decision. Thus, the Board has not completed its required environmental review before approving the project. This process violates CEQA. (CRPE4)

Response: Board Resolution 10-42 directed staff to finalize the cap-and-trade regulation. The resolution specifically indicates on page 10 that the regulation is not approved, and that the Executive Officer may bring the regulation back to the Board for its approval. The Board approved the regulation at its meeting on October 20, 2011.

Auction

Allowance Price

K-16. Comment: Section 95921(d) delineates the release and protection of transaction price and quantity information. WSPA believes that release individual transaction price and quantity information does not provide adequate confidentiality protection. WSPA recommends that this section be amended to require release of transaction price and quantity in an aggregated format for confidentiality protection. (WSPA3)

Response: Section 95921(d) does not indicate that individual transaction prices will be released. What data will be released and when is a question of implementation. ARB appreciates the complexity of protecting confidential business information and its relationship to the integrity of the allowance market.

Authority to Regulate

K-17. Comment: CSCME is pleased that CARB recognizes that a public notice and comment period would be required prior to implementation of any command-and-control measures requiring that firms take certain actions identified as cost-effective in each individual firm's Energy Efficiency and Co-Benefits Audit ("EEA"). CARB should not implement new command-and-control measures on top of existing cap-and-trade measure. CARB lacks legal authority to implement such a command-and-control provision to regulate emissions other than greenhouse gas ("GHG") emissions under AB 32. By utilizing the proposed command-and-control approach to require all cost-effective actions identified in EEAs, CARB would exceed its legislative delegation under AB 32 to regulate solely GHG emissions. In addition to GHG emissions, EEAs will consider criteria air pollutants and toxic air contaminant emissions. Although the legislature could have given authority to CARB to regulate other emissions under AB 32, it did not do so. Thus, CARB would exceed its authority by considering criteria pollutants in determining which measures are cost-effective. (CSCME4)

Response: This comment is not directed at changes to the cap-and-trade regulation, rather it is directed to the potential outcome of ARB's Energy Efficiency and Co-Benefits Audit and the relationship between that regulation and the cap-and-trade regulation. Any additional changes to either regulation (or any new regulation) would be subject to a new public process under the Administrative Procedure Act.

K-18. Comment: Western, a federal agency, continues to express concerns that CARB's regulations include Western as a regulated entity. The Supremacy Clause of the United States Constitution does not allow a state to directly regulate the federal government without its consent or within a field regulated entirely by the federal government. Western understands CARB believes the Clean Air Act provides a waiver of sovereign immunity for these regulations. While Section 118 of the Clean Air Act, 42 U.S.C. section 7418, provides a limited waiver of sovereign immunity and under certain circumstances requires federal facilities to comply with federal, state, interstate and local requirements for the abatement of air pollution to the same extent as any nongovernmental entity, under the Act, there must be an action by the United States to delegate authority over cap and trade for greenhouse gases to the state before a federal agency may comply with state regulations. As of this writing, neither the U.S. Congress nor the EPA has promulgated any such cap and trade laws or regulations. There is no waiver of sovereign immunity and Western does not have authority to bind Congress, EPA or other federal agencies with jurisdiction over such matters. Furthermore, these regulations directly impact Western's primary mission of marketing federal power, a field regulated entirely by the federal government. Therefore, Western continues to believe the regulations should not include Western as a regulated party. Western will continue to work with the state and may voluntarily participate in cap and trade. However, at this time, Western cannot consent to direct state regulation. Modify section 95802(a)(246) as follows:

> (246) "Retail Provider" means an entity that provides electricity to retail end users in California and is an electric corporation as defined in Public Utilities Code section 218, electric service provider as defined in Public Utilities Code section 218.3, local publicly owned electric utility as defined in Public Utilities Code section 224.3, a community choice aggregator as defined in Public Utilities Code section 331.1~~, or the Western Area Power Administration~~. For purposes of this article, electrical cooperatives, as defined by Public Utilities Code section 2776, are excluded.

(or)

> (246) "Retail Provider" means an entity that provides electricity to retail end users in California and is an electric corporation as defined in Public Utilities Code section 218, electric service provider as defined in Public Utilities Code section 218.3, local publicly owned electric utility as defined in Public Utilities Code section 224.3, a community choice aggregator as defined in Public Utilities Code section 331.1, ~~or the Western Area Power Administration~~. <u>Federal agencies, including Western Area Power Administration (WAPA) may voluntarily participate under these regulations.</u> For purposes of this article, electrical cooperatives, as defined by Public Utilities Code section 2776, are excluded. (WAPA2)

> **Response:** This comment does not address the 15-day changes to the regulation and restates the commenter's already expressed belief that it is not subject to the regulation because it is a federal agency. ARB continues to disagree with that assertion. Please refer to responses to Comments K-8 and K-9 in the 45-day responses.

K-19. Comment: BPA strongly disagrees with ARB that it has “authority” to regulate BPA and that BPA is “required” to comply. BPA wishes to make clear that BPA is participating in California’s GHG reporting program and cap and trade program purely on a voluntary basis. BPA is not conceding that California has any jurisdiction over BPA. Sovereign immunity may prevent BPA (and similarly WAPA) from being subject to these regulations. Despite ARB’s position that the Clean Air Act waives sovereign immunity, it is questionable whether that waiver would cover BPA because it is purely a marketer that is not engaged in an activity that discharges pollutants. Although BPA intends to voluntarily comply with these regulations, BPA is concerned that mandatory regulations could interfere with its existing contracts and conflict with the marketing scheme established by Congress in BPA’s governing statutes. Moreover, because BPA is willing to voluntarily comply, it is not necessary for ARB to include these jurisdictional assertions in its rules. Doing so could unnecessarily raise complicated legal issues that are unnecessary to fully and timely implementation of the greenhouse gas reporting rules and/or the cap and trade program. Modify section 95802(a)(84) as follows:

> (84) “Electricity importers” are marketers and retail providers that hold title to imported electricity. For electricity delivered between balancing authority areas, the entity that holds title to delivered electricity is identified on the NERC E-tag as the purchasing-selling entity (PSE) on the tag’s physical path, with the point of receipt located outside the state of California, and the point of delivery located inside the state of California. ~~Federal and s~~<u>S</u>tate agencies are subject to the regulatory authority of ARB under this article and include ~~Western Area Power Administration (WAPA), Bonneville Power Administration (BPA), and~~ California Department of Water and Power (DWR). When PSEs are not subject to the regulatory authority of ARB, including tribal nations, the electricity importer is the immediate downstream purchaser or recipient that is subject to the regulatory authority of ARB.

(or)

> (84) “Electricity importers” are marketers and retail providers that hold title to imported electricity. For electricity delivered between balancing authority areas, the entity that holds title to delivered electricity is identified on the NERC E-tag as the purchasing-selling entity (PSE) on the tag’s physical path, with the point of receipt located outside the state of California, and the point of delivery located inside the state of California. ~~Federal and s~~<u>S</u>tate agencies are subject to the regulatory authority of ARB under this article and include ~~Western Area Power Administration (WAPA), Bonneville Power Administration (BPA), and~~ California Department of Water and Power (DWR). <u>Federal agencies, including Western Area Power Administration (WAPA) and Bonneville Power Administration (BPA), may voluntarily participate under these regulations.</u> When PSEs are not subject to the regulatory authority of ARB, including tribal nations, the electricity importer is the immediate downstream purchaser or recipient that is subject to the regulatory authority of ARB. (BONNEVILLEPWR2, WAPA2)

Response: This comment does not address changes to the regulation and restates the commenter's already expressed belief that it is not subject to the regulation because it is a federal agency. ARB continues to disagree with that assertion. Please refer to responses to Comments K-8 and K-9 in the 45 day responses.

Tribes: Various Topics

K-20. Comment: Modify section 95975(l)(1). California Government Code Section 825(a) states "Nothing in this section authorizes a public entity to pay that part of a claim or judgment that is for punitive or exemplary damages." There are similar provisions to protect the federal government and the State of California. It would be discriminatory to only have punitive damages for Indian Tribes. The Tribe's proposed substitute language under this section adequately allows ARB to seek the remedies which are necessary to robustly enforce your regulations. Modify section 95975 (l)(1) as follows:

(1) The governing body of the Tribe must enter into a limited waiver of sovereign immunity with ARB related to its participation in the requirements of the Cap-and-Trade Program for the duration required by the applicable Compliance Offset Protocol(s). This waiver must include a consent to suit by ARB and the State of California, in the courts of the State of California, with respect to any action in law or equity commenced by ARB or the State of California to enforce the obligations of the Tribe with respect to its participation in the requirements of the Cap-and-Trade Program for the duration required by the applicable Compliance offset Protocol(s). This waiver must include a consent to suit by ARB and the State of California, in the courts of California, with respect to any action in law or equity commenced by ARB or the State of California to enforce the obligations of the Tribe with respect to its participation in the Cap-and-Trade Program,~~irrespective of the form of relief sought, whether monetary or otherwise.~~ <u>with such forms of relief, whether monetary or otherwise, which are acceptable to the ARB.</u> (YUROKTRIBE)

Response: California Government Code Section 825(a) applies specifically to instances in which a public entity conducts the defense of an employee or former employee for an injury that arose out of an act or omission occurring within the scope of his or her employment as an employee of the public entity. The commenter has not specified how this Government Code section is applicable to the offset projects contemplated in the Cap-and-Trade Regulation. We disagree that the specific language change requested by the commenter would address the concern, believe it is overly vague, and did not make the requested change. ARB notes that the cap-and-trade regulation is designed to ensure equitable treatment, to the greatest extent possible, of all offset project operators and all offset projects, whether on public or private land. We will, consistent with the design of the program, not discriminate against Tribes or other government entities and will treat all projects equitably.

K-21. Comment: The Solicitor of the Department of the Interior has not provided a formal opinion on the subject of federal approval of carbon sales on tribal lands. Modify section 95975(l)(3) as follows:

(1) For offset projects located on Indian lands, as defined in 25 U.S.C. section 81(a)(1), the Tribe must also provide ARB with proof of federal approval, <u>or proof that federal approval is not required</u>, of the Tribe's participation in the requirements of the Cap-and-Trade Program. (YUROKTRIBE)

Response: We agree with the commenter that federal approval may not be required for a Tribe's participation in the cap-and-trade program in all instances, and included modified regulatory language to specifically address the commenter's concern. This language will allow Tribes to provide either proof of federal approval or documentation that federal approval is not required.

K-22. Comment: Section 95975(l)(3) may be drafted too broadly. There is no consensus about the situations in which federal government (BIA) approval may be necessary for projects located on Indian lands, and in many circumstances the BIA may not yet have a policy formulated for whether approval is necessary. In essence, the question here is whether the project activity has been properly permitted. We urge ARB to treat this like any other governmental permit by simply requiring it "if applicable" and accept it in the form suitable to the permitting agency. Modify section 95975(l)(3) as follows:

(2) For offset projects located on Indian lands, as defined in 25 U.S.C. section 81(a)(1), <u>if necessary under applicable law and policy</u>, the Tribe must also provide ARB with proof of federal approval of the Tribe's participation in the requirements of the Cap-and-Trade Program, <u>in a form provided by the approving federal agency</u>. (NEWFOREST2)

Response: See the response to Comment K-21.

K-23. Comment: There is concern about the venue clause specifying the courts of the State of California in section 95975(l)(1). Native American Tribes are accustomed to litigating in U.S. Federal Court, and may be more comfortable with the system if this venue clause was changed to U.S. Federal Court. (NEWFOREST)

Response: Section 95975(l)(1) is not merely a venue provision, but it confirms the existing jurisdiction in the California courts. Moreover, federal jurisdiction cannot be unilaterally conferred by ARB's regulation. The Cap-and-Trade Regulation is a California State regulation, in which offset project developers are voluntarily participating in the provisions of the regulation, and ARB believes that it is appropriate to specify the courts of the State of California as the sole jurisdictional forum in order to avoid inter-jurisdictional conflicts in interpretation of the governing statute and the cap-and-trade regulation.

K-24. Comment: Section 95975(l)(1) defines a limited waiver of sovereign immunity by a tribe seeking to list offsets, or for projects located on specified lands. The waiver does not include consent to criminal prosecution and perhaps it should. (SCAQMD4)

Response: While we appreciate the commenter's suggestion, we believe that the requirement for a limited waiver of sovereign immunity in section 95975(l)(1) to include a consent to suit by the State of California, Air Resources Board, in the courts of the State of California, with respect to any action in law or equity commenced by the State of California, Air Resources Board, to enforce the obligations of the Tribe with respect to its participation in the cap-and-trade program is sufficiently inclusive to provide for equal treatment of offset projects conducted on tribal and non-tribal lands.

K-25. Comment: Section 95973(d) requires that "Land that is owned by any person, entity or tribe within the external borders of such Indian lands" must demonstrate the existence of a limited waiver of sovereign immunity between ARB and the governing body of the Tribe. There are two ways to interpret "external borders of such Indian lands." Since the term "Indian lands" uses the definition at 25 USC section 81(a)(1), which defines the term to mean Tribally owned lands, the most literal interpretation would be that it is referring to lands owned by parties other than Tribes (persons or entities) that are surrounded by Tribal lands. However, the use of the term "external borders" implies the section is referring to land owned by any person, entity or Tribe located within the boundaries of the Tribe's reservation, since the word "borders" is usually used in connection with the borders of a reservation. This second interpretation makes the most sense. However, regardless of which way this provision is interpreted, as written it does not make legal sense. It will require landowners who are not Tribes, but who are persons or entities owning land on reservations, to obtain a limited waiver of sovereign immunity from the Tribe. There are three kinds of land ownership on most reservations: land owned by Tribes, land owned by individual Indians and held in trust by the United States, and land owned in fee by non-Indians. The Tribe has no ownership of the latter two categories of land, has no jurisdiction over non-Indian owned land, and has minimal jurisdiction over the use of individual Indian owned land because of its trust status. As a result, the Tribe would have no involvement in a decision by an individual Indian or non-Indian landowner to put his or her land into an Offset Project. For this reason, there is nothing in connection with the Offset Project over which the Tribe would be waiving its immunity. It would therefore correctly refuse to provide such a waiver, and thus the provision as written would have the effect of excluding all non-Indian and individual Indian owned lands within reservations from participating in Offset Projects. Further, there are no legal barriers to ARB suing such land owners, so the section is unnecessary. ARB thus does not need a waiver of sovereign immunity to enforce carbon agreements against such persons or entities, since such persons are susceptible to suit in courts of competent jurisdiction in the same manner as any other person or entity. As a result, this subsection is both unnecessary and will have the effect of excluding all non-Tribally owned land within the external borders of Indian lands from participating in ARB offset projects. For these reasons, we recommend that subsection 95974(d)(3) be removed from the regulation and the requirements on Tribal limited waivers of sovereign immunity should be limited to land owned by Tribes. (MARTINN2)

Response: We agree with the commenter that the second interpretation is the only valid interpretation, and it is unclear how the commenter developed the first interpretation. We understand “within the external borders of such Indian lands” to refer to land owned by any person, entity, or Tribe located within the boundaries of the Indian lands (as defined in 25 U.S.C. section 81(a)(1)). We also believe that the commenter has misinterpreted 25 U.S.C. section 81(a)(1) by stating that this only includes tribally owned lands. 25 U.S.C. section 81(a)(1) defines Indian lands not exclusively as tribally owned lands, but as including lands held by the government in trust for a Tribe. We also note that, while the commenter listed three types of land ownership on most reservations, there may be more than three types of land ownership, including (1) land owned by the federal government in trust for the Tribe, (2) land owned in fee by the Tribe, (3) land owned in fee by members of the Tribe, (4) land owned by non-tribal members in fee, and (5) land owned by the federal government in trust for a member of the Tribe.

We disagree with the commenter that the provision requiring a limited waiver of sovereign immunity for land that is owned by any person, entity, or Tribe within the external borders of Indian lands as defined by 25 U.S.C. section 81(a)(1) does not make legal sense. In fact, and contrary to the commenter’s claim that the Tribe has no jurisdiction over land that it does not own because "the Tribe would have no involvement in a decision by an individual Indian or non-Indian landowner to put his or her land into an Offset Project," it is ARB’s understanding that lands within the external borders of Indian lands, as defined by 25 U.S.C. section 81(a)(1), are subject to sovereignty claims by the Tribe, specifically when such claims arise in the context of the Tribe’s exercise of governmental power over the land in question. While the commenter may be correct that some Tribes might refuse to enter into a limited waiver of sovereign immunity with ARB in relation to offset projects located within the external borders of Indian lands, and that it is possible that in a number of cases a refusal by a Tribe to consent to suit might mean that a project within the external borders of its Indian lands will not go forward, ARB does not agree that all Tribes would refuse to enter such waiver. ARB believes that a limited waiver of sovereign immunity by the Tribe is necessary in order to protect the ability of the State to enforce its interest in the proper functioning of the cap-and-trade regulation with respect to project operation within the external borders of Indian lands.

K-26. Comment: Section 95975(1)(1) requires that the governing body of a Tribe must enter into a limited waiver of sovereign immunity and "This waiver must include a consent to suit by ARB and the State of California, in the courts of the State of

California, with respect to any action in law or equity commenced by ARB or the State of California to enforce the obligations of the Tribe with respect to its participation in the Cap and Trade program, irrespective of the form of relief sought, whether monetary or otherwise." However, pursuant to long-standing U.S. Supreme Court decisions, Tribes in most states lack the legal authority to consent to be sued in state courts. In Kennerly vs. District Court of the Ninth Judicial District of Montana et. al., (400 U.S. 480 (1971)), the Court held that only Congress has the authority to give state courts jurisdiction over Tribes. In 1953, Congress enacted what is commonly known as Public Law 280, giving states the right to assume civil and/or criminal jurisdiction over Indians in their states. That law was amended in 1968 to require Tribal consent before a state could assume such jurisdiction. While California is a "280 state," a state that used the authority of the 1953 Act to assume state court jurisdiction over Tribes and Indians living on a reservation in California, its authority extends only to tribes and Indians in California. A few other states also assumed authority through Public Law 280, but doing so gave the courts in that state civil jurisdiction over the Indians in that state. It did not give California courts jurisdiction over Indians in those states. The Supreme Court made in clear in Kennerly that these statutes are the only ones in which Congress has granted to states the authority to assert jurisdiction over reservation Indians or Tribes and that without such authority, even consent by a Tribe or an individual Indian living on a reservation to be sued in state court is invalid. As a result, under the modified text of the regulation, only Tribes and Tribal members in California will be able to consent to be sued in California state courts, such that this provision will exclude the vast majority of Tribes from participation in carbon offset programs. The provision would, in particular, exclude most Tribes with significant forest land holdings and potential for Forest Offset Projects. There are other possible ways for ARB to ensure Tribes comply with their Offset Project agreements. We recommend that ARB provide a generic obligation on the part of Tribes to be bound, with the specifics worked on a case-by-case basis. Under this approach, the language in sections 95975(1)(1) and (2) could be replaced with "For projects on Tribal lands, the governing body of the Tribe must agree to such provisions as are necessary to ensure the terms of the Offset Project are enforceable. ARB will work with each Tribe on a case-by-case basis to develop enforceable terms that are also consistent with the law—on Tribal jurisdiction as established by the courts and Congress." Tribes cumulatively own over 18 million acres of forest land. By providing flexibility for Tribes in this manner, ARB will enable this forest land to contribute to carbon reduction without sacrificing ARB's appropriate concern that Offset Agreements be fully enforceable. (MARTINN2)

> **Response:** We disagree with the commenter that California courts would not have jurisdiction over offset projects conducted on Indian lands of a Tribe that voluntarily submits to the jurisdiction of California pursuant to the regulation. While Public Law (P.L.) 280 may not give California courts jurisdiction over Indians in other states, this law is irrelevant to the issue of tribal consent to suit, which is what the commenter is purportedly addressing. It may be that some Tribes lack capacity to consent to suit in California courts, but the case cited by the commenter, *Kennerly v. District Court of Ninth Judicial Dist. of Mont.* (400 U.S. 423 (1971)) does not stand for that proposition, or the proposition that

federal authorization is required before a tribe may give its consent. (ARB assumes that the commenter erred in citing to 400 U.S. 480, instead of 400 U.S. 423, when discussing *Kennerly*). *Kennerly* was decided on the basis that a tribal council's resolution vesting concurrent jurisdiction over civil matters in the tribal and state courts was ineffectual under P.L. 280 because the state had not acted through its legislature to assume jurisdiction, and was invalid under the 1968 amendments to P.L. 280 because the resolution authorizing concurrent jurisdiction had not been adopted by the Tribe's membership. (Id., 425-429.) *Kennerly*, in any event, has no application to California, which was one of five states on which P.L. 280 conferred civil jurisdiction without the procedural requirements prescribed for either the state or the Tribe that were at issue in that case. As the commenter acknowledges, there is no question that a Tribe in California can validly consent, by agreement, to the application of California law and to suit in a California court, but ARB disagrees that Tribes outside of California will not be able to provide valid consent.

K-27. Comment: Section 95975(1)(3) notes that "For offset projects located on Indian lands, as defined in 25 U.S.C. section 81(a)(l), the Tribe must also provide ARB with proof of federal approval of the Tribe's participation in the requirements of the Cap-and-Trade Program." ARB is correct in requiring that any Offset Project agreement be approved by the Department of Interior in its capacity as trustee of Indian land. However, to our knowledge, the Department has yet to establish a policy on such approvals, which could delay its action on such approval indefinitely. Our coalition urges ARB to work with us and other involved groups to educate the Department of Interior about the carbon market and the importance of developing a policy for acting on Offset Project agreements entered into by Tribes and by individual Indians whose land is held in trust by the United States. (MARTINN2)

Response: See the response to Comment K-21. This response only addresses those portions of the comment directly pertaining to the modified regulatory language in section 95975(l).

K-28. Comment: ACR believes the language in these sections, regarding offset projects on Tribal lands, is in some respects inconsistent with federal Indian policy as established by the courts and Congress, and will likely exclude most if not all offset projects on Tribal lands. This is because: Tribes generally lack jurisdiction over lands owned by individual Indians and non-Indians within the borders of reservations, and thus are unable to grant a waiver of sovereign immunity; Tribes in most states will not be willing, and/or do not have the legal authority, to consent to suit in California courts, per established Supreme Court decisions and Congressional acts; There is currently no clear Department of Interior policy regarding federal approval of Tribes' participation in the cap-and-trade program. However, we believe alternate language is possible in each case that achieves ARB's objective of enforceability of offset contracts on Tribal lands. ACR has submitted separate, detailed comments on this issue jointly with Van Ness Feldman, EcoAnalytics, and Finite Carbon Corporation. See "Native American Tribal Coalition ARB comments," submitted on August 10, 2011. (MARTINN3)

Response: We disagree with the commenter that Tribes are not able to grant limited waivers of sovereign immunity (See the response to Comment K-25). We also disagree with the commenter's claim that most Tribes do not have authority to consent to suit in California (See the response to Comment K-26). Moreover, we included modified language allowing participation of Tribes in the Cap-and-Trade Regulation if they provide proof of federal approval or documentation that such proof is not required (See the response to Comment K-21).

K-29. Comment: While we are supportive of efforts to ensure programs and projects undertaken through this regulation are in accordance relevant statutes governing sovereign relations with Tribes, the requirements for "limited waiver of sovereign immunity" in the regulation are much too vague at this point to provide the public or tribes with any understand of how limited or broad such a waiver might be. While enforcement of any portion of this regulation is imperative, vague and undefined terms may result ARB's inability to fully enforce the provisions of the rule. (FRIENDSOFEARTH2)

Response: We disagree that the provision related to "limited waivers of sovereign immunity" is too vague or that it would result in the inability to fully enforce the provisions of the regulation. In fact, ARB believes that the requirement of entering into a limited waiver of sovereign immunity, as well as the requirement that this waiver include a consent to suit, are sufficiently clear to provide the public and Tribes with an understanding of what is required under these provisions of the regulation. Each Tribe that wishes to participate in the Cap-and-Trade Regulation would be required to enter into an individual limited waiver of sovereign immunity with ARB in accordance with the Tribe's Constitution or other organic laws, by-laws and ordinances, and applicable federal laws. Given the independent, sovereign nature of each federally recognized Indian Tribe, and the unique legal structure of each Tribe, adding additional prescriptive regulatory requirements beyond those already listed in the regulation would be problematic and overly restrictive.

K-30. Comment: The sole form of dispute resolution contemplated under the regulations is litigation. Arbitration is the preferred mechanism. The regulations should require arbitration with court jurisdiction only to enforce the arbitration award. Arbitration is more cost effective for all parties, more collaborative, shorter in duration and can be handled across the country under either JAMS or AAA rules. In cross-jurisdictional transactions, such as the majority that will take place under the forestry protocol, arbitration is fairer because neither party can gain an unfair advantage. As will be explained in the Navajo example below, arbitration is a compromise because it allows objective rules to be relied on by the parties while still satisfying the requirement that the Navajo forum be utilized. Utilizing arbitration would be in line with the majority of contracts entered into nowadays. (UBCSSB)

Response: We do not agree that arbitration is necessarily the preferred mechanism for dispute resolution. While arbitration may be a common means of resolving commercial disputes, ARB does not believe it would be satisfactory as a means of enforcement of the State's interests based upon project participant conduct, in particular due to the fact that ARB's regulatory interests may require resolution of certain questions through the issuance of an authoritative and binding judicial precedent.

K-31. Comment: Requiring that all disputes be handled in the Courts of the State of California is too onerous and will dissuade tribes from participating. The number of tribes in California with sufficient forestry assets, or with land bases large enough to participate in the other protocols, is very limited. As such, the vast majority of offset projects will be located in other states. Requiring that all disputes be handled in California is only appropriate if the project is in California. The language needs to make clear that the limited waiver of sovereign immunity does not signify that the tribe's forum cannot be utilized for resolving disputes. While most tribes do not have courts, for those that do, it may make sense in some limited instances to allow the tribe's forum be utilized. For example, the Navajo Nation has 5,311,975 acres of forested lands. If the requirement is that disputes have to be in a forum other than the Navajo justice system, then they will not be able to participate in the California program. While the Navajo Nation readily enters into limited waivers of sovereign immunity, they have a blanket prohibition on allowing dispute resolution, arbitration, litigation and the like in forums other than the Navajo's forum. Their justice system is recognized as highly sophisticated and reliable. Recently, Key Bank entered into a $60 Million financing agreement containing a limited waiver of sovereign immunity with a forum selection clause requiring resolution of disputes within the Navajo system. *See http://www.pitchengine.com/keybank/keybank-and-navajo-nation-partner-on-groundbreaking--60-million-deal-governed-entirely-by-navajo-law/71893/*. (UBCSSB)

Response: We disagree with the commenter that requiring disputes to be handled in the Courts of the State of California is too onerous. It is ARB's understanding that each Tribe may have a completely separate and distinct judicial system, or none at all; and while ARB appreciates the commenter's reference to the Navajo's developed justice system, California must also take into consideration the fact that not all Tribes are similarly situated, either in terms of landbase or in the nature of their justice systems. Moreover, requiring ARB to submit disputes into these varied jurisdictions is neither practical nor would it serve the interests of the State in providing a consistent choice of law and judicial forum for all offset projects, regardless of where they were conducted.

K-32. Comment: The party with rights to bring actions to enforce the regulations should only be the Air Resources Board. While the Air Resources Board is a subdivision of the State of California it does not have the same connotations for tribes as the State itself. Given the hundreds of years of history in which tribes have been held to be free from suit by the States, it is likely to "feel" unacceptable to tribal membership to allow the State the ability to sue tribes. In our opinion, it will be very difficult to convince a tribe to agree to being sued by the State of California in the Courts of the State for 100 years. (UBCSSB)

Response: We agree with the commenter that the party with rights to bring actions to enforce the regulations is the State of California, Air Resources Board. We modified the language to more clearly reflect this and believe the modifications effectively address the commenter's concern. This response only addresses those portions of the comment directly pertaining to the modified regulatory language in section 95975(l).

K-33. Comment: The allowable remedy should not be monetary sanctions. The waiver of sovereign immunity should only be for the limited purposes of specific performance or injunction, and any other purposes necessary to fully enforce the regulations. If the ARB is not willing to accept such a limitation, then at the very least, the regulations should state that in no instance should enforcement of any kind be allowed against any assets of the Tribe itself and in no instance should enforcement of any kind be allowed against any assets of the Tribe except those revenues generated by the Cap-and-Trade Program. This type of provision is in line with most contracts with tribes. Typically monetary sanctions are limited to the revenue stream related to the underlying contract because like other governments there is very little "general fund" monies without an associated line item that are available. (UBCSSB)

Response: We believe that the availability of relief, monetary or otherwise, against offset project operators, including Tribes and entities created by Tribes, is necessary not only to ensure equitable and enforceable treatment of all offset projects, but also to ensure the environmental integrity of the offset program. In fact, providing different treatment for Tribes versus non-tribal offset projects would be contrary to the concept of voluntary participation in the offset program on an equal basis. As such, ARB believes that to limit an allowable remedy to specific performance or injunction, or to prohibit enforcement against assets of the Tribe itself, would be antithetical to this objective. Since the Cap-and-Trade Regulation does not require a contract between ARB and any particular Tribe, it is unclear how the commenter's statements on the "typical" nature of contracts with Tribes is applicable to the regulatory language on limited waivers of sovereign immunity.

K-34. Comment: Proof of federal approval of a tribe's participation in the Cap-and-Trade Program under 25 U.S.C. section 81(a)(1) may not be needed. Approval under 25 U.S.C. section 81(a)(1) should not be required if under 25 U.S.C. section 81(c) agreements related to offset projects are exempted or determined to not be covered under that subsection. There is discussion taking place with the Bureau of Indian Affairs and the Secretary of the Interior to exempt these offset projects. As such, the language should state that such approval is needed only if the Department of Interior has made clear that such approval is needed. (UBCSSB)

Response: See the response to Comment K-21.

K-35. Comment: The language needs to apply both to tribes and special purpose entities created by tribes. The language, as currently drafted, is applicable only to tribes. It is highly likely that for an offset project on the types of land described in the regulations, that a tribe would create a special purpose entity either under tribal or state law which may not be wholly-owned by the tribe. We suggest using the term "contracting party" in addition to "Tribe." (UBCSSB)

> **Response:** We agree with the commenter that the language should apply both to Tribes and to entities created by Tribes. We modified the definition of "Tribe" to include "any entity created by a federally-recognized Indian Tribe."

K-36. Comment: The language should contain conditions, which much be satisfied prior to commencement of an action by the ARB. Each of the following conditions should be met: (i) the claim is brought by the Air Resources Board ("ARB") and not by any third party; (ii) the claim alleges a material uncured breach by the Tribe (or contracting entity) of one or more of the specific obligations set forth in the Regulations; (iii) the claim seeks some specific action, or discontinuance of some action by the Tribe (or contracting entity) to bring it into full compliance with the duties and obligations expressly assumed by it under the Regulations and does not seek money damages (including special, consequential, incidental, punitive, or exemplary damages); (iv) the claim is first made in a written notice to the Tribe (or contracting entity), stating the specific action or discontinuance of action by the Tribe (or contracting entity) which would cure the alleged breach or non-performance and the Tribe (or contracting entity) shall have failed to cure such breach or non-performance within sixty (60) calendar days (or such additional time as may be set forth in such notice) after its receipt of such statement; and (v) the Parties have met and conferred prior to the commencement of any action. (UBCSSB)

> **Response:** We disagree that these prescriptive conditions should be included in the regulatory language. See the response to Comment K-29. We disagree with the specific conditions presented by the commenter, based on the reasons listed in the response to Comment K-33.

K-37. Comment: The language regarding the limited waiver of sovereign immunity is vague. Limited waivers of sovereign immunity can be extremely controversial for Tribes, especially when the underlying parameters of the waiver are undefined. This simply will not work for tribes. The vague language as written will surely dissuade tribes from participating in the Cap-and-Trade Program. The language should explain with specificity what enforcement could be sought against a tribe, that officials of the tribe are exempt, that rights are not created for third parties, and define what types of relief and remedies are permitted. The language above also does not suggest the exact language that will be needed in the limited waiver of sovereign immunity. Tribes need to be put on notice as to exactly what they are agreeing to. Below is language that we believe should be adopted.

The Tribe (or contracting entity) hereby expressly waives its respective rights of sovereign immunity from unconsented suit but only for the limited purpose of permitting the commencement, maintenance and enforcement of arbitration by the other Party to enforce the regulations found at Subchapter 10 Climate Change, Article 5, Sections 95800 to 96022, Title 17, California Code of Regulations ("the Regulations"), for the limited purposes of specific performance or injunction, and any other purposes necessary to fully enforce such regulations. The Tribe (or contracting entity) grants the limited waiver of its right of sovereign immunity herein, and action may be initiated if, and only if, each and every one of the following conditions is met: (i) the claim is brought by the Air Resources Board ("ARB") and not by any third party; (ii) the claim alleges a material uncured breach by the Tribe (or contracting entity) of one or more of the specific obligations set forth in the Regulations; (iii) the claim seeks some specific action, or discontinuance of some action by the Tribe (or contracting entity) to bring it into full compliance with the duties and obligations expressly assumed by it under the Regulations and does not seek money damages (including special, consequential, incidental, punitive, or exemplary damages); (iv) the claim is first made in a written notice to the Tribe (or contracting entity), stating the specific action or discontinuance of action by the Tribe (or contracting entity) which would cure the alleged breach or non-performance and the Tribe (or contracting entity) shall have failed to cure such breach or non-performance within sixty (60) calendar days (or such additional time as may be set forth in such notice) after its receipt of such statement; and (v) the Parties have met and conferred prior to the commencement of any action.

This limited waiver is applicable to the ARB only and does not apply to third parties. This limited waiver shall also not be construed as a waiver of any immunity of any elected or appointed officer, official, member, manager, employee, or agent of the Tribe (or contracting entity). In no instance shall enforcement of any kind be allowed against any assets of the Tribe itself. In no instance shall enforcement of any kind be allowed against any assets of the Tribe except those revenues generated by the Cap-and Trade Program that have not been distributed to the Tribe's government.

The Tribe and ARB hereby consent to the jurisdiction of the Tribe's court, the United States District Court, the United States Court of Appeals, and the United States Supreme Court or, if the offset project is located in California and the Federal Courts decline to take jurisdiction of the matter, the County Superior Court in which the Tribe's government is located, and/or the Court of Appeal of the State of California, but they do so separately and collectively solely for the purposes of enforcing arbitration pursuant to this Agreement and enforcing an arbitral award entered in connection with the resolution of a dispute arising out of this Agreement. No other action may be maintained in any court of law. (UBCSSB)

Response: See the response to Comment K-29. In relation to enforcement actions, ARB believes the regulatory requirements, which would apply to all offset projects, are clear, and including specific language limiting the nature of enforcement is contrary to ARB's interests in ensuring the operational and environmental integrity of the cap-and-trade program. Moreover, listing the specific language for a limited waiver of sovereign immunity in the regulation would be impractical for the reasons listed in the response to Comment K-36. In addition, ARB believes that the provisions regarding arbitration in this comment are impractical and unsuitable to ARB's purpose in this regulation for the reasons stated in the response to Comment K-30.

L. MARKETS

Applicability

L-1. Comment: LADWP recommends that section 95814(b) Other Registered Participants be deleted.

~~(b) Other Registered Participants.~~

~~(1) The following entities do not qualify to hold compliance instruments but may qualify as a Registered Participant to serve in the following functions:~~

~~(A) An offset verifier accredited pursuant to section 95978;~~

~~(B) A verification body accredited pursuant to section 95978;~~

~~(C) Offset Project Registries; or~~

~~(D) Other third-party registrants Early Action Offset Programs approved pursuant to subarticle 14.~~

~~(2) To qualify as a Registered Participant the entity must obtain registration approval from the Executive Officer pursuant to section 95830(c).~~

The term "Registration" in section 95814 is specifically required for holding any type of account and holding compliance instruments. It does not specify any other purpose. The type of participants listed as "other participants" includes independent third party entities that are involved in emissions verification for covered entities or offset verification for offset projects. By the very nature of their independent role, they should not be involved with the Cap-and-Trade program as a registered participant as this would introduce a potential conflict of interest, which could harm or invalidate the verification process for the projects and emissions they verify. There are other mechanisms in the MRR and Cap-and-Trade regulation that would allow ARB to certify or track entities involved in verification without including them as a registered participant. (LADWP4)

> **Response:** We disagree with the interpretation that the term "Registration" in section 95814 is specifically required for holding any type of account and holding compliance instruments, and that section 95814 does not specify any other purpose. We believe that section 95814(b)(1) specifies that the following entities do not qualify to hold compliance instruments, but may qualify as a Registered Participant to serve in the listed functions. It also specifies, under (b)(2), that to qualify as a Registered Participant, the entity must obtain registration approval from the Executive Officer. In this instance, registration approval is a discretionary action by the Executive Officer, not an automatic ministerial action.

L-2. Comment: Section 95814(a)(3) would add derivatives clearing organizations that take only temporary possession of compliance instruments to the definition of "voluntary associated entities." PG&E recommends that ARB define "temporary possession" as it is used in section 95814(a)(3) so as to ensure that derivatives clearing organizations that are claiming to qualify as voluntary associated entities pursuant to section 95814(a)(3) are in fact only taking temporary possession of allowances for the amount of time needed to provide the market clearing service and the transfer of compliance instruments. Otherwise, derivatives clearing organizations could use this section to exempt themselves from the registration information required of other entities by section 95830(c)(1)(D). Modify section 95814(a)(3) as follows:

> (3) An entity providing clearing services, <u>or clearing entity</u>, in which it takes only temporary possession of compliance instruments for the purpose of clearing transactions between two entities registered with the Cap-and-Trade Program<u>. Temporary possession shall only constitute the period of time required to facilitate clearing and the transfer of compliance instruments between parties. A clearing</u> entity ~~must be~~ <u>is</u> a derivatives clearing organization as defined in the Commodities Exchange Act (7 U.S.C. subsection 1a(9)) that is registered with the U.S. Commodity Futures Trading Commission pursuant to the Commodities Exchange Act (7 U.S.C. subsection 7a-1(a)). (PGE4)

> **Response:** We believe that section 95831(a)(5) makes the suggested modification to section 95814(a)(3) unnecessary. The 15-day changes to the regulation also added new section 95831(a)(5), a new type of account, Exchange Clearing Holding Accounts, specifically for voluntary associated entities registered pursuant to section 95814(a)(3). This section clarifies that the accounts administrator will create an exchange clearing holding account for the entity providing clearing services. Entities may transfer compliance instruments to exchange clearing accounts only for the purpose of transferring control of the instruments to the entity performing the clearing function. The clearing entity may only transfer the compliance instruments in its exchange clearing holding account to the account designated by the entity receiving the allowances under the transaction being cleared.

Trading / Trade Conduct

Secondary Market / Reversals / Exchange Clearing Holding Accounts

L-3. Comment: Section 95920(a) specifically states the holding limit applies to each voluntarily associated entity. Applying this concept to a clearinghouse disregards its basic function. Such an entity does not make choices on its investment decisions, but serves the needs of the market participants. It is not clear how such an entity could take measures to comply; the holding limit for an individual covered entity has many source and company specific terms that are not easily calculable or even known to the exchange, and the exchange will only know the anticipated low of allowances mere days before they are transferred to the exchange clearing holding account, and then immediately transferred out again. Also, the exchange will receive allowances from the seller's clearing firm. It is also worth noting that clearing firms may need a similar exemption as they will be pooling their selling customers' allowances to transfer to the exchange. Finally, the rule already counts, in the holding limit for the purchaser, any instruments which have been delivered from an exchange clearing trading account, (see (b)(3)). Exchange-traded environmental contracts are physically settled on specific expiration dates. For the California market, this could mean the transfer of tens of thousands of allowances on a single day. An unintended consequence of the proposed holding limit approach is that no clearinghouse will be able to serve the critical role as a true intermediary in any physically-settled contracts due to the likely violation of the holding limit levels on delivery days. To address this issue, we recommend modifying section 95920(b)(1). Delete the applicability of a holding limit to exchange clearing holding accounts or modify section 95920(b)(2) as follows:

> (2) The holding limit calculation will not include allowances contained in limited use holding accounts created pursuant to 95831 or exchange clearing holding accounts except pursuant to section 95920(b)(3) below." (GREENX)
>
> **Response:** We acknowledge the concern expressed in the comment, but we do not agree with the suggested change. We believe that the text added as section 95920(b)(3) is sufficient to prevent calculation of holding limits from interfering with the operation of exchange clearing entities, as it counts the allowances which are part of transfers against the holding limits of the party listed as recipient of the transfer not the exchange clearing entity.

L-4. Comment: We urge ARB to not rely on "reversal" of trades by the Executive Officer (section 95920(b)(4)). This provision will interfere with the sanctity of contract, result in litigation between market participants, could result in gaming where a party may try to unwind the least economic favorable contract(s), and will cause a lack of confidence in exchange-traded and over-the-counter contracts. We recommend that the rule be revised to instead allow for a cure period of fifteen days to allow market participant to sell any excess allowances, and if the participant does not do so, then the penalties already contemplated in (b)(4) would apply. ARB may also wish to make clear that the penalties will increase for repeat offenses. These changes will facilitate the efficient use of exchange traded contracts, which brings the benefits of market liquidity, price transparency and a safe and secure venue for companies to manage their short and long term risk, and will help prevent unintended consequences and the gaming opportunities described above. At the same time, it preserves ARB's authority to oversee and monitor the program, and take appropriate action if needed. Modify section 95920(b)(4) as follows:

> (4) If the Executive Officer determines that a reported transaction, whether or not it has been ~~yet~~ recorded into the tracking system would result in an entity's holdings exceeding the applicable holding limit, then the Executive Officer shall provide notice to the entities involved, and allow a fifteen day cure period for correction of the potential exceedance. The potential exceedance may be cured by a sale of the excess credits, or transfer of credits into a compliance account. If the potential exceedance has not been corrected by the end of the fifteen day cure period, ~~then the Executive Officer shall not approve the transaction pursuant to section 95921(a)(l). If the violation is not discovered until after the transaction~~

~~is recorded, then the transaction may be reversed pursuant to section 95921 (a)(2) and~~ penalties may be imposed pursuant to section 96013. Such penalties may increase due to repeated violations of this section. (GREENX)

Response: We acknowledge the concern expressed in the comment. However, we decided to respond by adding new text to section 95921 to deal with deficient transfer requests. We introduced the term “transfer request” to draw a distinction between the underlying market “transaction” and the request by the transacting parties to the accounts administrator to transfer the compliance instruments between accounts on the tracking system. We have final control over our recognition of the entity that holds an allowance for compliance purposes, and do not wish to interfere with market mechanisms. Therefore, section 95921(b) was revised to state that if we cannot resolve deficient transfer requests we may reverse transfers, not the underlying transaction.

We identified two cases that should be addressed separately. First, if the deficiency is detected prior to recording into the tracking system, the parties will be notified and should correct the deficiency within the transaction reporting time limit set in section 95921(a)(1)(A). If this cannot be done, they should resubmit or withdraw the request. Second, if the deficiency is detected after the transfer has recorded, we propose a “cure” period of five days. We find the fifteen-day cure period proposed in the comment to be far greater than what is needed to fix any violations of our rules.

L-5. Comment: PG&E is concerned about the lack of detail with respect to trades and raises the following questions. If ARB opts to not include this type of detail in the regulation, PG&E requests clarification regarding where this type of detail will be presented.

- Can ARB specify a timeframe at which point the transaction cannot be reversed?
- How will ARB resolve the circumstance where it determines a transaction should be reversed but a subsequent transaction has taken place such that the initial transaction can no longer be reversed?
- How does trade information get transferred? Via web application? XML? Paper? (PGE4)

Response: Under the revisions made to section 95921(b) in the second 15-day changes to the regulation, we will retain the ability to reverse the recording of a transfer request into the system, but do not require reversal of an underlying transaction. In addition, such a reversal would not be automatic, but only done if the parties to the transfer do not correct the deficiency. As deficient transfer requests represent some failure to follow the regulation, it is also possible that the remedy will be the imposition of a penalty instead of a reversal. The regulation does not address methods of communication. We will address this topic during the tracking system development and program implementation.

L-6. Comment: While Evolution Markets recognizes the need for ARB to have a mechanism to enforce holding limits and conduct market oversight, we are concerned with provisions in the revised section 95921 that grants the ARB Executive Officer the ability to reverse transactions as a means of enforcement. This mechanism provides ARB an unprecedented enforcement power, which ultimately could be detrimental to trading liquidity and the ability for entities to hedge price risk and comply with carbon reduction targets at the lowest possible cost. Reversing commercial transactions between counterparties creates a host of contractual and compliance issues. The foundation of a properly functioning market is that commercial contracts between counterparties cannot be unwound. An obligation to sell allowances to another counterparty must be met, and once the transfer of allowances and cash has taken place counterparties cannot be expected to reverse this transaction.

Furthermore, such reversals may create a daisy chain of violations of holding limit provisions. In the instance of ARB reversing a transaction, the buyer of allowances will return the allowances to the seller. The seller may have sold the allowances to ensure it did not violate its own holding limits, and the return of allowances from the reversed transaction might then put the seller over its holding limit. Rather than reverse transactions, which could have unintended negative consequences for multiple market participants, Evolution Markets recommends taking punitive action against the entity in violation. In the case of holding limits, this might include providing the entity a set period of time to dispense of excess allowances. (EVMKTS2)

> **Response:** Under the revisions made to section 95921(b) in the second 15-day changes to the regulation, we will retain the ability to reverse the recording of a transfer request into the system, but we do not automatically require reversal of an underlying transaction. Such a reversal would only be done if the parties to the transfer do not correct the deficiency. As deficient transfer requests represent some failure to follow the regulation, it is also possible that the remedy will be the imposition of a penalty instead of reversal.
>
> We clarified the distinction between the act of transferring control of a compliance instrument on the tracking system and the underlying agreement in the secondary market between entities which would result in a transfer. We modified section 95920(b) to replace the term "transaction" with the term "transfer request." We made this change to sections 95920(b)(3) and (4). We also modified section 95920(a) to clarify that the holding limit will be applied to a group of entities with a direct or indirect corporate association. We made this change to reflect a change to the classification of corporate associations in section 95833(a).
>
> The term "transaction" means an understanding among registered entities to transfer the control of an allowance from one entity to another, either immediately or at a later date. The "transfer" of a compliance instrument means the removal of the serial number of a compliance instrument from one account and placement into another account. In the California cap-and-trade program, a transfer will be

affected through a “Transfer Request” submitted by an authorized account representative or an alternate authorized account representative to the accounts administrator in order to register a transfer of allowances between accounts into the tracking system.

We eliminated section 95920(f) because changes to section 95920(a) render the section redundant. We renumbered existing section 95920(g) as section 95920(f).

We modified section 95920(f)(1) to clarify that the holding limit is applied only to allowances, not to all compliance instruments. In addition, the holding limit applies jointly to members of direct and indirect corporate associations, not to members of a discloseable corporate association. We also made this change to sections 95920(f)(2), (3) and (4). We modified section 95920(f)(4) to use the newly defined term “transfer request” in place of the term “transaction.” We made this change to clarify that the accounts administrator will not accept deficient transfer requests. Some stakeholders expressed concern that the provision would require the automatic unwinding of the transaction that resulted in the transfer request.

L-7. Comment: GreenX suggests revising section 95921(c) to exclude holders of exchange clearing holding accounts from the obligation to report the information required to be provided in 95921(c)(4-7). This information potentially will be reported already by the buyer, seller, the buyer's clearing firm and the seller's clearing firm. Any reporting of these transactions by an exchange will be duplicative information, will be overly burdensome for the exchange, and unnecessarily onerous for ARB to process this repetitive information. In addition, since the exchange holding account ills the transparency function of reporting, there is no need for an additional reporting by the exchange or the with respect to the exchange clearing holding account. Modify section 95921(c) as follows:

(c) Information Requirements. The following information must be provided for the accounts administrator to record the transaction~~:~~. Holders of Exchange Clearing Accounts are exempt from providing the information required under 95921(c)(4)-(7). However, exchange clearing holding requests transactional records will be preserved for five (5) years and may be made available, upon reasonable prior written request, to ARB. (GREENX)

Response: New section 95921(g) modifies the information required for transfer requests when submitted by holders of exchange clearing holding accounts. New section 95921(g)(1) exempts these entities from having to include dates, prices, and beneficial holdings information in transfer requests. This information would be in the transfer requests submitted by the entities using the exchange clearing accounts to transfer control of compliance instruments. We agree with stakeholders who commented that requiring this information would be an unnecessary requirement.

L-8. Comment: Section 95831(a)(5), uses the term "Exchange Clearing Holding Accounts." Elsewhere in the rules, "holding accounts" are addressed. We presume that ARB intended that exchange clearing trading accounts would be able to trade with regular holding accounts. In order to make clear that transfers from holding accounts may go to, or from, an exchange holding account. Modify section 95921(a)(2) as follows:

> (2) Except when the transaction is undertaken by the Executive Officer, all transactions <u>shall be</u> between two entities <u>and</u> will involve transfers between two holding accounts <u>and/or an exchange clearing holding account</u>. (GREENX)
>
> **Response:** We made the change to address the requested clarification.

L-9. Comment: The language in section 95922 should be made consistent with that of section 95831 (Account Types). For instance, sub-paragraph (c)(1) refers to surrender (of a compliance instrument) by a covered entity, whereas section 95831 refers to the transfer of compliance instruments from entity compliance accounts to the Retirement Account. (WPTF2)

> **Response:** The language is consistent. Compliance instruments are surrendered by an entity when they are placed in a compliance account by a compliance deadline. The Executive Officer retires surrendered instruments by transferring them to the Retirement Account.

L-10. Comment: In section 95921(d)(3), it is not clear why the accounts administrator has to keep confidential the information concerning the amount and serial number of instruments in an entity's holding account. This would appear to allow manipulation in the secondary market since no one will know who actually has compliance instruments to sell. (SCAQMD4)

> **Response:** We disagree with the comment. If a potential manipulator is unaware of who has allowances in holding accounts, that entity will not be able to estimate the probability of success of a manipulative scheme. The manipulator would also be unable to estimate whether covered entities are short and would need to buy even at higher prices.

L-11. Comment: PG&E is concerned about the addition of sections 95921(d)(1) and (4). PG&E strongly believes that the accounts administrator should not publicly release information on the transaction price and quantity of compliance instruments for any individual transaction. However, PG&E would support release of information on the aggregate price and quantity of compliance instruments sold in any given week, if the release was delayed until a week after the end of the given week. Under section 95921(d)(4), ARB intends for the accounts administrator to release information on the quantity and serial numbers of compliance instruments contained in compliance accounts. Such information should remain confidentially held by the accounts administrator until the end of each compliance period's surrender date. Only information about compliance instruments in retirement accounts, not compliance accounts, should be publicly released. Modify section 95921(d) as follows:

> (d) Protection of Confidential Information. The Executive Officer will ensure that the accounts administrator:
>
> > (1) Releases aggregated information, with names of entities withheld at the end of each week on the transaction price and quantity of compliance instruments for transactions recorded by ARB in the previous week ~~in a timely manner~~;
> > (2) Except as needed for market oversight and investigation by the Executive Officer, protects as confidential all other information obtained through transaction reports;
> > (3) Protects as confidential the quantity and serial numbers of compliance instruments contained in holding and compliance accounts; and
> > (4) Releases information on the quantity and serial numbers of compliance instruments contained in ~~compliance~~ retirement accounts in a timely manner no earlier than the surrender date following the end of a compliance period. (PGE4)

Response: We disagree with the suggested modifications to section 95921(d). In general, we recognize that there are both advantages and disadvantages to the public release of certain types of information, and we wish to balance these. New section 95921(d) (Protection of Confidential Information) was added to address many stakeholders concerns regarding the confidentiality of information reported on the transfer request. At the same time, section 95921(d)(1) was added to ensure that information needed by the market would be released, with the added protections of the restrictions imposed in the rest of the section.

Regular releases of holdings of individual firms may reveal commercially sensitive information on trade strategies that could increase the vulnerability of a participant or of the market as a whole to manipulation. We expect that market participants will have a variety of options to buy or sell allowances, through bilateral transactions, transactions through an intermediary, and exchange transactions in both spot and derivatives markets, as well as auctions. In addition, an entity's holdings are not necessarily indicative of its willingness or ability to sell compliance instruments.

Because compliance instruments cannot be removed from a compliance account except to retire them, the number in compliance accounts is important information to the market on the available supply for trading. Further, information on an entity's compliance with the requirements of an environmental regulation benefits the public interest.

L-12. (multiple comments)
Comment: Section 95921(a)(1)(A) addresses how transactions are reported. What

would happen if a transaction is reported later than three days of settlement of the transaction agreement? The language suggests that it will not be registered because the deadline was not met. We recommend that a penalty be assessed instead of not registering the transaction. (SCAQMD4)

Comment: ARB does not define "settlement of transaction agreement." ARB does distinguish between "settlement date and time" and "transaction agreement date and time" by allowing these two types of information to be sent to the accounts administrator, but these terms are also not defined. It could be difficult for entities to comply with a 3 calendar day requirement if the settlement of a transaction occurs on a Friday and repot of the transaction requires specific signatures. Seven calendar days is more reasonable. Modify section 95921(a)(1)(A) as follows:

> (1) Except when the transaction is undertaken by the Executive Officer, the cap-and-trade program will not register a change in ownership of a compliance instrument until:
> (A) The two parties to the change in ownership report the transaction to the accounts administrator within <u>(7) calendar</u> days of settlement of the transaction agreement. (LADWP4)

Response: We agree that the transfer process and consequences of not meeting the three-day time limit needed clarification. We modified sections 95921(a)(1) and (2) to clarify that all requests for transfer of compliance instruments between accounts in the tracking system must meet the requirements for this article before the accounts administrator will register them into the tracking system. The changes are needed to emphasize the distinction between the transfer request and the underlying transaction that results in the request. Existing section 95921(b) was replaced completely. New section 95921(b) outlines the procedure to be followed when the accounts administrator finds a deficiency in the transfer request submitted pursuant to 95921(a).

New section 95921(b)(1) describes the procedure when a deficiency is detected in a transfer request before it is recorded into the tracking system. New section 95921(b)(1)(A) requires the accounts administrator to inform both the Executive Officer and the entity submitting the request of the deficiency. New section 95921(b)(1)(B) states that the entities submitting the request may resubmit the request with the deficiency corrected within the three-day time limit set pursuant to section 95921(a)(1)(A). New section 95921(b)(1)(C) states that if entities fail to submit the corrected transfer request within the time limit, they must either withdraw the transfer request or submit a new request for transfer.

We created this procedure to ensure that some quality control checks are made when a transfer request is submitted. We anticipate that most deficiencies will be minor, such as failure to include correct account numbers, compliance instrument serial numbers, or other required information fields. We believe that these problems should be remedied within the existing requirement to submit a transfer request within three days of the settlement of a transaction that results in a request for transfer.

Timely requests for transfer are essential to proper functioning of the market and to market oversight. Delays in a transfer request may, for example, prevent the recipient from transferring instruments to settle another transaction. Delays in transfer requests could also allow an entity to, in effect, control more allowances than permitted by the holding limit. We believe three days is an adequate amount of time to submit transfer requests.

Transaction Data: Information Requirement

L-13. (multiple comments)
Comment: MSCG strongly recommends eliminating the "time" portion of the reporting requirement in sections 95921(c)(4) and (5). Current industry practices do not "time stamp" trades or agreements, nor do trade capture and settlement databases have fields for this datum. Complying with this requirement is likely to impose substantial costs for information technology expenditures. Furthermore, it will require a culture shift among traders to ensure they record the transaction times, suggesting a high rate of unintentional errors, at least in the early stages of trading. Weighed against these issues, the market monitoring benefits of time stamping do not seem likely to be of high value. FERC proposed "time stamping" in its recent "EQR" NOPR (RM10-12). Generally, the industry strongly opposed this addition in comments, due to the disproportionate cost/benefit ratio. FERC has yet to rule. While we believe elimination of time stamping would be the best decision, irrespective of FERC's ultimate ruling, at a minimum, we would urge ARB to hold off instituting such a requirement until and unless FERC does so. (MSCG3)

Comment: Section 95921(c) delineates the transaction information that must be submitted to the accounts administrator. Section 95921(c)(4) and (5) require that time and date be submitted for transactions agreements and settlements. WSPA does not believe that such information is necessary and will be difficult to track. WSPA recommends that sections 95921(c)(4) and (5) be deleted. (WSPA3)

Comment: Disclosure of unnecessary information will place significant unnecessary reporting burden (i.e. Time of transaction, time of settlement, price) and should be deleted in section 95921(c)(4) and (5). (CCEEB3)

Response: The original language of section 95921(c)(4) and (5) did not change, and therefore is outside the scope of the first 15-day changes to the regulation. However, we agree with stakeholders who commented that the "time of transaction" is not meaningful for many transactions. The requirement for the transfer request to include the time of the transaction settlement was removed from sections 95921(c)(4) and (5). Because the remaining comments fall outside the scope of the notice, no further response is required.

Executive Officer's Tools

L-14. Comment: Section 95921(f) provides an extensive list of options available to the Executive Officer in the event that a registered entity violates any of the provisions of section 95921. MID and NCPA recommend deleting section 95921(f)(1) as the remedies outlined in this section and throughout the proposed regulation are sufficient to dissuade a covered entity from engaging in improper market activities. Removing a covered entity's compliance instruments directly from its holding account effectively results in a taking, and unnecessarily punishes those covered entities that have a surrender obligation whose costs are directly borne by ratepayers. Modify section 95921(f)(1) as follows:

> (~~1) Reduce the number of compliance instruments a covered entity or opt in covered entity may have in its holding account below the amount allowed by the holding limit pursuant to section 95920;~~

In addition, subsection (A) below, by its own terms, applies only to revocations. Thus, the reference there to suspended accounts is not appropriate. Subsection (B) only applies in cases where (A) applies. Moreover, it does not make sense to require a suspended account that continues in existence and will be entitled to participate in the program in the future to be emptied of all allowances. Thus MID recommends the following changes.

> (f)(3) Suspend or revoke the registration...pursuant to section 95830; ~~or~~
>
> (A) If registration is revoked ~~or suspended~~ the entity must sell or voluntarily retire all compliance instruments in its holding account within 30 days of revocation; and
>
> (B) If registration is revoked ~~or suspended~~ and the entity fails to sell… (MID3, NCPA3)

Response: We disagree with the suggested modifications to section 95921(f)(1). The provision is not for removal of compliance instruments, but a reduction in the maximum number that may be held by a group of associated entities.

We disagree with the comment's characterization of suspension of an account. An entity's account will only be suspended in response to significant violation of this regulation. Only a registered entity may hold compliance instruments. An entity whose account is suspended loses all privileges associated with participation in the cap-and-trade program, including the ability to hold compliance instruments. Therefore, we did not make the suggested changes to section 95921(f)(3).

L-15. Comment: Section 95921(f) defines the actions that may be taken if an entity violates any provision of this article. The actions are quite broad, and it seems there should be some requirement to preclude arbitrary enforcement, such as some kind of proportional requirement, and some provision for appeal. (SCAQMD4)

> **Response:** We established a wide range of actions, which are augmented by our penalty-setting authority, to anticipate a wide range of severity of regulation violations. ARB's enforcement policy governs the severity of enforcement as well as discussions with violators.

Beneficial Holding

L-16. Comment: The existing language in section 95921(e)(1) would not prohibit a trade in which the parties do not report an ownership interest at all. Modify section 95921(e)(1) as follows:

> (1) A trade in which the parties to a transaction reported to the accounts administrator fail to disclose the ownership interest of a registered account holder in the sale or purchase of a compliance instrument before ~~until after~~ a transaction is recorded by the accounts administrator. (SCAQMD4)

> **Response:** We replaced section 95921(e)(1) with new section 95921(a) to clarify requirements for transfer requests. New section 95921(b) describes the process when a transfer request is found to be deficient.

L-17. Comment: SCE requests that ARB clarify how beneficial holding will affect the calculation of the Holding Limit of the principal and that of the agent. Section 95920(h) states that the "application of the holding limit will treat beneficial holding by an agent as part of the holding of the owner." SCE reads this to mean that beneficial holding, even if technically located in the holding account of the agent, will count toward the holdings of the principal or "owner." SCE recommends that ARB clarify this application of the Holding Limit. (SCE3)

> **Response:** Section 95920(h) was renumbered to section 95920(g) and clarified so that the holding limit will include a beneficial holding by an agent against the holding limit of the principal for whom it is held.

L-18. Comment: Section 95922. ARB Should Modify Banking To Include All Compliance Instruments. PG&E recommends that the banking scope be broadened to include all compliance instruments, not just allowances. PG&E suggests that the language be modified to read:

> (a) ~~Allowances~~ Compliance Instruments Issued for a Current or Previous Compliance Period. A CA GHG ~~allowance~~ compliance instrument or a~~n allowance~~ compliance instrument issued by an approved GHG ETS pursuant to subarticle 12 may be held ("banked") by an entity registered pursuant to section 95830. (PGE4)

Response: We did not make the requested change because it is addressed in section 95922(c). Section 95922(a) was included for the specific case of allowances that may be issued by ARB or an approved GHG ETS.

L-19. Comment: MSCG commends ARB Staff for recognizing the need for flexibility in holding limits to accommodate a wide variety of legitimate needs. We believe that the approach devised in the latest proposed regulation strikes a workable balance between not hampering legitimate commercial activities and providing comfort to regulators that there are sufficient safeguards in place against monopolization and market manipulation. However, we offer the following comments in support of suggested language clarification. It is unclear if the holding limits will be applied to each individual vintage within the current compliance period, or against all vintages combined that will be eligible for use in the current compliance period. Will there be separate holding limits for 2013 and 2014 vintages, or a single holding limit for the combined vintages? If the "future" holding limits will be applied to future compliance periods, not individual future vintage years, will there be separate holding limits for the 2015-2017 and 2018-2020 compliance periods in 2012, or will it be a holding limit for all future vintages combined? The formulas in the proposed regulation facilitate the calculation of the applicable holding limits. However, it would be very helpful if there was a chart indicating the "base" holding limits in absolute numbers (recognizing that the ability to carry over banked allowances and other adjustments make creation of a chart for final, adjusted holding limits impossible). (MSCG3)

Response: We modified section 95920(c) to clarify that the holding limit will apply to allowances that can be used for compliance in the current compliance year, separately from those that cannot be used for compliance in the current compliance year. We also modified section 95920(c)(1) to clarify a reference to section 95856(b), which defines the vintages that can be used for current compliance year. Additionally, we modified section 95920(c)(2) to be consistent with section 95856(b), and state that the ability to use allowances changes with each year, not each compliance period. That is, vintage 2015 allowances can be used for surrender for the compliance obligation in 2016, but vintage 2016 and 2017 allowances purchased at the advance auction may not be used for surrender for the compliance obligation in 2016, and together apply toward the holding limit for future vintages.

Holding Limits: Modify Calculation

L-20. Comment: Section 95920(d)(2)(B) Trading, Holding Limit. LADWP seeks clarification in the regulation to ensure that the holding limit is able to account for and accommodate annual fluctuations in emissions associated with electricity consumption. Per ARB's staff report, the purpose of having a holding limit is "to prevent a market participant, or a group of market participants that can coordinate their buying and selling, from gaining too large a share of the goods in a market. The limits are common features in commodity markets." However, the holding limits proposed can present a problem for compliance entities in the case where a previous year's emissions are significantly less than the next year's compliance obligation. For example, if an entity's 2012 emissions were 8 MMT, the limited exemption from the holding limit is 8 MMT after this amount is placed in the entity's compliance account. ARB's staff report states that the limit to the transfer of allowances added to an entity's compliance account is equal to the verified emissions reported for the entity for the previous year. So, for example, if that entity's allocation is 12 MMT, then 4 MMT is in the holding account and only up to 0.271 MMT can be purchased. If that entity projects that it will be short such that more than 0.271 MMT needs to be purchased, then it will likely face violations. (LADWP4)

> **Response:** We are unable to reproduce the calculation of the amount to purchase stated in this comment. The commenter notes that the Staff Report states a limit on transfer of allowances; however, section 95920(d) was completely rewritten in the proposed modifications. Under section 95920(d)(2), the limited exemption from the holding limit is, on June 1, 2012, the most recent verified emissions data report that has received a positive or qualified positive emissions data verification statement. Beginning in 2013, the exemption increases each October 1 by the amount of emissions contained in the most recent emissions data report that has received a positive or qualified positive emissions data verified statement during that year. On December 31 of the calendar year following the end of a compliance period, the limited exemption will be reduced by the sum of the entity's compliance obligation over that compliance period.
>
> In addition, the calculation of the limited exemption reflects the expansion of the program scope in 2015 by having the annual increase reflect the full scope emissions beginning with the report received in 2014.

Holding Limits: Flexibility and Competitiveness Concerns for Covered Entities

L-21. (multiple comments)
Comment: The proposed Regulation's holding limit would further put independent generators at a competitive disadvantage to the utilities they serve, preventing large generators such as Calpine from taking advantage of the flexibility afforded by multi-year compliance periods and only requiring covered entities to surrender 30 percent of their emissions in any year. Calpine suggests that CARB expand the limited exemption so that it would include the entirety of a covered entity's prior year's emissions, without first requiring the allowances to be deposited into the entity's compliance account. Modify section 95920(d)(2)(a) as follows:

> ~~(A)~~ The limited exemption is the number of allowances which are exempt from the holding limit ~~after they are transferred by a covered entity or an opt in covered entity to its compliance account.~~ (CALPINE3)

Comment: The holding limits described in the Regulation are irrespective of a compliance entity's allowance obligation. An entity with a very small allowance obligation is subject to the same absolute holding limit as an entity with a multi-million allowance obligation. The result is restrictive holding limits that represent a small fraction of the allowance obligation of compliance entities with large allowance surrender obligations. Any holding limit must take account of a compliance entity's full compliance period allowance obligation (i.e. not only annual compliance obligation) plus the need to bank and hedge allowances. A holding limit that does not consider compliance obligation and banking/hedging removes important compliance flexibility from those who most need it—i.e. those with large allowance surrender obligations. It is important to understand that the existence of a holding limit does not assure the avoidance of market manipulation, nor does the absence of an arbitrary holding limit allow for market manipulation. The largest carbon market in the world (the EU ETS) operates without an allowance holding limit. We are unaware of any demonstrable manipulation issues in that market. Likewise, other major commodity markets operate with general prohibitions on market manipulation that do not require the imposition of arbitrary or across-the-board holding limits to help detect or enforce. BP recommends against the use of allowance holding limits. The Regulation attempts to address concerns about holding limits by introducing a very limited exemption. However, the holding limit "exemption" is not really an exemption at all as in order to qualify for the "exemption," allowances have to be deposited in a compliance account from which they cannot be removed. If a very limited exemption is as far as the Regulation will go to address these concerns about holding limits, then it must be an actual exemption from the holding limit—which means the allowances subject to the exemption can reside in the holding account. Modify section 95920(d)(2)(A) as follows:

(A) The limited exemption is the number of allowances which are exempt from the holding limit calculation after they are transferred by a covered entity or opt-in covered entity to its holding ~~compliance~~ account….

The Regulation introduces the concept of compliance accounts as an apparent means to mitigate the effect of the very low holding limits. It appears that once an allowance is deposited in this account, it cannot be removed for trading or future use. These allowances would thus be removed from the market, unable to flow freely to provide market liquidity and confidence. For entities with large allowance surrender obligations, this essentially removes any flexibility from a multi-year compliance period and results in a real-time allowance surrender obligation. (BP2)

Comment: The modified regulation limits the number of allowances a regulated entity can hold in any given year, and the limits are essentially identical for all covered entities. Given the variation in the sizes of covered entities' compliance obligation, setting the holding limit at the same level for all entities is inappropriate. An entity with low emissions would potentially be able to hold sufficient allowances to cover their compliance obligations for multiple years, while an entity with high emissions may not be able to hold sufficient allowances to cover even a single year. The holding limit would thus greatly restrict the ability of larger entities to manage their compliance. The provision that exempts allowances in the compliance account up to the level of accrued emissions is not sufficient to address this problem because it would require annual retirement of allowances in order to stay under the holding limits, which undermines the intended flexibility of the three-year compliance interval. Rather than set the holding limit at the same level for all entities, the holding limit for covered entities should be set relative to each entity's most recent emissions data report, and all allowances in the compliance account and any allowances banked from previous periods should be exempted from the holding limit. This would ensure that each entity has sufficient flexibility to manage its compliance obligation over time. For voluntary associated entities, the holding limit shall be calculated as outlined in section 95920(d). Modify section 95920 as follows:

(d) The holding limit ~~will be calculated~~ for allowances qualifying pursuant to section 95920(c)(1) will be calculated as

(1) for covered entities, the amount of emissions contained in the most recent emissions data report that has received a positive or qualified positive emissions data verified statement during the year ~~sum of:~~

(~~1~~2) for voluntary associated entities, ~~T~~the number given by the following formula:

Holding Limit = 0.1*Base + 0.025*(Annual Allowance Budget – Base)

In which:

"Base" equals 25 million metric tons of CO_2e.

"Annual Allowance Budget" is the number of allowances issued for the current budget year.

(~~2~~3) A Limited Exemption from the Holding Limit is calculated as:

(A) The limited exemption is the number of allowances which are exempt from the holding limit calculation after they are transferred by a covered entity or an opt-in covered entity to its compliance account.

~~(B) On June 1, 2012 the limited exemption will equal the annual emissions most recent emissions data report that has received a positive or qualified positive emissions data verification statement.~~

~~(C) Beginning in 2013 on October 1 of each year the limited exemption will be increased by the amount of emissions contained in the most recent emissions data report that has received a positive or qualified positive emissions data verified statement during that year.~~

~~(D) If for any year ARB has assigned emissions to an entity in the absence of a positive or qualified positive emissions data verification statement the calculation of the limited exemption will use the assigned emissions.~~

~~(E) For the first compliance period all reported emissions or assigned emissions used to calculate the limited exemption will include only the emissions associated with the scope for the program during the first compliance period.~~

~~(F) Beginning in 2015, all reported emissions or assigned emissions used to calculate the limited exemption will include the~~

~~emissions associated with the change in scope taking place in 2015.~~
~~(G) On January 1, 2015 the limited exemption will be increased by the amount of emissions included in the emissions data report received during 2014 but not yet included in the limited exemption pursuant to section 95920(d)(2)(E).~~
~~(H) On December 31 of the calendar year following the end of a compliance period, the limited exemption will be reduced by the sum of the entity's compliance obligation over that compliance period.~~ (WPTF2)

Comment: PG&E is concerned that the existing holding limit prevents entities with a large compliance obligation from being able to sufficiently physically hedge future obligations and is unnecessarily high for entities that lack any compliance obligation. PG&E believes the holding limit should be established as 100 percent of each entity's most recent verified emissions plus a fixed holding limit quantity. PG&E recommends that the formula for calculating the holding limit for current compliance allowances be adjusted downward, as the holding limit is unnecessarily high for entities with little or no compliance obligation. Further, all allowances transferred to an entity's compliance account should be exempt from the holding limit. Entities should be able to designate at the time of bid submission whether any purchased allowances should be placed directly into a buyer's compliance account, bypassing their holding account. If so, then those allowances should also be exempt from the holding limit and the holding limit constraint associated with bidding into the auction per section 95911(d)(3)(B). PG&E recommends ARB clarify that the limited exemptions specified in Section 95920(d)(2)(B) and (C) represent a cap on the number of allowances that will be exempted from the holding limit. PG&E also recommends ARB clarify that on June 1, 2012, this cap will equal the annual emissions contained in the most recent emissions data report. In addition, as stated above, PG&E recommends that all allowances transferred to an entity's compliance account be exempt from the holding limit. Modify sections 95920(b)(2), 95920(d)(1), 95920(d)(2), and 95920(e) as follows:

(2) The holding limit calculation will not include allowances contained in limited use holding accounts or compliance accounts created pursuant to section 95831.

(1) The number given by the following formula:

Holding Limit = 0.017 ~~0.01~~*Base + 0.00417 ~~0.025~~* (Annual Allowance Budget – Base)

In which:

"Base" equals 25 million metric tons of CO_2e.
"Annual Allowance Budget" is the number of allowances issued for the current budget year.

(2) A Limited Exemption from the Holding Limit is calculated as:

(A) The limited exemption is the number of allowances which are exempt from the holding limit calculation ~~after they are transferred by a covered entity or an opt-in covered entity to its compliance account~~.

(B) On June 1, 2012 the limited exemption cap will equal the annual emissions contained in the most recent emissions data report that has received a positive or qualified positive emissions data verification statement.

(C) Beginning in 2013 on October 1 of each year the limited exemption cap will be increased by the amount of emissions contained in the most recent emissions data report that has received a positive or qualified positive emissions data verified statement during that year.

(e) The holding limit will be calculated for allowances qualifying pursuant to section 95920(c)(2) as the number given by the following formula:

Holding Limit = 0.017 ~~0.01~~*Base + 0.00417 ~~0.025~~*(Compliance Period Budget – Base)

In which:

“Base” equals 75 million metric tons of CO_2e.

“Compliance Period Budget” is the number of allowances issued for the future compliance period from which the allowances were sold at the advance auction. (PGE4)

Comment: Barclays strongly believes that holding limits, in their current and proposed form, should be excluded from the proposed rules. Holding limits, as currently proposed, will serve to decrease liquidity and compromise market efficiency while increasing the costs of risk management. Ultimately, this will pass increased costs along to the consumer. For example, if covered entities are in danger of breaching their holding limits, they may be forced to either transfer excess allowances into their compliance accounts, or to sell their allowances into the market at a time and at a price which may not conform to approve hedging programs. Transferring allowances into a covered entity’s compliance account precludes further trading of those allowances, thereby taking them out of the system. Although such allowances would eventually have been retired for compliance and removed from the system, holding limits require that they be removed from the system earlier than necessary. Holding limits undermine the system’s intended banking benefits. Banking is included in most emissions trading systems to provide cost containment and to allow hedging programs to smooth compliance pricing out over several periods. Holding limits undermine the intended purpose of the banking provisions of the Cap and Trade rule by removing the flexibility provided by banking guidelines. Ultimately, the increased risk and decreased liquidity associated with holding limits will deter the growth of this nascent market. This will increase the cost of compliance with the Cap and Trade Program, which will eventually lead to increased costs to California energy consumers. (BARCLAYS)

Comment: The Compliance Account Exemption – Mitigation of costs: Under the compliance account exemption, allowances deposited in a covered entity's compliance account will not count towards such covered entity's holding limit. The compliance account exemption, however, fails to adequately mitigate the increased costs resulting from the holding limit rule that are imposed on covered entities with compliance obligations in excess of the holding limit. Compliance Obligations: The compliance account exemption does not address a fundamental inconsistency in the application of the holding limit rule that relates to covered entities. Covered versus non-covered: All allowances held by the covered entities, including those needed to satisfy their compliance obligations, count toward the limit under the holding limit rules. Nothing in the compliance account exemption addresses this disparate treatment between covered entities and non-covered entities, and consequently, non-covered entities continue to enjoy more flexibility and discretion then covered entities. In our view, the most appropriate manner to address the increased costs and added burdens imposed on covered entities by the holding limit is to exclude from the holding limit the number of allowances needed by covered entities to satisfy their compliance obligations. In other words, a covered entity holding the number of allowances equal to its compliance obligation should be treated no differently for holding limit purposes than a non-covered entity that is not holding any allowances. (CHEVRON3)

Comment: The holding limit should account for differences between covered and non-covered entities. The holding limit rule does not account for material differences in the behavior and interests of covered entities and non-covered entities. Whereas the primary objective of covered entities is to purchase sufficient allowances to satisfy their compliance obligation, the objective of non-covered entities is to purchase allowances and subsequently sell them at a higher price. By treating both covered and non-covered entities the same, the holding limit rule does not take into account the fact that a covered entity must retain most, if not all, of the allowances it acquires in order to fulfill its compliance obligations. Therefore, if it is determined that holding limits must be implemented, such holding limits should only apply to the number of allowances in excess of a particular covered entity's compliance obligation. A covered entity holding the number of allowances equal to its compliance obligation should be treated no differently for holding limits purposes than a non-covered entity that is not holding any allowance. Otherwise a key policy objective for imposing holding limits (i.e., limiting market manipulation) will be undermined as non-covered entities will be given an advantage over all other participants. (CHEVRON3)

Comment: The holding limit is too low. As currently written, significant amounts of allowances, for large compliance entities will be locked in compliance accounts. This creates an uneven playing field that favors traders over regulated entities. Compliance entities must be able to hold and trade a larger portion of their allowances to adequately manage their risk throughout the Cap and Trade program. CCEEB recommends that the program allow compliance entities to hold sufficient allowances to cover their obligation for the entire compliance period based on a rolling three year emissions obligation. This change would free up allowances for the major compliance entities and enable a much more liquid market where an entity could adequately hedge its forward risk without major complications. While there are still allowances locked in compliance accounts in some years, the increase in holding limits makes these limitations much more manageable. (CCEEB3)

Comment: The Holding limit on allowances should be modified to reflect individual Covered Entities compliance obligations. IEP shares CARB's concerns regarding hoarding, market manipulation, etc., there needs to be a mechanism in place to address the compliance needs of large obligated entities where the current holding limit potentially creates discriminatory impacts, with respect to flexible compliance instruments. In order to compensate for these disparate impacts on obligated entities, CARB should adjust the holding limit calculation for large obligated entities to reflect the different magnitudes of compliance obligations among obligated entities. Specifically, upon an application by a covered entity, CARB may determine that the established Holding Limits disadvantage the covered entity unreasonably, and CARB may establish a unique holding limit for that covered entity scaled to the appropriate magnitude of the covered entity's compliance obligation. (IEPA2)

> **Response:** As structured, the holding limits have two components: a quantity determined by the formula in section 95920(d)(1), and a limited exemption for compliance entities described in section 95920(d)(2). The quantity determined by formula applies uniformly to allowances held in holding accounts for compliance and non-compliance entities alike. The quantity of the limited exemption for entities with a compliance obligation is unique to each entity, based on that entity's reported emissions from previous years, as described in section 95920(d)(2). The limited exemption applies only to allowances within an entity's compliance account. Allowances in a compliance account may not be removed from that account except for transfers by the Executive Officer to the Retirement Account.
>
> Commenters argue that this structure has several consequences. To summarize, the main contentions are: (1) That the limits reduce compliance flexibility, including the benefits of three-year compliance periods, (2) that the limits reduce trading/hedging flexibility, (3) that the limits' restrictions on trading/hedging flexibility are unequal for entities with compliance obligations of varying sizes, and particularly restrict entities with large compliance obligations, and (4) that limiting the exemption for compliance entities to allowances in compliance accounts reduces market liquidity.
>
> To remedy these consequences, commenters propose various ways to allow compliance entities to hold more allowances in their holding accounts. We disagree with these recommendations.

As stated in the Staff Report, the purpose of a holding limit is to prevent a market participant, or a group of market participants that can coordinate their buying and selling, from gaining too large a share of the goods in a market. The size of the limit, coupled with the limited exemption, represents a trade-off between having a limit that is small enough to reduce opportunities for market manipulation and a limit that is so small that it reduces banking and market liquidity by restricting the activity of non-covered entities.

We agree that the holding limits could have the consequence of minor reductions in trading flexibility. However, we do not believe that this consequence will be severe. The holding limit calculation would allow all covered entities to keep about 6 million MT of allowances, along with an unlimited amount of offsets, in their holding accounts during the first compliance period. This number rises to over 11 million MT in the second compliance period. Allowances kept in the holding account may be traded. These levels should give covered entities the opportunity to make profitable sales when they are able to identify short-term price increases. Many covered entities have informed us that they will procure as close in time as they emit, so the actual effect of the limit on market liquidity cannot be predicted. Overall, we believe we have struck the proper balance between promoting market flexibility and preventing market abuse.

The holding limits as structured provide equivalent treatment for compliance and voluntarily associated entities. All types of entities may hold up to the same quantity of allowances for trading, hedging, banking, and other speculative behavior. Compliance entities may also hold, in their compliance accounts, the allowances needed to comply. To allow compliance entities larger exemptions for the purpose of speculative behavior would undermine both the uniform application of the holding limit to all entities and the prevention of dangerous levels of concentration in the holding of allowances. Lowering the holding limit for voluntarily associated entities would similarly favor speculative behavior by compliance entities. We do not believe either approach recommended in the comments is appropriate.

The multi-year compliance periods and the annual compliance obligation of 30 percent of the previous year's emissions are design features of the cap-and-trade program that provide temporal flexibility in compliance with the surrender obligation. Other features of the program, including the very use of cap-and-trade as a measure, give entities a great deal of flexibility in how and when to reduce emissions. Entities are free to move allowances to their compliance account at any time before the compliance deadline, a fact that is unchanged by the holding limit.

Beyond the requirement to surrender instruments on a compliance date, entities may choose to engage in any of a wide variety of strategies to trade allowances (including buying, selling, and holding) and hedge risk. We believe options for trading to implement a strategy will include bilateral transactions, transactions through an intermediary, and exchange transactions in both spot and derivatives markets, as well as auctions. One strategy implied in the comments is to accumulate a number of instruments equal to an entity's compliance obligation in a holding account, and to move those instruments into the compliance account at the compliance deadline. We agree that this particular trading strategy, and perhaps others, may be restricted by the holding limit for the entities with the largest compliance obligations. However, we believe that entities have sufficient remaining trading flexibility, and that the regulatory language implements the correct tradeoff between flexibility and managing the risk of manipulation.

Since allowances in a compliance account may not be removed except for retirement, they cannot be traded by the entity that holds them. We agree that this has the potential to reduce market liquidity. However, we believe the effect is not large, because risk-averse firms acquiring allowances for compliance (as opposed to speculative purposes) will generally not make those allowances available to the market; the available supply is not likely to be much different even if the allowances are not in compliance accounts. Second, the concentration of allowances among a few large traders could also reduce liquidity, and this is a potential outcome of removing the holding limits. We believe that the net effect on liquidity cannot be predicted.

For the reasons above, we do not agree with the proposed changes to section 95920.

L-22. Comment: SCE is very concerned about the small size of the Holding Limits relative to SCE's total annual GHG price exposure. This substantial difference will make it extremely difficult to effectively hedge SCE customers' exposure to fluctuating GHG prices. In addition, SCE has a relatively low direct compliance obligation (for which it must retire compliance instruments) relative to its contractual obligations and electricity market price exposures (which are both financial exposures rather than compliance obligations). As such, SCE cannot mitigate its GHG price exposure by simply transferring compliance instruments into its Compliance Account and thereby take advantage of the Limited Exemption laid out in section 95920(d)(2)(A)(H) to avoid approaching its Holding Limit. Accordingly, SCE proposes ARB revise the Holding Limit calculation to be the greater of the current formula contained in the July 2011 Proposed Modifications or a compliance entity's allowance allocation for that same year. This modification would allow SCE and other similarly situated compliance entities with large GHG price exposures to more effectively manage their exposure, but would also avoid market manipulation concerns that might arise through more general Holding Limit increases. Modify section 95920(d)(1) as follows:

(1) The number given by the following formula:

Holding Limit = <u>the greater of</u>

<u>1)</u> 0.1*Base + 0.025*(Annual Allowance Budget – Base)

In which:
"Base" equals 25 million metric tons of CO_2e, or

2) an individual utility's allowance allocation for that same year as defined in Table 9-3. (SCE3)

Response: We do not agree with the commenter's assertion that SCE cannot hedge its customers' exposure to fluctuating GHG prices. First, SCE can cover its direct emissions through transfers to its compliance account. For the first compliance period, SCE could hold up to about 6 million MT of allowances, plus offsets, in its holding account. In the second compliance period this increases to over 11 million MT. SCE could acquire and hold allowances under its holding limit for transfer to generators if that is how SCE resolves its exposure for purchase entity. Second, we modified section 95834, which governs beneficial holdings. This is a voluntary path by which a principal and agent could both agree to have the agent hold allowances for later transfer to the principal. Using this approach, allowances held by SCE would not count against its holding limit.

L-23. Comment: Holding limits are difficult to effectively enforce and can actually impede the proper functioning of a Cap and Trade program, particularly in the early years of the program when liquidity is most needed. The position limit contained in the modified Cap and Trade Regulations is unprecedented and does not exist in any other major carbon or commodities market. The limit is actually a rule developed by the Commodities Futures Trading Commission for the purpose of limiting financial exposure in futures commodities markets. IETA is concerned that ARB's proposal to extend a rule designed to regulate futures markets to regulate spot (i.e., inventory) markets is both untested and unsupported by the record. IETA is pleased to see the addition of a holding limits exemption, detailed in section 95920(d)(2). This exemption seems to permit covered entities to hold in their compliance account allowances in excess of the position limit, if such allowances are necessary to meet a compliance obligation. There are a number of issues with the proposed rules. First, as allowances in compliance accounts cannot be withdrawn by their account holders, the rule will result in a number of allowances being taken out of the market early. This will reduce liquidity and increase the ability of any player to manipulate markets. Second, the rule treats large covered entities unfairly by requiring them to comply earlier than their smaller competitors. Such covered entities with large compliance obligations will also be forced to consistently purchase a sufficient amount of allowances per auction, regardless of market conditions, at each auction for placement in their compliance accounts and will be unable to trade these allowances when market conditions improve. This also prevents entities from engaging in hedging strategies that might ultimately save ratepayers money. Based on the foregoing, IETA recommends that holding limits be discarded or, in the alternative, holding limits be adjusted to permit large covered entities to hold a quantity of allowances equal to the greater of (1) the holding limits currently proposed in section 95920 or (2) a quantity equal to that covered entity's compliance obligation. (IETA3, BARCLAYS)

Response: First, the comment is not correct in its assertion that the holding limit was developed by the CFTC to regulate futures markets. The holding limit was developed in consultation with Jeffrey Harris, who was formerly employed at the CFTC. His recommendations were specific to the carbon market being developed by California and the other WCI jurisdictions.

Second, members of the EU ETS did not conclude that auction frequency alone can control the risk of market manipulation. They have other procedures, analogous to "responsibility levels" in U.S. commodity markets, which are part of EU national programs. Consideration of position and purchase limits are not unprecedented. The EU ETS members have identified position and purchase limits as backstops which could be introduced as needed in case anti-competitive conditions emerge.

Third, we believe the commenter overstates the effect of the limited exemption on market liquidity by assuming that a covered entity will be willing to trade away all of its accumulated allowances. Based on our conversations with stakeholders, we expect that most covered entities will be prudent and not accumulate allowances in much smaller numbers than their cumulative emissions obligations. Thus, even if we had no holding limit, the number of allowances held would overstate the number that could be expected to enter the market at any point because most will be "committed" to compliance needs.

Fourth, all registered entities can keep in their holding accounts up to about 6 million MT of allowances in the first compliance period and about 11 million MT in the second compliance period, all of which will be available for trading. The comment does not explain why this is not sufficient to provide market liquidity.

Finally, the holding limit does not force large covered entities to buy uniform amounts at the auction. Revised section 95912(k)(3) allows the transfer of allowances purchased at auction directly to an entity's compliance account, so the amount purchased at each auction is not restricted by the amount that can be placed directly into a holding account.

Registration and Accounts

L-24. Comment: Section 95921(e)(3) does not exist. This is an incorrect cross reference. It appears both (B) and (C) are referring to the same consignment allowances from EDUs per section 95831(a)(3). Modify section 95831(b)(2) as follows:

> (2) A holding account to be known as the Auction Holding Account into which allowances are transferred to be sold at auction from:
>
> (A) The Allocation Holding Account;
>
> (B) The holding accounts of those entities for which allowances are being auctioned on consignment pursuant to section 95831(a)(3) ~~95921(e)(3);~~ and

(C) The limited use holding accounts of those entities consigning (allowances to auction pursuant to section 95910 subarticle 8. (LADWP4)

Response: We agree that the cross-reference was incorrect. In the second 15-day changes to the regulation, the cross-reference was corrected to read section 95921(f)(3).

L-25. Comment: Section 95830 proposes to reduce the registration period with ARB from 45 calendar days to 30 calendar days because ARB believes this provides enough time to submit all the information needed to register. The registration time frame should remain at 45 calendar days since the program is new and unproven, and internal company reviews could take longer than the proposed 30 calendar days to ensure the accuracy and completeness of submittals. (VALERO2)

Response: We believe that the 30 calendar days specified in section 95830(d)(1), Registration Deadlines, is sufficient time to register, given that the requirement applies to entities that are not covered entities as of January 1, 2013. That date is one year after the initial registration, so entities that are covered under the MRR will have adequate time to determine when they have to register.

Authorized Account Representatives/Attestation

L-26. Comment: GreenX requests ARB exempt exchange clearing holding accounts from the limit on a single authorized account representative and an alternate authorized account representative (section 95832). The purpose of such a change is to support efficient delivery of exchange traded allowances. Permitting only two account representatives for clearinghouse accounts could significantly delay the transfer of cleared contracts, making the market less efficient. To facilitate timeline and accurate deliveries, the clearinghouse will often dedicate the entire Deliveries Team (5-10 staff members) to the process. By allowing up to ten users access to the exchange clearing holding account, these risks will be mitigated. Modify section 95832 as follows:

<u>(i) For exchange clearing trading accounts, the authorized representative may designate up to ten delivery analysts responsible for the account to directly access the account and assist in performing the functions of an entity meeting the requirements of 95814(a)(3) and making submissions pursuant to 95832(h).</u> (GREENX)

Response: Although account holders must designate one authorized account representative and one alternate authorized account representative, the authorized account representative or alternate authorized account representative may delegate, to one or more natural persons, his or her authority to make an electronic submission (section 95832(h)). This existing provision accommodates multiple users of an account. Therefore, we do not agree that a modification of section 95832(y) is necessary.

L-27. (multiple comments)
Comment: Section 95832(a) sets forth the regulations pursuant to which a covered entity establishes personnel to serve as the Authorized Account Representative. As part of these regulations, individuals who are tasked with serving as their company's Authorized Account Representative are required to "certify that I have all the necessary authority to carry out the duties and responsibilities contained in title 17, article 5, sections 95800 et seq. on behalf of such persons and that each such person shall be fully bound by my representations, actions, inactions, or submissions and by any order or decision issued to me by the accounts administrator or a court regarding the account;" (page A-63). This certification is overly broad and should not be required for an entity to serve as its company's Authorized Account Representative. (WPTF2)

Comment: Sections 95832(a) and (d) require the Authorized Account Representative to attest that all the information submitted by the Authorized Account Representative is true, accurate and complete. Typically, such attestations would state that any such statements are "to the best of my knowledge and belief true, accurate, and complete." This language was contained in the earlier version of section 95832(d) of the regulation, but has been deleted from the modified regulation. Removal of this language creates a burden for the Authorized Account Representative that goes beyond what is typical for such attestations, and WPTF believes that the deleted language should be re-instated into the modified regulation. Modify sections 95832(a)(4)-(6) and (d) as follows:

> (4) The authorized account representative and any alternate authorized account representative must attest, in writing, to ARB as follows: "I certify ~~under penalty of perjury under the laws of the State of California~~ that I was selected as the authorized account representative or the alternate authorized account representative, as applicable, ~~by an agreement that is binding on all persons~~ <u>for entities</u> who have an ownership interest with respect to compliance instruments held in the account. I certify that I have all the necessary authority to carry out the duties and responsibilities <u>of an authorized account representative, as specified</u> in title 17, article 5, sections 95800 et seq., on behalf of such entities. ~~persons and that each such person shall be fully bound by my representations, actions, inactions, or submissions and by any order or decision issued to me by the accounts administrator or a court regarding the account;~~
> (5) The signature of the authorized account representative and any alternate authorized account representative and the dates signed; and
> (6) An attestation as follows: "I certify that I have personally examined, and am familiar with, the statements and information submitted in this document and all its attachments. I also certify ~~under penalty of perjury of the laws of the State of California~~ that all information required to be submitted to ARB is true, accurate, and complete <u>to the best of my knowledge and belief</u>.
>
> (d) Each submission concerning the account shall be submitted, signed, and attested to by the authorized account representative or any alternate authorized account representative for the entities that own compliance instruments held in

the account. Each such submission shall include the following attestation statement by the authorized account representative or any alternate authorized account representative: "I certify ~~under penalty of perjury under the laws of the State of California~~ that "I am authorized to make this submission on behalf of the entities that own the compliance instruments held in the account. I certify ~~under penalty of perjury of law~~ that I have personally examined, and am familiar with, the statements and information submitted in this document and all its attachments. Based on my inquiry of those individuals with primary responsibility for obtaining the information, I certify ~~under penalty of perjury under the laws of the State of California~~ that the statements and information submitted to ARB are true, accurate, and complete to the best of my knowledge and believe. " I consent to the jurisdiction of California and its courts for purposes of enforcement of the laws, rules and regulations pertaining to title 17, article 5, sections 95800 et seq., and I am aware that there are significant penalties for submitting false statements and information or omitting required statements and information, including the possibility of fine or imprisonment." (WPTF2)

Comment: CARB states that inclusion of "under penalty of perjury" is necessary to ensure that all information submitted is true and complete. However, typical EPA and SCAQMD certifications do not include this language. The underline/strikeout language makes this attestation more consistent with SCAQMD language for Title V operating permit certification. The alternate recommendation is for ARB to preserve its previous language. Modify section 95832(a)(4) as follows:

(4) The authorized account representative and any alternate authorized account representative must attest, in writing, to ARB as follows: "I certify ~~under penalty of perjury under the laws of the State of California~~ that I was selected as the authorized account representative or the alternate authorized account representative, as applicable, by an agreement that is binding on all persons who have an ownership interest with respect to compliance instruments held in the account. I certify that l have all the necessary authority to carry out the duties and responsibilities contained in title 17, article 5, sections 95800 et seq. on behalf of such persons and that each such person shall be fully bound by my representations, actions, inactions, or submissions and by any order or decision issued to me by the accounts administrator or a court regarding the account;" (LADWP4)

Comment: The draft regulation requires that any submission is absolutely true, accurate and complete. Submissions will include unverified emissions reports that will undergo verification where errors would be found. This draft also specifically deletes "to the best of my knowledge and belief..." which recognizes that the account representative is limited to his knowledge. There are enforcement provisions that would address violations that warrant higher penalties for misconduct. Modify section 95832(d) as follows:

(d) Each submission concerning the account shall be submitted, signed, and attested to by the authorized account representative or any alternate authorized account representative for the entities that own compliance instruments held in the account. Each such submission shall include the following attestation statement by the authorized account representative or any alternate authorized account representative: "I certify ~~under penalty of perjury under the laws of the State of California~~ that I am authorized to make this submission on behalf of the entities that own the compliance instruments I held in the account. I certify ~~under penalty of perjury~~ that I have personally examined, and am familiar with, the statements and information submitted in this document and all its attachments. Based on information and believe formed after ~~my~~ inquiry of those individuals with primary responsibility for obtaining the information, I certify ~~under penalty of perjury~~ under the laws of the State of California that the statements and information submitted to ARB are to the best of my knowledge and belief true, accurate, and complete. " I consent to the jurisdiction of California and its courts for purposes of enforcement of the laws, rules and regulations pertaining to title 17, article 5, sections 95800 et seq., and I am aware that there are significant penalties for submitting intentionally false statements and information or intentionally omitting required statements and information, including the possibility of fine or imprisonment." (LADWP4)

Comment: The phrase "to the best of my knowledge" must be re-inserted in the attestations below. Although the Utilities understand CARB's concern to ensure the information submitted is accurate, it is unreasonable to require the authorized account representative to become personally liable for any incomplete or inaccurate information that the representative was not aware of after completing his or her due diligence.

Section 95832(a)(6) An attestation as follows "I certify that I have personally examined, and am familiar with, the statements and information submitted in this document and all its attachments. I also certify under penalty of perjury of the laws of the State of California that to the best of my knowledge all information required to be submitted to ARB is true, accurate, and complete."

Section 95832(d) … "I certify under penalty of perjury of the laws of the State of California that the statements and information submitted to ARB are to the best of my knowledge true, accurate, and complete."… (MID3)

Comment: Sections 95832 (a)(6) and (d) provide certification requirements for submittals to ARB. We noticed the deletion of the phrase "to the best of my knowledge" and we believe it is appropriate to include this language as consistent with the certification requirements under the Monitoring and Reporting Rule and the EPA MRR. (UNITEDAIRLINES2)

Comment: In sections 95832(a)(6) and (d), we propose that the language regarding the attestation of the authorized account representative be consistent with the MRR regarding certification, which points to the U.S. EPA Mandatory Reporting of

Greenhouse Gases Rule regarding certification of the GHG emissions report. The EPA reporting rule at section 98.4(e)(1) includes the language, “to the best of my knowledge and belief…” We recommend that this language be added to the end of the sentence in section 95832(a)(6), and reinserted in 95832(d). This will ensure consistency between all three related regulations. (CACC2)

> **Response:** The account representative was always required to sign under penalty of perjury. However, it appears that “to the best of my knowledge and belief” was inadvertently deleted. Unfortunately, we cannot fix this at this time. However, the intent is to hold the Authorized Account Representative to the “best of my knowledge and belief” standard. We will correct this omission when the regulation is amended in the future.

Compliance Accounts

L-28. Comment: Section 95831(a)(4)(B) does not allow compliance instruments to be moved from the compliance account. WSPA believes that the rule must allow compliance instruments within a compliance account to be transferred to another account by the holder. WSPA recommends that this section be amended to allow for compliance instruments within a compliance account to be transferred to another account by the holder. (WSPA3)

> **Response:** We disagree with the suggestion that compliance instruments should be able to be transferred to another account. Compliance accounts from which instruments may not be removed allow for the equal treatment under holding limits of entities with and without compliance obligations. Striking the characteristic that instruments may not be removed would undermine the purpose of the holding limits by allowing entities with large compliance obligations to accumulate and trade a much larger share of the allowances than entities with smaller or no compliance obligation.

L-29. Comment: WPTF suggests that CARB consider the need for separate compliance accounts for each compliance interval. Different compliance accounts would facilitate entities’ tracking and management of compliance across different compliance intervals, and simply the identification of units that are exempt from holding limits. (WPTF2)

> **Response**: We disagree with the suggestion of multiple compliance accounts for each entity, and modified section 95831(a)(1) to clarify that each registered entity will have no more one holding account, compliance account, limited use holding account, or exchange clearing holding account. The tracking function suggested in the comment will be accommodated in the tracking system by the vintage year that is coded into each instrument’s serial number.

L-30. Comment: Accounts under Control of the Executive Officer: Under Auction Holding Accounts, a reference to untimely surrender of allowances in section 95857(d) is needed in section 95831(b)(2). Under Allowance Price Containment Reserve Account, section 95831(b)(4)(c) should be deleted. (WPTF2)

> **Response:** We agree that section 95831(b) needed modification due to changes made in section 95857. We added new section 95831(b)(2)(D) to be consistent with a change in section 95857(d)(1) in the first 15-day changes to the regulation that redirects three of the allowances submitted to fulfill an untimely surrender obligation to the auction holding account. We eliminated existing section 95831(b)(4)(C) due to the revisions to section 95857(d)(1) that redirects three of the allowances submitted to fulfill an untimely surrender obligation to the auction holding account, not to the reserve, as specified in the existing text.

L-31. Comment: Section 95833(a)(2) defines an entity as having a "direct corporate association" with another registered entity when it holds compliance instruments in its own holding account in which another entity has an ownership interest, but it is unclear what is meant by "ownership interest." It would appear that under this section, an electrical distribution utility holding compliance instruments on behalf of another entity in a Beneficial Holding relationship would be considered to have a direct corporate association with the other entity. Section 95833(a)(3) defines "indirect corporate association," but again, it is unclear what is meant by "percentage ownership of the entity in the other entity." PG&E is concerned that if its Beneficial Holding relationships as currently defined by section 95834(a)(2) are considered to be direct corporate associations with ownership interests, it will have to disclose to each of its entities with whom it has such Beneficial Holding relationship the existence of its other Beneficial Holding relationships, in order for those entities to disclose indirect corporate associations in accordance with section 95833(c). PG&E believes that its disclosure of such Beneficial Holding relationships to ARB should be confidential and the disclosure of the relationships should not be shared among the entities with which it has a Beneficial Holding relationship. Further, if such Beneficial Holding relationships are defined as direct corporate associations, PG&E and the entities with which it has Beneficial Holding relationships would be subject to a shared holding limit under section 95920(f) and (g). ARB should resolve this issue by clarifying that an electrical distribution utility's Beneficial Holding relationship as defined in section 95834(a)(2) does not constitute an "ownership interest" as that term is used in section 95833(2)(a). (PGE4)

> **Response:** We agree with the comment and revised sections 95833(a)(2) and (3) to clarify the process and remove all references to the term "ownership interest." Pursuant to section 95834(c), a beneficial holding relationship is not a corporate association unless the entity serving as agent refuses to agree to the information-sharing restrictions contained in section 95834(c)(1).

L-32. (multiple comments)
Comment: Section 95833(a)(1)(D) should be deleted. That section provides that an entity has a "direct corporate association" with another entity if any one of the entities "controls more than 20 percent of the other entity's affairs through some other means."

The phrase “controls more than 20 percent of the other entity’s affairs through some other means” is too vague to have any practical application. How would an entity or the ARB know if that entity controls 20 percent of another entity’s affairs through “some other means”? Section 95833(a)(2) should be deleted. The section provides that an entity has a “direct corporate association” when it holds “allowances in its holding account in which another entity has an ownership interest.” It is unclear what possible ownership interest a second party could have in instruments in a first party’s account, given that:

- The instruments exist only to the extent that they are recorded in an account—they have no independent existence in the way that physical goods do; and
- Section 95820(c) (p. 55) explicitly provides that allowances do not constitute property rights: “A compliance instrument issued by the Executive Officer does not constitute property or a property right.”

The wording of section 95833(a)(2) provides that a corporate association only arises under this provision if an entity has attested that its relationship constitutes a corporate association. It would appear, then, that if an entity does not attest to a corporate association, and section 95833(a)(1) does not apply, that entity will not have a corporate association, making this provision essentially voluntary in nature. Modify section 95833 as follows:

> (a) Entities registered pursuant to section 95830 must disclose direct and indirect corporate associations with other registered entities.
>
> > (1) An entity has a “direct corporate association” with another entity if any one of these entities:
> >
> > > (A) Holds more than 20 percent of any class of listed shares, the right to acquire such shares, or any option to purchase such shares of the other entity;
> > >
> > > (B) Holds or can appoint more than 20 percent of common directors of the other entity; or
> > >
> > > (C) Holds more than 20 percent of the voting power of the other entity.~~; or~~
> > >
> > > ~~(D) Controls more than 20 percent of the other entity’s affairs through some other means.~~
> >
> > ~~(2) An entity has a “direct corporate association” with another registered entity when it holds compliance instruments in its own holding account in which another entity has an ownership interest and the entity has attested to the Executive Officer that its relationships with the other entities constitute a corporate association.~~ (SCPPA6)

Comment: Section 95833. Disclosure of Direct and Indirect Corporate Associations.

(a) Entities registered pursuant to section 95830 must disclose direct and indirect corporate associations with other registered entities.

(1) An entity has a "direct corporate association" with another entity if either one of these en titles:

(A) Holds more than twenty percent of any class of listed shares, the right to acquire such shares, or any option to purchase such shares of the other entity;

(B) Holds or can appoint more than twenty percent of common directors of the other entity;

(C) Holds more than twenty percent of the voting power of the other entity; or

~~(D) Controls more than twenty percent of the other entity's affairs through some other means.~~

LADWP recommends that subparagraph (D) be deleted as the term "through some other means" is too vague. LADWP is a member of the Southern California Public Power Authority and the Intermountain Power Authority. LADWP is a significantly larger utility in comparison to its sister POUs in SCPPA and IPA that will also be registered entities under the Cap-and-Trade program. LADWP seeks clarification from ARB in the regulation that these types of POU associations would not constitute a corporate association, insofar as the POUs each have their own separate governing body and rate setting structure, regardless of their participation in these types of Joint Power Authorities. (LADWP4)

Comment: Direct and Indirect Corporate Relationships. Section 95833(a)(1) describes the disclosure requirements for direct and indirect corporate association with other registered entities. Although this seems to be an improvement from current rule language WSPA believes the language is still unclear. WSPA recommends that ARB engage in further discussions with stakeholders, including WSPA, to further clarify issues for rule amendment in the 2nd 15-Day package of amendments. (WSPA3)

Comment: An element of the Regulation that exacerbates the already troubling holding limits is the language on corporate associations. The language here is very broad and results in associated entities with no practical means to jointly hold or manage allowances, subjected to a joint, unworkably low holding limit. Again, the solution here is to avoid the use of holding limits on compliance entities—or to impose a limit that accounts for full compliance obligation and needed flexibility to bank and hedge. (BP2)

Comment: Section 95833 requires disclosure requirements for direct and indirect corporate associations. The thresholds for requiring disclosure of direct and indirect are quite low. Section 95833(a)(2) reiterates that a direct corporate relationship exists when an entity holds compliance instruments in its "own holding account" in which another entity has an ownership interest with other entities." (WSPA3)

Response: We acknowledge the concern expressed in the comments that the language in section 95833(a)(1)(D) would be difficult to implement, and we removed it in the second 15-day changes to the regulation.

We also agree that the language in section 95833(a)(2) can be further clarified, especially in the use of the term "ownership interest." We also removed that language. The intent of the original language was to address cases in which an entity acquires and holds compliance instruments on behalf of a client entity. We addressed that situation through the new language in section 95834 and section 95921(e)(1) and (2), which deal with beneficial holdings and transfers initiated on behalf of clients.

We also revised section 95833(a)(1) which contains the levels of control that establish whether a corporate association exists. We raised the value of these levels from 20 percent to 50 percent for both direct and indirect corporate associations. We believe this change clarifies when an association exists, as well as the concerns raised by the POUs regarding Joint Power Authorities.

L-33. (multiple comments)
Comment: Section 95834, Disclosure of Beneficial Holding. LADWP seeks clarification on the disclosure of beneficial holdings and would appreciate further discussions with ARB staff regarding how this provision is proposed to be implemented. (LADWP4)

Comment: WSPA believes that section 95834 should be clarified to define the exact meaning of beneficial holding. Is it relating to a trader or is it relative to owners and operations? WSPA recommends that ARB engage in further discussions with stakeholder, including WSPA, to further clarify issues for rule amendment in the second 15-day package of amendments. (WSPA3)

Response: We agree with the comment, and we revised the section in the second 15-day changes to the regulation to clarify several features. First, the section provides a voluntary approach that requires the approval of both parties to a beneficial holdings relationship. Second, we expect most traders and brokers to use section 95921(e)(2) to arrange transfers on behalf of clients.

L-34. Comment: For a small subset of IPPs operating under existing, long-term contracts, currently no viable mechanisms exist within their contract structures to recover the cost of the GHG allowances they are obligated to obtain under the C&T program. This limited set of IPPs and combined-heat and power facilities ("CHP") operate under long term contracts. CARB should amend the section 95834, Disclosure of Beneficial Holding, to require a distribution utility to enter into a beneficial holding relationship to cover the emissions obligation of the IPP generator selling to the utility under an existing long-term contract. IEP proposes the following addition, a new section 95834(a)(4) as follows:

> (4) In the event there is a Long-Term Contract for the sale of electricity at wholesale which: i) does not directly or indirectly provide or refer to GHG costs either explicitly or through a) a CPUC approved contract or, b) a CPUC authorized pricing basis that includes GHG costs; ii) was fully executed before the final approval of AB 32 (September 27, 2006); and, iii) has not been renegotiated as of January 1, 2012 to address GHG costs, then, a beneficial holding relationship is deemed to exist pursuant to section 95834(a)(1)(A) without further action. The electric distribution utility party to the Long-Term Contract shall purchase and hold allowances for the eventual transfer to the other party to the Long-Term Contract for the sole purpose of supplying the second entity with compliance instruments to cover emissions resulting from satisfaction of the Long-Term Contract. (IEPA2)
>
> **Response:** We revised section 95834 in the second 15-day changes to the regulation, in part to provide a voluntary path by which parties to electricity contracts could have flexibility to determine who would be responsible for covering generation emissions, and in part to indicate who would have an ability to hold and transfer compliance instruments for that purpose. At no time did we intend to force a resolution to the issue of how long-term contracts should allocate responsibility for emissions. We believe that is the sole responsibility of the parties to the contracts, and we wrote the regulation to provide flexibility. However, we remain neutral on how the responsibility should be assigned.

L-35. (multiple comments)
Comment: Section 95834(b)(1). WSPA believes that the 10 day registration period seems unreasonably strict. WSPA recommends that this section be amended to allow 30 days for the registration period. (WSPA3)

Comment: In general, PPG believes that several of the limitations in the proposed modifications to the cap-and-trade regulation are unnecessarily restrictive. For example, the time limits on certain disclosure and registration requirements in Sections 95830(f) and 95834(b) are unnecessarily short. It should be sufficient that such information be updated by the deadline for the reporting or registration event for which the information is needed. (PPGI)

> **Response:** We disagree with the commenter’s assertion that the information needs only to be updated in time for a reporting or registration event. The information in both sections cited by the comment is used for other purposes. The information collected pursuant to section 95830(f) is needed for market monitoring and to conduct auctions. When an entity updates this information, we will have to analyze the information and update a number of records. Market monitoring is an ongoing process. For the auctions, this updating must be done well before the auction deadlines so that we can analyze the auction application information on the auction’s rather short timelines. The timeline for section

95834(b) is short because we need the information to process any transfers subject to the beneficial holdings arrangements. Longer timelines run the risk of us erroneously flagging transfers as violations.

L-36. Comment: ARB should clarify its requirement that compliance instruments be "earmarked" for a specific principal at the time of purchase. This requirement would limit the usefulness to SCE of entering into a beneficial holding relationship. SCE's *pro forma* and existing contractual language provides SCE with the option of using financial means to settle its GHG obligations to dispatching generators, and this provision would restrict that valuable flexibility. In addition, this pre-procurement earmarking will effectively require agents to predict how many compliance instruments they will want to transfer to their principals. This will lead to speculation, which could result in over-procurement of allowances by compliance entities for their principals, which in turn could raise allowance prices and tie up the market if allowances are no longer unavailable for long-term transfer. ARB should revise section 95834(b) to require the agent to disclose only the transfer of compliance instruments from an agent's Beneficial Holding Account to the Holding Account of the principal. Agents should be able to respond to defined needs from their principals and disclose this information after the fact. (SCE3)

Response: We added section 95834 to provide a voluntary path by which an agent could accumulate allowances for eventual transfer to a principal while counting the allowances against the principal's holding limit. The requirement that the principal confirm the transactions is needed to ensure that it is voluntary. If the agent could act unilaterally, then it could hold more than the principal anticipated, potentially leading to holding limit violations.

We agree that the approach cannot solve all the complexities inherent in electricity contracts. However, the commenter is not correct in asserting that the procedure would restrict the flexibility that utilities need to settle their obligations, for two reasons. First, the utilities have enough room under the holding limit and limited exemption to accumulate more than their direct emissions obligation. Second, any obligation that the utilities take on resulting from contracts for generation are taken on voluntarily, through contract negotiation. Accumulation for eventual transfer can be handled within the holding limit. As the comment states, utilities have options of financial settlement as well. The provisions of section 95834 do not interfere with these options.

The comment is incorrect in its assertion that the provisions would result in over-procurement. This is not logical. Because the principal and agent must both agree to the transactions, the procedure cannot be implemented until there is agreement on how many allowances must be transferred.

Finally, it is not clear why denying the principal the ability to approve transfers under a beneficial holding arrangement would help define their compliance needs as the comment asserts. Allowing the principal to be informed and confirm transfers would seem to be the best way of meeting their needs.

Outside the Scope of the 15-Day Changes to the Regulation

Oversight

L-37. Comment: To safeguard the market and limit individual instances of market manipulation, we recommend that the ARB rely on existing Commodity Future Trading Commission (CFTC) and designated contract market (DSM) rules and their oversight of the commodity markets. (BARCLAYS)

> **Response:** This comment is not suggesting any edits to the regulation. As part of program implementation, ARB will be coordinating with the CFTC to ensure there is oversight of the market program.

L-38. Comment: Cap and Trade Systems Are Difficult to Regulate; Open to Fraud and Manipulation. As the Legislative Analyst's Office (LAO) has found, the State of California lacks authority to effectively regulate markets arising from a cap and trade system. The LAO stated, "ARB has no experience in regulating [trading of compliance instruments in the spot market], and its lack of technical expertise and institutional knowledge of such matters increases the chance that market manipulation could go undetected, in spite of any monitoring efforts that it puts in place." The U.S. Commodity Futures Trading Corporation has not developed carbon spot market regulations. In the words of a 2011 CFTC report, "No set of laws currently exist that apply a comprehensive regulatory regime—such as that which exists for derivatives—specifically to secondary market trading of carbon allowances and offsets. Thus, for the most part, absent specific action by Congress, a secondary market for carbon allowances and offsets may operate outside the routine oversight of any market regulator." ARB's current rulemaking includes general provisions prohibiting fraud, manipulation and gaming but has provided very little detail in way of enhancing carbon market oversight. For example, ARB should include detailed provisions for preventing insider trading, which is a particular risk for carbon markets. ARB should also set rules to deter excessive speculation, such as setting higher position limits, barring financial speculators from bidding in auctions, and prohibiting long-only passive investment in carbon. (FRIENDSOFEARTH2)

> **Response:** No changes were made to the regulation based on the comments. The program already includes provisions to prevent the accumulation of market power by the market participants. CFTC is currently working to finalize its rules, and ARB has been in discussion with their staff to coordinate on market oversight.

L-39. Comment: ARB should use the program delay to reconsider provisions not covered in this rulemaking—like trade exposure and including fuels in the cap—that will create economic burdens and competitive disadvantage in the second compliance period. While trade exposure is not being discussed at this point, it is critical for ARB to review trade exposure for refining as part of its cap and trade program monitoring. Trade Exposure for Refineries and Fuels under the Cap should be evaluated at least one year prior to the start of the second compliance period to prevent adverse effects of the program on California industry, jobs, and the economy. (CHEVRON3)

> **Response:** No changes were made to the regulation based on the comments. Board Resolution 11-32 directs the Executive Officer to continue to evaluate trade exposure for the capped entities and propose amendments, as appropriate.

L-40. Comment: Registration will be required by January 1, 2012 or within 30 days of effective date of the rule. In order for this provision to become effective, the tools and system requirements must be provided sufficiently ahead of time for compliance to occur. WSPA believes a specific date should be deleted from section 95830(d)(1)(B), and the section amended to require registration when ARB publishes appropriate tools and provides a 30 day notice to registrants. (WSPA3)

> **Response:** These comments were previously submitted and responded to under the 45-day changes to the regulation, and fall outside the scope of the first 15-day changes to the regulation. No further response is required.

L-41. (multiple comments)
Comment: The Regulation should specify the authority and responsibilities of a market monitor to include: auction certification, quarterly auction reporting and reports on overall market status. (PGE4)

Comment: We have no recommended changes to section 95921, but would note that the requirements for transactions could and should be built into the functionality of the market tracking system. For instance, the requirement in subparagraph (a)(1)(A) that both parties to a transaction must report the transaction to the accounts administrator within three calendar days can be operationalized within the tracking system by requiring the accounts representative of both parties to authorize the transfer of units between holding accounts. Similarly, the information requirements in subparagraph (c) should be integrated into electronic transaction requests within the tracking system. (WPTF2)

> **Response:** These comments fall outside the scope of the first 15-day changes to the regulation. We have initiated activities to develop the necessary rule implementation infrastructure for the regulation, including a market tracking program to trade allowances; contracts for an auction services provider; and a financial services provider. We are also committed to providing continual public updates, with opportunity for stakeholder comment, on the implementation of the regulation. Because the comments fall outside the scope of the first 15-day changes to the regulation, no further response is required.

Holding Limits

L-42. Comment: Generally, physical commodity markets are not subject to holding limits. Although the CFTC and DCMs impose position limits and position accountability levels on futures contracts, physical positions are not so limited. Even with respect to future contracts, entities are exempt from such limits to the extent they are engaged in "bona fide hedging transactions." This exclusion to the CFTC and DCMs' position limits has existed since 1936 and covers "various balance sheet and trading strategies that are risk reducing." Accordingly, even under the CFTC and DCM rules, an entity can pursue risk reducing hedging strategies that breach position limits. We see no reason that allowances should be treated differently from any other commodity. Similar to other commodities, regulated entities should be able to trade allowances in the physical market without holding limits. Even if the Board does not adopt this view, it should not drive against over 75 years of history that exempts bona fide hedges from trading limits and should adopt a similar exclusion to the proposed rules' holding limits. Furthermore, the CFTC will be able to indirectly exercise anti-manipulation jurisdiction over the physical allowance market. The CFTC may regulate physical markets that relate to and affect a futures market. Because allowances will be listed on an exchange, the CFTC will be able to regulate and punish market manipulation of physical allowances. The Board should not intrude on the CFTC's jurisdiction by imposing holding limits, and should instead rely on the CFTC and the exchanges' expertise and experience in this area. (BARCLAYS)

> **Response:** The comment is not correct in its portrayal of the enforcement actions of the CFTC. While the CFTC can obtain information on spot markets for which there is contract instrument under its jurisdiction, the CFTC only does this when a disruption in the spot market leads to disruption on a designated contract market. The CFTC does not have general enforcement power over spot markets and does not expend monitoring or enforcement resources on these markets. We have explored cooperation with the CFTC, and we will actively share information where it is appropriate.
>
> We are very mindful of CFTC authorities. There is no intrusion on the CFTC's jurisdiction because we are not placing requirements on designated contract markets. Since we are not regulating those markets, we are not restricting covered entities' hedging opportunities.

Registration and Accounts

L-43. Comment: Section 95830 details the registration process for the entities including the information that must be submitted and the deadlines for submittal. Subsection (e) defines that registration is complete when the EO approves the registration and notifies the entity. There is no timeline for EO approval. Modify section 95830(e) as follows:

> (e) Completion of Registration. Registration is completed when the Executive Officer approves the registration and informs the entity and the accounts

administrator of the approval. <u>The executive officer shall approve or deny a registration application within 30 days of submittal.</u> (CCEEB3, PGE4, WSPA3)

Response: This comment falls outside the scope of the first 15-day changes to the regulation. We did not change the language of section 95830(e) from the initially proposed regulatory language, and therefore it was not subject to comment under the first 15-day changes to the regulation. No further response is required.

L-44. (multiple comments)
Comment: Section 95832(f)(4) allows only 1 day to submit a revision of “any change in the entities that own compliance instruments in the account”. PG&E proposes that the time requirement be changed to a minimum of five business days. A small increase in the number of days will help alleviate the challenge of submitting a revision in the situation when “any change” is made on a Friday or a day prior to a California State Holiday, while still ensuring that entities provide the ARB with prompt notice of change. (PGE4)

Comment: Section 95832(f)(4) requires that an entity submit any changes to the account within one day of the change. WSPA believes that one day is simply infeasible for submittal of a revision even with electronic recordkeeping. WSPA recommends that this section be amended to allow 10 days for submittal of changes. (WSPA3)

Response: These comments fall outside the scope of the first 15-day changes to the regulation. We did not change the language requiring that an entity submit an revision “within one day following any change in the entities that own compliance instruments in the account” from the initially proposed regulatory language, and therefore it was not subject to public comment under the first 15-day changes to the regulation. No further response is required.

L-45. Comment: ARB should provide more clarity as to the responsibility and authority of the market monitor. In addition, the role of the market monitor should be transparent to the market. We understand that ARB is planning to hire an independent market monitor. This is important because market monitoring is essential to help ensure reasonable market behavior and results, and to instill confidence with market participants and other stakeholders. CCEEB recommends that the Independent Market Monitor that ARB selects be established with authority to: (1) review bids prior to the running of any auction; (2) provide analysis of the competitiveness of any auction, preferably on an ex-ante basis (e.g. prior to running the auction); and (3) report findings and concerns to the ARB. (CCEEB3)

Response: No changes were made to the regulation based on the comments. These requested actions are part of program implementation and will be addressed as part of that process.

L-46. Comment: CARB states in the Section H of the Summary of Proposed

Modifications, “Modifications to section 95820”, that section 95820(a)(3) was modified to remove the requirement for the Executive Officer to place allowances into a holding account within 15 days of the effective date of the regulation as it is unlikely there will be a system with a holding account available within 15 days to meet this requirement. This highlights the fact that CARB is intent on promulgating a regulation that doesn’t have all the necessary support elements in place to effectively support what CARB is hoping to achieve. (VALERO2)

> **Response:** We made this change because the regulation comes into effect to allow registration of covered entities by January 1, 2012. However, the market and auction systems are not scheduled to begin operating until July 2012, to allow for the first scheduled auction. The enforcement of the first compliance year does not begin until January 1, 2013. The reason for the staggered startup of the main components of the program, as well as the elimination of the date referred to in the comment, was to ensure that the operating systems will be ready when each component of the program begins.

L-47. Comment: A strong Cap and Trade market design is vital to the success of the Cap and Trade program. SCE supports the Joint Utilities Group in recommending that ARB adopt a roadmap and market readiness checklist before beginning the program. (SCE3)

> **Response:** No changes were made to the regulation based on the comments, as these actions are related to program implementation.

L-48. Comment: We are concerned that language has not yet been added to the Regulation to incorporate the role of the market monitor and seek clarification from ARB regarding where the role and responsibilities of the monitor will be described. Specifically, we recommend that ARB designate in the Regulation a Market Monitor with the following authority and responsibilities:

1. Auction Certification. The Regulation requires that each quarterly auction be certified that it was conducted pursuant to the regulation prior to its official closing. PG&E recommends that the certification of the auction allow up to seven days for ARB and the Market Monitor to review the auction and associated calculations, review participant/group behavior or scan for other suspect activity, and certify results (similar to RGGI) prior to consummation of any trades from that auction. The result of certification would be a report that either:

   a. Certifies that the auction functioned properly, participant behavior appeared reasonable and verifies results (prices, including correcting any potential errors and winners), or

   b. Notes concerns with the auction (potential concerns could include, but are not limited to, buyer concentrations, suspect collusion or prices at unreasonable levels) and proposes resolution. Resolution could include declaring the auction a failure (and not executing trades), re-running the auction, or temporarily suspending the auction and compliance obligation.

2. Market Monitor Reports. A Market Monitor to monitor auction and bilateral markets and to issue reports after each quarterly auction and at least annually for bilateral markets.

3. Annual Report on Market Status. A consultant annually reviews the market, its price levels, participants progress toward compliance, whether any manipulation is occurring and report to participants and the ARB. Reports should be vetted with stakeholders and address their input questions. (PGE4)

> **Response:** No changes were made to the regulation based on the comments, as these actions are all part of program implementation.

L-49. Comment: PG&E encourages ARB to establish a system that allows participants to perform automated reconciliation with the compliance instrument registry. This will allow participants to obtain a complete allowance inventory of accounts in an electronic format to support their own internal automated reconciliation with the registry. (PGE4)

> **Response:** No changes were made to the regulation based on the comments, as such functionality would be part of program implementation. For security reasons, it is unlikely that any external system will be allowed to access the compliance instrument registry.

L-50. Comment: The ARB proposal has not adequately defined many of the tools (i.e., forms, registrations, procedures, software) required for a Cap and Trade program (even one with the proposed “soft start” in 2012). Hence, a smooth and efficient start of the program is uncertain. If development of appropriate tools is further deferred, efficient functioning of the program could be put in jeopardy. WSPA recommends that where ARB has identified specific dates for program implementation, but that will require ARB tools (such as registration forms) for successful implementation, those dates should be deleted and a timeframe instead be defined. For example, instead of saying the registration is required on January 1, 2012, the Regulation should say, registration is required 30 days after ARB publishes (releases) the registration tools. Further, WSPA recommends that ARB develop a schedule for development procedures and requirements associated with the Cap and Trade program to allow interested parties to develop their approaches in line with ARB concepts. This collaborative process will facilitate involvement by stakeholders and ensure broad input into details required by the Cap and Trade program. (WSPA3)

> **Response:** Many of the 'tools' listed in the comment are part of program implementation and do not have to be included in the regulation itself.
> As components of the infrastructure become operational, we are committed to having stakeholders provide feedback on the design and recommend improvements. We included specific deadlines in the regulation to ensure that the regulation is enforceable. The compliance start date was moved from 2012

to 2013 to ensure that all the regulatory elements are in place and fully functional. We have initiated activities to develop the necessary rule implementation infrastructure for the regulation, including a market tracking system to trade allowances and offsets; contracts for an auction services provider; a financial services provider; and a market monitor. We are also committed to providing continual public updates, with opportunity for stakeholder comment, on the implementation of the regulation.

Trading and Banking

L-51. Comment: WSPA disagrees that imposing holding limits is required to reduce market manipulation. The position limits included in the regulation are a rule developed by the CFTC to regulate futures markets. No agency has ever attempted to use such limitation to regulate the inventory or spot market as suggested in the regulations and nothing on the record supports such a position. To the contrary, evidence available from the administration of carbon markets in Europe suggests that auction frequency, not holding limits, can control the risk of market manipulation most effectively. As written, the proposed regulations limit the ability of WSPA companies to trade and cost optimize to a fraction of the amount needed. Modify section 95920(d)(3) as follows:

<u>(3) The holding account limit for compliance entities will be calculated pursuant to section 95920(c)(1) as two times the average of the entities previous two year's reported emissions</u>. (WSPA3)

Response: First, the response is not correct in its assertion that the holding limit was developed by the CFTC to regulate futures markets. The holding limit was developed in consultation with Jeffrey Harris, who was formerly employed at the CFTC.

Second, members of the EU ETS did not conclude that auction frequency alone can control the risk of market manipulation. They have other procedures, analogous to "responsibility levels" in U.S. commodity markets, which are part of EU national programs. In addition, the EU members have identified position and purchase limits as backstops in case anti-competitive conditions emerge. As to whether our approach is unprecedented, our selection of policy instruments is restricted by the Administrative Procedure Act, which limits our discretion in managing markets. We do not have the full range of policy instruments that are available to national agencies in the EU. For example, we cannot use responsibility levels because we cannot make ad hoc determinations of when limits must be reduced in response to judgments on market conditions. We cannot introduce position or purchase limits as backstop measures in response to short-term market conditions because we must adopt them through a lengthy rulemaking process.

The holding limit calculation would allow all covered entities to keep about 6 million MT of allowances, along with an unlimited amount of offsets, in their holding accounts during the first compliance period. This number rises to over 11 million MT in the second compliance period. These levels should give covered entities the opportunity to make profitable sales when they are able to identify short-term price increases. Many covered entities have informed us that they will procure as close in time as they emit, so we concluded that the limits will not overly restrict speculative behavior by covered entities.

L-52. Comment: Section 95922. We previously commented that unlimited banking could have the unintended consequence of the program not meeting the 2020 emissions goal. Provisions need to be added to limit the number of banked compliance instruments or the time that they can be banked. With the economic downturn it is likely that many facilities will be able to bank unused compliance instruments in the early years of the program and may not need to use them in the future. This may also lead to price fluctuations in the market. For example, in the last compliance period, if large amounts of banked compliance instruments are offered for sale, the price could drop dramatically which would limit the amount of on-site reductions made by facilities. This may make it even more difficult to achieve the transformative changes that will be needed to meet the 2050 greenhouse gas emission reductions target for the state. (SCAQMD4)

Response: No changes were made to the regulation based on the comments. The program was designed on forecasted emissions that included the impacts of the economic downturn.

M. OFFSETS

Limits on Offsets

Restrict Offsets to Local and/or In-State Offset Projects

M-1. (multiple comments)
Comment: Research shows that out-of-state offsets will increase criteria pollution. (David Roland-Holst, "Carbon Emission Offsets and Criteria Pollutants: A California Assessment," March, 2009, University of California, Berkeley.) Air pollution is worst in low-income communities and communities of color, such as the neighborhoods downwind from oil refineries in the LA area. We call upon ARB to eliminate out-of-state offsets and greatly reduce the allowed in-state offsets. It is embarrassing that over 85 percent of the GHG reductions could come from offsets. Relieve low-income communities and communities of color from this heavy burden. (EDLA)

Comment: Offsets should be limited to assure the integrity of the emission reductions and fulfill the letter and spirit of the law. Excessive reliance on offsets could open up loopholes that undermine the very purposes of California's AB 32 cap on emissions. Curbing global warming will require a fundamental transformation of our energy economy, a task that cannot be outsourced to other countries. Requiring California's largest polluters to reduce their own emissions will spur technological advances that can be exported to the rest of the world, bringing green jobs to the Golden State. If polluters are allowed to outsource their emission reductions to other sectors and jurisdictions, the clean-energy revolution will be delayed. Research shows that out-of-state offsets will increase criteria pollution. The staff proposal would allow polluters to offset almost half of the emission reductions required under this rule. That amount should be significantly reduced. (We supported the 10 percent limit in AB 1404, which was passed by the Legislature but vetoed by the Governor in 2009). (SIERRACLUBCA5)

Comment: We urge CARB to explore how it can give greater weight to offset credits from California agriculture compared to credits from other states and countries. Many of the agricultural activities that provide reduced GHG emissions have additional environmental and health benefits such as improved air and water quality. California should seek to maximize those additional environmental and health benefits by structuring the offset credit market to incentivize the use of credits from California first and outside of the state second. (CACAN3)

> **Response:** The commenters reference a University of California (UC) Berkeley study which they state demonstrates that allowing out-of-state offsets in the program would increase co-pollutant emissions in California. Contrary to the commenters' concerns, the facilities' ability to use offsets that originate outside of California will not cause an increase in co-pollution emissions in California. The UC Berkeley study found that if all facilities only purchased out-of-state offsets, then the potential co-pollutant benefits realized by a greenhouse gas cap-and-trade program would be less than if no offsets were allowed. This finding should

not be misinterpreted to imply that out-of-state offsets would lead to an increase in co-pollutant emissions in California.

Furthermore, as stated in the response to comments for the Staff Report, numerous studies have evaluated the potential for inequitable impacts from emissions trading programs on minority neighborhoods, racial and ethnic groups, and general community demographics, and found that trading did not have a disproportionate impact.

The most effective way to reduce the impacts of co-pollution emissions in low-income and disadvantaged communities is to implement programs that target reductions in co-pollutant emissions directly. While a GHG-focused program would likely reduce co-pollutant emissions along with GHG emissions, it is not the most effective mechanism for decreasing exposure to co-pollutants.

Although we anticipate that co-pollutant emissions would decrease under the cap-and-trade program, we are committed to monitoring the implementation of the regulation to identify and address any situations where the program results in an increase in criteria air pollutant or toxic emissions. In Resolution 11-32, the Board approved an adaptive management plan for the cap-and-trade program.

At least once each compliance period, we would use information collected through the mandatory reporting regulation, the cap-and-trade regulation, and other sources of information to evaluate how individual facilities are complying with the cap-and-trade regulation. The public will have ample opportunity to comment on these assessments. At least once a compliance period, we will update the Board on the adaptive management plan. Where necessary and appropriate, we will consult with the local air district, CDPH, and outside experts. We do not believe that tracking specific public health outcomes will provide data that will be useful to the adaptive management plan because many health impacts are not observed until years after exposure occurs and due to the low levels of exposure anticipated it would be difficult to observe a significant association, and extremely challenging to establish causation.

If adverse co-pollutant impacts are identified and can be attributed to the cap-and-trade regulation, we are committed to promptly developing and implementing appropriate responses through a public process, including consideration and approval by the Board as necessary.

The program imposes a limit on the amount of offsets that an individual covered entity can use for compliance. All offsets used for compliance are real reductions, albeit outside the cap. Allowing a limited number of offsets into the program provides cost-containment benefits and ensures that some GHG emissions reductions occur within the sectors covered by the cap-and-trade program. The program includes provisions that would allow a maximum of 201 $MMTCO_2e$ of offsets through the year 2020. This limit will be enforced through a limit on the use of offsets by an individual entity equal to eight percent of its compliance obligation. It is highly unlikely that the eight percent offset usage limit could result in 85 percent of the reductions required under the cap coming from offsets. Combined with the Allowance Price Containment Reserve, the eight percent limit ensures that a majority of reductions from the program come from sources covered by the program at expected allowance prices, while use of the reserve will relax that constraint if prices rise.

No Offsets/Reduce Number of Offsets

M-2. Comment: In regards to section 95854, we recommend that in the second and third compliance periods, the percentage of total emissions that would be permitted to come from offsets is reduced. We propose that no more than 2.5 percent of total emissions in the second compliance period and no more than one percent of total emissions in the third (and any subsequent) compliance period be permitted to come from any type of offset. This would be equivalent to roughly one-third of emission reductions from business as usual in the 2nd compliance period and 12 percent of emission reductions in the 3rd compliance period. These modifications in quantity will help promote technological innovation in the highest-emitting sectors, increase opportunities for in-state co-benefits (including air quality benefits), and reduce the risk that a high proportion of compliance credits will not represent real and additional reductions in emissions. We oppose any suggestion to have one offset usage limit through 2020. Limits on offsets should remain as a per compliance period percentage and not be counted cumulatively across compliance period. (UCS6, UCS7)

Response: We did not change the limit on the use of offsets in the program. We believe that a limited use of offsets is necessary in the program to contain costs and incentivize reductions in uncapped sectors. The program imposes a limit on what we believe is an appropriate amount of offsets that an individual covered entity can use for compliance. All offsets used for compliance are real reductions, albeit outside the cap. Allowing a limited number of offsets into the program provides cost containment benefits and ensures that some GHG emissions reductions occur within the sectors covered by the cap-and-trade program. The program includes provisions that would allow a maximum of 201 $MMTCO_2e$ of offsets through the year 2020. This limit will be enforced through a limit on the use of offsets by an individual entity equal to eight percent of its compliance obligation. Combined with the Allowance Price Containment Reserve, this limit ensures that a majority of reductions from the program come from sources covered by the program at expected allowance prices, while use of the reserve will relax that constraint if prices rise.

Unlimited Offsets/ Increase Number of Offsets

M-3. (multiple comments)
Comment: We believe that the level of assault from the environmental and environmental justice communities will never allow CARB to fully utilize offsets to the

degree that would ever give the regulated community any comfort. We lament the lack of approved protocols for offset development, and the convoluted fractions of fractions of compliance obligations allowed to be met through the use of offsets and their general politicization by those with radical environmental agendas. (CIPA)

Comment: CARB has established a very stringent framework both for existing offset protocols and for approving new offset protocols. These requirements are likely to limit the size of the offset market available to California businesses and offset developers. Given this level of stringency, CARB should not continue to set an arbitrary limit on the number of offsets that can be used to meet a compliance entity's surrender obligation. The proposed 8 percent limit is no more likely than the previous 4 percent limit to provide enough offsets to meet the needs of a growing economy in California. This arbitrary limit on the number of offsets that can be used increases costs and leakage. (AB32IG2)

Comment: The quantitative usage limit on offsets will only serve to increase the overall costs of compliance of the program. As long as offset credits are deemed by ARB to be real, permanent, and verifiable, there should be no restrictions on their use. Not only does it increase the costs of the program, but such usage limits may also inhibit investment in offset projects. This is particularly true in those projects with long-term planning horizons, where investors may be less willing to support development of large-scale or capital intensive offset projects if there is uncertainty as to whether they will be able to monetize the carbon reduction off-take portion of the project. This opposition to quantitative usage limits noted, Evolution Markets recognizes ARB has modified the provision to apply the limit to the triennial compliance period (or biannual compliance period for 2013-2014). This change, however, may not provide enough flexibility to compliance buyers to realize the full cost-saving potential of offsets or stimulate investment in capital intensive offset projects. Evolution Markets recommends ARB extend the period of time to which the quantitative usage limit would apply to the full length of the program—from 2013 to 2020. The added flexibility ensures each compliance entity has an opportunity to maximize use of low-cost offsets by allowing them to invest in offset projects or purchase offset credits in the market in an efficient and risk-managed manner. (EVMKTS2)

Comment: Offsets represent an important cost containment tool for many food processors and producers and should the economy ever rebound, offsets will be vital to keeping the cost of allowances from skyrocketing as industries begin to ramp up production to meet demand. CLFP recommends that CARB not take a restrictive approach to the use of emission offsets by Cap and Trade program participants such as limiting the number or percentage of offsets that can be used; the geographic location of offsets; or the types of offsets that would be eligible. (CALFP3)

Comment: Allowing the use and availability of a large quantity of offsets from the very beginning of the program will be crucial to the program's success. Policies that increase the likelihood of an inadequate supply of offsets and the inability to link to other Cap and Trade programs will greatly decrease the potential for a cost effective

California program. CLFP recommends that CARB instead focus on the quality of offsets; that they meet the requirements of being real, additional, quantifiable, verifiable, and permanent. As long as offsets meet that rigorous standard, then their use by regulated entities should not be limited for compliance purposes. (CALFP3)

Comment: CLFP recommends that the proposed 8 percent level be established as a floor, and that additional offsets be allowed as necessary to maintain costs of the program within acceptable limits. (CALFP3)

Comment: Section 95854 limits the volume of offsets that facilities can use for their annual and triennial compliance obligation to only 8 percent, thus artificially raising the cost of compliance. This restriction, combined with the expected use of auctions as a means to distribute the allowances will marginalize (render inconsequential) the use of offsets, reduce offset supply, discourage out-of-program sources that would otherwise be subject to CARB control (for it is only such sources that can create credits) from taking steps that would have otherwise be taken to reduce emissions, and increase the cost of compliance. Offset creators will be more likely to choose to expend their capital in regions that allow for the greater use of offsets and potential offset buyers will be more likely to choose to expand and possibly move their operations to regions that are not burdened with such restrictions. CantorCO2e recommends that CARB remove the quantitative restriction. Instead, limits should be based on quality of offset credits. Any offset credits which meet CARB's qualitative criteria should be allowed to be used by sources. (CANTORCO2E2)

Comment: Ag Council urges ARB to remove the 8 percent threshold of offsets allowed in a company's portfolio when surrendering allowances. Given the stringent criteria ARB is requiring to register an offset project, this arbitrary 8 percent threshold will only further stifle investment into offset projects. While it is an improvement over the 4 percent threshold which was previously suggested, 8 percent is only a minor step forward. (ACC4)

Comment: CARB should eliminate both quantitative and geographic limits on the use of qualified offsets to satisfy compliance obligations. Currently, CARB has proposed that a maximum of 8 percent of an industrial facility's compliance obligation can be met by offsets. This limit is unnecessary in light of CARB's stringent offset qualification rules, and it is also counterproductive as it could limit the cost effectiveness of CARB's GHG reduction program, particularly for California cement producers who have few, if any, additional cost-effective abatement opportunities available. In order to ensure adequate offset availability, CARB should not limit the geographical location of qualified offset projects. If CARB does maintain some limit on the use of offsets, limits should vary based on an industry's leakage category. The cement sector, with its high vulnerability to leakage, therefore should have a high limit (if any) on its ability to rely on offsets to meet its compliance obligations. (CSCME4)

Comment: Quantitative limits on the use of offsets may prevent cost effective greenhouse gas reductions. As long as ARB has rules in place to ensure that offset credits are high quality, there is no reason to implement artificial limits on their usage. ARB should be encouraging investment in projects and should understand the long time horizon required for planning and investing in projects. Limits on the use of offsets will serve to inhibit investment and create uncertainty regarding the monetization of the carbon reduction portion of the projects. If ARB believes that a limit is needed on the use of offsets, the Trust recommends that ARB extend the time period for the quantitative limit to the full length of the program (from 2013-2020). This allows a maximum number of years for a compliance entity to invest in projects, or purchase offset credits in the market, in an efficient and cost effective manner. (TCT)

Comment: CMTA opposes the limit on the use of qualified offsets. Stringent offset qualification rules and the need for CARB approval of any offset protocol will ensure only effective projects will be approved, and the rigorous process will likely constrain the availability of offsets in any event. There should be no additional, artificial constraints on the use of qualified offsets, and the evidence in the rulemaking record does not support a finding that limits in the use of offsets are necessary to meet the goals of AB 32. (CMTA3)

Comment: BP has previously commented on the importance of the role of offsets. Given the concerns about the potential economic impact of AB 32, the State of California's economy, the fact that significant emissions reductions in an already very efficient California energy production system will require long-term transformation, and the likelihood that California will be linking with few or no other Cap and Trade programs over the near term, we believe it is more important than ever that CARB seriously reconsider the enforcement of strict quantitative limits on offsets. Instead, CARB should look to incorporate the maximum use of design elements that control costs while maintaining the environmental integrity of the emission reduction goal. The use of offsets is a clear example of such a design element. The very restrictive quantitative limit on the use of offsets is compounded by what appears to be an incomplete, bureaucratic and potentially very exclusive offset-approval process. CARB staff should move expeditiously toward completion of an offset-approval process that ensures an adequate supply of offsets (especially early in the program), does not impose geographic limits (either explicit or implicit—through limited scope of approval), and that utilizes as much as possible existing offset protocols in use within California, the United States and globally. (BP2)

Comment: CERP recommends that ARB include a provision in the final regulations that would allow the quantitative offset limit to be modified in the future if allowance prices become too high. As CERP suggested in December 2010, the regulations should provide that if at any time half the allowances from the Allowance Price Containment Reserve have been purchased, additional cost containment should be provided by increasing the offset usage limit for that compliance period. If depletion of the Reserve occurs, ARB should also consider using revenue from the sale of Reserve allowances to purchase offsets which can then be used to replenish the Reserve. This system would allow for important price containment that would prevent the program from faltering under difficult economic conditions. (CERP4)

Response: We did not increase the amount of offsets allowed to be used in the program. The program imposes a limit on the amount of offsets that an individual covered entity can use for compliance. All offsets used for compliance are real reductions, albeit outside the cap. Allowing a limited number of offsets into the program provides cost-containment benefits and ensures that some GHG emissions reductions occur within the sectors covered by the cap-and-trade program. This limit will be enforced through a limit on the use of offsets by an individual entity equal to eight percent of its compliance obligation. Combined with the Allowance Price Containment Reserve, this limit ensures that a majority of reductions from the program come from sources covered by the program at expected allowance prices, while use of the reserve will relax that constraint if prices rise.

We recognize stakeholder concerns regarding offset supply. We may not adopt additional protocols as part of this cap-and-trade rulemaking. All offset protocols used in the compliance program must be adopted by the Board after undergoing a full regulatory process, including an ARB stakeholder process, in accordance with the Administrative Procedure Act, and an environmental review. We plan to look at further offset protocols for potential inclusion in the cap-and-trade program beginning in 2012. The details surrounding any new offset project types for which ARB adopts an offset protocol will be dealt in that rulemaking(s).

Carry Over of Offset Limit

M-4. (multiple comments)
Comment: ARB should fix the "buyer liability" issues with regard to offsets and allow carryover of the 8 percent compliance limit across years and compliance periods. Modify section 95854 as follows:

(a) Compliance instruments identified in section 95820(b) and sections 95821 (b),(c), and (d) are subject to a quantitative usage limit when used to meet a compliance obligation.

(b) The total number of compliance instruments identified in section 95854(a) that each covered entity may surrender to fulfill the entity's compliance obligation ~~for a compliance period~~ must conform to the following limit:

Oo/S must be less than or equal to Lo

In which:

Oo = Total number of compliance instruments identified in section 95854(a) submitted since January 1, 2013 to fulfill the entity's total compliance obligation ~~for the compliance period~~ through the current compliance year.

S = Covered entity's total compliance obligation beginning January 1, 2013 through the current compliance year.

Lo = Quantitative usage limit on compliance instruments identified in section 95854(a), set at 0.08. (CCEEB3)

Comment: The OWG both acknowledges and appreciates ARB’s improvement of Section 95854 by removing the applicability of the 8 percent quantification usage limitation to the annual compliance obligation. As the OWG considered this improvement, however, it came to light that the availability of offsets may not necessarily follow an artificial schedule based on calendar years. It's probable that the limited supply of offsets will become available in a lumpy manner, with greater amounts being available in the later compliance periods as forestry projects progressively sequester greater amounts of carbon and as additional protocols are added. This could lead to a scarcity of offsets in the earlier compliance periods and an unusable abundance in the later compliance periods. Also, the three-year limitation may place verification restrictions on Offset Project Operators (OPOs), forcing them to verify at times strictly by the calendar year. This may not be optimal or cost-effective for reducing emissions. A case in point is when variations in the reductions achieved by a forestry project may be out of sync with the strict 3-year compliance periods. Although a forestry offset project is only required in the Regulation to verify its carbon sequestration every 6 years, the project would need to, in fact, verify every 3 years in order to coordinate with the Covered entities' triennial compliance obligations. This would result in higher costs to the project developer with no additional benefit to sequestering additional emissions by the project. In order to overcome these artificially imposed problems and ensure that Covered entities have full access to an ample supply of offsets, ARB should modify the quantitative usage limitation to a running 8 percent of each Covered Entity's total compliance obligation. The OWG supports amendments to Section 95854 as follows

(b) The total number of compliance instruments identified in section 95854(a) that each covered entity may surrender to fulfill the entity's compliance obligation ~~for a compliance period~~ must conform to the following limit:

O_O/S must be less than or equal to L_O

In which:

O_O = Total number of compliance instruments identified in section 95854(a) submitted since January 1, 2013 to fulfill the entity's total compliance obligation ~~for the compliance period~~ through the current compliance year.

S = Covered entity's total compliance obligation beginning January 1, 2013 through the current compliance year. (OFFSETSWG3)

Comment: Section 95854(a) allows the use of the compliance instrument through to the end of the compliance period. WSPA believes this limited use of compliance instruments will only add to cost of compliance. WSPA recommends that the rule be amended to allow the use of the compliance instrument through to the end of the program, rather than to the end of a compliance period, as currently proposed. (WSPA3)

Comment: WSPA supports a robust offsets program as a critically important element of a cost-effective emission reduction and trading program. In the December rulemaking, Regulations creating the allowance reserve were adopted which take allowances from the cap in each compliance period and supplement that reduction in the cap by increasing the offset limits on specific facilities. Since the significant reductions in the cap due to the allowance reserve occurs throughout the program, ramping up in the second and third compliance period, WSPA proposes that the limit on offset use should extend to the full nine year period. (WSPA3)

Comment: As opposed to having an annual compliance obligation, ARB's quantitative usage limit on offsets (currently set at eight percent) will now apply to an entity's biannual compliance obligation for the first compliance period (2013-014) and triennial compliance obligation for the future compliance periods (2015-2017, 2018-2020). IETA is generally opposed to quantification limits. As long as only real, permanent, and verifiable offset credits are allowed into the market, arbitrary usage limits will only prevent further reductions of greenhouse gas emissions in a cost-effective manner. Furthermore, offset usage limits applied on the program and entity level inhibits investment in offset projects, particularly those with long-term planning horizons. Investors may be less willing to support development of large-scale or capital intensive offset projects if there is uncertainty as to whether it will be able to monetize the carbon reduction off-take portion of the project. These are the very projects that ARB hopes to foster with the offset program, as they are more likely to employ innovation in sustainable development and create good-paying green jobs. However, should quantification limits remain in place, IETA believes the modification from an application of the usage limit from an annual calculation to one based on the biannual or triennial compliance period is insufficient. In order to maximize flexibility, and therefore aid in reducing the costs of compliance, IETA recommends ARB extend the period of time to which the quantitative usage limit would apply to the full length of the program—eight years or from 2013 to 2020. The added flexibility ensures each compliance entity has an opportunity to maximize use of low-cost offsets by allowing them to invest in offset projects or purchase offset credits in the market in an efficient and risk-managed manner. In addition, this extension factors in the expectation that offsets are likely to be in short supply, especially at the program's start. (IETA3)

Comment: SCE continues to be concerned that ARB's offset policies are being implemented in a manner that will reduce the number of eligible offset projects brought to market. Furthermore, regulated entities may not be able to use offsets for the full 8 percent of emissions reductions authorized in the Regulation. Covered entities will not be able to substantially avoid direct emissions reductions using offsets. Currently, an overwhelming majority of the emissions reductions under AB 32 are already being achieved directly within California by regulated entities. Thus, the Cap and Trade program will comprise a relatively small share of the emissions reductions required to comply with AB 32, and the share of reductions due to offsets will be even smaller. Yet offsets, assuming sufficient supply, still have enormous potential to provide significant cost containment opportunities for the California emissions market. SCE offered detailed suggestions for implementation of ARB's offsets program in its December 2010 comments on the Proposed Draft Regulation. This process includes many steps such as the development and approval of protocols, verification services, third-party registries, offsets projects registration, and offsets certification and listing. SCE refers ARB staff to those earlier comments. The ARB offset program must be fully in place for the first compliance period in order to provide real cost containment, and SCE strongly urges ARB staff to take the necessary steps to ensure a robust supply of offsets by the first compliance period. SCE encourages the ARB to develop offset rules that will enable the State to achieve its AB 32 emission reduction goals efficiently and effectively. (SCE3)

Comment: SCE continues to have serious concerns about offset supplies in the first two compliance periods, which would limit compliance entities from using the offsets toward the full 8 percent of emissions reductions authorized in the Regulation. Offsets are a critical source of cost containment for regulated parties under AB 32. By contrast, concerns over concentrated offset use later in the Cap and Trade program are misguided, given that climate change is a global, long-term challenge, and the share of offsets retired in any particular compliance period is neither relevant nor environmentally important. As the regulated community anticipates the increase in offset supply in the later years of the program, ARB should allow covered entities the flexibility to use offsets up to 8 percent of reported emissions to date over the eight years of the program. In doing so, ARB would be assured that the use of offsets would never exceed 8 percent of the entity's compliance obligation to date, while affording flexibility to minimize the cost of compliance over the entire term of the Cap and Trade program. Modify section 95854 as follows:

> (a) Compliance instruments identified in section 95820(b) and sections 95821 (b), (c), and (d) are subject to a quantitative usage limit when used to meet a compliance obligation.
> (b) The total number of compliance instruments identified in section 95854(a) that each covered entity may surrender to fulfill the entity's compliance obligation ~~for a compliance period~~ must conform to the following limit:
>
> OO/S must be less than or equal to LO
>
> In which:
> OO = Total number of compliance instruments identified in section 95854(a) submitted <u>since January 1, 2013</u> to fulfill the entity's <u>total</u> compliance obligation ~~for the compliance period~~ <u>through the current compliance year</u>.
> S = Covered entity's total compliance obligation <u>beginning January 1, 2013 through the current compliance year</u>.
> LO = Quantitative usage limit on compliance instruments identified in section 95854(a), set at 0.08. (SCE3)

Comment: The Joint Utilities propose that the quantitative limits for the use of offsets in section 95854 be revised to account for all offsets submitted by an entity since the start of the Cap and Trade program and the total compliance obligation of the entity since the start of the Cap and Trade program, rather than looking at the compliance obligation for a single compliance period. Modify section 95854(b) as follows:

> (b) The total number of compliance instruments identified in section 95854(a) that each covered entity may surrender to fulfill the entity's compliance obligation ~~for~~

~~a compliance period~~ must conform to the following limit:

O_O/S must be less than or equal to L_O

In which:
O_O = Total number of compliance instruments identified in section 95854(a) submitted since January 1, 2013 to fulfill the entity's total compliance obligation ~~for the compliance period~~ through the current compliance year.

S = Covered entity's total compliance obligation beginning January 1, 2013 through the current compliance year.

L_O = Quantitative usage limit on compliance instruments identified in section 95854(a), set at 0.08. (JOINTUTILITIES)

Comment: For the most efficient use of the offset limit, all offsets submitted by the entity since the start of the Cap and Trade program should be included in the calculation of the offset limit, not just the offsets submitted in a particular compliance period. The total compliance obligation of the entity since the start of the cap and trade program should also be included in this formula, not just the compliance obligation in a particular compliance period. Modify section 95854 as follows:

(a) Compliance instruments identified in section 95820(b) and sections 95821 (b), (c), and (d) are subject to a quantitative usage limit when used to meet a compliance obligation.

(b) The total number of compliance instruments identified in section 95854(a) that each covered entity may surrender to fulfill the entity's compliance obligation ~~for a compliance period~~ must conform to the following limit:

O_O/S must be less than or equal to L_O

In which:

O_O = Total number of compliance instruments identified in section 95854(a) submitted since January 1, 2013, to fulfill the entity's total compliance obligation ~~for the compliance period~~ through the current compliance year.

S = Covered entity's total compliance obligation beginning January 1, 2013, through the current compliance year.

L_O = Quantitative usage limit on compliance instruments identified in section 95854(a), set at 0.08.

(c) The number of sector-based offset credits that each covered entity may surrender to meet the entity's compliance obligation for a compliance period must not be greater than 0.25 of the LO for the first compliance period and not more than 0.50 of the LO for subsequent compliance periods. (SCPPA6)

Comment: Section 95854 Quantitative Usage Limit on Designated Compliance Instruments—Including Offset Credits.

(a) Compliance instruments identified in section 95820(b) and sections 95821 (b), (c), and (d) are subject to a quantitative usage limit when used to meet a compliance obligation.
(b) The total number of compliance instruments identified in section 95854(a) that each covered entity may surrender to fulfill the entity's compliance obligation ~~for a compliance period~~ must conform to the following limit:

O_o/S must be less than or equal to LO

In which:

O_o = Total number of compliance instruments identified in section 95854(a) submitted <u>since January 1, 2013</u> to fulfill the entity's <u>total</u> compliance obligation for the compliance period <u>through the current compliance</u> period.
S = Covered entity's <u>total</u> compliance obligation <u>beginning January 1, 2013 through the current compliance year</u>.
LO = Quantitative usage limit on compliance instruments identified in section 95854(a), set at 0.08.
(c) The number of sector-based offset credits that each covered entity may surrender to meet the entity's compliance obligation for a compliance period must not be greater than 0.25 of the LO for the first compliance period and not more than 0.50 of the LO for subsequent compliance periods.

ARB proposes a quantitative usage limit of 8 percent for offsets (i.e. a covered entity can meet up to 8 percent of its compliance period obligation with offsets). LADWP recommends that the offset limit be calculated on a cumulative basis as opposed to a compliance period basis. This would ensure that a covered entity's use of offsets for compliance in any given period does not exceed 8 percent of covered emissions. (LADWP4)

Comment: In the first compliance period, the supply of offsets is likely to be inadequate to cover 8 percent of emissions, as would be permitted under the proposed Regulation. To address this situation, PG&E encourages expedited approvals of additional protocols and proposes a simple method to allow complying entities the flexibility to use offsets up to the 8 percent limit over the entire Cap and Trade program. (PGE4)

Comment: Evolution Markets is concerned that the offsets program, as proposed to be amended by ARB, could seriously limit its effectiveness in containing costs to California consumers. Rules proposed to encourage early investment in carbon offsets are administratively complex and burdensome. There could likely be a bottleneck of supply or too high a cost of issuance, which could limit the availability of early action offsets and lead to higher compliance costs. In addition, the ability for ARB to invalidate offset credits once issued and used for compliance—and putting the liability of replacement on the buyer—will likely adversely impact investment in offset projects. Compliance entities or other firms may be less willing to finance an offset project considering the unprecedented liability. This will be particularly true for small offset project developers who cannot provide a compliance guarantee for the credits they sell. This will result in fewer offset projects developed, less offset credit supply, and higher costs of compliance. (EVMKTS2)

Comment: In an effort to provide flexibility and reduce compliance costs to regulated entities, CalChamber believes entities should be allowed the flexibility of banking unused offsets on a year-to-year basis. Another mechanism that should be available to regulated entities is the ability to trade the balance of their remaining unused offsets to another company. (CALCHAMBER)

Comment: In an effort to provide flexibility and reduce compliance costs to regulated entities, these entities should be allowed the flexibility of banking unused offsets on a year-to-year basis. Another mechanism that should be available to regulated entities is the ability to trade the balance of their remaining offsets to another company. (CMTA3)

Comment: In an effort to provide flexibility and reduce compliance costs to regulated entities, companies should be allowed the flexibility of banking unused offsets on a year-to-year basis. Another mechanism that should be available to regulated entities is the ability to trade the balance of their remaining offsets to another company. (CALFP3)

Comment: In order to promote lower cost compliance and market efficiency, CARB should allow facilities to carry forward and trade unused offset capacity. Facilities and market participants have expressed concern that they cannot bank unutilized offset compliance requirements for use between compliance periods. As a means to reduce compliance costs and provide flexibility, sources should be given the ability to carry forward and trade unused offset capacity. (CANTORCO2E2)

Comment: CERP continues to believe that the eight percent quantitative limit on offsets will significantly raise the cost of compliance and is unnecessarily restrictive. Because it appears likely that there will not be sufficient offset supply in the early compliance periods to meet demand, covered entities will not be able to purchase the maximum number of offsets and could lose the cost containment benefits that offsets provide. As an alternative, CERP supports the proposal to modify the regulations to apply the eight percent limit to provide that covered entities are able to use unused offsets in future compliance periods as long as their total offset usage never exceeds eight percent of their compliance obligation. This would entail changing the regulations to allow the eight percent usage limit to apply over the entire term of the program to date. This could provide important cost relief if offset supply is low in early years of the program and compliance entities are therefore only able to employ a small number of offsets during those periods. (CERP4)

Comment: In order for offsets to provide cost control, they must be available to the market. In addition to the previously mentioned concerns about quantitative limits and a bureaucratic approval process, there is also the potential that even if offsets are available, some regulated entities may not be inclined or able (for whatever reason) to make use of offsets—a development that can affect all market participants. CARB should monitor the quantity of offsets used as compared to the allowed limit, and create a system to carry over to new compliance periods and distribute amongst all market participants, the ability to use offsets unused in a previous compliance period. For example, if offsets make up only 6 percent of compliance instruments in the first compliance period (due to a lack of offset supply, use, or for other reasons), the unused 2 percent should allow for all regulated parties to use 10 percent (i.e. 8 percent plus 2 percent) offsets in the next compliance period. (BP2)

> **Response:** The regulation allows offsets to account for eight percent of an individual entity's emissions over a compliance period. We did not allow the carryover of unused offsets between compliance periods, to ensure that emission reductions are being achieved by capped sources throughout the life of the program. Keeping it to the compliance period allows some flexibility by giving three years to total emissions, but still requires emission reductions to come from within capped sectors in all years of the program.

M-5. (multiple comments)
Comment: We oppose any suggestion to have one offset usage limit through 2020. Limits on offsets should remain as a per compliance period percentage and not be counted cumulatively across compliance periods. (UCS6)

Comment: Camco supports the revision made from the previous version of the Regulations (i.e. not requiring utilization of the full 8 percent limit on offsets within one year) to permit covered entities to carry-over their offset allowance within compliance periods. We believe this strikes the right balance between providing flexibility to covered entities while at the same time stimulating the development of the offset market. However, we would not support the carry-over from one compliance period to the next as we are concerned this may constrain the development of the offset sector and make demand for offsets, and thus the development of projects, irregular and unpredictable particularly in the early stages of the market. Offsets will provide an important cost containment mechanism for the market, particularly in the later stages of the program beyond 2015. Demand for offsets through the initial compliance period will provide all market participants with the opportunity to become familiar with this aspect of the program and should allow project developers, verifiers, registries and other service providers time to develop to meet gradually increasing demand. (CIG2)

> **Response:** We did not make changes to the regulation to allow one offset usage limit through 2020.

Calculation of the Quantitative Limit on Offsets

M-6. (multiple comments)
Comment: Section 95854 was revised to clarify that the quantitative usage limit on offsets is 8 percent per compliance period, rather than on an annual basis. SCE thanks ARB staff for making this clarification to address stakeholder concerns about offset supply. (SCE3)

Comment: In section 95854(b) of the 15-day changes document, CARB clarifies what was likely an identical requirement in the prior version of the Regulation that eight percent of an "entity's compliance obligation for the compliance period" can be satisfied by compliance instruments subject to a quantitative usage limit (for example offsets). Although this does not appear to be a substantive change to the rule from the prior version, it does clarify the quantitative usage limit. (EDF4)

> **Response:** Thank you for your support on the modifications to the regulation.

Ensuring Offset Quality and Criteria of AB 32

M-7. Comment: The use of offsets as a compliance instrument presents substantial risks of not achieving the emissions reductions called for in AB 32. When offsets credits are generated by business-as-usual projects that were going forward, regardless of the offsets payments, the companies under the cap are able to emit more than the cap, but equivalent additional emissions aren't reduced elsewhere. Companies are simply paying project owners outside of the cap to do what they were doing anyway. The Cap and Trade program is effectively weakened by the number of non-additional business-as-usual offset credits allowed for compliance. By allowing most of the Cap and Trade emission reductions to come from offsets, the state substantially reduces opportunities to realize in-state co-benefits from AB 32. (UCS6)

> **Response:** We disagree that the inclusion of offsets does not require capped sources to reduce emissions. The program imposes a limit on the amount of offsets that an individual covered entity can use for compliance. All offsets used for compliance are real reductions, albeit outside the cap. Allowing a limited number of offsets into the program provides cost-containment benefits and ensures that some GHG emissions reductions occur within the sectors covered by the cap-and-trade program. The program includes provisions that would allow a maximum of 201 $MMTCO_2e$ of offsets through the year 2020. This limit will be enforced through a limit on the use of offsets by an individual entity equal to eight percent of its compliance obligation, or total emissions. Combined with the Allowance Price Containment Reserve, this limit ensures that from the program come from sources covered by the program at expected allowance prices, while use of the reserve will relax that constraint if prices rise.
>
> In regard to additionality, we believe that the Compliance Offset Protocols, in conjunction with all of the strict and thorough requirements in the regulation

regarding offsets, meet the requirements of AB 32. The Compliance Offset Protocols adopted under the cap-and-trade regulation have been established with multiple levels of review, use conservative methods to account for uncertainty and emissions leakage, and establish the additionality of offset projects in setting project baselines.

M-8. Comment: The proposed offsets represent a substantial portion of required reductions. The Regulation allows up to 8 percent of all compliance obligations to be met with offsets. CARB notes that a reduction is required from projected 2020 emission levels of 507 million metric ton CO_2E to 427 million metric ton CO_2E emissions, current 2011 levels are not noted, nor is the percentage reduction needed to reach the goal of 1990 levels by 2020. However, the Electric Power Research Institute's paper "Overview of the California Greenhouse Gas Offsets Program," dated April 2011, states at page 10 that if the maximum quantity of offsets is submitted for compliance, offsets could be used to satisfy as much as 85 percent of required reductions (see http://globalclimate.epri.com/doc/EPRI_Offsets_W10_Background%20Paper_CA%20Offsets_040711_Final2.pdf). Even if a smaller percentage of compliance obligations are met with offsets, it is clear that offsets are intended to be a substantial portion of required reductions and their failure to represent real, additional, enforceable reductions could be extremely damaging to California's efforts to address climate change, as well as to efforts of the many states and countries expected to follow California's lead. See also, Offsets Could Make Up 85 percent of Calif.'s Cap-and-Trade Program, New York Times, August 8, 2011 at http://www.nytimes.com/gwire/2011/08/08/08greenwire-offsets-could-make-up-85-of-califs-cap-and-tra-29081.html?emc=eta1, in which CARB staff confirms that it is possible that offsets could make up 85 percent of reductions under the proposed program. (WILLIAMSZ2)

Response: We did not change the limit on the use of offsets in the program. The program imposes a limit on what we believe is an appropriate amount of offsets that an individual covered entity can use for compliance. All offsets used for compliance are real reductions, albeit outside the cap. Allowing a limited number of offsets into the program provides cost-containment benefits and ensures that some GHG emissions reductions occur within the sectors covered by the cap-and-trade program. The program includes provisions that would allow a maximum of 201 $MMTCO_2e$ of offsets through the year 2020. It is highly unlikely that the eight percent offset usage limit could result in 85 percent of the reductions required under the cap coming from offsets. Combined with the Allowance Price Containment Reserve, the eight percent limit ensures that a majority of reductions from the program come from sources covered by the program at expected allowance prices, while use of the reserve will relax that constraint if prices rise.

M-9. (multiple comments)
Comment: We believe that offset projects registered under an approved protocol should not cause significant adverse effects on human health or the environment, regardless of the location of the project. (UCS6, UCS7)

Comment: Modify section 95973 as follows:

(a) General Requirements for Offset Projects. To qualify under the provisions set forth in this article, an Offset Project Operator or Authorized Project Designee must ensure that an offset project must:

> add: <u>(e) not cause significant adverse effects on human health or the environment;</u> (UCS7)
>
> **Response:** No change was made to the regulation. We agree that any Compliance Offset Protocols approved in the cap-and-trade regulation must undergo a CEQA review. These protocols are designed to avoid significant adverse effects on human health or the environment. This environmental review is part of the rulemaking process.

M-10. Comment: Please do not use forest carbon projects to offset emissions from California industries. Please cut emissions at the source. (GIESE)

> **Response:** We do not agree that forest projects should not be allowed into the program. The program imposes a limit on what we believe is an appropriate amount of offsets that an individual covered entity can use for compliance. All offsets used for compliance are real reductions, albeit outside the cap. Allowing a limited number of offsets into the program provides cost-containment benefits and ensures that some GHG emissions reductions occur within the sectors covered by the cap-and-trade program. The program includes provisions that would allow a maximum of 201 $MMTCO_2e$ of offsets through the year 2020. This limit will be enforced through a limit on the use of offsets by an individual entity equal to eight percent of its compliance obligation, or total emissions.
>
> In addition, we believe that the Compliance Offset Protocols, in conjunction with all of the strict and thorough requirements in the regulation regarding offsets, meet the requirements of AB 32. The Compliance Offset Protocols adopted under the cap-and-trade regulation have been established with multiple levels of review, use conservative methods to account for uncertainty and emissions leakage, and establish the additionality of offset projects in setting project baselines.

M-11. Comment: The Board should close potential loopholes in the offset process by giving the Executive Officer explicit authority to deny any offset proposals that do not meet standards, and should ensure that the same offset project cannot be sold more than once through different registries. (SIERRACLUBCA5)

Response: We agree with the suggested change and modified the proposal to give the Executive Officer the exclusive authority over offset proposals, and added language in the verification section to delete Offset Project Registries from the appeals process for Adverse Verification statements. This clarification was made to be consistent with the MRR, and reflects stakeholder comments that the appeals process should only be limited to determinations made by the Executive Officer of ARB and that ARB should be the only one to make these determinations. We also clarified that ARB makes the final determination on whether or not ARB offsets credits should be issued and whether they meet all requirements of the regulation.

In addition we added new section 95975(c)(5) to the regulation. This section requires Offset Project Operators or Authorized Project Designees to disclose any offset credits issued for the same project for any other purposes in any other program. In addition, we added new attestations to section 95981(c). Offset Project Operators and Authorized Project Designees must make these attestation(s) in order for ARB to issue offset credits. Also, if we find that ARB offset credits were issued to the offset project for the same GHG reductions or GHG removal enhancements, we may invalidate the ARB offset credits pursuant to section 95985. This provision addresses double-counting of the GHG reductions or GHG removal enhancements in multiple programs.

M-12. Comment: ARB Must Include Grievance Mechanisms and Appeals Processes for Offset Credits. Section 95972, ARB should require that all offset protocols establish environmental and social safeguard standards, and also provide a grievance or compliant mechanism to allow affected citizens and communities to hold offset developers accountable for adhering to the policies and procedures within the protocol. We recommend that ARB provide impartial, independent, transparent and credible accountability mechanisms for human rights violations and non-compliance of any and all other regulatory provisions of either California or the jurisdiction where the offset credit is issues. The mechanism should have the authority to serve in both dispute-resolution and compliance functions. The processes for submitting a complaint should allow for affected individuals and communities of varying capabilities to effectively communicate their concerns and make a complaint without the need to hire outside experts.

Section 95980 and 95981: Because of the substantial evidence indicating that a significant proportion of offset projects, particularly those in the Clean Development Mechanism (CDM), do not meet even basic regulatory requirements or actually mitigate global climate change, ARB should provide an appeals process for ARB and registry offset credits. Such an appeals process should be established to ensure accountability for environmental integrity of offsets, and be fair, objective and effective. The appeals process should be broadly available to civil society and affected communities. Appeals must be available for decisions to credit a project on the basis of both procedural and substantive violations. Stakeholders must be afforded the right to request a review of registration or issuance requests in order to avoid unnecessary appeals. The time within which appeals may be brought should not be limited where new, material facts come to light indicating that an offset project does not meet the core requirements. Finally, an accurate and complete record upon which the appeal is based must be compiled and made publicly available. (FRIENDSOFEARTH2)

Response: We designed our regulatory offset verification program to provide a transparent process by which we and the public can review offset project documentation and verification documents and fully understand any findings uncovered during the course of verification of an offset project by an ARB-accredited verification body. We will also develop an audit and oversight program for offset project verifications. All oversight functions are part of implementation and need not be specified in the regulation. We understand some of the problems exhibited under the CDM program and have designed our program to ensure those same types of issues do not happen here. We may also invalidate an offset if it is later found to not meet the requirements of the regulation, or environmental, and health and safety laws. If at any point a stakeholder is concerned about a particular project, the stakeholder may notify us.

Our analysis indicates that the cap-and-trade regulation is expected to have a beneficial impact on air emissions by reducing emissions of criteria pollutants and toxics. Based on the available data, current law and policies that control industrial sources of air pollution, and expected compliance responses, we believe that emission increases due to the regulation at the statewide, regional, or local level are extremely unlikely, at best. Nevertheless, we are committed to monitoring the implementation of the cap-and-trade regulation to identify any situations where the cap-and-trade program has led to an increase in criteria pollutant or toxic emissions. In Resolution 11-32, the Board approved an adaptive management plan. This plan commits ARB to review information from local air districts regarding permit modifications and new permit applications for covered sources. This information will be used to identify compliance activities that could lead to increased emissions, and to determine whether further investigation of potential criteria pollutant and toxic emissions is warranted. If unanticipated adverse localized emissions impacts that can be attributed to the cap-and-trade regulation are identified during this periodic review, we will consider whether these impacts affect the achievement of the program objectives. If so, we will promptly develop and implement appropriate responses.

M-13. Comment: General Requirements for Compliance Offset Protocols and Credit are Insufficient; General requirements are of little use if not complemented by robust verification processes to ensure that requirements are actually being met. Section 95972 identifies general requirements for compliance offset protocols. While these requirements, in principle, would assist in ensuring environmental integrity of compliance offset credit generated through approved protocols, we see no assurances that these principles are being met in either domestic offset protocols (see Section 7) or in ongoing policy discussions to develop international sector-based REDD credits (see Section 10). The Board Resolution requires the Executive Officer (EO) to review compliance offset protocols and approve any necessary changes to ensure consistency throughout the program. The EO must ensure that these concerns are addressed prior to implementation of the program. Some of these requirements are further undermined by weak, insufficient measurement and verification requirements (see Section 6 below). General requirements are of little use if not complemented by robust verification processes to ensure that requirements are actually being met (FRIENDSOFEARTH2).

Response: We believe that the Compliance Offset Protocols in conjunction with all of the strict and thorough requirements in the regulation regarding offsets meet the requirements of AB 32. The Compliance Offset Protocols adopted under the cap-and-trade regulation have been established with multiple levels of review, use conservative methods to account for uncertainty and emissions leakage, and establish the additionality of offset projects in setting project baselines. The regulation requires that all Compliance Offset Protocols address activity-shifting and market-shifting leakage. Each protocol incorporated by reference, including the forest protocol, accounts for leakage in the quantification of the reductions or removals achieved by the offset projects. In addition, when uncertainty exists in quantifying GHG reductions, we will only issue offset credits when there is a high level of confidence that reductions actually occurred. The regulation employs a principle of conservativeness in the quantification of emissions reductions. This method will ensure that the accounting will underestimate, rather than overestimate, any reductions when there is a high level of uncertainty.

We agree that offset protocols must ensure environmental integrity. Generally, we do not include implementation-related procedures in our regulations. We plan to develop guidance documents related to the protocol approval process in 2012. In addition, all offset protocols used in the compliance program must be adopted by the Board after undergoing a full regulatory process, including an ARB stakeholder process, in accordance with the Administrative Procedure Act, and an environmental review. We plan to look at further offset protocols for potential inclusion in the cap-and-trade program beginning in 2012. The details surrounding any new offset project types for which ARB adopts an offset protocol will be dealt with in that rulemaking.

We disagree that the program includes a weak and insufficient verification program. The regulation proposes a robust monitoring program for offset projects—the verification that the offsets are real, additional, and enforceable, and that Offset Project Operators, verifiers, and Offset Project Registries are operating according to regulatory requirements. In addition to the ARB audits, Offset Project Registries are required to conduct oversight of their registry program and randomly audit verifications to ensure that our regulatory requirements are being met by Offset Project Operators and verification bodies. We will provide rigorous oversight of our approved Offset Project Registries.

In addition, we designed our regulatory offset verification program to provide a transparent process by which we can review verification documents and fully understand any findings uncovered during the course of verification of an offset project by an ARB-accredited verification body. We will also develop an audit and oversight program for offset project verifications. All oversight functions are part of implementation and need not be specified in the regulation.

This comment falls outside the scope of the first 15-day changes to the regulation. Because the comment falls outside the scope of the rulemaking, no further response is required. Furthermore, there are no provisions that allow ARB to accept REDD credits at this time.

M-14. (multiple comments)
Comment: Section 95975(c)(5) requires an Offset Project Operator to disclose issued credits by any mandatory or voluntary program for the same offset project. Why shouldn't the Offset Project Operator be prohibited from claiming any offsets for such "already used" reductions, rather than simply being required to disclose them? (SCAQMD4)

Comment: We strongly recommend that CARB also formally reach out to other voluntary and mandatory carbon crediting regimes to track registered reductions and investigate possible instances of double counting. (UCS6)

Comment: CARB should formally reach out to registries and other compliance regimes to aide in ensuring that each offset credit used for compliance has not been claimed by another person or entity under any GHG compliance program. (UCS7)

Comment: Current Draft Regulation Allows for Double Counting of Emissions. Section 95975 (c)(5) merely requires the Offset Project Operator and any Authorized Project Designees to disclose credits issued for the same offset project being listed. ARB must ensure that there is no double counting of emissions reductions credits in the ARB program alongside other voluntary or compliance markets, as this totally defeats the objective of the program to deliver emissions reductions. (FRIENDSOFEARTH2)

Response: In addition to requirements in section 95975(c)(5), we added new attestations to section 95981(c). Offset Project Operators and Authorized Project Designees must make these attestation(s) in order for us to issue offset credits. Also, if we find that ARB offset credits were issued to the offset project for the same GHG reductions or GHG removal enhancements, we may invalidate the ARB offset credits pursuant to section 95985. This provision addresses-double counting of the GHG reductions or GHG removal enhancements in multiple programs.

M-15. Comment: Section 95970 of the Cap-and-Trade regulation restates the mandate of AB 32 that a compliance offset credit must “represent a GHG emission reduction or GHG removal enhancement that is real, additional, quantifiable, permanent, verifiable, and enforceable." However, section 95971, "Procedures for Approval of Compliance Offset Protocols," identifies no actual procedures to ensure that adopted protocols satisfy these requirements, instead expressing a general commitment to provide public notice and opportunity for public comment. Section 95972, "Requirements for Compliance Offset Protocols," provides a list of general requirements for offset protocols, but no specific criteria or standards by which to determine the achievement of those requirements. The result of these sections is that there is no clear, consistent process identified for the adoption of compliance offset protocols.

The establishment of specific, standardized, quantitative criteria to be applied in the review of compliance offset protocols is critical to providing clarity, transparency, and consistency in offset protocols and the offset credits they generate. The Cap-and-Trade regulation should identify explicit determinations, based on standardized criteria, which ARB will apply in their evaluation of all offset protocols. For example, the regulation should require specific determination of the risk of non-additionality, reversal, and fraud associated with an offset protocol, provided in the context of the volume of offset credits an offset protocol is expected to generate, and a comparison of these factors among project types within an offset protocol and among offset protocols. Requirements for offset credit buffer pool contributions must be based on these assessments of risk and the volume of offset credits an offset protocol is expected to generate.

Without specific determinations based on consistent, standardized criteria, the Cap-and-Trade regulation does not provide that the review of offset protocols will ensure that offset credits are real, additional, quantifiable, permanent, verifiable, and enforceable. We understand that the wide variation in potential offset projects make the development of specific criteria challenging. However, it is precisely this tremendous variation in the character of offset projects that makes the use of standardized, quantitative criteria necessary to guard against ad hoc reviews that are inconsistent and potentially influenced by the demand for greater volumes of offset credits.

To use the example of the Compliance Offset Protocol U.S. Forest Projects ("Forest Offset Protocol"), this protocol contains a number of inadequacies that substantially increase the risk that the Forest Offset Protocol will generate non-additional offset credits. For example, under the Forest Offset Protocol, forest offset projects are not prohibited from shifting timber harvesting from project areas to elsewhere in their land ownership, and are not even required to report such "leakage;" forest offsets provide a much lower degree of permanence than the other adopted offset projects; forest offsets carry a much greater risk of reversal than offsets from the other adopted protocols; and the forest offset protocol relies significantly on carbon sequestration in a pool beyond the knowledge and control of the project operator, and which is therefore much more uncertain and unenforceable than other offset protocols. The current projections that California's Cap-and-Trade program will rely on offsets from the Forest Offset Protocol more than from any other offset protocol should be included in the context for evaluating the protocol and addressing inadequacies. Offset protocols should only be adopted, and should remain valid for new projects, only if the project types credited under the protocol are not likely to be pursued, or would be pursued at significantly lower rates, in the absence of the offset protocol, and if the business-as-usual reductions that are inadvertently credited under the protocol are counter-balanced by conservative methods to calculate emissions reductions. At a minimum, for the project types allowed to generate credits under offset protocols, ARB should thoroughly assess: the factors that influence project development decisions; the expected influence of AB 32 offsets credits on those decisions; the business-as-usual activities that are likely to go forward regardless of the ability to generate offsets credits; and whether the business-as-usual reductions that are inadvertently credited under the protocol are counter-balanced by conservative methods to calculate emissions reductions.

Finally, the regulation should require that all protocols use a baseline that reflects the most stringent combination of statutory and regulatory requirements between California and the jurisdiction where the offset project is located. This would avoid creating a perverse incentive for states to refrain from enacting regulation as strict as in California, since the enactment of such regulation could lead to the generation of fewer carbon credits from activities in their state. States with weaker regulations will have weaker baselines that could lead to the generation of larger numbers of offset credits from the same activity. The Center for Biological Diversity has submitted a separate comment letter in conjunction with other organizations on this topic, and those comments are incorporated here by reference. (CBD4)

> **Response:** Thank you for your comment. We agree that offset protocols must ensure that GHG reductions and that GHG-removal enhancements resulting from the use of them meet AB 32 requirements. Generally, we do not include implementation-related procedures in our regulations. We plan to develop guidance documents related to the protocol approval process in 2012. In addition, all offset protocols used in the compliance program must be adopted by the Board after undergoing a full regulatory process, including an ARB stakeholder process, in accordance with the Administrative Procedure Act, and an environmental review. We plan to look at further offset protocols for potential inclusion in the cap-and-trade program beginning in 2012. The details surrounding any new offset project types for which ARB adopts an offset protocol will be dealt with in that rulemaking.
>
> In order to ensure that GHG reductions and GHG removal enhancements credited as offsets are real, the regulation requires that all Compliance Offset Protocols address activity-shifting and market-shifting leakage. Each protocol incorporated by reference, including the forest protocol, accounts for leakage in the quantification of the reductions or removals achieved by the offset projects. In addition, when uncertainty exists in quantifying GHG reductions, we will only issue offset credits when there is a high level of confidence that reductions actually occurred. The regulation employs a principle of conservativeness in the quantification of emissions reductions. This method will ensure that the accounting will underestimate rather than overestimate any reductions when there is a high level of uncertainty.

In regard to regulatory additionality, we intend to implement this policy through the adoption of each Compliance Offset Protocol and do not find it necessary to include language regarding this in the regulation itself. The decision to only include offset projects that qualify based on a regional additionality test throughout the WCI was made by the Partners to ensure that offset projects will be developed in WCI Partner jurisdictions and to ensure that a portion of the revenues generated from offsets would be generated in-state. WCI Partners do not want to create a program that pays parties in other states and provinces to undertake activities that they are requiring their sources to undertake by capping them or applying other direct regulations to such activities. The four Compliance Offset Protocols contain criteria and tests to ensure that the projects and resulting offset credits are additional.

M-16. (multiple comments)
Comment: We recommend the following protocol requirements be added to the Regulation. These requirements are essential to fulfill the meaning of "real" and "additional" and are more specific than the criteria in the draft regulation. Protocols should only be adopted, and should only remain valid for new projects, if:

- there is a very high level of confidence that the number of credits that will be generated under the protocol will not exceed the reductions enabled by that protocol;
- the project types credited under the protocol are not likely to be pursued, or would be pursued at significantly lower rates, absent being eligible as part of a compliance offset protocol; and
- the business-as-usual reductions that are inadvertently credited under the protocol are counter-balanced by conservative methods to calculate emissions reductions. (UCS6, UCS7)

Comment: The Regulation should incorporate specific procedures for adopting new protocols and periodically reviewing existing protocols consistent with the above criteria (see prior UCS7 comment). At a minimum, for the project types allowed to generate credits under offset protocols, CARB should thoroughly assess:

- the factors that influence project development decisions;
- the expected influence of AB 32 offsets credits on those decisions;
- the business-as-usual activities that are likely to go forward regardless of the ability to generate offsets credits; and
- whether the business-as-usual reductions that are inadvertently credited under the protocol are counter-balanced by conservative methods to calculate emissions reductions.
- Moreover, periodic reviews of existing protocols should assess the influence that the protocol has already had on new project development.

In addition, each approved protocol should conservatively account for uncertainty in quantification factors for the offset project type. Each approved protocol should use a baseline that reflects the most stringent combination of statutory and regulatory requirements between California and the jurisdiction where the offset project is located. CARB should monitor research advances, modifications to associated registry protocols and market conditions related to project types eligible for crediting under CARB protocols and revise protocols as necessary to ensure that offsets credits are real and additional and that uncertainty is accounted for in a conservative manner. (UCS6, UCS7)

> **Response:** Thank you for your comment. We agree that offset protocols must ensure that GHG reductions and GHG removal enhancements resulting from them meet the criteria listed by the commenters. We believe that the requirements for offset protocols in section 95972, along with our Compliance Offset Protocol stakeholder processes, will ensure that this is met. We did add language to state that Compliance Offset Protocols will be reviewed and periodically revised as needed.
>
> We believe that the Compliance Offset Protocols, in conjunction with all of the strict and thorough requirements in the regulation regarding offsets, meet the requirements of AB 32. Any Compliance Offset Protocols adopted under the cap-and-trade regulation will include multiple levels of review, use conservative methods to account for uncertainty and emissions leakage, and establish the additionality of offset projects in setting project baselines. To assure offset quality, the program includes rigorous oversight and audit procedures for all ARB-accredited offset verifiers, offset project developers, and Offset Project Registries. In addition, the registry system for compliance instruments is being designed to provide strong enforcement capabilities, including mechanisms to prevent double-counting, public disclosure requirements, and methods to clearly define ownership.
>
> Generally, we do not include implementation-related procedures in our regulations. We plan to develop guidance documents related to the protocol approval process in 2012. In addition, all offset protocols used in the compliance program must be adopted by the Board after undergoing a full regulatory process, including an ARB stakeholder process, in accordance with the Administrative Procedure Act, and an environmental review. We plan to look at further offset protocols for potential inclusion in the cap-and-trade program beginning in 2012. The details surrounding any new offset project types for which ARB adopts an offset protocol will be dealt with in that rulemaking.

M-17. Comment: Add three new subsections to section 95972 or publish these procedures in an adopted procedures document:

<u>(d) Review of new protocols: All protocols adopted after January 2012 shall undergo a thorough review before adoption to ensure that each protocol meets the requirements established in 95972(a). This review shall include:</u>

(1) A review of research on emissions quantification and verification related to that project type;
(2) A study of the considerations facing existing and potential developers regarding the development or expansion of the project type(s) covered by the protocol.
(A) At a minimum, this study shall include:
1. interviews with potential developers of the project types included under the offset project protocol,
2. interviews with developers of some existing projects, if relevant, and
3. input from experts familiar with the considerations of developers of project type/s supported by the protocol;
(B) In conducting this study, the Board shall consider:
1. the factors that influence project development decisions of the project types that qualify under the protocol
2. the expected influence of offsets credits on those decisions;
3. the business-as-usual activities that are likely to go forward regardless of the ability to generate offsets credits; and
4. whether the business-as-usual reductions that are inadvertently credited under the protocol are counter-balanced by conservative methods to calculate emissions reductions.
(3) Review by one or more independent experts. At least one independent expert must have demonstrated expertise in the quantification of emissions reductions related to the project type;
(4) A timely opportunity for public comment on the review results.

add (e) Periodic review of all adopted protocols: All adopted protocols shall be reviewed, and revised if necessary, at least once every three years, or less frequently if the number of credits issued under a particular protocol is very small (CARB staff to decide on what this threshold should be) to ensure that it meets the requirements established in 95972(a). Each review shall include:
(1) Updating methods of calculating emissions reductions under the protocol when there have been substantial advances in research on emissions quantification related to that project type;
(2) A thorough review and evaluation of updates made to related registry protocols;
(3) A study of the considerations facing existing and potential developers of the project type/s covered by the protocol. At a minimum, this study shall include:
(A)input from experts familiar with the considerations of developers of project type/s supported by the protocol;
(B) interviews with existing and potential developers of projects of the project type/s covered under the protocol;
(4) Assessment of the extent to which the protocol has enabled additional emissions reductions or enhancements that would not otherwise have taken place without the offset protocol. This shall involve an analysis of the incentives that have been created through the offset program and whether those incentives

have been a significant factor in allowing for the development of or expansion of projects pursuant to the proposed protocol; and
(5) Assessment of the extent to which the protocol may have credited business-as-usual activities;
(6) Review by one or more independent experts. At least one independent expert must have demonstrated expertise in the quantification of emissions reductions related to the project type;
(7) A timely opportunity for public comment on the review results.

(f) Ongoing monitoring of protocols: protocols shall be monitored to ensure their consistency with the requirements of 95972(a). Protocols shall be revised when any of the following would result in substantial changes in the estimation of emissions reductions from offset projects:
(1) Research advancements on quantifying emissions reductions from protocol project types;
(2) Updates to related registry protocols that lead to more accurate or conservative measurement of emissions reductions;
(3) Significant changes in market conditions affecting the rate at which projects would be developed without the offset protocol; or
(4) Changes in the baseline. (UCS7)

Response: Thank you for your comment. Generally, we do not include implementation-related procedures in our regulations. We plan to develop guidance documents related to the protocol approval process in 2012. In addition, all offset protocols used in the compliance program must be adopted by the Board after undergoing a full regulatory process, including an ARB stakeholder process, in accordance with the Administrative Procedure Act, and an environmental review. We plan to look at further offset protocols for potential inclusion in the cap-and-trade program beginning in 2012. The details surrounding any new offset project types for which ARB adopts an offset protocol will be dealt with under that specific rulemaking, and modification will be made to the cap-and-trade regulation as needed.

We added new section 95971(b) which requires that all offset protocols will be reviewed and periodically revised if needed.

M-18. Comment: The Regulation should incorporate specific procedures for periodically reviewing existing protocols. Moreover, periodic reviews of existing protocols should assess the influence that the protocol has already had on new project development. (UCS6)

Response: We added new section 95971(b), which requires that all offset protocols will be reviewed and periodically revised if needed.

M-19. Comment: CARB should develop additional guidance for protocol development for use in the Cap and Trade program, in particular for use of modeling to calculate emissions reductions. EDF recommends that CARB provide additional clarification to inform project developers of the steps needed to bring new credit protocol ideas to the agency for consideration, development, and eventual adoption. Guidance on the use of models for calculating emissions reductions would be particularly useful since models are becoming increasingly accurate, yet complex, and are likely to take an active role in credit development for high quality agricultural projects in the future. (EDF4)

> **Response:** Thank you for your comment. Generally, we do not include implementation-related procedures in our regulations. We plan to develop guidance documents related to the protocol approval process in 2012. In addition, all offset protocols used in the compliance program must be adopted by the Board after undergoing a full regulatory process, including an ARB stakeholder process, in accordance with the Administrative Procedure Act, and an environmental review. We plan to look at further offset protocols for potential inclusion in the cap-and-trade program beginning in 2012. The details surrounding any new offset project types for which ARB adopts an offset protocol will be dealt with under that specific rulemaking, and modification will be made to the cap-and-trade regulation as needed.

M-20. (multiple comments)
Comment: Modify section 95972 as follows:
(a) To be approved by the Board, a Compliance Offset Protocol must:(1) ~~accurately determine~~ Conservatively estimate the extent to which GHG emission reductions or GHG removal enhancements are achieved by the offset project type; (UCS7)

Comment: (5) Conservatively account for uncertainty in quantification factors for the offset project type; (UCS7)

Comment: *Add:* (11) Ensure, with a high degree of confidence, that the total credits generated under the protocol will not exceed the total reductions and enhancements enabled by that protocol; (UCS7)

Comment: *Add:* (12) Ensure the project types that qualify under the protocol, absent being eligible as part of the compliance offset protocol, are not likely to be pursued, would be pursued at significantly lower rates, or result in reductions that are negligible in number; (UCS7)

Comment: Add: (13) Ensure the business-as-usual reductions that are inadvertently credited under the protocol are counter-balanced by conservative methods to calculate emissions reductions; (UCS7)

Comment: *Add:* (14) Ensure the project types that qualify under the protocol do not hinder the long term sustainability of the related sector, including the resilience and adaptability of agricultural systems. (UCS7)

Response: We did not include the exact language requested by the commenter in the regulation. We agree that offset protocols must ensure that GHG reductions and GHG removal enhancements resulting from them meet the criteria listed by the commenters. We believe that the requirements for offset protocols in section 95972, along with our Compliance Offset Protocol stakeholder processes, will ensure that these criteria are met.

In order to ensure that reductions or removals credited as offsets are real, the regulation requires that all Compliance Offset Protocols address activity-shifting and market-shifting leakage. Each protocol must account for leakage in the quantification of the reductions or removals achieved by the offset projects. In addition, when uncertainty exists in quantifying GHG reductions, we will only issue offset credits when there is a high level of confidence that reductions actually occurred. The regulation employs a principle of conservativeness in the quantification of emissions reductions. This method will ensure that the accounting will underestimate, rather than overestimate, any reductions when there is a high level of uncertainty.

In regard to additionality, we believe that the Compliance Offset Protocols, in conjunction with all of the strict and thorough requirements in the regulation regarding offsets, meet the requirements of AB 32. Any Compliance Offset Protocols adopted under the cap-and-trade regulation will undergo multiple levels of review, use conservative methods to account for uncertainty and emissions leakage, and establish the additionality of offset projects in setting project baselines.

M-21. Comment: *Add:* <u>(10) Use a baseline that reflects the most stringent combination of statutory and regulatory requirements between California and the jurisdiction where the offset project is located;</u> (UCS7)

Response: We intend to implement this policy through the adoption of each Compliance Offset Protocol and do not find it necessary to include language regarding this in the regulation itself. The decision to only include offset projects that qualify based on a regional additionality test throughout the WCI was made by the Partners to ensure that offset projects will be developed in WCI Partner jurisdictions and to ensure that a portion of the revenues generated from offsets would be generated in-state. WCI Partners do not want to create a program that pays parties in other states and provinces to undertake activities that they are requiring their sources to undertake by capping them or applying other direct regulations to such activities.

M-22. Comment: Some existing protocols simply prohibit (as an eligibility condition for use of the protocol) the conditions that pose a risk of leakage, and require the Offset Project Operator or Authorized Project Designee to demonstrate that these eligibility conditions are met. For example, ACR's Fertilizer Management protocol makes projects that increase fertilizer use outside the project boundary, or lead to decreases in yield, ineligible. As long as the Offset Project Operator or Authorized Project Designee can demonstrate to a verifier these conditions have been met, the risk of activity-shifting or market-shifting leakage exceeding de minimis levels is effectively eliminated. ACR recommends revising section 95972(a)(4) to read: "Account for activity-shifting leakage and market-shifting leakage for the offset project type, unless the Compliance Offset Protocol stipulates eligibility conditions for use of the protocol that eliminate the risk of activity-shifting leakage and/or market-shifting leakage exceeding de minimis levels as defined in the protocol;" (MARTINN3)

Response: We agree and added similar text to section 95972(a)(4).

M-23. Comment: While the Regulations provide extensive requirements for verification, if the program allows offsets based on subjective, speculative and unenforceable criteria, then verifiers cannot change this underlying flaw. In addition, verifiers have an incentive to validate the overall program, without which their employment would be unnecessary. (WILLIAMSZ2)

Response: We disagree that the offsets in our program do not provide real reductions. We believe that the Compliance Offset Protocols, in conjunction with all of the strict and thorough requirements in the regulation regarding offsets, meet AB 32 requirements and provide for prescriptive project development methods. The Compliance Offset Protocols adopted under the cap-and-trade regulation have been established with multiple levels of review, use conservative methods to account for uncertainty and emissions leakage, and establish the additionality of offset projects in setting project baselines.

The regulation proposes a robust monitoring program for offset projects—both the verification that the offsets are real, additional, and enforceable, and that Offset Project Operators, verifiers, and Offset Project Registries are operating according to regulatory requirements. In addition to the ARB audits, Offset Project Registries are required to conduct oversight of their registry program and randomly audit verifications to ensure that our regulatory requirements are being met by Offset Project Operators and verification bodies. We will provide rigorous oversight of our approved Offset Project Registries.

In addition, we designed our regulatory offset verification program to provide a transparent process by which we can review verification documents and fully understand any findings uncovered during the course of verification of an offset project by an ARB-accredited verification body. We will also develop an audit and oversight program for offset project verifications. All oversight functions are part of implementation and need not be specified in the regulation.

M-24. Comment: The Regulations repeatedly indicate that an important function of offsets is to keep the costs of compliance low and thereby prevent leakage of California's industry and attendant polluting activities to other jurisdictions, as well as to address other sectors of the economy not subject to the cap. Leakage of emissions is a significant concern. However, the potential for leakage to occur is not an excuse for adopting a fatally flawed and unworkable approach, such as Cap and Trade with greenhouse gas offsets. In addition, relying solely on compliance caps and offsets to reduce emissions, rather than an increase in prices, hurts many of the incentives that would drive the rapid transition to a clean-energy economy needed to avert dangerous climate change. For instance, if CARB were to adopt carbon fees that rise predictably to insure that clean energy will become cost-competitive with fossil fuels within a known time frame, this would create huge incentives for a shift in private investment from fossil fuel energy into clean energy infrastructure and innovation as well as in energy efficiency. Similarly, individuals and businesses would experience a strong incentive to be creative in reducing their carbon footprint. In this respect, the cost containment approach of greenhouse gas offsets is not only lacking in integrity but also undermines critical incentives needed to provide the rapid reductions without which costly and potentially irremediable effects of climate change are likely to become inevitable. As noted in the Scoping Plan, one way to address leakage is "border adjustments," adding costs to goods that arrive from jurisdictions whose regulations do not have programs to address greenhouse gases and rebating costs to goods that travel from California to other jurisdictions (see Supplement at p.92). While such border adjustments can be more easily imposed on international trade, it may be possible to impose such adjustments on interstate commerce as long as the adjustments merely create a level playing field for out of state businesses and are not protectionist. Essentially, CARB fails to acknowledge that higher prices for activities that produce greenhouse gases are an extremely valuable tool for driving greenhouse gas reductions. CARB instead claims that keeping costs low is a higher value, discarding the alternative as politically and legally untenable, rather than analyzing this alternative as required by the Superior Court decision and State law. (WILLIAMSZ2)

> **Response:** We do not agree the requirements of AB 32 have not been met regarding leakage. We designed the regulation to avoid unintended consequences. However, given the complexity of the program, it is important to incorporate systems to monitor and evaluate the performance of the cap-and-trade program. We propose to monitor emissions leakage, the generation and use of offset credits, and the potential for emissions increases, to ensure that the program continues to meet the diverse objectives described in Health and Safety Code sections 38562(b) and 38570(b) over time.
>
> AB 32 states that ARB must minimize leakage to the extent feasible. The cap-and-trade program is designed to minimize leakage to the extent feasible through the allocation strategy and the accounting for leakage, using a principle of conservativeness in the offsets program. Offsets are a small component of the cap-and-trade program, which is only one of the strategies that have been adopted to reduce statewide greenhouse gas emissions. The cap-and-trade program, together with the other complementary measures that have been adopted, meet the requirements of AB 32 in this area.

We disagree that the inclusion of offsets does not require capped sources to reduce emissions. The program imposes a limit on what we believe is an appropriate amount of offsets that an individual covered entity can use for compliance. All offsets used for compliance are real reductions, albeit outside the cap. Allowing a limited number of offsets into the program provides cost-containment benefits and ensures that some GHG emissions reductions occur within the sectors covered by the cap-and-trade program. The program includes provisions that would allow a maximum of 201 $MMTCO_2e$ of offsets through the year 2020. This limit will be enforced through a limit on the use of offsets by an individual entity equal to eight percent of its compliance obligation, or total emissions. Combined with the Allowance Price Containment Reserve, this limit ensures that emission reductions come from sources covered by the program at expected allowance prices, while use of the reserve will relax that constraint if prices rise.

The Scoping Plan FED provided several alternatives to the proposed regulation. That document identified the cap-and-trade program as the best option to reduce GHG emissions and meet the additional mandates of AB 32, including cost effectiveness and certainty of meeting the 2020 GHG emissions target. The Staff Report also evaluated other options and concluded that the cap-and- trade regulation was the best option.

Offset Supply and Additional Offset Protocols

M-25. (multiple comments)
Comment: Since ARB may in the future approve additional Compliance Offset Protocols, ACR suggests adding section 95973(a)(2)(C)(5), "Reserved for additional Compliance Offset Protocols." (MARTINN3)

Comment: Since ARB may in the future approve additional Compliance Offset Protocols, ACR suggests adding section 95975(e)(5), "Reserved for additional Compliance Offset Protocols." (MARTINN3)

Comment: Since ARB may in the future approve additional Compliance Offset Protocols, ACR suggests adding section 95976(d)(5), "Reserved for additional Compliance Offset Protocols." (MARTINN3)

Comment: A shortage of offsets threatens the viability of the entire program. Just as ARB's "no offset" model showed a huge increase in the cost of the program, a program with an anemic supply of offsets also will increase the costs to levels that would threaten the viability of the entire program. Yet ARB has not proposed to add any new compliance offset protocols nor added to the list of projects eligible for early action credit. We strongly recommend that ARB explore additional paths for generating offset credits. Of course, the best way to expedite the development of compliance offset protocols is to adapt the high quality ones that exist today in the voluntary market. We strongly encourage ARB to consider the protocols developed by such carbon project standards organizations as the Climate Action Reserve ("CAR"), the Verified Carbon Standard, the American Carbon Registry, and the Gold Standard. For new compliance protocols developed in this way, the projects developed in accordance with the forerunner voluntary protocols ought to be made eligible for early action credit—as is now the case with ARB's four existing compliance protocols. Not to do so would violate AB 32's mandate that "appropriate credit" be given to voluntary early actions. Cal. Health & Safety Code section 38562(b)(3). (COPC3)

Comment: I recommend that ARB expand the list of eligible protocols so that the supply of offset credits issued under the ARB-approved protocols are more capable of meeting demand. More clarity must be provided for how early action protocols can be brought forward for consideration and approval. (GRINNELL)

Comment: CLFP encourages CARB to address offset supply options by accepting energy efficiency projects as an approved offset. (CALFP3)

Comment: CARB recognized in the Scoping Plan that increasing the energy efficiency of existing buildings provides the "greatest potential for GHG reductions in the building sector." CARB's Scoping Plan urges "adopting mechanisms to encourage and require retrofits for existing buildings that do not meet minimum standards of performance." NAIMA urges CARB to broaden its scope of acceptable offsets. Energy efficiency offsets should be added to the list of acceptable/approved offsets. Energy efficiency measures should be given top priority over renewable, where benefits tend to be uncertain, distant, and unpredictable. (NAIMA2)

Comment: CARB should weigh the significant environmental benefits offered by insulation products. Unlike other energy efficiency measures, such as energy efficient appliances or energy saving light bulbs, insulation, once installed, requires no additional energy to save energy. It not only provides significant economic benefits to the State, but it helps CARB meet its goal to reduce GHG emissions through increased efficiency. (NAIMA2)

Comment: Section 95973(a)(2): Additionality. We are concerned that, as described, the additionality requirements of offset credits may lead to unintended, perverse incentives. We seek clarity from CARB on how it intends to avoid creating such negative incentives, which we describe in greater detail below. If early adopters of agricultural conservation practices, which demonstrate reduced GHG emissions benefits, are prohibited from receiving offset credits, early adopters may choose to stop their use of those conservation practices so that they may, in the future, re-establish those practices to then qualify for offset credits. To avoid penalizing early adopters of beneficial practices and creating such perverse incentives, CARB should establish that additionality for agricultural offset protocols is determined by the common practice for the industry and should not include a fixed date requirement of when the practice was to be established on the operation. For example, the common practice for soil management for a particular crop may be the use of synthetic fertilizer applications. Those who rely on alternative soil management practices (e.g. compost, cover crops, reduced fertilizer use, etc.), which are above the common practice in terms of demonstrated GHG emission reduction benefits and meet the other offset protocol requirements, should be eligible for the offset credit, regardless of when they began their use of the alternative soil management practices. (CACAN3)

Comment: The marketplace tends toward simplified approaches to agricultural GHG mitigation—rewarding single practices rather than assessing and rewarding whole farming system approaches—which may not lead to overall GHG emission reductions. For example, altering some agricultural management practices to reduce GHG emissions may lead to changes in management practices elsewhere on the farm or ranch that could cause greater, unintended GHG emissions. To minimize the chance that agricultural offset credit protocols will fail to account for displaced GHG emissions within the agricultural operations, CARB should only adopt offset protocols that account for the full life cycle impacts of agricultural practices on the entire operation. (CACAN3)

Comment: To the extent that high quality protocols for emissions reductions that occur in disadvantaged communities can be developed, EDF recommends that CARB pursue them. (EDF4)

Comment: ARB has made no modifications to the draft Regulations regarding the four Climate Action Reserve (CAR) protocols used to classify compliance-eligible offsets and those eligible to receive early action credit. IETA has continued concerns limiting eligible offsets to these four project types alone would cause an immediate supply shortage. We believe there are simply not enough offsets presently available under these four protocols to provide the market with sufficient supply to effectively mitigate costs to California consumers. Additional paths for generating offset credits should be explored and incorporated into California's Cap and Trade program. These include the issuance of offset credits for projects using ARB-approved protocols, beyond the four identified. Emission reductions from all qualified existing CAR projects should be brought into the compliance system and become compliance eligible. In addition, ARB should consider recognizing protocols from other high-quality carbon project standards organizations, such as the Verified Carbon Standard, the American Carbon Registry, the Chicago Climate Exchange, and the Gold Standard. Recognizing existing projects will help to create a greater initial supply of offset credits for the market. In addition to expanding CAR offset limits and criteria, state officials must continue to consider how to practically link with external offset and allowance programs, including the Western Climate Initiative (WCI), the Regional Greenhouse Gas Initiative (RGGI), Clean Development Mechanism (CDM), and EU ETS. There is a great need for ARB to provide more clarity regarding additional project types that may become eligible for offset credit. Developing offsets is a long and complex process that requires significant investment. It can take years for new projects to become market ready. Considering the demand for offsets will only rise over time, giving project investors as much foresight as possible will help ensure adequate supply is available. In addition, IETA recommends ARB establish an open and defined mechanism through which offset project developers can propose new project types and methodologies for consideration.

At the moment, there is no formal path for introducing such methodologies and this would greatly streamline the process. (IETA3)

Comment: We encourage the Board to consider and adopt additional standardized, performance-based protocols that have been developed with broad stakeholder input and support as soon as possible. Doing so will allow sufficient time for offset projects to be built and operate so that they may begin providing a flow of offset credits into the program well before it launches. (CAR4)

Comment: We recommend that the Board consider and adopt each of the Reserve's high-quality offset protocols: Organic Waste Composting, Organic Waste Diversion, Nitric Acid Production, Landfill Methane Capture and Destruction, Coal Mine Methane, Destruction of Ozone Depleting Substances from Article 5 Countries, and Livestock and Landfill Methane Capture and Destruction for Mexico. The Reserve will shortly complete two additional protocols for the agricultural sector, Rice Cultivation and Nutrient Management. We also encourage the Board to consider and adopt these protocols as soon as they are completed. (CAR4)

Comment: CCSF strongly urges ARB to adopt offset protocols for composting and anaerobic digestion in the Cap and Trade program. Composting and anaerobic digestion projects are proven highly beneficial strategies that avoid the fugitive biogas releases from landfills. Further, the use of the compost produced by these strategies provides multiple greenhouse gas reduction benefits. Therefore, CCSF urges ARB to provide clear incentives for composting and anaerobic digestion over landfilling. (SFMAYOR3)

Comment: Offsets are an important component of compliance with AB 32. Given that the emission targets are very aggressive and require equipment that is technology-forcing, there is a danger that offsets will not be developed in sufficient quantity to provide the needed program flexibility. For example, we note that ARB has only approved a handful of protocols at this time, when there are eleven protocols that have been developed by the Climate Action Registry. Two key protocols, landfill gas for North America and coal mine methane have been developed and used by Climate Action Registry for several years recommend that these be considered by ARB in early 2012. The North America landfill gas protocol would add over 50 percent more offsets in the first compliance period. The coal mine methane protocol holds the potential to provide a large supply of valuable and verifiable offsets that could ensure that AB 32 emission reductions are achieved cost-effectively. (WSPA3)

Comment: CARB should adopt more high quality protocols for offset credit development and use in the Cap and Trade program, with emphasis on land-based greenhouse gas reductions. EDF recommends CARB staff identify high quality offset credit protocols and submit them for adoption by the board as soon as possible. Based on the multiple benefits that can be achieved by offsets, and the great potential to locate these projects in California, EDF recommends CARB staff prioritize high quality agricultural protocols for adoption in the Cap and Trade program. (EDF4)

Comment: CCSF supports expanding current programs and developing new regulations to further encourage reductions in natural gas consumption. Additionally, given the intensity and more immediate impact of emissions of high methane content biogas relative to carbon dioxide, CCSF urges ARB to develop offset protocols that encourage investment in facilities that capture and reduce methane emissions from landfills, wastewater treatment, and leakage from natural gas transmission lines. (SFMAYOR3)

Comment: Conversion technology facilities should have the ability to generate offsets in the proposed Cap and Trade system because they are reducing GHGE emissions from several sources, including a reduction in fossil-based electricity generation, transportation of waste, and deposition of waste in a landfill leading to methane emissions. Rather than excluding such facilities from being able to "sell, trade, give away, claim, or otherwise dispose of any of the carbon credits, carbon benefits, carbon emissions reductions, carbon offsets or allowances," ARB should encourage the development of protocols that would validate the GHGE reduction potential of conversion technologies and encourage development of conversion technologies within California. (CLADPW)

Comment: Promote innovation by allowing more flexibility in measurement of offsets. Impacts on innovation stimulated by offsets were frequently cited as a concern in developing offset policy. Offsets are a driver of innovation. This might occur through two pathways: First, use of offsets in uncapped sectors (e.g., agriculture and forestry in California) creates an incentive to innovate in areas that would not otherwise be reached by the carbon price signal under the cap. As emissions reductions from offsets lead to learning-by-doing, costs fall and the supply of offsets increases, providing further opportunities. Second, offset use in developing countries might not only contribute direct emissions reductions it could also serve as a vehicle for technology transfer. The technology diffusion process, kick-started with offsets, would contribute additional emissions reductions. (WSPA3)

Comment: CalChamber appreciates that the offset limit has been raised from 4 percent to 8 percent of a covered entity's compliance obligation. While we believe the extension of offset limitation is a step in the right direction, we believe that in order to reduce program costs, especially the high costs of a California-only program, a robust supply of offsets is required. Therefore, we encourage CARB to consider the inclusion of other offset protocols outside of the four protocols currently under consideration and to delegate authority for offset approval to capable third parties. We believe that a broad qualitative use of offsets is an important cost-containment mechanism within the cap-and-trade program. Geographic limitations will result in unnecessarily high compliance costs. For that reason CalChamber urges CARB to consider the inclusion of other offset protocols with linkage to existing offset programs, near term linkage to regional programs such as the Western Climate Initiative (WCI), and future linkage to a possible EU offset program as well. (CALCHAMBER3)

Comment: While PG&E understands that a separate rulemaking is required for additional offset protocols, PG&E is supportive of and encourages the speedy approval of additional protocols. Using the current data from the Climate Action Reserve's database, PG&E has updated its offset forecast. This forecast predicts that the four protocols under consideration by the ARB will generate approximately 15 million metric tons by the end of the first compliance period and approximately 30 million metric tons by the end of the second compliance period. PG&E reviewed the potential of the other Reserve protocols and the Nitric Acid Production, U.S. Landfill, and Article 5 Ozone Depleting Substances Protocols show the greatest potential to generate sufficient offset volume so that complying entities can use up to 8 percent offsets to meet their compliance obligation. PG&E also recommends that the ARB consider the American Carbon Registry's Conversion of High-Bleed Pneumatic Controllers in Oil & Natural Gas Systems and the Reserve's Coal Mine Methane, Organic Waste Digestion, and Organic Waste Composting Protocols as high quality protocols capable of generating robust volumes of offsets. (PGE4)

Comment: CCEEB recommends that ARB begin the process to delegate approval of offsets to third party registries and adopt new protocols rapidly to ensure that adequate supply is available in the first compliance period. Additional supply options should include the use of five additional Climate Action Reserve Protocols; use of offsets from Western Climate Initiative Partners; support the development of Pilot REDD Projects; use of Climate Action Reserve Landfill Credits generated before 2012; and approval of protocols developed by California air districts, as appropriate. (CCEEB3)

> **Response:** Any new protocols would be subject to new rulemaking process. ARB will be evaluating additional protocols in 2012. Responses to similar comments can be found in this category under the 45-day comment responses.

M-26. (multiple comments)
Comment: While they may be the preferred way to go, standardized approaches are limited in number, take time to develop, and require significant resources. Allowing project-based protocols to be approved for a limited time will encourage a diverse and creative range of protocol types over the longer term. Importantly, the development of project-based approaches can serve to inform the creation of standardized approaches in certain sectors and will provide the necessary incentives to motivate an industry-wide move towards lower carbon emissions. Restricting approved protocols to only standardized approaches could also result in insufficient offset supply arising from a limited set of protocols. ARB should specify that project-based approaches, like those used in many other offset programs around the world, will be accepted for a limited transition period at the beginning of the Cap and Trade program's implementation, and as a transition to sector-wide approaches. (VCSA)

Comment: The modified draft rule provides no formal path for submitting methodologies for review, evaluation and approval by ARB. An open, transparent process for reviewing, evaluating and approving offset methodologies is a necessary signal for the market to continue developing protocols (and projects) that will provide the offsets necessary for effective cost-abatement. ARB should establish an open and defined mechanism through which offset project developers can submit new project types and methodologies for consideration. VCSA suggests that ARB consider adopting a process similar to that employed by the Australian Department of Climate Change and Energy Efficiency for inviting parties to submit methodologies for review and approval under that country's forthcoming Carbon Farming Initiative. Details about that submission process can be found at http://www.climatechange.gov.au/government/initiatives/carbon-farming-initative/methodology-development/methodology-guidelines.aspx. (VCSA)

> **Response:** New protocols will be developed as part of new rulemaking, and staff will be evaluating new protocols in 2012 through a public process. The program has been designed to develop standardized protocols to ensure consistency across project types. Project-based protocols would be labor intensive, as each protocol would be a separate rulemaking. Staff will be developing documentation on the process for protocol review and development as part of program implementation. Responses to similar comments can be found in this category under the 45-day comment responses.

M-27. Comment: The offset market will be a key component of the State's carbon management strategy. However, the lack of approved protocols, coupled with the new stringent liability restrictions that CARB has proposed, will stifle this market to the extent that its function as a "cost containment measure" will be meaningless. We urge CARB to reduce the self-imposed barriers to this environmentally-beneficial mechanism by approving more protocols, eliminating the buyer-liability component, and allowing greater than 8 percent of a sources' allowance obligation to be met through the use of offsets. (VALERO2)

> **Response:** In regard to the adoption of additional protocols, this comment falls outside the scope of the First 15-Day Changes Notice. Responses to similar comments can be found in this category under the 45-day comment responses. Because the comment falls outside the scope of the notice, no further response is required.
>
> We did not increase the amount of offsets allowed to be used in the program. The program imposes a limit on the amount of offsets that an individual covered entity can use for compliance. All offsets used for compliance are real reductions, albeit outside the cap. Allowing a limited number of offsets into the program provides cost-containment benefits and ensures that some GHG emissions reductions occur within the sectors covered by the cap-and-trade program. This limit will be enforced through a limit on the use of offsets by an individual entity equal to eight percent of its compliance obligation. Combined with the Allowance Price Containment Reserve, this limit ensures that a majority of reductions from the program come from sources covered by the program at expected allowance prices, while use of the reserve will relax that constraint if prices rise.

We do not agree that we should eliminate buyer liability associated with the invalidation of ARB offset credits. Requiring the user to replace the invalidated offsets ensures that purchasers and users of offset credits do their due diligence in seeking out high-quality offset credits. We have clear enforcement authority over covered entities that will be using ARB offsets for compliance. If the covered entity replaces any invalidated offset credits, they may then take appropriate action through third-party contractual arrangements that they may have established prior to purchase. These arrangements currently exist in the voluntary offset market, and we expect that as the offset market becomes more established that additional mechanisms to deal with the risk of invalidation will also be established. In the event that the offset credit has not yet been used or retired, it will be canceled in the market tracking system and removed from any Holding or Compliance Accounts. These provisions in no way diminish our authority to assess penalties under section 96014 on any offset project developer or verifier that has provided false information to ARB.

M-28. Comment: We encourage ARB to take expedited action separate from this 15-day package to finalize new protocols. Such new protocols will be crucial for ensuring sufficient supply of offsets in the cap-and-trade system.

To this end, and in order to facilitate planning, CERP requests that ARB make additional information on the schedule for consideration of new offset protocols public. It would be helpful if ARB announces a date for the offset workshop on new protocols, and signals when those engaged in the market can look forward to seeing such new protocols introduced.

CERP stresses that offset projects take significant time to complete and therefore new offset protocols must be introduced as early as possible so that project development may begin in a timely manner and offset credits may begin to be generated. The need for timely introduction of protocols is especially great because the Western Climate Initiative (WCI) has issued draft guidance that, if finalized, will require a new protocol to go through public comment processes both on the WCI level and in individual member jurisdictions, which will be extremely time-consuming and generally uncertain. The disclosure of further information regarding ARB's process and timing is especially important to project developers who are trying to determine whether to invest significant capital in new project types and who need signals concerning what protocols will likely be accepted and able to earn ARB credits.

Even if ARB can only provide a tentative indication of protocols under consideration, such a message can be helpful. The market is comfortable making advance investments around such conditional information.

CERP also requests that ARB make additional information public concerning the process and proposed timeline for setting up the offsets registry and the accreditation of verifiers, as well as the listing of offset projects. It is our understanding that many of these activities will be occurring during 2012 as the cap-and-trade system gets up and running, but before the compliance obligation begins in 2013. Any new information that ARB can provide the public with regard to their process for offset system development will be helpful in preparing the cap-and-trade market to begin operation. (CERP4)

> **Response:** In regard to the adoption of additional protocols, this comment falls outside the scope of the First 15-Day Changes Notice. Responses to similar comments can be found in this category under the 45-day comment responses. Because the comment falls outside the scope of the notice, no further response is required.
>
> We have provided a role for Offset Project Registries (OPR) to perform some of the administrative functions of the offset process in the regulation. We plan to utilize OPRs in lieu of having ARB perform these duties, and may choose to continue this approach throughout the program. We have not yet determined if and when we would perform these roles. Therefore, in the meantime, all parties seeking to use Compliance Offset Protocols must go directly to an OPR to list their projects. We are in the process of developing the training for OPRs and plan to approve OPRs sometime in 2012.
>
> In addition, we are in the process of developing the training for offset verifiers and plan to accredit offset verifiers in 2012 as well.

M-29.
Comment: Further consideration should be given to the need for robust offset supply. As more offsets become available, the probability that the reserve pool would be accessed drops significantly. As the allowed use of offsets goes down, the chance the reserve pool will be accessed goes up. We found that at the proposed 8 percent quantitative limit for using offsets, there is a 15 percent chance the reserve pool will be accessed; at a 4 percent quantitative limit for using offsets, there is an 89 percent chance the reserve pool will be accessed; and if no offsets are allowed in the program, the proposed allowance reserve is not likely to be sufficient to keep prices below $40 per ton. Also, since the reserve pool is populated with emissions allowances from future compliance periods and offsets are composed of present day reductions (or vintage reductions having occurred in the past), avoiding the use of the allowance pool (due in part to offsets availability) can be seen as achieving present day program benefits from current actions rather than as promises of actions yet taken. (EDF4)

> **Response:** We do not agree that there will be insufficient offset supply in the first compliance period. We estimate that if every entity used their allowable eight percent offsets, approximately 26 million metric tons of offsets would be needed in the first compliance period. This reduced need is due to a start of the first compliance period in 2013 instead of 2012. At this time, based on the four offset protocols the Board has endorsed—manure digesters, forestry, urban forestry, and destruction of ozone depleting substances—we will be close to the

supply demand for the first compliance period. We also will be looking to propose additional Compliance Offset Protocols beginning in 2012.

The program imposes a limit on the amount of offsets that an individual covered entity can use for compliance. All offsets used for compliance are real reductions, albeit outside the cap. Allowing a limited number of offsets into the program provides cost-containment benefits and ensures that some GHG emissions reductions occur within the sectors covered by the cap-and-trade program. This limit will be enforced through a limit on the use of offsets by an individual entity equal to eight percent of its compliance obligation. Combined with the Allowance Price Containment Reserve, this limit ensures that a majority of reductions from the program come from sources covered by the program at expected allowance prices, while use of the reserve will relax that constraint if prices rise.

Offset Project Registries

Registry Approval Process and Requirements

M-30. (multiple comments)
Comment: To ensure the integrity of all registry offset credits, provide proper oversight of the third-party verification process, identify and correct errors in offset project documentation, and minimize the risk of offset invalidations, we recommend that ARB approve only Offset Project Registries with significant technical expertise and years of experience conducting similar functions in the voluntary market. (MARTINN3)

Comment: The Board must therefore ensure that the registries participating in ARB offset generation have the expertise needed to perform this role and that they are performing their oversight tasks adequately. In addition to reviewing the performance of verifiers and verification bodies directly, CARB must also review the performance of the registries in conducting their oversight tasks. CARB must use discretion in approving registries. (UCS7)

Comment: Given the complexity and necessary knowledge required for these tasks, require that entities seeking to provide offset registry services for the regulatory cap-and-trade program have at least three years of demonstrated experience in operating a registry before they can be accredited, and establish competency requirements for registries equivalent to or better than those required for verification bodies. The draft regulation requires that verification bodies have experience before they may be accredited, but does not impose similar requirements for the registries that are meant to provide the first-level oversight of those verifiers. The competency requirements for staff at an offset registry (section 95986(c)(1)) should either be the same as, or stricter than, the competency requirements for staff at accredited verification bodies (specified in Title 17 at section 95132), since offset registries are required to check the work of the verification bodies through Offset Project Data Report review and verification audits. (CAR4)

Comment: EDF believes that having multiple high-quality offset registries operating with the Cap and Trade program will benefit the program as a whole. However, we caution against allowing sub-standard registries into the program or creating a system where credit developers can go registry shopping to find lax rules or less than rigorous registry oversight. As registries are allowed to participate, CARB must be careful to ensure they meet the highest standards for competence and do not possess conflicts which may undermine their ability to perform their designated market function with impartiality and objectivity. The Executive Officer and CARB staff should perform an up-front analysis of whether the registry meets the necessary provisions to be included in the program, including review of staff competence, experience and internal procedures. CARB needs to apply rigorous conflict of interest principles to registries. Registries should not be allowed to have a financial stake in the projects they accredit, especially if that stake has the potential to impact registry impartiality. Registries should perform a market function without acting as a market participant. (EDF4)

Comment: We believe that it is reasonable to include in the Regulation that all registry management and all registry staff complete training and pass an examination in not only all Compliance Offset Protocols, but also complete ARB approved general verification training and pass an examination (sections 95986(h) and 95986(i)). (FIRSTENVIRON3)

> **Response:** The regulation requires that we will only approve registries that meet a high standard under the regulation. The registry staff will be required to demonstrate practical knowledge of the protocols approved by the Board. The regulation contains requirements for regular information sharing between the registries and ARB. The regulation allows for ARB to request information or discussions with registry staff at any point. As with many of ARB's regulations, compliance training will be available, and in this case required, to ensure the highest qualified personnel are on staff at the registries.

M-31. Comment: Section 95986(j) provides for the approval of an entities' application to be an Offset Project Registry only after the applicant's management staff have completed the ARB training required in section 95986(h). Requiring applicants to undergo training before they are approved (or not approved) imposes an unnecessary expense and time burden on them. Since it is likely that an application will be rejected on other, more substantive grounds, we make the following recommendation. Revise the application review and approval process outlined in section 95986 that directs the Executive Officer to make a contingent approval of an applicant that meets the requirements defined in section 95986(c) through (g), with final approval subject to the applicant providing evidence that it has successfully completed the training requirement. Upon determining that an applicant meets requirements 95986(c)-(g), the Executive Officer would then notify the applicant of its contingent approval and provide a specified timeframe within which the applicant must successfully complete the training in order to receive final approval. Once the applicant provides evidence that it has successfully completed the training, the Executive Officer would then issue a final approval. (VCSA)

> **Response:** We did not make this change. The regulation requires that we will only approve registries that meet a high standard under the regulation. The registry staff will be required to demonstrate practical knowledge of the protocols approved by the Board. The regulation contains requirements for regular information sharing between the registries and ARB. The regulation allows for ARB to request information or discussions with registry staff at any point. As with many of ARB's regulations, compliance training will be available, and in this case required, to ensure the highest qualified personnel are on staff at the registries.

M-32. (multiple comments)
Comment: To maintain program integrity, registries must be free of real and perceived conflicts of interest. The prior version of the Regulation made it clear that for a registry to be accredited by the Board; its primary function must be operating an offsets registry. However, the revised Regulation now would allow any entity to designate a subdivision to provide registry services. If such entities provide other services in addition to registry functions, then they too must be free of conflicts of interest, including not being permitted to provide consulting services to offset projects, verifiers, or others involved in the carbon market. Remove the language at sections 95986(c)(2)(F) and 95986(d)(3) allowing 'subdivisions' of larger entities to be accredited, or modify the Regulation to prohibit such entities from providing consulting services to project developers, verifiers, compliance entities, and other affiliated organizations in order to avoid real or perceived conflicts of interest. (CAR4)

Comment: Section 95986(c) allows subdivisions of parent companies to act as registries. A potential unrestricted conflict of interest may arise under the rule because consulting services are not included in the list of prohibited activities in section 95986(d)(3). Accordingly, CARB will need to be extremely careful when reviewing subdivision registries and evaluating walling off procedures in place to ensure complete impartiality by the subdivision registry is retained. In the alternative, CARB could add consulting to the list of prohibited activities within section 95986. (EDF4)

> **Response:** Section 95986(c)(2)(F) was modified to clarify that the prohibition for serving as an offset project consultant applies at the subdivision level for those applicants that have designated a subdivision to provide registry services. In addition, registries must submit conflict-of-interest information to ARB, and we have the authority to revoke or suspend the approval of registries that violate the conditions in the regulation.

M-33. Comment: The revised Regulation appears to require the Executive Officer to accredit any entity that seeks to provide registry services so long as it meets the Board's minimal criteria (section 95986(j)(3)), though this appears to be inconsistent with the language at section 95986(b), that may provide more discretion. Such an approach could potentially lead to a proliferation of registries of variable quality and integrity. We recommend that the Executive Officer fully evaluate the procedures, operations, and capabilities of each Offset Project Registry to determine whether they are adequate to ensure that all offset credits issued meet the requirements of the

Regulation. Further, the Executive Officer should be provided the authority to not approve additional registries if it is determined that a sufficient number have been accredited to serve the program's needs. Limiting the total number of accredited registries will also serve to minimize the potential for errors and reduce the resource burden on the Board staff in overseeing such entities and their activities. (CAR4)

> **Response:** We did not make this change. If the requirements of this section are met, we must approve the applicant. We cannot pick and choose which programs to approve and which to deny, as long as all the requirements of the regulation are met.

M-34. Comment: Given the central role that registries play in ensuring the environmental and financial integrity of an emissions reduction and trading program, it is important that the providers of registry services are themselves technically capable, financially sound, and managerially competent entities. VCSA believes that the requirements for Offset Project Registries outlined in the proposed rule are not robust enough for purposes of establishing the sound, long-term functioning of the offsets program. For its own program, the VCSA requires its registry service providers to meet strict financial standing requirements (including, for example, more extensive insurance coverage than required by ARB and minimum net asset requirements), and have in place insolvency protections and conflict of interest policies (including prohibitions on proprietary trading of carbon instruments) that go beyond the requirements indicated in the modified draft rule. We suggest that ARB establish similar standards. Amend section 95986(c) to include requirements that Offset Project Registry applicants meet more robust financial standing standards similar to those established by VCSA for its registry service providers. As its agreements with its registry service providers are confidential, VCSA would be willing to share more details on these requirements with ARB as long as that confidentiality can be preserved. (VCSA)

> Response: We agree and added similar criteria to the regulation in sections 95986(c)(2)(A)(3.) and (d)(1).

Registry Services

M-35. Comment: We do have a concern that the requirement in section 95987(e)(3), may be difficult to achieve in the early years when there are relatively few projects. ACR recommends adding flexibility to this language in the event that, for example, the majority of the projects registered on a given Offset Project Registry happened to be clustered geographically, or by project type, or be mostly verified by the same body. (MARTINN3)

> **Response:** We did not make any change to the regulation in this area and consider this part of program implementation. We will work closely with registries to ensure that they develop audit plans that meet the regulation's requirements.

M-36. (multiple comments)
Comment: Section 95987(e) has been changed to require ten percent of the annual offset verifications to be audited by a registry. The version adopted in December 2010 had 20 percent offset verifications. Since offset quality is critical to program success, we would recommend keeping the higher audit requirement. (SCAQMD4)

Comment: CAPCOA believes the handling of offsets in the Cap and Trade program will significantly affect the success of the program, and we continue to support the use of only the highest quality verified offsets. We recommend that ARB continue to require that 20 percent of the annual offset verifications be audited by a registry, rather than the lesser amount (10 percent) proposed in the 15-day changes. (CAPCOA2)

> **Response:** We did not make this change. We changed the number of in-person audits that Offset Project Registries must perform from 20 percent to 10 percent because we will also have the audit program, which will include in-person audits in addition to those performed by Offset Project Registries. We will also have access to the audit results collected by Offset Project Registries. We believe that this approach will ensure rigor in the program and that it sets an appropriate level of audits.

M-37. Comment: To ensure the integrity of registry offset credits and to help identify problems or misstatements with projects before registry offset credits become eligible as ARB offset credits (and thereby reduce the risk of credits being invalidated later), we strongly recommend that offset registries not be limited in their responsibilities to only checking that verification reports are complete (section 95977.1(b)(3)(R)(4)(a)). Registries should also be required to review the substance of those reports for accuracy, just as the Reserve does with every project in its system today. Requiring this type of quality assurance and control will provide the Board with an important security step in the approval process. The Reserve does not issue credits without a significant level of review and oversight of verification reports and the Board should similarly require that offset registries provide this level of strict quality assurance before a credit can be considered as an ARB offset credit. (CAR4)

> **Response:** We agree and added a new provision that requires registries to check for completeness and to ensure that the regulation's requirements are met.

M-38. (multiple comments)
Comment: Clarification of registry duties for quality control and assurance of project documents is needed in section 95977. The new language requires that registries evaluate statements for "completeness and to ensure it meets the requirements of section 95977.1(b)(3)(R)(4)(a)." In section 95977.1, requirements include submission of an Offset Verification Plan, the detailed comparison of the data checks, the issues log, any qualifying comments on findings, and calculations performed in section 95977.1(b)(3)(Q). However, the changes do not yet make it clear what registries must do to evaluate this information for accuracy or to make sure the required boxes are

checked and paperwork is filed without regard to the accuracy of the information included in it. (EDF4)

Comment: We request that ARB clarify in section 95987(f) what is meant by report "completeness." We believe this term is subject to differing interpretation which could affect the quality and consistency of the required review. (FIRSTENVIRON3)

> **Response:** Offset Project Registries must ensure that the information submitted meets the regulation's requirements before accepting it from the verifier or Offset Project Operator or Authorized Project Designee. We will conduct training for Offset Project Registries so they will be equipped to interpret the regulatory requirements.

M-39. Comment: Modify section 95987(b) as follows:

> (b) The Offset Project Registry must make the following information publicly available for each offset project:
> (2) within 10 working days of the Offset Project Data Report being issued an Offset Verification Statement:
> add: <u>(F) Offset Project Data Report for each year the Offset Project Data Report was verified. Confidential information shall be treated as per section 96021</u> (UCS7)

> **Response:** We did not make this change. We will establish a minimum list of information for each project data report that will be made publically available for each project type as part of program implementation. This standardized approach will provide consistency across the program and ensure that confidential data is protected.

M-40. Comment: IETA is unconvinced that offset project registries can provide a workable insurance pathway. First, as ARB's own regulations recognize, registries themselves could be the source of a credit discrepancy. Second, registries are not well capitalized, and therefore could not be relied upon to pay out on claims. (IETA3)

> **Response:** While we included provisions allowing Offset Project Registries to provide an insurance mechanism against invalidations, the regulation does not require any parties to offer or use the insurance. It remains optional.

M-41. Comment: Regarding section 95987(e)(1), we assert that checks (B) and (C) are neither necessary nor appropriate for determining whether offset project verification was performed consistent with requirements of the regulation and request these clauses be removed from the Regulation. (FIRSTENVIRON3)

Comment: We feel that the check in section 95987(e)(1)(F)(1) is unnecessary since the verification body has already attested to this information per section 95979(e)(3)(F) and request these clauses be removed from the Regulation. (FIRSTENVIRON3)

Response: We did not make these changes. All of the requirements in section 95987(e) are part of oversight of the verification program and provide information to ensure that the program is functioning properly.

M-42. Comment: Section 95987(d) provides no timeline for registries giving guidance. Guidance should also be made public to improve transparency. The Climate Action Reserve now makes such guidance public and guidance is made public in other programs such as the CDM. Public guidance also helps developers to anticipate what changes will be incorporated in future protocol versions and prepare for them. It reduces duplication of effort where multiple project developers may ask for similar guidance. (CIG2)

Response: Section 95987 specifies that an Offset Project Registry may seek clarity from ARB before providing guidance to offset verifiers and Offset Project Operators. In addition, the regulation requires that Offset Project Registries submit a monthly report to ARB regarding the guidance they have provided. We will then make this information available on a publicly accessible website, so that verifiers and project operators can consult this guidance without having to request it from the Offset Project Registry. We believe that we will be in constant contact with the registries and do not anticipate a problem in this regard.

ARB vs. Offset Project Registry Roles

M-43. Comment: Offset Project Registry Requirements. We appreciate that the regulations lay out requirements for new registries. We however do not think that the language in section 95987 (f) is adequately clear or rigorous for ensuring that interpretation and implementation of these highly technical and complex protocols offset are consistent across registries. We recommend that ARB create a central repository and publically available site for answers to questions on how to interpret specific aspects of the protocol; that ARB clearly identifies itself as the final arbiter of disagreements or questions over interpretation; and that ARB actively ensures that consistent interpretation is being applied. (PFT3)

Response: Section 95987 specifies that an Offset Project Registry may seek clarity from ARB before providing guidance to offset verifiers and Offset Project Operators. In addition, the regulation requires that Offset Project Registries submit a monthly report to ARB regarding the guidance they have provided. We will then make this information available on a publicly accessible website, so that verifiers and project operators can consult this guidance without having to request it from the Offset Project Registry. We believe that we will be in constant contact with the registries and do not anticipate a problem in this regard.

Also, the regulation ensures that we will only approve registries that meet a high standard under the regulation. The registry staff will be required to demonstrate practical knowledge of the protocols approved by the Board and the compliance offset program.

Monitoring, Reporting, and Record Retention Requirements

General Monitoring Comments

M-44. (multiple comments)
Comment: Section 95976(a) requires meters to be maintained and calibrated at a frequency required by the manufacturer. However, the Livestock Protocol states that meters may be calibrated more frequently than manufacturers' recommendations and requires more frequent inspections. This is confusing. Which document should a developer follow? We believe that protocol-specific requirements should be left in the protocols, and not put in regulations. ARB staff should review the Regulations to make sure that there are no contradictions between what the Regulations prescribe and what the protocols prescribe. (CIG2)

Comment: In a number of instances, the main regulations and the individual protocols impose overlapping but different verification requirements that are particular to a specific offset project types. For example, section 95976(a) provides that meters for livestock offset projects be maintained and calibrated at a frequency required by the manufacturer. However, the Livestock Offset Protocol states that meters may be calibrated more frequently than manufacturers' recommendations; in addition, the protocol requires more frequent inspections. This type of confusion between the main regulations and the protocol could have significant adverse impacts on the program by leading to delays and disputes. In particular, these discontinuities could result in significant disarray if ARB continues to require invalidation of all offset credits from a data report if it is not "accurate." We recommend that protocol-specific requirements be left in the protocol, and not addressed separately and different in the main regulations. We urge ARB to review the regulations to identify and eliminate overlapping provisions. (CERP4)

> **Response:** We agree and clarified the language to say "unless otherwise specified in a Compliance Offset Protocol."

Interim Data Collection Procedures and Variances

M-45. Comment: It is not obvious how to make "A demonstration that no feasible alternative procedure exists that would provide more accurate emissions data." As written in section 95976(f)(2)(D), this requirement assumes knowledge of all possible data collection procedures, from which one could make feasibility determinations for the case at hand. Modify section 95976(f)(2)(D) as follows:

> (D) A demonstration that ~~no feasible alternative procedure exists that would provide more accurate emissions data~~<u>the proposed data collection procedure is conservative; that is, the proposed data collection procedure and any accompanying calculation methods will necessarily result in fewer verifiable emission reductions than the standard data collection method would have</u>

provided given identical project performance. (TPI5)

Response: These requirements have already been successfully implemented under the MRR. The offset project developer must conduct due diligence in proposing an interim data collection method. This requirement ensures that they explore several alternatives and not just the easiest one before proposing a particular one to ARB.

Record Retention Requirements for Offset Project Operators and Offset Verifiers

M-46. (multiple comments)
Comment: The OWG agrees with ARB's change to the records retention requirement which was reduced to 15 years from the previous 100-year requirement. The longer requirement was unreasonable and unnecessarily burdensome and the OWG appreciates ARB's recognition of this. However, in light of ARB's 8-year statute of limitations for invalidating offset credits, the OWG requests ARB to explain the necessity for having a retention requirement that is longer than the relevant statute of limitations. (OFFSETSWG3)

Comment: Section 95976 of the regulation sets out record retention requirements. Clearly a sequestration project could be allowed to establish a final crediting period baseline plus all offsets credits registered and then enter a monitoring process that would not require maintenance of all the preceding decades of documents. Of course during the active crediting period these records are necessary, but once in the monitoring period, with no additional revenue cost is an important issue. (CFA2)

Response: The record retention requirements in section 95976(e)(2) were changed to 15 years following the issuance of ARB offset credits due to stakeholder concerns about an unnecessarily long record retention requirement for forestry projects. Verifiers are also required to retain related documents for 15 years. The record retention requirements must be extensive enough for verification of each Offset Project Data Report. This provision is necessary to ensure that ARB or an OPR will have enough data to confirm that the crediting project has been operating in accordance with the appropriate ARB-approved protocol. These records may have additional enforcement uses, such as establishing a pattern of behavior. The invalidation time limit is independent of any other enforcement activities ARB may need to pursue.

Reporting and Verification Deadlines

M-47. Comment: Sections 95976 and 95977(d) provide a very strict delivery date for offset verification and offset project data reports. The penalty for being late is denial of eligibility of the offset credits reported in that Offset Project Data Report. This seems highly punitive especially given that many projects will have multiple years of data verified in the first report and if necessary to avoid this penalty just wait another year and submit this first Offset Project Data Report without any penalty. Especially in the first few years such deadlines should be more flexible to allow verifiers to get up to speed and ARB to have a steady flow of offsets arriving to keep Cap and Trade economic impacts down. (CFA2)

> **Response:** Section 95976(d) was modified to address stakeholder concerns about a calendar year reporting period with a fixed annual "verification period." The new requirements cover a reporting period that is not tied to the calendar year to address these stakeholder concerns. Additional modifications were made to the timing for the schedule for verification (sections 95977(b) and (c)) and the submittal of Offset Verification Statements (section 95977(d)) to be consistent with the new offset reporting schedule in section 95976(d) and clarify the verification cycle. The new cycle requires that Offset Project Data Reports be submitted to ARB within four months after the conclusion of the Reporting Period. They subsequently have to be verified within nine months after the conclusion of the Reporting Period. We believe the new requirements provide sufficient flexibility to meet the deadlines. For example, if a project developer completes their reporting within two months, they have seven months to get their Offset Project Data Report verified.

M-48. Comment: Though CERP appreciates the more reasonable period in the revised regulations for submitting reports, the requirement in section 95977(d) that states a project will not be eligible for registry offset credits if the deadline is missed is far too harsh a response when there may be a good faith reason for delay. For this reason, CERP urges ARB to include in the regulations a provision authorizing the agency to provide deadline extensions on the basis of specified reasons. Such reasons could include:

- A verification is delayed because the verifier is working on too many projects.
- A verification is delayed because the relevant Offset Project Registry loses its approval and the project must switch to another registry.
- A contracted verifier ceases to provide verification services.
- A verifier determines that a qualified positive verification statement is likely appropriate but will require consultation with ARB or the approved offset registry and/or the collection of further data to support the qualified positive verification statement.
- Data that must be submitted in an Offset Project Data Report must be obtained from a third party and the third party (or the third party's equipment) is responsible for the delay (e.g., meter malfunction).
- A verifier determines that additional data must be collected to meet important data quality standards (e.g. delays due to additional or repeated sampling of plots in a forestry project to improve statistical confidence).
- A decision by ARB or an Offset Project Registry is appealed by an Offset Project Operator or a verifier.
- A decision by a verifier is appealed by an Offset Project Operator.
- A verifier or an Offset Project Operator requires clarification on a protocol or its applicability to a specific project from ARB or an approved offset project registry.

- Project data collection or required verification site visits are delayed because the project site cannot be accessed (e.g. due to inclement weather) or because data collection equipment must be repaired or replaced. (CERP4)

  Response: We previously changed the reporting deadlines to an annual reporting cycle instead of a calendar-date deadline. We believe that this creates enough time for verification to occur, so extensions to the deadline in the regulation are unnecessary.

Verification

General Verification Comments

M-49. Comment: Section 95977.1(b)(3)(E) references a review of the GHG emissions inventory which we do not believe is intended in this section on offset verification services and request that the language be removed from the regulation. (FIRSTENVIRON3)

> **Response:** We agree and made this change.

M-50. Comment: We request that the language in sections 95977.1(b)(3)(D)(2)(f) and 95977.1(b)(3)(D)(2)(h), very clearly and explicitly identify what is required relative to these assessments as similar regulatory reviews under voluntary programs have lacked clear guidance regarding this issue. (FIRSTENVIRON3)

> **Response:** We did not make any changes to the regulation, but plan to provide guidance on how a verification body can conduct reviews, to ensure that these requirements are met.

M-51. Comment: We believe it is unclear in section 95977.1(b)(3)(L)(4) what is meant by “any discrepancies must be investigated” in this context and request that the language be revised to “any discrepancies must be identified.” (FIRSTENVIRON3)

> **Response:** We agree and made this change.

M-52. Comment: Please provide clarification on section 95977.1(b)(3)(M) regarding what is meant by “make any possible improvements or corrections to the submitted Offset Project Data Report.” What could be considered “possible” could be subject to different interpretations. (FIRSTENVIRON3)

> **Response:** This comment requires no change to the regulation itself. We will provide training to verifiers on how to provide services to ensure that the regulatory requirements are met.

M-53. Comment: Page A-205 (b)(3)(D) Site Visits for Offset Projects. It is unclear whether projects can register ARB credits based on less intensive verification opinions occurring between 6-year site visits. We request that it be clarified that credits can be issued based on optional Less Intensive Verifications occurring in intervening years when no site verification occurs. (BLUESOURCE2)

> **Response:** Less intensive verification allows desk reviews to be performed in the interim years that full offset verification services are not provided. We have maintained the requirement for site verification every six years and by including less intensive verification requirements, registry offset credits and ARB offset credits may be issued in the interim years if they meet the requirements of the regulation and the protocol.

M-54. Comment: The adoption of a "less intensive verification" in section 95977.1(b)(3)(D) is critical for sequestration projects facing excessive verification costs. However, it is not defined in the Regulation. We recommend that this term be defined in the Regulation and that the definition explicitly state that ARB Offset Credits can be issued upon the submission of a non-qualified less intensive verification opinion. (FINITE)

> **Response:** The term "less intensive verification" is defined in section 95802 of the regulation. Less intensive verification allows desk reviews to be performed in the interim years that full offset verification services are not provided. We have maintained the requirement for site verification every six years and by including less intensive verification requirements, registry offset credits and ARB offset credits may be issued in the interim years if they meet the requirements of the regulation and the protocol.

M-55. Comment: We request that section 95977.1(b)(1)(C) be revised to specifically identify what is meant by "documentation that the offset verification team has the skills required to provide offset verification services." (FIRSTENVIRON3)

> **Response:** We did not make this change. It is clear in the regulation that the offset verification team must have an offset project specialist on the verification team for the project type for which it is providing offset verification services.

M-56. Comment: While the intent of section 95977.1(b)(3)(G)(2) is clear within the context of an emissions report for the MRR, it is not clear relative to projects since most have a single primary source of GHG emissions. We request the removal of this clause or if it is still considered important, we request additional clarification in the Regulations regarding the performance of this ranking in the context of emission reduction projects. (FIRSTENVIRON3)

> **Response:** The term "GHG emission source" is defined in section 95802 of the regulation.

M-57. Comment: We request that the language in section 95977.1(b)(3)(A) be changed to indicate that "The Offset Project Operator or Authorized Project Designee must provide to the verification team the following information necessary to develop an Offset Verification Plan" instead of specifying that the verification team must obtain this information since the list that follows is clearly information that the Offset Project Operator or Authorized Project Designee would possess and could provide. (FIRSTENVIRON3)

Response: We agree and modified the regulation accordingly.

M-58. Comment: The requirements for offset verification services in section 95977.1 roughly correspond to the verification approach contained in ISO14064 Part 3 (the standard) which represents recognized international best practice regarding the performance GHG verification. However, the Regulation's requirements omit several steps specified by the standard. These omissions include, but are not limited to, an initial strategic review, and more significantly, the assessment of the GHG information system and its controls, an assessment which originates from financial auditing, from which GHG verification best practices were derived. In addition, the Regulation lacks the detailed guidance regarding the performance of verification activities contained in Annex A of the standard. For these reasons, we believe that the verification process as presented in the Cap and Trade Regulation does not meet the standard of international best practice. Recognizing that activities implemented under AB 32 provide an example to other North American programs and beyond, we strongly encourage ARB to ensure the regulations are consistent with international best practice by either incorporating all of the requirements of ISO 14064 Part 3 into the Regulation, or incorporating its requirements by reference to the standard. (FIRSTENVIRON3)

Response: We believe that the offset verification requirements do embody the best practices provided in the ISO 14064 guidance. We do not believe a change is necessary

M-59. Comment: Modify section 95977 as follows:

(g) The Board shall periodically review and evaluate the relationships between verifiers and verification bodies and project developers and consider a system where the Board assigns verifiers or verification bodies for each project. (UCS7)

Response: We did not make this change. The regulation contains rigorous conflict-of-interest provisions to guard against inappropriate relationships between verifiers, verification bodies, and project developers. This additional requirement is unnecessary, as its intent is to provide the same result.

M-60. Comment: We recommend against the revised definition of "Offset Material Misstatement" that would allow the first five percent of emissions over the reported level to be protected from enforcement. By including this language, ARB has essentially raised the cap by five percent. It is not necessary from a programmatic standpoint, and is not allowed in other air programs. If ARB continues to allow this exclusion, at a minimum, the rule should be clear that if an entity under-reports by more than the five percent “free” level, all under reported emissions will be subject to violation, not just emissions beyond five percent. (CAPCOA2)

> **Response:** We disagree that the material misstatement “essentially raised the cap by five percent.” Offset projects are calculated using conservative methods that take into account uncertainty. Due to the conservative methods, the five percent level does not artificially raise the cap. Because the comment falls outside the scope of the notice, no further response is required.

M-61. Comment: In order to protect against gaming and conflicts of interest, there should be a periodic review the relationships between verifiers and project developers. CARB should consider a system where the CARB executive officer assigns a verification body, or a list of three verification bodies from which to choose, to each offset project. (UCS6)

> **Response:** We are committed to continually evaluating the verification bodies' services as specified in the ARB's regulatory requirements and the verification bodies' professional care and conduct to ensure the integrity and consistency of verifications. As part of this oversight process, each reporting year, ARB staff will audit every active verification body to ensure verifiers are providing high quality offset verification services. Audit findings and observations are sent to verification bodies at the completion of verification services in order for each verification body to take any necessary actions to improve their performance. We will not take on the additional workload to assign verifiers and then try to negotiate fees between project developers and assigned verifiers.

M-62. Comment: Section 95977.1(b)(3)(D)(2)(h) prohibits a project from receiving CARB offset credits or registry offset credits if it does not meet the requirements of section 95977.1(b)(3)(D)(2)(f) regarding compliance with local, state, and federal environmental laws. This prohibition should apply to a project that does not meet any requirement of the Cap and Trade rule. (SCAQMD4)

> **Response:** We believe the regulation does require offset projects to meet the requirements of the cap-and-trade program to be issued offset credits.

General Verification Process

M-63. Comment: The annual reporting and six year site visits as well as full inventory every 12 years should only be required for the crediting period. ARB should develop monitoring period requirements that recognize the 100 year permanence and the need being of lower resolution, and an investment and detail level that demonstrates that the level of onsite carbon stocks must be maintained at or above that amount needed to assure all registered tonnes. For example a satellite monitoring of change detection could be more than reasonable for monitoring period needs and cost effective. (CFA2)

Response: We will continue to discuss these types of alternatives for post-project monitoring with stakeholders. We need to review and evaluate any alternatives before making a change to the regulation as part of a separate rulemaking.

M-64. Comment: While we agree the list included in section 95977.1(b)(3)(L)(3) includes data checks that could be performed for a particular source, not all of them would be necessary, appropriate, or efficient to confirm the accuracy of source data so we would request that "at a minimum a data change must include the following" be changed to "at a minimum a data check may include one of the following." (FIRSTENVIRON3)

Response: We modified section 95977.1(b)(3)(L) to require a verification team to clearly show how the riskiest sources of offset project information were reviewed for accuracy. This is needed to provide written documentation that the verification team fulfilled its regulatory verification requirements, and to provide a minimum standard for all offset verifications.

M-65. (multiple comments)
Comment: The requirement in section 95977.1(b)(3)(R)(4)(c) for verifiers to have "a final discussion with the Offset Project Developer" is in our opinion and experience unnecessary. We strongly suggest that there needs to be more flexibility. (CIG2)

Comment: Further, the requirement in section 95977.1(b)(3)(R)(4.)(d.) for verifiers to have "a final discussion with the Offset Project Developer" is also, based on our experience, unnecessary. We strongly suggest that this requirement be eliminated. In addition, section 95977.1(b)(3)(D) requires verifiers to make a site visit every year. We suggest that the requirement could be made more flexible, while still achieving the same purpose, if verifiers were required to undertake a site visit within two months of the end of the reporting period. (CERP4)

Response: In our experience with inventory verification under the MRR, too often the verifiers failed to communicate their findings to their clients before submitting a verification statement to ARB. It is important for offset project developers to understand the findings from verification services from their verifiers.

We changed the regulation to require that a site visit for non-sequestration projects must be conducted in the year that offset verification services occurs. For smaller projects that opt to conduct verification every two years, a site visit will only be required in the second year (the year in which full offset verification services are provided).

M-66. (multiple comments)
Comment: Finally, we strongly urge ARB to recognize that small-scale projects cannot and should not have to carry the full verification burdens borne by larger projects. In

particular, we recommend that ARB allow projects below a certain ton threshold to undertake a site-visit verification every two years instead of annually (the project still could report annually). CERP recommends a threshold of 25,000 metric tons CO_2e/yr for this threshold. This is the same threshold ARB uses for reporting of emissions by sources. A lower threshold (such as 10,000 tons) would be too small; many Offset Project Operators would have to do a significant amount of work even to determine whether they meet such a lower threshold. By contrast, 25,000 tons/yr is an appropriate, established, and credible threshold for what constitutes a small-scale project that should merit a once-every-two years site visit rule. (CERP4)

Comment: The existing CAR protocols and the draft Compliance Offset Protocols take a performance-based approach for determining the eligibility of projects to generate offsets. We agree with this. We believe that it provides project developers, such as Camco, with greater certainty that projects will be able to register offsets and reduce overall transaction costs. This will be particularly beneficial to smaller-scale projects. We believe that ARB must uphold the environmental integrity of the Cap and Trade program. However, the way to address integrity for small-scale projects is to make the protocols conservative, by default, to minimize the chances of over-estimating emission reductions. Further, we believe that Regulations should be scalable to reflect the contribution and impact smaller-scale projects can have on the overall system. ARB should recognize that all offset projects do not have the potential to pose the same threat to the level of environmental integrity intended by the law and regulation, and that the Regulations should take account of the scale of the offset action. While the principle of environmental integrity must be maintained in all eligible offset projects, the various costs of ensuring that integrity, from administrative, management to MRV costs, should reflect the scale of the project, particularly for small-scale projects. It is important to allow smaller-scale projects flexibility to demonstrate their emissions reductions, if we are to encourage the development of these types of small-scale activities. The CDM (and other standards) allow greater flexibility for smaller-scale projects. There are simplified project design and MRV procedures for these size projects which significantly reduce the costs of registration, monitoring, reporting and verification. We strongly suggest that the same principles for small-scale offset projects be applied in California, following international best practice. (CIG2)

Comment: Small and mid-scale agricultural producers because of the size or nature of their operation may find that, they alone do not qualify for a sufficient number of offset credits to make the project application and verification process worthwhile. To avoid disadvantaging small and mid-scale producers in the marketplace, where they must compete on price for their commodities with larger competitors who may benefit financially from the carbon market and, therefore, could offer their commodities for lower prices than their smaller competitors, CARB or the state of California (through California Department of Food and Agriculture or the Department of Conservation) should consider other ways to support innovative, conservation-oriented small and mid-scale producers who provide climate change mitigation benefits in California. We describe in greater detail below how allowance revenue can be used to support these efforts. (CACAN3)

Response: We included provisions to allow for projects below 25,000 tons/yr to opt to conduct verification every two years. We changed the regulation to require that a site visit for non-sequestration projects must be conducted in the year that offset verification services occurs. For smaller projects that opt to conduct verification every two years, a site visit will only be required in the second year (the year in which full offset verification services are provided).

M-67. (multiple comments)
Comment: We do not believe the requirement under section 95977.1 (b)(3)(R)(1) for verification reports to be scrutinized by a different independent person each time is necessary, practical or workable. We believe that after two or three projects, verifiers will no longer have the staff to "independently" review projects, if this requirement for different, independent parties is applied to each verification report. (CIG2)

Comment: CERP strongly believes that a sound system of independent project verification is the bedrock for environmental integrity in the offsets program. However, we have grown concerned that the verification-related regulations have become overly and unnecessarily restrictive. The regulations now go beyond what is needed to safeguard environmental integrity, reaching a point where the burdens and costs will dissuade the development of even the highest-quality projects. Already, the Climate Action Reserve process takes an average of three months to navigate; the additional layers imposed by the ARB regulations will mean that many projects will be approaching the nine month "hard" deadline for data reports. In other words, it is an example where the perfect is the enemy of the good. For example, section 95977.1(b)(3)(R)(1.) requires that verification reports be scrutinized by a different independent person each time. In our view, this requirement is not practical, workable—or necessary. It is very possible that, after two or three projects, a verifier will no longer have the staff to verify projects if this requirement for different, independent parties is applied. (CERP4)

Response: We did not make this change. The commenter's suggestion is contrary to the basic premise that an offset project be subject to an internal independent review to ensure that the verification process and findings are appropriate for the offset project.

M-68. (multiple comments)
Comment: Page A-184 (c) and (d) Annual Verification Required. While (c) grants sequestration projects the ability to verify every six years, (d) states that credits which are not verified within 9 months of the end of each (yearly) Reporting Period cannot ever be registered, and are thereby lost. Such an annual verification requirement would impose an unnecessary burden on smaller projects that do not generate sufficient carbon volume to justify annual verification expenses. We recommend these sections be clarified to require verification within 9 months of end of the last Reporting Period being verified, with the ability to include multiple reporting Periods in one verification report. (BLUESOURCE2)

Comment: Section 95977(d) conflicts with section 95977(c). Section 95977(c) allows sequestration projects to verify annual Offset Project Data Reports at up to 6 year intervals. Section 95977(d) requires that a verification statement be submitted within 9 months after the conclusion of each Reporting Period. We recommend that this section is amended to allow for the provision for sequestration projects. (FINITE)

> **Response:** We agree and modified section 95977(d) to the following: "Any Offset Verification Statement must be received by ARB or an Offset Project Registry within nine months after the conclusion of the Reporting Period for which offset verification services were performed."

M-69. Comment: We are concerned by the prescriptive nature of the actions a verifier is required to undertake, as set out in section 95975. A verifier will have to be accredited by ARB and will have to follow the requirements of a protocol. Adding additional requirements will raise transaction costs in four ways. First, it will require verifiers to do more work they are already doing, thus leading to unneeded duplication. Second, it increases the verification timeline for the project. Third, it increases the risk that there is overlap and confusion between the Regulations, the Protocols and ARB's accreditation process. Finally, it may raise the cost of liability insurance. Currently, verification requirements are the same regardless of the size of project. Incorporating requirements into protocols would allow ARB to provide for more flexibility depending on the size of each project. Currently, under CAR it takes some three months for projects to complete the verification process. Adding additional steps will increase the time period for verification. It has the potential of making the process longer than 9 months, thereby contravening section 95976(d)(6) and 95977(d). (CIG2)

> **Response:** We disagree that the verification requirements in the regulation are too prescriptive. We included requirements for a verification program that are consistent with international standards and subject to ARB oversight. This oversight includes verifier accreditation, verification body accreditation, requirements for verification services, and conflict-of-interest requirements. The regulation includes enforcement provisions that apply to parties that participate in the offset program. These parties include offset project developers, verifiers, and covered entities. To establish a high level of trust in the program and address public concerns related to the integrity of offset projects, staff has developed a verifier accreditation process and conflict-of-interest process that ensures quality in the evaluations and prevents potential bias when offset projects are verified by independent third parties. These requirements are necessary to ensure the integrity of the overall program and that claimed GHG reductions and GHG removal enhancements have been achieved in accordance with the regulation and Compliance Offset Protocols.
>
> We believe that nine months is sufficient time to complete the verification process. We modified the timing for verification so that there is not an annual fixed "verification period," and that the new requirements cover a reporting period that is not tied to the calendar year.

Site Visits

M-70. Comment: The list of activities identified in section 95977.1(b)(3)(D)(1) required for site visits includes items that, because of aspects of the actual assessment performed, may be performed more accurately or efficiently during a desktop review not during the actual site visit. While the activities in section 95977.1(b)(3)(D)(1)(c) and (e) represent reasonable and appropriate site visit activities, we assert that the activities in sections 95977.1(b)(3)(D)(1)(a), (b), (d), and (f) are not either appropriate for a site visit or more accurately and efficiently performed during off-site desktop review and, therefore, should be removed from this clause of the regulation. The list of activities in section 95977.1(b)(3)(D)(2) required for site visits includes items that, because of aspects of the actual assessment performed, may be performed more accurately or efficiently during a desktop review, not during the actual site visit. While we agree that the activities in section 95977.1(b)(3)(D)(2)(a), (c), and (d) represent reasonable and appropriate site visit activities, we assert that the activities in section 95977.1(b)(3)(D)(2)(b), (f), (g), and (h) are not either appropriate for a site visit or more accurately and efficiently performed during off-site desktop review and, therefore, should be removed from this clause of the regulation. (FIRSTENVIRON3)

> **Response:** We modified section 95977.1(b)(3)(D)(2.)(i.) in response to stakeholder comments to allow flexibility to the verification team to conduct some verification services offsite, and not during the time spent at the offset project site. Specifically, the activities performed pursuant to sections 95977.1(b)(3)(D)(2.)(f.) through (b)(3)(D)(2.)(h.) may be included in a site visit or, alternatively, may be conducted as part of a desk review.

M-71. Comment: Section 95977.1(b)(3)(D) requires verifiers to make a site visit every year. We suggest that it would be much more flexible if they were required to undertake a site visit within two months of the end of the reporting period, allowing the project developer flexibility as to when to schedule a site-visit while still requiring a site visit occur in order for offsets to be issued. (CIG2)

> **Response:** We changed the regulation to require that a site visit for non-sequestration projects must be conducted in the year that offset verification services occurs. For smaller projects that opt to conduct verification every two years, a site visit will only be required in the second year (the year in which full offset verification services are provided).

Offset Verifier Accreditation

M-72. Comment: Regarding section 95987(e), we note that most major U.S. carbon registries which could be expected to serve as registries under ARB's Cap and Trade program and perform this audit function have previously signed MOUs with the American National Standard Institute to accredit verification bodies and audit the verification body verification activities. We believe that this demonstrates the registries' acknowledgement of ANSI's competence and value in performing this activity. We encourage ARB to likewise consider ISO 14065 as the standard of accreditation for verification bodies under the Cap and Trade Regulation and assign responsibility to accredit and audit offset project verification bodies to the American National Standards Institute. (FIRSTENVIRON3)

Response: The ARB accreditation program was developed using international best practices as laid out in ISO 14065, which is the standard to which greenhouse gas verifiers need to be accredited. The ISO standards are meant to be guidelines that programs can use to develop and tailor for their own program needs. The standard is program neutral.

ARB's verification accreditation program is consistent with the ISO 14065 standard for accrediting verification bodies. The following list highlights the areas in ARB's verification body requirements that are inclusive of all of the major requirements in the ISO 14065 standard:

- Be a legal entity that can be held accountable;
- Possess an internal conflict of interest policy, mechanisms to monitor, and requirements to remove and control for conflicts if they arise;
- Maintain Liability Insurance;
- Competencies for sectors, if applicable;
- Requirements to form verification teams with appropriate skills for verification of special sectors;
- Take responsibility for any subcontractors potential for conflict of interest with the client and the quality of their work;
- Identify a verification team lead; and
- Maintain record retention requirements.

However, we chose to advance the requirements for accreditation past the ISO 14065 standard for verification bodies to the level of individual verifiers. This higher standard of verifier accreditation has only recently been considered by ISO as they sought to develop a new ISO 14066 standard that seeks to attain California's higher level of competency for verifiers. We chose to add such a

requirement to ensure a competency standard at a level beyond that currently required by international best practices. This includes a minimum educational and work experience requirement for individual verifiers. It also includes training and accrediting verifiers as sector specialists. We have developed a training program that builds on international GHG auditing skills and ARB's regulatory requirements for reporting and verification. In the future, ARB's training program will be updated to include general offset verification and offset project-specific verification training for verifiers interested in providing verification services for offset projects to support the proposed Cap-and-Trade offsets program.
We are committed to continually evaluating the verification bodies' services as specified in the ARB's regulatory requirements and the verification bodies' professional care and conduct to ensure the integrity and consistency of verifications. As part of this oversight process, each reporting year, ARB staff will audit every active verification body to ensure verifiers are providing high quality offset verification services. Audit findings and observations are sent to verification bodies at the completion of verification services in order for each verification body to take any necessary actions to improve their performance.

M-73. Comment: We recommend that CARB institute a regular and detailed performance review of verification bodies. The results of performance reviews should of course be factored into the re-accreditation process. (UCS6)

> **Response:** We agree and included language requiring offset verifiers and Offset Project Registries to undergo performance reviews.

M-74. Comment: An important factor in ensuring a sufficient supply of early action credits for use in compliance will be the availability of verifiers. Evolution Markets experience in other offset markets, such as the Clean Development Mechanism (CDM) under the Kyoto Protocol, has shown that an insufficient number of verifiers can present significant delays in the development of projects and the issuance of credits. A lack of verifiers not only has the ability to restrict supply but introduces an element of uncertainty in the timing of credit supply that has corresponding price risk for compliance buyers of offsets. Therefore, Evolution Markets recommends ARB make the creation of the accreditation program for verifiers a priority upon the completion of this set of rule changes. Efforts to establish the accreditation program and initiate the accreditation process will allow holders of CRTs to begin the process of conversion to ARB offset credits in advance of the onset of compliance obligations, ensuring a robust early supply of offsets to be used as a cost containment mechanism. (EVMKTS2)

> **Response:** We are in the process of developing the training for offset verifiers and plan to accredit offset verifiers in 2012.

M-75 Comment: At the time of verification of the first forest carbon offset projects, the Climate Action Reserve Forest Project Protocols were not accredited under the American National Standards Institute. (SCS2)

Response: We acknowledge the comment, but no change is necessary.

M-76 Comment: Since the FPP, Version 2.1 was not an ANSI-accredited standard and no Project Design Document (PDD) was required, the limited extent of project documentation and transparency for the Offset Project Data Assessment will likely present many challenges in conducting an ex post facto materiality test, as presently proposed by ARB. Many of the discussions related to computations and spreadsheets were conducted in person and were not well-documented. Also, the cases where the original project developers are no longer involved in the project (e.g., John Nickerson for the van Eck Forest Project) may present challenges. (SCS2)

Response: We understand that early action credits that go back several years may have challenges in documentation. However, as these offset credits may be used in a regulatory program, there needs to be a rigorous verification process to ensure that the early action offsets meet the AB 32 criteria as defined in the regulation to be used for subsequent compliance. We did not make any changes that set a different standard for credits issued under early action programs to ensure that we maintain the environmental integrity of the ARB cap-and-trade program.

Offset Verifier Conflict of Interest

M-77. Comment: At present, offsets developers directly hire verifiers to verify the reductions they claim to have made. There is an inherent conflict of interest in the relationship between the developer and the verifier. Under this arrangement, verifiers have incentives to charge less, do less, and be less strict in their assessments in order to be hired again by the same developer or other developers. Given this inherent conflict of interest, effective government oversight of the quality of verification services is essential. An important change that needs to be made to the draft regulation is to institute a performance review of verification bodies. The results of performance reviews should be factored into the reaccreditation process. CARB should periodically review the relationships between verifiers and project developers and consider a system where the Board assigns verification bodies to each offset project. CARB must ensure that the registries participating in ARB offset generation have the expertise needed to perform their role overseeing verifiers and offset report quality and that they are performing their oversight tasks adequately. CARB must review the performance of the registries in conducting their oversight tasks and use discretion in approving registries. CARB should also consider the following:

- Offset Project Data Reports should be made publically available along with the verification reports.
- Offsets projects should be required to not cause significant adverse effects on human health or the environment.
- It is a positive improvement that developers must disclose if their projects are generating credits under another voluntary or mandatory greenhouse gas program. To ensure that developer statements are correct and that credits are

not double counted, CARB must also actively reach out to other voluntary and mandatory crediting programs to seek instances of double counting. (UCS7)

Response: We believe our conflict-of-interest rules for offset verifiers are very strict and meet a high standard of rigor. We included language requiring offset verifiers and Offset Project Registries to undergo performance reviews. In addition, the regulation proposes a robust monitoring program for offset projects—both the verification that the offsets are real, additional, and enforceable, and that Offset Project Operators, verifiers, and Offset Project Registries are operating according to regulatory requirements. Offset Project Registries are required to conduct oversight of their registry program and randomly audit verifications to ensure that our regulatory requirements are being met by Offset Project Operators and verification bodies. We will provide rigorous oversight of our approved Offset Project Registries. In addition, we designed our regulatory offset verification program to provide a transparent process by which we can review verification documents and fully understand any findings uncovered during the course of verification of an offset project by an ARB-accredited verification body. We will also develop an audit and oversight program for offset project verifications. All oversight functions are part of implementation and need not be specified in the regulation.

We did not require that registries make Offset Project Data Reports publicly available as we already include requirements for key parts of the offset project data reports to be made publically available.

The Compliance Offset Protocols approved in the cap-and-trade regulation must undergo a CEQA review and are designed to avoid significant adverse effects on human health or the environment. Some projects may be required to do an additional project-specific CEQA analysis prior to implementation if required by local regulations.

M-78. Comment: We request clarification on section 95979(b)(3) regarding what constitutes an “incentive” as defined under this clause. (FIRSTENVIRON3)

Response: The term “incentive” is used in the context of conflict of interest, where a gift or work in-kind may compromise the objective review of an Offset Project Data Report.

M-79. Comment: After substantial contemplation of this issue by the OWG, the OWG expresses its concern surrounding the true opportunity for conflict of interest issues to arise by including an Air Quality Management District (AQMD) as an offset verifier. Since the AQMD’s are essentially governed by ARB, it is impossible to assume that their role could be completely separated from ARB’s role as the primary regulator of the entire cap-and-trade program. In addition, many of the Covered entities, including all members of the OWG, hold title to air permits issued and overseen by their regional AQMD’s. There is no certainty in the regulations to prevent an AQMD from holding such an air quality permit to an additional standard above the current state requirements by requiring the Covered entity to purchase additional offsets beyond what is allowed under the cap-and-trade program. Further, the role of offset verification is out of the scope of the AQMD's regulatory authority. Exercising this role seems to create a conflict through unauthorized use of taxpayer funds. (OFFSETSWG3)

> **Response:** We do not govern air districts. The air districts are not required to provide offset verification services; any decision to do so would be a voluntary decision on the part of the district. Furthermore, it is optional for covered entities to use air districts as offset project verifiers if there are any concerns about service or conflicts of interest with their regulatory duties.

Issuance of ARB Offset Credits and Registry Offset Credits

General Issuance Comments

M-80. Comment: Subarticle 13: ARB OFFSET CREDITS AND REGISTRY OFFSET CREDITS. The Utilities are members of the Offsets Working Group (OWG) and refer to comments submitted by the OWG on items within this Subarticle. (MID3)

> **Response:** Thank you for your comments. We have reviewed and responded to the OWG comments.

Timing for Issuance

M-81. (multiple comments)
Comment: The ARB process has a timeline for offset credit issuance that defines the timelines for ARB's intermediate steps and the resultant credit issuance. The starting point, however, is not fixed in time. The regulations should set the timeline for ARB to begin its review of Verification Statements submitted for approval. This will create more certainty for OPOs and serve as a guideline for their data submissions to ARB. In addition, a maximum timeline will benefit Covered entities that are considering the purchase of offset credits near the end of a compliance period. The OWG supports an addition to Section 95981.1 as follows:

Section 95981.1. <u>Process for Issuance of ARB Offset Credits</u>

(a) <u>ARB will review the Positive Offset or Qualified Positive Offset Verification Statement within 30 calendar days after submission to ARB by an Offset Project Registry, Offset Project Operator, Authorized Project Designee, or any other third party authorized by the Offset Project Operator</u>. (OFFSETSWG3)

Comment: PG&E welcomes the added language in section 95981.1 on the process for issuing offset credits. The one recommendation PG&E would make to this section is the addition of a deadline for ARB to determine the completeness of a submission by a project operator. PG&E would like to suggest that a deadline of 30 days be added to the Regulation. PG&E is supportive of the other deadline additions, including that ARB will issue credits to offset project operators 30 days after it determines completeness, that ARB will then notify the project operator 15 days later, and ARB will place credits in the account 15 days later. Modify section 95981.1 as follows:

> <u>(a) ARB will review the Positive Offset or Qualified Positive Offset Verification Statement within 30 calendar days after submission to ARB by an Offset Project Registry, Offset Project Operator, Authorized Project Designee, or any other third party authorized by the Offset Project Operator.</u> (PGE4)

Comment: There are no timelines set under the issuance of ARB offsets for the review of offset verification statements. If ARB requires the project developer to operate within tight time schedules, then it needs to provide similar timescales for itself and for standards bodies. This would provide greater certainty for owners and buyers on delivery schedules for credits and would better standardize the overall verification process, thereby reducing costs and increasing transparency. (CIG2)

Comment: There is no deadline for ARB to make the threshold completeness determination; the absence of such a deadline will add uncertainty and costs to the process. The absence of a deadline also deprives interested parties of any recourse in the event that ARB is dilatory. Accordingly, CERP respectfully requests that ARB have no more than 30 days to make such a determination. (CERP4)

> **Response:** We made changes to the timing for issuance of offset credits. We will review the Offset Verification Statement within 45 calendar days of receiving it (new section 95981(c)) and issue ARB offset credits within 15 days of making the determination that the Offset Verification Statement is positive or a qualified positive (section 95981.1(a)). Within 15 days, ARB will transfer the ARB offset credits into the appropriate Holding Accounts (section 95981.1(f) and notify the recipients (section 95981.1(c)). We believe the notification and transfer of ARB offset credits into the appropriate Holding Accounts can be done simultaneously and do not have to occur consecutively.

M-82. Comment: Section 95981.1(d)(4) appears to say that the Executive Officer's decision to deny issuance of CARB offset credits is "final." This should be clarified to state "subject to judicial review." (SCAQMD4)

> **Response:** ARB is the final arbiter of determining whether or not ARB offset credits should be issued. Therefore, we did not make this change.

M-83. Comment: Under section 95981(c)(1) the project developer is asked to state that reductions “will be measured.” This is hard to attest to, as developers may not have the rights to a project for its entire crediting period. We believe this might be an error in the text, as it is inconsistent with the spirit of the rest of the text. For a particular verification period the developer can only attest that the reductions “have been measured.” (CIG2)

Response: We agree and made this change.

Authorized Project Designee

M-84. (multiple comments)
Comment: The buyer liability approach in the draft rules does not efficiently address the problem of invalidated credits. Under ARB's proposed rules, the holder or user of a credit is presumptively liable. If that party is no longer in business, ARB will require the Offset Project Operator or Authorized Project Designee to replace the invalidated ARB credits. The Trust recommends that the Authorized Project Designee be removed from this requirement. The Authorized Project Designee is defined in section 95802(a)(21) as "an entity authorized by an Offset Project Operator to act on behalf of the Offset Project Operator". There are many situations where the Authorized Project Designee has no connection with the actions that lead to invalidation. One obvious example is where the discrepancy is due to intentional acts of the verifier, or project registry. (TCT)

Comment: While the definition of "authorized project designee' is straightforward, the liabilities associated with this designation are significant since they can ultimately be held liable for replacing offsets affected by an intentional reversal or invalidation. It is advantageous to project owners to designate a third-party to take on the task of project development. These third-parties are often consultants and other small businesses. While the ability to assign an APD has utility to project owners, the liabilities associated with it will prevent consultants from taking on this role. We recommend that liabilities for reversals and invalidation exclude the Authorized Project Designee under this Regulation. (FINITE)

Comment: The Regulation assigns significant liabilities to the "Authorized Project Designees," who do not have control over forest management or project standing, and may lack the financial upside or resources to bear such liabilities. We recommend that default liabilities for reversals and invalidation therefore exclude the Authorized Project Designee. This would not preclude the Offset Project Operator from assigning these liabilities to Designees who have the financial resources to bear them via contracts or reduce ARB's ability to regulate the project itself. (BLUESOURCE2)

Response: We agree and removed the Authorized Project Designee from being responsible for replacing invalidated ARB offset credits.

Crediting Periods for Compliance Offset Projects

M-85. Comment: CERP is concerned about what will occur if a project resubmitting its information to a new registry misses a deadline for a reporting its reductions. The regulations suggest that in this case the crediting year may simply be lost. CERP recommends modifying section 95986(k)(3) so that it is clear that a project may have an extension of relevant crediting deadlines if the re-submission process is time consuming. Modify section 95986(k)(3) as follows:

An Offset Project Operator or Authorized Project Designee who has been notified by an Offset Project Registry of a suspended or revoked approval must re-submit its project information with a new Offset Project Registry or ARB. An offset project listed at ARB or a new Offset Project Registry will continue to operate under its originally approved crediting period, provided that ARB may extend the crediting period or the relevant deadline in section 95977(d) for one year if ARB determines that such extension is necessary to provide time for re-submission of information to the new Offset Project Registry or ARB. (CERP4)

Response: Original section 95986(j), now section 95986(l), was modified to clarify what happens to offset projects that reside at an Offset Project Registry, whose approval has been suspended or revoked. These offset projects may transfer to another approved registry and continue its current crediting period. This change was necessary because stakeholders were concerned that their offset projects could be ineligible if an Offset Project Registry's approval was suspended or revoked.

In addition, new section (l)(3) allows offset projects that must transfer to another registry in the event their current registry's approval is revoked to qualify for a one-year crediting period extension. These modifications were made in response to stakeholder comments that switching Offset Project Registries could cause a delay in the reporting of GHG reductions and GHG removal enhancements and subsequently cause those reductions to be ineligible for crediting.

M-86. (multiple comments)
Comment: Section 95972(b) limits the crediting period for sequestration offset projects to no greater than 30 years. WSPA believes that 30 years is too short for a crediting period for geologic sequestration projects. WSPA recommends that the Regulation be amended to provide 100 year crediting period for geologic sequestration projects. (WSPA3)

Comment: The OWG repeats its request for extending the crediting period for forestry projects. Firstly, forestry projects are required to exist for at least 100 years and a 10-30 year crediting period establishes an arbitrary limitation. Secondly, a typical reforestation project will produce the majority of its emission reductions in the second half of its 100-year project term. Forest project operators should be given greater certainty than provided by a 10-30 year crediting period. They are already required to file annual reports to ARB and be verified no later than every 6 years. With these limitations, it's not as if a reforestation project could operate "under the radar" if the crediting period were extended to 50 years. The OWG refers ARB back to the data on the Cuyamaca Rancho State Park reforestation project that was entered into ARB's official record by the OWG's comments on the 45-Day language. The OWG believes that the data provides substantial evidence for increasing the crediting period to 50 years. (OFFSETSWG3)

Response: We do not agree that the crediting period for forest carbon projects should be extended. The intent of a 25-year crediting period is not to limit sequestration of carbon and offset issuance from forest projects. In fact, renewal periods allow for forest projects to sequester carbon and obtain offset credits beyond the 25-year crediting period. A crediting period of 25 years allows for the updating of protocols, if necessary, ensuring that projects use the more up-to-date factors (e.g., leakage, buffer account) and scientific standards.

Invalidation and Forest Reversals

Invalidation Provisions

M-87. Comment: CCEEB recommends the obligation to replace offset tons due to reversals should be treated differently depending on the cause of the reversal. For intentional or fraud-related reversals, such as when a forest offset developer decides to harvest the forest, then the developer who is making the business decision should be responsible for replacing the lost carbon sequestration. For unintentional reversals due to causes such as forest loss from fire, pests, disease, or bankruptcy, the lost carbon should be replaced from a reserve held back when credits are issued for such projects. CCEEB recommends that ARB provide for the establishment of such a reserve by itself or by another agency. (CCEEB3)

Response: Section 95983(b)(2) now states that we will retire a quantity of ARB offset credits from the Forest Buffer Account in the event of an unintentional reversal. Sections 95983(c) and (d) specify that in the event of an intentional reversal, the Forest Owner must replace ARB offset credits to ARB in the amount specified in the regulation. In addition, the definition of a "Forest Owner" is such that there can be multiple Forest Owners. We have enforcement authority over all Forest Owners involved in the offset project, and the Forest Owners can determine through contractual arrangements how to handle replacement obligations among themselves.

M-88. (multiple comments)
Comment: CARB's ability to decertify an offset after it has been purchased and impose liability for this decertification on the offset purchaser, will have the direct effect of pulling allowances out of the market as a hedge against decertified offsets, raising allowance prices and compliance costs for all capped entities. Given the stringency of offset approval, it is questionable why CARB would even propose to decertify offsets that had already qualified under the most rigorous rules. (AB32IG2)

Comment: For the foregoing reasons, covered entities and other buyers will avoid offsets issued by ARB if they carry with them the risk of later invalidation. This avoidance could have significant implications in the event that California ultimately links its program with other Western Climate Initiative (WCI) jurisdictions. If one or more of the other WCI jurisdictions adopts a different approach to addressing post-issuance offset discrepancies, then covered entities throughout the WCI will gravitate to offsets issued by those other jurisdictions. This will distort the efficiency and effectiveness of a broader WCI market. It also will mean that buyers will steer way from projects based in California. (CERP4)

Comment: BP supports the comments submitted by IETA and others which clearly articulate the perils of a "Buyer Liability" system. Such a system is likely to stunt the formation of a robust market for offsets as it will reduce the ability of market participants to consider offsets as fungible compliance instruments. (BP2)

Comment: In its role as a seated Director to both the International Emissions Trading Association (IETA) and Environmental Markets Association (EMA), Barclays endorses the comments regarding buyer liability filed by IETA and EMA, on August 11, 2011. (BARCLAYS)

Comment: The buyer offset liability language in section 95985 is problematic because buyers suffer sanctions or must replace credits that, though approved by CARB, later turn out to be invalid. The net effect will be higher offset transaction costs than need be; programmatic compliance costs will be higher; existing, standard seller liability used in all other cap and trade programs in the US and EU will be duplicated; offsets we be judged by the market to be second class compliance instruments; faced with higher costs, sources on the margin will expand their operations and/or export jobs outside the jurisdiction of AB 32. (CIPA)

Comment: SCPPA has strong concerns about ARB's "buyer liability" approach to addressing situations in which problems are identified with offset credits after they have been issued in section 95985. To be clear, SCPPA believes the risk of such post-issuance problems is small because of the rigor of the ARB's offset regulations. However, any policy under which already issued offset credits carry a risk of invalidation will prevent the development of a market in offsets and the current provisions make it very easy for invalidation to occur. An unworkable offsets program would have very adverse consequences for the AB 32 program, as shown by ARB's own March 24, 2010, economic analysis. As part of this analysis, ARB modeled the cap and trade program under a scenario in which no offsets could be utilized. Relative to the baseline case (in which offsets are utilized to the full 8 percent limit), ARB's modeling concluded that this "no offsets" scenario would yield allowance prices in 2020 that would be $108 higher ($148/ton instead of $30/ton)—resulting in $18 billion more in costs in that year alone [*Id.*, at p. ES-7 (Table ES-2)]. The current buyer liability approach effectively will drive the AB 32 program to the "no offsets" scenario. (SCPPA6)

Comment: ARB's ability to invalidate offsets would place liability on those entities holding or using offset credits to meet their compliance obligation. IETA warns buyer liability is not a workable approach to addressing post-issuance problems with offsets for the following reasons:

1. A buyer liability rule will prevent the development of a viable offsets program, resulting in adverse impacts on the entire A.B. 32 effort**.** IETA has strong concerns about ARB's "buyer liability" approach to addressing situations in which problems are identified with offset credits after they have been issued (see section 95985). To be clear, we believe the risk of such post-issuance problems is small because of the rigor of the ARB offset Regulations. However, any policy under which already-issued offset credits carry a risk of invalidation will prevent the development of a market in offsets—and the current provisions make the circumstances very easy for invalidation to occur, as they are very open-ended and non-specific thus giving a "free hand" to the regulator to decide when, where and how to invalidate offsets. An unworkable offsets program would have very adverse consequences for the AB 32 program, as shown by ARB's own March 24, 2010 economic analysis. As part of this analysis, ARB modeled the Regulations under a scenario in which no offsets could be utilized. Relative to the baseline case (in which offsets are utilized to the full 8 percent limit), ARB's modeling concluded that this "no offsets" scenario would yield allowance prices in 2020 that would be $108 higher ($148/ton instead of $30/ton)—resulting in $18 billion more in costs to compliance entities and subsequently Californian consumers in that year alone. The current buyer liability approach effectively will drive the AB 32 program to the "no offsets" scenario.
2. Buyer liability is neither fair nor efficient. In the case of offset discrepancies, it almost certainly will be the offset project operator, verifier, or offset project registry that is at fault—and, under the Cap and Trade Regulations, each of these parties submits to the jurisdiction of ARB. Yet, under ARB's proposed buyer liability rules, the holder or user of a credit is presumptively liable. This arrangement turns fairness on its head. In addition, the approach is highly inefficient. To be efficient, a liability system should impose liability on the party that has the most information and ability to control performance as well as minimize the number of legal actions that must be filed to garner a resolution. Most covered entities do not have any special insight into methane digesters, ozone-depleting substances, or forestry. In an offsets program, covered entities will rely on the work of verifiers—and on ARB itself as credit issuer. For this reason, making covered entity buyers liable for problems not detected through the regulatory system will impose substantial new costs on buyers without materially reducing the risk that such problems will occur. ARB officials also have asserted that buyers can easily and efficiently manage their liability risk through contracts. This view is not consistent with marketplace realities. A viable offsets program will involve the participation of many buyers and sellers—including aggregators who intermediate between smaller covered entities and offset project operators. A buyer liability rule implies a market in which invalidation would unleash a chain of contractual claims involving every party that ever held custody of the credit, paralyzing the marketplace. Aggregators and small businesses will avoid such a market—leaving a stunted offsets program involving only bilateral arrangements by largest covered entities for the largest projects. Small businesses and small projects will fall out of the equation. (IETA3)

Comment: MSCG has previously expressed its non-support for the concept of "buyer liability" with respect to offsets (section 95985). When ARB finds it necessary to invalidate a previously granted credit due to discovery of fraud or error, the holder of the credit at that point in time, or the compliance entity that previously submitted it for compliance, bears either the obligation for replacement (in the case of credits submitted for compliance) or economic loss (for those who hold an un-submitted credit). We think this is an inappropriate approach, but will not revisit such recommendations in detail. (MSCG3)

Comment: ConocoPhillips supports the proposal submitted by the International Emissions Trading Association (IETA), which involves a Compliance Buffer Account funded by a hold back of a certain percentage of credits from each offset project. CARB should also hold the responsible parties liable for making the system whole in the case of fraud or error. The IETA proposal, which is very widely supported by market participants including WSPA, would allow covered entitles to address risks associated with offsets and ultimately reduce costs related to compliance. (CONOCO2)

Comment: We and many others have identified problems with the "buyer liability" approach, and have supported an alternative—a compliance buffer account. (See Appendix C for the compliance buffer account proposal previously provided to ARB by CERP and a number of other organizations.)

Our central point is that any policy under which already issued offset credits can be invalidated will prevent the development of a market in offsets. The marketplace will not deal in instruments that are shadowed by the risk of invalidation and penalties. ARB's buyer liability rule will impose costs and risks on the offsets program that will strongly discourage the use of offsets and drive the program far closer to the "no-offsets" scenario—and, yet, will not provide any greater environmental integrity than a compliance buffer account or other similar approach that involves setting aside credits that can be retired in the event of offset credit problems.

In particular, the current proposed regulations require ARB to invalidate 100 percent of the offset credits issued for a project in a particular year if it determines that the Offset Project Data Report for that year was not "true, accurate, or complete." There is no materiality condition associated with this requirement. In other words, a minor inaccuracy or omission in a project's paperwork will cause ARB to invalidate all of the credits issued for the project—even if all of the emission reductions achieved by the project were 100 percent real, additional, and verified. This establishes an impossible, unfair, and unnecessary condition for offset projects—particularly in light of the extensive and detailed requirements for verification of projects (the general regulations include 18 pages of verification requirements, which do not include the additional requirements in the project-specific protocols).

There are several flaws with the buyer liability system. First, the approach is not fair. To be fair, a liability system should impose liability on the party actually responsible for the default. In the case of offset discrepancies, it almost certainly will be the offset project operator, the verifier, or the offset project registry that is at fault—and, under the cap-and-trade regulations, each of these parties makes attestations and submits to the jurisdiction of ARB. By contrast, the buyer of a credit will rarely if ever be responsible for a discrepancy related to offset credit issuance. Yet, under ARB's proposed buyer liability rules, the holder or user of a credit is presumptively liable. Liability shifts to the offset project operator only if the holder or user of the credit is no longer in business. This arrangement turns fairness on its head. To be clear, even most project developers would prefer a liability system in which liability rests with the party actually responsible for the discrepancy. (Indeed, ARB has adopted precisely this approach in the case of intentional reversals of forest projects, which we applaud.)

In addition, the buyer liability approach is highly inefficient. To be efficient, a liability system should impose liability on the party that has the most information and ability to control performance. Again, it is the offset project operator, verifier, and registry that have the greatest ability to avoid discrepancies—not the current holder of the offset credit. Accordingly, the buyer liability approach imposes additional and unnecessary transaction costs on the buyer of credits to protect itself against invalidation. (CERP4)

Comment: Some ARB officials have expressed a view that the buyer liability approach will reduce the risk of offset credit problems by creating incentives for buyers to scrutinize and avoid problematic sellers of offset credits. This view does not reflect the reality of how an offsets market works.

To be sure, covered entities have ample reasons to seek out scrupulous and competent sellers of offset credits—even without a buyer liability rule. Mainly, covered entities want to be assured that a seller is the kind of entity that will follow through on delivery of credits that are issued. However, covered entities are not well positioned to develop the kind of understanding of projects to allow them to discern whether claims of reductions are valid and that the project paperwork is 100 percent free of any errors. Companies that are in the business of electricity generation, refining, or cement manufacturing, for example, do not have any special insight into the business of methane digesters, ozone depleting substances, or forestry. In an offsets market, these companies will rely on the work of verifiers—and on ARB itself as credit issuer.

For this reason, making buyers liable for errors not detected by verifiers or the ARB itself will impose a substantial new cost and risk on buyers without materially reducing the risk of such events occurring. Buyers do not have added ability to avoid these events, short of incurring the costs of obtaining a second complete verification. If ARB truly seeks to reduce the risk of such occurrences, it should impose liability on the party actually responsible. (CERP4)

Comment: The Offset Buffer Account should be specified as a new account type, in section 95831. The Offset Buffer Account will be one of the accounts under the control of the Executive Officer. This proposed language, to be inserted into section 95831(b)

(p. 60), mirrors the existing language for the Forest Buffer Account. Modify section 95831(b) as follows:

> (b) Accounts under the Control of the Executive Officer. The accounts administrator will create and maintain the following accounts under the control of the Executive Officer: …
>
> > (7) A holding account to be known as the Offset Buffer Account:
> >
> > > (A) Into which ARB will place offset credits pursuant to section 95981.1; and
> > >
> > > (B) From which ARB may retire ARB offset credits pursuant to section 95985 and place them into the Retirement Holding Account. (SCPPA6)

Comment: Offsets should be deposited into the Offset Buffer Account, in section 95981.1. A step should be added to the offset credit issuance process in section 95981.1, under which ARB would hold back a portion of credits and place them in the Offset Buffer Account. The language mirrors the existing process for the Forest Buffer Account, but the percentage of the hold-back is specified in the Regulation. Modify section 95981.1(g) as follows:

> (g) Offset Buffer Account. ARB will place a portion of ARB offset credits issued to an offset project into the Offset Buffer Account.
>
> > (1) The amount of ARB offset credits that must be placed in the Offset Buffer Account shall be [1.5% of the amount issued to a project.]
> >
> > (2) ARB will transfer ARB Offset credits to the Offset Buffer Account at the time of ARB offset credit registration pursuant to section 95982.
> >
> > (3) If an offset project is originally submitted through an Offset Project Registry, an equal number of registry offset credits must be retired by the Offset Project Registry and issued by ARB for placement in the Offset Buffer Account. (SCPPA6)

Comment: In general, the proposed regulation assumes a system exists that would enable allowances to be auctioned, banked and traded, yet no system has been identified by CARB that would ensure the program is administered efficiently and accurately to protect the assets of the seller or buyer of credits. CARB staff suggests that buyers can be protected from bad credits through due diligence, the use of trained verifiers, or through the use of conveyance contracts. Although these measures may help protect the parties, they cannot be relied upon to protect the interests of the buyer and the needs of the market. (VALERO)

Comment: In our view, any approach to managing offset invalidation should meet four criteria: (1) it should ensure that the program is made environmentally whole; (2) it should be fair; (3) it should minimize costs to the offsets program; and (4) and it should minimize administrative burdens on ARB. For the reasons discussed above, the buyer liability approach may meet the first criterion, but substantially flunks the second two. Furthermore, it is not clear to us whether it imposes reasonable burdens on ARB because the effectiveness of buyer liability relies on ARB carrying out successful enforcement actions against potentially multiple buyers of credits from an affected project.

We and many others have advocated that ARB adopt an alternative approach: a compliance buffer account. ARB's expressed hesitations about this approach seem to us to underestimate the adverse impacts of the buyer liability approach and overestimate the administrative burdens and risks borne by ARB under a compliance buffer account approach.

In any event, we note that the proposed revisions to the regulations suggest that ARB is willing to adopt a variation on the compliance buffer account in the case of forest offsets. Though the approach does not conform precisely to the compliance buffer account mechanism supported by ourselves and others, we would greatly prefer ARB's use of this approach to the buyer liability system.

Under ARB's proposed regulations, ARB will hold back a certain amount of credits from each issuance of credits to a forest project. It will place these credits in a Forest Buffer Account. In the event of an "unintentional reversal" affecting the forest project, the already-issued credits will remain valid, but ARB will retire a corresponding number of credits in the Forest Buffer Account. In the event of an intentional reversal, the already issued credits again will remain valid, and ARB will require the forest owner (not a buyer) to deliver a corresponding number of compliance instruments credits from the forest owner (not the buyer). If the forest owner does not provide replacement instruments, ARB will cancel credits in the Forest Buffer Account.

We respectfully urge ARB to apply this approach for all offset projects. Compared to the buyer liability system, this approach would be: (1) equally effective in making the system whole in the event of invalid credits; (2) far fairer (by holding "bad actors" liable where possible); and (3) much more efficient (by effectively putting in place a system-wide, socialized insurance backstop). ARB has provided no reason that this kind of approach is workable and appropriate for forest offset projects, but not for other offset project types.

In particular, ARB has not explained why extending this approach to all offset projects establishes an unreasonable administrative burden on the agency. We do not believe such a burden would result. The primary role of ARB under the buffer account approach is to determine the portion of offset credits to set aside in the account. We believe this set-aside should be conservative. In any event, ARB would have the ability to increase the amount of the set-aside if the buffer account runs low.

Some ARB officials seem to have impression that "management" of the buffer account itself would impose burdens on the agency, and even require the employment of additional staff. This is incorrect. Once the set-aside amount is determined, the buffer account only exists for the purpose of retiring credits—which is an all but automated response to a finding of invalidation. The account requires no active management. It is not a bank account.

For these reasons, we urge ARB to expand the Forest Buffer Account concept to all offset credits. Modify sections 95802(a)(167) and 95831(b) as follows:

> (167) "Offset Buffer Account" means a holding account for ARB offsets credits. It is used as a general insurance mechanism against failure to surrender additional compliance instruments when ARB has made a determination pursuant to Section 95985(f). (CERP4)
>
> (b) Accounts under the Control of the Executive Officer. The accounts administrator will create and maintain the following accounts under the control of the Executive Officer.
>
> (7) A holding account to be known as the Offset Buffer Account:
>
> > (A) Into which ARB will place offset credits pursuant to section 95981.1; and
> >
> > (B) From which ARB may retire ARB offset credits pursuant to section 95985 and place them into the Retirement Holding Account. (CERP4)

Comment: SDG&E has concerns about ARB's "buyer liability" approach to addressing situations in which problems are identified with offset credits after they have been issued. The risk of such post-issuance problems is small because of the rigor of the ARB offset regulations. However, any policy under which already-issued offset credits carry a risk of invalidation will prevent the development of a well-functioning market in offsets. An unworkable offsets program that results in substantially less offsets being developed could have adverse consequences for the AB 32 program, as shown by ARB's own March 24, 2010 economic analysis. In order to develop a well-functioning offset market, buyer liability has to be eliminated. One way is to use the structure of the forestry offset buffer, but expand it to be a general offset buffer. The following proposed changes would be to implement an offset buffer in general rather than a specific forestry offset buffer. Modify sections 95802(a), 95831(b)(5), 95983, and 95985(g) as follows:

Section 95802(a)

> "~~Forest~~ Offset Buffer Account" means a holding account for ARB offset credits issued to ~~forest~~ ARB-approved offset projects. It is used as a general insurance mechanism against unintentional reversals, for all ~~forest~~ offset projects listed under a Compliance Offset Protocol.

Section 95831(b)

(5) A holding account to be known as the ~~Forest~~ Offset Buffer Account:

Section 95983 ~~Forestry~~ Offset Reversals.

(a) For ~~forest sequestration~~ offset projects, a portion of the ARB offset credits issued to the offset project will be placed by ARB into the ~~Forest~~ Offset Buffer Account.

(1) The amount of ARB offset credits that must be placed in the ~~Forest~~ Offset Buffer Account shall be determined as set forth in the relevant Compliance Offset Protocol ~~U.S. Forest Projects~~,

(2) ARB offset credits will be transferred to the ~~Forest~~ Offset Buffer Account by ARB at the time of ARB offset credit registration pursuant to section 95982.

(3) If an ~~forest~~ offset project is originally submitted through an Offset Project Registry an equal number of registry offset credits must be retired by the Offset Project Registry and issued by ARB for placement in the ~~Forest~~ Offset Buffer Account.

(b) Unintentional Reversals. If there has been an unintentional reversal, the Offset Project Operator or Authorized Project Designee must notify ARB and the Offset Project Registry, in writing, of the reversal and provide an explanation for the nature of the unintentional reversal within 30 calendar days of its discovery.

(1) In the case of an unintentional reversal the Offset Project Operator or Authorized Project Designee shall, provide in writing: to ARB and an Offset Project Registry, if applicable, a verified estimate of current carbon stocks within the offset project boundary within one year of the discovery of the unintentional reversal.

(2) If ARB determines that there has been an unintentional reversal, and ARB offset credits have been issued to the offset project, it ARB will retire a quantity of ARB offset credits in the amount of metric tons of CO_2e reversed from the ~~Forest~~ Offset Buffer Account.

(c) Intentional Reversals. Requirements of the Offset Project Operator or Authorized Project Designee for intentional reversals are as follows:

(1) If an intentional reversal occurs, the Offset Project Operator or Authorized Project Designee shall, within 30 calendar days of the intentional reversal:

(A) Give notice, in writing, to ARB and the Offset Project Registry, if applicable, of the intentional reversal; and

(B) Provide a written description and explanation of the intentional reversal to ARB.

(2) Within one year of receiving the notice for intentional reversal from ARB the occurrence of an intentional reversal, the Offset Project Operator or Authorized Project Designee shall submit to ARB and the Offset Project Registry, if applicable, a verified estimate of current carbon stocks within the offset project boundary.

(3) If an intentional reversal occurs from an ~~forest~~ offset project, the ~~forest~~ owner must replace each metric ton of CO_2e with a valid ARB offset credit

or another approved compliance instrument pursuant to subarticle 4, within 90 calendar days of notification by ARB. Notification by ARB will occur after the verified estimate of carbon stocks has been submitted to ARB, or after one year has elapsed since the occurrence of the reversal if the Offset Project Operator or Authorized Project Designee fails to submit the verified estimate of carbon stocks. If the ~~forest~~ owner does not replace each metric ton of CO_2e within 90 calendar days of notification by ARB, ARB will retire a quantity of ARB offset credits in the amount of metric tons of CO_2e reversed from the ~~Forest~~ Offset Buffer Account and the ~~forest~~ owner will be subject to enforcement action and each ARB offset
credit retired from the ~~Forest~~ Offset Buffer Account will constitute a separate violation pursuant to section 96014.

(4) In the event of an early ~~forest~~ offset project termination ARB will retire from the ~~Forest~~ Offset Buffer Account a quantity of ARB offset credits in the amount calculated pursuant to project termination provisions in Compliance Offset Protocol~~, U.S. Forest Projects [DATE]~~. ARB will notify the ~~forest~~ owner of retirement within 10 calendar days. The ~~forest~~ owner must submit a valid ARB offset credit or another approved compliance instrument pursuant to subarticle 4 for each ARB offset credit retired by ARB from the ~~Forest~~ Offset Buffer Account within 90 calendar days of ARB's retirement. If the ~~forest~~ owner does not replace each ARB offset credit within 90 calendar days of ARB's retirement, they will be subject to enforcement action and each ARB offset credit retired from the ~~Forest~~ Offset Buffer Account will constitute a separate violation pursuant to section 96014.

(d) Disposition of Offset ~~Forest Sequestration~~ Projects After an Unintentional Reversal. If a reversal lowers the ~~forest~~ offset project's actual ~~standing live~~ carbon stocks below its project baseline ~~standing live~~ carbon stocks, the ~~forest~~ offset project will automatically be terminated by ARB or an Offset Project Registry.

(1) If the ~~forest~~ offset project is automatically terminated due to an unintentional reversal, another offset project may be initiated and submitted to ARB or an Offset Project Registry for listing within the same offset project boundary.

(2) If the ~~forest~~ offset project has experienced an unintentional reversal and its actual ~~standing live~~ carbon stocks are still above the approved baseline levels, it may continue without termination as long as the unintentional reversal has been compensated by the ~~Forest~~ Offset Buffer Account. The offset project Offset Project Operator or Authorized Project Designee must continue contributing to the ~~Forest~~ Offset Buffer Account in future years as quantified in section 95983(a)(1).

(3) If the ~~forest~~ offset project is terminated due to any reason except an unintentional reversal, new offset projects may not be initiated within the same offset project boundary.

Section 95985

(g) Requirements for ~~Forest~~ Offset Projects contributing to the Offset Buffer Account. If an ARB offset credit is found to be invalid pursuant to sections 95985(b) and (d) for an ~~forest~~ offset project, the ~~Forest~~ Owner must replace each ARB offset credit with a valid ARB offset credit or another approved compliance instrument pursuant to subarticle 4, within 90 calendar days of being notification by ARB pursuant to section 95985(e). If the Forest Owner does not replace the invalid ARB offset credit within 90 calendar days of being notified by ARB pursuant to section 95985(e), each outstanding ARB offset credit will constitute a violation pursuant to section 96014. (SEMPRA3)

Comment: CantorCO_2e recommends that CARB amend the Regulation to create a CARB-administered insurance pool that is either privately funded with credits or through a CARB administered shave that is applied to each credit issued and/or traded. (CANTORCO2E2)

Response: We do not agree that we should eliminate buyer liability associated with the invalidation of ARB offset credits. Requiring the user to replace the invalidated offsets ensures that purchasers and users of offset credits do their due diligence in seeking out high-quality offset credits. We have clear enforcement authority over covered entities that will be using ARB offsets for compliance. If the covered entity replaces any invalidated offset credits, they may then take appropriate action through third-party contractual arrangements that they may have established prior to purchase. These arrangements currently exist in the voluntary offset market, and we expect that as the offset market becomes more established, that additional mechanisms to deal with the risk of invalidation will also be established. In the event that the offset credit has not yet been used or retired, it will be canceled in the market tracking system and removed from any Holding or Compliance Accounts. These provisions in no way diminish our authority to assess penalties under section 96014 on any offset project developer or verifier that has provided false information to ARB.

M-89. (multiple comments)
Comment: ARB proposes to look first to the current holder or compliance submitter for “replacement”, and if that entity is no longer in business, the offset project developer. MSCG believes this sequence is the reverse of what it should be. Upon invalidation, ARB should first notify the project owner of the invalidation, and inform it that it is obligated to replace both credits submitted for compliance, and credits in the accounts of existing holders. This obligation can be made part of the conditions imposed by the ARB for project approval and credit creation in the first instance. Only when the project owner is no longer in business, or is otherwise unable to replace invalidated credits, should ARB turn, in the second instance, to a compliance submitter to surrender replacement compliance instruments (a holder who owns credits which are invalidated, but have not yet been submitted in satisfaction of a compliance obligation, simply suffers an economic loss due to invalidation, and should not incur any “obligation to replace”, from ARB’s perspective). We strongly believe that the approach suggested

above is consistent with ARB's rationale for adopting a "buyer liability" approach, but would be a substantial improvement that significantly mitigates the flaws in buyer liability from the market's perspective. (MSCG3)

Comment: Assign offset liability to those that are best able to manage it, the project owner and CARB. Section 95985 states that users of credits which at the time of their acquisition were determined to be eligible for use that later turn out to be invalid are required to replace bad credits or suffer sanctions. Making the buyer liable for offset maintenance is problematic because buyers suffer sanctions and/or must replace credits that, though approved by the CARB, later turn out to be invalid; costs will be higher; and CARB will have fewer tools to guarantee environmental protection. An approach that relies purely upon the use of high quality credit verifiers will not work because verifiers are not officers of the government and do not have the ability determine if the credit creating activity meets the requirements of the rules as may be subsequently determined by the CARB; cannot (and are not paid to) monitor a project after the credits are claimed and/or transferred; will find it very challenging to secure professional liability insurance; and will only validate only the project data that is provided them. It will be difficult to write conveyance contracts in a fashion to remove buyer risk because credits may change hands many times; the actual credits may be divided, segmented, and conglomerated into financial instruments that allow market participants to transact products that represent emission reductions from a variety of different offset creating projects; and there is no guarantee that buyers will be in a position to purchase replacement credits. The problem of offset reversals cannot be adequately managed through the use of insurance or financial derivative products because such products may initially reduce the risk of purchasing offsets, but the instruments will, if priced considering consequential damages, sell at prices that dramatically increase transaction costs; and the insurance provider does not have the ability to understand, much less mitigate the potential financial consequences of offset reversals. (CANTORCO2E2)

> **Response:** We do not agree that the responsible party of an invalidated ARB offset credit should be the offset developer. We have clear enforcement authority over covered entities that will be using ARB offsets for compliance. If the covered entity replaces any invalidated offset credits, they may then take appropriate action through third-party contractual arrangements that they may have established prior to purchase. These arrangements currently exist in the voluntary offset market, and we expect that as the offset market becomes more established, that additional mechanisms to deal with the risk of invalidation will also be established. In the event that the offset credit has not yet been used or retired, it will be canceled in the market tracking system and removed from any Holding or Compliance Accounts. Requiring the user to replace the invalidated offsets ensures that purchasers and users of offset credits do their due diligence in seeking out high-quality offset credits.

M-90. Comment: Impose liability for the replacement of invalidated credits on the underlying project rather than on purchasers of such credits (section 95985). We continue to believe that the primary liability for replacing offset credits that have been invalidated by the Board should be imposed on the underlying project (the Offset Project Operator or Authorized Project Designee), as they are responsible for errors leading to invalidation. Such an approach has been used successfully in the Reserve's offset program and provides assurances that once a credit has been issued, it remains valid, while protecting the environmental integrity of the overall offset system. The draft regulation adopts this approach for forest projects in section 95985(g). We recommend that it be extended to all project types. Other mechanisms should only be considered if ARB is unable to obtain compensation from the project. (CAR4)

> **Response:** We do not agree that we should eliminate buyer liability associated with the invalidation of ARB offset credits. Requiring the user to replace the invalidated offsets ensures that purchasers and users of offset credits do their due diligence in seeking out high-quality offset credits. We do not agree that the responsible party of an invalidated ARB offset credit should be the offset developer. We have clear enforcement authority over covered entities that will be using ARB offsets for compliance. If the covered entity replaces any invalidated offset credits, they may then take appropriate action through third-party contractual arrangements that they may have established prior to purchase. These arrangements currently exist in the voluntary offset market, and we expect that as the offset market becomes more established, that additional mechanisms to deal with the risk of invalidation will also be established. In the event that the offset credit has not yet been used or retired, it will be canceled in the market tracking system and removed from any Holding or Compliance Accounts. Requiring the user to replace the invalidated offsets ensures that purchasers and users of offset credits do their due diligence in seeking out high-quality offset credits.

M-91. (multiple comments)
Comment: We believe the offset invalidation rules will further reduce the utility of offsets as a critical cost control mechanism. The ability of CARB to take 8 years to invalidate an offset covers the entire time period of the Cap and Trade program and essentially results in no time limits on reversals. This period should be reduced to 2 years in that regulated parties deserve timely due process and some degree of certainty that these purchased compliance instruments have value. (BP2)

Comment: Section 95985(b) gives ARB eight years to invalidate an offset credit. WSPA believes that eight years is too long a period for an offset to be invalidated. WSPA recommends that this section be amended to allow ARB only three years to invalidate offset credits. (WSPA3)

> **Response:** Section 95985(b) was modified to establish a statute of limitations for the invalidation of ARB offset credits of three years if the Offset Project Data Report or a subsequent Offset Project Data Report, depending on project type, is verified by a different verifier within that time frame. If the offset project does not qualify under these requirements, the default statute of limitations is eight years.

We believe that the three-year time period is sufficient to uncover any new information, as long as the project has been reviewed by a second verifier. If it is not looked at by a second verifier, we believe that eight years is necessary to uncover any new information that could lead to the invalidation of ARB offset credits. We believe the eight-year statute of limitations is sufficient because it would allow two verification parties to examine the offset credits in question for continuous projects.

M-92. Comment: Section 95985 provides that a California offset credit may be invalidated by ARB within 8 years of its issuance and that in that event, the user of that offset credit would be required to replace it with another compliance instrument. WPTF and many other stakeholders have consistently opposed such a "buyer liability" approach for offsets because it is unworkable. Buyers cannot manage the risk of credit invalidation and no insurance products exist now or are likely to emerge to fully mitigate this risk. Covered entities will almost certainly avoid using offsets altogether than be held presumptively liable for errors committed by another party such as an offset project operator, verifier, or registry. "Buyer liability" will drive the cap and trade program to a "no-offsets" scenario, which ARB has estimated would yield carbon prices of over $100 per ton and raise compliance costs by $18 billion in 2020. Rather than invalidating offsets after issuance, CARB should instead require that a portion of offset credits issued be deposited in an offset buffer account. In the event that any offsets are found deficient due to that entity's negligence or misconduct, the appropriate quantity would be retired from the buffer account. Offsets that have been issued would be unaffected. This approach would ensure that the environment is made whole in the event that offsets are deemed deficient, while providing certainty to offset buyers that all issued offsets could be used for compliance. (WPTF2)

Response: We do not agree that we should eliminate buyer liability associated with the invalidation of ARB offset credits. Requiring the user to replace the invalidated offsets ensures that purchasers and users of offset credits do their due diligence in seeking out high-quality offset credits. We have clear enforcement authority over covered entities that will be using ARB offsets for compliance. If the covered entity replaces any invalidated offset credits, they may then take appropriate action through third-party contractual arrangements that they may have established prior to purchase. These arrangements currently exist in the voluntary offset market, and we expect that as the offset market becomes more established, that additional mechanisms to deal with the risk of invalidation will also be established. In the event that the offset credit has not yet been used or retired, it will be canceled in the market tracking system and removed from any Holding or Compliance Accounts. These provisions in no way diminish our authority to assess penalties under section 96014 on any offset project developer or verifier that has provided false information to ARB.

Section 95985(b) was modified to establish a statute of limitations for the invalidation of ARB offset credits of three years if the Offset Project Data Report or a subsequent Offset Project Data Report, depending on project type, is verified by a different verifier within that time frame. If the offset project does not qualify under these requirements, the default statute of limitations is eight years. We believe that the three-year time period is sufficient to uncover any new information, as long as the project has been reviewed by a second verifier. If it is not looked at by a second verifier, we believe that eight years is necessary to uncover any new information that could lead to the invalidation of ARB offset credits. We believe that the eight-year statute of limitations is sufficient because it would allow two verification parties to examine the offset credits in question for continuous projects. We do not believe that one year would provide sufficient time to detect all relevant new information or uncover any mistakes that a verifier may have missed.

M-93. Comment: We are concerned that the proposed provisions in section 95985 for invalidating an offset up to eight years after its certification will undermine market stability, and add unnecessary and significant compliance costs. If a seller successfully performs all requirements determined by CARB to establish an offset and offers it for sale, and a buyer purchases an offset in good faith and with the certification of CARB that the offset is valid, that seller and buyer should not bear the risk of the State having committed an error in its evaluation and certification, or a change of law, regulation or policy that retroactively invalidates or devalues the offset. If the State of California cannot stand behind its offset validation system, the marketplace will not function. Placing the risk of invalidation on the seller will chill generation to the point that only those offsets that can be backed by significant security, most probably worth more than the offset itself, will enter the market. The cost of that security could vary widely, as the risk itself of purchasing an unknown quantity of offsets up to eight years in the future cannot be defined by either party. While there is legal precedent generally for buyers to shoulder the risk of devaluation of a product absent fraud on the part of the seller, an unconditional, eight-year guarantee of value placed on a seller is assigned in the very rare instances where not to do so would risk bodily harm or death to the purchaser. We recommend the Regulations separate fraud and intentional misrepresentation from all other circumstances that CARB believes might invalidate an offset. In the case of fraud, the fraudulent party should be liable for replacement of the offsets through contracts between offset buyers and sellers. However, absent fraud or intentional misrepresentation, the risk should fall squarely on the party establishing the Cap and Trade system, offset protocols and verification procedures. That is the State of California. This approach will provide the security essential for a strong and cost-effective Cap and Trade program. (WM3)

Response: We do not agree that we should eliminate buyer liability associated with the invalidation of ARB offset credits. Requiring the user to replace the invalidated offsets ensures that purchasers and users of offset credits do their due diligence in seeking out high-quality offset credits. We have clear enforcement authority over covered entities that will be using ARB offsets for compliance. If the covered entity replaces any invalidated offset credits, they may then take appropriate action through third-party contractual arrangements that they may have established prior to purchase. These arrangements currently exist in the voluntary offset market, and we expect that as the offset market becomes more established, that additional mechanisms to deal with the risk of invalidation will also be established. In the event that the offset credit has not yet been used or retired, it will be canceled in the market tracking system and removed from any Holding or Compliance Accounts. These provisions in no way diminish our authority to assess penalties under section 96014 on any offset project developer or verifier that has provided false information to ARB.

Section 95985(b) was modified to establish a statute of limitations for the invalidation of ARB offset credits of three years if the Offset Project Data Report or a subsequent Offset Project Data Report, depending on project type, is verified by a different verifier within that time frame. If the offset project does not qualify under these requirements, the default statute of limitations is eight years. We believe that the three-year time period is sufficient to uncover any new information, as long as the project has been reviewed by a second verifier. If it is not looked at by a second verifier, we believe that eight years is necessary to uncover any new information that could lead to the invalidation of ARB offset credits. We believe the eight-year statute of limitations is sufficient because it would allow two verification parties to examine the offset credits in question for continuous projects. We do not believe that one year would provide sufficient time to detect all relevant new information or uncover any mistakes that a verifier may have missed.

In addition, we included extensive modified provisions in section 95985 to make it clear what would trigger an invalidation, how ARB will invalidate offsets, and which offsets will need to be replaced. We believe that these changes provide clarity on this point.

M-94. Comment: Modify section 95985. These modifications would do the following:

- Reduce the statute of limitations for invalidation to the earlier of 8 years and the date that the project obtains a second verification.
- Eliminate from the conditions that could lead to invalidation a finding that the project documentation was not "true, accurate, or complete." This condition is overbroad and unnecessary given that there are other conditions that address errors that overstate emissions and failure to comply with legal requirements.
- Clarify that all entities involved with a project will be notified of a finding of invalidation.
- Require ARB to identify the entity responsible for the condition that resulted in identification.
- Require the responsible entity to provide replacement credits or face penalties. If the responsible entity fails to provide replacement credits, ARB will retire a corresponding amount of credits in the Offset Buffer Account. This language mirrors the existing language for the Forest Buffer Account.

- Allow the responsible entity six months (instead of 90 days) to replace credits; this approach is consistent with the provisions on liability for under-reporting of emissions.

(a) An ARB offset credit issued under this Article will remain valid ~~unless invalidated pursuant to sections 95985(b) and (c).~~ provided that, if ARB makes a determination pursuant to section 95985(b) then an additional compliance instrument must be surrendered in accordance with sections 95985(e).
(b) ARB may determine~~, within 8 years of issuance, except as provided in section 95985(b)(5) and 6, that an ARB offset credit is invalid for the following reasons:~~ at any time until the earlier of

(i) a post-issuance verification of the Offset Project Data Report by a different offset verifier or
(ii) 5 years ~~of~~ after issuance, that:

~~(1) ARB determines that information provided to ARB for an Offset Project Data Report or Offset Verification Statement by offset verifiers, verification bodies, Offset Project Operators, Authorized Project Designees, or Offset Project Registries related to an offset project was not true, accurate, or complete; or~~
~~(2)~~(1) The Offset Project Data Report contains errors that overstate the amount of GHG reductions or GHG removal enhancements by more than 5 percent (in which case, ARB shall determine the amount of offset credits that corresponds to the overstatement); or
~~(3)~~(2)The offset project did not meet all local, state, or national regulatory requirements during the time covered by an Offset Project Data Report; or
~~(4)~~(3)ARB determines that Offset credits have been issued in any other voluntary or mandatory program within the same offset project boundary or for the same GHG reductions or GHG removal enhancements covered by an Offset Project Data Report.
~~(5) If an offset project is developed under Compliance Offset Protocol U.S. Ozone Depleting Substances Projects, ARB may invalidate within five years of issuance of the ARB offset credits covered by an Offset Project Data Report.~~
~~(6) If an offset project is verified after three years of ARB offset credit issuance by a different offset verifier, ARB may invalidate within five years of issuance of the ARB offset credits covered by and Offset project Data Report~~
~~(7)~~(4)An update to a Compliance Offset Protocol in itself, will not result in an invalidation of ARB offset credits issued under a previous version of the Compliance Offset Protocol.

(c) If ARB ~~determines that an ARB offset credit is invalid~~ makes a determination pursuant to section 95985(b), ARB will:

(1) Identify all parties that may have some responsibility for the action that gave rise to the determination. Such parties may include:
~~(1)~~ (2) ~~Identify~~ The current holder of an ARB offset credit that has not been transferred to a compliance account or submitted for retirement;

~~(2)~~ (3) ~~Identify~~ The entity that holds an ARB offset credit in its compliance account or has submitted it for compliance or retirement; and

~~(3)~~ (4) The Offset Project Operator and Authorized Project Designee, and, if applicable, the Forest Owner~~, if applicable.~~

(d) ARB will notify the parties identified in section 95985(c) of the ~~invalidation~~ determination pursuant to section 95985(b) and provide ~~the~~ each party an opportunity to submit additional information to ARB ~~prior to invalidation~~ as follows:

(1) ARB will include the reason for the ~~invalidation of an ARB offset credit~~ determination pursuant to section 95985(b) in its notification to the part~~y~~ies identified in 95985(c).

(2) After notification the part~~y~~ies identified in 95985(c) will have 25 calendar days to provide any additional information to ARB.

(3) ARB may request any additional information as needed in addition to the information provided under this section.

(4) The Executive Officer will have 30 days after all information is submitted under this section to make a final determination ~~to invalidate an ARB offset credit~~ that one of the conditions listed pursuant to section 95985(b) has occurred, identify and notify the party responsible, and determine the number of offset credits affected and the compliance instruments that are required to be surrendered.

(e) Requirements for Surrender of Additional Compliance Instruments. If the Executive Officer ~~determines that an ARB offset credit is invalid~~ makes a determination pursuant to section 95985(b) and (d),

~~(1) The ARB offset credit will be invalidated and removed from any Holding or Compliance Account;~~

~~(2) The party identified pursuant to section 95985(c) will be notified of ARB's determination of invalidation pursuant to section 95985(d)(4);~~

~~(3) The Offset Project Operator or Authorized Project Designee, or the Forest Owner, if applicable, of the offset project for which the ARB offset credits were invalidated will be notified of ARB's determination of invalidation pursuant to section 95985(d); and~~

~~(4) Any approved program for linkage pursuant to subarticle 12 will be notified of the invalidation at the time of ARB's determination pursuant to section 95985(d)(4).~~

~~(f) Requirements for Non-Sequestration Offset Projects. If an ARB offset credit is found to be invalid pursuant to sections 95985(b) and (d), the party identified in section 95985(c)(2)~~ the party identified by ARB under 95985(c) ~~must replace each ARB offset credit with a valid ARB offset credit or another approved compliance instrument~~ must surrender the specified number of valid ARB offset credits or other approved compliance instruments pursuant to subarticle 4, within ~~90 calendar days~~ six months of notification by ARB pursuant to section 95985(e). If the party identified in section 95985~~(c)(2)~~(c)(1) does not ~~replace each invalid ARB offset credit~~ surrender the specified number of compliance instruments within ~~90 calendar days~~ six months of the notice ~~of invalidation~~ pursuant to section 95985(e), ~~each outstanding ARB offset credit will constitute a violation pursuant to section 96014.~~

(1) ARB will retire the specified quantity of ARB offset credits from the Offset Buffer Account; and

(2) the party will be subject to enforcement action pursuant to section 96014; and

(3) each ARB offset credit retired from the Offset Buffer Account will constitute a violation pursuant to section 96014. ~~If the party identified in section 95985(c)(2) is no longer in business ARB will require the Offset Project Operator or Authorized Project Designee to replace each invalidated ARB offset credit and will notify the Offset Project Operator or Authorized Project Designee that they must replace them. The Offset Project Operator or Authorized Project Designee must replace each ARB offset credit with a valid ARB offset credit or another approved compliance instrument pursuant to subarticle 4, within 90 calendar days of notification by ARB pursuant to section 95985(e).~~

~~If the Offset Project Operator or Authorized Project Designee does not replace each invalid ARB offset credit within 90 calendar days of notification by ARB pursuant to section 95985(e), each outstanding ARB offset credit will constitute a violation pursuant to section 96014.~~

~~(g) Requirements for Forest Offset Projects. If an ARB offset credit is found to be invalid pursuant to sections 95985(b) and (d) for a forest offset project, the Forest Owner must replace each ARB offset credit with a valid ARB offset credit or another approved compliance instrument pursuant to subarticle 4, within 90 calendar days of notification by ARB pursuant to section 95985(e). If the Forest Owner does not replace the invalid ARB offset credit within 90 calendar days of being notified by ARB pursuant to section 95985(e), each outstanding ARB offset credit will constitute a violation pursuant to 95985 96014.~~

~~(h)~~(f) Nothing in this section shall limit the authority of the State of California from pursuing enforcement action against any parties in violation of this article. (CERP4)

Response: We do not agree that we should eliminate buyer liability associated with the invalidation of ARB offset credits. Requiring the user to replace the invalidated offsets ensures that purchasers and users of offset credits do their due diligence in seeking out high-quality offset credits. We have clear enforcement authority over covered entities that will be using ARB offsets for compliance. If the covered entity replaces any invalidated offset credits, they may then take appropriate action through third-party contractual arrangements that they may have established prior to purchase. These arrangements currently exist in the voluntary offset market, and we expect that as the offset market becomes more established, that additional mechanisms to deal with the risk of invalidation will also be established. In the event that the offset credit has not yet been used or retired, it will be canceled in the market tracking system and removed from any Holding or Compliance Accounts. These provisions in no way diminish our authority to assess penalties under section 96014 on any offset project developer or verifier that has provided false information to ARB.

Section 95985(b) was modified to establish a statute of limitations for the invalidation of ARB offset credits of three years if the Offset Project Data Report or a subsequent Offset Project Data Report, depending on project type, is verified by a different verifier within that time frame. If the offset project does not qualify under these requirements, the default statute of limitations is eight years. We believe that the three-year time period is sufficient to uncover any new information, as long as the project has been reviewed by a second verifier. If it is not looked at by a second verifier, we believe that eight years is necessary to uncover any new information that could lead to the invalidation of ARB offset credits. We believe the eight-year statute of limitations is sufficient because it would allow two verification parties to examine the offset credits in question for continuous projects.

In addition, we included extensive modified provisions in section 95985 to make it clear what would trigger an invalidation, how we will invalidate offsets, and which offsets will need to be replaced. We believe that these changes provide clarity on this point.

We changed the timing for when the responsible party must replace the invalidated ARB offsets from 30 days to six months. This should provide enough flexibility for those that must replace invalidated offsets to purchase additional compliance instruments while still ensuing that the environmental integrity of the cap is maintained.

M-95. (multiple comments)
Comment: We strongly recommend ARB reconsider the concept of invalidating offset credits. This provision will threaten the use of offsets, investment in green projects, development of new technologies that California entrepreneurs are uniquely suited to provide, and if it does not destroy or significantly impair the market for offset projects, it will severely diminish transparency on any trades or transactions involving offsets. GreenX notes that verifiers are in a position of responsibility for invalid offsets. Each of the items identified in section 95985 as bases for invalidating an offset are items which are part of either the project verification to a methodology or the verification for issuance of credits. Subparagraph (b)(1) is a general incorporation of the requirements for obtaining ARB offset credits; (b)(2) seems to reflect the verifier requirements of proposed sections 95977 and 95977.1(b); Subparagraph (b)(3) appears vague and does not seem to add anything to (1) and (2) and the jurisdictions referenced likely would have their own remedies for any violations: and subparagraph (b)(4) we believe is already covered by (b)(1). Enforcement of the verifier and project proponent rules will achieve the very same result as attempted by the proposed section 95985. If there are issues discovered through a rotation of the verifiers, then the enforcement should be against those who created or verified the offset credit, those who would be liable for economic replacement of the invalidated credit. This approach would put the

accountability at the point of concern. We recommend the removal of section 95985. (GREENX)

Comment: The revision continues to propose that offset buyers be held liable in the event of offset reversals regardless of whether the reversal is intentional or unintentional. Failure to do so will constitute a violation resulting in CARB assessing penalties. CalChamber opposes buyer liability amongst the regulated entities and believes that enforcement of such liability ignores the purpose of approved offsets and a certification process supported by a third party verifier. Imposition of liability upon the buyer creates uncertainty that could raise transaction costs and suppress the market. It is reasonable to expect CARS, which approves every offset, to stand behind the offsets it approves, ensuring real, permanent and additional offsets without shifting any onerous liability burdens onto buyers. (CALCHAMBER3)

Comment: Section 95985 does not distinguish between situations in which errors in offset reporting are the result of an unintentional or "good faith" effort to be accurate, and those in which misstatements are intentional and fraudulent. We recommend that the cause of errors be bi-furcated, and the remedy for unintentional mistakes in offset reports be to 1) allow the verifier or offset operator the chance to correct the information; 2) create a buffer pool similar to the one used for unintentional reversals to allow for re-payment if errors result in an over-issuance of offset credits; and 3) if unintentional errors in offset data reports resulted in an under-issuance of credits, that correction to associated accounts be allowed and no invalidation occur.

For intentional or fraudulent actions leading to invalidation, we recommend that 1) the party responsible for the intentional error be held responsible (e.g., offset project operator, verifier, or registry) and required to replace the credits. Both the intentional commission of a fraud and failure to replace credits would be subject to substantial fines. If fraudulent reports are submitted by any party more than once, the party should be disqualified from participating in the ARB offset program. (PFT3)

Comment: The standard for invalidation of ARB offset credits provided in section 95985 is too broad, and in the case of forestry projects, the locus of responsibility for replacement is too narrow. As written, this rule will significantly deter forestry offset project development. A preferred approach would mirror the approach used to replace offsets lost to reversals. For example, section 95985(b) provides that offsets may be invalidated if "information provided to ARB for an Offset Project Data Report or Offset Verification Statement by offset verifiers, verification bodies, Offset Project Operators, Authorized Project Designees or Offset Project Registries related to an offset project was not true, accurate, or complete." Our experience with the verification process is that good faith errors may occur in the course of a given verification. These errors may occur at any point in the course of project development, verification, or registration. While our experience also indicates that these errors are identified and rectified in subsequent verifications, the penalties in the proposed invalidation procedure would already have been levied. This outcome is particularly onerous in the case of a forest project because section 95985(g) imposes the obligation for replacement solely on the forest project developer irrespective of where in the chain of production the error occurred. ARB should consider an approach to invalidation similar to that used for replacement of offsets lost to a reversal. Specifically, ARB should distinguish between an “unintentional invalidation” and an “intentional invalidation”. An intentional invalidation would be any offset invalidated due to negligence, gross negligence or fraud. In such a case, responsibility for replacement would be similar to that required for intentional reversals in connection with forestry projects (section 95983(c)). To cover unintentional invalidations, ARB should consider requiring offset projects to contribute to a buffer pool in a percentage appropriate to the type of project and potential for good faith errors. The buffer pool would be used to retire the number of tons deemed to be invalid. Alternatively, in the case of unintentional invalidations, ARB could consider allowing a project developer to replace the invalidated offsets by making contributions from offsets issued in future verifications of the project. (TCF2)

> **Response:** We do not agree that we should eliminate buyer liability associated with the invalidation of ARB offset credits. Requiring the user to replace the invalidated offsets ensures that purchasers and users of offset credits do their due diligence in seeking out high-quality offset credits. We have clear enforcement authority over covered entities that will be using ARB offsets for compliance. If the covered entity replaces any invalidated offset credits, they may then take appropriate action through third-party contractual arrangements that they may have established prior to purchase. These arrangements currently exist in the voluntary offset market, and we expect that as the offset market becomes more established, that additional mechanisms to deal with the risk of invalidation will also be established. In the event that the offset credit has not yet been used or retired, it will be canceled in the market tracking system and removed from any Holding or Compliance Accounts. These provisions in no way diminish our authority to assess penalties under section 96014 on any offset project developer or verifier that has provided false information to ARB.
>
> We included extensive modified provisions in section 95985 to make it clear what would trigger an invalidation, how we will invalidate offsets, and which offsets will need to be replaced. We believe that these changes provide clarity on this point.

M-96. Comment: NextERA urges ARB to eliminate the “buyer liability” provision in the Regulation. NextEra strongly believes that once an offset credit is verified and certified, it should remain viable and non-revocable. In section 95985, ARB provides a mechanism for the invalidation of certified offset credits. The purchaser the offset credit assumes a “buyer liability” and would be required to replace any invalidated offsets used for compliance with either another certified offset or an allowance. We urge ARB to change section 95985 and eliminate the “buyer liability” imposed on purchasers of offset credits. The viability of the offset credit should be the responsibility of the certification process, registered certifying agents, and the offset provider. In many cases the purchaser of the offset credit will be completing transactions through a third party and not be directly involved with the offset project. The purchaser should be able to trust the certification process developed by ARB to assure what they are buying is a real reduction in GHG emissions and that it qualifies for use as a compliance tool in the GHG Cap and Trade program. The criteria established by ARB to allow offsets for use under the Regulation state that reductions qualifying for offsets must be permanent. The ability of ARB to invalidate a certified offset at a future date contradicts that criterion. The mechanism for the verification and certification of offset credits needs to supply the purchaser with the confidence that the credit they are purchasing will remain viable for use to meet a compliance obligation in future years. The ability of ARB to revoke the viability of an offset implies that anyone who uses offsets to meet a compliance obligation remains in a tentative state of compliance for a period of up to eight years. This has potential implications that could affect the value of or risk associated with an asset on a rolling 8 year schedule. Once a compliance obligation is met using certified compliance instruments, it is not acceptable from a risk perspective that a facilities compliance status can then be reversed. Failure to provide assurance that a certified offset is reliable could lower demand for offsets and in turn discourage investment in offset projects. An unnecessary element of risk would be added into every offset transaction. In addition, this risk could affect property values, asset transactions, and credit evaluations. These added risks and the liability to buyers of invalidation are unnecessary and should be removed from the Regulation. (NEXTERAENERGY2)

> **Response:** We do not agree that an offset credit should remain viable under all conditions. To ensure the enforceability of compliance offsets, we need to have the ability to investigate and take action for violations or noncompliance with the proposed regulation. In the event of fraud or malfeasance on the part of project developers or verifiers, there may be cause to invalidate offset credits after they have been issued, to protect the environmental integrity of the program. These provisions in no way diminish our authority to assess penalties under section 96014 on any offset project developer or verifier that has provided false information to ARB.
>
> Section 95985(b) was modified to establish a statute of limitations for the invalidation of ARB offset credits of three years if the Offset Project Data Report or a subsequent Offset Project Data Report, depending on project type, is verified by a different verifier within that time frame. If the offset project does not qualify under these requirements, the default statute of limitations is eight years. We believe that the three-year time period is sufficient to uncover any new information, as long as the project has been reviewed by a second verifier. If it is not looked at by a second verifier, we believe that eight years is necessary to uncover any new information that could lead to the invalidation of ARB offset credits. We believe the eight-year statute of limitations is sufficient because it would allow two verification parties to examine the offset credits in question for continuous projects.

M-97. (multiple comments)
Comment: We recognize the effort made to create a shorter period of liability for the invalidation of offset credits. However, we remain concerned that the liability provisions

as presently written will deter emitters from using offset credits as a compliance option, because emitters will neither be able to estimate nor control the resulting financial exposure. Further, while we might expect emitters to contractually assign the liability to other parties, this practice will not eliminate the liability nor the cost, as the ARB would still enforce against the emitter and legal action would be required for the emitter to attempt to recoup its costs from other parties in the offset chain of custody. We recommend that the Board adopt some mechanism by which an offset credit can be deemed permanently valid as soon as possible after the verification period. We have several suggestions along these lines:

- Eliminate future liability for credits that undergo simultaneous (or directly subsequent) verifications by two different verifiers, and submit both verifications to the ARB prior to issuance. This would give buyers and project developers an option to eliminate the invalidation risk for a given vintage or project at additional cost; or
- In addition to releasing liability after three years of issuance and a subsequent verification by a new verifier as currently proposed, release liability after 1 year of issuance and a subsequent verification by a new verifier, if that the new verifier audits the previously verified credits. Specifically, the new verifier would be required to conduct a desk review and as warranted a full re-verification of the previously verified credits, using the same rules as specified for the re-verification of Early Action offset credits.
- With this suggestion in mind, we recommend that Early Action offset credits which are transferred to the ARB having undergone a second verification (once for the original offset program, and once for the ARB compliance review) should not carry any risk of invalidation. (TPI5)

Comment: Section 95985(b)(1) allows ARB to invalidate an offset within 8 years of issuance if ARB has determined that information provided to ARB related to an offset project "was not true, accurate, or complete." SCE requests that ARB add further detail on what is meant by "true or accurate." As currently written, ARB could reverse offsets for even clerical errors. SCE believes that this is not the intent of this provision, and requests that ARB clarify these provisions. Furthermore, in the event that ARB chooses to reverse an offset as a result of information that is not true or accurate, ARB should first require that the entity most directly responsible for the incorrect information or fraud to retire instruments equal to the offset in question. The Regulation should clearly state that in the event that ARB is able to obtain replacement compliance instruments from the "bad actor" project developer or verifier, these replacement compliance instruments will be retired by ARB, leaving the validity of the original offsets unchanged. In this way, the environmental integrity of the program persists without undue hardship to downstream purchasers of offsets from these projects. (SCE3)

> **Response:** We do not agree that an offset credit should remain viable under all conditions. To ensure the enforceability of compliance offsets, we need to have the ability to investigate and take action for violations or noncompliance with the proposed regulation. In the event of fraud or malfeasance on the part of project developers or verifiers, there may be cause to invalidate offset credits after they

have been issued, to protect the environmental integrity of the program. These provisions in no way diminish our authority to assess penalties under section 96014 on any offset project developer or verifier that has provided false information to ARB.

Section 95985(b) was modified to establish a statute of limitations for the invalidation of ARB offset credits of three years if the Offset Project Data Report or a subsequent Offset Project Data Report, depending on project type, is verified by a different verifier within that time frame. If the offset project does not qualify under these requirements, the default statute of limitations is eight years. We believe that the three-year time period is sufficient to uncover any new information, as long as the project has been reviewed by a second verifier. If it is not looked at by a second verifier, we believe that eight years is necessary to uncover any new information that could lead to the invalidation of ARB offset credits. We believe the eight-year statute of limitations is sufficient because it would allow two verification parties to examine the offset credits in question for continuous projects. We do not believe that one year would provide sufficient time to detect all relevant new information or uncover any mistakes that a verifier may have missed.

M-98. Comment: Reduce the offset project invalidation to one year. The invalidation of an offset credit due to "The offset project did not meet all local, state, or national regulatory requirements during the time covered by an Offset Project Data Report;" does not need to be in the Regulation. This provision is too broad and exponentially increases the risk to offset generators and buyers. The reasons given for potential invalidation in this section are potentially not even related to the validity of the offsets generated by a project. For instance, according to the current wording to the Regulation, if a property fence surrounding the project is not properly placarded the project triggers the criteria for invalidation. We hope that this is merely an oversight on ARB's part and not their intent. In order to avoid this type of scenario, section 95985(b)(3) should be eliminated. Financial or regulatory status of a project can be added to the verifier's criteria for project verification but we feel that this section is unnecessary. Again NextEra feels that ARB should be proactive when addressing this issue and not reactive. (NEXTERAENERGY2)

Response: We included extensive modified provisions in section 95985 to make it clear what would trigger an invalidation, how we will invalidate offsets, and which offsets will need to be replaced. We believe that these changes provide clarity on this point.

Section 95985(b) was modified to establish a statute of limitations for the invalidation of ARB offset credits of three years if the Offset Project Data Report or a subsequent Offset Project Data Report, depending on project type, is verified by a different verifier within that time frame. If the offset project does not qualify under these requirements, the default statute of limitations is eight years. We believe that the three-ear time period is sufficient to uncover any new information, as long as the project has been reviewed by a second verifier. If it is not looked at by a second verifier, we believe that eight years is necessary to uncover any new information that could lead to the invalidation of ARB offset credits. We believe the eight-year statute of limitations is sufficient because it would allow two verification parties to examine the offset credits in question for continuous projects. We do not believe that one year would provide sufficient time to detect all relevant new information or uncover any mistakes that a verifier may have missed.

M-99. (multiple comments)
Comment: We urge ARB to revisit the provisions related to "overstatement" to avoid unnecessarily punitive outcomes.

The rules provide that one of the grounds of invalidation of offset credits is a finding that an offset project data report "overstate the amount of GHG reductions or GHG removal enhancements by more than 5 percent"—irrespective of whether such overstatement resulted from malfeasance or good faith error.

It is unclear from the rules themselves what penalty flows from such an occurrence. However, we have learned from ARB staff that a finding of more than 5 percent overstatement will result in invalidation of all of the credits issued in connection with the data report. In other words, in the event of an overstatement of 6 percent, ARB would invalidate 100 percent of the credits associated with the report—even though 94 percent of the reported reductions would be real, additional, and verifiable. It is this kind of draconian rule that will dissuade many entities (and insurers) from even participating in the offsets program.

ARB officials have explained that they have adopted this approach because the invalidation system only includes a step in which there is a general determination of material misstatement, and does not include a second step of determining the specific amount of the overage. We believe that it is only consistent with due process and fairness to penalize only the actual overage. We would support adding a step in the process that make such a precise determination of liability possible—even if it necessitates required cooperation by the offset project operator and a new verifier.

ARB officials also have said that they are reluctant—under a buyer liability system—to penalize only some holders of credits from a particular year and not others. Yet, such an outcome is not necessary. If ARB retains the buyer liability approach—which, again, we strongly oppose—we recommend that ARB apply the overage penalty on a pro rata basis to all holders of credits from the relevant vintage year. See the following example:

a. For a particular offset project, two entities are holders or users of credits issued in a particular vintage year: Entity A (60 percent of credits) and Entity B (40 percent of credits).

b. ARB subsequently finds a material misstatement for the project of 1000 tons.

c. ARB invalidates 600 of Entity A's credits and 400 of Entity B's credits.

We believe such a pro rata approach is fair and efficient. (CERP4)

Comment: Section 95985(b)(2) should be drafted with greater clarity to ensure its consistency with AB 32 and the proposed regulations as a whole. The regulations should unequivocally state that a finding of greater than a 5 percent overstatement in a project will not result in the invalidation of all offset credits from that project. The regulations should clearly state that only the overstated amounts are subject to invalidation. ARB must remain true to the regulatory principle that serialized offset credits representing real, additional, permanent, quantified, and verified emission reductions are valid. Each serialized offset credit should stand on its own. In sum, ARB has no authority to invalidate registered offset credits that are in full compliance with the regulations. (OFFSETSWG3)

Comment: It is PG&E's understanding that if an Offset Project Data Report contains errors that overstate reductions or removals by more than five percent, it will result in invalidation of all credits associated with that report, not just the overage. PG&E feels this is overly burdensome and unnecessary to maintain environmental integrity. It implies that the over-crediting of a project means that all the credits from the given vintage should not have been issued. PG&E believes that the conservative protocols and rigorous verification and issuance process should eliminate projects that could have the potential for over-crediting. Modify section 95985 as follows:

(a) An ARB offset credit issued under this Article will remain valid: unless invalidated pursuant to sections 95985(b) and ~~(c)~~ (d).
(b) ARB may determine ~~within~~ by no later than a date that is the earlier of a post-issuance verification of the Offset Project Data Report by a different verifier and 8 years ~~of~~after issuance, except as provided in section 95985(b)(5) and (6), that an ARB offset credit is invalid for the following reasons:

(1) ARB determines that information provided to ARB by verifiers, verification bodies, Offset Project Operators, Authorized Project Designees, or Offset Project Registries, related to an offset project was not true, accurate, or complete; or
(2) ~~The Offset Project Data Report contains errors that overstate the amount of GHG reductions or GHG removal enhancements by more than 5 percent; or~~
~~(3)~~ The offset project did not meet all local, state, or national regulatory requirements during the time covered by an Offset Project Data Report; or
(4) ARB determines that offset credits have been issued in any other voluntary or mandatory program within the same offset project boundary or for the same GHG reductions or GHG removal enhancements.
(5) If an offset project is developed under Compliance Offset Protocol U.S. Ozone Depleting Substances Projects, ARB may invalidate within five

years of issuance of the ARB offset credits covered by an Offset Project Data Report.
(6) If an offset project is verified after three years of ARB offset credit issuance by a different offset verifier, ARB may invalidate within five years of issuance of the ARB offset credits covered by an Offset Project Data Report.
(7) An update to a Compliance Offset Protocol in itself, will not result in an invalidation of ARB offset credits issued under a previous version of the Compliance Offset Protocol. (PGE4)

Comment: At the July 15 workshop MSCG raised an issue that is not addressed by the current draft of the rule. When less than 100 percent of the credits are invalidated, which credits are selected for invalidation? For example, suppose it is realized that an inadvertent error in a calculation algorithm caused a project's emissions reductions to be systemically overstated by 10 percent for the first three years of the project. Presumably, the remedy would be to invalidate 10 percent of the credits issued from that period. How would ARB determine which 10 percent to invalidate? This question has major equity issues associated with it. Depending on how it is handled, a single entity could suffer a hugely disproportionate economic lost due to invalidation. When the issue was briefly discussed at the workshop, staff stated that it believed it had a methodology devised that would address this issue. However, this methodology has not yet been made public. We believe that the methodology should be explicitly included in the rule, and that prior to final adoption, it needs to be vetted through a stakeholder process to get input with regard to possible oversights and flaws, and at least attempt to obtain stakeholder consensus with regard to the method adopted being the best available approach. (MSCG3)

Response: We included extensive modified provisions in section 95985 to make it clear what would trigger an invalidation, how we will invalidate offsets, and which offsets will need to be replaced. We believe that these changes provide clarity on this point.

In addition, we included new section 95985(c)(1)(A)), which includes provisions for ARB to invalidate the overage of credited GHG reductions and GHG removal enhancements. Under this provision, we will only invalidate the number of ARB offset credits that correspond to the overstated GHG reductions and GHG removal enhancements and not 100 percent of the ARB offset credits in that Offset Project Data Report. We also included a procedure for how we will determine which serial numbers we will invalidate. We believe this approach will maintain the environmental integrity because any overage will immediately be compensated. These provisions address stakeholder concerns that projects will be unfairly penalized for small calculation mistakes.

M-100. (multiple comments)

Comment: We have strong concerns about ARB's "buyer liability" approach to addressing situations in which problems are identified with offset credits at some point after issuance. (See generally section 95985.) The risk of such post-issuance problems is very small due to the rigor of the ARB offset regulations. However, any policy under which already-issued offset credits carry the risk that they may be invalidated will prevent the development of a market in offsets. The buyer liability approach is neither fair nor efficient. In the case of offset discrepancies, it almost certainly will be the offset project operator, verifier, or offset project registry that is at fault. All of these parties are subject to ARB enforcement, as each must affirmatively submit to ARB's jurisdiction in order to participate in the program. Yet, under ARB's proposed buyer liability rules, it is the holder or user of a credit that is presumptively liable for any discrepancy. This arrangement turns fairness on its head. The approach also is highly inefficient. To be efficient, a liability system should impose liability on the party that has the most information and ability to control performance. Most covered entities do not have any special insight into methane digesters, ozone-depleting substances, or forestry, and it will be costly for them to double-check the quality of the offset credits. In an offsets program, covered entities should be able to will rely on the work of verifiers—and on ARB itself as credit issuer. For this reason, making covered entity buyers liable for problems not detected through the regulatory system will impose substantial new costs on buyers without materially reducing the risk that such problems will occur. ARB has suggested that buyers can easily manage their liability risk through contracts. This is simply not consistent with marketplace realities. A viable offsets program will involve the participation of many buyers and sellers—including aggregators that mediate between smaller covered entities and offset project operators. A buyer liability rule would unleash a chain of potential contractual claims involving every party that ever held custody of the credit. Aggregators and small businesses will avoid such a market—leaving a stunted offsets program involving only bilateral arrangements between the largest covered entities and the largest offset projects. Small businesses and small projects will fall out of the equation.

The buffer account approach should be applied to all offsets. The Regulation includes a buffer account to address post-issuance problems associated with forest offset projects. We strongly urge ARB to apply the approach of this Forest Buffer Account to all offset projects. This approach would be just as effective at ensuring the integrity of the program as the buyer liability system, as it would ensure that the system would be made whole in the event of invalid credits. It would be easier for ARB to manage, as it would need only to withdraw credits from the buffer account in order to make the system whole. There would be no need to make demands upon an unlucky (and unhappy) user of credits that have been invalidated after issuance. It also would be far more fair, as it would hold "bad actors" liable where possible rather than unlucky purchasers of credits. The buffer account's approach of a system-wide backstop would enable the market as a whole to manage the risk of post-issuance invalidation in an efficient manner that also would be more effective and more fair. Applying this buffer account approach to all offset projects would not impose unreasonable administrative or risk burdens on ARB. The primary role of ARB would be to determine the portion of offset credits to set aside in the account. As the risk of invalidation is extremely low due to the rigor of ARB's program leading up to issuance, we believe the set-aside would be quite conservative. However, ARB would have the ability to increase the amount of the set-aside if the buffer account runs low. Finally, as noted above, in the event of invalidation, ARB need only withdraw credits from the account to make the program whole. The account requires no active management—and no need to make demands on the unlucky holders of invalidated credits, demands that may well be contested. (COPC3)

Comment: In section 95985 of the proposed rule, ARB has made several modifications and clarifications to the mechanism for the invalidation of offset credits. While Evolution Markets appreciates these changes, we continue to believe the process for invalidating offset credits and resting the liability for replacing the credits solely with the buyer introduces an unacceptable element of uncertainty to the offset market. The result could be a reluctance of market participants to invest in offset projects and a difficulty in creating necessary liquidity in secondary offset markets, which makes low-cost offsets available to all compliance entities. In fact, Evolution Markets sees the impacts of these regulations in the market today. As an intermediary assisting counterparty investment in offset credits, we have seen a noticeable slowdown in the flow of capital to early action-eligible offset projects. The inability to complete transactions has often been directly attributable to uncertainty resulting from ARB's "buyer liability" approach. Such an approach is unprecedented in offset markets, and counterparties have not been able to address the extended risk associated with purchasing or selling offset credits. We have seen transactions break down as buyers have requested guarantees against invalidation that sellers are unwilling and unable to provide. And, we have seen investments fall through as both buyers and sellers seek to address invalidation risk post-deal confirmation. The market activity (or lack thereof) in early action offset credits in recent months demonstrates to ARB that its assumption that market participants will be able to address the invalidation liability issue through contracts does not bear out. Furthermore, this experience should raise concern at ARB that these provisions might be having a direct impact on offset supply, and perhaps could lead to higher costs for compliance. We recommend ARB strongly consider the Compliance Buffer Account approach presented by the industry coalition led by the International Emissions Trading Association, or at the very least open a dialogue with industry representatives on a viable alternative. (EVMKTS2)

Comment: The process for potential invalidation of offsets creates large, uninsurable risks for project developers. Only the largest developers will be able to develop projects, further restricting an already limited offset market. PG&E suggests use of a compliance buffer account and dual verifications to ensure the environmental integrity of offsets while encouraging the development of offset projects. (PGE4)

Comment: Invalidation of issued offsets and the current designation of liability will interfere with the development of an efficient and cost effective offset market.
The focus of ARB's rules related to offsets should be on rigorous verification and certification standards to ensure that only quality credits enter the market. If stringent requirements are established, the need to invalidate credits would be rare. Once credits

are certified by ARB, invalidation of the credits should be an extraordinary occurrence. However, if ARB finds it necessary to retain the option of invalidation, a buffer account should be established for all credit categories, similar to the buffer account for forestry projects. For example, ARB could implement an insurance pool where a small part of allowances and/or credits are banked and set aside only to be drawn upon in the event that an extraordinary reversal cannot be otherwise resolved. (TCT)

Comment: The Joint Utilities believe that the provisions of section 95985 regarding "buyer liability" for post-issuance invalidation of offsets would hinder the ability of the offsets program to function efficiently and jeopardize the program's emissions reduction goals. Instead of imposing buyer liability, the Joint Utilities recommend that CARB apply a "buffer" account approach for all types of offset projects. (JOINTUTILITIES)

Comment: We recommend adding a step to the credit issuance process under which ARB would hold back a portion of credits and place them in the Offset Buffer Account. The language mirrors the existing process for the Forest Buffer Account, but allows ARB to specify the percentage of the hold-back and provides a recommended percentage. It also allows ARB to increase or decrease the percentage to ensure that the amount of credits in the Offset Buffer Account is sufficient to address any invalidations. Modify section 95981.1(g) as follows:

> (g) Offset Buffer Account. A portion of ARB offset credits issued to an offset project will be placed by ARB into the Offset Buffer Account.
>
> > (1) The amount of ARB offset credits that must be placed in the Offset Buffer Account shall be [1.5 percent] of the amount issued to a project; provided that ARB shall increase this percentage if ARB determines that the amount of offset credits in the Offset Buffer Account is less than [1.5 percent] of the number of offset credits issued in the previous five years, and ARB shall decrease the percentage if the amount in the Offset Buffer Account is more than [1.5 percent] of the number of offset credits issued in the previous five years. Any such modification to the percentage placed in the Offset Buffer Account shall apply to offset projects listed or starting a new crediting period after the date of the modification.
> > (2) ARB Offset credits will be transferred to the Offset Buffer Account by ARB at the time of ARB offset credit registration pursuant to section 95982.
> > (3) If an offset project is originally submitted through an Offset Project Registry, an equal number of registry offset credits must be retired by the Offset Project Registry and issued by ARB for placement in the Offset Buffer Account. (CERP4)

Comment: CLFP believes the buyer offset liability language is problematic because buyers suffer sanctions or must replace credits that, though approved by the CARB, later turn out to be invalid. As a result, offset transaction costs will be higher than need be, programmatic compliance costs will be higher, offsets are likely to be considered to be second class compliance instruments by the market; and sources on the margin will be that much more inclined to expand their operations and/or export jobs outside the jurisdiction of AB 32 due to higher costs. Standard seller liability is used in all other Cap and Trade programs in the US and EU. CARB has suggested that a "buyer beware" approach will suffice, one utilizing exhaustive due diligence, the deployment of trained verifiers, or even the use of cleverly written conveyance contracts and sophisticated derivative products. It will not work, especially in situations where a credit may be created and then sold a number of times before it is used and applied. Instead, buyer liability will more than likely raise transaction costs. Nor should CARB conclude that the problem of offset reversals can be managed through the use of insurance or financial derivative products. While such products may initially reduce the risk of purchasing offsets the instruments, if priced based on risk, will sell at prices that dramatically increase transaction costs. CLFP recommends that CARB amend the language to give buyers an opportunity to avoid liability by:

- Allowing a source to secure CARB/air district review and approval of credits. This is how it has been done for decades in California with offsets that have been useable for new source review compliance purposes.
- CARB/air district issuance of permits to offset creating sources. Again, consider the NSR example.
- Creating an insurance pool that is either privately funded with credits or through a CARB administered shave that is applied to each credit issued and/or traded. (CALFP3)

Comment: If ARB is concerned that certain invalidation factors may only come to light after a period of time, we suggest that the ARB separate the requirement to replace invalidated credits from the ARB's other enforcement capabilities:

- We recommend that initial double verifications or subsequent re-verifications as described above release any credit holder from a requirement to replace those credits if they are invalidated thereafter.
- In such case, the ARB could retain the right under its pervasive enforcement authority to take actions against the offset project developer, the offset verifier, or the offset project owner, all of whom will have submitted themselves to ARB jurisdiction, should the project's credits become suspect. At its option, the ARB could choose to levy fines sufficient to purchase replacement credits, or could require the surrender of replacement credits in addition to fines and other penalties levied in such enforcement actions. (TPI5)

Comment: We urge ARB not to include section 95985 as proposed. Invalidation of offsets credits will threaten the use of offsets, investment in green projects, development of new technologies that California entrepreneurs are uniquely suited to provide, and, if it does not destroy or significantly impair the market for offset projects, it will severely diminish transparency on any trades or transactions involving offsets. If there are issues discovered through a rotation of the verifiers, the enforcement should be against those who created or verified the offset credit, and would be liable for economic replacement of the invalidated credit. This approach would put the accountability at the point of concern. The issues identified by proposed section 95985 are each issues that the project proponent and/or the verifier for the project are in the best position to not only have the facts, but also to advocate their views. Verifiers will want to protect their reputation and thus have a vested interest in verifying only quality offsets. In addition, this risk of a penalty may be able to be addressed through insurance coverage by the verifier, and the costs of riskier projects that may require higher insurance can be passed on via fees to the project developer. We recommend removing section 95895. If ARB wishes to retain the concept of invalidating issued ARB offset credits, provide an exemption step for the Offset Project Operator and/or the Authorized Project Designee so either (or the verifier) can choose to avoid the sanctions threatened by section 95985 and risk of liability years after the offset credit was created. Any project which has had a second verifier review the project, such as the requirements proposed in section 95977.1 for rotation to a new verifier, should be exempt from the threat of invalidation. We believe such is an unnecessary extra cost for projects, but it is far better than putting the market at risk because of the vague and uncertain threat of proposed section 95985. In lieu of this exemption or "safe harbor" concept, we also would support the buffer pool concept as proposed by IETA. In addition to the above, or perhaps as an alternative, remove the buyer liability terms and put the onus squarely on the entities that put the credit into the compliance market. Modify section 95985(c) and (f) as follows:

> (c) If ARB determines that an ARB offset credit is invalid pursuant to section 95985(b), ARB will~~:–~~identify the Offset Project Operator, the Authorized Project Designee and the verifier(s) of the offset credit in question. ~~the current holder of the ARB offset credit or the entity that submitted the ARB offset credit for compliance or retirement.~~
>
> > ~~(1) Identify the current holder of an ARB offset credit that has not been transferred to a compliance account or submitted for retirement;~~
> > ~~(2) Identify the entity that holds an ARB offset credit in its compliance account or has submitted it for compliance or retirement; and~~
> > ~~(3) The Offset Project Operator and Authorized Project Designee, and Forest Owner, if applicable.~~
>
> (f) Requirements for Non-Sequestration Offset Projects. If an ARB offset credit is found to be invalid pursuant to sections 95985(b) and (d), the part~~y~~ies identified in section 95985(c) must replace each metric ton of CO_2e with a valid ARB offset credit or another approved compliance instrument pursuant to subarticle 1 within 90 calendar days of the notice of invalidation pursuant to section 95985(e)(2), each outstanding ARB offset credit will constitute a violation pursuant to section 96014. If ~~the~~ any party identified in section 95985(c) is no longer in business ARB will require those who are still in business, whether the Authorized Project Operator, the Authorized Project Designee and/or the verifier(s) to provide the full amount of the replacement within said 90 days and each outstanding ARB offset credit following that 90 days will constitute a violation of section 96014. ~~the Offset Project Operator or Authorized Project Designee to replace each invalidated ARB offset credit and will notify the Offset Project Operator or Authorized Project Designee that they must replace them. The Offset Project~~

~~Operator or Authorized Project Designee must replace each metric ton of CO2e with a valid ARB offset credit or another approved compliance instrument pursuant to subarticle 4 within 90 days of notification by ARB pursuant to 95985(e)(3). If the Authorized Project Operator or Authorized Project Designee does not replace each invalid ARB offset credit within 90 calendar days of notification by ARB pursuant to section 95985(c)(3), each outstanding ARB offset credit will constitute a violation pursuant to section 96014.~~ (GREENX)

Comment: Further revise the offset liability to expand the Forest Buffer Account concept to all offset credits and amend the invalidation period to expire when ARB accepts a second verification. As proposed, the liability for offset credits that have been issued but later invalidated by ARB is placed on the buyer of the credit. Shell believes the risks associated with such invalidation and penalties will inhibit the development of the offsets market and the innovations and pioneering GHG technologies that offsets can drive. We appreciate ARB's efforts to establish criteria and limitations to the invalidation process and to promote development of insurance products. However, we believe more is necessary to address this issue. Shell supports and recommends the following two amendments proposed by IETA:

- Expand the Forest Buffer Account concept to create a compliance buffer account for all offset credits. ARB has a precedent for administering a compliance buffer account with the Forest Buffer Account. Credits subject to an unintentional reversal will remain valid, and ARB will retire credits from the Forest Buffer Account. A similar thought process is behind IETA's proposed compliance buffer account, where invalid offsets will remain in circulation, but the system will be made whole through the retirement of offsets from the compliance buffer account. The proposal also allows ARB to pursue the responsible party in instances of egregious error or fraud to prevent issues of moral hazard. This is a fair and workable model.
- Allow the invalidation period of expire upon the date of ARB's acceptance of the second verification. As proposed, the Regulation includes an eight year statute of limitations for the invalidation of offsets that may be reduced to five years, if a project undergoes a second verification within 3 years of issuance of credits. We believe the invalidation period should be lifted as soon as the second verification is accepted by ARB. (SHELLOIL)

Comment: CCEEB is concerned that the risks associated with invalidation of approved offset credits will inhibit the development of the offset market. We appreciate the changes that ARB has made in establishing criteria and limitations to the invalidation process. However more must be done. CCEEB supports the IETA proposal and recommends that ARB should expand the Forest Buffer Account concept to create a compliance buffer account for all offset credits and allow the invalidation period to expire upon ARB's acceptance of the second verification. (CCEEB3)

Comment: If ARB retains the concept of invalidating issued offset credits, we suggest removing the buyer liability terms and put the onus squarely on the entities that put the credit into the compliance market. Focusing on those who create and verify the credit will enhance the offset market and provide additional comfort to the market as to the quality of offsets thereby promoting a more liquid market. In addition to, or as an alternative, ARB could provide an exemption step for the Offset Project Operator and/or the Authorized Project Designee so either (or the verifier) can choose to avoid the sanctions threatened by 95985 and risk of liability years after the offset credit was created. We suggest that any project which has had a second verifier review the project, such as the requirements proposed in section 95977.1 for rotation to a new verifier, should be exempt from the threat of invalidation. We believe this is an unnecessary extra cost for projects, but it is far better than putting the market at risk because of the vague and uncertain threat of proposed section 95985. This is a concept similar to that suggested by IETA. In lieu of this exemption or "safe harbor" concept, we also would support the buffer pool concept as proposed by IETA. Modify sections 95985(c) and (f) as follows:

> (c) If ARB determines that an ARB offset credit is invalid pursuant to section 95985(b) ARB will identify the Offset Project Operator, the Authorized Project Designee and the verifier(s) of the offset credit in question, the current holder of the ARB offset credit or the entity that submitted the ARB offset credit for compliance or retirement.
>
> > (~~1) Identify the current holder of an ARB offset credit that has not been transferred to a compliance account or submitted for retirement;~~
> > ~~(2) Identify the entity that holds an ARB offset credit in its compliance account or has submitted it for compliance or retirement; and~~
> > ~~(3) The Offset Project Operator and Authorized Project Designee, and Forest Owner, if applicable.~~
>
> (f) Requirements for Non-Sequestration Offset Projects. If an ARB offset credit is found to be invalid pursuant to sections 95985(b) and (d). the part~~y~~ies identified in section 95985(c) must replace each metric ton of CO_2e with a valid ARB offset credit or another approved compliance instrument pursuant to subarticle 1 within 90 calendar days of the notice of invalidation pursuant to section 95985(e)(2), each outstanding ARB offset credit will constitute a violation pursuant to section 96014. If ~~the~~ any party identified in section 95985(c) is no longer in business ARB will require those who are still in business, whether the Authorized Project Operator, the Authorized Project Designee and/or the verifier(s) to provide the full amount of the replacement within said 90 days and each outstanding ARB offset credit following that 90 days will constitute a violation of section 96014. ~~the Offset Project Operator or Authorized Project Designee to replace each invalidated ARB offset credit and will notify the Offset Project Operator or Authorized Project Designee that they must replace them. The Offset Project Operator or Authorized Project Designee must replace each metric ton of C02e with a valid ARB offset credit or another approved compliance instrument pursuant to subarticle 4 within 90 days of notification by ARB pursuant to 95985(e)(3) If the Authorized Project Operator or Authorized Project Designee does not replace each invalid ARB offset credit within 90 calendar days of~~

~~notification by ARB pursuant to section 95985(c)(3), each outstanding ARB offset credit will constitute a violation pursuant to section 96014~~. (GREENX)

Response: We do not agree that we should eliminate buyer liability associated with the invalidation of ARB offset credits. Requiring the user to replace the invalidated offsets ensures that purchasers and users of offset credits do their due diligence in seeking out high-quality offset credits. We have clear enforcement authority over covered entities that will be using ARB offsets for compliance. If the covered entity replaces any invalidated offset credits, they may then take appropriate action through third-party contractual arrangements that they may have established prior to purchase. These arrangements currently exist in the voluntary offset market, and we expect that as the offset market becomes more established, that additional mechanisms to deal with the risk of invalidation will also be established. In the event that the offset credit has not yet been used or retired, it will be canceled in the market tracking system and removed from any Holding or Compliance Accounts. These provisions in no way diminish our authority to assess penalties under section 96014 on any offset project developer or verifier that has provided false information to ARB.

We do not agree that ARB offset credits should no longer be invalidated in the event that a second verification is performed on the Offset Project Data Report. The minimum statute of limitations is three years if the Offset Project Data Report or a subsequent Offset Project Data Report, depending on project type, is verified by a different verifier within that time frame. If the offset project does not qualify under these requirements, the default statute of limitations is eight years. We do not believe that any time period less than three years would provide sufficient time to detect all relevant new information or uncover any mistakes that verifiers may have missed or may have been unintentionally omitted.

M-101. (multiple comments)
Comment: Assigning liability for replacement of invalidated offset credits to the buyer or any entity within the supply chain (section 95985) would drive market participants to attempt to create chains of indemnity. Most Forest Owners would require that any companies or individuals involved in project development not only indemnify the forest owner for professional errors, but also carry insurance. In the absence of a proper insurance product, most potential offset producers would elect to not participate in the market because the relative risk of liability. We therefore suggest that ARB reconsider the alternative mechanism of addressing valid concerns over material mistakes or fraud in offset production: an ex-ante deduction and buffer reserve. The mechanics of operating a buffer account do not differ at all between different types of buffer accounts. Only the root cause of credit invalidation varies. ARB has the option of simply setting the deduction at a very conservative rate and applying adaptive management as data comes in. If the ex-ante deduction was too high and very few credits are being invalidated, ARB could reduce the deduction in future vintage years. If the ex-ante deduction was too low and more credits were invalidated than were retained by the

buffer reserve, ARB could increase the deduction in future vintage years and ensure climate integrity by reducing the cap by an appropriate amount. (NEWFOREST2)

Comment: EDF is very concerned by the portion of the draft regulation which imposes front-line responsibility for credit reversal and invalidation on the purchasers of credits, (i.e. buyer liability). While EDF does support the requirement that any credit which is determined to be invalid, either through reversal or invalidation, is replaced with a certified emission reduction credit, the current approach to make buyers responsible for making up the credit is likely to suppress the overall market without furthering environmental integrity when compared to alternative designs. Buyer liability makes offsets non-homogenous, which will hurt the liquidity of the market. Financial entities will likely provide credit replacement insurance products, but because the market cannot calculate the risk that ARB will invalidate a credit, this insurance will be expensive and inefficient. The cost of the insurance will increase the costs of offsets, thereby increasing costs of emission reductions for the entire program, and for Californians. Because smaller projects will likely be the most expensive to insure, buyer liability will also discourage the types of offset projects which often have the greatest environmental co-benefits for California communities. We recommend CARB consider other frameworks that have been suggested that will guarantee the environmental integrity of offsets without these unnecessary costs and without threatening the viability of the market. CARB could require 1.05 tons of offset credits to be surrendered for every ton of compliance obligation, with the extra 5 percent placed in an account that is available for surrender if offset credits are later reversed. As the risk of reversal for offsets became clearer, or the size of the account grew or shrunk, the percentage of additional offsets that CARB required covered entities to submit could be adjusted. This approach ensures market integrity while also removing potential barriers to credit development. (EDF4)

Comment: Liability for Offset Rescission – Cost containment provided by a robust offset supply is a critical element of the December 2010 rule. The liability regime for offset rescission included in the proposal, however, will jeopardize this supply because it will significantly discourage investment in and financing of offset projects. The offset rescission risk is difficult to manage on a transaction-by-transaction basis—based on experience, no private insurance product is available or likely to be available to address it—but the risk can easily be borne by the market as a whole at a marginal cost to each market participant. Overall this risk is best managed by the creation of a buffer pool on a program-wide basis, with the ultimate risk residing with the program itself. If ARB does not believe that this option is practical or feasible, ARB should consider the alternative of removing a quantity of allowances from the cap equal to the number of offsets rescinded, for which recovery from a culpable party is not possible. Chevron would generally oppose removing any allowances from the cap. However, faced with the prospect of inadequate offset supply and higher allowance prices in the market, Chevron would rather have ARB implement this alternative solution than leave the current proposal in place. (CHEVRON3)

Comment: Requiring regulated entities to replace invalidated credits will unnecessarily restrict the supply of high quality offsets without real net environmental gains. The problem lies in the assumed benefits of this system. Buyers (regulated entities) are assumed to be protected from receiving bad credits through use of insurance mechanisms, trained offset verifiers, innovative contracting, and extensive due diligence. It is also assumed that ARB is more likely to recover an invalidated offset credit if a regulated entity is held liable for its replacement. However, no private carbon offset insurance products currently exist; the private sector cannot mandate that all projects and offset holders purchase a common insurance policy or participate in a common buffer account; any voluntary insurance policy or buffer account would suffer from "adverse selection" as project developers and sellers would be incentivized to submit only their riskiest projects to the voluntary insurance policy or buffer account, and they would sell the least risky projects directly to large compliance entities via bilateral contract; transparency will be sacrificed and market oversight will be more difficult; and smaller compliance entities would not have equal access to quality offsets. The solution to addressing the problems associated with holding regulated entities responsible for replacing an invalidated offset credit is to mirror the current ARB Forest Buffer Account structure and procedures to apply separately (and additionally) to all compliance offset projects. This system would reduce transaction costs while maintaining environmental integrity in the overall Cap and Trade system. This system would also align the incentives of Offset Project Operators, verifiers, buyers, sellers, and regulated entities, as well as result in a fungible, commoditized offset market which is equitable, accessible by all compliance entities, and would allow transparent trading and clearing via exchange. It would merely be an extension of the buffer account management and enforcement action responsibilities already undertaken by ARB for forestry projects, and will reduce invalidation risk because the incentives of Offset Project Operators will be properly aligned to ensure the quality of their projects. (CE2CC)

> **Response:** We do not agree that we should eliminate buyer liability associated with the invalidation of ARB offset credits. Requiring the user to replace the invalidated offsets ensures that purchasers and users of offset credits do their due diligence in seeking out high-quality offset credits. We have clear enforcement authority over covered entities that will be using ARB offsets for compliance. If the covered entity replaces any invalidated offset credits, they may then take appropriate action through third-party contractual arrangements that they may have established prior to purchase. These arrangements currently exist in the voluntary offset market, and we expect that as the offset market becomes more established, that additional mechanisms to deal with the risk of invalidation will also be established. In the event that the offset credit has not yet been used or retired, it will be canceled in the market tracking system and removed from any Holding or Compliance Accounts. These provisions in no way diminish our authority to assess penalties under section 96014 on any offset project developer or verifier that has provided false information to ARB.

With regard to the comments related to the development of insurance, we believe that given all of the clarifications to section 95985, the market should be able to quantify and cover the risk associated with invalidation. We expect that insurance products will emerge once the market has been established.

With regard to the suggestion to hold allowances to replace invalidated offsets, this suggestion would most likely face serious opposition from other covered entities, as it would reduce the amount of compliance instruments available in the market and would take the incentive off buyers to conduct due diligence in reviewing and selecting offsets for purchase and compliance purposes.

M-102. Comment: ACR believes that significant problems remain in section 95985. In the case that ARB is relying on the assumption that commercially available insurance will cover invalidation risk, five years may still be too long a horizon for insurance underwriters since there is no history on which to determine probability of occurrence of invalidations. It is a challenge even for experienced insurers to take on risk beyond three years, particularly in a new market. More broadly, the fact that replacement liability remains with the current holder of the ARB offset credit will likely pose obstacles to the development of a smoothly functioning offset market. ACR has not seen evidence that insurance products covering invalidation risk are commercially available or can necessarily be assumed to become available in the near-term. Even if insurance products are offered in the future, whether these will cover invalidation, will be available at competitive prices, and will adequately protect the market remains to be seen. Thus we feel that assigning replacement liability to the current holder of the credit or the entity that submitted the credit for compliance or retirement is fundamentally problematic. A "seller liability" approach, in which the replacement responsibility rests with the Offset Project Operator or Authorized Project Designee in the case of invalidation, more appropriately aligns the liability for invalidation with those who have the sectoral knowledge and ability to minimize the risk of invalidation. This would in effect require the sellers to stand by their product and to offer buyers some form of warranty that product is guaranteed valid until the offset is used for compliance or retired. ACR believes that market-based risk mitigation solutions are possible, either offered directly to Offset Project Operators or Authorized Project Designees, or offered via the Offset Project Registries, to cover invalidation risk. We will work with ARB to identify such solutions. (MARTINN3)

Response: We do not agree that the responsible party of an invalidated ARB offset credit should be the offset developer. We have clear enforcement authority over covered entities that will be using ARB offsets for compliance. If the covered entity replaces any invalidated offset credits, they may then take appropriate action through third-party contractual arrangements that they may have established prior to purchase. These arrangements currently exist in the voluntary offset market, and we expect that as the offset market becomes more established, that additional mechanisms to deal with the risk of invalidation will also be established. In the event that the offset credit has not yet been used or retired, it will be canceled in the market tracking system and removed from any

Holding or Compliance Accounts. Requiring the user to replace the invalidated offsets ensures that purchasers and users of offset credits do their due diligence in seeking out high-quality offset credits.

With regard to the comments related to the development of insurance, we believe that given all of the clarifications to section 95985 the market should be able to quantify and cover the risk associated with invalidation. We expect that insurance products will emerge once the market has been established.

M-103. Comment: ARB believes that a market of insurance products will be created to address the risk of invalidation. An insurance product in California would need to cover a post-delivery risk that does not exist in any other market. According to insurance companies and brokers, this risk cannot be easily quantified. Because of the quantification risk, only the largest projects would be able to obtain such insurance. Smaller offset projects, such as manure digesters, will either not develop, or will be very expensive to develop. Some have asserted that complying entities can manage their liability risk through contractual language. The primary remedies a complying entity may seek are inclusion of liquidated damages and indemnification clauses in their contracts with sellers of offsets. In our investigation, PG&E has learned that at least one of the largest developers of offsets would not sign such contracts. Even if the offset seller was willing to accept such contractual language, the seller would need to remain solvent or post significant amounts of collateral with PG&E for the entire invalidation period in order to limit PG&E's liability. Even if they are willing to post, offset sellers are likely to build the cost of collateral and additional risk into the cost of the offset, which will shift the cost to PG&E and other offset purchasers. Because only the largest projects would be able to meet such collateral requirements, the available supply of offsets would be even more restricted than predicted. If a buyer liability approach cannot be avoided, PG&E supports two potential approaches to address the potential risk of invalidation. The first is the development of a Compliance Buffer Account funded through the hold back of a percentage of credits from every offset project. This account could be managed by the ARB as the Forest Buffer Account or be managed separately by a third party. Under this proposal, the market itself bears the risk of invalidated credits. Rather than requiring each buyer to manage this risk on a project-by-project basis, this proposal effectively has the entire market taxing itself—by taking issued credits out of the market—in order to create a buffer account that ensures the environmental integrity of the program. ARB staff has posed the question about what would happen should the Compliance Buffer Account become depleted. This could be addressed by increasing the percent held back from a project if more than 50 percent of the offsets are withdrawn from the Compliance Buffer Account. The second approach would be a "double verification" of all projects. This is similar to section 95985(b)(6), which allows the reduction of the statute of limitation from eight to five years "if an offset project is verified after three years of ARB offset credit issuance." PG&E recommends that ARB simply allow the invalidation period to expire upon the date of ARB's acceptance of the second verification. We see no reason to require that a second verification "sit" for five years before lifting the shadow of invalidation. Nothing is gained from the passage of time, and the marketplace will not consider the credit valid and marketable for the length of that period. (PGE4)

> **Response:** We do not agree that ARB offset credits should no longer be invalidated in the event that a second verification is performed on the Offset Project Data Report. The minimum statute of limitations is three years if the Offset Project Data Report or a subsequent Offset Project Data Report, depending on project type, is verified by a different verifier within that time frame. If the offset project does not qualify under these requirements, the default statute of limitations is eight years. We do not believe that any time period less than three years would provide sufficient time to detect all relevant new information or uncover any mistakes that verifiers may have missed or may have been unintentionally omitted.
>
> With regard to the comments related to the development of insurance, we believe that given all of the clarifications to section 95985 the market should be able to quantify and cover the risk associated with invalidation. We expect that insurance products will emerge once the market has been established.

M-104. (multiple comments)
Comment: PG&E appreciates the development of an eight year statute of limitations for an offset project and the reduction of the eight year statute of limitations to five years if an offset project is verified after three years of ARB offset credit issuance. PG&E recommends the addition of a double verification option prior to offset credit issuance. (PGE4)

Comment: We urge ARB simply to allow the invalidation period to expire upon the date of ARB's acceptance of the second verification. We see no reason to require that a second verification "sit" for five years before lifting the shadow of invalidation. Nothing is gained from the passage of time—and yet, the marketplace will not consider the credit valid and marketable for the length of that period. (CERP4)

Comment: The current language on the Statute of Limitations on offset invalidation in section 95985(b)(6) allows for the potential to reduce the Statue of Limitations on offset invalidation from eight years to five if the project is verified by a different verifier after three years, versus the requisite six years. The Regulation should include additional options to eliminate the Statute of Limitations if the Offset Project Operator or Early Action offset holder elects to use two different verifiers at the time of verification for Compliance projects or regulatory re-verification (i.e. desk review) for Early Action offsets; and allow the Statute of Limitations to be reduced to two years if a project voluntarily uses a different verifier after one year. These options allow more flexibility and would continue, to, "encourage a quicker verifier rotation so that any issues that may occur may be uncovered sooner, further enhancing the integrity of the offset program." (CE2CC)

Comment: In the current proposal, ARB has added a statute of limitations of eight years for invalidation of already-issued offset credits. In addition, it appears that a project can shorten the statute of limitations to five years if it undergoes a second verification after three years of issuance of the credits. According to this yardstick of credibility, ARB considers the validity of offset credits sufficiently established after the project has been reviewed by a second, independent ARB-accredited verifier and the second verifier has not identified any grounds for validation as set forth in section 95985(b). IETA believes this is a well-grounded approach. Also, it provides a basis for minimizing the most problematic aspect of buyer liability: the extended period of time during which an already-issued offset credit remains subject to invalidation. In particular, we think it would lead many entities in the offsets market to manage their risk by obtaining a second verification of each data report immediately following the issuance of credits, which would bolster the credibility of the program. A long statute of limitations would also severely impact the ability to access insurance products. IETA urges ARB simply to allow the invalidation period to expire upon the date of ARB's acceptance of the second verification. We see no reason to require that a second verification "sit" for five years before lifting the shadow of invalidation. Nothing is gained from the passage of time, and the marketplace will not consider the credit valid and marketable for the length of that period. (IETA3)

Comment: Section 95985(b)(6) provides that if an offset is certified by two different verifiers (after three years), then ARB may invalidate the offset within five years of issuance rather than the usual eight years. SCE supports this move toward limiting offset invalidation as this will create more market confidence and has the potential to lower compliance costs. However, SCE strongly recommends that ARB further adjust its provisions to increase confidence in the offset markets while maintaining the environmental integrity of the fully verified offsets. Modify section 95985(b)(6) as follows:

> (6) If an offset project is verified ~~after three years of~~ <u>at any time after</u> ARB offset credit issuance by a different offset verifier, ARB may <u>no longer</u> invalidate ~~within five years of issuance of~~ the ARB offset credits covered by an Offset Project Data Report. (SCE3)
>
> **Response:** We do not agree that ARB offset credits should no longer be invalidated in the event that a second verification is performed on the Offset Project Data Report. The minimum statute of limitations is three years if the Offset Project Data Report or a subsequent Offset Project Data Report, depending on project type, is verified by a different verifier within that time frame. If the offset project does not qualify under these requirements, the default statute of limitations is eight years. We do not believe that any time period less than three years would provide sufficient time to detect all relevant new information or uncover any mistakes that verifiers may have missed or may have been unintentionally omitted.

M-105. (multiple comments)
Comment: The process for invalidation of credits should be carefully constructed with a limited horizon. The Trust recommends that ARB limit the time frame for invalidation

of credits to the earlier of the eight year statute of limitations, or the second verification of credits, whichever comes first. ARB considers the validity of credits to be convincingly established after five years if a second verifier has not identified any grounds for invalidation as set forth in section 95985(b)(6). The Trust believes there is no reason to wait five years; ARB should accept a second verification as the final point for any potential invalidation.

In addition, The Trust urges ARB to modify the provisions under which offset credits may be invalidated. Modify section 95985(b) as follows:

- ~~Information that is not "true, accurate, or complete" (section 95985(b)(1)).~~
- Documentation that contains errors whereby emission reductions are overstated by 5% or more (section 95985(b)(2)).
- The project did not meet applicable legal requirements (section 95985(b)(3)).
- The credits have been issued in another program (section 95985(b)(4)).

In the Trust's experience, it is foreseeable that some projects will have documentation with unintended inaccuracies or omissions. Furthermore, under the rule as written, it appears ARB could invalidate all of the credits from the project rather than just the credits affected by the inaccuracies. This is an overly broad and punitive solution. ARB should limit the liability from "overstatement" to the extent of the overage. (TCT)

Comment: The criteria which determines whether CARB can or will invalidate an offset is too broad. Invalidation should occur only when there is a material misstatement or inaccuracy in the information submitted to CARB or to verifiers. "Material" should be defined as a misstatement or inaccuracy that overstates the amount of GHG reduction by more than 5 percent. The Regulation considers that offsets could be verified twice and thereafter reduce the statute of limitations on invalidation to five years. We believe a second verification should result in a reduction in the statute of limitations of one year. (BP2)

> **Response:** We included extensive modified provisions in section 95985 to make it clear what would trigger an invalidation, how ARB will invalidate offsets, and which offsets will need to be replaced. We believe that these changes provide clarity on these points.
>
> Section 95985(b) was modified to establish a statute of limitations for the invalidation of ARB offset credits of three years if the Offset Project Data Report or a subsequent Offset Project Data Report, depending on project type, is verified by a different verifier within that time frame. If the offset project does not qualify under these requirements, the default statute of limitations is eight years. We believe that the three-year time period is sufficient to uncover any new information, as long as the project has been reviewed by a second verifier. If it is not looked at by a second verifier, we believe that eight years is necessary to uncover any new information that could lead to the invalidation of ARB offset credits. We believe the eight-year statute of limitations is sufficient because it

would allow two verification parties to examine the offset credits in question for continuous projects.

We do not agree that ARB offset credits should no longer be invalidated in the event that a second verification is performed on the Offset Project Data Report. The minimum statute of limitations is three years if the Offset Project Data Report or a subsequent Offset Project Data Report, depending on project type, is verified by a different verifier within that time frame. If the offset project does not qualify under these requirements, the default statute of limitations is eight years. We do not believe that any time period less than three years would provide sufficient time to detect all relevant new information or uncover any mistakes that verifiers may have missed or may have been unintentionally omitted.

M-106. Comment: Specific modifications should be made to the invalidation rules to improve fairness and efficiency. We urge ARB to consider the further modifications outlined below.

Modify the "Statute of Limitations." ARB has proposed to shorten the period of time during which an offset credit is subject to invalidation from eight years to five. See Section 95985(a). We urge ARB simply to allow the invalidation period to expire upon the date of ARB's acceptance of the second verification, regardless of when that occurs. It is that second verification that will provide the final measure of assurance regarding the credit's validity. There is not need to require a credit be subject to a further arbitrary period of five years during it which would be subject to invalidation—and thus unmarketable.

Modify the Conditions for Invalidating Credits. We appreciate ARB's proposal to modify section 95985(b) to specify the conditions under which offset credits may be invalidated. As now proposed, subsections 95985(b)(1)-(4) establish four conditions under which offset credits may be invalidated: (1) the project information is not "true, accurate, or complete"; (2) the project documentation contains errors such that emission reductions achieved by the project are overstated by 5% or more; (3) the project did not meet all applicable legal requirements; and (4) a finding that credits already have been issued for the project in another program.

Eliminate the Catch-All Condition. We respectfully suggest that ARB eliminate subsection 95985(b)(1). Given the myriad requirements of the offset regulations, any number of projects will have documentation that has inadvertent inaccuracies or omissions. Yet, under this new provision, a minor paperwork problem could result in invalidation of 100% of the offset credits already issued for a project—even if there was no impact on the reductions or removals actually achieve by the project. Any discrepancies that do have material effects on the environmental integrity of the project are addressed by subsections (b)(2), (3), and (4).

> Tailor the "Overstatement" Condition to the Actual Invalidity. We respectfully suggest that ARB modify subsection 95985(b)(2) relating to "overstatement" to tailor it to those credits actually impacted by the overstatement. In the event that an offset data report overstates emission reductions achieved by a project, ARB should invalidate only an amount of credits that corresponds to the overstatement. As currently proposed, ARB would invalidate *all* credits associated with the report, even the credits that correspond to real emission reductions. (COPC3)

Response: Section 95985(b) was modified to establish a statute of limitations for the invalidation of ARB offset credits of three years if the Offset Project Data Report or a subsequent Offset Project Data Report, depending on project type, is verified by a different verifier within that time frame. If the offset project does not qualify under these requirements, the default statute of limitations is eight years. We believe that the three-year time period is sufficient to uncover any new information, as long as the project has been reviewed by a second verifier. If it is not looked at by a second verifier, we believe that eight years is necessary to uncover any new information that could lead to the invalidation of ARB offset credits. We believe the eight-year statute of limitations is sufficient because it would allow two verification parties to examine the offset credits in question for continuous projects.

We included extensive modified provisions in section 95985 to make it clear what would trigger an invalidation, how we will invalidate offsets, and which offsets will need to be replaced. We believe that these changes provide clarity on this point.

M-107. Comment: In the Proposed Changes, ARB added a provision under which the period of time during which the offset credit is subject to invalidation can be shortened from eight years to five years. This period should simply expire upon the earlier of the date of the ARB's acceptance of the second verification, or five years after issuance. There is no reason to require that a second verification "sit" for a certain period of time before lifting the shadow of invalidation. Nothing is gained from the passage of time—and yet, the marketplace will not consider the credit valid and marketable for the length of that period.

Second, the ARB should modify the list of potential issues with offset credits. SCPPA respectfully requests the ARB to eliminate section 95985(b)(1): the project information is not "true, accurate, or complete." Given the myriad requirements of the offset regulations, any number of projects will have documentation that has inadvertent inaccuracies or omissions. Yet, under this vague and overbroad provision, a minor paperwork problem could result in invalidation of 100 percent of the offset credits already issued for a project—even if there was no impact on the reductions or removals actually achieved by the project. This is a draconian, "gotcha" approach that will deter development of offset projects for reasons unrelated related to environmental integrity. Furthermore, any discrepancies that do have material effects on the environmental integrity of the project are completely addressed by sections 95985(b)(2), (3), and (4). For these reasons, SCPPA respectfully urges the ARB to delete section 95985(b)(1). Third, the provision related to "overstatement" (section 95985(b)(2)) should be modified to avoid unnecessarily punitive outcomes. If an offset data report overstates emission reductions achieved by a project, the ARB should require additional offsets to be surrendered in an amount that corresponds to the overstatement. As currently proposed, the ARB would invalidate all offset credits associated with the report, even the portion of the offset credits that correspond to real emission reductions. If the ARB continues to rely on a buyer liability approach, it could apply the more limited invalidation pro rata to all holders of offset credits from the particular vintage year. Finally, 90 days remains a very tight timetable for any entity to obtain additional compliance instruments. SCPPA respectfully urges the ARB to align this provision with the provision on under-reporting of emissions, which allows six months to surrender additional compliance instruments (section 95858(c)). For the reasons discussed above, section 95985 should be revised as follows, to implement the buffer approach, remove references to invalidation, and refine the grounds for finding that problems have arisen in relation to issued offset credits. Modify section 95985 as follows:

Section 95985. Surrender of additional~~Invalidation of~~ ARB Offset Credits if circumstances arise in relation to existing ARB Offset Credits.

(a) An ARB offset credit issued under this Article will remain valid provided that, if ARB makes a determination pursuant to section 95985(e)(4) then an additional compliance instrument must be surrendered in accordance with sections 95985(f) and (g). ~~unless invalidated pursuant to sections 95985(b) and (c)~~.

(b) ARB may determine at any time until the earlier of (i) a post-issuance verification of the Offset Project Data Report by a different offset verifier, and (ii)~~within~~ 5~~8~~ years after~~of~~ issuance, ~~except as provided in section 95985(b)(5) and (6),~~ that ~~an ARB offset credit is invalid for the following reasons~~:

~~(1) ARB determines that information provided to ARB for an Offset Project Data Report or Offset Verification Statement by offset verifiers, verification bodies, Offset Project Operators, Authorized Project Designees, or Offset Project Registries, related to an offset project was not true, accurate, or complete; or~~

(~~2~~1) The Offset Project Data Report contains errors that overstate the amount of GHG reductions or GHG removal enhancements by more than 5 percent (in which case, ARB shall determine the amount of offset credits that corresponds to the overstatement); or

(~~3~~2) The offset project did not meet all local, state, or national regulatory requirements during the time covered by an Offset Project Data Report; or

(~~4~~3) ~~ARB determines that o~~Offset credits have been issued in any other voluntary or mandatory program within the same offset project boundary or for the same GHG reductions or GHG removal enhancements covered by an Offset Project Data Report.

~~(5) If an offset project is developed under Compliance Offset Protocol U.S. Ozone Depleting Substances Projects, ARB may invalidate within five years of issuance of the ARB offset credits covered by an Offset Project Data Report.~~

~~(6) If an offset project is verified after three years of ARB offset credit issuance by a different offset verifier, ARB may invalidate within five years of issuance of the ARB offset credits covered by an Offset Project Data Report.~~

(~~7~~c) An update to a Compliance Offset Protocol in itself, will not result in an invalidation of ARB offset credits issued under a previous version of the Compliance Offset Protocol.

(~~c~~d) If ARB makes a determination pursuant to section 95985(b), then ~~determines that an ARB offset credit is invalid pursuant to section 95985(b)~~ ARB will identify all parties that may have some responsibility for the action that gave rise to the determination. Such parties may include:

> (1) ~~Identify~~ the current holder of an ARB offset credit that has not been transferred to a compliance account or submitted for retirement;
>
> (2) ~~Identify~~ the entity that holds an ARB offset credit in its compliance account or has submitted it for compliance or retirement; and
>
> (3) The Offset Project Operator and Authorized Project Designee, and, if applicable, the Forest Owner~~, if applicable~~.

(~~d~~e) ARB will notify the parties identified in section 95985(~~c~~d) of the determination pursuant to section 95985(b)~~invalidation~~ and provide ~~the~~each party an opportunity to submit additional information to ARB ~~prior to invalidation~~ as follows:

> (1) ARB will include the reason for finding that the issue listed in section 95985(b) occurred~~invalidation of an ARB offset credit~~ in its notification to the party identified in 95985(d~~c~~).
>
> (2) After notification the part~~y~~ies identified in 95985(d~~c~~) will have 25 calendar days to provide any additional information to ARB.

(3) ARB may request any additional information as needed in addition to the information provided under this section.

(4) The Executive Officer will have 30 days after all information is submitted under this section to make a final determination that one of the conditions listed in section 95985(b) has occurred, to identify and notify the party responsible, and to determine the number of offset credits affected and the compliance instruments that are required to be surrendered~~to invalidate an ARB offset credit~~.

~~(e) If the Executive Officer determines that an ARB offset credit is invalid pursuant to sections 95985(b) and (d):~~

~~(1) The ARB offset credit will be invalidated and removed from any Holding or Compliance Account;~~

~~(2) The party identified pursuant to section 95985(c) will be notified of ARB's determination of invalidation pursuant to section 95985(d)(4);~~

~~(3) The Offset Project Operator or Authorized Project Designee, or the Forest Owner, if applicable, of the offset project for which the ARB offset credits were invalidated will be notified of ARB's determination of invalidation pursuant to section 95985(d); and~~

~~(4) Any approved program for linkage pursuant to subarticle 12 will be notified of the invalidation at the time of ARB's determination pursuant to section 95985(d)(4).~~

(f) Requirements for Surrender of Additional Compliance Instruments~~Non-Sequestration Offset Projects~~. If the Executive Officer makes a determination~~an ARB offset credit is found to be invalid~~ pursuant to section~~s~~ 95985(e)(4)~~b) and (d)~~, the party identified in section 95985(e)(4)~~c)(2)~~ must surrender the specified number of ~~replace each ARB offset credit with a~~ valid ARB offset credits or ~~an~~other approved compliance instruments pursuant to subarticle 4, within ~~90 calendar days~~six months of notification by ARB pursuant to section 95985(e).

(g) If the party identified in section 95985(e~~c~~)(~~2~~4) does not surrender the specified number of compliance instruments~~replace each invalid ARB offset credit~~ within ~~90 calendar days~~six months of the notice ~~of invalidation~~ pursuant to section 95985(e):~~,~~

(1) ARB will retire the specified number of ARB offset credits from the Offset Buffer Account; and

(2) the party will be subject to enforcement action pursuant to section 96014; and

(3) each ~~outstanding~~ ARB offset credit retired from the Offset Buffer Account will constitute a violation pursuant to section 96014. ~~If the party identified in section 95985(c)(2) is no longer in business ARB will require the Offset Project Operator or Authorized Project Designee to replace each invalidated ARB offset credit and will notify the Offset Project Operator or Authorized Project Designee that they must replace them. The Offset Project Operator or Authorized Project Designee must replace each ARB offset credit with a valid ARB offset credit or another approved compliance instrument pursuant to subarticle 4, within 90 calendar days of notification by ARB pursuant to section 95985(e). If the Offset Project Operator or Authorized Project Designee does not replace each invalid ARB offset credit within 90 calendar days of notification by ARB pursuant to section 95985(e), each outstanding ARB offset credit will constitute a violation pursuant to section 96014.~~

~~(g) Requirements for Forest Offset Projects. If an ARB offset credit is found to be invalid pursuant to sections 95985(b) and (d) for a forest offset project, the Forest Owner must replace each ARB offset credit with a valid ARB offset credit or another approved compliance instrument pursuant to subarticle 4, within 90 calendar days of notification by ARB pursuant to section 95985(e). If the Forest Owner does not replace the invalid ARB offset credit within 90 calendar days of being notified by ARB pursuant to section 95985(e), each outstanding ARB offset credit will constitute a violation pursuant to section 96014.~~

(h) Nothing in this section shall limit the authority of the State of California from pursuing enforcement action against any parties in violation of this article. (SCPPA6)

Response: Section 95985(b) was modified to establish a statute of limitations for the invalidation of ARB offset credits of three years if the Offset Project Data Report or a subsequent Offset Project Data Report, depending on project type, is verified by a different verifier within that time frame. If the offset project does not qualify under these requirements, the default statute of limitations is eight years. We believe that the three-year time period is sufficient to uncover any new information, as long as the project has been reviewed by a second verifier. If it is not looked at by a second verifier, we believe that eight years is necessary to uncover any new information that could lead to the invalidation of ARB offset credits. We believe the eight-year statute of limitations is sufficient because it would allow two verification parties to examine the offset credits in question for continuous projects.

We included extensive modified provisions in section 95985 to make it clear what would trigger an invalidation, how we will invalidate offsets, and which offsets will need to be replaced. We believe that these changes provide clarity on this point.

We changed the timing for when the responsible party must replace the invalidated ARB offsets from 30 days to six months. This should provide enough flexibility for those that must replace invalidated offsets to purchase additional compliance instruments while still ensuing that the environmental integrity of the cap is maintained.

M-108. (multiple comments)
Comment: Economically viable insurance products will not emerge to manage buyer liability. Some ARB officials see insurers coming to the rescue. For several reasons, IETA is skeptical about the emergence of viable insurance products. Insurers typically assess and insure against risks that apply to private activities or enterprises. In an offsets market, by contrast, the risk relates to the performance of a government program, and the ARB offsets system is a government program with no track record of experience. Cost-effective insurance for individual projects/trades are very unlikely to materialize in such a small and idiosyncratic market, particularly in the early stages. In other types of more mature and "natural" markets, the cost of insurance can come down if offered on the basis of large pools. However, there is no mechanism in the offset Regulations that makes such pooling possible for private insurers unless ARB was to purchase insurance on behalf of the market to cover all trades. Still, insurers would always require a deductible and there are the issues as to how to price it based on no direct experience initially. As a result, any insurers for ARB offsets market would have to build up such pools on their own over time with resulting higher costs. These costs will be passed through to covered entities in their rates. (IETA3)

Comment: Some ARB officials have said they see insurance products emerging to fill the gap—and say that some insurance companies already have come to the agency with a "build it and we will come" message. Based on what we have learned about conversations with insurance companies about the California offsets program and our experience with insurance in other markets, we are much more skeptical. We have concluded that, for the following reasons, economically viable insurance products are not likely to emerge under a buyer liability regime.

First, insurers generally are confounded by the area of government-issued offsets. Insurers typically assess and insure against risks that apply to activities or enterprises. In an offsets market, by contrast, the relevant risk relates to the performance of a government program—and, in the case of the ARB offsets system, a government program with no track record of experience. Like most buyers of credits, insurers have no particular insight into the risk of measurement errors made by an ARB-accredited verifier or an offset public registry. To be sure, they could pay the cost of a second, independent verification for each project, but that would be a significant cost. For these reasons, if insurers have to individually insure each project—and be ready to pay claims on that insurance for upwards of eight years—such insurance will be cost-prohibitive.

In other types of more mature and "natural" markets, the cost of insurance can come down if offered on the basis of large pools, in which case invalidation risks can be spread among numerous and diverse activities or individuals. However, there is no mechanism in the offset regulations that makes such pooling possible for private insurers. As a result, any insurers for the ARB offsets market will have to build up such pools on their own over time and at very high cost—and these costs will be passed through to covered entities in their rates.

In addition, in order to be prepared to pay out on claims, each insurer will have to amass a buffer account of allowances and offset credits. This means that there will be additional players in the market buying up allowances and offset credits and passing the costs of these purchases through to covered entities in insurance rates. Carbon prices will also be higher than they would otherwise be because there will fewer allowances and offset credits available to covered entities to use for compliance because of this additional buying by insurers to maintain their own buffer accounts.

Finally, even where such insurance becomes available, our members' experience is that insurers will refuse to cover "market risk." In other words, if the market price of offset credits increases from the time the insurance is purchased, insurers will not cover that difference. Thus, even "high-end" insurance products will fall short, forcing buyers of offset credits effectively to self-insure for some portion of their risk. We have noted that the proposed regulations now authorize offset project registries to offer (but not mandate) insurance. However, for at least two reasons, it is our view that registries will not provide a workable insurance pathway. First, registries have a conflict of interest. As ARB's own regulations recognize, registries themselves could be the source of a credit discrepancy. Second, registries are not well capitalized, and therefore could not be relied upon to pay out on claims. Without a balance sheet, a registry would not be in a position to play the role of insurer.

Accordingly, experience suggests that viable and economical insurance products will not materialize under the buyer liability regime proposed by ARB. The insurance products that do emerge will be available only at very high prices, which will severely impair the ARB offsets program. The need to obtain high-priced insurance will amount to a substantial and unnecessary cost to the offsets program, crowding out small projects and small businesses. Far fewer offset credits will be used in the program, including from offset projects that otherwise could pass all of the program's environmental rules with flying colors. Again, this outcome will drive the regulations far closer to the "no-offsets" side of the cost spectrum. (CERP4)

> **Response:** We believe that given all of the clarifications to section 95985, the market should be able to quantify and cover the risk associated with invalidation. We expect that insurance products will emerge once the market has been established, and nothing limits such mechanisms to come from offset project registries.

M-109. Comment: Some ARB officials have asserted that buyers can easily manage their liability risk by entering into contracts with offset project operators that force the latter to pay penalties for invalidated credits. However, this view is not consistent with marketplace realities. Managing the risk through contracts is not feasible.

Such contractual provisions will unleash a chain of contractual claims involving not only the buyer and the offset project operator but also every other party that held custody of the invalided offset credit prior to it being invalidated. The buyer will turn in the first instance to the party that sold the invalidated offset credit to it; this party will then go to the party from whom it received such credit; and so forth down the chain until the offset project operator is reached. Each receiving party of the invalidated offset credit will seek to enforce a contractual claim for damages on the delivering party. Resolving this chain of claims will be hugely time-consuming and costly; it will paralyze the market, and strongly discourage covered entities (especially small businesses) from ever venturing to buy offsets at all.

These outcomes will have seriously adverse effects on the offset program. In effect, aggregators, who intermediate between covered entities and offset project operators by sourcing and developing projects and sell the resulting offset credits to covered entities, will be forced out of the market. This is because no aggregator will guarantee delivery of offset credits to a buyer if there is a possibility that the aggregator will face a contractual claim against it in the event an offset credit is invalidated for reasons beyond its control.

The exit of aggregators will have real consequences. Aggregators play the crucial role of providing covered entities—especially small- and medium-sized businesses that have limited resources—with offsets credits to which they would not otherwise have access. Managing offset credits requires technical expertise and infrastructure that is costly to maintain, and generally beyond the ability of all but the largest covered entities. If aggregators are foreclosed from the market, then far fewer covered entities will use far fewer offsets.

Without aggregators, the offsets market will consist, if it exists at all, of bilateral arrangements between covered entities and individual projects. Even bilateral contracts will require covered entities to count on enforcing these contracts several years into the future. In reality, it is very difficult and costly for covered entities to rely on contract clauses to “carry” for eight years the risk that they suddenly will face a 90-day clock to replace credits.

Such bilateral deals will be manageable only by the largest covered entities, and such entities will be interested only in the largest projects. Covered entities likely will not find it worthwhile to deal with smaller projects—which are the kinds of projects likely to be located in California.

With such a stunted offsets program, allowance prices will necessarily increase in order to provide incentives for the more costly abatement needed to meet the cap. In the end, we will be much closer to the “no-offsets” end of the spectrum. (CERP4)

Response: We do not agree that we should eliminate buyer liability associated with the invalidation of ARB offset credits. Requiring the user to replace the invalidated offsets ensures that purchasers and users of offset credits do their due diligence in seeking out high-quality offset credits. We have clear enforcement authority over covered entities that will be using ARB offsets for compliance. If the covered entity replaces any invalidated offset credits, they may then take appropriate action through third-party contractual arrangements that they may have established prior to purchase. These arrangements currently exist in the voluntary offset market, and we expect that as the offset market becomes more established, that additional mechanisms to deal with the risk of invalidation will also be established. In the event that the offset credit has not yet been used or retired, it will be canceled in the market tracking system and removed from any Holding or Compliance Accounts. These provisions in no way diminish our authority to assess penalties under section 96014 on any offset project developer or verifier that has provided false information to ARB.

We are not convinced that aggregators will be pushed out of the market in response to our policies. The new clarifications will provide quantification of risk and still ensure that every party, including aggregators, conducts due diligence in trading offset credits.

M-110. Comment: Set up a buffer pool for all offset projects. A problem associated with ARBs' "buyer liability" approach is determining which offsets get invalidated. If ARB finds a discrepancy, will an entire vintage year or years of offsets from a project be deemed invalid or just the shortfall? Unless all the offsets are purchased by the same entity, ARB will be saddled with determining which entity is holding invalid offsets. For instance if ARB determines the accreditation of offsets is overstated by more than 5 percent, which offsets within the total lot for that year will be invalidated? Will it be the first offsets generated, the last, or some in the middle? This would cause offsets within the same lot to potentially be offered at different prices. ARB will have to determine which offset credits no longer have value. In turn, ARB will have to develop a mechanism that is fair and unbiased in order to make this determination. ARB's effort to protect the integrity of the offset system is commendable however it has created a level of complexity and element of risk that is unnecessary. The adjustment of the accreditation and verification process to lock in a verified offset after eight or even five years is a step in the right direction. This will alleviate some of the risk this approach presents to buyers and developers but does not completely eliminate the problems associated with this approach. ARB needs to attack the issue on the front end rather than just reacting to an error. NextEra proposes ARB establish a buffer pool of allowances to protect the offset program in the event of a project going bankrupt or a large reversal of sequestration. In addition, credits should be considered irrevocable after they are certified by an accredited verifier. In the case of any calculation errors or discrepancies like those listed in the proposed rule modifications, the offsets should be deducted from a future year offset vintage that has not been transferred to another entity to account for the shortfall. One option would be to take and replace offset credits from the buffer pool. This way the integrity of the program remains intact since the faulty or overstated offsets have been replaced and the risk to the buyer is eliminated. (NEXTERAENERGY2)

> **Response:** We do not agree that we should eliminate buyer liability associated with the invalidation of ARB offset credits. Requiring the user to replace the invalidated offsets ensures that purchasers and users of offset credits do their due diligence in seeking out high-quality offset credits. We have clear enforcement authority over covered entities that will be using ARB offsets for compliance. If the covered entity replaces any invalidated offset credits, they may then take appropriate action through third-party contractual arrangements that they may have established prior to purchase. These arrangements currently exist in the voluntary offset market, and we expect that as the offset market becomes more established, that additional mechanisms to deal with the risk of invalidation will also be established. In the event that the offset credit has not yet been used or retired, it will be canceled in the market tracking system and removed from any Holding or Compliance Accounts. These provisions in no way diminish our authority to assess penalties under section 96014 on any offset project developer or verifier that has provided false information to ARB.
>
> We included extensive modified provisions in section 95985 to make it clear what would trigger an invalidation, how we will invalidate offsets, and which offsets will need to be replaced. We believe that these changes provide clarity on this point.
>
> In addition, we included new section 95985(c)(1)(A)) which includes provisions for ARB to invalidate the overage of credited GHG reductions and GHG removal enhancements. Under this provision, we will only invalidate the number of ARB offset credits that correspond to the overstated GHG reductions and GHG removal enhancements and not 100 percent of the ARB offset credits in that Offset Project Data Report. We also included a procedure for how we will determine which serial numbers we will invalidate. We believe this will maintain the environmental integrity because any overage will immediately be compensated. These provisions address stakeholder concerns that projects will be unfairly penalized for small calculation mistakes.

M-111. Comment: In the case of offset discrepancies, it almost certainly will be the offset project operator, verifier, or offset project registry that is at fault—and, under Regulation, each of these parties submits to the jurisdiction of ARB. Yet, under ARB's proposed buyer liability rules, the holder or user of a credit is presumptively liable. This arrangement turns fairness on its head, as the party less likely to be responsible for the issue bears the cost, while the parties that may be responsible bear no direct cost. This approach does not encourage offset project operators and verifiers to be careful and conservative. In addition, the approach is highly inefficient. To be efficient, a liability system should impose liability on the party that has the most information and ability to control performance. Most covered entities do not have any special insight into methane digesters, ozone-depleting substances, or forestry. In an offsets program, covered entities will rely on the work of verifiers—and on ARB itself as credit issuer. For this reason, making covered entity buyers liable for problems not detected through the regulatory system would impose substantial new costs on buyers without materially reducing the risk that such problems will occur. ARB officials also have asserted that buyers can easily and efficiently manage their liability risk through contracts. This view is not consistent with marketplace realities because of informational asymmetries between buyers (less informed) and sellers (better informed). A viable offsets program will involve the participation of many buyers and sellers—including aggregators who intermediate between smaller covered entities and offset project operators. A buyer liability rule implies a market in which invalidation would unleash a chain of contractual claims involving every party that ever held custody of the credit, paralyzing the marketplace. Aggregators and small businesses will avoid such a market—leaving a stunted offsets program involving only bilateral arrangements by largest covered entities for the largest projects. Small businesses and small projects will fall out of the equation. Some ARB officials see insurers coming to the rescue. For several reasons, SCPPA is skeptical about the emergence of viable insurance products. Insurers typically assess and insure against risks that apply to private activities or enterprises. In an offsets market, by contrast, the risk relates to the performance of a government program—and the ARB offsets system is a government program with no track record of experience. Cost-effective insurance will not materialize in such a small and idiosyncratic market, where the insurance products would have to change over time to match regulatory requirements. In other types of more mature and "natural" markets, the cost of insurance can come down if offered on the basis of large pools of varying risks. However, there is no mechanism in the Regulation that makes such pooling possible for private insurers. As a result, any insurers for the ARB offsets market will have to build up such pools on their own over time and at very high cost—and these costs will be passed through to covered entities in their rates. Finally, SCPPA is skeptical that offset project registries can provide a workable insurance pathway. First, as ARB's own Regulation recognizes, registries themselves could be the source of a credit discrepancy. [See section 95985(b)(1) (providing that a grounds for invalidation includes a determination by ARB that "information provided to ARB for an Offset Project Data Report or Offset Verification Statement by offset verifiers, verification bodies, Offset Project Operators, Authorized Project Designees, or *Offset Project Registries,* related to an offset project was not true, accurate, or complete") (emphasis added).] Second, registries are not well capitalized, and therefore could not be relied upon to pay out on claims. For these reasons, ARB Should Apply the Forest Buffer Account Approach to All Offsets. ARB has included in the Regulation a buffer account that applies for post-issuance problems associated with forest offset projects. SCPPA strongly urges the ARB to apply this Forest Buffer Account approach to all offset projects. The integrity of the emissions cap would be maintained by retiring additional offsets from the buffer account if any problems arise, and offsets would not need to be invalidated. Compared to the buyer liability system, this approach would be:

- equally effective in making the system whole in the event of invalid credits;
- far fairer (by holding "bad actors" liable where possible); and
- much more efficient (again by holding bad actors liable, but also including a systemwide backstop).

ARB has not explained why this kind of approach is workable and appropriate for forest offset projects, but not for other offset project types. In particular, ARB has not explained why extending this approach to all offset projects would impose unreasonable administrative or risk burdens on the agency. SCPPA does not believe such burdens would result. The primary role of ARB under the buffer account approach is to determine the portion of offset credits to set aside in the account. This set-aside should be conservative. In any event, ARB would have the ability to increase the amount of the set-aside if the buffer account runs low. The account requires no active management, and no purchase or sale of offsets. It is not a bank account. The offset buffer account would not be the primary recourse. First, the ARB should identify the entity responsible for the problems with the offsets, and require that entity to provide additional compliance instruments or face penalties. If the responsible entity fails to provide additional compliance instruments, ARB will retire a corresponding amount of offset credits from the Offset Buffer Account. This is similar to the approach taken with the Forest Buffer Account. To implement the buffer approach discussed above, a definition of “Offset Buffer Account” is required, as a new subsection in section 95802(a). A proposed definition is set out below, mirroring the existing language for the Forest Buffer Account. Modify section 95802 (a) as follows:

> (a)<u>(X) “Offset Buffer Account” means a holding account for ARB offset credits. It is used as a general insurance mechanism against failure to surrender additional compliance instruments under section 95985(f) when ARB has made a determination pursuant to Section 95985 (e)(4).</u> (SCPPA6)
>
> **Response:** We do not agree that we should eliminate buyer liability associated with the invalidation of ARB offset credits. Requiring the user to replace the invalidated offsets ensures that purchasers and users of offset credits do their due diligence in seeking out high-quality offset credits. We have clear enforcement authority over covered entities that will be using ARB offsets for compliance. If the covered entity replaces any invalidated offset credits, they may then take appropriate action through third-party contractual arrangements that they may have established prior to purchase. These arrangements currently exist in the voluntary offset market, and we expect that as the offset market becomes more established, that additional mechanisms to deal with the risk of invalidation will also be established. In the event that the offset credit has not yet been used or retired, it will be canceled in the market tracking system and removed from any Holding or Compliance Accounts. These provisions in no way diminish our authority to assess penalties under section 96014 on any offset project developer or verifier that has provided false information to ARB.
>
> We included extensive modified provisions in section 95985 to make it clear what would trigger an invalidation, how we will invalidate offsets, and which offsets will need to be replaced. We believe that these changes provide clarity on this point.
>
> In regard to insurance and risk management mechanisms, we believe that given all of the clarifications to section 95985, the market should be able to quantify

and cover the risk associated with invalidation. We expect that insurance products will emerge once the market has been established. As noted by the commenter, we have also included a role for Offset Project Registries to offer insurance mechanisms, such as a buffer account, for offset projects associated with their registries. While the regulation allows for this, we made it clear in the provision that market participants must not participate or purchase registry insurance.

The buffer account for forestry is necessary to account for reversals in the forest sector due to the issues surrounding permanence. We do not believe that non-sequestration projects pose the same risks, and that such a mechanism is only appropriate to account for sequestration-based reversals.

M-112. Comment: The OWG supports the use of offsets, within the limit established by ARB's regulations, as an effective cost containment tool for the cap and trade program. However, the OWG is concerned that there will be insufficient supply of offsets, and specifically in this context that ARB's current approach to invalidation will both constrain the supply and increase the costs of offsets. The OWG believes that it will not be easy or cost-effective to insure the risk of offset invalidations through traditional insurance markets. Nor does the OWG believe that including language in contracts that will pass the risk from the buyer to the original developer (or someone up the contract chain) will work well, as indications from the market is that many offset project developers will not entertain such clauses**.** Some counterparties may not be willing to enter contracts obligating an entity other than the buyer, and OPOs are in the best position to understand whether particular offset credits have a risk of invalidation. Instead of placing a strict liability on buyers, the OWG recommends that ARB establish a Compliance Buffer Pool (CBP) that is separate but similar to ARB's Forest Buffer Pool. The CBP would be filled with a fraction of all offset credits surrendered to ARB for compliance. ARB could use a risk factor for each type of offset project. For example, the OWG expects that the chance of invalidation for ODS and livestock methane projects is slight. Therefore, ARB could begin filling its CBP with a very low percentage of credits from each lot that is surrendered, possibly 0.5%. This would create a minimal impact on the price of offsets, and yet achieve significantly more certainty for buyers as a whole. If ARB does establish a CBP, the OWG recommends that the regulations include a review by ARB after the first triennial compliance period. Pursuant to this review, ARB could then determine whether the 0.5% (as used in the OWG's example) was too high, too low, or sufficient to cover the invalidations actually observed during that time period. (OFFSETSWG3)

Response: We do not agree that we should eliminate buyer liability associated with the invalidation of ARB offset credits. Requiring the user to replace the invalidated offsets ensures that purchasers and users of offset credits do their due diligence in seeking out high-quality offset credits. We have clear enforcement authority over covered entities that will be using ARB offsets for compliance. If the covered entity replaces any invalidated offset credits, they may then take appropriate action through third-party contractual arrangements that they may have established prior to purchase. These arrangements currently exist in the voluntary offset market, and we expect that as the offset market becomes more established, that additional mechanisms to deal with the risk of invalidation will also be established. In the event that the offset credit has not yet been used or retired, it will be canceled in the market tracking system and removed from any Holding or Compliance Accounts. These provisions in no way diminish our authority to assess penalties under section 96014 on any offset project developer or verifier that has provided false information to ARB.

In regard to insurance and risk management mechanisms, we believe that given all of the clarifications to section 95985, the market should be able to quantify and cover the risk associated with invalidation. We expect that insurance products will emerge once the market has been established.

We do not agree that there will be insufficient offset supply in the first compliance period. We recently estimated that if every entity used their allowable eight percent offsets, approximately 26 million metric tons of offsets would be needed in the first compliance period. This reduced need is due to a start of the first compliance period in 2013 instead of in 2012. At this time, based on the four offset protocols the Board has endorsed—manure digesters, forestry, urban forestry, and destruction of ozone depleting substances—ARB will be close to the supply demand for the first compliance period. We also will propose additional Compliance Offset Protocols for Board consideration beginning in 2012.

M-113. Comment: Offset liability in the proposed modifications allows for certainty for the market to develop insurance. However, if this insurance market is either very expensive or does not meet the needs of the covered entities, the buyers and the developers of offsets will face increased transaction costs and market uncertainty. This will increase costs to all in the market. In contrast, ARB, assumed that insurance will meet the needs of the market. We propose that ARB review this assumption in early 2013 using, as a criteria, both the existence of insurance and the actual use of it by covered entities. Early review of the availability and use of insurance to address offset liability is essential to prevent offset supply issues that will arise in 2015, caused by the long lead times needed to develop offsets. All of these issues, the lack of available protocols, the chilling effect on the market from the offset liability costs, and the overly prescriptive ARB approval process, have the serious potential to limit the amount of offsets and reduce the ability of the market to function efficiently to achieve emission reductions cost-effectively. ARB must be more aggressive in promoting the use of offsets. This would be accomplished by: i) increasing the speed at which offset protocols are adopted; ii) streamlining the process by reducing the prescriptive details of the approval process, iii) focusing on approving independent offset approval agencies to issue usable offsets to reduce bottlenecks and increase the supply of offsets and iv) adopting policies to either provide a buffer account or review the availability and use of insurance in early 2013. (WSPA3)

Response: We recognize stakeholder concerns regarding offset supply. We do not agree that there will be insufficient offset supply in the first compliance period. We recently estimated that if every entity used their allowable eight percent offsets, approximately 26 million metric tons of offsets would be needed in the first compliance period. This reduced need is due to a start of the first compliance period in 2013 instead of in 2012. At this time, based on the four offset protocols the Board has endorsed—manure digesters, forestry, urban forestry, and destruction of ozone depleting substances—ARB will be close to the supply demand for the first compliance period.

ARB may not adopt additional protocols as part of this cap-and-trade rulemaking. All offset protocols used in the compliance program must be adopted by the Board after undergoing a full regulatory process, including an ARB stakeholder process, in accordance with the Administrative Procedure Act, and an environmental review. We plan to look at further offset protocols for potential inclusion in the cap-and-trade program beginning in 2012. The details surrounding any new offset project types for which ARB adopts an offset protocol will be dealt with under that specific rulemaking, and modification will be made to the cap-and-trade regulation as needed.

ARB has provided a role for Offset Project Registries (OPR) to perform some of the administrative functions of the offset process in the regulation. We plan to utilize OPRs in lieu of having ARB perform these duties in the short-term, and may choose to continue this approach throughout the program. We have not yet determined if and when ARB would perform these roles. Therefore, in the meantime, all parties seeking to use Compliance Offset Protocols must go directly to an OPR to list their projects. We plan to approve OPRs sometime in 2012.

M-114. (multiple comments)
Comment: Iberdrola Renewables agrees that offsets will be an important part of the cap-and-trade regulation to provide options for entities with compliance obligations. Iberdrola Renewables is concerned by the proposed ability for CARB to invalidate a previously validated offset credit up to eight years after issuance. The existing provision for offset invalidation will create risk and uncertainty in the offset market, and place liability on entities holding or using offset credits to meet their compliance obligation. The end result will be an inefficient offset market comprised only of bilateral agreements between large entities, as small businesses and projects will not be able to absorb the resulting contractual complexity, eight years of subsequent performance assurance, and compliance and other risks presented by retroactivity. If clear requirements for offset verification and certification are established, a mechanism for revocation should not be required. (IBERDROLA)

Comment: IETA understands and shares California's desire to maintain the environmental integrity of the emissions cap, but believes that providing ARB with the ability to invalidate issued offset credits is the wrong avenue to do so. A proposal to invalidate issued offsets is likely to threaten compliance, increase administrative costs, and decrease offset supply. Because of this, IETA's first recommendation is to establish rigorous offset verification and subsequent certification standards to ensure only quality offsets enter the market. With confidence in every issued offset, retaining the right to revoke offset credits is simply unnecessary. However, if ARB insists on retaining the ability to revoke issued offset credits, IETA's second recommendation would be for California to adopt a forest buffer account approach on all offsets. We note that ARB has included in the proposed Regulations a buffer account that applies for post-issuance problems associated with forest offset projects. IETA strongly urges ARB to apply this Forest Buffer Account to all offset projects. Compared to the buyer liability system, this approach would be: (1) equally effective in making the system whole in the event of invalid credits; (2) far fairer (by holding "bad actors" liable where possible); and (3) much more efficient (again by holding bad actors liable, but also including a system-wide backstop). Why should this kind of approach be workable and appropriate for forest offset projects, but not for other offset project types? IETA would like to reiterate its proposal modeled roughly on a forest buffer account for unintentional reversals that (1) provides absolute assurances of environmental integrity, and (2) avoids imposing undue administrative risks or costs. IETA's proposal, which is explained in greater detail in the appendix, works as follows:

- Before issuing credits to an offset project, ARB would hold back a certain percentage of credits and place the credits in a Compliance Buffer Account (CBA).
- In the event that ARB determined that documentation supporting an offset credit is materially not true, accurate or complete, then ARB would immediately retire credits from the CBA to replace those that had been invalidated.
- In the event that the credits were invalidated due to a discrepancy that resulted from willful intent or gross negligence, ARB would seek to replenish the credits retired from the CBA from the entity actually responsible for the discrepancy. Requiring the CBA to be replenished in this manner will ensure the long-term viability of the CBA and guard against the moral hazard of lax compliance with the offset program.
- In any event, the credits already issued would remain unaffected, but the program would be made whole by retiring credits from the Compliance Buffer Account.

Under this proposal, the market itself, not ARB, bears the risk of flawed credits. In our view, this approach is just as effective in ensuring environmental integrity, but far more efficient and consistent with a robust market. A CBA provides an ironclad compliance backstop resulting in more emissions, reducing offset projects without imposing unreasonable administrative burdens on California. We understand ARB is reluctant to take on additional administrative or risk burdens, but IETA does not believe such burdens would result. The primary role of ARB under this compliance buffer account approach is to determine the portion of offset credits to set aside in the account. We believe this set-aside should be conservative. In any event, ARB would have the ability to increase the amount of the set-aside if the buffer account runs low. The account requires no active management. It is not a bank account. (IETA3)

Response: We do not agree that we should eliminate buyer liability associated with the invalidation of ARB offset credits. Requiring the user to replace the invalidated offsets ensures that purchasers and users of offset credits do their due diligence in seeking out high-quality offset credits. We have clear enforcement authority over covered entities that will be using ARB offsets for compliance. If the covered entity replaces any invalidated offset credits, they may then take appropriate action through third-party contractual arrangements that they may have established prior to purchase. These arrangements currently exist in the voluntary offset market, and we expect that as the offset market becomes more established, that additional mechanisms to deal with the risk of invalidation will also be established. In the event that the offset credit has not yet been used or retired, it will be canceled in the market tracking system and removed from any Holding or Compliance Accounts. These provisions in no way diminish our authority to assess penalties under section 96014 on any offset project developer or verifier that has provided false information to ARB.

We do not agree that an offset credit should remain viable under all conditions. To ensure the enforceability of compliance offsets, we need to have the ability to investigate and take action for violations or noncompliance with the proposed regulation. In the event of fraud or malfeasance on the part of project developers or verifiers, there may be cause to invalidate offset credits after they have been issued, to protect the environmental integrity of the program.

M-115. Comment: IEP recommends that the CARB pursue an offset program in which credits, once certified, are non-revocable. Alternatively, if CARB continues to pursue a program where certified and verified offset credits are revocable, all invalidated offsets should be treated similar to the requirements for forest offset projects [section 95895(g)] in which the forest owner must replace each invalidated ARB offset credit with a valid ARB offset credit or another approved compliance instrument. Offset credits, once issued, should not be revocable by CARB. Alternatively, CARB should remove provisions that make the buyer liable for invalidation, and instead place the liability to replace the offset credit on the offset project operator. Also, revise the regulation so that an offset credit can only be invalidated within one year after the offset is issued.

1. Delete Section 95985: Invalidation of ARB Offset Credits.
2. Alternatively, modify section 95985(f) and section 95985(b) as follows:

(f) Requirements for Non-Sequestration Offset Projects. If an ARB offset credit is found to be invalid pursuant to sections 95985(b) and (d) the party identified in section 95985(c)~~(2)~~ (3) must replace each ARB offset credit with a valid ARB offset credit or another approved compliance instrument pursuant to subarticle 4, within 90 calendar days of notification by ARB pursuant to section 95985(e). If the party identified in section 95985(c)~~(2)~~ (3) does not replace each invalid ARB offset credit within 90 calendar days of the notice of invalidation pursuant to section 95985(e), each outstanding ARB offset credit will constitute a violation pursuant to section 96014. ~~If the party identified in section 95985(c)(2) is no longer in business ARB will require the Offset Project Operator or Authorized Project Designee to replace each invalidated ARB offset credit and~~

~~will notify the Offset Project Operator or Authorized Project Designee that they must replace them. The Offset Project Operator or Authorized Project Designee must replace each ARB offset credit with a valid ARB offset credit or another approved compliance instrument pursuant to subarticle 4, within 90 calendar days of notification by ARB pursuant to section 95985(e). If the Offset Project Operator or Authorized Project Designee does not replace each invalid ARB offset credit within 90 calendar days of notification by ARB pursuant to section 95985(e), each outstanding ARB offset credit will constitute a violation pursuant to section 96014.~~

Section 95985
(b) ARB may determine within ~~8~~1 year~~s~~ of issuance, ~~except as provided in section 95985(b)(5) and (6),~~ that an ARB offset credit is invalid for the following reasons:
(1) ARB determines that information provided to ARB for an Offset Project Data Report or Offset Verification Statement by offset verifiers, verification bodies, Offset Project Operators, Authorized Project Designees, or Offset Project Registries, related to an offset project was not true, accurate, or complete; or
(2) The Offset Project Data Report contains errors that overstate the amount of GHG reductions or GHG removal enhancements by more than 5 percent; or
(3) The offset project did not meet all local, state, or national regulatory requirements during the time covered by an Offset Project Data Report; or
(4) ARB determines that offset credits have been issued in any other voluntary or mandatory program within the same offset project boundary or for the same GHG reductions or GHG removal enhancements covered by an Offset Project Data Report.
(5) If an offset project is developed under Compliance Offset Protocol U.S. Ozone Depleting Substances Projects, ARB may invalidate within ~~five~~ one year~~s~~ of issuance of the ARB offset credits covered by an Offset Project Data Report.
(6) If an offset project is verified after three years of ARB offset credit issuance by a different offset verifier, ARB may invalidate within ~~five~~ one year~~s~~ of issuance of the ARB offset credits covered by an Offset Project Data Report.
(7) An update to a Compliance Offset Protocol in itself, will not result in an invalidation of ARB offset credits issued under a previous version of the Compliance Offset Protocol. (IEPA2)

Response: We do not agree that we should eliminate buyer liability associated with the invalidation of ARB offset credits. Requiring the user to replace the invalidated offsets ensures that purchasers and users of offset credits do their due diligence in seeking out high-quality offset credits. We have clear enforcement authority over covered entities that will be using ARB offsets for compliance. If the covered entity replaces any invalidated offset credits, they may then take appropriate action through third-party contractual arrangements that they may have established prior to purchase. These arrangements currently exist in the voluntary offset market, and we expect that as the offset market becomes more established, that additional mechanisms to deal with the risk of invalidation will also be established. In the event that the offset credit has not yet been used or retired, it will be canceled in the market tracking system and removed from any Holding or Compliance Accounts. These provisions in no way diminish our authority to assess penalties under section 96014 on any offset project developer or verifier that has provided false information to ARB.

We do not agree that an offset credit should remain viable under all conditions. To ensure the enforceability of compliance offsets, we need to have the ability to investigate and take action for violations or noncompliance with the proposed regulation. In the event of fraud or malfeasance on the part of project developers or verifiers, there may be cause to invalidate offset credits after they have been issued, to protect the environmental integrity of the program.

Section 95985(b) was modified to establish a statute of limitations for the invalidation of ARB offset credits of three years if the Offset Project Data Report or a subsequent Offset Project Data Report, depending on project type, is verified by a different verifier within that time frame. If the offset project does not qualify under these requirements, the default statute of limitations is eight years. We believe that the three-year time period is sufficient to uncover any new information, as long as the project has been reviewed by a second verifier. If it is not looked at by a second verifier, we believe that eight years is necessary to uncover any new information that could lead to the invalidation of ARB offset credits. We believe the eight-year statute of limitations is sufficient because it would allow two verification parties to examine the offset credits in question for continuous projects. We do not believe that one year would provide sufficient time to detect all relevant new information or uncover any mistakes that a verifier may have missed.

M-116. Comment: We have serious concerns about ARB's "buyer liability" approach to addressing situations in which problems are identified with offset credits after they have been issued. At present, buyer liability will undermine a liquid, and efficient market open to all. Instead, offsets will become a high-risk private investment exercise suited only to a small number of specialist intermediaries. It will prevent the development of a market in offsets, limit allowance supply for California large emitters, and may increase compliance costs. Buyer liability will significantly increase the overall cost of the California Cap and Trade Program. Buyers of offset allowances will demand lower prices to reflect their risk that offset allowances could be invalidated. This will likely result in a large discount for offset allowances relative to non-offset allowances. Low pricing will not provide the necessary incentive for emission reduction project to be developed. ARB modeled the Regulations under a scenario in which no offsets could be utilized. Relative to the baseline case (in which offsets are utilized to the full 8 percent limit), ARB's modeling concluded that this "no offsets" scenario would yield allowance prices in 2020 that would be $108 higher ($148/ton instead of $30/ton)—resulting in $18 billion more in costs in that year alone. The current buyer liability approach effectively will drive the AB 32 program toward the "no offsets" scenario, resulting in significantly increased compliance costs. Some ARB officials see insurers coming to the rescue. For several reasons, we are skeptical about the emergence of viable insurance products. Insurers typically assess and insure against risks that apply to private activities or enterprises. In an offsets market, by contrast, the risk relates not only to identifiable actor failures to perform, but also to the performance of a government program. This form of regulatory risk is very difficult to measure in general, but more so in a new and untested regime. Cost-effective insurance will not materialize in such a small and idiosyncratic market. Under similar programs, companies have attempted to secure third party coverage from large insurers as well as re-insurers to mitigate buyer liability risk. Both internationally and domestically, these efforts have failed to yield a satisfactory insurance product covering compliance exposure. This risk is difficult for insurance markets to quantify because one ton of offset allowance may or may not have equivalent monetary value between two periods; and the market replacement cost may only cover part of the exposure. In the end, it is more than a market risk issue. It contains elements of regulatory, reputational and market risk. That part of the equation has proven to be unquantifiable in many instances, particularly over very long time periods. The proposed rules also contemplate that offset project registries may offer voluntary insurance products to protect against buyer liability risks." We are skeptical that offset project registries can provide a workable insurance pathway. First, as ARB's own regulations recognize, registries themselves could be the source of a credit discrepancy." Second, registries are not sufficiently capitalized, and even with third party balance sheet support (insurance), cannot necessarily be relied upon to pay out claims. We believe that the ARB should reconsider offset invalidation procedures and instead rely on the pre-issuance process. Multiple verifications over sequential operating periods can provide the necessary safeguards. If enough security cannot be provided pre-issuance, then we further encourage the consideration of a much shorter period over which issued offsets can be subject to invalidation proceedings. Post issuance, multiple verifications of sequential operating periods together with rotating verifier assignments could support a shorter "at-risk" period and provide comfort. We believe an aggressive and secure pre-issuance process can provide regulators with the certainty to issue offsets permanently. Absent relying on a secure issuance, ARB could consider an alternative to the cancelling of credits that would not impair the compliance value of issued offsets. Swapping and cancelling equal numbers of viable offsets in a compliance buffer account for offsets subject to invalidation proceedings could relieve this risk. Alternatively, ARB could follow the procedure for invalidating CERS and require verification bodies that wrongly verify offset allowances to procure and extinguish an equal number of allowances. However, should the Board retain the offset invalidation rules as they are currently proposed, the statute of limitations on the invalidation of offsets could be reduced from eight to not more than two years. These measures will help ensure that normal market transaction rules reduce cost and increase market transparency and fairness. (BARCLAYS)

Response: We do not agree that we should eliminate buyer liability associated with the invalidation of ARB offset credits. Requiring the user to replace the invalidated offsets ensures that purchasers and users of offset credits do their due diligence in seeking out high-quality offset credits. We have clear enforcement authority over covered entities that will be using ARB offsets for compliance. If the covered entity replaces any invalidated offset credits, they may then take appropriate action through third-party contractual arrangements that they may have established prior to purchase. These arrangements currently exist in the voluntary offset market, and we expect that as the offset market becomes more established, that additional mechanisms to deal with the risk of invalidation will also be established. In the event that the offset credit has not yet been used or retired, it will be canceled in the market tracking system and removed from any Holding or Compliance Accounts. These provisions in no way diminish our authority to assess penalties under section 96014 on any offset project developer or verifier that has provided false information to ARB.

Section 95985(b) was modified to establish a statute of limitations for the invalidation of ARB offset credits of three years if the Offset Project Data Report or a subsequent Offset Project Data Report, depending on project type, is verified by a different verifier within that time frame. If the offset project does not qualify under these requirements, the default statute of limitations is eight years. We believe that the three-year time period is sufficient to uncover any new information, as long as the project has been reviewed by a second verifier. If it is not looked at by a second verifier, we believe that eight years is necessary to uncover any new information that could lead to the invalidation of ARB offset credits. We believe the eight-year statute of limitations is sufficient because it would allow two verification parties to examine the offset credits in question for continuous projects.

As noted by the commenter, we have also included a role for Offset Project Registries to offer insurance mechanisms, such as a buffer account, for offset projects associated with their registries. While the regulation allows for this, we made it clear in the provision that market participants are not required to participate in or purchase registry insurance.

With regard to the comments related to the development of insurance, we believe that given all of the clarifications to section 95985 the market should be able to quantify and cover the risk associated with invalidation. We expect that insurance products will emerge once the market has been established.

M-117. Comment: PG&E appreciates the addition of section 95987(k) to the Regulations, allowing an Offset Project Registry to offset an insurance mechanism. An Offset Project Registry could serve as a third party administering a Compliance Buffer Account, but for such an account to be effective, contribution to the Account should be mandatory for all offset credit projects and triggers should be included to increase contribution to the Account if more than 50 percent of the offsets are withdrawn due to the provisions in section 95985. (PGE4)

> **Response:** As noted by the commenter, we have also included a role for Offset Project Registries to offer insurance mechanisms, such as a buffer account, for offset projects associated with their registries. While the regulation allows for this, we made it clear in the provision that market participants do not need to participate in or purchase registry insurance. It will be up to each registry to decide if and how to best establish an insurance mechanism.

M-118. (multiple comments)
Comment: IETA appreciates that ARB has extended the period of time from 30 days to 90 days that an invalidated credit must be replaced. Firstly, IETA believes that it should be the responsibility of the project owner or other relevant entity that committed the error (not the buyer) which leads to the invalidation to replace the offsets credits, as discussed above. Secondly, 90 days remains a very tight timetable for any entity to obtain replacement credits, particularly if it must obtain a large quantity. IETA respectfully urges ARB to further lengthen this period, and we do not believe that a longer period would impose any particular added burden on the program—or the climate. To this end, we note that the Regulations allow six months in the event of under-reporting of emissions for a covered entity to surrender additional compliance instruments. It is unclear why there should be a shorter period in the context of an ARB determination of offset invalidation under section 95985(c), and therefore respectfully urge ARB to modify the relevant provisions. (IETA3)

Comment: We urge ARB to allow for at least five months for replacement of offset credits with other compliance instruments in all circumstances (section 95983). It could prove very difficult for a market participant to acquire the necessary compliance instruments in 90 days, particularly if the market is illiquid at any given time. (NEWFOREST2)

Comment: We appreciate that ARB has extended the period of time from 30 days to 90 days that an invalidated credit must be replaced.

Firstly, we believe that it should be the responsibility of the project owner or other relevant entity that committed the error (not the buyer) which leads to the invalidation to replace the offsets credits, as discussed above.

Secondly, 90 days remains a very tight timetable for any entity to obtain replacement credits, particularly if it must obtain a large quantity. We respectfully urge ARB to further lengthen this period, and we do not believe that a longer period would impose any particular added burden on the program—or the climate.

To this end, we note that the regulations allow six months in the event of underreporting of emissions for a covered entity to surrender additional compliance instruments. Furthermore, in the context of an intentional reversal in a sequestration project, the regulations sensibly provide a year to determine the extent of the reversal. It is unclear why there should be a far shorter period in the context of an ARB determination of offset invalidation under section 95985(f), and therefore respectfully urge ARB to modify the relevant provisions. (CERP4)

> **Response:** We changed the timing for when the responsible party must replace the invalidated ARB offsets from 30 days to six months. This should provide enough flexibility for those that must replace invalidated offsets to purchase additional compliance instruments while still ensuing that the environmental integrity of the cap is maintained.

M-119. (multiple comments)
Comment: Most offset protocols incorporate a concept of materiality, in part in consideration of the fact that unintentional errors, minor measurement errors, etc. may occur that do not materially affect the GHG assertion. We believe it is not ARB's intent to invalidate ARB Offset Credits in the case of immaterial errors. We thus recommend adding the word to section 95985(b)(1): "ARB determines that information provided to ARB for an Offset Project Data Report or Offset Verification Statement by offset verifiers, verification bodies, Offset Project Operators, Authorized Project Designees, or Offset Project Registries related to an offset project was not <u>materially</u> true, accurate or complete;" (MARTINN3)

Comment: IETA respectfully requests that ARB eliminate section 95985(b)(1). Given the myriad requirements of the offset Regulations, any number of projects will have documentation that has inadvertent inaccuracies or omissions. Yet, under this vague and overbroad provision, a minor paperwork problem could result in invalidation of 100 percent of the offset credits already issued for a project, even if there was no impact on the reductions or removals actually achieve by the project. This is a draconian, "gotcha" approach that will deter development of offset projects for reasons unrelated related to environmental integrity. Furthermore, any discrepancies that *do* have material effects on the environmental integrity of the project are completely addressed by sections 95985(b)(2), (3), and (4). For these reasons, we respectfully urge ARB to eliminate section 95985(b)(1). (IETA3)

Comment: We urge to ARB modify the provisions under which offset credits may be invalidated. Currently, these include four conditions: the project information is not "true, accurate, or complete" (section 95985(b)(1)); the project documentation contains errors such that emission reductions achieved by the project are overstated by 5 percent or more (section 95985(b)(2)); the project did not meet all applicable legal requirements (section 95985(b)(3)); and a finding that credits already have been issued for the project in another program ((section 95985(b)(4)). We respectfully request that ARB eliminate (b)(1). Given the myriad requirements of the offset regulations, any number of projects could have documentation that has inadvertent inaccuracies or omissions. Yet, under this vague and overbroad provision, a minor paperwork problem could result in invalidation of 100 percent of the offset credits already issued for a project—even if there was no impact on the reductions or removals actually achieve by the project. This is a draconian, "gotcha" approach that will deter development of offset projects for reasons unrelated related to environmental integrity. Furthermore, any discrepancies that do have material effects on the environmental integrity of the project are completely addressed by (b)(2), (3), and (4). For these reasons, we respectfully urge ARB to eliminate (b)(1). Modify section 95985 as follows:

> (a) ARB may determine~~, within 8 years of issuance, except as provided in section 95985(b)(5) and 6, that an ARB offset credit is invalid for the following reasons:~~ at any time until the earlier of (i) a post-issuance verification of the Offset Project Data Report by a different offset verifier and (ii) 5 years ~~of~~ after issuance, that:
> ~~(1) ARB determines that information provided to ARB for an Offset Project Data Report or Offset Verification Statement by offset verifiers, verification bodies, Offset Project Operators, Authorized Project Designees, or Offset Project Registries related to an offset project was not true, accurate, or complete; or~~
> ~~(2)~~(1) The Offset Project Data Report contains errors that overstate the amount of GHG reductions or GHG removal enhancements by more than 5 percent (in which case, ARB shall determine the amount of offset credits that corresponds to the overstatement); or
> ~~(3)~~(2)The offset project did not meet all local, state, or national regulatory requirements during the time covered by an Offset Project Data Report; or
> ~~(4)~~(3)ARB determines that Offset credits have been issued in any other voluntary or mandatory program within the same offset project boundary or for the same GHG reductions or GHG removal enhancements covered by an Offset Project Data Report.
> ~~(5) If an offset project is developed under Compliance Offset Protocol U.S. Ozone Depleting Substances Projects, ARB may invalidate within five years of issuance of the ARB offset credits covered by an Offset Project Data Report.~~
> ~~(6) If an offset project is verified after three years of ARB offset credit issuance by a different offset verifier, ARB may invalidate within five years of issuance of the ARB offset credits covered by and Offset project Data Report~~
> ~~(7)~~(4)An update to a Compliance Offset Protocol in itself, will not result in an invalidation of ARB offset credits issued under a previous version of the Compliance Offset Protocol. (CERP4)

Comment: ARB should only invalidate those credits that are in excess of the actual value. If a second verifier discovers a material mistake that led to an overstatement of offset issuance by 10 percent, then 10 percent of the total issuance to that offset project data report should be retired from the buffer reserve. Invalidating all offset credits under an offset project data report is not necessary for any reason. It is only necessary if ARB is seeking to recover the invalidated offsets from participants ex post. If ARB adopts a buffer reserve approach, it could invalidate the appropriate amount while continuing to recognize valid emissions reductions or avoided emissions. (NEWFOREST2)

Comment: ARB should continue to provide additional clarification regarding the basis for and extent of offset credit invalidation. TNC commends ARB for providing additional clarification in the Regulations to identify the circumstances under which offset credits may be invalidated. Such clarity will help encourage investments in offset projects as market participants (forest owners, OPOs, capped entities, etc.) will have greater certainty and ability to manage risk. TNC recommends that ARB provide additional clarification to section 95985(b) by identifying the extent to which offset credits may be invalidated. For instance, subsection (b)(2) indicates that credits may be invalidated when the Offset Project Data Report overstates the amount of GHG reductions or removals by more that 5 percent. It is unclear from this provision whether all credits or just the portion that is overstated would be invalidated. Additional detail regarding the scope of invalidation or the process that will be used to determine the scope of invalidation for this subsection as well as the others in this provision would be useful. (NC8)

Comment: We recommend that ARB further refine the conditions in which credits are invalidated. No measurement is completely precise. We can expect offset project data reports to yield credit estimates that are higher and lower than the actual, true value. It is necessary and appropriate to invalidate credits when such errors (or outright fraud) are discovered. However, it makes no sense for ARB to invalidate all offset credits from an offset project data report due to any error that renders the report not “true, accurate or complete” in any way. ARB should strike section 95985(b)(1). The other provisions in this subsection address both fraud and significant errors, and this catch-all provision is unnecessary. If section 95985(b)(1) is retained, ARB should add a materiality qualifier so that offset project data reports are not invalidated due to immaterial errors that have no significant effect on offset credit issuance, e.g. “materially true, accurate or complete.” (NEWFOREST2)

> **Response:** We included extensive modified provisions in section 95985 to make it clear what would trigger an invalidation, how we will invalidate offsets, and which offsets will need to be replaced. We believe that these changes provide clarity on this point.

M-120. (multiple comments)
Comment: If emissions reductions are overstated by 5 percent or more, then ARB can invalidate all offsets generated by a project during the verification period. For smaller-scale projects, with many “moving parts” (e.g., cattle, generators, boilers, flares), it will be very unlikely that all of the credits from the verification period will be issued in error. It will be more likely that there could be a faulty meter or a calculation error or a missing piece of data that causes a downward revision of the reductions. In this case, there needs to be a provision for the number of offsets issued to be adjusted after the error is determined. We suggest that the project owner have the option of carrying out a re-verification and that a discount be applied retroactively to each offset

issued in the year where the misstatement has occurred. This should be relatively straightforward, as each offset will have a serial number linking it to a vintage year and project. (CIG2)

Comment: If the Board does ultimately decide to enact the buyer liability approach that it has proposed, the Board should make it clear that only invalidated offset credits that have been used for compliance (placed into a Compliance Account) need be replaced, rather than all invalidated credits (section 95985(f)). In an emissions trading system, if an incorrectly issued credit has not yet been used for compliance, its removal from the system is sufficient to ensure the system's atmospheric integrity. The holder of the invalidated credit should then be entitled to make its own decision regarding replacement with another offset or an allowance. (CAR4)

> **Response:** We agree and included provisions in section 95985 to clarify that only ARB offset credits in the Retirement Account must be replaced. ARB offsets credits that reside in any Holding or Compliance Accounts will be removed, but do not need to be replaced. We do not believe it is possible to list every type of situation under which a downward revision to an offset project data report is necessary, and did not add such text.

M-121. Comment: Section 95985(b)(7) provides that in itself, an update to a Compliance Offset Protocol "will not result in an invalidation of ARB offset credits issued under a previous version of the Compliance Offset Protocol." SCE applauds ARB's inclusion of this section. In order to promote the most effective and efficient offset reductions, the regulated community must have confidence that ARB will not reverse the approval it gave to an offset project or offset after it has been verified. However, SCE recommends that ARB add explicit language to this section stating that a protocol change cannot in any way influence a decision to reverse an offset. Modify section 95985(b)(7) as follows:

> (7) An update to a Compliance Offset Protocol ~~in itself~~, will not <u>in any way</u> result in an invalidation of ARB offset credits issued under a previous version of the Compliance Offset Protocol. (SCE3)

> **Response:** We agree and have added new section 95985(c)(4)(A).

M-122. Comment: It is improper for CARB to set aside a percentage of the total offsets into a fund that would be used to cover future invalidations. This hedge fund approach devalues an offset from the outset, and makes the seller assume the risk by giving away part of his asset, or the buyer pay more for less. (WM3)

> **Response:** We agree and will not be changing the responsible party for covering an invalidation.

M-123. Comment: We commend ARB for adopting a "statute of limitations" for invalidation. This is reasonable and reduces the uncertainty significantly. (MSCG3)

Response: Thank you for your support.

M-124. (multiple comments)
Comment: Section 95985(b) gives ARB the sole authority to invalidate credits. WSPA believes that invalidation should be judged by impartial third party. WSPA recommends that this section be amended to incorporate input and recommendations from an impartial third party. (WSPA3)

Comment: In section 95985(h), the reference to not precluding the "State of California" from taking enforcement action should be broadened to include any entity authorized by law to enforce the provisions of this Regulation. (SCAQMD4)

Response: We disagree that a third-party should make determinations regarding invalidations. We are the only party that can regulate the compliance offsets market and determine which ARB offset credits are valid. We already receive input from third parties through the third-party verification process and the offset project registries. We have sole responsibility to enforce this regulation and do not believe it is appropriate to delegate that authority to another entity.

M-125. Comment: ARB should use the forest offset buffer pool for invalidation of forest offsets in the same manner it relies on the pool for intentional reversals to avoid inconsistencies. In the event of an intentional reversal of forest offsets, the current draft of the Regulation (Subarticle 13, section 95983(c)(3)) requires the forest owner to replace these reversed tons with valid offset credits or other compliance instruments. TNC recommends that this replacement responsibility be assigned to the OPO since this party, according to the “forest owner” definition, is effectively the forest owner. In instances where intentionally reversed forest offsets are not replaced within 90 calendar days, ARB relies on the forest buffer account to replace the reversed tons. In the case of forest offsets, there may be instances where there is little difference between an intentional reversal and the invalidation of a forest offset. For instance, a party may intentionally harvest timber in a forest offset project area that effectively reverses (or reduces) offset credit that has already been attributed to a compliance obligation. This action could qualify as an intentional reversal, triggering the remedial process of section 95983(c)(3). At the same time, this intentional reversal could also qualify for offset credit invalidation pursuant to section 95985(b)(1) or (b)(2) as the reversal could be characterized as information that was not accurate or as a data report that overestimated the amount of GHG removal enhancements. While this instance could qualify for either scenario, the processes for addressing this issue in the Regulations are different with one using the forest buffer as a fall back option (intentional reversal) and the other not using the forest buffer account at all (invalidation). To avoid this inconsistency and likely future conflict in regulatory interpretation, TNC recommends that ARB utilize the same remedial process to address forest offset credit invalidation and intentional reversals. The forest buffer account should be used as security in instances where the OPO does not replace the invalidated or intentionally reversed forest offsets within 90 days. To ensure that the forest buffer account maintains sufficient offsets to remedy reversals and invalidation, ARB could adjust the forest buffer risk rating in the Forest Protocol (see Appendix D of the Compliance Offset Protocol for U.S. Forest Projects) to include invalidation risk. (NC8)

> **Response:** We do not agree that we should eliminate buyer liability associated with the invalidation of ARB offset credits. Requiring the user to replace the invalidated offsets ensures that purchasers and users of offset credits do their due diligence in seeking out high-quality offset credits. We have clear enforcement authority over covered entities that will be using ARB offsets for compliance. If the covered entity replaces any invalidated offset credits, they may then take appropriate action through third-party contractual arrangements that they may have established prior to purchase. These arrangements currently exist in the voluntary offset market, and we expect that as the offset market becomes more established, that additional mechanisms to deal with the risk of invalidation will also be established. In the event that the offset credit has not yet been used or retired, it will be canceled in the market tracking system and removed from any Holding or Compliance Accounts. These provisions in no way diminish our authority to assess penalties under section 96014 on any offset project developer or verifier that has provided false information to ARB.
>
> In addition, we made clarifications to both sections 95983 and 95985 to address stakeholder concerns that the regulatory language requires that offset credits be double compensated in the event of reversals. Section 95983(b)(2) now states that we will retire a quantity of ARB offset credits from the Forest Buffer Account in the event of an unintentional reversal. Sections 95983(c) and (d) specify that in the event of an intentional reversal the Forest Owner must replace ARB offset credits to ARB in the amount specified in the regulation. Also, in new section 95985(c)(4)(B) we specify that reversals do not constitute an invalidation, and if a reversal occurs, the provisions in section 95983 apply.

M-126. Comment: The provisions in section 95985 Invalidation of Offset Credits (b) should be modified. PacifiCorp recommends the inclusion of a materiality requirement for all provisions except for section 95985 (b)(2) The Offset Project Data Report contains errors that overstate the amount of GHG reductions or GHG removal enhancements by more than *5 percent.* Further, PacifiCorp recommends that section 95985(b)(4) include a provision that excludes the issuance of RECs from invalidating the offset credit. For example, if a dairy methane capture project, which qualifies as a carbon offset, burns the captured methane for electricity generation and the electricity generation qualifies for a REC, it should not invalidate the original offset (removal of methane from the atmosphere). (PACIFICOR3)

> **Response:** We included extensive modified provisions in section 95985 to make it clear what would trigger an invalidation, how we will invalidate offsets, and which offsets will need to be replaced. We believe that these changes provide clarity on this point. We have already clarified that biogas used for an

REC does not affect the digester project's ability to generate offset credits for destroyed or captured methane.

M-127. Comment: ARB should refine forest offset liability associated with invalidation and intentional reversals by identifying the Offset Project Operator as the party initially responsible for invalidation of forest offsets. According to sections 95983 and 95985 of Subarticle 13, the forest owner is responsible for replacing offsets whether it's due to invalidation or an intentional reversal. However, as stated previously, the forest owner is broadly defined to include any entity that has an interest in the property involved in the forest offset. The result of this broad definition creates significant uncertainty regarding who among the "forest owners" would be responsible for replacing offsets. The forest owner definition also states that only one entity who qualifies as a forest owner can be the Offset Project Operator. According to Subarticle 2, section 95802(a)(172), an "Offset Project Operator" is the "entity(ies) with legal authority to implement the offset project." If the Offset Project Operator (OPO) has the legal authority to implement the offset project and those who qualify as forest owners must identify only one OPO, it would be consistent and more clear to identify the OPO as the party, at least initially, who would be responsible to replace forest offsets in the event of forest offset invalidation and intentional reversals. ARB could also include a separate provision as it does in section 95985(h) that retains the authority of California to pursue enforcement action against any party in violation of the article. Doing so would provide more certainty to forest owners, market participants and regulated entities regarding the chain of liability that ARB would seek in an enforcement action and allow these parties to more thoughtfully address these risks in contracts. (NC8)

> **Response:** We do not agree that the Offset Project Operator should be liable for forest offset invalidations instead of the Forest Owners. We have enforcement authority over all forest owners under the regulation; however, identifying one party as the Offset Project Operator will be more administratively simple for both ARB and the forest owners when dealing with the various offset processes. At least one forest owner will be identified as the offset project operator. Forest owners have physical custody of the carbon stocks and therefore should have liability for the offset projects. The Forest Owners can establish contractual arrangements among themselves for establishing specific responsibility for invalidated credits.

Clarification of Reversals and Invalidation

M-128. (multiple comments)
Comment: Additional clarification about the relationship between intentional forest reversals and offset invalidation would be helpful. (TWS)

Comment: We are confused by the discontinuities between the forestry intentional reversals language and the invalidation provision regarding forestry. As written, the invalidation provision states in section 95985(g) that the Forest Owner must replace any ARB offset credit if it is found to be invalid pursuant to section 95985(b) and (d), and states that failure to do so will be considered a violation pursuant to section 96014. However, it is unclear whether section 95985(g) also incorporates section 95983(c)(3) and gives ARB to the authority to retire credits from the forestry buffer account if there is an invalidation of credits for reasons other than an unintentional or intentional reversal, or if ARB's sole recourse is to the forest owner to replace such credits. CERP requests clarification on this issue. (CERP4)

Comment: CMTA believes it is unreasonable and counterproductive to impose liability for intentional or unintentional offset reversals. The enforcement and potential penalty assessment of such liability ignores the purpose of the certification process. Since CARB has assured quality offsets through stringent offset qualification rules and third party verification, it is redundant and unreasonably onerous for the entity purchasing or surrendering the offset credit to also be responsible for it being real, permanent, etc. Allowing CARB to invalidate offsets eight years from the time they are issued will create unnecessary uncertainty and risk that could suppress the market. There is not substantial evidence in the record to justify the need for buyer liability to protect the integrity of the offset market. (CMTA3)

Comment: section 95985. Invalidation of ARB Offset Credits. The Regulation places the liability for invalidation due to errors and omissions made by unrelated third parties, such as verifiers, registries and software providers, on Forest Owners (including easement holders with no control over the project). This unknowable liability for multiple parties for incidents beyond their control will prevent many forestry projects from participating in the ARB program, especially those operated by small landowners. We therefore recommend ARB adopt a buffer pool approach to manage the risk of invalidation. If the current approach is maintained, Owner liability should be restricted to errors and omissions under their control, but leave liability for unintentional good-faith errors to a buffer pool or contributions from future verifications. (BLUESOURCE2)

> **Response:** We agree and made clarifications to both sections 95983 and 95985 to address stakeholder concerns that the regulatory language requires that offset credits be double-compensated in the event of reversals. Section 95983(b)(2) now states that we will retire a quantity of ARB offset credits from the Forest Buffer Account in the event of an unintentional reversal. Sections 95983(c) and (d) specify that in the event of an intentional reversal the Forest Owner must replace ARB offset credits to ARB in the amount specified in the regulation. Also, in new section 95985(c)(4)(B) we specify that reversals do not constitute an invalidation, and if a reversal occurs, the provisions in section 95983 apply.

Reversals in the Forest Sector

M-129. Comment: For unintentional forest reversals, ARB will retire credits from a 'Forest Buffer Account.' In the case of intentional forest reversals, a forest owner must provide a replacement offset or other compliance instrument or ARB will retire credits from Forest Buffer Account and commence an enforcement action against the forest owner. It is unclear what mechanism, if any, exists for replenishing the Forest Buffer

Account. ARB should make explicit any mechanism by which an enforcement action in the case of an intentional reversal will result in replenishment of the Forest Buffer Account and if any process exists for replacing retired Forest Buffer Account credits in the case of unintentional reversals. If no process exists for replacing Forest Buffer Account credits, or even if the Forest Buffer Account is only replenished in the case of intentional reversals, depletion of the Forest Buffer Account is a concern. If the Forest Buffer Account is depleted and unable to help restore tons to the Cap and Trade system that are lost due to reversals, then the integrity of the cap may be compromised. (TWS)

> **Response:** The regulation requires that the Forest Owner replace the reversed tons to the Forest Buffer Account. If they do not, there will be financial penalties that will apply. The replenishment of offset credits in the Forest Buffer Account is derived from a portion of offset credits issued to forestry projects. We believe the amount of offset credits received from forestry projects will sustain the Forest Buffer Account from retirement of offset credits due to unintentional or intentional reversals.

M-130. Comment: As with the quantification of intentional reversals from forestry projects in section 95983(c)(3), project owners should have one year to complete another verification and 90 days to replace the number of credits which were found to have been issued in error. If this can be applied to forestry projects, we believe similar latitude can be, and should be, applied to livestock offset projects. (CIG2)

> **Response:** We agree and allow Forest Owners to re-verify their forest projects within one year of the intentional reversals. In addition, we modified the regulation to give the Forest Owner six months to replace the reversed tons. In the case that ARB offset credits issued to livestock projects are invalidated pursuant to section 95985 the operator also has six months to replace the invalid ARB offset credits.

Permanence

M-131. Comment: CAR's reversal compensation rule for improved forest management projects (and in effect the same rule ARB is adopting in section 95983(c)(3)) is unnecessarily punitive for true working forest projects that do not choose to fully incur the incredible opportunity costs of sacrificing timber values and strongly disincentivizes forestland owners to concurrently improve forest management and supply legitimate offsets to the market. If compensation of reversals continues to be a requirement, as opposed to the VCS method of canceling credits from the buffer pool equal to the reversal, reversal compensation should be limited to the credits issued prior to the reversal. Such a rule would significantly improve the appeal of engaging in the CA offset market to forestland owners holding less than 1,000 acres because they wouldn't be penalized for occasional silvicultural activities that temporarily push above-ground standing live carbon stocks below the minimum baseline level (MBL). This potential change in reversal compensation would also preserve the relevance of conservation easements because the protocol wouldn't necessarily induce the level of conservation practices that are already incentivized by payments from land conservancies. Such compensation on top of what a landowner would commit to for carbon value would make participation in the California offset market even more financially rewarding, thereby facilitating increased landowner engagement. I recommend that ARB change the reversal compensation rule accordingly, and adopt the VCS Program requirements for the development of Agriculture, Forestry and Other Land Use (AFOLU) projects and methodologies found in sections 3.6.7, 3.6.8, and 3.6.11 as follows:

3.6.7 Where an event occurs that is likely to qualify as a loss event and VCUs have been previously issued, the following applies:
2) At the verification event subsequent to the loss event, the monitoring report shall restate the loss from the loss event and calculate the net GHG benefit from the monitoring period in accordance with section 4.7.2 and the methodology applied. In addition the following applies:
a) Where the net GHG benefit of the project, compared to the baseline, for the monitoring period is negative, taking into account project emissions, removals and leakage, a reversal has occurred and buffer credits equivalent to the reversal shall be cancelled from the AFOLU pooled buffer account as follows:
3.6.8 At a verification event, where a reversal has occurred, the following applies:
2) Where the reversal is a non-catastrophic reversal (eg, due to poor management or over-harvesting) the following applies:
a) No further VCUs shall be issued to the project until the deficit is remedied. The deficit is equivalent to the full amount of the reversal, including GHG emissions from losses to project and baseline carbon stocks.
3.6.11 Although buffer credits are cancelled to cover carbon known, or believed to be lost, the VCUs already issued to projects that subsequently fail are not cancelled and do not have to be "paid back." (GRINNELL)

> **Response:** To ensure permanence of GHG reductions and GHG removals we will manage the risk of reversals through the Forest Buffer Account. We believe this mechanism provides enough flexibility for developers of forest offset projects to manage the risk of potential reversals, and we do not see a need for additional mechanisms within the regulation.

Early Action

Early Action Operations

M-132. Comment: PG&E supports the modifications to the Early Action Offset section of the Regulations. These modifications will encourage existing projects to transition to the ARB Compliance Protocols. These projects are critical to address the expected shortage of offset credits early in the program. (PGE4)

> **Response:** Thank you for your support on the modifications to the regulation.

M-133. Comment: We are not sure why a project developer is not allowed to use ARB protocols to register new projects in 2012. To us, using ARB protocols from 2012 would greatly simplify and harmonize registration. It would provide an opportunity to "road-test" these protocols and the ARB issuance process. Again, requiring projects to effectively undergo two verifications (one for CAR and another for ARB) has a disproportionate impact on smaller-scale projects and increases uncertainty for small-scale developers. For example, the price differential, showing the uncertainty over the ARB re-verification process, at the moment between CAR livestock CRTs and ARB offsets is around $3, or 25-30 percent. (CIG2)

> **Response:** The regulation includes provisions to allow early action offset credits to be credited as ARB offset credits and used in the cap-and-trade program. We included these provisions to allow parties to develop offset projects and purchase offset credits that are being issued by Early Action Offset Programs. These provisions will provide parties with certainty that the regulation will allow them to participate in the offsets market while we finalize the regulation and take the necessary implementation steps to develop a fully functioning ARB offsets program and offsets tracking system. Once ARB Compliance Offset Protocols are finalized, project developers will be able to use them to quantify, monitor, and report their GHG reductions and GHG removal enhancements. In 2012, we will approve additional Offset Project Registries so that project developers can list and report their emissions with these registries. We will also accredit ARB offset verifiers to verify GHG reductions and GHG removal enhancements from offset projects developed under Compliance Offset Protocols.
>
> In addition, we added new section 95990(k) to the regulation to clarify how early action offset projects transition to Compliance Offset Protocols.

M-134. (multiple comments)
Comment: Section 95990(i) states that section 95985 applies to entities submitting Early Action Offset Credits for ARB Offsets. It also contains language which states the entity which submits the EAOCs for ARB Offsets is liable in the event an offset is invalidated and the end-user is no longer in business. For forest owners who submit EAOCs, this language directly conflicts with section 95985(g). We recommend that ARB clarify this section so that the language in this section is specific for Holders of EAOCs while the language in 95985(f) and (g) is referenced for the Offset Project Operator, Offset Project Designee, or Forest Owner if applicable if one of these is the entity which submits the EAOCs for ARB Offsets. (FINITE)

Comment: Page A-265 (1) Transfer of Early Action Offset Credits to ARB by Credit Holders vs. Project Operators. While we support the ability of Holders of Early Action Offset Credits to submit credits for listing, pay for verification and receive issued ARB offsets independently of the Forest Project Operator, the Operator's immediate and long term roles remain unclear in the current draft of the Regulation. We request that it be made clear that Project Operators who have sold Early Action Offset Credits under CAR that are subsequently independently submitted to ARB by third party Holders, are not subject to any associated liabilities for Reversal and Invalidation. (BLUESOURCE2)

Comment: Clarify in sections 95990(l) and 95990(f)(3)(E)) where an Early Action forestry offset holder that chooses to transition their issued offsets to ARB but the forest owner and/or Offset Project Operator choose not to transition the entire project, whether the invalidation risk would be borne by the forest owner or the Early Action offset holder who transitioned the offsets to ARB. Please note that in many cases the Early Action offset holder has no contractual link to the forest owner and may not be able to compel the forest owner to transition their project to ARB. (CE2CC)

> **Response:** We modified section 95990(l), which now deals with invalidation, to clarify the invalidation provisions related to early action offset credits. The requirements are that for non-sequestration projects the party that surrendered the offsets must replace them. If they are no longer in business, it is the party that brought the offsets into the system. This could be the project developer or the current holder of the CRTs. For forest projects, the forest owner must replace them. We believe these clarifications address the commenter's concerns.

M-135. Comment: Section 95990 allows holders of Early Action Offset Credits to submit projects for listing, pay for verifications, receive issued ARB offsets, and requires them to provide attestations binding them to comply with the Regulation. We commend ARB for including this option and recognize its necessity during the program through 2014. We request that ARB make it explicit that project owners who have sold Early Action Offset Credits and subsequently have those offsets submitted to ARB by holders of Early Action Offset Credits are not subject to the liabilities associated with such credits under ARB, specifically in regard to sections 95983 and 95985 (specifically as it pertains to forest owners). (FINITE)

> **Response:** We modified section 95990(l), which now deals with invalidation, to clarify the invalidation provisions related to early action offset credits. The requirements are that for non-sequestration projects the party that surrendered the offsets must replace them. If they are no longer in business, it is the party that brought the offsets into the system. This could be the project developer or the current holder of the CRTs. For forest projects, the forest owner must replace them. We believe these clarifications address the commenter's concerns.
>
> If the party that surrendered the offsets does not replace them, we have the authority to enforce against the party that brought them into the system. These provisions ensure our enforcement authority and the integrity of the program. We did not eliminate the attestation requirements; however, we did make minor modifications to the wording of the attestations. These attestations are necessary to ensure our enforcement authority and the integrity of the system.

M-136. Comment: While IETA understands that sections 95990(h)(5)(A), (B), and (C) relate to ARB attempting to apply its buyer liability rule to early action offset credits, holders of early action offsets cannot make the attestations outlined in (A) and (C), as these elements are beyond their control and fall, instead, under the purview of the original project verifier and ARB appointed verifier. IETA strongly recommends these attestations not be required of the project operator, designee, or holder of the early action offset credit seeking issuance. They are an additional administrative burden that may prevent holders of early action credit from seeking issuance, ultimately discouraging participation and disrupting supply. If ARB insists on a buyer liability approach, despite IETA's recommendations and proposed solutions in the previous section, then it will presumably apply to early action offset credits as well and should not warrant a requirement to make the above attestations on the part of project owners, designees, and holders. (IETA3)

> **Response:** We modified section 95990(l), which now deals with invalidation, to clarify the invalidation provisions related to early action offset credits. The requirements are that for non-sequestration projects the party that surrendered the offsets must replace them. If they are no longer in business, it is the party that brought the offsets into the system. This could be the project developer or the current holder of the CRTs. For forest projects, the forest owner must replace them. We believe these clarifications address the commenter's concerns.
>
> If the party that surrendered the offsets does not replace them, we have the authority to enforce against the party that brought them into the system. These provisions ensure our enforcement authority and the integrity of the program.

M-137. Comment: The OWG is highly supportive of ARB's inclusion of early action offsets within the cap-and-trade program. In order for projects to qualify for early action credit, the OPO must carefully follow the proper steps for listing, verification, issuance, and registration. The regulations also have requirements for transitioning early action offset projects into ARB offset projects. The OWG requests ARB to hold at least one stakeholder workshop to explain the entire process in a clear and concise manner. This workshop should be held very soon as OPO's are already contemplating structuring their projects to produce these early action offset credits. If the record is re-opened for a second round of 15-Day comments, the workshop should be held in advance of this period. (OFFSETSWG3)

> **Response:** Thank you for your comment. We will consider holding a workshop on the details of the offset program once the rulemaking process is completed. In addition, we will develop guidance documents as necessary regarding specific aspects of the offsets program.

M-138. Comment: Section 95990(j)(1) and (2) of the proposed revised Regulations appear to require that all holders of early action credits from a particular project must register in order for ARB to issue ARB Early Action Credits for the project. This language is problematic because some holders of credits from a project listed under a non-ARB offset project registry have no intention of exchanging early action credits for ARB Early Action Credits. Yet, these entities would be required to register and prove ownership of such credits in order for any holders to receive ARB Early Action Credits. ARB staff have told CERP members that their intention is that only those holders that wish to transition their credits should have to register. Modify section 95990(j) as follows:

> (j) Registration and Transfer of ARB Offset Credits for Purposes of Early Action. An ARB offset credit issued pursuant to section 95990(i) will be registered by creating a unique ARB serial number. ARB will transfer the serial numbers into the Holding Account of ~~the~~ a holders of the original early action offset credit within 15 working days of the notice of issuance pursuant to section 95990(i)(4), unless otherwise required in section 95990(i)(1)(D), and as long as the holders meets the following requirements
>
> (1) ~~All~~ The holders of the original early action offset credits registers with ARB pursuant to section 95830; and
>
> (2) ~~All~~ The holders of the original early action offset credit~~s~~ proves ownership of ~~those~~ the offset credit~~s~~, including original serial numbers issued by the Early Action Offset Program. (CERP4)
>
> **Response:** We agree that the requirements as written were confusing and clarified the language in this section.

Early Action Offset Supply and New Early Action Protocols

M-139. (multiple comments)
Comment: The OWG is concerned that with just four approved compliance offset protocols and the opportunity for some Early Action Offsets there will still not be adequate supply of offsets in the market, particularly in the early years. The OWG, therefore, urges ARB to expeditiously consider and adopt new compliance offset protocols. The OWG believes that a variety of protocols that have been developed in the market can be fairly quickly adopted as compliance protocols. (OFFSETSWG3)

Comment: VCSA notes that, with the exception of the placeholder language in section 95990 regarding early action offsets, the modified draft rule still limits the number of offset protocols eligible for use in the California cap and trade program to the four project types already approved. Such a limitation places an unnecessary constraint on the market, stifling innovation, creating uncertainty among project developers and investors, and ultimately limiting the cost containment benefits that offsets offer to a cap and trade system. There exist a number of established carbon offset standards that have significant standing in the domestic and international carbon markets that stand as ready sources of protocols for ARB's consideration. ARB should initiate an open, transparent process for evaluating and approving protocols from established, high quality carbon offset standards prior to the 2013 implementation of the cap and trade program. (VCSA)

Comment: Evolution Markets encourages ARB to adopt additional early action offset project protocols as expeditiously as possible to ensure adequate offsets are available at the outset of the program, as well as sufficient market liquidity. Short of ARB adopting additional protocols in 2011, Evolution Markets strongly recommends ARB provide a short list of project types and standards that have been reviewed and are a priority for adoption. (EVMKTS2)

Comment: VCSA is pleased to see that the criteria for approval of early action offset credits issued by early action offset programs (section 95990 (c)) now includes a place holder for GHG reductions or enhancements that result from the use of “additional early action offset project protocols” (i.e., protocols other than the four protocols already approved by ARB) (95990(c)(5)(E)). Expanding the list of eligible protocols will encourage more projects to seek credit for early action and, as a consequence, will enhance liquidity and help contain the cost of compliance early in the program. This is especially important given the possibility that the supply of offset credits issued under the four approved protocols may not meet demand. The modified draft rule, however, does not identify a mechanism for how additional protocols will be considered and added to the list of existing eligible early action methodologies. To truly facilitate the development of an adequate pool of early action credits, more clarity must be provided for how early action protocols can be brought forward for consideration and approval. Amend section 95990 to include a provision that describes a transparent process that ARB will employ to consider, evaluate and approve additional early action offset protocols. (VCSA)

Comment: CERP encourages ARB to expand early action eligibility beyond the four currently approved Climate Action Reserve (CAR) protocols to substantially similar voluntary protocols from other well-established project registries. (CERP4)

Comment: The GHG Early Action Group holds approximately half a million tonnes of GHG reductions, primarily from Ozone Depleting Substances as defined by ARB. These entities hold credits issued for ODS destruction and livestock methane destruction from the Chicago Climate Exchange (CCX). These credits were issued by the CCX under quantification rules and requirements nearly identical to those in the ARB protocols for ODS destruction and livestock methane destruction. Though these credits were issued under protocols which are substantially equivalent as two of the methods recognized by ARB, were developed using public participation procedures, and even though some of the project represented here have "migrated" to the Climate Action Reserve, the credits which are the subject of this comment are not susceptible to transfer. These credits remain valid and ought to be recognized. At the same time, while the CCX has advised that it has in place each of the requirements for an Early Action Offset Program in 95990(a) with respect to these credits, the CCX may or may not be continuing to issue credits. Given the proposed language of 95990(a), there is some question as to whether the CCX would be eligible. (GEAG)

Comment: Since ARB may in the future approve additional early action offset project protocols, as noted in the new section 95990(c)(5)(E), ACR suggests adding section 95990(i)(1)(F), <u>"Reserved for additional early action offset project protocols approved under section 95990(c)(5)."</u> (MARTINN3)

Comment: ACR suggests adding, section 95990(k)(1)(F), "Reserved for additional early action offset project protocols approved under section 95990(c)(5)." (MARTINN3)

> **Response:** In regard to additional early action offset protocols, this comment falls outside the scope of the First 15-Day Changes Notice. Because the comment falls outside the scope of the notice, no further response is required. Responses to similar comments can be found in this category under the 45-day comment responses.

M-140. Comment: PG&E supports the addition of section 95990(c)(5)(E) which would allow for the inclusion of additional early action offset project protocols. The inclusion of additional early action offset project protocols will help address PG&E's concerns regarding the expected shortage of offset credits early in the program. (PGE4)

> **Response:** Thank you for your support on the modifications to the regulation.

Early Action Offset Project Eligibility

M-141. Comment: Page A-271 (D)(2) Potential Double Buffer. If CAR or another registry is unwilling to transfer buffer pool credits to ARB, the project or credit owner would need to submit an equivalent number of credits to the ARB buffer pool. This has no scientific basis as the risk is unchanged. It imposes an unfair burden on the landowner when the maintenance of a buffer mechanism equivalent to that of ARB should be the responsibility of the ARB Early Action Offset Program. (BLUESOURCE2)

> **Response:** We added a requirement in section 95990(i)(1)(D)(1.) that the Early Action Offset Program transfer all offsets that reside in their buffer account for forestry to ARB, so that we may ensure permanence of any offset project in the ARB compliance program. Once the early action offset credits are verified pursuant to section 95990(f) and meet the requirements for early action we will issue ARB offset credits to replace the early action offset credits, and the Early Action Offset Program must permanently remove them from their registry system. This clarifies that we have full control over the offset credits that are issued, even for early action purposes, and the Forest Buffer Account. These additional requirements should alleviate concerns that the Forest Owner must replace reversed tons in both programs.

M-142. Comment: Section 95973 states early offsets can include offsets before December 31, 2006. Is there an estimate (or limit) on the number of these early offsets that can be allowed? This recognizes very old offset projects, and could diminish onsite reductions from covered entities. (SCAQMD4)

> **Response:** We expect the number of offsets with vintages prior to December 31, 2006, to be a very low percentage of the overall number of offsets allowed into the system. The only offsets that are eligible prior to this date are GHG reductions or GHG removal enhancements that occurred in 2005 or 2006. We do not believe that this will diminish on site reductions from covered entities. The program imposes a limit on what we believe is an appropriate amount of offsets that an individual covered entity can use for compliance. All offsets used for compliance are real reductions, albeit outside the cap. Allowing a limited number of offsets into the program provides cost-containment benefits and ensures that some GHG emissions reductions occur within the sectors covered by the cap-and-trade program. The program includes provisions that would allow a maximum of 201 $MMTCO_2e$ of offsets through the year 2020. This limit will be enforced through a limit on the use of offsets by an individual entity equal to eight percent of its compliance obligation. Combined with the Allowance Price Containment Reserve, this limit ensures that a majority of reductions from the program come from sources covered by the program at expected allowance prices, while use of the reserve will relax that constraint if prices rise.

M-143. (multiple comments)
Comment: Page A-264 (c)(1) Compliance Vintages. The Regulation limits early-action compliance vintages to 2005-2014. The justification for the earliest vintage to be 2005 is that it was the first year Climate Action Reserve offset protocols were available for verification. We recommend that ARB revise the early action vintage date to 2001, which corresponds to the signature of California Senate Bill No. 527. This would justify start date based on a landmark California legislative precedent (not a private administrative procedure) as well as align with CARs own rationale for allowing projects to 2001. (BLUESOURCE2)

Comment: Section 95990(c)(1) limits early-action compliance vintages to 2005-2014. The justification for the earliest vintage to be 2005 is that it is the first year Climate Action Reserve offset protocols were available for verification. This justification is problematic. First, although it was the first year the Climate Action Reserve protocols were available for verification, there is nothing in the ARB Regulation which limits early-action criteria to Climate Action Reserve projects only. Another registry which may be approved by ARB may have had its first protocol available for registration in 2002 or 2004 or any of a number of dates. Second, while 2005 is the year in which the protocols were first available to be used for verifications, the Climate Action Reserve Protocols allow for projects to receive verified CRTs as far back as 2001. Third, the early action criteria do not have a cut-off for early start dates. Therefore, a project may start in 2001 but its 2001-2004 vintages would not be considered compliance-grade while its 2005 vintages are. There is no scientific or policy reason that a 2004 vintage offset and a 2005 vintage offset from the same project do not constitute equal quality emissions reductions. Forest carbon projects in particular are adversely impacted by this provision. Forest carbon offset projects tend to have a significant number of offset credits issued in the first year of the project with annual offsets issued to a much lesser extent. If a project were to have a start date of 2001, the majority of the project offsets would come at that time. If 2001 vintages are excluded as compliance offsets, they will lose significant value in the market and make it difficult if not impossible for the project to pay for the 100+ year compliance costs let alone the opportunity cost for foregone harvest. Of the 72 forest carbon projects listed or registered on the Climate Action Reserve, 29 have pre-2005 start dates. We recommend that ARB revise the early action vintage date to 2001 which corresponds to the signature of SB 527 so that the justification is rooted in a California precedent and is not specific to an independent registry which may be one of many ultimately approved. (FINITE)

Early Action Offset Project Transition

M-144. (multiple comments)
Comment: Transitioning an early action project to ARB's Forest Project Protocol (FPP), section 95990(k)(3)(C), requires that the project be listed with ARB or an Offset Project Registry by February 28, 2015. Early action forestry projects will most likely not have completed the verification of their 2014 offsets by that date. To eliminate potential inconsistencies between the listing requirements for transition to the ARB FPP and the requirements for verifying early action project offsets under FPPv.2.1, modify section 95990(k)(3)(C) as follows:

(C) To transition an early action offset project to the ARB compliance offset program, the offset project must be listed with ARB or an Offset Project Registry by ~~February 28, 2015~~ <u>June 30, 2015</u>. (TCF2)

Comment: PG&E appreciates the addition of section 95990(k), which requires projects to transition to the ARB protocol no later than February 28, 2015. It is PG&E's assumption that, because the Climate Action Reserve protocols listed in section 95990(c)(5) do not specify a timeframe for the annual verification, an Early Action Offset Project has "nine months after the conclusion of each Reporting Period" to verify its 2014 offset credits consistent with section 95977(d). Therefore, an Early Action Offset Project "must be listed with ARB or an Offset Project Registry by February 28, 2015" (section 95990(k)(3)(C)), but has until September 30, 2015 to complete the verification of its 2014 offset credits. (PGE4)

Comment: CERP seeks clarification about the timeframe for transitioning. The ambiguity arises because the Climate Action Reserve protocols listed in section 95990(c)(5) do not specify a timeframe for the annual verification. Accordingly, we request clarification that an Early Action Offset Project has "nine months after the conclusion of each Reporting Period" to verify its 2014 offset credits, which is consistent with the time period for verification in section 95977(d). If this is correct, an Early Action Offset Project "must be listed with ARB or an Offset Project Registry by February 28, 2105" (section 95990(k)(3)(C)), but has until September 30, 2015 to complete the verification of its 2014 offset credits. This additional time will especially important for forestry 2.1 projects that are required to recalculate their baselines prior to transitioning. (CERP4)

> **Response:** We modified section 95990(k)(3)(C) to allow GHG reductions and GHG removal enhancements that occur in 2014 under an early action protocol to be verified by September 30, 2015. This change was made in response to stakeholder comments that we should streamline the requirements for early action offset projects with those for offset projects using Compliance Offset Protocols by allowing early action offset projects to have nine months to verify their Early Action Data Report.

M-145. (multiple comments)
Comment: Section 95990(k)(3) allows projects to re-start their crediting period when they transition to a Compliance Offset Protocol. However, when an offset is no longer an early action offset, we are not sure that 95973(a)(1)(b) still applies. We request that ARB clarify that early action projects which have start dates prior to December 2006 will be able to transition to the Compliance Offset Protocol. (CIG2)

Comment: The OWG recommends greater clarity in this Section by removing the second sentence in Section 95973(a)(2) from that paragraph. As it stands, the sentence implies that the items in (A) through (C) are for Early Action Offset Protocols, rather than Compliance Offset Protocols as intended. In addition to the deletion in 95973(a)(2), the core component of the sentence should be re-inserted into Section 95973(c) as follows:

(a)(2) Meets the following additionality requirements, as well as any additionality requirements in the applicable Compliance Offset Protocol, as of the date of Offset Project Commencement. ~~Early action offset projects which transition to the compliance offset program pursuant to section 95990(k) must meet the requirements of that section:~~

(c) Early Action Offset Project Commencement Date. Offset projects that transition to Compliance Offset Protocols pursuant to section 95990(k) must meet the requirements of that section. These projects may have an Offset Project Commencement date before December 31, 2006. (OFFSETSWG3)

Comment: The last sentence in section 95973(a)(2) implies that the items in (A) through (C) are for Early Action Offset Protocols, rather than Compliance Offset Protocols which is what PG&E believes was intended. We recommend that the sentence “Early action offset projects which transition to the compliance offset program pursuant to section 95990(k) must meet the requirements of that section” should be added as a new item under section (a). (PGE4)

Response: We modified the language in section 95973 to make it clear that early action offset projects may have a start date prior to December 31, 2006.

M-146. Comment: Early action projects have an effective crediting period of ten years (2005 through 2014). For forest sequestration projects, this relatively short crediting period may be insufficient to induce an early action forest project developer to submit to ARB's jurisdiction and enforcement authority for 100 years. The transition of an early action project to the ARB FPP pursuant to section 95990 provides an opportunity for an early action project to establish the longer crediting period contemplated in section 95972(b) (as well as the opportunity for unlimited renewals as set forth in 95975(k)(1)). The opportunity to transition to the ARB FPP and gain a longer crediting period is a powerful incentive for early action projects to participate in the compliance program. However, we are concerned that the ARB FPP may change in material respects after we enter our projects into the compliance program but before we complete the transition, most likely in early 2015. To address this uncertainty, modify section 95990(k)(1)(D) as follows:

(D) Early action offset projects using Climate Action Reserve Forest Project Protocol version 2.1 must use and meet all the requirements in Compliance Offset Project U.S. Forest Projects <u>in effect on the date ARB offset credits are issued to the project pursuant to 95990(i)</u>. At the time of transition the early action offset project must calculate its project based according to all the provisions in Compliance Offset Protocol U.S. Forest Projects, [DATE] and the requirements in this article from the date of offset project commencement under the Early Action Offset Program to the date the early action offset project applies for transition pursuant to section 95990(k). This project baseline will remain valid for the duration of the offset project life. (TCF2)

Response: New section 95990(k) was added to clarify how early action offset projects transition to Compliance Offset Protocols. New section 95990(k)(2) clarifies that once an early action offset project transitions to a Compliance Offset Protocol it will begin an initial crediting period. The crediting period under the early action offset program does not count under the compliance offset program, so the early action offset project may transition to a Compliance Offset Protocol any time before February 28, 2015, but must list or register with an Early Action Offset Program by January 1, 2014 (section 95990(c)(3)). We removed any requirements that restrict the earliest date that early action offset projects must transition to Compliance Offset Protocols. It is necessary for offset projects beginning February 28, 2015, to transition to Compliance Offset Protocols to ensure consistency in the program and that all offset projects are following the rules of the regulation, including the rules in the Compliance Offset Protocols.

M-147. (multiple comments)
Comment: Page A-274 (k)(1) Transition of Early Action Projects to Compliance Program. Early Action Projects' inability to transition to ARB before 1/1/13 seems

arbitrary and problematic. This unnecessary restriction will limit the supply of offsets to the ARB program at its outset and impose unnecessary costs on landowners who must verify 2011-12 credits under both CAR and ARB programs. We therefore recommend ARB allow projects to transition to the ARB Compliance Offset Protocols as soon as these protocols and associated verification infrastructure are available. (BLUESOURCE2)

Comment: Section 95990(k)(1) does not allow projects to transfer to ARB Compliance Offset Protocols until after January 1, 2013. There is no reason to prevent projects from transferring to the Compliance Protocols as soon as these protocols are available. Many projects are only registering with Early Action Offset Programs because they have no other option. By forcing a project to remain under an Early Action Offset Program until after 2013, a project will face double verification costs (once under the EAOP and another under ARB) which could add up to $35,000 in unnecessary duplicative verification costs. We recommend ARB delete this requirement and allow projects to transition to the ARB Compliance Offset Protocols as soon as these protocols are available. (FINITE)

> **Response:** We agree and removed the requirement that a project may not transition prior to 2013. New section 95990(k) was added to clarify how early action offset projects transition to Compliance Offset Protocols. The early action offset project may transition to a Compliance Offset Protocol any time before February 28, 2015, but must list or register with an Early Action Offset Program by January 1, 2014 (section 95990(c)(3)).

M-148. Comment: Because offset projects cannot transfer registration to the ARB prior to 2013, we expect many projects will submit re-verified credits to the ARB for transfer on more than one occasion. For example, a project developer may submit all credits through vintage 2011 during 2012, and then submit vintage 2012 credits during 2013. With this in mind, the proposed language is not clear as to the implications of the second (in our example, 2013) desk review on credits which have already been transferred to the ARB. Specifically, it is not clear whether credits which have already been transferred successfully and issued as ARB offsets must be re-reviewed (again) if any subsequent regulatory re-verification finds a material misstatement in a later vintage. We recommend that if an Early Action offset credit has successfully completed a desk review and has been converted to an ARB offset, that no further reviews or re-verifications be automatically triggered if a subsequent desk review of later vintages is found to require a full regulatory verification with site visit. That is to say, once an ARB offset credit has been issued from an Early Action offset credit, that ARB offset credit should not be subject to re-verification as a result of subsequent Early Action offset credit transfer activities. (TPI5)

> **Response:** We agree and removed the requirement that a project may not transition prior to 2013. New section 95990(k) was added to clarify how early action offset projects transition to Compliance Offset Protocols. The early action offset project may transition to a Compliance Offset Protocol any time before

February 28, 2015, but must list or register with an Early Action Offset Program by January 1, 2014 (section 95990(c)(3)).

We also added new section 95990(f)(7) which specifies that once an Offset Project Data Report has been reviewed and early action offset credits have been issued, it does not need to be re-reviewed if future data report years are verified according to section 95990(f).

M-149. (multiple comments)
Comment: Section 95973(c) allows projects with start dates prior to December 31, 2006 to register under the ARB Compliance Protocols provided that they transition from an Early Action Offset Program. In order for a forest project to transition from CAR to an ARB Compliance Protocol, the forest owner would have to terminate the Project Implementation Agreement (PIA) with CAR. CAR has a provision which may allow an owner to cancel the PIA in order to transition to a state or regional compliance program. However, if a project has a pre-2005 start date, the project will be unable to transfer 2001-2004 offsets to ARB as the Regulation currently stands. This will either result in forest owners being prevented from transitioning to the ARB Compliance Protocol or require the forest owner to pay a penalty to CAR for all 2001-2004 offsets issued in order to terminate the PIA. Of the 72 forest carbon projects listed or registered on the Climate Action Reserve, 29 have pre-2005 start dates. We recommend that ARB allow forest owners avoid this obstacle by allowing them to transfer 2001-2004 offsets to ARB's registry provided they are immediately retired (or allow them to be eligible for compliance use). (FINITE)

Comment: Page A-170 (c) Early Action Offset Project Commencement Date. Projects with pre-2005 start dates will be unable to transfer 2001-2004 offsets to ARB as the Regulation currently stands. However, in order to transfer credits into the ARB program a landowner would need to terminate its PIA with CAR. They would therefore need to purchase and return to CAR a number of 2001-2004 credits equivalent to the number that has previously been sold in the market. We recommend that ARB remove this obstacle by allowing landowners to transfer 2001-2004 offsets to the ARB program for buffer or other purposes. Approximately 40 percent of current CAR-listed forestry projects face this obstacle. (BLUESOURCE2)

Response: These comments relate to agreements having to do with voluntary greenhouse gas reduction projects, not the regulation. We were not involved with the voluntary program or any agreements it requires; therefore, we did not get involved in trying to resolve the types of issues presented in the comments.

M-150. Comment: Section 95990(i)(1)(D)(2) states that Buffer Account Credits may either come from the registry which issued the credits or be subtracted from the number of EAOCs submitted for ARB Offsets. This policy leaves the policy decision for transfer of Forest Buffer Account Credits from the Early Action Offset Program to ARB in the hands of the Early Action Offset Program. Since ARB has the capacity to create the terms under which an EAOP is accepted under the Regulation, it should require that an

EAOP must transfer any Forest Buffer Account Credits associated with EAOCs which are submitted for ARB Offsets. This would provide a more certain environment for project owners to submit early action forestry projects to EAOPs while awaiting the ability to submit directly under the ARB Compliance Offset Protocols. We recommend that ARB amend the language so that: "ARB offset credits placed into the Forest Buffer Account must come from a buffer account held by the Early Action Offset Program, if they are determined to meet the criteria of section 95990(h); or, if there are insufficient forest buffer account credits to meet the requirements of ARB, or subtract the difference between the available forest buffer account credits and the amount determined in section 95990(i)(1)(D)(1) from the total number of ARB offset credits issued pursuant to this section." (FINITE)

> **Response:** We added a requirement in section 95990(i)(1)(D)(1.) that the Early Action Offset Program transfer all offsets that reside in their buffer account for forestry to ARB, so that we may ensure permanence of any offset project in the ARB compliance program. We also included requirements in the regulation to subtract the difference between the buffer credits from the registry's buffer account and the amount determined to be due to ARB pursuant to Compliance Offset Protocol U.S. Forest Projects.

M-151. Comment: IETA recommends ARB provide additional clarification to the provisions dealing with the conversion of forestry offsets to ARB early action offset credits. For instance, IETA is unsure of the intent of section 95990(i)(E) and would like ARB to clarify its objectives under this section. (IETA3)

> **Response:** We agree that early action projects should have the option to transition to compliance offset projects, and made several modifications to the regulation to facilitate this process while still ensuring the integrity of the offsets. New section 95990(k) was added to clarify how early action offset projects transition to Compliance Offset Protocols. New section 95990(k)(2) clarifies that once an early action offset project transitions to a Compliance Offset Protocol it will begin an initial crediting period.
>
> The section you are referring to as 95990(i)(E) is now section 95990(k)(1)(E) of the regulation. This provision requires projects developed under CAR's forest protocol version 2.1 to recalculate their baseline based on ARB's Compliance Offset Protocol. This provision is necessary to ensure consistency across all forest projects in the compliance program. Early action offset projects developed under the other protocols mentioned in section 95990(c)(5) must transition to the appropriate Compliance Offset Protocol but do not need to change their baselines.

Transitioning Early Action Offset Credits to ARB Offset Credits

M-152. (multiple comments)
Comment: Section 95990(d) requires an Offset Project Operator or Authorized Project Designee for an early action offset project to register with ARB before ARB offset credits may be issued. This step should be modified to also allow holders, or owners, of early action offset credits to register with ARB in case there is no interest or incentive to do so on the part of project operators or authorized designees. (IETA3)

Comment: Clarify who may submit information or be identified under section 95990(e). As written, the only persons who can submit information under section 95990(e)(1) are "Offset Project Operator or Authorized Project Designee." Under section 95990(e)(2) the program only needs to list the same persons. The list of persons who may submit information under section 95990(e)(1) and who should be identified under section 95990(e)(2)(C) should be expanded to those who currently hold the offset credits, whether they be CFIs, CRTs, VCUs, or ERTs. As shown by the Members of the Early Action Offset Group, these early carbon credits do have value and have been sold. Whether now held by investors or potential end users, those persons too should be entitled to start the process for issuance of ARB offset credits in section 95990(e). (GEAG)

> **Response:** We made modifications to section 95990 to streamline the process for transitioning early action offset credits into ARB offset credits that can be used for compliance. This includes allowing holders/current owners of early action offset credits to transition them into the compliance program if the project developers do not do so in most cases.

M-153. (multiple comments)
Comment: ARB has proposed to modify the rules for creating early action offset credits to now include the process for converting early action credits into ARB-issued offsets. We welcome the intent of this proposed modification, though we are concerned that the process for accrediting early action credits and transitioning them to ARB-certified offsets is still too administratively burdensome. We propose a number of specific additional modifications to help ensure a smooth transition mechanism, and thus encourage more projects to seek credit for early action. This will help to ensure that more valid emission reductions are transferred from the voluntary market to California's compliance market, which is important given that ARB and most analysts currently predict that there will be a shortage of offsets in the early period. Our proposed minor modifications are listed below.

- Expand the scope of those that can register the early action credits. Section 95990(d) requires an Offset Project Operator or Authorized Project Designee for an early action offset project to register with ARB in order for compliance offset credits to be issued. We recommend that this be modified to allow holders of early action offset credits to register with ARB in case the project operators or authorized designees do not do so.

- Eliminate the Burdensome Attestation Requirements. Sections 95990(h)(5)(A), (B),and (C), require the Offset Project Operator, Authorized Project Designee, or each holder of the early action credit seeking issuance of ARB offset credits to attest in writing that (A) the reductions/removals have been measured in accordance with the appropriate early action offset protocol and that all information submitted to ARB is true, accurate and complete; (B) its participation in the Program is voluntary and subject to ARB's regulatory requirements and subject to ARB's exclusive jurisdiction to resolve any and all disputes; and (C) it acknowledges the need to fulfill all applicable local, regional, and national regulatory requirements that apply to the offset project—in essence, attesting to the offset project's regulatory additionality. We have no objection to the second of these, subsection (h)(5)(B), provided that it can be extended to any holder a credit that may seek to register it per our first proposed modification. However, the other two attestations, subsections (h)(5)(A) and (C), are properly within the purview of the verifiers. We respectfully recommend that these attestations not be required of the project operator, designee, or holder of the early action offset credit seeking to register them with ARB as compliance offset credits. (COPC3)

Comment: The Trust has concerns that the process for accrediting early action credits and transitioning them to ARB certified offset credits remains burdensome and confusing. Procedures for transitioning early action offset credits need tightening and clarification. In particular Section 95990(d) should be modified to allow holders or owners of early action credits to register with ARB in addition to Offset Project Operators and Authorized Project Designee. Sections 95990(h) (5) (A), (B) and (C) should be tailored more narrowly to the statements each of these entities would be competent to make about the status of projects and credits. For example, an Authorized Project Designee may not be able to attest to how the credits were measured since this is the responsibility of the verifier.

A smoothly functioning system that takes into account the realities of the state of the carbon market, and the fact that the credits have already been verified, will reduce the uncertainty around the transfer of Climate Action Reserve Tonnes. This is necessary to ensure that more projects seek credit for early action and to enhance liquidity early in the compliance periods, thereby reducing the costs of the program. (TCT)

> **Response:** We made modifications to section 95990 to streamline the process for transitioning early action offset credits into ARB offset credits that can be used for compliance. This includes allowing holders/current owners of early action offset credits to transition them into the compliance program if the project developers do not do so in most cases. We did not eliminate the attestation requirements; however, we did make minor modifications to the wording of the attestations. These attestations are necessary to ensure our enforcement authority and the integrity of the system.

M-154. Comment: CERP respectfully requests that ARB streamline the listing process of an early action project. Section 95990(e) suggests that offset project operators for early action projects will have to go through the entire listing and information submission process that would apply for a "compliance" offsets project. CERP believes that this adds needless costs, especially given that the Climate Action Reserve and other registries already require much of the same information and require that such information be made public. A shorter listing process, such as a form on which the Offset Project Operator or Designee could provide basic information about the project and the vintages and volumes to be transferred, could provide sufficient information for early action projects while maintaining environmental integrity. It also would help speed implementation by ARB. (CERP4)

> **Response:** We did not make these changes. This information is needed for transparency purposes.

M-155. Comment: IETA notes that ARB has modified its rules for creating early action offset credits to now include the process for converting early action credits into ARB-issued offsets. While IETA is pleased to see ARB recognize early actors that have invested in low-carbon and clean technology projects, IETA has concerns the process for accrediting early action credits and transitioning them to ARB-certified offsets is still too administratively burdensome. A smooth and simple transition mechanism will facilitate the process, encourage more projects to seek credit for early action, and reduce uncertainty on the transferability of Climate Reserve Tons and offset credits issued under other qualifying programs. Such a program will also enhance liquidity early in the offsets market which is especially important considering there will likely be not enough offsets to satisfy demand. This also will enable firms to hedge more confidently early in the program, further reducing the costs of the program. (IETA3)

> **Response:** We disagree with the commenter concerns, even after the modifications in the First 15-Day Change Notice, that the process for accrediting early action credits and transitioning them to ARB-certified offsets is still too administratively burdensome. However, we recognize all regulations can be improved. Significant changes were made to section 95990 in the Second15-Day Change Notice that further clarify the transition of early action offsets, add greater transparency to the program, and clarify the use of early action offset credits in the program.

M-156. Comment: Section 95990(k) - Transition of Early Action Offset Projects to the Compliance Program: The current language requires that CAR V 2.1 forest projects calculate how many offset credits would have been issued under the ARB compliance protocol from the project start date to the time of transition, and a comparison of that number to CRTs actually issued. If the number of credits would have been greater under the ARB compliance protocol, ARB will issue offset credits to make up the difference. If the application of the ARB protocol would result in fewer credits, then ARB only issues credits according to the Compliance Offset Protocol for U.S. Forests from the date of transition. We think that it is highly unlikely that V 2.1 projects will generate fewer offset credits compared to if they had been constructed using the baseline and project quantification requirements of the ARB compliance protocol. Given this situation, we propose that the requirement to compare offset credits between the two protocols from project start to the time of transition be made optional. This way, project operators can opt to take the approach that generates the fewest offsets, rather than engaging in a complicated paperwork exercise. Calculating hypothetical credits from past will be time consuming, and may not be fully technically possible because 2.1 project developers likely do not have harvested wood product data in the form required by the ARB compliance protocol for past years. Retaining the requirement to calculate the new baseline under the ARB compliance protocol from the original start date and starting new offset credit calculations from the year of the transition makes sense. (PFT3)

> **Response:** We agree and made this an optional provision. If Offset Project Operators or Authorized Project Designees choose not to do the calculation, they would still be issued ARB offset credits on a one-to-one basis if they meet the requirements of section 95990. This provision was made optional in response to stakeholder comments that some projects may not want to go through the calculation process to be issued additional ARB offset credits.

M-157 Comment: Because of relatively minor differences between the CAR and ARB protocols, the number of credits issued by the Climate Action Reserve for an ozone depleting substance (ODS) destruction project may need to be adjusted in the calculation of early action offsets. Given that potential scenario, we recommend that the Regulations specify documentation that must be reviewed by the early action offset verification body:

1) Original Verification Report
2) Certificate of Destruction
3) Reports of Gas Chromatography Analysis
4) Weight Tickets. (EOSC3)

> **Response:** The regulatory verification and issuance of early action credits will be based on the version of the protocol that was initially used in the Early Action Offset Program. We will not recalculate the number of credits generated based on ARB's Compliance Offset Protocol. However, once the offset project transitions to ARB's Compliance Offset Protocol it will be issued ARB offset credits based on the calculations in that protocol.

Regulatory Verification of Early Action Offset Credits

M-158. Comment: Section 95977(e) includes a limit of six consecutive years of offset project data verification. This six year limit needs to be adjusted for the first verification on early action projects and reforestation projects. This is problematic in the first few years due to the availability of verifiers. Also, the first verification may cover 2007 through 2011 vintages (5 consecutive years). Thus, a verifier will need replacement in one additional year of verification (after only two years of actual work). This is costly and there may be limited numbers of verifiers. Another drawback to this limit is that a verifier who is familiar with the project and conducts the first site visit (and the entity most likely to recognize issues) is prevented from doing the second required site visit at the 6 year interval. We recommend that initial or first verifications, regardless of offset credit vintage years generated, should only count as one year towards this verifier year limit. To assure verifier quality, ARB should do random reviews of projects for the purpose of testing the verifiers and thus obviate this verifier replacement requirement. (CFA2)

> **Response:** The commenter's interpretation of the regulation is incorrect. Early action offset credits must be verified according to the requirements in section 95990(f). They do not need to meet the requirements of section 95977(e), now new section 95977.1, as those requirements must be met by offset projects using Compliance Offset Protocols. Once the project transitions to a Compliance Offset Protocol it must meet the requirements of section 95977 through 95977.2.
>
> Section 95990(f) was modified to clarify the requirements for regulatory verification of early action offset projects. The new requirements include a desk review of each Offset Project Data Report (new section 95990(f)(3)) by an ARB-accredited verification body based on all original early action offset project documentation. This provision was added in response to stakeholder comments to streamline the requirements for regulatory verification.

M-159. (multiple comments)
Comment: Section 95990(f)(4) stipulates that if the desk review concludes that the offset project documentation for an Offset Project Data Report year includes an "offset material misstatement" of 3 percent or 25,000 $MTCO_2e$, whichever is higher, then a full re-verification of the project is triggered. Evolution Markets believes that the 3 percent level will create an unnecessarily large amount of reviews, which could impede the generation of an early supply of credits. Therefore, Evolution Markets suggests raising the threshold to 5 percent. This is the level at which projects may not receive Climate Reserve Tonnes from the Climate Action Reserve. Conforming these thresholds will allow ARB to maintain the environmental integrity of the program, while also eliminating unnecessary and expensive re-verifications. (EVMKTS2)

Comment: The regulatory verification requirements in section 95990(f) impose a vague and inconsistent standard for determining whether the early action offset credits were adequately verified. For example, section 95990(f)(3)(A) requires that the review "ensure that the previously provided offset verification services were sufficient to render a reasonable assurance to support the issuance of the early action offset credits." However, there is no guidance as to what is "sufficient" to meet the "reasonable assurance" standard. Is the standard of sufficiency that which was required by the applicable early action protocol? If not, a requirement that holds a project to a standard not applicable at the time of its original verification would seem to undercut the "early action" principle by introducing standards inapplicable and unavailable at the time the project first registered with the early action program. There are only three early action projects verified under the Climate Action Reserve Forest Project Protocol version 2.1. Given that there will not be any more projects registered and verified under this protocol, it will be very difficult to find an ARB-approved verifier who can cost effectively re-verify these projects in accordance with a standard no longer available to other projects. We would be happy to work with ARB to develop an alternative approach to achieving regulatory verification of projects verified under FPP v.2.1. (TCF2)

Comment: It is difficult to assign a materiality threshold retroactively. Should the original verification not meet this threshold, this threshold leaves little recourse for the original verification body. They have no opportunity to amend their original verification activities given this newly determined materiality threshold. Had the stated requirements of the standard/regulation and accompanying materiality threshold been known during the course of the original verification, the verification body would have developed their risk-based verification design accordingly. (SCS2)

Comment: The three percent offset material misstatement for early action projects should be better defined. The stated “offset material misstatement of three percent or more” should be defined relative to what is being compared. This could be three percent of a verifier’s measurement of a sample of forest plots to the original verifier’s sample of the same forest plots, or three percent of the originally verified CRT assertion to the second verifier’s CRT assertion. (SCS2)

Comment: Neither CAR, nor any other widely used voluntary carbon standard and methodology such as VCS, has incorporated a materiality requirement such as that proposed by ARB to assess a three percent offset material misstatement (or any quantitative percentage) of the total CRT assertion. This laborious task of a complete duplication of all of the project developer’s calculations would not be in line with the risk-based approach, and dramatically increase the time and expense of verification. Were ARB to incorporate a fundamentally different materiality requirement, the efficient transfer of Early Action Projects into the ARB’s compliance system will be substantially hampered. (SCS2)

Comment: The three percent metric used to assess the materiality of the Early Action Project is simply not compatible with the current Climate Action Reserve Verification Project Manual or earlier CCAR/CAR verification standards. The current materiality threshold for the Climate Action Reserve to evaluate offset projects such as landfill and livestock, but not forest carbon offset projects, is 5 percent. This value is also consistent with the California Climate Action Registry General Verification Protocol, Version 2.2, which relates to GHG inventory accounting that was in effect when the first forest carbon project was being assessed under the Reserve protocols in 2007. (SCS2)

Comment: The materiality threshold stated in the regulation is 5 percent for overstatements, but not understatements of CRTs. The materiality threshold for the assessment of Early Action Projects is 3 percent and makes no distinction between overstatements or understatements of CRTs. This difference is not justified in the regulation, nor do we believe it is warranted. (SCS2)

Comment: For the assessment of Early Action Projects, ARB could choose to follow the lead of the Public Resources Code, which requires an independent review of appraisals on conservation lands, and assess Early Action Projects under the standards established by the protocol used during the verification. In many cases, the selected protocol for forest carbon early action projects would be the Climate Action Reserve Forest Project Protocol, Version 2.1. It is important to note that the materiality threshold in the Forest Project Protocol, Version 2.1 is different than the previously discussed three percent material misstatement proposed by ARB's draft regulation. The Forest Project Protocol, Version 2.1 does not have a materiality threshold. Rather, it incorporates a Minimum Quality Standard, which considers the 15-percent difference between the verifier's inventory data and the forest owner's from a subsample of plots; and if there is a 10 percent difference between the projected activity line and the actual activity line. Should the requirements of the originally verified protocol be followed, these two requirements would be considered the metrics for evaluating material misstatements. (SCS2)

Comment: PG&E supports ARB's revisions to the Early Action section, which allow a "desk review" of projects for re-verification and further supports ARB's decision to allow the same verifier to do a desk review for all vintage years at the same time. To leverage the verification conducted by these projects and encourage them to participate in the Cap and Trade program, PG&E recommends the desk review focus on whether the initial verification conforms to the ARB's standards. The verifier would confirm that the initial verification sampled the right type and quantity of data, used the correct verification methodology and that the conclusions were reasonable. The verifier would not independently verify the data used or attempt to establish his or her own opinion on the project. This would encourage these existing projects to undergo the verification to become Early Action Offset Credits. (PGE4)

Comment: Under section 95990(f)(4), a finding of "offset material misstatement" for a particular Offset Project Data Report year triggers a full re-verification of the project. Section 95590(f)(4) defines offset material misstatement as a misstatement of the smaller of: (1) three percent or more; or (2) 25,000 metric tons CO_2e. In CERP's view, the three percent threshold may trigger an unnecessarily large number of costly re-verifications, and therefore we suggest changing the percentage threshold in section 95990(f)(4) to four percent. This is a reasonable compromise between three percent and the five percent level at which projects may not receive Climate Reserve Tonnes in the first instance. Accordingly, this compromise level is consistent with the dual goals of upholding environmental integrity and minimizing the number of unnecessary and expensive re-verifications. (CERP4)

Comment: Section 95990(f)(4) provides that in the event of a finding of offset material misstatement with respect to a particular Offset Project Data Report year, the verification body must conduct full verification services for the project "for all years eligible and applicable pursuant to section 95990(c)(1)." It is unclear from this language whether ARB intends full re-verification to apply: (1) only to the year(s) for which there was a material misstatement or (2) for all years for which the project seeks early action credits. ARB officials have told CERP members that they intend the former. Modify section 95990(f)(4) as follows:

> (4) If during the desk review the verification body concludes that the offset project documentation for an Offset Project Data Report year includes an offset material misstatement of three four percent or more or the offset material misstatement equates to greater than 25,000 metric tons CO_2e, whichever is smaller, then the verification body must conduct all offset verification services in section 95977.1 and any additional verification requirements in the protocols identified in section 95990(c)(5) for an early action offset project of that type, for the year to which the Offset Project Date Report applies ~~all years eligible and applicable pursuant to section 95990(c)(1)~~; provided that an offset material misstatement that equates to 10,000 metric tons CO_2e metric or less shall not result in the offset verification service requirements of this section. Offset verification services for each Offset Project Data Report year may be done by the same verification body that performed the desk review and may be applied as one single offset verification service and meet the following requirements. (CERP4)

> **Response:** In the second 15-day changes to the regulation, section 95990(f) was modified to clarify the requirements for regulatory verification of early action offset projects. The new requirements include a desk review of each Offset Project Data Report (new section 95990(f)(3)) by an ARB-accredited verification body based on all original early action offset project documentation. This provision was added in response to stakeholder comments to streamline the requirements for regulatory verification.

M-160. Comment: In many cases, a single project will have many holders of credits. In those cases, the credit holders and offset project operator will have to negotiate an apportionment of the costs of going through the early action process. Two elements of the revised regulations may complicate this process: (1) the apparent requirement in section 95990(f) that any verification report be made public; and (2) the requirement in section 95990(j) that any holder of original early action credits be issued Early Action Credits (provided that it does nothing more than register and prove its ownership of the underlying credit). As a result of these elements, any holder of an early action credit will have the ability to “hold out” in negotiations on the apportionment of verification costs—because the holder will know that as soon as the verification report is completed, it has a right to the resulting Early Action Credit irrespective of whether it contributed to paying the cost of implementing the verification. (CERP4)

> **Response:** In the second 15-day changes to the regulation, section 95990(f) was modified to clarify the requirements for regulatory verification of early action offset projects. New section 95990(f) includes new requirements for regulatory verification that is intended to streamline the process and minimize costs associated with converting the voluntary offsets into compliance offsets that can be used for compliance.

The regulatory verification and transition of early action offset credits to the compliance program is a voluntary step. We established rules in the regulation for those who would like to participate in early action offset program. The Climate Action Reserve and the offset verifiers can work with the project developers and the holders of early action offset credits to transition them to the compliance program; however, we will not act as a facilitator of voluntary contracts and voluntary commitments.

M-161. (multiple comments)
Comment: Section 95990 (f.) of the proposed regulations allows for a "desk review" of early action projects for re-verification as ARB offset credits. Evolution Markets supports this important change, which will assist in streamlining the issuance process and reduce compliance costs. However, Evolution Markets believes that requiring the desk review be conducted by an ARB accredited verifier other than the original verifier of the project is unnecessary to maintain the integrity of the offset conversion process and presents an impediment to efficient generation of offset supply. Evolution Markets recommends that ARB permit any ARB-accredited verifier conduct the desk review, even one that might have previously validated or verified the project in question. (EVMKTS2)

Comment: CERP urges ARB to consider an additional streamlining step. Specifically, if the original CAR verifier for an early action project earns an accreditation from ARB, it should be possible for this verifier to perform the desk review. It is unclear to CERP why this approach would raise any concerns of "bias." Precluding such an approach will result in additional costs without increasing environmental integrity. Modify section 95990(f) as follows:

(1) The project must be verified by an ARB-accredited verification body that meets the accreditation requirements in section 95978. The verification body performing regulatory verification pursuant to this section must be different than the verification body that conducted offset verification services for the early action offset project under the Early Action Offset Program <u>unless the verification body that conducted offset verification services under the Early Action Program is an ARB-accredited verification body that meets the accreditation requirements in section 95978.</u> (CERP4)

Response: We did not make this change. Section 95990(f) was modified to clarify the requirements for regulatory verification of early action offset projects. New section 95990(f)(1) includes new requirements that the verifier performing the regulatory verification services must be different than the one that did the initial verification for the Early Action Offset Program. This ensures that the review is completely independent and unbiased.

M-162. Comment: If an Offset Project Operator and/or Authorized Project Designee does not transition an entire Early Action project to ARB but the current Early Action offset holder wishes to transition their issued offsets, the language relies on the Early

Action Offset Program to submit the Early Action Verification Report(s) to ARB. However, the potential Early Action Offset Program we have spoken to (the Climate Action Reserve) has stated they are unsure whether they have the authority to submit Early Action Verification Reports to ARB. This could be a substantial obstacle to transitioning Early Action offsets and could decrease the availability of offsets in the program. Please help clarify what action the issued Early Action offset holder may take if both the Offset Project Operator/Designee and the Early Action Offset Program decline to submit the Early Action Verification Report(s) to ARB. (CE2CC)

> **Response:** In most cases, the verification reports were provided both to the Climate Action Reserve and the offset project developer. The offset project developer should be able to provide the verification reports to facilitate verification or they can request the Climate Action Reserve to provide those reports on their behalf.

M-163. (multiple comments)
Comment: CERP respectfully requests that ARB add a de minimis tons-based threshold for re-verification below which a finding of offset material misstatement would not trigger a full re-verification. CERP suggests 10,000 metric tons for the material misstatement threshold because it mirrors the level that triggers reporting under the Mandatory Reporting Rule. (CERP4)

Comment: We suggest ARB place a minimum threshold on material misstatement to reduce the burden on small-scale projects and to bring reporting of emissions reductions in line with other articles and regulations. As currently written, a project which generates 4,000 tonnes of reductions could be required to undergo a full re-verification if there was uncertainty of 3 percent (120 tonnes of reductions). There is a strong case for scaling the threshold relative to a project's size, recognizing the costs for small-scale projects of re-verification, the conservative nature of the protocol and the small number of emissions reductions at stake. Indeed, ARB does not require capped facilities emitting less than 10,000 tonnes of CO_2e per year to report under its program at all. We suggest that an appropriate minimum threshold for material misstatement could be 10,000 tonnes. Setting an absolute minimum threshold for small-scale projects would reduce their burden and would be consistent with ARB's approach elsewhere. (CIG2)

Comment: The process for re-verifying projects, as currently drafted, will have a disproportionate impact on the ability of small-scale projects due to the low threshold for a full re-verification and the high costs associated with a re-verification relative to the total number of credits produced by a project. ARB could impose a size threshold here, requiring projects generating less than the threshold for covered sources (25,000 tCO_2e) to be desk-reviewed by the same verifier who verified the project to CAR (and who would need to be accredited by ARB). Where a material misstatement has occurred, the project would need to undergo a full re-verification. (CIG2)

Response: We did not make this change. The requirements for regulatory verification must be met to ensure that the early action offset credits meet the requirements in AB 32 that all offsets must undergo regulatory verification. We cannot rely on a non-regulatory program to perform regulatory verification of offsets that will be used for compliance, and AB 32 requires that all offset credits used for compliance be based on the result of regulatory verification.

M-164. Comment: Recognition of Early Action Offset Credits. Section 95990 (f) – Regulatory verification of early action offsets: We would like to note that the regulatory verification standards are different from the verification requirements of CAR v 2.1 forest projects. We think this could lead to difficulties in getting v 2.1 forest offset early action projects re-verified that are not due to lack of proper verification the first time, but from the application of different measures of success. We recommend that independent verification for regulatory purposes for all early action offset projects be done according to the same standards that applied during the original verification—i.e., following the verification instructions published along with the CAR 2.1 Forest Project Protocol. We also recommend that regulatory verification be done according to a procedural assessment of the methods and practices of the original verifier rather than a quantitative re-calculation. (PFT3)

Response: The commenter's interpretation of how the regulatory verification will be conducted is incorrect. We will issue ARB offset credits on a one-to-one basis for each early action offset credit if the ARB-accredited verifier determines with reasonable assurance that the original Offset Project Data Report should have been issued a positive verification statement. We will not recalculate the number of GHG reductions or GHG removal enhancements achieved by the early action offset project.

We modified section 95990(f) to clarify the requirements for regulatory verification of early action offset projects. New section 95990(f) includes new requirements for regulatory verification that is intended to streamline the process and minimize costs associated with converting the voluntary offsets into compliance offsets that can be used for compliance.

AB 32 requires all offset credits used for compliance purposes to be subject to regulatory verification; we cannot rely on a non-regulatory program to perform regulatory verification of offsets that will be used for compliance.

Early Action Conflict of Interest

M-165. Comment: CERP supports the changes to the conflict-of-interest requirements for early action credits in section 95990(g). The December 2010 version of the regulations required that the new verifier be free of conflicts of interest with the project operator and any and all of the holders of credits from the project. CERP recommended limiting the conflict-of-interest test to the project operator and any holder of a large number of the credits. ARB was responsive on this point, limiting the "conflict-of-interest" test to the holder of 30 percent or more of the credits. CERP believe that the changes now provide a reasonable conflict-of-interest structure for early action. (CERP4)

Response: Thank you for your support on the modifications to the regulation.

Early Action Offset Programs

M-166. Comment: Clarify section 95990(a). Some have read section 95990 to require that the Early Action Offset Program must be one that is continuing to issue offset credits. We would ask that the rule be modified to remove the suggestion that an ongoing issuance of credits is required. Modify section 95990(a) as follows:

(7) Nothing in this rule shall preclude a program which meets the requirements of this section from being an Early Action Offset Program solely because it is no longer issuing offset credits. (GEAG)

Response: We did not include this language in the regulation because the requirements for Early Action Offset Programs are clearly defined in the regulation. It is not the intent of the regulation to require that Early Action Offset Programs continue to issue offset credits, and there is no provision for such requirements.

M-167. Comment: As written, section 95990(c)(5) could be interpreted to mean that only credits issued by the Climate Action Reserve may qualify. That is not the message that has been communicated by ARB with respect to early offsets. Instead, we understand that the referenced CAR methodologies represent the standard for quantification, not the exclusive way to obtaining early action credits. A similar change is appropriate in section 95990(i)(1). Modify section 95990(c)(5) as follows:

(5) Results from the use of one of the following offset quantification methodologies, or methodologies which provide a substantially equivalent quantified result from the same activity: (GEAG)

Response: We did not make the changes requested by the commenter. Section 95990(a) allows any registry that meets the requirements of that section to be approved as an Early Action Offset Program. It is not limited to CAR. Our regulations must be prescriptive, and we must specifically list the protocols that qualify under this section. We cannot use a blanket approval as suggested. In addition, we added section 95990(c)(5)(E) as a placeholder to include additional early action offset protocols in the future. The inclusion of these protocols will have to go through the full regulatory process in accordance with the APA.

M-168. Comment: Section 95990(a)(2)(B) requires an Early Action Offset Program to have a system for tracking ownership and transactions of all offset credits it issues at all times. It is not clear if this means including the secondary market. This may not be reasonable. (SCAQMD4)

Response: There are no statements related to secondary markets in the offsets section or tracking transactions on those systems. We believe this section is clear in its intent.

Sector-Based Crediting

M-169. Comment: Study after study shows that, even with the promulgation of additional protocols, the supply of offsets is well short of demand until the protocols for Reducing Emissions from Deforestation and Degradation (REDD) projects come on line. For this reason, CERP strongly urges ARB to accelerate the process of development of these protocols. Further, we recommend that ARB expand the list of sub-national regions that can participate in the protocol development process and host projects. ARB's current process unreasonably excludes Brazilian states, such as Pará, that have expressed strong and direct interest in working with California, and that are currently working with high-quality, high integrity projects. We urge ARB to bring such states, including Pará, into the fold. (CERP4)

Response: This comment falls outside the scope of the First 15-Day Changes Notice. Because the comment falls outside the scope of the notice, no further response is required. We must undertake a full rulemaking process, including a stakeholder process and an environmental review, to accept REDD credits.

M-170. Comment: Modify section 95991 as follows:

Sector-based offset credits may be generated through reduced or avoided GHG emissions from within, or carbon removed and sequestered from the atmosphere by a specific sector in a particular jurisdiction. The Board may consider for acceptance compliance instruments issued from sector-based offset crediting programs that meet the requirements set forth in section 95994 and originate from developing countries or from subnational jurisdictions within those developing countries~~,~~. ~~except as specified in subarticle 13~~ (CCEEB3)

Response: This comment falls outside the scope of the First 15-Day Changes Notice. Because the comment falls outside the scope of the notice, no further response is required. We must undertake a full rulemaking process, including a stakeholder process and an environmental review, to accept REDD credits.

M-171. (multiple comments)
Comment: ARB is proposing a "nested sectoral approach" to generating REDD credits. The "nested sectoral crediting" approach proposed by ARB poses significant risks to the environmental integrity of California's cap and trade program. Project level crediting significantly increases the risk of emissions leakage, when REDD efforts simply prompt deforesting or degrading activities to shift elsewhere. Section 95994, the ARB rules on sectoral offsets do not reference the rights of indigenous peoples, requiring only mechanisms for public participation. This falls well short of the benchmarks established by the UN Declaration on the Rights of Indigenous Peoples. The World Bank, UN-REDD and the UN Framework Convention on Climate Change have all recognized that

ensuring the rights of indigenous peoples and local communities is essential the success of REDD policies. Project-and subnational-based REDD credits are incapable of meeting the environmental integrity standards demanded by AB 32, and they should be excluded from any cap and trade program in California. (FRIENDSOFEARTH2)

Comment: We are particularly alarmed at plans to allow international forest carbon offsets, known as REDD credits to enter California's carbon trading system. No other carbon trading system in the world has allowed such credits to enter their program because of serious, and perhaps intractable, problems with environmental integrity. However, under the Governor's Climate and Forests Task Force and the REDD Offsets Working Group, California is working with the heads of several provinces and states to provide recommendations to policymakers and to secure REDD offsets. California's tight timetable to create REDD carbon credits is undercutting the years of study, effort, and deliberation conducted by policy-makers engaged in other REDD processes (such as the United Nations Framework Convention on Climate Change, UNFCCC) aimed at ensuring the effectiveness of REDD programs. Successful REDD efforts will require meaningful governance reform, respecting the rights of indigenous peoples and local communities, as well as addressing the underlying drivers of deforestation. These measures take both time and political will and cannot be solved with injections of private capital alone. We therefore urge you to suspend further work on REDD until and unless a decision is taken at the UNFCCC that ensures social and environmental integrity as well as financial market stability. (FRIENDSOFEARTH3)

> **Response:** These comments fall outside the scope of the first 15-day changes to the regulation; therefore, no further response is required. However, there are no provisions that allow ARB to accept REDD credits at this time. We must undertake a full rulemaking process, including a stakeholder process and an environmental review, to accept REDD credits.

M-172. Comment: Approval of additional protocols. We note that even though the regulations concerning sector-based REDD offsets credits are limited in scope, California government officials continue to participate in the Governor's Climate and Forests Taskforce and the REDD Offsets Working Group. We are concerned that this process mirrors past processes to establish the domestic forest offset protocol, which has been criticized for its failure to ensure effective public participation. In the future, ARB must ensure that there are opportunities for review and public comment period, including on the scope and intent of proposed actions. (FRIENDSOFEARTH2)

> **Response:** This comment falls outside the scope of the First 15-Day Changes Notice. Because the comment falls outside the scope of the notice, no further response is required. We must undertake a full rulemaking process, including a stakeholder process and an environmental review, to accept REDD credits.

M-173. Comment: PG&E supports the development and approval of sector-based offset crediting programs. PG&E commends ARB for establishing a working group which is developing recommendations for Reducing Emissions from Deforestation and forest Degradation (REDD) offset criteria which can be adopted by the Board and bring REDD credits into the Cap and Trade program. Because of the lead time required to develop the necessary infrastructure for REDD credits, PG&E encourages ARB to develop a timeline and milestones for the development and approval of REDD criteria and agreements. (PGE4)

> **Response:** This comment falls outside the scope of the First 15-Day Changes Notice. Because the comment falls outside the scope of the notice, no further response is required. We must undertake a full rulemaking process, including a stakeholder process and an environmental review, to accept REDD credits.

Air District Comments Regarding Offsets

M-174. (multiple comments)
Comment: CAPCOA supports the 15-day language included in section 95979(g) that is specific to air districts and will allow districts to verify Offsets in the program. We appreciate this change to the rule language, and we believe it addresses our concern about this provision of the rule. (CAPCOA3)

Comment: We are pleased to see that CARB has incorporated all the points regarding conflict of interest proposed by the District and CAPCOA for section 95979(g). This new provision will ease the way for air districts to offer offset verification services to facilities subject to the regulation. (BAAQMD3)

> **Response:** We appreciate your support.

M-175. (multiple comments)
Comment: SCAQMD may wish to run an offset registry, but this is currently precluded in section 95986. Further, an organization that runs a registry cannot do many other functions related to offsets, such as run projects or verify offsets. Section 95990(a)(3) requires that the program's primary business be operating as an offset registry, and prohibits it from offering any verification services. We have previously requested an exception for air districts from these requirements. (SCAQMD4)

Comment: Section 95986 only allows an organization to serve as a registry if that is the organization’s primary business, and prohibits such an organization from performing many other functions related to offsets. As with our concerns about section 95814, there are legitimate reasons for a regulatory agency to perform multiple functions that, in a non-regulatory organization could create a conflict of interest or compromise the integrity of the program. Air districts will make programmatic choices to enhance efficiencies across air programs, and support effective enforcement and the best overall performance of the program; we are not motivated by profit or other concerns. Restrictions designed to prevent other types of businesses or organizations from taking advantage of or otherwise corrupting the market system are appropriate, but should clearly not apply to co-regulators. CAPCOA strongly urges ARB to include the language previously submitted to address this issue:

“Section 95989. California air pollution control districts or air quality management districts. Notwithstanding any other provision of this regulation, California air pollution control districts or air quality management districts may be approved for multiple roles, including verification for mandatory reporting or Offsets, holding compliance instruments, implementing offset projects that are verified by a third party and approved by ARB, and running a Registry, provided the appropriate training, certification, or approvals are obtained from ARB. Decisions on such approval requests will be provided in a timely fashion.”

In the eight months since the December Hearing, ARB staff has not discussed this language with CAPCOA or met with us to resolve the underlying concern, in spite of our requests to do so. We would like to emphasize that under this language, districts are still required to have the necessary training, certifications, and approvals from ARB, and we do not understand why the language is not part of the 15-day proposal. Again, we strongly urge that it be included. (CAPCOA3)

Comment: Contrary to the inclusion in the Mandatory Reporting Regulation of a presumption that air districts' multiple functions do not constitute a potential for a high conflict of interest, new language in the Cap and Trade Regulation included in section 95986(d)(3) specifically precludes entities (presumably including air districts) from acting both as a verification body and as a provider of registry services. Likewise, section 95814(b)(1) continues to preclude entities (presumably including air districts) from holding compliance instruments if they are also verifiers, verification bodies or manage Offset Project Registries. We continue to believe that the performance of multiple functions is a fundamental characteristic of any regulatory agency. Therefore, we again ask for the inclusion of the language proposed by CAPCOA in a new section 95989: California Air Pollution Control Districts or Air Quality Management Districts, to align the Cap and Trade Regulation with the principle resolved in the Mandatory Reporting Regulation. This would ensure the issue is addressed consistently throughout the Climate Protection Program. Add section 95989 as follows:

> <u>Section 95989. California Air Pollution Control Districts or Air Quality Management Districts.</u>
>
> <u>California air pollution control districts or air quality management districts shall be approved for multiple roles, which include verification of offset projects or emissions data for mandatory reporting, holding compliance instruments, implementing offset projects that are verified by a third party and approved by CARB, and running a Registry; provided the appropriate training, accreditation or approvals are obtained from CARB pursuant to sections 95132, 95978, 95814 and 95986. Decisions on such approval requests shall be provided in a timely fashion.</u> (BAAQMD3)

Comment: Section 95814 precludes any air district that is acting as a verifier from holding compliance instruments. There are legitimate reasons why a regulating agency may need to do this. Districts do hold emission reduction credits (or other credits that are analogous to compliance instruments as the term is used here) in criteria pollutant programs without compromising the integrity of the program. In fact, in every case that a district has elected to do this, it is to ensure the proper, efficient, and effective functioning of the program. CAPCOA has offered to work with ARB to clarify our concerns and derive a mutually agreeable solution. (CAPCOA3)

Comment: Section 95814(b)(1) would prevent air districts serving as a verification body or as an offset verifier from holding compliance instruments. This should be allowed for air districts, as holding a small amount of compliance instruments may be needed for insurance purposes for verification services. (SCAQMD4)

> **Response:** Air districts are able to participate in the cap-and-trade program, but must meet the eligibility and conflict-of-interest requirements in the regulation for whichever role(s) they decide to take. The cap-and-trade regulation provides for distinct roles within the compliance offset program. The roles include project developers, offset verifiers, and approved offset project registries. There is a careful separation of roles for offset project developers, verifiers, and registries, to keep in place a system of independent checks and balances throughout the whole offset system. This parsing of roles is consistent with international standards and best practices, as well as program elements developed within the Western Climate Initiative, and applies to all participants (private and non-private) that choose to be part of the compliance offset program.

M-176. Comment: CAPCOA requests the careful consideration and processing for adoption by CARB of GHG offset protocols that have been fully vetted and developed by California Air Districts. (CAPCOA2)

> **Response:** We are committed to working with air districts to identify new offset protocols that could be included in the cap-and-trade program. As with all protocols and offset project ideas submitted to ARB, we will review and evaluate their potential for use in the program.

M-177. Comment: Section 95979(g)(3) provides special provisions for air districts serving as offset verifiers. It states that if an air district hires a subcontractor who is not an air district employee, then the air district shall be subject to all the requirements of section 95979. This should be changed to "the subcontractor" shall be subject to all those requirements. (SCAQMD4)

> **Response:** We did not make this change. The language is consistent with the same types of provisions in MRR and the treatment of air districts as regulatory agencies only applies as long as the verification team is comprised of air district staff.

Forest Owner Definition

M-178. (multiple comments)
Comment: The forest owner definition in the Compliance Offset Protocol for Forests should be adjusted to be internally consistent and consistent with the cap and trade regulations. The Compliance Offset Protocol for Forests contains two different forest owner definitions on pages 10 and 82. The former definition is consistent with the definition in the Cap and Trade Regulations, Subarticle 2, section 95802(a)(103). However, the latter definition is inconsistent and excludes conservation easement holders from the forest owner definition. This definition needs to be amended, and TNC recommends that the definition in the Protocol be adjusted to reflect our recommendations stated in section 1. (NC8)

Comment: Section 95802(103), we recommend first that the definition "forest owner" be narrowed to those parties with an interest in the land and/or the trees, and further that the forest owner who is designated as the project operator be defined as the responsible party for the offset project. We recommend these changes to the definition of forest owner also be made in the Compliance Offset Protocol for U.S. Forests. (PFT3)

> **Response:** We clarified the definition in the forest protocol and in the regulation with respect to conservation easement holders. The definition states that a
>
> > "Forest Owner is the owner of any interest in the real (as opposed to personal) property involved in a Forest Project, excluding government agency third party beneficiaries of conservation easement; and that Generally, a Forest Owner is the (owner in fee) of the real property involved in a Forest Project. In some cases, one entity may own the land while another entity may have an interest in the trees or the timber on the property, in which case all entities or individuals with interest in the real property are collectively considered Forest Owners, however, a single Forest Owner must be identified as the Offset Project Operator."
>
> We believe this makes the exclusion of easement holders explicit. We also modified text where needed to ensure consistency in the term as defined in the protocol and the Regulation.

Other Offset-Related Comments

M-179. Comment: PCAPCD agrees that offset credits used by a facility for its compliance obligation under the ARB Cap and Trade Regulation should not be used to satisfy the GHG mitigation requirement from any other mandatory program. (PCAPCD2)

> **Response:** No response is necessary.

M-180. (multiple comments)

Comment: The Reserve strongly supports the revised Regulation's inclusion of language requiring that Compliance Offset Protocols use standardized methods (section 95972(a)(9)). The use of such methods helps to reduce uncertainty, inconsistency, and subjectivity in the assessment and quantification of offset projects. However, we recommend that this language be clarified to specifically state that Compliance Offset Protocols must determine the eligibility and additionality of projects using standard criteria rather than project-specific assessments, and that they quantify emission reductions using standard baseline assumptions, emission factors, and monitoring methods. This will ensure that the Board's Compliance Offset Protocols do not suffer from the issues that have occurred in the United Nations Clean Development Mechanism program and other offset efforts that rely on more subjective, less consistent project-specific approaches. (CAR4)

Comment: ACR strongly supports the objective of consistent implementation of all offset projects within a project type. However it is unclear what ARB means by "standardized methods," which is open to subjective interpretation since this is not a term included in the list of definitions in section 95802. We are concerned that this could unintentionally exclude some potential Compliance Offset Protocols that are judged not to meet an undefined requirement. If the intent of the "standardized methods" language is simply to signal that ARB will only approve one protocol per project type—to prevent project developers from bringing new protocols to ARB for review in a project type for which ARB has already approved a protocol—this could simply be stated. ACR recommends section 95972(a)(9) be clarified. Any Compliance Offset Protocols ARB approves by definition will consist of ARB-approved methods, and ARB will have ample opportunity in reviewing and approving Compliance Offset Protocols to determine whether methods are standardized. section 95972(a)(9) could be revised to read: <u>"Consist of ARB-approved ~~standardized~~ methods. It is ARB's intent to approve only one Compliance Offset Protocol per project type."</u> (MARTINN3)

Comment: The proposed revision for section 95972(a)(9) "Consist of approved standardized methods" should be more specific and state that the protocols must use standard criteria for additionality, project eligibility, and standard baselines assumptions, emission factors, and monitoring methods. This would avoid protocols and offsets that rely on project-specific and inconsistent determinations. (EOSC3)

Comment: Section 95972 of the modified draft regulation text adds a new condition that in order to be approved by the Board, compliance offset protocol must: "Consist of approved standardized methods" (section 95972(a) (9)). However, no definition is provided regarding what constitutes "approved standardized methods." To provide greater guidance to methodology and project developers, investors and other offset market stakeholders, ARB should clarify exactly what this provision means, especially as it has several dimensions. First, it would be useful if ARB indicated whether standardized methods relate to the determination of additionality, the calculation of emissions reductions, or both. It may be worth concentrating initially on standardized approaches to additionality, since there is more experience to date with such approaches. Second, it would be helpful if ARB indicated whether standardized methods refer to positive lists, performance benchmarks or other approaches. Finally, it would be helpful if ARB identified the offset project types for which it is seeking standardized methodologies and provided detailed parameters for how those methodologies are to be designed. VCSA has convened an expert committee to draft requirements that will guide methodology developers and others working on performance benchmarks, positive lists and other standardized approaches for determining baselines and additionality. The VCS Steering Committee on Standardized Approaches for Baselines and Additionality is comprised of individuals representing a broad range of stakeholders knowledgeable in the effective functioning of GHG programs including methodology and project developers, environmental non-profit organizations, GHG program regulators, validation and verification bodies, and businesses. The Steering Committee will complete its initial work by late 2011 or early 2012 and VCSA would be happy to share the Committee's recommendations with ARB at that time. (VCSA)

> **Response:** We clarified language referring to standardized methods in the regulation—see new section 95972(a)(9) to alleviate confusion in this area. In addition, we cannot allow a transition from project-based protocols to standards-based protocols because each protocol must be approved by the Board. Approving additional protocols does not fall under the purview of this rulemaking. If we were to adopt any additional protocols that could be recognized for bringing in early action offset credits, it would have to be done as part of a separate rulemaking and approval process.

M-181. (multiple comments)
Comment: CantorCO_2e recommends that CARB amend the Regulation to allow issuance of CARB/air district permits to offset-creating sources. Such permits would be issued to sources under CARB control, would mandate the maintenance of the reductions, and sanctions for non-compliance that would have the dual effect of, in the event that the credits are not maintained, protecting the environment and penalizing (and gain recompense from) the offset creator. (CANTORCO2E2)

Comment: CantorCO_2e recommends that CARB amend the Regulation to allow a source to secure CARB/air district review and approval of credits. Specifically, with offsets useable for new source review, the company creating the reduction must apply to the regulator (i.e., CARB or the anointed Air District) for recognition of such reductions. Upon receipt of an application, CARB should approve those credits that satisfy AB 32 criteria and protocols; or deny those that do not, and conditionally approve those credits which may be subject to revocation. Two different kinds of credits will emerge from this process: those with CARB approval (which cannot be invalidated or withdrawn and which will sell at a premium) and those that lack CARB approval (which the buyer will be aware are at risk of revocation and which the market will discount). (CANTORCO2E2)

Response: We did not make any change. The cap-and-trade program is designed with a clear system for issuance of compliance instruments, under the jurisdiction of ARB to ensure enforceability and oversight of the system. The suggested changes would add complexity to the program without further increasing the system's environmental integrity.

M-182. Comment: For future changes and clarity over a 100 year period, ARB should adopt a numbering system for the protocol versions as surely they will be updated. Since they would apply for at least one crediting period, there will be need to identify which specific protocol applies to a particular project. (CFA2)

Response: Thank you for the comment. We will consider it as we approve and revise Compliance Offset Protocols in the future.

M-183. Comment: Section 95980.1 does not provide for a "registration" step prior to offsets being issued. There are a number of reasons to make a clear distinction between registration and issuance. For example, project developers may want a project to be registered, but, may want to delay issuing, or to seek partial issuance at any point in time, due to commercial and/or cost reasons or because the buyer of the offsets may want the offsets delivered straight into their account (so they maintain full visibility). From a sales point of view, selling and marketing offsets from a "registered" project is better than from a "listed" project. Allowing the project developer to dictate the issuance timeline provides greater flexibility. We suggest that ARB adopts a process similar to the Climate Action Reserve, where the project first becomes "registered" after the acceptance of all documentation related to the verification, and that the project developer then has 60 days to provide for issuance of the credits. In our opinion, 30 days is too short a timeframe to notify, process payment and issue (most companies pay invoices net 30 days), especially where the sums involved are large and may require corporate approvals. (CIG2)

Response: We do not see a need to have a "registration" step in the offsets program. "Registration" is used in other offset programs to show that an initial approval step has been satisfied for the offset project. We will not make a determination regarding the offset project until it has been listed on a public and transparent website and has been assessed by an independent ARB-accredited verifier. This occurs at the time of verification. According to the regulation, an Offset Project Operator must list the project with ARB and submit their first Offset Project Data Report within 24 months of listing. Within five months of submitting the Offset Project Data Report, the operator must verify the GHG reductions and GHG removal enhancements. After the verification process is completed we may issue ARB offset credits for the projects. At this time the project will become listed as active.

M-184. Comment: Camco suggests that ARB provide some benchmarks or indicative caps on transaction, administration and MRV costs. For example, there are no provisions regulating the cost of registering projects and issuing credits, or whether these will be uniform or different for different projects. Providing project developers, verifiers and others engaged in the process will bring more clarity and certainty into the market, and will encourage more project developers to participate. (CIG2)

> **Response:** ARB has established rules in the regulation for those who would like to participate in the program, and we expect the market to price the needed services as appropriate. ARB will not be charging fees; therefore, it is up to the Offset Project Registries and offset verifiers to figure out the terms of third-party contracts with offset project developers and purchases of offsets. ARB will not be involved in third-party pricing.

M-185. Comment: The word “based” in the second sentence of section 95990(k)(1)(D) should be replaced with the word “baseline.” (TCF2)

> **Response:** We agree and made this change.

M-186. Comment: The perjury provisions in section 95990(a)(6) should say "under penalty of perjury under the laws of the State of California.” (SCAQMD4)

> **Response:** We agree and made this change.

M-187. Comment: PG&E found a misspelling of “section” in section 95990(i)(1)(E). (PGE4)

> **Response:** We agree and made this change.

M-188. Comment: We strongly recommend that the accreditation and reaccreditation procedures for verifiers be made more rigorous than currently outlined in the draft regulation. Below we lay out minimum requirements that could be included in the regulation text, or could otherwise be adopted by CARB. Modify section 95132(c)(4) as follows:

(4) The applicant must pass a performance review.

(A) At a minimum, a performance review of a verification body shall include:

1. review of the detailed sampling plans and verification reports from a representative sampling of geographic locations, lead verifiers and project types;

2. visits to a sampling of project sites;

3. visit to verifier primary office to review verification systems;

4. comparisons to other accredited verifiers who have verified projects of the same project type; (variability of verification procedures and interpretations can indicate differences in the quality of the verifications)

5. investigative review of the conflict of interest assessment provided by the verification body; and

6. opportunity for public comment on verification body performance.

(B) At a minimum, a performance review of a verifier involves review of the detailed verification reports and sampling plans from a representative sampling projects and documentation of any discrepancies found during the review. (UCS7)

Response: We included a performance review as part of reaccreditation, but the specific suggested text was not all included in the MRR. Many of these actions are part of program implementation, and therefore are not included in the MRR.

M-189. Comment: Per section 95850, an emission violation is based on the reports submitted by the verification body and reporting entity. We recommend that the Regulation, to the extent possible, prohibit the execution of indemnification agreements between the program participants and the verification/reporting agencies. In order to establish a foothold in the program, it is foreseeable that reporting agencies might offer or facilities might demand indemnification agreements which will provide that, in the event that a violation is established through one of their reports, the reporting agency will bear the penalty. This will dilute the incentive for program participants to accurately report their emissions and may result in the concealment of information from the verification body. (SCAQMD4)

Response: We did not make this change. Reporting entities and third-party verification bodies are able to resolve their own contracting terms. These agreements between private parties in no way circumvent our penalty provisions in section 96014. We retain enforcement authority over all parties involved in the cap-and-trade program.

N. PROTOCOLS

Forest Protocol

Table 3.1

N-1. Comment: The Compensation Rate for Improved Forest Management Offset Projects presented in Table 3.1 conflicts with text in the Regulation which requires offsets subject to intentional reversals to be replaced at a one to one ratio. The Regulation sets a precedent that all compliance instruments are equivalent and can be substituted interchangeably. We recommend that ARB delete this table since it is not applicable given the terms of replacement in the Regulation. (FINITE)

> **Response:** We changed the regulation to clarify how the reversal ratios apply to forest projects. No change was made to the protocol.

Accounting/Baseline/Benefits

N-2. Comment: The summary of the Risk Analysis in Table D-10 still refers to the Project Implementation Agreement, which will no longer be required. (CFA2)

> **Response:** We agree, and in the first 15-day changes to the regulation, modified the language removing the reference to the Project Implementation Agreement.

N-3. Comment: CARB has adopted offset policies imposing restrictions that will inappropriately limit the availability of offsets for the forest products industry. We believe it is important that any offset protocol adopted by CARB appropriately recognize the contributions of sustainably managed forests and wood and paper products to sequester and store carbon and reduce GHGs. We again request that CARB revise the protocols to appropriately recognize these contributions. (AFPA2, AFPA3)

> **Response:** We believe that the Forest Protocol meets the objective of providing offsets that are real, permanent, quantifiable, verifiable, enforceable, and efficient for industries that provide sustainable managed forests and forest products.

N-4. (multiple comments)
Comment: We recommend that ARB explicitly state in section 3.1 that state tax abatement programs are not considered legal constraints as they can be voluntarily entered and exited at any time. (BLUESOURCE2)

Comment: In regards to section 3.1, land use assessment (aka land use taxation and land use tax abatement) programs are common throughout the U.S. and counties. These programs allow forest owners to commit to keeping forested properties as forestland and many require landowners to follow specific silvicultural guidelines. These programs are wholly voluntary to enter into and to exit. However, though while voluntary, once entered into they are legally enforceable until they are exited. (FINITE)

> **Response:** We believe that the requirements in section 3.1 are sufficient to ensure that credits generated provide additional GHG emission reductions or removal enhancements that exceed any GHG reductions or removals otherwise required by law or regulation, or that would otherwise occur.

N-5. Comment: The setting of a default for other Episodic Catastrophic Events is an error (found in CAR 3.2). This category was added for places predominately outside of California, where hurricanes, tornado or extreme high wind events occur, so setting this to default at 3 percent is unfair to California projects and should allow for verifier to review and accept much lower values for lands not found in these types of high wind event areas. Similarly especially unique areas, say in the blast zone of volcanoes should allow the verifier to add a risk factor in this catch-all unique category. (CFA2)

> **Response:** The risk rating for episodic catastrophic events may cover a variety of risks not accounted for in other categories. At the outset of the cap-and-trade program, there are not sufficient data to determine if all the initial risk values that were used to calculate the forest buffer account contribution are appropriate. However, in the absence of better risk data, we believe that it is important to err on the side of having the risk factors too high, to ensure that there is a sufficient quantity of offset credits in the forest buffer account to cover any reversals in the early years. These risk ratings may be decreased or adjusted at a later time once more data are available on the rate of reversals due to various risks and the functioning of the forest buffer account. It is conceivable that these average risk ratings could be made adjusted based on geography, eco-region, and other factors in the future, but it is not possible to conduct such an analysis at this time.

N-6. Comment: Section 3.8.3 of the Forest Project Protocol requires live carbon stock must be maintained and/or increased during the project life. This provision needs to be revised to state that this is required for the crediting period and that after such period standing life carbon stock may increase and decrease as long as it does not fall below that level to support all registered tonnes. This could easily be clarified by adding a 5th exception to the requirement in section 3.8.3 as follows:

5. The decrease in standing live carbon stocks occurs after the crediting period and the residual stocking is above the level that assures all verified credits will be permanent. (CFA2)

> **Response:** We agree and, in the second 15-day changes to the regulation, modified the language using your suggested language.

N-7. Comment: Section 6 of the protocol, which describes the general calculation of baselines for all types of forest projects, provides that modeling of the baseline must assume a 100-year period. The 100-year figure is repeated in the baseline calculation sections for each project type in sections 6.1.1, 6.1.2, and 6.2.1. The 100-year time period is taken from the original Climate Action Reserve forestry protocol, and is sensible in that context because the CAR crediting period is 100 years. However, such baseline estimation is arbitrary in the context of a 25-year crediting period followed by a 100-year permanence period. Because projects can be renewed at the end of a 25-year crediting period, the project life is actually not known at the outset of the project. It would thus make sense to revise the protocol such that the initial baseline calculation is projected for the applicable crediting period. Then, if the project is renewed, the baseline would be recalculated as part of the renewal process. Accordingly, we recommend the following modification to Section 6 (and corresponding edits to the other sections):

To establish baseline onsite carbon stocks, the carbon stock changes in each of the Forest Project's required onsite carbon pools (identified in Section 5.1 to 5.3) must be modeled over ~~100~~ the Forest Project's crediting period. Modeling must be based on the inventoried carbon stocks at the time of the Forest Project's ~~offset project~~ crediting period commencement. (CERP4)

> **Response:** Our requirements regarding crediting periods and permanence are in place for sound technical reasons. It is anticipated that over time, the Forest Offset Protocol will be updated and improved based on science and practical experience. It is complicated both for regulators and market participants to have many different versions of the same protocol in use, so there is a desire for all projects to move to the latest protocols over time. Risk factors related to leakage and forest buffer account contributions are expected to be updated over time, and potentially other requirements related to the forest carbon inventory or verification. We believe that the current baseline requirements are robust, and agree that providing certainty that project baselines will not be recalculated, as a condition of a renewed crediting period is appropriate to provide greater certainty for those developing offset projects. We added a sentence to the protocol to indicate that the baseline for any Forest Project under this version of the Forest Offset Protocol is valid for the duration of the project life following a successful initial verification where the project receives a positive verification statement.
>
> In determining the appropriate length of a crediting period, we sought to balance the need for investor certainty in projects and the recognition that forest projects often involve reductions that accrue over a long period of time, with the need to be able to review project eligibility and additionality, and make improvements to offset protocols at some later date. Economic considerations cannot be the only factor considered. There is no explicit limit on the number of renewals possible for forest projects, so there is the possibility that forest projects can continue to generate offset credits for 100 years or longer if the program remains in place.
>
> Requirements for maintaining permanence are a separate issue from crediting periods. Any GHG reduction or removal that is issued an offset credit by us will need to be maintained for the period of time that we determine, to ensure

permanence—in this case 100 years. While the existing cap-and-trade program is initially set to continue through 2020, we designed a program that can and is expected to continue to operate well beyond that year. However, we cannot consider specific mechanisms beyond the scope of AB 32 requirements at this time.

N-8. Comment: Section 3.4 provides that, in the event of project termination, the Offset Project Operator or Authorized Project Designee must retire ARB Offset Credits issued for the project from the preceding 100 years. This language should be revised to clarify that the time period is focused only on the applicable crediting periods. Accordingly, we recommend deleting “preceding 100 years” and substituting “preceding crediting period(s).” (CERP4)

Response: We did not make this change. The 100-year requirement is in the context of the permanence requirement for sequestered carbon where an offset is generated to allow a GHG emission from a capped entity. Limiting the time period to the crediting period would undermine the way sequestered carbon is treated under the permanence requirements of the regulation.

N-9. Comment: Section 7 provides that all intentional reversals must be compensated. CERP respectfully requests that this requirement be modified so that the requirement applies only to the stocks for which ARB offset credits have been issued. Intentional reversals after the crediting period need not be compensated as long as the stocks that are associated with issued credit during the crediting period(s) are maintained for 100 years past the crediting period end. This interpretation is supported by other language in the protocol; for example, section 3.8.3, example 5, provides that reversals are permissible during the 100-year monitoring period as long as the stocks associated with issued tons are maintained. However, because this is not made explicit, CERP requests that it be more fully clarified in the protocol. Accordingly, we recommend the following modification to Section 7, subpart 2 (and corresponding edits to other sections):

2. The regulatory obligation <u>that</u> all intentional reversals of GHG reductions and GHG removal enhancements, <u>except those that occur after the crediting period and that do not reduce stocks below those associated with the issued tons,</u> must be compensated for through retirement of other Compliance Instruments. (CERP4)

Response: Thank you for your suggestion, but modified language in this section is not necessary. We clarified language in the regulation related to reversals of forestry offset credits to limit replacement to the amount of credits reversed.

N-10. Comment: Section 7.2.2 provides that the buffer risk rating must be recalculated every year that a project undergoes verification. This language must be clarified to make clear that buffer contributions must be made for each year that a project is receiving credits, but not during the 100 year monitoring period (during which verification will also be required). (CERP4)

Response: The regulation is clear that a forest project only contributes to a buffer account as credits are issued. Therefore, we did not make any changes to the protocol.

N-11. Comment: We believe further discussion of section 6.1.1, Estimating Baseline Onsite Carbon Stocks, is needed to add additional clarity. There is a requirement for a pre-site prep inventory for pools that maybe affected by the site prep. While very few pools would be affected by site prep, for early action projects, this pre-site prep inventory cannot be measured. We suggest adding a professional estimate by an RPF based upon non reforested areas nearby and including a specific requirement for a verifier to check this estimate for reasonableness. (CFA2)

Response: The ARB Forest Offset Protocol requirement that carbon pools affected by site preparation activities must be conducted prior to any site preparation activities is contained in versions 3.0 through 3.2 of the CAR protocol, though the requirements are more detailed in v3.2 and the ARB protocol. We are not aware of any early action reforestation projects under v2.1 of the CAR protocol. Consequently, we do not see any barriers to transition for early action reforestation projects that followed the requirements in versions 3.0 through 3.2 of the CAR Forest Project Protocol and conducted inventories of carbon stocks prior to site preparation activities.

N-12. Comment: Section 6.2.1.1 of the Forest Protocol requires that Logical Management Units must “where even aged management is utilized, have a uniform distribution (by area) of 10-year age classes that extend to the normal rotation age (variation of any 10-year age class not to exceed 20 percent).” This is an impossible test, as most areas have histories which prevent this uniform distribution by age class. If there is any necessary test on age class distribution, then it is already included in the project requirements for Natural Forest Management under section 3.8.2 and shown in Table 3.2. (CFA2)

Response: We understand the concern that the definition of a logical management unit (LMU) may not be readily applicable to all management situations. However, the forest protocol recognizes this possibility and offers an alternative approach that is similarly conservative in evaluating whether carbon stocks within the project area are significantly different from the forest owner’s broader management practices in the area. In situations where an LMU containing the project area cannot be identified, the protocol requires that an LMU instead be defined by all lands where the forest owner or its affiliate(s) either own in fee or hold timber rights within the same assessment area covered by the project boundary. This alternative definition should be readily applicable in the situation described by the commenter.

N-13. Comment: Section 6.2.6 for quantifying secondary effects of projects that reduce harvesting, fails to account for differences in timing for baseline estimates and actual project real harvesting. This calculation is done annually and does not take into account timing of harvest and would require secondary effects contributions from projects that over time increase harvest above average baseline carbon harvests and thus have no reduced harvesting secondary effects. Since a project that increases onsite carbon additionality and increases offsite storage of carbon in wood products is sequestering the maximum CO_2 such a result (project) shouldn't be discouraged. This methodology also applies the 20 percent multiplier to total onsite carbon harvested when the leakage effect is only applicable to the harvested wood products, since all other pools are required to be stable or increasing this over-estimates the leakage effect. The required onsite stock maintenance or increase takes care of the carbon in the non-product portions of harvested trees at issue. An identical over estimate occurs in the contribution to landfills for those projects that harvest more than baseline. See Appendix C in section C.4. This calculation requires landfill deductions even though the project increases wood product production as compared to the baseline. In both these cases, the verifier could evaluate the project and determine if the project will actually harvest more than the baseline over the crediting period and correctly calculate these contributions. This decision can be re-evaluated at each 6 year site visit and if need be corrected in the inventory true-up process. (CFA2)

> **Response:** We understand the commenter's concern about the quantification of secondary effects (emissions leakage) due to decreased harvest; however, the forest offset protocol that we adopted addresses this concern already with a change that was initially incorporated into version 3.2 of the Climate Action Reserve forest project protocol and subsequently our protocol. In section 6.2.6, when secondary effects due to harvest are evaluated, the differences between actual and baseline harvest for the current and all previous years are summed. If the result is that actual harvest has exceeded baseline harvest over the life of the project, then the discount is not applied in the current reporting year. However, if the baseline harvest has exceeded actual harvest, then the deduction is applied in the current reporting year. The equation addressing carbon in harvested wood products entering landfills functions in the same manner by evaluating the summed difference between actual and baseline carbon entering landfills over the project life before determining if the deduction will be applied in the current reporting year.
>
> The application of the secondary effects deduction for reduced harvest to total onsite carbon harvested (rather than only the carbon entering wood products) is appropriate because the full effects of emissions leakage involved all the carbon in the harvested trees, and not just the wood products. The deduction for the secondary effects is only applied once, and we do not agree that the onsite carbon stock maintenance requirements account for the non-product portion of the emissions leakage.

N-14. Comment: We encourage ARB to incorporate aggregation rules into the compliance Forest Offset Protocol (or establish forest carbon aggregation through a related, separate protocol). Aggregation makes carbon projects feasible for family forest owners by helping them achieve economies of scale while maintaining high standards for carbon measurement and offset quality. Enabling aggregation will be critical to delivering offset supply from U.S. forests and to ensuring that the carbon markets are not accessible only to large industrial forest owners. Incorporating a version of the Aggregation Guidelines adopted by CAR in August 2010 would level the playing field for family forest owners, help protect older-growth forests managed by families, and provide a significant boost to forest carbon offset supply. (NEWFOREST2)

> **Response:** We recognize the significant potential benefits for the environment and offset supply of lowering barriers to participation for small Forest Owners. However, the aggregation rules for forest projects developed by CAR are a separate protocol, and we will need to conduct further review to determine their compatibility with the cap-and-trade program and specific offset provisions. Any consideration of an aggregation methodology would be part of a separate rulemaking with a full public process.

N-15. Comment: The forest protocols use a number of accounting assumptions that overestimate the climate benefits of ‘improved forest management’ projects compared to internationally accepted approaches. Since these overstated benefits would be offset by an equal number of additional emissions, there could be significant backwards progress for every IFM offset credit sold under the CARB approved system. To measure the ‘with project’ and ‘without project’ climate benefits of forest management, the CARB protocols count all the carbon in wood residues that are used to generate energy as a 100 percent emission rather than as a true carbon benefit that can be measured by the avoided emissions from fossil fuel burning. RPS energy is an integral part of State policy because they increase carbon sequestration of fossil fuels that can stay buried rather than burned to generate energy. Much of the wood residues collected at the logging operation, sawmill operation, and post-consumer collection operations are used for RPS eligible energy in California, but are counted as pure ‘waste’ by CAR. Not counting these energy-related benefits would appear to inflate the number of offset credits ascribed to a project and reduces what had been sustainable harvest levels. Purchasing CAR IFM credits could actually emit more GHGs by ‘creating’ credits by not burning wood residues for energy. This could require re-evaluation of actual climate benefits if the CAR methodology was independently assessed by national or international bodies. (UCB2)

> **Response:** It is appropriate for the forest protocol to treat wood residues as “waste.” Any benefits created by the combustion of these residues at capped sectors as replacement of fossil fuels is accounted for appropriately under the cap-and-trade regulation.

N-16. Comment: CAR asserts that only 20 percent of the forest products not produced as part of the CAR project will be replaced by other forest products. While the 20 percent ‘leakage’ number does a good job in inflating the size of claimed benefits, better estimates of leakage at the global scale that CO_2 operates at, are usually well over

80 percent. Using a 20 percent leakage factor is far below the estimates for generic timber produced in the United States. A number of scholarly articles estimated leakage factors of around 90 percent for west coast conifers. Using the unsubstantiated 20 percent leakage rate rather than a possibly more relevant leakage rate of 80-90 percent creates at least a four-fold change in the baseline calculations for net storage in products. Since the carbon offsets can be sold to emitters anywhere in the world, it would seem that the local benefits of more carbon inventories in a local forest are not the same as the global benefits from increased carbon storage and decreased emissions. (UCB2)

> **Response:** The Protocol attempts to conservatively account for the risk of increased emissions outside the project boundary as a result of project activity. To accomplish this, the Protocol assumes 20 percent of the carbon emissions resulting from reduced harvesting will be shifted to harvest on other lands, either from within or outside of California, to meet market demands. Currently, there is little data available on actual leakage rates. The leakage factors in the Protocol can be updated as better data become available.

N-17. Comment: The forest protocols underestimate how much of the harvested material ends up in forest products, and how long all products will stay in use. It appears that the protocol formulas are based on historical estimates as a proxy for the lifespan of products rather that forward looking estimates for what will happen in upcoming decades. Empirical data analyzed by Skog (2008) documents considerably longer lifespan for products over time. In both the case of estimating the GHG benefits of renewable energy and the lifespan of wood products, the most recent federal accounting uses the numbers in Smith (2009 and Skog (2008) rather than the older and less accurate measurements used in these protocols. (UCB2)

> **Response:** We will review and update protocols as new information becomes available, and we will propose amendments if needed.

N-18. (multiple comments)
Comment: In advance of ARB's adoption of the Forest Offset Protocol in December 2010, a broad coalition of public interest organizations dedicated to forest conservation strongly recommended changes to the Forest Protocol in order to improve the integrity of the carbon accounting in the protocol and to protect forest ecosystems and habitats from adverse impacts caused by the Forest Protocol. These recommendations included: 1) Clarify that the Forest Protocol does not permit forest offset projects to generate credits for converting a diverse, natural forest to a simplified even-age stand; 2) Improved forest management projects must include the forest carbon pools associated with lying dead wood and, when there is intense site disturbance above certain thresholds, soil carbon, in order to ensure accurate accounting. The same day that ARB adopted the Forest Protocol as part of the Cap-and-Trade regulation, the Climate Action Reserve—the entity that had initially developed the forest protocol—made public a series of white papers they had commissioned to provide information on many of these same topics. In short, the white

papers state that soil carbon and down woody debris carbon pools comprise substantial portions of the carbon at a forest site; the carbon in these pools can be greatly mobilized (i.e., result in GHG emissions) by disturbance resulting from intensive management actions such as forest clearcutting and soil preparation; and that accurate accounting of the GHG impacts of forest projects requires accounting for the soil and down woody debris carbon pools in projects that include disturbance of these carbon pools. Following the publication of these white papers, the Climate Action Reserve committed to a series of revisions over the next several months to address these issues. In contrast, the proposed modifications to the Cap and Trade Regulation currently proposed by ARB fail to address these inadequacies in the Forest Protocol, and we have been told that ARB may not take up revisions to the Forest Protocol until 2012 or later. In order to provide accurate accounting in the Forest Protocol, protect forest ecosystems and habitats from adverse impacts caused by the Forest Protocol, and improve the integrity of the Cap and Trade program to the extent that it relies on offset credits from the Forest Protocol, ARB should propose modifications to address these inadequacies. (CBD4)

Comment: Triggers for Offset Protocol Updates. The proposed regulation would benefit from clearly articulating conditions that would trigger a review and update of offset protocols. At a minimum, new research or information that would substantially alter the accuracy of an ARB protocol should instigate a protocol review by ARB. We note that the recent white papers on the Forest Protocol commissioned by the Climate Action Reserve illuminate significant accounting shortcomings as well as opportunities to make the protocol more cost effective for project developers. (PFT3)

> **Response:** We are aware of the papers that CAR released and the ongoing work to revise the protocol established for the voluntary program. We will review new information and periodically revise the Compliance Offset Protocols, if needed. As the protocols are regulatory documents, they are subject to APA requirements and Board action. For program efficiency, we will develop a schedule for review and updates that is efficient and provides certainty to project developers that protocols will not change from year to year. Board Resolution 11-32 directs the Executive Officer to conduct such periodic reviews and propose updates to the protocols, as appropriate.

Federal Land Eligibility

N-19. Comment: TWS applauds ARB on its decision to remove federal land eligibility for projects under the forest protocol until the technical and policy contexts of any such projects are better understood. (TWS)

> **Response:** We thank you for your support.

N-20. Comment: A thorough public and scientific review is necessary to develop a cohesive national policy regarding the appropriateness of use of federal lands in any offset program. National Forests, National Wildlife Refuges, National Parks, and BLM lands exist and should be managed for the full spectrum of ecosystem services and the benefits to human and natural systems that those services represent. Any commitment of federal land agencies to manage for increased carbon sequestration, and participation of these agencies in private offset markets must be consistent with their broad public mission and fully protect other public benefits. The experience of California State lands participating in the California compliance offset program may provide valuable information to inform the development of federal public land policies regarding offsets. (TWS)

Response: No response is necessary.

N-21. Comment: TWS believes that the proposed 15-day changes amended the title of the forest compliance protocol to read "Compliance Offset Protocol for U.S. Forest Projects" in order to distinguish such protocols from protocols in development for projects based in other countries such as Mexico. However, TWS respectfully submits to ARB that "U.S. Forests" is a term of art used to refer to federal forest lands. Therefore, the title of the protocol may be misleading given the explicit exclusion of federal lands from participation in the California Cap and Trade program. TWS suggests that the protocol instead be titled, "Compliance Offset Protocol for Forest Projects in the United States." (TWS)

Response: Thank you for your comment. We believe that the U.S. Forests Protocol title summarizes the ARB forest protocol in the United States appropriately.

N-22. Comment: The forest protocol should not be part of the proposed Cap and Trade rule unless, at the minimum, the following critical amendments are adopted:

a. Forest carbon offset projects may not include conversion of native forests to tree plantations.

A Forest Project may not include conversion of native forest stands comprised of multiple ages or mixed native species to even-age or monoculture management, and may not include even-age management of any stand that had been converted to even-age or monoculture management in the harvest cycle preceding the registration of the Forest Project.

b. Forest carbon offset projects must account for changes in down and dead wood and soil carbon pools.

Forest Projects that include timber harvesting are required to account for changes in the following forest carbon pools: lying dead wood, and soil carbon. (SIERRACLUBCA5)

Response: Under the ARB Compliance Offset Protocol for U.S. Forest Projects (Forest Offset Protocol) harvesting, including clear-cut harvesting, does not generate offset credits. The protocol requires projects to maintain or increase the standing live carbon stocks in the project area. While harvesting may occur, the protocol accounts for harvesting as a decrease in standing live carbon stocks that must be compensated for by an increase in sequestration in the rest of the forest project lands. Offset credits will not be issued if, over any consecutive 10-year period, the data reports indicate a decrease in the standing live carbon stocks. If such a decrease does occur it may be considered an intentional reversal requiring the replacement of all credits issued for the reversed carbon.

In addition to the requirement to increase carbon on project lands, projects must be in compliance with all existing rules and regulations to be eligible for generating offsets. The Protocol does not allow any forest management activity that is not already allowed by state, federal, or local laws and regulations. To the extent feasible, the Protocol includes environmental safeguards to help assure the environmental integrity of Forest Offset Projects. These include requirements for projects to demonstrate sustainable long-term harvesting practices, limits on the size and location of even-aged management practices, and requirements for natural forest management, which require all projects to utilize management practices that promote and maintain native forests comprised of multiple ages and mixed native species at multiple landscape scales.

The protocol also recognizes that lying dead wood is recruited from the standing dead wood pool. The Protocol requires (1) visual inspections of lying dead recruitment by verifiers, and (2) minimum standards for standing dead wood recruitment that is increased if a verifier observes that lying dead wood in the project area is not commensurate with recruitment from standing dead trees. We also recognize that lying dead wood provides important environmental and ecological benefits, but that quantification methods for lying dead wood have relatively high uncertainties. For these reasons, we consider the current carbon accounting framework and protocol requirements to be sufficient to prevent or account for significant decreases in the lying dead wood and soil carbon pools.

N-23. Comment: The forest protocol, as currently written, would allow shortfalls, whether unintentional or intentional to be replaced with offsets of any kind. It is inappropriate to substitute offset credits that are being marketed as benefiting our forests to be replaced by other, unspecified credits that would not capture any of the co-benefits being lost with the forest offset. (SIERRACLUBCA5)

Response: The protocol includes flexibility by providing participants with compliance instrument options to make up for forestry protocol offset shortfalls. We will issue credits based on their ability to reduce GHG emissions, and the subsequent replacement instruments only have to demonstrate that same benefit—to reduce GHG emissions.

N-24. (multiple comments)
Comment: Section 2.1.2 eliminates the opportunity for forest carbon projects which had previously been verified under other voluntary carbon offset programs such as the Chicago Climate Exchange (CCX) and the American Carbon Registry (ACR). Hundreds of thousands of acres of land submitted to the CCX in the mid to late 2000s. The associated offsets are currently worthless and many project owners were never able to sell their offsets before the market crashed. Landowners can cancel their commitments to the CCX as well as ACR by retiring 100 percent of their issued offsets. Once a project is free of all liens and encumbrances associated with a carbon offset registry, it is free to operate as it chooses. By excluding canceled CCX and ACR projects ARB is turning away landowners willing to commit to carbon increasing activities that would not otherwise take place. We recommend that ARB modify this provision so that projects which have properly satisfied the terms of replacement and cancellation can register under ARB. (FINITE)

Comment: Section 2.1.2 eliminates the opportunity for forest carbon projects that had previously been verified under earlier voluntary programs to participate in the ARB program. Once a project has cancelled prior credits and is free of all liens and encumbrances associated with the earlier registry, it is free to operate as it chooses. We therefore recommend that ARB modify this provision so that projects that have properly satisfied the terms of replacement and cancellation of prior registries can register under ARB. (BLUESOURCE2)

> **Response:** We agree with these suggestions and made the appropriate changes to the protocol.

N-25. Comment: CCSF applauds the incentive offered to forests through the development of carbon credits which support reforestation and preservation of California's forests. However, we are concerned that the Compliance Offset Protocol U.S. Forest Projects may create incentives to plant trees in grasslands, which harbor significant native biodiversity in the state of California. The requirements for reforestation projects (sections 2.1.1 and 3.1.2.1 of the Compliance Offset Protocol U.S. Forest Projects) should be amended to include measures to prevent net loss of native biodiversity and prevent conversion of California's grasslands to forest. Native biodiversity should be protected and considered at all scales including species diversity and diversity in land cover and ecological function. (SFMAYOR3)

> **Response:** Projects must be in compliance with all existing rules and regulations to be eligible for generating offsets. The Protocol does not allow any forest management activity that is not already allowed by state, federal, or local laws and regulations.

Qualified Conservation Easement

N-26. Comment: Section 3.5 does not provide an adequate description of what a landowner must do in order to have ARB recognize a "Qualified conservation

Easement." We request ARB issue specific language it requires an easement to contain. (FINITE)

> **Response:** We included additional language in the Forest Protocol package during the second 15-day changes to the regulation that addresses the commenter's concern.

N-27. Comment: Regarding section 3.5(b), since a forest carbon offset project under ARB can be terminated due to both intentional and unintentional reversals (both under the control of the landowner and under provisions for automatic termination under conditions out of the control of the landowner), a Qualified Conservation Easement should not be perpetual. If a project is terminated under the Regulation, the easement naming ARB as a third-party beneficiary, or at the very least ARB's standing as a third-party beneficiary, should be able to be terminate at this time. We recommend that ARB amend this section so that the easement will not have to be in force any longer than the project's carbon commitment and that if the easement is perpetual in nature, ARB's status as a third-party beneficiary be automatically terminated in the event of termination of the carbon project. (FINITE)

> **Response:** We made changes to the protocol to address this concern.

N-28. Comment: CERP requests clarification concerning whether Avoided Conversion projects implemented on public, non-federal land are required to obtain a conservation easement. Section 3.5 of the protocol states: "for Avoided Conversion projects on private land (emphasis added), the forest owner must record a Qualified Conservation Easement against the offset project's property in order for the forest project to be eligible." Section 3.6 provides that: "Avoided Conversion Projects must be implemented on private land, unless the land is transferred to public ownership as part of the program." Section 3.6 also specifies a number of steps that such projects on public, non-federal land must engage in, including public vetting processes sufficient to evaluate management and policy decisions. However, section 4 of the protocol states: "All lands in the project area must be covered by a qualified conservation easement." This language is ambiguous as to whether it applies to Avoided Conversion projects not only on private land, but also those on public land. CERP therefore requests that ARB clarify whether the transfer to public ownership is sufficient for Avoided Conversion projects. If so, such projects should not also have to have a conservation easement. (CERP4)

> **Response:** We modified Section 4 to make it clear that either the Avoided Conversion projects have a conservation easement or they be transferred to public ownership.

N-29. Comment: Section 3.5 does not provide an adequate description of what easement language is required for ARB to recognize it as a "Qualified conservation Easement." We request the specific language ARB is seeking. Moreover, at the conclusion of carbon commitments to ARB the Forest Owner should be allowed to terminate ARB's standing in any easement, as well as the underlying easement itself, if allowed under that easement's terms. Finally, many early action projects will be unable to successfully petition easement holders to bear the administrative and legal costs of evaluating potential new liabilities to ARB established by adding Qualification language, then re-drafting, executing and registering the modified easement. We request that ARB waive this requirement for early action projects or otherwise address this barrier to small landowner participation. (BLUESOURCE2)

> **Response:** We did not make a change, as the protocol is explicit in the types of rights provided to ARB in the conservation easement. We made modifications to terminate our interest in the easement if the forest project has met its carbon commitments or been terminated. We believe the requirement for ARB inclusion in the conservation easement is essential to our ability to ensure permanence in the offset project.

N-30. Comment: Compliance Protocol for U.S. Forest Offsets, Section 3.5 Use of Qualified Conservation Easements. We understand the need for ARB to have the ability to intervene in conservation easement issues that relate to carbon offset projects. However, we think that ARB having the same enforcement authority as the easement holder, and broadly defined to encompass all aspects of an easement is overly broad and could create confusion about roles and responsibilities. We think it is more appropriate to 1) narrow ARB's scope of concern to provisions of easements that affect the integrity of offset projects, and 2) to clearly define the time at which it is appropriate for ARB to intervene in the execution and enforcement of the easement. We believe that requiring holders of qualified conservation easements for carbon offset projects be accredited by the Land Trust Accreditation Commission should provide a layer of assurance that easements will be properly executed and ARB should only have the right to intervene when such land trusts have demonstrably failed to enforce provisions of qualified easements that adversely affect carbon projects. We would like to work with ARB to craft acceptable language. (PFT3)

> **Response:** While the commenter provides some specific cases on how and when our interests could be limited in a conservation easement, we did not make the change. These requirements are written broadly, as we cannot anticipate all situations under which we may need to exercise enforcement authority or intervene to ensure that the permanence requirements of the offset project remain intact. No other commission can substitute for the regulatory enforcement duties of ARB in implementing its programs.

N-31. Comment: The default financial risk continues at 5 percent of all offset credits issued, which is far too high. There is no evidence of a 5 percent rate of financial failure for forest owners. The work group assumed that most projects would also include the deed restriction as well, and received the 1 percent default financial risk, which is a much more realistic value. Small non-capitalized projects may have slightly elevated risk, but still less than 2 percent. We recommend that ARB change the 5 percent to 2 percent and allow the verifier to consider forest owner capitalization and allow reduction even without a Qualified Conservation Easement to use 1 percent. (CFA2)

> **Response:** No changes were made to the regulation based on the comments. The current risk values are conservative, but necessary to ensure the environmental integrity of the program as it is first implemented. If data collected during the implementation support a different risk rating, we will propose changes, as necessary.

Measurement and Verification

N-32. Comment: Measurement and Verification Processes Insufficient to Address Forest-related Mitigation Actions. Section 95973 (b) only requires the Offset Project Operator and any Authorized Project Designees to fulfill all local, regional, and national requirements on environmental impact assessment. Section 95973 (b) should be amended to ensure all local, state, national environmental laws and regulations are met in the course of the offset project. (FRIENDSOFEARTH2)

> **Response:** This comment falls outside the scope of the first 15-day changes to the regulation. Therefore, no further response is required. However, section 95975 requires offset project operators to attest that their projects will meet all applicable local, regional, and national environmental regulations.

N-33. Comment: Section 95977, Verification Requirements: There are a number of weaknesses in the verification section, especially to the extent these verification requirements will apply to any future agreement to include international sector-based REDD offset credits. For sequestration projects, the schedule of verification is wholly insufficient to address the likelihood of both leakage and reversals. The current draft allows sequestration projects to be verified once every six years, and after initial verification, reforestation project can delay verification for twelve years. This is particularly alarming in light of Section 95983 on Forestry Offset Reversals (see below); the State cannot rely on virtuous reporting of intentional reversals and must ensure annual verification of stated greenhouse gas emissions reductions. Section 959779(c) must be amended to require annual verification for all sequestration projects. (FRIENDSOFEARTH2)

> **Response:** While the regulation provides a framework for the potential acceptance of REDD credits, we do not currently have provisions in the regulation to approve those credits or allow them to be used in the compliance program. When it is appropriate for us to begin to consider a REDD regulatory program, we will be analyzing each of these issues very carefully. This would require a separate regulation that includes its own public stakeholder review and a separate regulatory and environmental review process. This comment falls outside the scope of the first 15-day changes to the regulation. Therefore, no further response is required.

N-34. Comment: Section 95977.1 (b)(3)(G) on sampling plans for offset project data reports and section 95977.1 (b)(3)(L) on data checks for offset project data reports are insufficient for addressing the complexity of measuring carbon stocks and fluxes from land based emissions. The use of default values in offset project calculations is widespread and estimates of carbon volumes stored in the respective forest areas vary considerably. A recent study assessing the uncertainty in measuring forest carbon found that, “the overall model output uncertainty reaches an average of +/-43.5 percent” and that “none of the scenarios tested … achieve emissions reductions outside the error margins.” Given the significant uncertainty and error margins in GHG calculations in the forest sector, qualitative narratives of uncertainty risk assessments in baselines, sequestration calculations, among others is not sufficient. Using professional judgment in determining the number of data checks (Section 95977.1 (b)(3)(L)3.) is not adequate to ensure environmental integrity. (FRIENDSOFEARTH2)

> **Response:** The forest offset protocol is written to account for uncertainty and only provide conservative estimates for offset crediting. The regulation does not prescribe the number of data checks that the offset verification team must perform. The offset verification team must exercise professional judgment in choosing these. Ultimately, the offset verification team must have reasonable assurance that: (1) the reported emissions reductions or removals do not contain a material misstatement that would overestimate reductions or removals, or a material misstatement that would underestimate reductions or removals, by more than five percent of the reported emissions reductions or removals, and (2) that all applicable regulatory requirements in the proposed regulation and the applicable protocol have been met in the estimation and reporting of those reduction or removal estimates. We will have oversight of the offset verification team’s verification program to ensure consistency and quality across its verifiers.

N-35. Comment: Section 95983, Forestry Offset Reversals: ARB must further clarify and justify the percentage of ARB offset credits that will be held in buffer accounts will be sufficient to address the problem. While we appreciate the intent to safeguard against both intentional and unintentional reversals, this section does not amount to a prudential approach to risk management. (FRIENDSOFEARTH2)

> **Response:** No changes were made to the regulation based on the comments. The current risk values are conservative, but necessary to ensure the environmental integrity of the program as it is first implemented. If data collected during the implementation support a different risk rating, staff will propose changes, as necessary

N-36. Comment: CERP recommends that ARB apply simplified verification and reporting requirements for a project after the end of its 25-year crediting period. After the crediting period, monitoring will play a different function: that of proving that stocks have not decreased from their levels in year 25 of the crediting period, and monitoring attendant natural forest management requirements. However as currently written, in sections 9.2.1 and 9.2.2, the regulations require the Offset Project Data Reports to contain a variety of information that is not relevant once the credits have been created, such as the application of a confidence deduction, if above 10 percent, for the inventory. In addition, a calculation of the forest buffer contribution or the GHG reductions are not applicable after the crediting period, and should not be required. (CERP4)

> **Response:** No changes were made to the regulation based on the comments. ARB will continue to discuss and evaluate these suggestions, and if appropriate, propose modifications to the regulation.

Clearcutting

N-37. Comment: Do not include forest clearcutting as part of the California's Cap and Trade offset program. Forest clearcutting and the conversion of native forests to tree plantations pose great risk to the climate, while simultaneously degrading forest ecosystems, water quality, and wildlife habitat, and impairing the forest's resilience to the impacts of climate change. Forest projects eligible for offset credit should not include even-aged management (clearcutting), and should not become an incentive for the conversion of native forests to tree plantations. Rather than promote the conversion of native forest to a patchwork of clearcuts, California should use this opportunity to incentivize the best kinds of "green" forms of forest management, which can benefit the climate and the forest. (SIERRACLUBCA5)

> **Response:** No changes were made to the regulation based on the comments. The provisions related to forest management already incorporate existing legal requirements and limits to forest harvesting. Please see responses to similar comments in the Protocols category of Chapter III.

N-38. Comment: We have concerns over the carbon calculations. The Climate Action Reserve issued two white papers demonstrating that our concerns are valid, and we believe emphasize the reason that the Board needs to withdraw clearcut projects from at least Phase I of the program implementation until the problems with accounting are fully examined, justified, and a detailed protocol is developed and adopted for calculating gross and net carbon containment and verification processes. (SIERRACLUBCA5)

> **Response:** We will review new information as it becomes available and revise our protocols as needed. This comment falls outside the scope of the first 15-day changes to the regulation. Therefore, no further response is required.

N-39. Comment: Domestic Forest Offset Protocols Lead to Forest Clearcutting. Forty-seven organizations wrote a letter to ARB in December 2010 raising concerns about the domestic forest offset protocol, arguing that "ARB's proposed cap-and-trade rule currently not only explicitly invites forest clearcutting as a carbon offset project, but also incentivizes the conversion of natural forests into tree farms." When ARB Board members raised questions about the inclusion of forest clearcutting when the protocol was first considered in September of 2009, they were assured that these flaws would be addressed and the forest protocol would become the “gold standard” for forest carbon offsets. Unfortunately, the cap and trade rules adopted by ARB still include forest clearcutting. (FRIENDSOFEARTH2)

> **Response:** No changes were made to the regulation based on the comments. The provisions related to forest management already incorporate existing legal requirements and limits to forest harvesting. Please see responses to similar comments in the Protocols category of Chapter III.

Livestock Manure (Digester) Protocol

N-40. Comment: Section 95852.1.1(b), which restricts biogas projects from receiving carbon credits, offsets or allowances “attributed to the fuel production that would otherwise result in holding a compliance obligation for combustion CO_2,” seems overly broad and counter to what ARB had indicated in the past with respect to offsets from biogas projects. First, it is not clear whether biogas projects are prohibited from claiming ARB-issued offsets or offsets from other programs (such as CAR). If it is the former, then ARB has already determined which projects are eligible to earn offsets through its protocols, and any adjustments with respect to offset project boundaries and which credits can be claimed should be made in the protocols themselves. If it is the latter, it is not clear what authority ARB has to restrict offsets that are issued by non-ARB programs. In any case, the combustion of biogas releases biogenic emissions, which should be treated as carbon neutral. If an offset protocol awards credits for avoided methane emissions, that is a separate “reduction” from the value associated with combusting a biogenic fuel, and awarding this credit does not result in “double counting” downstream carbon benefits. If ARB seeks to restrict offsets from the combustion of the biogenic fuel (but not from avoided methane emissions), it would be much clearer if this adjustment were made in the Livestock Offset Protocol or other future methane destruction credit protocols developed by ARB. We urge ARB to clarify (as it has for Renewable Energy Credits) that generation or use of generation or use or transfer of offset credits from methane destruction projects under the Livestock Offset Protocol and any future protocols that provide for credit methane destruction, or any other recognized protocols for methane destruction, will not prevent biomass-derived fuels from being exempt from compliance obligations. Modify section 95852.1.1(b) as follows:

> ~~(b) An entity may not sell, trade, give away, claim or otherwise dispose of any of the carbon credits, carbon benefits, carbon emission reductions, carbon offsets or allowances, howsoever entitled, attributed to the fuel production that would otherwise result in holding a compliance obligation for combustion CO_2.~~ Generation or use or transfer of Renewable Energy Credits <u>or of carbon offset credits that are available for methane destruction</u> ~~is~~ <u>are</u> allowable and will not prevent a biomass-derived fuel that meets the requirements in this section from being exempt from a compliance obligation. (EM)

Response: We clarified text in the regulation to allow digester projects to sell credits for methane destruction, and for digester biogas CO_2 combustion emissions to be exempt from a compliance obligation.

N-41. Comment: From our experience nationally and internationally, we believe the requirement to have a meter on every destruction device is unnecessary and overly conservative. We know that it will cost over $5,000 per extra biogas meter, further costs for annual maintenance and impose additional risks that the meters may fail, leading to downtime, etc. Where there are identical destruction devices and those destruction devices can be demonstrated to be operating, there is no need for additional meters to determine the gas which flowed to each device. (CIG2)

Response: We agree with the comment and modified the text accordingly.

N-42. Comment: Section 6 of the Livestock Offset Protocol reintroduces language that requires every destruction device to have a meter installed. This individual meter requirement will be onerous for small farms that currently have a number of generators with one meter on the main pipe running to the generation sets. Each individual meter costs $5,000, and there will also be on-going costs for maintenance and calibration. For instance, if one meter goes out of calibration it can cost as much as $1,000 to have it fixed, and the facility will lose the credits that were generated in the month or more it takes to fix the meter. Furthermore, as long as destruction devices are identical, a facility can demonstrate that they are operational by monitoring the performance of flares. This is done by looking at temperature readings which denote their operation. This use of temperature readings is an efficient and less costly proxy that maintains environmental integrity, and should be reintroduced in the final regulations. (CERP4)

Response: We agree with the comments and modified the text accordingly.

N-43. Comment: We strongly recommend that ARB allow project developers to use more updated versions of data, such as volatile solids defaults. This is permitted currently under CAR. Reflecting this in the protocol would reduce the need for project developers to seek clarification from registries who would need to check with ARB. (CIG2)

Response: The APA process requires our regulations to be very specific. Any deviation from the protocols would be considered a noncompliance. We will update protocols with new data and emissions factors as part of period reviews and updates.

Ozone Depleting Substances (ODS) Protocol

N-44. Comment: We believe that an additional refrigerant, CFC-13 (R13) should be added to the list of eligible refrigerants in the Protocol for Ozone Depleting Substances Projects. CFC-13 has been used in low temperature commercial and industrial applications, such as ultra-low temperature laboratory freezers. The Climate Action

Reserve working group had assumed that remaining use and inventories of R13 were negligible. Based on our work with refrigerant reclaimers and facility owners and operators, demand for CFC-13 remains in high demand to recharge high value older equipment. Because of their age and high-pressure requirements, these older units commonly leak, and in many cases, the full refrigerant charge is released. Newer units use ethane, propane, HFC-245fa, HFC-236 and propylene. For industrial process refrigeration, 40 CFR 82 allows a leak rate up to 35 percent. The Climate Action Reserve workgroup compiled data and input from industry and government experts, including the EPA Vintaging Model. That survey reported an average annual leak rate for CFC-13 between 7 and 33 percent. (EOSC3)

> **Response**: We agreed and modified the protocol to include CFC-13.

N-45. Comment: We recommend that ARB conduct verifications on each of the discreet reporting periods within an individual project to ensure accurate accounting for different ODS sources and destruction events. (EOSC3)

> **Response:** We did not make this change. We believe that the documentation and reporting requirements for a 12-month period are sufficient to support rigorous project verification. Each reporting period must have its own offset project data report that is verified separately from the next offset project data report.

O. GENERAL, OPPOSITION, AND SUPPORT

General

O-1. (multiple comments)
Comment: Cap and trade with offsets is too complicated and would require the State to create a whole new bureaucracy. Trading of permits could create spikes in pricing and the inclusion of offsets is an essentially dishonest way of reducing emissions. A straight forward fee on carbon would be simpler and if we rebated all the revenue to California households, then poor and middle class people would be dealt with fairly. The approach to reducing emissions exhibiting the greatest simplicity, efficiency (least cost), and likelihood of being adopted by other states is the Fee and Dividend approach. In this approach, a fee for carbon emissions gradually increases over time to a level deemed likely to achieve the desired emission reductions. As such, emission price certainty is assured, allowing for smoother business and investment planning and therefore greater job creation. All (100 percent revenue neutral) of the fees are returned via check to households so that there is a clear reward for the program to go along with the market incentive to reduce. Also, there are minimal administrative costs to the program and no permit market to regulate. The greatest reason to embrace this approach is its appeal to other states and the country as a whole. We need an approach that is simple, effective, and 100 percent revenue neutral, and attractive for others to adopt. It would jump-start renewables, well-paying jobs, and more effectively lower emissions. Regional disparities would be very minimal. (CCL1, CCL2, CCL3, CCL4)

Comment: I strongly support the use of a carbon tax model in lieu of cap and trade for controlling emissions. A carbon tax is much more transparent. It meets the need for income, which can be used to clean up the effects of pollution, and works as a more direct motivation to polluters to reduce their emissions. I do not think pollution should become a 'market' consideration by allowing it to be a Wall Street commodity. I trust my government to design a tax code that is consistent and effective in limiting pollution. (MORSE2)

Comment: Please develop a fee and dividend program instead of Cap and Trade. It will add a fee to carbon/dirty energy sources and pay a fee to clean energy users and creators. (KENNEY)

> **Response**: We considered alternatives to the cap-and-trade program and implementing a carbon fee was one of the alternatives considered; however, we determined that a cap-and-trade program was more favorable. Details on why we chose cap-and-trade over a carbon fee can be found in Chapter IV of the Staff Report.

O-2. Comment: Consistent with prior CCC recommendations (see www.caclimate.org), the Board should establish an Executive Office-level position with the primary responsibility of ensuring that the very clean technology and facility investments anticipated by the AB 32 program and its complementary measures (e.g., the low carbon fuel standard, the renewable electricity standard and motor vehicle technologies, among other measures) are expedited by the ARB and its sister departments, commissions, agencies and air districts. This responsibility should include appropriate reform of CEQA and air quality regulations so that low carbon fuels and technologies rapidly receive required product or facility performance verifications, certifications and permits. The responsible ARB Executive should submit periodic reports to the Board regarding obstacles, proposed solutions and degree of success. (CCC2)

> **Response**: This comment falls outside the scope of the first 15-Day change notice. However, as stated in the responses to the 45-day package comments, we are committed to integrate all AB 32 and Climate Change Programs and established policies to maximize fuel and energy efficiency that will initiate investments in clean technologies for California's clean energy future.

Opposition

Oppose Cap and Trade Regulation

O-3. (multiple comments)
Comment: Cap and Trade has not been proven to provide the results that this plan is aiming for. Cap and Trade passes on the cleanup costs (or healthcare costs) to the government (i.e. taxpayers), which in the end doesn't benefit the public. (FISCHER)

Comment: In the middle of a great depression, this is not the time to destroy the California economy with this ill-advised cap and trade scheme. (MURRAYD)

Comment: I will begin by expressing my disappointment with the decision to move forward with Cap and Trade. This legislation is a monstrosity, which only serves to suck more money from business and establish another revenue source for people involved in trading CO_2 credits. This is just a system which will, over the years, allow for billions of dollars to change hands, make traders a lot of money, increase business costs while not having any measurable effect on our climate. (KENNERLY2)

Comment: I, as well as my fellow members and citizens of color in California, are being directly attacked based on their race and income. This is another attack of their civil liberties and freedoms as Americans, by taking their moneys away from them in the form of a "get rich" scheme you call Cap and Trade. The ethnic people of this State cannot afford to pay higher prices for electricity, natural gas, gasoline, diesel fuels, as well as the giant spike in the price of every consumer good and service in this state due to the implementation of this Cap and Trade program. The proposed Cap and Trade program is nothing but a giant scheme to make money off of every person and business in California who uses electricity, natural gas, gas, or diesel. Especially affected are the ethnic peoples in this state who have a subsequent lower income due to their race and prejudice in the job force. You are quite aware of how much money you are gaining to make and how you are using this as a monopoly to get rich and to control the people. This is stealing. You are telling the people it is in the name of saving the environment, which it is obviously not. Where would all of this money off of carbon credits be going to? Who is going to get rich off of this? I, as well as my fellow ethnic people's and members of the NAACP, are against this attack on our rights, and economic freedoms imposed by this Cap and Trade program. We are whole heartedly against this and must see it stop now. (NAACP)

Comment: Enough already. Look at what is and has happened to California. High unemployment, second highest taxes in the US already, stagnant growth, businesses leaving California for more favorable states like TX, run away government spending that this will add to as the bureaucracy grows and it is ridiculous to think that this added regulation will reduce any emissions other than running more people out of the State. This proposed regulation needs to be tabled forever and the agency dismantled. (FORMLETTER12)

> **Response:** This comment falls outside the scope of the first 15-day change notice. As we explained in the 45-day responses, we conducted a thorough evaluation of both the health and economic effects of the proposed program to ensure to the extent feasible that no disproportionate negative impact will occur. We have designed the cap-and-trade program to minimize the cost of implementation and compliance and to maximize the overall benefits. Because this comment does fall outside the scope of the notice, no further response is required.

O-4. Comment: Meaningful global action to limit atmospheric concentrations of GHGs can only be achieved through broad action taken across all major global economies. But in the absence of global action, an integrated market-based national policy is the most rational approach to cost-effective, meaningful emissions reductions that can overcome the adverse impacts of leakage, volatility, risk and cost. Further, an integrated market-based national program also provides the most environmentally effective approach to achieving GHG targets at the least economic cost because there is no opportunity for domestic emissions leakage. Climate policy limited to California will be less environmentally effective and have greater economic impacts than comparable efforts implemented within a national Cap and Trade system or even a broad regional system if one were to actually come together with enough participants to make it meaningful and not cost prohibitive to its participants. Given the limited likely effectiveness of a California only program, CIPA believes that it is only under a federal program that policies that can mitigate adverse economic and environmental consequences should be pursued and the current effort under way at the Air Resources Board is a costly exercise that we hope will never be fully realized on the limited geographic basis currently contemplated. To do otherwise would be to embark on a mission that will yield little to the environment at great cost and disadvantage to the state’s economy. Yet, despite the peril inherent in a California only scheme, CARB presses forward with Cap and Trade notwithstanding a flawed design, notwithstanding having already actually met the emissions reductions called for under the authorizing legislation, notwithstanding the failure of the Chicago Climate Futures Exchange and in the face of litigation by forces that would overtake the climate change policy process for their own social ends. (CIPA)

> **Response:** This comment falls outside of the first 15-day change notice. As explained in the 45-day responses, we recognize that we cannot do it alone, but California's economy is among the top 10 largest economies in the world, and therefore is uniquely positioned to take action. Our climate change plan relies on a strong network of climate partnerships. California is working with other states, jurisdictions in the Western Climate Initiative and the federal government to encourage the reduction of greenhouse gases. The flexibility of the cap-and-trade program, together with specific design features included in the regulation to help contain costs, ensures that the reductions needed to meet the requirements of the regulation are cost-effective. Because the comment falls outside the scope of the notice, no further response is required.

Oppose 15-Day Changes to the Regulation

O-5. Comment: The changes that have been made to the Regulations and protocols since they were first proposed have not addressed the flaws that will make them ineffective at solving the critical threat of major climate disruptions that they are allegedly designed to address. (WILLIAMSZ2)

> **Response:** The regulation and protocols are designed to meet the requirements of AB 32. This regulation is one strategy of many developed under AB 32 to reduce GHGs. Please see responses to similar comments in the 45-day section that are related to program design.

O-6. Comment: I do not think these modifications go far enough in this economy to reduce the economic impact. I believe they should be rejected. (GOEDJEN2)

> **Response:** AB 32 calls on ARB to adopt regulations and implement measures to "achieve the maximum technologically feasible and cost-effective reductions in greenhouse gas emissions." AB 32 requires that the reductions be real, permanent, quantifiable, verifiable, and enforceable. AB 32 includes specific standards that apply to regulations that use market-based compliance mechanisms, such as the cap-and-trade program. We have designed the cap-and-trade program to maximize the overall benefits. We evaluated both the health and economic effects of the program to ensure to the extent feasible that no disproportionate negative impact will occur. The overall health and environmental effects of the regulation are expected to be positive, and the program has been designed to minimize the economic costs of the program, which will minimize the effects on low-income communities. The Staff Report provides supporting details on the economic analysis conducted by us in designing the cap-and-trade program.

Support

Cap-and-Trade and AB 32

O-7. (multiple comments)
Comment: GreenX supports the efforts of California and the Air Resources Board to adopt and implement not only a Cap and Trade regulation, but also its efforts to be the model for effective and efficient use of Cap and Trade rules to reduce greenhouse gas emissions in California, and in other jurisdictions in North America. (GREENX)

Comment: Morgan Stanley Capital Group, Inc. strongly supports the use of a cap-and trade program as the best way to achieve reductions of greenhouse gas emissions in California. At an overarching level, we believe the Cap and Trade Rule is largely on target as a workable framework for implementing AB 32. (MSCG3)

Comment: Environmental Defense Fund (EDF) supports the California Air Resources Board's (CARB) most recent actions to improve the efficacy of the Regulation. We believe this Regulation will deliver significant benefits to the state of California. EDF wholeheartedly recommends the Regulation be adopted by the Board without delay. (EDF4)

Comment: Covanta Energy supports the goals of AB 32 and the efforts to reduce GHGs in California. (COVANTA)

Comment: I support cap and trade and am excited to see it go into place in one year's time. It's time we begin to control and decrease our carbon footprint and preserve the one environment we have. This will save lives, create good jobs that benefit society and the Earth, and help us tackle climate change. We can afford this because we must to address climate change. If we wait much longer, it will be too late. (BROWNA)

Comment: Yes on this bill, it is an excellent beginning. There is simply no question that human activity is causing drastic changes in climate. To believe otherwise means one is not reading serious science and is rather like not "believing" in evolution, i.e. what we "believe" doesn't change the truth. We must act quickly and effectively to reduce carbon emissions. As usual, California should lead the way. This bill is a positive step in the right direction. (DAVISSTEIN2)

Comment: I would like to voice my support for the California Cap on Greenhouse Gas Emissions and Market-Based Regulations. It is a responsible first step in controlling the increase of CO_2 for our State and sets goalposts for other western states and the federal government. I am a fisherman and controlling CO_2 emissions is an important step in insuring healthy growing conditions for shellfish as we move into the future. California can be proud of its proactive stance on protecting air and water resources. Action to control CO_2 emissions will have positive effects decades into the future. Acidification of our oceans is a serious threat to aquaculture and wild fisheries in our State. Thank you for looking out for future generations of people and wildlife. (STEELEBR)

Comment: I strongly support the California Cap on Greenhouse Gas Emissions and Market-Based Regulations. It is a reasonable, market-based approach to controlling the increase in carbon dioxide and provides an example of leadership and problem solving for other states and the federal government. I am an environmental scientist with a great deal of experience in water quality and natural resource management in California and other west coast states, including Alaska. I have seen firsthand the evidence for increasing effects of climate change on water supply and natural resources, and am increasingly concerned about the potentially drastic effects of ocean acidification on fisheries and other marine resources. Your decision in support of this program would be an important step toward developing pragmatic solutions to the CO_2 problem that provide incentives for creative problem solving and begin to bring this major externality into the market system. (BERNSTEIN)

Comment: EDF continues to support the programmatic design of a market with free allowance distribution at the outset and a transition to a system that auctions a majority of allowances over the next compliance periods. (EDF4)

> **Response:** We acknowledge your support on the cap and trade regulation and our efforts to reach the greenhouse gas (GHG) reduction goals required in the California Global Warming Solutions Act of 2006, Assembly Bill 32.

Components of the First 15-Day Change Notice

O-8. (multiple comments)
Comment: CSCME is pleased that CARB recognizes the importance of offsets as both a cost-control mechanism and a way to advance the goal of GHG emissions reductions. Offsets are an important tool to help minimize leakage. (CSCME4)

Comment: CERP supports the goal of ensuring that California creates an environmentally rigorous and highly functional offset system in order to contain the costs of achieving the AB 32 emission limits and to serve as a model for other regional and federal greenhouse gas regulatory programs. (CERP4)

Comment: We support the decision by the California Air Resources Board (CARB) to adjust the start date for compliance to 2013. This adjustment will allow the regulated industries the time necessary to assure their reporting and emission reduction protocols are in place, as well as, allow CARB the time to make any fine-tuning adjustments to the program to ensure its success in meeting AB 32 implementation goals. (AB32IG2)

Comment: IEP thanks staff for their attentiveness to stakeholder input during this rulemaking, and notes there are important improvements in the July 27th version of the Cap-and-Trade regulation. IEP appreciates the amendments CARB has made to Section 95852.2, which will aid in encouraging Municipal Solid Waste conversion projects. Second, IEP supports the change to the compliance periods, so that the first compliance period only contains the 2013 and 2014 emission years. This will allow more time to test the auctions and auction software, and better evaluate market stability concerns. Finally, IEP is pleased to see CARB's treatment of allowance auction revenue, such that auction proceeds shall be used exclusively for the benefit of retail ratepayers of each electrical distribution utility consistent with the goals of AB32, while also requiring that each electrical distribution utility report on the use of auction proceeds and allowance value. (IEPA2)

Comment: CAW supports the decision not to exempt the emissions from the combustion of municipal solid waste from having to hold compliance obligations under the cap-and-trade program. The July 7th discussion draft contained a categorical exemption for municipal solid waste incinerators, a significant and arbitrary change for which no public process had been held, and, while this was subsequently removed, we urge you not to include this exemption in any future changes to this Regulation. (CAW)

> **Response**: We acknowledge your support on various components of the first 15-day change notice.

P. USE OF AUCTION PROCEEDS

General

P-1. (multiple comments)
Comment: ARB should work with the legislature to establish a program that commits use of allowance revenue to the investment categories identified by the Economic Allocation and Advisory Committee and supported by Board resolution last December. While TNC acknowledges that ARB may not have full authority to determine how allowance revenue may be used, we urge ARB to work with the legislature to develop an infrastructure that facilitates the investment of allowance revenue consistent with the recommendations of the Economic Allocation and Advisory Committee, published in March 2010, and subsequently endorsed by the Board in its December 16, 2010 resolution (Resolution 10-42). These categories supports funding for, among other things, adaptation of natural systems to climate change (e.g., nature-based adaptation), land use and transportation, job training, disadvantaged communities and regional and local governments. Investments in these categories are critical to facilitate additional greenhouse emission reductions and help nature and people adapt to the unavoidable impacts of climate change. (NC8)

Comment: The Board should embrace the following principles for applying auction revenues. Auction revenues: i) from any sector should be applied primarily to greenhouse gas emission reductions from within that sector; ii) from all sectors should be used for comparable purposes; and iii) to the extent consumer rebates are offered, similar rebates should be available to consumers of fuels and other consumer products as well as electricity. (CCC2)

Comment: If an auction is instituted, the auction proceeds should go back into advancing energy efficiency. (NAIMA2)

> **Response:** These comments fall outside the scope of the first 15-day changes to the regulation. The Governor and Legislature have the ultimate authority on directing the use of auction revenue; therefore, no specific language was included in the initially proposed regulatory language or the first 15-day changes to the regulation. Resolution 10-42 includes the Board’s suggestions for use of auction proceeds. Furthermore, in Resolution 11-32 the Board directed the Executive Officer to develop recommendations for the appropriate use of auction revenue. These recommendations should consider the Board’s direction in Resolution 10-42.

P-2. Comment: CARB's proposal to raise funds via an auction for reasons outside of administrative fee purposes is beyond CARB's regulatory authority. CARB justifies an auction system as a means of lowering GHG emissions and satisfying requirements under AB 32. CARB proposes that revenues from an auction be appropriated to fund programs such as a community benefits fund, green collar employment training, and a low carbon investment fund. These and other proposed programs are outside the scope of administrative fees. We ask CARB to keep in mind that fees must be closely tied to the regulatory programs serving the fee payers, otherwise, these fees are actually taxes and are subject to a two-thirds vote of the legislature. Without a legitimate nexus, the above mentioned auction revenue proposals will likely be challenged as they are contrary to the legislative intent of AB 32. (CALCHAMBER3)

Response: This comment falls outside the scope of the first 15-day changes to the regulation. Nevertheless, in Resolution 11-32 the Board directed the Executive Officer to develop recommendations for the appropriate use of auction revenue. These recommendations should consider the Board's direction in Resolution 10-42.

P-3. Comment: The Cap and Trade regulation provides that proceeds from the sale of allowances will be placed in the Air Pollution Control Fund for appropriation by the Legislature for the purposes designated in AB 32. TWS urges that ARB explicitly reference the 2010 report of the Economic and Allocation Advisory Committee (EAAC) in the Cap and Trade regulation as an articulation of possible relevant uses of AB 32 allowance value. As the economic, financial, and policy experts on the EAAC found, investments in adaptation will be especially important, including investments in ecological services that are not dependent on offsets for funding. California's natural systems provide multiple benefits to current and future generations. The resiliency of these natural systems is increasingly threatened by climate change impacts and the loss of these systems will imperil the health and economic welfare of California. (TWS)

Response: This comment falls outside the scope of the first 15-day changes to the regulation; however, we stated in Board Resolution 10-42 that the Board agrees with the uses of allowances recommended by the EAAC, including the use of revenue for economic opportunities and environmental improvements in disadvantaged communities.

Additionally, in Resolution 11-32 the Board directed the Executive Officer to develop recommendations for the appropriate use of auction revenue. These recommendations should consider the Board's direction in Resolution 10-42.

P-4. Comment: We urge the Board to include provisions in the Regulation to initiate a Community Benefits Fund from the outset of the Cap and Trade Program, funded by a minimum four percent of allowances from the industrial and electricity sectors. Funds should be used for programs or projects in the most impacted and disadvantaged communities identified by ARB for:

- Air pollution and climate change mitigation measures;
- Community public health programs;
- Green-collar employment opportunities in these communities. (SIERRACLUBCA5)

Response: This comment falls outside the scope of the first 15-day changes to the regulation. Per Board Resolution 10-42, we will deposit a minimum of 10 percent of annual proceeds generated from the direct auction of allowances in the Air Pollution Control fund for appropriation by the Legislature to programs and projects that reduce GHG emissions or mitigate direct health impacts of climate change and promote green-collar employment opportunities in California's most impacted and disadvantaged communities.

Additionally, in Resolution 11-32 the Board directed the Executive Officer to develop recommendations for the appropriate use of auction revenue. These recommendations should consider the Board's direction in Resolution 10-42.

P-5. Comment: Is returning allowance value to households as a dividend compatible with the regulation? My reading of the current Cap and Trade Regulation still allows for at least a portion of allowance value to be returned to households as a rebate or dividend in two ways. In the electricity sector, utilities receive free allowances, turn around and auction those to generators, and then use some or all of those revenues as a dividend to consumers. When transportation fuels enter the cap in 2015 in the second compliance period, they will presumably be auctioned to fuel providers, and those revenues may be returned to consumers as a dividend. Is this correct? Will the 15-day changes be more specific about this? Are there other ways consumers may be made whole as costs are passed down to them? (CARBONSHARE2)

Response: We do not believe that it is appropriate to include specific language in the regulation about the use of auction revenue, as this will ultimately be decided upon by the Governor and Legislature. However, in Resolution 11-32 the Board directed the Executive Officer to develop recommendations for the appropriate use of auction revenue. These recommendations should consider the Board's direction in Resolution 10-42. Furthermore, in Resolution 11-32 the Board directed the Executive Officer to work with the California Public Utilities Commission (CPUC) and publicly owned utilities to reflect the findings of the Board that the impact of the cap-and-trade regulation on electricity rates creates appropriate incentives to further the goals of AB 32. In this resolution, the Board further directed the Executive Officer to work with CPUC and publicly owned utilities to reflect the finding of the Board that if allowance value provided to the electric distribution utilities for ratepayer benefit is returned directly to customers, it is consistent with State efforts to promote energy efficiency and energy conservation.

P-6. Comment: Can ARB offer a dividend to consumers in 2012? Although only limited allowances will be auctioned into the system, even a small dividend could have a big impact on public perception of the program. The recent withdrawal of New Jersey from the Regional Greenhouse Gas Initiative is a cautionary tale for what could happen if allowance value is used for efficiency programs that are invisible to most consumers. Because consumers did not see a direct connection to the use of revenues, the lack of consumer support failed to prevent New Jersey's new Governor from withdrawing his state from the program a few months ago. An immediate 2012 dividend could help California avoid this fate. (CARBONSHARE2)

> **Response:** We appreciate your comment; however, specific uses for auction revenue will be determined by the Governor and Legislature.

P-7. Comment: ICCT recommends a streamlined allocation process that is appropriate for small businesses that are eligible for free allowances for transportation hydrogen. The Cap and Trade opt-in procedures may not be appropriate for a small renewable producer that has zero emissions or other small producers with small emissions that can be determined based on LCFS data. (ICCT3)

> **Response:** Small businesses that wish to receive allowances for hydrogen production may do so by becoming opt-in covered entities.

P-8. Comment: In the utility sector, every recipient of allowances should be required to invest their full value on AB 32-related purposes, including cost-effective energy efficiency, renewable electricity, and rebates to low-income consumers. ARB should provide guidance on how utilities spend the allowance value to assure that funded programs are additional and cost-effective, and should require specific and uniform reporting by the utilities. (SIERRACLUBCA5)

> **Response:** We agree that allowance value given to utilities must be used for AB 32-related purposes, and we specified such limitations in section 95892 of the regulation. Section 95892(a) and 95892(d) ensure that allowance value given to a distribution utility will be used on behalf of ratepayers, and in ways that are consistent with AB 32 statutory objectives.
>
> To this end, in Resolution 11-32 the Board directed the Executive Officer to work with the CPUC and publicly owned utilities to reflect the findings of the Board that the impact of the cap-and-trade regulation on electricity rates creates appropriate incentives to further the goals of AB 32. In this resolution, the Board further directed the Executive Officer to work with CPUC and publicly owned utilities to reflect the finding of the Board that if allowance value provided to the electric distribution utilities for ratepayer benefit is returned directly to customers, it is consistent with State efforts to promote energy efficiency and energy conservation.

P-9. Comment: We recommend additional incentives for transitioning to renewable steam and electricity and energy efficiency measures for both crude oil production and refining. (ICCT3)

> **Response:** We believe that the structure of the cap-and-trade program, including coverage and allocation to crude oil production and refining, creates the correct incentives for increased energy efficiency and use of renewable steam

production and electricity generation technologies.

P-10. Comment: At the December 2010 meeting, ARB agreed to include the EAAC recommendations on use of allowance revenue in the Board's final recommendations to the legislature on how the state may allocate future allowance revenue. We strongly urge the Board to include the EAAC recommendations in its final recommendations to the legislature on allowance revenue allocation. The EAAC recommendations are in keeping with other interagency and advisory groups recommendations on allowance revenue, particularly on how allowance revenue can support California agriculture in addressing climate change. In their final report to the Governor, EAAC recommended investing a portion of allowance revenue in biological carbon sequestration activities in agriculture and forestry. Their recommendations were echoed by other advisory bodies for AB 32. We cannot rely entirely on the carbon markets to achieve GHG emission reductions in agriculture. The marketplace lacks adequate funding for research to understand opportunities within farming systems to achieve GHG emission reduction. Translating research findings into real opportunities for California agriculture to provide voluntary GHG reductions requires technical assistance. In some cases, when transition costs may be high, financial incentives for farmers are essential. Allowance revenue can turn research into opportunities for certain agricultural activities to help meet the state's GHG targets. And for small and mid-scale California farmers and ranchers who may not benefit significantly from the carbon market because of the size or nature of their operation, state-oriented conservation programs may be a more viable alternative to assist them in reducing barriers to on-farm conservation efforts. We strongly urge the Board to support the recommendations of EAAC as well as the AgCAT and ETACC by including in its recommendations to the legislature competitive grants for research, technical assistance and financial incentives for agricultural practices that reduce GHG emissions and sequester atmospheric carbon while providing environmental and health cobenefits. (CACAN3)

> **Response:** We believe that the comment is not requesting specific amendments to the regulation and is more appropriate for the prospective process we will initiate to develop recommendations for use of auction revenue to the Governor and the Legislature. We stated in Board Resolution 10-42 that the Board agrees with the uses of allowances recommended by the EAAC, including the use of revenue for investments in low cost GHG emission reductions including investments in energy efficiency, public transit, transportation and land-use planning, and research, development and deployment. Further, in Resolution 11-32 the Board directed the Executive Officer to develop recommendations for the appropriate use of auction revenue. These recommendations should consider the Board's direction in Resolution 10-42.

Use of Consignment Auction Proceeds

P-11. Comment: Section 95892(a) was added to explicitly state CARB's intent that allowances allocated to electrical distribution utilities are to be used for ratepayer benefit, and any proceeds from the sale of allowances be similarly used for ultimate ratepayer benefit. The Regulation does not provide detail for how this would be managed to ensure there is a ratepayer benefit. (VALERO2)

> **Response:** The allowance value given to distribution utilities will be used on behalf of ratepayers and in ways that are consistent with AB 32 statutory objectives. We also acknowledge that distribution utility proceeds from the sale of allowances at auction will be subject to limitations imposed by either the CPUC or by the governing bodies of publicly owned utilities. To this end, in Resolution 11-32 the Board directed the Executive Officer to work with the California Public Utilities Commission (CPUC) and publicly owned utilities to reflect the findings of the Board that the impact of the cap-and-trade regulation on electricity rates creates appropriate incentives to further the goals of AB 32. In this resolution, the Board further directed the Executive Officer to work with CPUC and publicly owned utilities to reflect the finding of the Board that if allowance value provided to the electric distribution utilities for ratepayer benefit is returned directly to customers, it is consistent with State efforts to promote energy efficiency and energy conservation.

P-12. (multiple comments)
Comment: ARB should delete sections 95892(d)(3)(B) and (d)(3)(C), which purport to establish utility rate design, since they are at odds with ARB's allocation method across utilities described in detail in Appendix A to the 15-day Modifications to the cap-and-trade regulation, and since they attempt to usurp the PUC's exclusive authority governing the setting of utility retail rates. These two sub-sections of the cap-and-trade regulation were adopted at a time when it was still unclear whether ARB would base the allocation to individual electric utilities on a transition to a sales-based approach proposed by the CPUC and CEC or a method based on compliance burden. A sales-based approach would provide a price signal, while a compliance burden approach would not. Since ARB adopted an allocation in section 95892 Table 9-3 based on compliance burden, it should allow the CPUC the same flexibility to adopt a similar approach, if it chooses, in rate-making instead of keeping the outdated language in Sections 95892(d)(3)(B) and 95892(d)(3)(C). Sections 95892(d)(3)(B) and 95892(d)(3)(C) should also be deleted since they are in conflict with AB 32, in that the language expands the scope of that statute's authority, and the language conflicts with the California Constitution and the Public Utilities Code, which, read together, convey exclusive rate-making jurisdiction to the CPUC; OAL may strike down the language on its own initiative. To avoid this outcome, ARB should strike sections 95892(d)(3)(B) and 95892(d)(3)(C) of its own accord. To be consistent with ARB's demonstrated intent to allocate allowance revenue to assist in mitigating compliance burden, to recognize section 95892(d)(3) Sections (B) and (C) go beyond ARB's authority, and to avoid legal challenges, modify section 95892(d)(3) as follows:

> ~~(B) To the extent that an electrical distribution utility uses auction proceeds to provide ratepayer rebates, it shall provide such rebates with regard to the fixed portion of ratepayers' bills or as a separate fixed credit or rebate.~~
> ~~(C) To the extent that an electrical distribution utility uses auction proceeds to~~

~~provide ratepayer rebates, these rebates shall not be based solely on the quantity of electricity delivered to ratepayers from any period after January 1, 2012.~~ (SEMPRA3)

Comment: SCE supports the use of all GHG allowance revenues received pursuant to auctions under the Cap and Trade program for customer rate relief. However, SCE disagrees with section 95892(d) and the "fixed rebate" language in particular because it exceeds the scope of ARB's authority. AB 32 does not grant ARB authority to direct how investor-owned utilities (IOU) should use revenues earned from the sale of emissions allowances. It is the CPUC that has the exclusive authority over this rate-setting function. Pursuant to the California Constitution, the CPUC has general regulatory authority to fix rates and assure that rates and allocation of costs are just and reasonable, and nondiscriminatory. Likewise, the Public Utilities Code grants the Commission specific authority to fix and design rates. Accordingly, the CPUC's jurisdiction over rate-setting and rate design is exclusive. Apart from the fact that ARB lacks authority to promulgate this "fixed rebate" language, the "fixed rebate" approach will not achieve the most equitable, cost-effective policy outcome for Cap and Trade. SCE recommends allowance revenues should be returned to customers in proportion to the costs incurred by such customers for GHG compliance, or "volumetrically," rather than through the use of a fixed rebate. Furthermore, all of the allowance revenues should be returned directly to customers, rather than funneled to other programs. A volumetric approach is preferable because it is a less expensive and more equitable way to reduce emissions, will garner broad public support for future Cap and Trade programs, and is more likely to result in a successful GHG reduction program. (SCE3)

Comment: Section 95892(d) sets forth restrictions on the use of auction proceeds, including a requirement that any ratepayer rebate: (1) be applied to "the fixed portion of ratepayers' bills or as a separate fixed credit or rebate" and (2) "shall not be based solely on the quantity of electricity delivered to ratepayers from any period after January 1, 2012." PG&E continues to have serious concerns with the ARB restrictions on the CPUC-regulated use of auction proceeds specified in section 95892 including subsection (d)(3)(B) and (d)(3)(C). AB 32 specifically preserves and reaffirms the CPUC's jurisdiction over utility rates, stating: "(n)othing in this division affects the authority of the Public Utilities Commission." Therefore, ARB's proposal to directly mandate how allowance proceeds should be included in CPUC-regulated utility rates in a specific manner exceeds the scope of ARB's jurisdiction and should be deleted. (PGE4)

Comment: The instructions on the use of allowance auction proceeds contained in section 95892(d)(3)(B) and (C) go directly to the CPUC's regulatory discretion to set electric rates. CARB has no authority to direct the CPUC to make rates in any particular manner and it should not attempt to do so here. CLECA therefore urges the CARB to remove subsections (B) and (C). (CLECA)

Comment: In deferring to the CPUC and the California Legislature on electric ratemaking matters, the ARB can and should consider the carbon-related conservation and price signals already embedded in existing CPUC-regulated utility rates and programs. The current tiered electricity rate structure mandated for residential customers by the Legislature and CPUC, the carbon price premium directly and indirectly included in wholesale electricity procurement prices and passed through to all retail customers, and the existing utility customer-funded Energy Efficiency programs for all retail customers, provide incentives and support for carbon emission reductions through energy savings. Any further price signal from the cap-and-trade program would only be imposed on a small subset of customers due to existing rate design restrictions and would disparately punish those upper-tier consuming households who already pay rates for marginal consumption far in excess of cost of service (and thus see very strong price signals to conserve). It would also unfairly and ineffectively punish non-residential customers who already have adopted carbon-minimizing energy efficiency measures (e.g., large but efficient industrial customers would be penalized for being large rather than rewarded for being efficient). PG&E therefore recommends deletion of sections 95892(d)(3)(B) and 95892(d)(3)(C) in full. (PGE4)

Comment: The CPUC has exclusive jurisdiction over Investor-Owned Utility ratemaking and is solely responsible for determining how consignment auction proceeds are distributed to utility customers. Current rates and programs already send a strong conservation signal to customers, and an additional carbon cap-and-trade price signal will unfairly penalize a subset of customers who already see incentives to use less energy. (CCEEB3)

Comment: Under the California Constitution, the CPUC has been provided exclusive jurisdiction over the ratemaking for Investor-Owned Utility costs and revenues, and thus is solely responsible for determining how consignment auction proceeds are distributed by Investor-Owned Utilities to utility customers. Therefore, ARB would exceed its authority by issuing regulations that would require the utilities to return the auction proceeds they receive to ratepayers in a specific manner. Current electric rates and programs already send a strong conservation signal to households who consume in upper tiers. An additional carbon Cap and Trade price signal will unfairly penalize a subset of customers who already see incentives to use less energy. (PGE4)

> **Response:** We acknowledge that electrical distribution utility proceeds from the sale of allowances at auction will be subject to limitations imposed by either the CPUC or by the governing bodies of publicly owned utilities, and that these entities have exclusive electricity ratemaking authority. Based on these grounds, we removed the language that the commenter refers to as “fixed rebate” language.
>
> However, proper carbon pricing is the primary way in which the cap-and-trade program achieves emissions reductions. Compensation provided volumetrically (per MWh consumed) will not create the correct incentives for greenhouse gas reduction. Volumetric return of allowance value eliminates incentives for GHG reduction strategies such as conservation of electricity, efficient combined heat and power, and distributed electrical generation.

To this end, in Resolution 11-32 the Board directed the Executive Officer to work with the CPUC and publicly owned utilities to reflect the findings of the Board that the impact of the cap-and-trade regulation on electricity rates creates appropriate incentives to further the goals of AB 32. In this resolution, the Board further directed the Executive Officer to work with CPUC and publicly owned utilities to reflect the finding of the Board that if allowance value provided to the electric distribution utilities for ratepayer benefit is returned directly to customers, it is consistent with State efforts to promote energy efficiency and energy conservation.

When we determined that allowance value should be allocated to electrical distribution utilities on behalf of customers, we made this decision with the explicit understanding that value would not be used to skew carbon pricing or reduce incentives for GHG reductions. We retain the authority to revoke free allocation if it is used in a way that is counter to the statutory objectives of AB 32.

We note that our Economic and Allocation Advisory Committee (EAAC) recommended against allocating allowance value to electrical distribution utilities because the EAAC believed that preventing increases in electricity rates would be the likely outcome of this allocation approach.

Carbon price signals in electricity rates should reflect the emissions rate of the marginal generator dispatched into the power markets. In establishing the appropriate carbon price in rates, the CPUC and POU governing boards will need to account for the costs of other GHG-reducing policies, including the 33 percent renewable portfolio standard and the impact of these programs on electric rates.

P-13. Comment: LGSEC opposes the limiting language of the proposed revision in section 95892 as it appears to allocate all allowance revenue to ratepayer relief and IOU programs related to energy efficiency and renewable energy, without providing any portion of the revenues to other public and private entities. Not only would this exclusive allocation be contrary to existing policy, but it would also be anti-competitive. It would be difficult for any other group to compete with the estimated $5.8 billion over eight years that IOUs are estimated to receive from revenues from Cap and Trade allowances. Local governments are legally responsible for implementing a number of local, regional, and State mandates related to land use and transportation, integrated resource management, air quality, energy efficiency codes and standards and green building practices. Ensuring that revenues from Cap and Trade are used to build on existing local government success is sound public policy, consistent with guidance from ARB. It is LGSEC's understanding that the proposed revisions to the regulation relate only to a portion of the allowance revenue. ARB should clarify that the proposed revisions relate only to the allocation of allowances to utilities, and not to the disbursement of revenue from allowance sales. Should this interpretation be incorrect, we urge that the ARB maintain the policy it adopted in December. More importantly, ARB should refrain from adopting any new regulations until the CPUC has completed its deliberations, anticipated to be in early 2012. (LGSEC2)

> **Response:** The use of allowance value and auction proceeds for allowances allocated to the electrical distribution utilities will be at the discretion of the CPUC and the governing bodies of the POUs. We believe that the regulatory language provides flexibility for the CPUC and POUs to provide funding to local governments programs if they meet the goals of AB 32.

P-14. (multiple comments)
Comment: Since utilities are managing their own auction mechanism within the program, it is appropriate for CARB to give guidance (in collaboration with CPUC) on how the allowance allocation revenue will be used. EDF supports the inclusion of the new language in section 95892(a), which offers such guidance, and ensures that ratepayers who will ultimately feel the impact of the incurred costs will be protected. (EDF4)

Comment: We urge ARB to retain the provisions in the rule providing guidance to the electric IOUs on how to return auction revenue for the benefit of their retail customers. (KUSTIN16)

> **Response:** We removed language in the regulation regarding the allowed use of proceeds from the sale of consigned allowances, since ARB does not have the authority to appropriate funds. However, we believe that the principles underlying the intent of the removed language are important. To this end, in Resolution 11-32 the Board directed the Executive Officer to work with the CPUC and publicly owned utilities to reflect the findings of the Board that the impact of the cap-and-trade regulation on electricity rates creates appropriate incentives to further the goals of AB 32. In this resolution, the Board further directed the Executive Officer to work with CPUC and publicly owned utilities to reflect the finding of the Board that if allowance value provided to the electric distribution utilities for ratepayer benefit is returned directly to customers, it is consistent with State efforts to promote energy efficiency and energy conservation. Therefore, we continue to work with the CPUC and the POU governing boards to ensure that their requirements will follow the goals of AB 32 as required in 95892(d) and ensure equal treatment to their customers.

P-15. Comment: CCSF strongly supports the guidance contained in the current proposal and believes it is critical to achieving the goals set forth by the ARB that the use of auction proceeds 1) be "used exclusively for the benefit of retail ratepayers of each electrical distribution utility;" 2) "ensure equal treatment of [the IOU's] own customers and customers of electricity service providers and community choice aggregators;" and 3) not mute the price signals that the cap and trade program is supposed to provide end users to reduce their GHG footprint. As a jurisdiction implementing community choice aggregation (CCA), CCSF is particularly concerned that the use of auction proceeds by the investor-owned utilities not unfairly disadvantage San Francisco residents and businesses that choose to take electric service from CCSF's CCA rather than the incumbent utility. Operating as an electric distribution utility that also would be subject to this guidance, CCSF believes these are reasonable conditions on the use of allowances that ensure the goals of AB 32 are achieved. Therefore, the existing requirements in the ARB's proposed Regulation should be retained. (SFMAYOR3)

> **Response:** Thank you for your support.

P-16. Comment: CCSF would like to support ARB as the appropriate enforcement entity to ensure that revenues received by electric distribution utilities from the sale of allocated allowances will benefit all of the utility's ratepayers. As a jurisdiction implementing community choice aggregation (CCA), CCSF urges ARB to ensure that allowance auction proceeds received by the investor-owned utilities are spent in a manner that does not unfairly disadvantage San Francisco residents and businesses that choose to take service from CCSF's CCA rather than the incumbent utility. (SFMAYOR3)

> **Response:** Thank you for your support. We retain the authority to revoke free allocation if it is used in a way that is counter to the requirements of the regulation and the statutory objectives of AB 32.

P-17. (multiple comments)
Comment: Praxair suggests that CARB provide greater guidance to the POUs with respect to the application of allowances to benefit their customers. Praxair is concerned that similar facilities located within different service areas—one IOU and one POU—could potentially face different economic impacts in their electricity costs due to different applications of value from the CARB allocated allowances. While true parity in the compliance burden between the different types of utilities is unlikely, potential differences to customer costs should not be exacerbated from vastly different applications of the allocated allowances. To avoid this inequitable result, CARB should specifically direct publicly owned utilities to use allowance revenue for the benefit of their customers, as independently owned utilities are required to do. (PRAXAIR2)

Comment: ARB should provide guidance to the state's POUs should they consign allowances to auction. Unlike the IOUs, the POUs will not be subject to a decision from the CPUC that will develop a framework and methodology for returning auction revenues to customers. Building on ARB's expertise and extensive examination of this issue, identifying the potential uses that ARB deems consistent with the goals of AB 32 will help steer the POUs in the right direction. (KUSTIN16)

> **Response:** Section 95892(d) of the regulation now provides the same requirements for POUs and IOUs on the limitations on the use of auction proceeds and allowance value.

P-18. (multiple comments)
Comment: We are confused by and request more definitive basis for electric ratepayer compensation in the allocation determination. Will compensation exist for both residential and commercial users? How will the compensation program work? (CIPA)

Comment: In the electricity sector, we urge you to direct utilities to protect ratepayers by returning allowance value directly to residential customers as a rebate check. Your clear statement of your intent here will assist the PUC as it deliberates how to apply this portion of the regulation to utilities. Allowing utilities to use allowance value for a vaguely-defined “ratepayer benefit” gives too much discretion to the use of billions of dollars, which is coming out of Californians pockets in the form of higher fuel and electricity prices. We urge CARB to follow recommendations from the EAAC, PUC, and CEC and regarding allocating to utilities. Any consumer rebate from utilities should not show up as a line item on electricity bills, shielding consumers from the price signal and discouraging changed behavior. The rebate must be separated from the utility bill. It should come to consumers as a “lump-sum transfer,” which could be implemented through a dividend or rebate check. The customer would still receive the carbon price signal on their utility bill, but would receive a rebate check to help buffer them from the regressive impact of increased electricity prices. We favor EAAC’s recommendations that “The largest share (roughly 75 percent) of allowance value should be returned to California households” in the form of a dividend check. The remaining 25 percent would be used for a variety of purposes including preventing leakage (a very small percent), investments in renewables and energy efficiency, and a Community Benefits Fund.

If the public receives a 75 percent dividend and utility rebate checks, they will understand that they have the ability to reduce their emissions and turn the program into a moneymaker and not a tax. This approach to revenue allocation could actually build public and political support for the implementation of this law over time. More importantly, AB 32 requires that the regulations that your board approves “ensure low income communities are not disproportionately impacted.” Without a dividend or rebate low and middle income citizens will be disproportionately impacted by increased energy prices creating an economic hardship and potential political backlash against the implementation of the law. (CPC6)

> **Response:** The allowance value given to distribution utilities must be used on behalf of ratepayers and in ways that are consistent with AB 32 statutory objectives. We acknowledge that distribution utility proceeds from the sale of allowances at auction will be subject to limitations imposed by either the CPUC or by the governing bodies of publicly owned utilities. We agree that properly structured rebates are consistent with the statutory objectives of AB 32 and could help build support for the program.

P-19. Comment: CLECA wholeheartedly agrees with CARB's statement that utility allowance auction proceeds must be used exclusively for the benefit of ratepayers. We also agree with the CARB's direction that utilities shall assure that proceeds are used in a manner which provides equal treatment of bundled and direct access customers.

CLECA includes firms that utilize bundled service and firms that take service from energy service providers under direct access. However, CLECA believes that the CARB's instruction that the use of such proceeds to provide a rate reduction or rebate to utility customers should only apply to the fixed portion of the customer bill and should not be based on usage for any period after January 1, 2012 is misguided. Not only do these restrictions make the pass-through of allowance auction proceeds to customers cumbersome to implement, and risk the possibility that some customers will receive a disproportionate share of proceeds in relation to their exposure to higher electric costs, whether higher or lower, they fail to acknowledge the fact that the rates paid by California investor-owned electric utilities currently reflect a very significant "carbon premium". CLECA submits that the proceeds should be used to soften the blow of Cap and Trade and they should be used in a way that addresses the fact that different customers will face different levels of cost increase as a result of AB 32. The implementation of Cap and Trade will increase wholesale electric costs. But, the overarching goal of reduced GHG emissions can be achieved without having to pass through in retail rates the full impact of such costs. Indeed, the benefit of Cap and Trade over a simple carbon tax is the possibility that we will be able to achieve reduced levels of GHG emissions in a more economical way, thereby benefitting the economy and each of us as residents of the State. Further, those proceeds should be passed through to ratepayers in a manner that reflects the extent of their exposure to higher electric costs. It should reflect their current usage and it should reflect the degree to which their rates are exposed to price increases resulting from Cap and Trade. Some ratepayers are currently protected from rate increases, or the full effect of rate increases, through programs such as CARE for low-income customers, or the residential inverted tier rate structure which subsidizes rates for initial volumes of usage through excess charges on higher volumes of usage. CARE customers and low usage non-CARE residential customers will not feel the full effects of Cap and Trade on their electric rates and they should not receive a full share of allowance auction proceeds through "per capita" or "per ratepayer" rebates. (CLECA)

> **Response:** Proper carbon pricing is the primary way in which the cap-and-trade program achieves emissions reductions. We believe that carbon price signals in electricity rates should reflect the emissions rate of the marginal generator dispatched into the power markets. In establishing the appropriate carbon price in rates, the CPUC and POU governing boards will need to account for the current rate structure limitations (including the CARE program) and the impact of other GHG-reducing policies, including the 33 percent renewable portfolio standard on electric rates. We support providing benefits to residential ratepayers such that the compensation serves to reward those that choose low-carbon electricity services, including green power pricing programs, while discouraging high carbon choices.

P-20. Comment: We strongly support ARB's modification of the rule to ensure there is transparency with respect to both the amount and distribution of allowance value allocated to the State's utilities, including California's publicly-owned utilities (POU). ARB designed the allocation scheme for the utility sector to mitigate the bill impacts of the program on retail electricity customers by returning allowance value through retail electricity providers. While the rule is clear that allowance value must be used for the exclusive benefit of customers, adding reporting provisions will enable ARB to assess more effectively whether and how the utilities are fulfilling this obligation. (KUSTIN16)

> **Response:** The use of allowance value and auction proceeds must be reported annually to us. The provisions are listed in 95892(e). The utilities must state how the allowance value and auction proceeds were used to meet the goals laid out in AB32 to benefit their ratepayers.

P-21. Comment: PG&E believes that electric utilities are uniquely positioned to return allowance value to customers because they are subject to state utility commission or board oversight. In fact, PG&E is already working with the CPUC to determine the method for returning allowance value. PG&E will continue to oppose any proposals to allocate allowances to generators, which have neither the necessary regulatory oversight nor the established relationship with customers that would ensure that all utility customers receive the full benefit of allowance revenue. PG&E supports the aforementioned elements of ARB's allocation proposal, as they appropriately recognize the role that electric utility customers will have in meeting AB 32 goals. (PGE4)

> **Response:** We appreciate PG&E's support of the allocation methodology and acknowledge the CPUC's process to determine how allowance value should be used by the IOUs. We do not currently plan to allocate allowances to electricity generators.

P-22. Comment: PG&E understands that ARB intends to return allowance value to the electric distribution utility, including bundled utility customers, along with community choice aggregation customers, direct access customers, and other electricity service provider customers. PG&E suggests that ARB add language to Appendix A clarifying the intent to include all utility customers. (PGE4)

> **Response:** The regulatory process does not include making changes in Appendix A to the First 15-Day Change Notice.

P-23. Comment: CARB should defer to CPUC as to the dispensation of the funds that the IOU's receive from monetizing their emissions allocations. CPUC is the agency charged with protecting ratepayers, not CARB. All of the funds should be refunded back to all classes of ratepayers and not diverted to fund solar, wind, or environmental justice community projects. The same concept should apply when natural gas is brought into the Cap and Trade system. Despite assurances from CARB, there exists real concern that non-regulated entities will game the system. CARB should initiate at least one dry run before the first auction. With a system as complex as this, the stakes for entities required to participate are high. (CALFP3)

> **Response:** The use of allowance value and auction proceeds for allowances allocated to the electrical distribution utilities will be determined by the CPUC and

the governing bodies of the POUs. We will continue to work with these entities to ensure that allocation of allowance value to ratepayers creates proper incentives. The regulation does not allocate funds to natural gas utilities for the benefit of ratepayers.

V. SUMMARY OF COMMENTS MADE DURING THE SECOND 15-DAY COMMENT PERIOD AND RESPONSES

The table below identifies the comments received during the second 15-day comment period. Despite falling outside the scope of the second 15-Day Change Notice, a number of comments nevertheless are summarized and responded to below. Although ARB legally is not required to summarize and respond to these comments under the APA, we provided a response to these comments because it was felt the general public and interested stakeholders could benefit from the additional clarity provided by the responses.

B. AB 32/CAP-AND-TRADE DESIGN

Emissions Levels/Targets/Forecasts

B-1. Comment: To reiterate our previously filed comments, we are opposed to CARB continuing on the path of adoption of the cap and trade program. As noted previously, while CIPA began the climate change policy journey with a position that market mechanisms most efficiently provide for compliance flexibility, the evolution of our position has been influenced by two irrefutable factors. First are the emissions numbers. The Legislative Analyst's Office has covered quite comprehensively, and we have previously detailed, that enough activity has been undertaken—numerous programs and policies put into place that coupled with dramatically reduced economic output have allowed us to achieve, or at least establish the glide path to the emission reduction targets envisioned by the framers of AB 32. Second, we look at the market design features of the currently proposed program and inherently understand that no matter how well intentioned they portend disaster for the economy as a whole and regulated entities specifically. We note that a market based system is permissive and not mandated under AB 32. Health and Safety Code section 38570 reads in part: 38570. (a) The state board may include in the regulations adopted pursuant to section 38562 the use of market-based compliance mechanisms to comply with the regulations (emphasis added). CIPA asserts, again, that CARB has met all of the emissions targets required by AB 32 and need only eliminate cap and trade from the current policy mix to arrive at a combined strategies alternative that satisfies AB 32 and does not set us up for a rerun of the terrible crisis the state experienced the last time it embarked upon an untested and ill-conceived Rube Goldberg policy regime. (CIPA2)

> **Response:** The comment falls outside the scope of the second 15-day changes to the regulation. No response is necessary. Please see responses in Chapters III and IV, in sections B and F.

General

B-2. Comment: This regulation places many requirements on regulated entities, which must be able to plan for and comply within a timely manner. Entities will be unable to do so without the necessary enabling compliance tools, guidance, and infrastructure in place from the onset of this regulation. Delays and uncertainties will unnecessarily increase costs and exposure to violations. CCEEB appreciates the 2013 start date and believes this should help implementation of this regulation. ARB should clearly announce the full schedule from now to the end of this rulemaking in October 2011 and outline the additional rulemakings and amendment topics that will take place through 2012. CCEEB recommends that:

- ARB develop a work plan with a clear lists of tools, guidance, policies, trainings, and systems that they must develop, along with completion deadlines for each activity that must be in place for the regulated entities to comply. This should include the timeline for the 45-day changes in the future that will be needed prior to the launch of the market.

- ARB include a mechanism that links an entity's compliance deadlines directly to availability of theses compliance tools, allowing for sufficient lead time for facility compliance. (CCEEB4)

  Response: The comment falls outside the scope of the second 15-day changes to the regulation. Nevertheless, we will provide tools and guidance to help covered entities understand and comply with the regulation. Moreover, we will consider using tools, such as guidance documents during implementation, to help covered entities comply with the regulation.

B-3. Comment: We urge ARB to ensure that the infrastructure and programs necessary to support the objectives and requirements of a cap-and-trade program are fully developed before adopting a final rule. (VALERO3)

> **Response:** We believe that the necessary infrastructure and programs will be in place, and we adjusted the compliance start date from 2012 to 2013 to ensure that all the regulatory elements are fully functional. We initiated activities to develop the necessary rule implementation infrastructure for the regulation, including a market tracking program to trade allowances and offsets; contracts for an auction services provider; a financial services provider; and a market monitor. We are also committed to providing updates to the Board on the implementation of the regulation.

B-4. Comment: CalChamber is disappointed to see that the Board addressed nearly none of the concerns raised in our previous comment letter dated August 11, 2011. The comments submitted expressed concern for the current design of the program and recommended modifications that are vital to ensuring an operable, cost-effective market designed to meet the GHG emission goals of AB 32. Without the recommended changes, the cap-and-trade regulation remains incomplete, and lacks the confidence and certainty needed toward successful implementation. (CALCHAMBER4)

> **Response:** The comment is outside the scope of the second 15-day changes to the regulation. However, any comments submitted in the August 11, 2011, letter that were within the scope of the first 15-day changes to the regulation were summarized, and responses were provided in Chapter IV “Summary of Comments Made During the First 15-Day Comment Period and Responses.”

B-5. (multiple comments)
Comment: Design aspects of EU carbon trading, which caused bad results in Europe are being replicated in the current California cap and trade proposal, including allowing banking credits, resulting in less progress in later years; free allocations, overallocation, and offsets, allowing industries to escape reductions; failure to account for swamping of reductions through high-carbon imports (a different kind of leakage of emissions into instead of out of the system); and taking credit for reductions caused only by economy crashes. (CBE3)

Comment: California's Draft Regulation replicates the failed design elements of European carbon trading. CARB's assumption that the EU-ETS is working is wrong, and this fact challenges CARB's basis for replicating that program's features. First, the European program did not make good progress over time. An International Energy Agency report found emissions and energy use started high in 2005 compared to 1990 levels. European CO_2 emissions increased in 2007 and carbon credits were effectively free. Second, the EU-ETS has created perverse incentives and resulted in dubious projects. EU offsets were massively abused, caused perverse incentives, and could cause increased emissions. Both these conditions are present in the proposed California cap and trade regulation. For example, CARB provides 100 percent free allocation for oil drilling operations through 2020, and gives 10 times more allocations for higher-pollution types of drilling. Oil refineries receive mostly free allocations (about 72 percent total over the eight years from 2013-2020) and are proposed to use the distorted Solomon index, which favors more energy-intensive refinery processes. There are dozens of reports, papers, and articles available showing the failure of the design elements of carbon trading. CBE provided other evidence about this in our July comments on the Scoping Plan. Many others have documented these problems. The continued march toward this program in California is at this point disgraceful. At the same time as the EU-ETS provided windfall profits for companies, it increased costs for the public. BTI Europe found that the EU emissions went up, and still cost the public 100 billion. CARB is doggedly counting on the same regulatory structure to get different results. There is no reason to believe that California's market will perform any better, especially since the same traders and bankers will be involved. (CBE3)

> **Response:** This comment falls outside the scope of the second 15-day changes to the regulation. Nevertheless, steps will be taken to carefully monitor industry progress toward compliance with the regulation, as well as the operation of the markets, to avoid the issues that were experienced in Europe.
>
> As specified in Board Resolution 10-42, the Board directed the Executive Officer (EO) to hold public consultations to identify potential obstacles to compliance and, as necessary, incorporate or enhance compliance assistance mechanisms into the program. The Board also directed the EO to contract with an independent entity with appropriate expertise to monitor and provide public reports on the market's operation, including auctions and reserve sales, on a quarterly basis and recommend appropriate action, which could include taking corrective action prior to the next auction, adding future allowances to the allowance reserve or future auctions, or temporarily suspending trading in the market. We have released a Request for Proposal for the market monitor.
>
> We had reported data and third-party verified emission data to use when designing the program; therefore, based on the data, we will not overallocate allowances, thus avoiding windfall profits. We have addressed leakage by using an updating output-based allocation system for industrial producers . In addition, the requirement to use allowance value for investor-owned or publically owned utilities is designed to avoid providing windfall profits in the electricity sector (as

happened in the EU). Lastly, the commenter asserts that the EU took "credit for reductions caused only by economy crashes." The cap-and-trade program is designed to limit overall emissions for those covered by the program. Reductions occur as a result of the declining emissions limit. If the demand for energy, which creates emissions, is reduced as a result of lower economic activity, the program goals are met with lower allowance prices. The cap-and-trade program responds automatically to changes in economic activity while ensuring environmental protection.

District Role

B-6. (multiple comments)
Comment: Once implemented, this program requires extensive oversight by CARB not only to monitor emissions from many entities' intrinsic operations, but also to provide oversight to other participants such as verifiers, project developers, registries, account holders, and brokers, whose motives are not solely for the benefit of this program. Having other public agencies such as air districts participate further will strengthen the intended results and co-benefits of this program while helping alleviate some of the oversight burden. (SCAQMD5)

Comment: SCAQMD's and CAPCOA's previous comment letters on draft versions of the Cap and Trade regulation outlined areas in which Air Districts should be allowed to participate with multiple roles. To date, several of the suggested changes allowing air districts to participate with multiple roles have not been accommodated, nor have discussions between CAPCOA and CARB occurred as directed in Resolution 10-42. We would still like to have discussions facilitated by CARB with CAPCOA to outline how Air Districts may participate and accommodate the implementation of the Cap and Trade program. (SCAQMD5)

Response: As discussed in Board Resolution 11-32, we will partner with the local air districts in the implementation of the cap-and-trade program. We are continuing dialogue with the air districts to better define their roles with implementation of the regulation. We believe this will accomplish the goal of having the air districts participate in multiple roles, including participation in greenhouse gas permitting and Adaptive Management Plan implementation.

Working Group/Advisory Group

B-7. (multiple comments)
Comment: The AB 32 Implementation Group supports and encourages a stakeholder advisory committee to provide continual and thoughtful feedback to CARB as the program rolls out during the next few years. (CALFP4)

Comment: The AB 32 Implementation Group supports and encourages a stakeholder advisory committee to provide continual and thoughtful feedback to CARB as the program rolls out during the next few years. (AB32IG3)

Response: These comments fall outside the scope of the second 15-day changes to the regulation. Nevertheless, as stated in the responses in the first 15-day comments to the regulation, we do not see the need for the specific stakeholder committees or working groups suggested by the commenters. As specified in Board Resolution 10-42 for the original regulation, the Board directed the EO to hold public consultations to identify potential obstacles to compliance with the regulation.

Public Process

B-8. (multiple comments)
Comment: Regarding the CARB process, as the deadline for submitting the rule to the Office of Administrative Law approaches, CLFP believes it is necessary to express our dismay regarding the 15-day update process and the prospect for further rule changes and updates next year. This rule is extremely complex and it will have a large impact on the California economy. It should be incumbent upon CARB to conduct additional workshops and provide more time for the public to provide feedback, as well as for the staff to hear and incorporate reasonable changes to the rule. Fifteen days for written comment is insufficient for a rule of this magnitude. CLFP urges CARB to adopt a more robust public process going forward. Getting it right is more important than meeting a deadline dreamed up by a dysfunctional political process. (CALFP4)

Comment: WIRA recognizes and appreciates the difficulty and obstacles that arose during this adoption process that CARB staff had to overcome, but in adopting such a complex and important regulation, public process is key. We have already noted that any additional changes to the Cap and Trade Regulation based on this open comment period cannot occur during this specific rulemaking. WIRA urges CARB not only to respond to these comments now, but also to use them as the basis and starting point for the inevitable first round of regulatory adjustments to the program. (WIRA4)

Comment: Valero is concerned that ARB has not addressed all stakeholder comments submitted during the previous comment period. In addition, we believe that the proposed regulation, as written, provides an incomplete rulemaking package. Valero strongly urges ARB to fully evaluate the merits of comments submitted in both the first and second public comment periods to ensure a thorough regulatory development process prior to adoption of any cap-and-trade regulation. (VALERO3)

Comment: Gaps and inconsistencies between the Cap-and-Trade program and the MRR remain and could threaten the long-term success of the programs. Powerex encourages ARB to include in its resolutions adopting the rules a directive to ARB staff to continue vetting these important issues through a regulatory refinement process that includes stakeholder workshops. Such a directive, which could be modeled upon Resolution 10-42, should direct the ARB Executive Officer to prepare additional 15-day rule modifications which then would form the basis of amendments to the rules that then could be adopted by the Board in 2012 prior to the Cap-and-Trade Rule's full implementation in 2013. Powerex also requests that ARB utilize the 2012 period to develop detailed guidance documents to clarify many of the issues in the rules that remain ambiguous. These additional steps would not interfere with adoption of the modified rules in October, but would ensure that ARB staff has full authority to continue its work on refining the program prior to its full implementation in 2013. (POWEREX2)

Comment: As we come closer to the deadline for submitting the rule to the Office of Administrative Law, we want to express our concern about the 15-day comment process and the need for further rule changes and updates next year. The rule is extremely complex and it will have a large impact on the California economy. In that regard, we would request the California Air Resources Board (CARB) include in the Final Statement of Reasons (FSOR) a schedule by which workshops and needed revisions will occur so the public can schedule and provide feedback in order for the staff to hear and incorporate reasonable changes to the rule. (AB32IG3)

> **Response:** The rulemaking process provided ample opportunity for input from interested stakeholders and the public. The notices for the first and second 15-day changes to the regulation were posted on the ARB website, and were followed by an email list serve notice that provided a link to submit public comments on regulatory changes.
>
> On July 15, 2011, we held a public workshop to discuss the first 15-day changes to the regulation and to seek additional input for the second 15-day changes to the regulation. We also released a discussion draft that was the subject of the July 15th workshop. The format of the workshop included an informal interaction among stakeholders and ARB staff. The workshop was also available via webcast. In addition, we maintained a public meetings web page, where we made available all workshop materials. In addition, on August 26, 2011, we held a technical team meeting discussing topics related to electricity and GHG emission reporting.
>
> By way of this FSOR document, we prepared written responses to all public comments received during the initial 45-day comment period; comments presented at the December 16, 2010, Board hearing, both orally and in writing; and comments received during the first 15-day changes to the regulation and the second 15-day changes to the regulation. The Administrative Procedure Act (APA) only requires that ARB respond to changes that are noticed.
>
> We will provide tools and guidance to help covered entities understand and comply with the regulation. Moreover, we will consider using tools, such as guidance documents during implementation, to help covered entities comply with the regulation.

Implementation

B-9. (multiple comments)
Comment: As with any new regulatory program, some "learning by doing" will be embedded into the cap-and-trade implementation process. However, EDF believes the regulation as written meets the goals and objectives of AB 32 and will stimulate the development of innovative emissions reductions projects and technologies. We look forward to working with CARB and other stakeholders throughout California in these ongoing efforts. (EDF6)

Comment: Delaying the implementation of the cap-and-trade component of AB 32 would not only jeopardize California's goals to tackle global climate change but would also introduce market uncertainty that undermines an engine to create innovation, investments and jobs in California. Although emissions obligations are not in effect until January 2013, major components of AB 32 were to be implemented in January 1, 2012. The Bay Area Council supports pushing ahead on implementation of the re-approved AB 32 Scoping Plan to get California on track in solving global climate change and keep investments, innovations and jobs in the clean energy sector within our State. (BAC)

> **Response:** We appreciate the support. As stated in the responses to the 45-day public notice, the compliance start date was moved from 2012 to 2013 to ensure that all the regulatory elements are in place and fully functional. We initiated activities to develop the necessary rule implementation infrastructure for the regulation, including a market tracking program to trade allowances and offsets; contracts for an auction services provider; a financial services provider; and a market monitor. We are also committed to providing continual public updates, with opportunity for stakeholder comment, on the implementation of the regulation.

Program Monitoring

B-10. (multiple comments)
Comment: EDF views the development of strong and transparent guidance documents relating to program enforcement and offset evaluation as an important effort that should be pursued as soon as possible. While procedures and guidance for compliance and enforcement will necessarily be based on implementation of the regulatory wording, ensuring regulated entities and project developers understand the way in which the regulation is applied, (and in particular, where CARB has discretionary authority), is important to maximize certainty and assist financial decision making. (EDF5)

Comment: A periodic review of the cap-and-trade program is critical to ensure GHG reductions are achieved while maintaining the competitiveness of California businesses and the health of the economy. (CALCHAMBER4)

Comment: Adopting and setting the cap-and-trade regulation in motion does not signify the end of the regulatory process. To make sure the program is performing as planned and to enable CARB to respond to unwanted conditions that may arise, effective programmatic review must be a part of the regulatory agenda, both during the first compliance period and following periods. To achieve public support and overall integrity, reviews should be built on sound scientific data and observations of market activity, and be completed in a transparent, public process. EDF encourages CARB remain committed to the following important efforts:

- Performing periodic reviews of existing and future offset protocols;
- Continuously performing reviews of market operations to assess leakage and guard against windfall profits—leading to a thorough evaluation of the appropriateness of the current allocation formulas in future compliance periods;
- Developing a new refinery allocation formula, based on information developed during ongoing and planned research efforts, for use starting in the second compliance period. (EDF6)

  Response: These comments fall outside the scope of the second 15-day changes to the regulation. However, we are committed to regular reviews of the implementation of the regulation, periodic updates to the Board, and proposed modifications to the regulation, as needed. As discussed in Resolution 10-42 and 11-32, the Board directed the Executive Officer to update the Board at least annually on the status of the cap-and-trade program. In addition, we will provide tools and guidance to help covered entities understand and comply with the regulation. Moreover, we will consider using tools, such as guidance documents during implementation, to help covered entities comply with the regulation.

B-11. (multiple comments)
Comment: It is imperative that the State monitor leading indicators that reflect the economic health of California. California must be positioned to identify any potential problems that may be inadvertently caused by this regulation, before they cause significant damage to the economy so that any regulatory structural problems can be corrected in a timely manner. CCEEB recommends that the ARB include provisions in the cap-and-trade regulation to:

- Monitor specific economic indicators, including the price in the auctions, the functioning of secondary markets, adequacy of the Allowance Price Containment Reserve, detection of market manipulation, offset supply, evidence of contract shuffling, progress towards achieving the 2020 target, total cost of the program, jobs in manufacturing, vacancy rates, home sales, volume of trade through ports, Gross State Product, energy prices, and other indicators used by the Department of Finance to monitor the health of California's economy;
- Establish criteria and process to be used to determine the need and amend the regulations;
- Establish formal reviews of the regulation at least once each compliance period; and
- Develop and implement a more structured process and approach for evaluating the comparative cost-effectiveness of program measures, as well as the relative

cost-effectiveness of those measures vis-a-vis the cap-and-trade program and identify any potential problems. (CCEEB4)

Comment: We understood that ARB expects to incorporate, into the regulation, specific requirements for a review of the program at least once every compliance period in the ISOR. However, there are no references to this proposal in the actual regulation. We also understand that ARB intends to use "adaptive management" as an element in review of the program to identify and mitigate adverse impacts of the program, and help develop any additional improvements or changes necessary to this regulation. WSPA believes that in order to ensure that the changes can be made in a timely manner and that the obligated entities are provided certainty, ARB should identify leading indicators that should be monitored for the economic and energy health of California and criteria for changes to the program, before the program begins. Staff proposes to incorporate into the regulation specific requirements for a review of the program at least once every compliance period. The new regulatory text will include specific deadlines for completion of the review, a list of topics that must be addressed in the review, and minimum requirements for public input during the review process. We recommend that ARB identify the leading indicators of California's economic and energy health that should be monitored routinely and specify the criteria that will drive any changes to the program. Moreover, ARB should specify that any review of the cap and trade regulation shall occur at least once every compliance period. If revisions are needed, they should be completed no later than one year before the start of the next compliance period to allow sufficient time for compliance by program participants. (WSPA4)

Response: These comments fall outside the scope of the second 15-day changes to the regulation. However, we are committed to regular reviews of the implementation of the regulation with opportunity for stakeholder comment, periodic updates to the Board, and proposed modifications to the regulation, as needed. As discussed in Resolution 10-42 and 11-32, the Board directed the Executive Officer to update the Board at least annually on the status of the cap-and-trade program. In addition, we will provide tools and guidance to help covered entities understand and comply with the regulation. Moreover, we will consider using tools, such as guidance documents during implementation, to help covered entities comply with the regulation.

Adaptive Management

B-12. Comment: EDF encourages CARB remain committed to the following important efforts: Adaptively managing the program for unwanted indirect environmental impacts. (EDF6)

Response: In Resolution 11-32, the Board approved an Adaptive Management Plan. This plan will monitor for potential adverse environmental impacts associated with potential localized air quality impacts and the U.S. forest offset protocol.

The adaptive management approach will allow us to collect and review applicable data sources (i.e., the MRR data, market tracking system, economic data, emission inventory, air monitoring data, and forest protocol annual report information) and develop the appropriate tools to determine if there are impacts due to compliance with the cap-and-trade regulation as information becomes available. We will work with other State agencies and local air districts during this process. The adaptive management strategy will go through a public process to allow stakeholders to provide comments.

We will monitor the implementation of the cap-and-trade regulation and will develop appropriate responses to rectify any identified adverse impacts. If it is determined that an adverse impact has been identified as result of the regulation, ARB will conduct a public process and develop recommendations for Board action.

We will update the Board at least annually on the status of the cap-and-trade program, including activities related to the Adaptive Management Plan in accordance with the direction in Board Resolution 10-42 and 11-32.

Delay Action

B-13. Comment: Ag Council appreciates ARB's decision to delay implementation of cap and trade for one year. There are many outstanding issues with this regulation that we continue to work on, therefore the delay in implementation is appreciated by our membership. (ACC5)

Response: We appreciate the support.

B-14. Comment: It is not clear to us that the Cap-and-Trade program is ready for implementation in 2012-2013. New developments such as the 10 percent cut in allowances and its impact on companies need broader evaluation. We ask that ARB consider deferral of the start of the program to resolve these and other uncertainties. (CONOCO3)

Response: This comment falls outside the scope of the second 15-day changes to the regulation. Nevertheless, we believe that we have sufficient time before the compliance obligation begins in 2013 to allow us to address outstanding issues and ensure that the market tracking system is developed and tested. We also note that the benchmark stringency referred to by the commenter as a "10 percent cut in allowances" is not a new development, but rather was specifically outlined in Appendix J of the Staff Report and in response to Board inquiry at the December 16, 2010, hearing.

Economic Harm/Burden

B-15. (multiple comments)
Comment: Valero believes that if ARB thoughtfully considers all comments, then the final regulation would minimize the impact to the economy, industry and consumers. (VALERO3)

Comment: It is imperative for the Board to "get this right." Not only does this regulation affect the entire California economy, but it has the potential to be the model for other regions and states. If additional regulatory proceedings are needed to get it right, then WIRA recommends that they be done as soon as possible. (WIRA4)

> **Response:** These comments fall outside the scope of the second 15-day changes to the regulation. No response is necessary. Nevertheless, we note that we will monitor the implementation of the regulation and propose regulatory changes, as necessary.

Cap/Allowance Budget

B-16. Comment: CCEEB is concerned that the cap in this regulation exceeds previously defined scoping plan levels, driving the program reductions below 1990 emissions levels. This is particularly evident given the new 2010 emissions levels that are roughly half of the projected emissions for 2012. CCEEB recommends that the ARB clearly articulate the rational for this increased compliance obligation and the reasons why the emission estimates are higher when the economy, production, and business are down, and reconcile this data with the updated GHG forecast and the recent Legislative Analyst Office analysis. (CCEEB4)

> **Response:** This comment falls outside the scope of the second 15-day changes to the regulation. Nevertheless, as stated in the responses to the 45-day and first 15-day comments to the regulation, the main difference between the estimated cap of 365 $MMTCO_2e$ in the Scoping Plan, and the 334 $MMTCO_2e$ cap in the regulation is the Scoping Plan estimate was based on entire sectors. It did not consider sources that are not addressed by the regulation or certain types of transportation fuels that are used in small quantities.
>
> We disagree with the commenter's assumption regarding projected emissions for 2012, and adjusted our estimates to take into account for the economic downturn. The changes in fuel use are reflected in the baseline levels. The initial 2012 allowance budget of 165 $MMTCO_2e$ per year was selected based on projected 2012 emission levels and by using mandatory reporting data to ensure accuracy in cap setting.

Sectors/Facilities: Oil and Gas

B-17. Comment: Methane accounts for much of the total GHG pollution from the oil and gas sector and it also has an extremely high global warming potential. According to the 1996 IPCC Second Assessment Report, methane was estimated to be 21 times more effective at trapping heat in the atmosphere when compared to CO_2 over a 100-year time period. However, the global warming potential of methane has been revised upward and in the IPCC Fourth Assessment Report in 2007, methane is now estimated to be 25 times more effective at trapping heat in the atmosphere when compared to CO_2 over a 100- year time period. We draw your attention as well to a review of methane waste issues undertaken by the Government Accountability Office (see Federal Oil and Gas Leases: Opportunities Exist to Capture Vented and Flared Natural Gas, Which Would Increase Royalty Payments and Reduce Greenhouse Gases (GAO 11-34, October 2010), as well a June 2011 letter (attached) to the U.S. Department of the Interior, U.S. Bureau of Land Management, U.S. Department of Energy, U.S. EPA, and Council of Environmental Quality from twenty-one environmental organizations, discussing methane waste from oil and gas development. Replacing high-bleed pneumatic controllers with available low-bleed controllers not only reduces methane emissions, but also improves operational efficiency. However, other voluntary incentive programs, such as U.S. EPA's Natural Gas STAR Program have failed to spur large-scale retrofits. Despite the potentially large GHG benefits from such conversions, the general trend has been that funds that might be directed toward efficiency retrofits have otherwise been directed toward other expenditures (such as expenditures to increase production that may have greater capacity to increase industry revenues). Given the high global warming potential of methane, and the strong and compelling public interest in minimizing GHG emissions impacts, TWS believes that direct regulations should be implemented to require these cost-effective, efficiency producing retrofits, especially where public lands have been made available to companies for oil and gas development. (TWS2)

> **Response:** No response is necessary. Please see responses in Chapter III regarding our evaluation of alternatives to the cap-and-trade regulation.
>
> In addition, we have announced that we are working on an offset protocol that would address high-bleed pneumatic valves used in oil and gas operations. In addition, ARB has the authority to pursue direct regulations in combination with the cap-and-trade regulation.

Refineries

B-18. Comment: Elements of ARB's planned program pick winners and losers within the State and create competitive disadvantages for in-state operations that will encourage the import of fuel from out-of-state and international refineries. (CONOCO3)

> **Response:** We disagree that the regulation creates competitive disadvantages at the sector level. We analyzed the potential for competitive disadvantages of a

cap-and-trade program on covered entities, and the regulation includes methods to reduce competitiveness loss through the allocation process. For example, free allowances are distributed to industrial sectors that are affected by carbon allowance costs and do not have the ability to pass through costs to customers without suffering a competitive disadvantage. We worked with the refinery sector to develop an allocation mechanism based largely on a method proposed by the industry. The industry understood that less-efficient facilities within the sector would receive fewer allowances than those that are more efficient. Board Resolution 11-32 directs the Executive Officer to continue to review information concerning the emissions intensity, trade exposure, and in-state competition of industries in California; and to recommend to the Board changes, if needed.

New Source Performance Standards (NSPS)

B-19. Comment: PacifiCorp understands that ARB has been working with the U.S. EPA to recognize the State's greenhouse Cap-and-Trade Program as equivalent to the EPA's proposed New Source Performance Standards (NSPS) for GHG emissions under the Clean Air Act pursuant to section 111(b) for new sources or section111(d) for existing sources. Specifically, PacifiCorp understands that ARB has requested reciprocity for sources located in California that will be subject to the EPA's new NSPS GHG rule since those sources will also be required to comply with the State's GHG cap-and-trade program. PacifiCorp is concerned that reciprocity for in-state sources may have a discriminatory impact on out-of-state sources that import electricity into California. Out-of-state sources importing power into California will potentially be subject to the new NSPS GHG rule in the state where the source physically resides. When another state in which PacifiCorp operates develops its implementation plan to satisfy its obligations required by the new NSPS GHG rule, California's reciprocity, if it does not exempt out-of-state sources from the state's Cap-and-Trade Program will create a situation where an out-of-state source is regulated twice under the new NSPS GHG rule —once in the state where it physically resides and again in California. This issue should be clarified. PacifiCorp specifically requests that ARB consider how reciprocity would affect out-of-state sources, and specifically consider how reciprocity for in-state sources may create a discriminatory impact on out-of-state sources, and whether changes to California's Cap-and-Trade Program would be necessary. Though as not currently imminent, a discriminatory impact on out-of-state sources may also occur if and when a federal or other state GHG cap is imposed. PacifiCorp recognizes that ARB is cognizant of this issue and respectfully requests that ARB continue to consider this in future changes to the Cap-and-Trade Program. (PACIFICOR4)

Response: ARB has been involved with U.S. EPA and stakeholders in early discussions regarding NSPS for GHG emissions (see http://www.epa.gov/airquality/ghgsettlement.html). However, no federal rule has been proposed, and the timetable for proposal is unclear. Therefore, currently the commenter's concern regarding reciprocity is premature and any ARB response here would be speculative. Board Resolution 11-32 directs us to report to Board at least annually on the status of the cap-and-trade program, including federal greenhouse gas activities, which include federal equivalency for a state program. As requested, we will continue to consider this issue during the cap-and-trade program implementation and consider changes, if warranted, to the cap-and-trade program.

Linkage

B-20. (multiple comments)
Comment: Chevron understands, based on conversations with ARB staff, that while this 15-day package represents the completion of the December 16 rulemaking, several important issues will be considered next year. Without linkage and an adequate supply of offsets, the program will not be able to function in an economically efficient manner. Trade exposure to out-of-state competitors creates competitive disadvantage for California's refining and production sectors and threatens California's economic well-being and energy balance. (CHEVRON4)

Comment: In its December 15, 2010 comments to ARB, BCSE emphasized that the California cap-and-trade program should be compatible with other state and regional programs, both to lay the groundwork for a national program and to allow for possible linkages with other carbon markets. The Council continues to encourage ARB to work with other programs to develop linkage agreements. (BCFSE2)

Comment: ConocoPhillips supports the development of federal climate change policy in the United States that is economically efficient and environmentally effective, but that ensures the availability of secure, affordable, and reliable energy. We believe that a mandatory national framework with international linkages will be the most effective approach to achieve meaningful impact on global greenhouse gas emissions. As such, we oppose development of a patchwork of state-level policies. (CONOCO3)

Response: These comments fall outside the scope of the second 15-day changes to the regulation. Nevertheless, we recognize the importance of linkage with other jurisdictions and the need for an adequate supply of offsets. We analyzed the potential of a cap-and-trade program on California businesses, and the regulation includes methods to reduce competitiveness loss through the allocation process.

The proposed regulation establishes a framework for linkages and considers the issue of linkage with other GHG emissions trading systems. Subarticle 12 of the regulation includes procedures to evaluate external GHG emissions trading system. Establishing linkage with other programs will require further assessment and establishment of a formal rulemaking process under the APA before allowances and/or offset credits from an external program can be used for compliance with this regulation. When evaluating whether we should link to another program, we will consider criteria that the potential linked program must meet, to ensure that the linked program has provisions for cost-containment, market tracking, registration, monitoring, reporting, verification, and enforcement that are reliable and sufficient to ensure its environmental integrity. California is a partner state of WCI and has been actively involved in WCI activity and the design element. We will evaluate linkage with WCI partner jurisdictions that may be ready to implement their cap-and-trade programs in the near term.

Duplicative Regulations

B-21. Comment: CCEEB is concerned that California businesses will be subject to duplicative GHG regulations from the State and federal government. Although it is unlikely that a federal cap-and-trade regulation will be forthcoming in the near term, U.S. EPA has been working to develop GHG regulations such as GHG BACT and NSPS. Compliance with duplicative regulations will be costly and will not result in material benefit toward our GHG reduction goals. CCEEB recommends that ARB clearly state its intent to not subject California's businesses to duplicative GHG regulations. (CCEEB4)

Response: This comment falls outside the scope of the second 15-day changes to the regulation. Nevertheless, we recognize the importance of harmonization between State and federal GHG emissions-reduction requirements. In Board Resolution 10-42, the Board directed the Executive Officer to work with U.S. EPA on the development of a federal regulatory framework to grant delegation or equivalency to California’s climate change program where appropriate. In addition, Board Resolution 11-32 directs us to report to Board at least annually on the status of the cap-and-trade program, including federal greenhouse gas activities, which include federal equivalency for a state program. We are working with U.S. EPA on how the Clean Air Act (CAA) would benefit from GHG emission-reduction efforts. Further emissions accounting will be needed once U.S. EPA has finalized their requirement and accounting approach.

C. ALLOCATION OF ALLOWANCES

Support for Auction

C-1. Comment: The preferred option for allocating allowances in the cap and trade program would be to allocate allowances exclusively with auctioning and address leakage issues via border adjustment if and when they arise. UCS urges CARB to maximize the use of auctioning in the cap-and-trade program in order to achieve the greatest public benefit from the program. Most of our comments and concerns could be adequately addressed by simply instituting auctions rather than the current free distribution of allowances for the industrial sector. (UCS8)

> **Response:** This comment falls outside the scope of the second 15-day changes to the regulation. We addressed comments on border adjustments, as well as comments on auctioning as an allowance distribution method, in responses contained in Chapter III and Chapter IV.

Multi-Year Allocation

C-2. (multiple comments)
Comment: CARB's proposal to issue allowances on a one year forward only basis creates uncertainty for entities in terms of financial and capital planning purposes. (CALCHAMBER4)

Comment: Without the benefit of multi-year allowance allocations, regulated entities will not be able to properly determine their growth potential and plan accordingly to select new sites or expand current facilities. A multi-year allocation approach allows regulated entities the time necessary for capital planning purposes. It is not very feasible for a facility to responsibly plan an expansion or retrofit that will take multiple years, if it must start the project without knowing how it will obtain allowances to cover facility emissions in future years of the project. Multi-year allocations will allow businesses to plan ahead. (CALFP4)

> **Response:** These comments fall outside the scope of the second 15-day changes to the regulation. However, we do not believe multi-year allocations are necessary. We believe that there is enough information in the regulation for a firm to forecast an expected allowance allocation through 2020. Because allocation is tied to production, if the firm can anticipate future levels of production they can calculate their allowance allocation for that period.

Facility Shutdown

C-3. Comment: Section 95891 of the regulations indicate that facilities may not retain (nor gain) allowances if they cease operations. Depriving sources with the ability to gain revenue from the shutdown of emitting units will:

- Increase compliance costs. When streams of allowances from shutdown facilities are repatriated back to the state we can presume that they will be sold through a state sponsored auction with a minimum clearing price ($10 in 2012) that will likely be above that which is offered on the secondary market.
- Encourage older/inefficient emitting units to stay on line. Knowing that it will forfeit its allowances and credits a source operator will be inclined to keep the source operating as long as feasible. This will have the dual effect of discouraging equipment replacement (thereby keeping inefficient sources online) and keeping credits from the market (thereby reducing supply).

As a means to mitigate costs and encourage companies to remove older and inefficient sources, CARB should allow for the creation of shutdown-derived offsets. Further, should CARB elect to issue multi-year allowance streams, companies should be allowed to retain, redeploy, or sell allowances that are no longer needed by sources that are curtailed or shutdown. (BGCEBS)

> **Response:** We do not agree that the regulation promotes the use of inefficient units. Our industrial allocation approach is based on emissions efficiency benchmarks. Product-based benchmarking is based on emissions intensity per unit product. An inefficient unit relative to these benchmarks will be disadvantaged relative to a more efficient unit. The amount of allowances received is proportional to the amount of product produced, so a facility that runs at a low level will not obtain the same level as it would at a higher level of operation.
>
> We will not provide shutdown-derived offsets because an offset has to result from an activity that is not required by regulation or would otherwise occur in the absence of receiving offset credits. "Offsets" generated by a facility shutdown would not meet the criteria for "additionality" under AB 32.

Positive Verification Requirement

C-4. Comment: WSPA supports the use of a well-designed benchmarking method that results in an equitable distribution of allocations for facilities in the upstream oil and gas extraction sector as well as the downstream refining sector. Characteristics of a well-designed benchmark (i.e., one that yields equitable treatment of facilities and does not produce arbitrary windfalls or shortfalls) include: an accurate and reliable reflection of a facility's GHG emissions considering the quantity of oil and gas produced, or the processing required; inclusion of GHG emissions associated with use of electricity irrespective of generation location (i.e., on-site or off-site); inclusion of GHG emissions associated with hydrogen production irrespective of location (i.e., on-site or off-site); clarity and transparency in the calculation methodology; fulfillment of ARB's objective of minimizing leakage and providing assistance during a transition period, and specific to the upstream sector, segmentation of comparable facilities based on appropriate consideration of key operational parameters. Section 95890 requires that an entity obtain a positive or qualified positive verification statement to be eligible for direct allocation. WSPA believes that this section needs to recognize that there are circumstances where an entity cannot get a qualified positive product data verification—this is a new procedure that could have complications. WSPA recommends that the regulation be amended to allow an EO decision or a method for direct allocation in case a decision is pending on a qualified positive verification or in case of an adverse verification opinion. WSPA further recommends that the regulation be amended to allow an EO determination for a direct allocation in case a decision is pending on a qualified positive verification or in case of an adverse verification opinion. (WSPA4)

> **Response:** We do not believe there is a need to modify the regulation and allow an EO decision or to create a method to allow entities that did not obtain a positive or qualified position product data verification direct allowance allocations. Appropriate flexibility is already included in the verification process.

Product Benchmarks

True-up

C-5. Comment: On September 8, 2011, CSCME submitted brief comments to CARB proposing a modification to the "true-up" method in the allowance allocation system. This simple modification would ensure that facilities receive the appropriate true-up for the last two years of the program if the Cap-and-Trade program is discontinued. CSCME now reiterates those comments, and attaches them to ensure they are part of the record of this proceeding. (CSCME5)

> **Response:** We believe our second 15-day changes to the regulation for the "true-up" method is sufficient. We prefer to keep the calculation of allowance allocation separate from the calculation of compliance obligation. We will address the issue of discontinuation of the program, if and when the need arises, through future rulemaking.

Stringency: Support or Request Increased Stringency

C-6. Comment: UCS urges the promotion of technology-forcing best practices by basing benchmarks on best-in-class international or national carbon intensity standards which are transparent, based on publicly available information and do not subsidize dirtier lower quality crude feedstocks. (UCS8)

> **Response:** We believe that benchmark stringency should reflect the emissions intensity of highly efficient, low-emitting facilities within each sector. We do not agree that our approach subsidizes lower-quality crude feedstocks. We believe that complexity-adjusted allocation methods are neutral to crude quality. That is, they neither excessively penalize nor reward refineries sourcing poorer quality crude. We do not believe these methods create an incentive to switch to poorer quality crudes. The phase-out of free allocation and the switch to auctioning as the primary method for allocation to the refining sector by the third compliance

period will penalize facilities with more emissions-intensive processing, including more emissions-intensive processing due to crude quality.

Stringency: Request for Reduced Stringency

C-7. Comment: Appropriate and equitable benchmark methodology is important as it serves the fundamental basis for the distribution of free allowances. CARB should not use benchmarking methodology to serve unrelated goals and thus undercut the basic principle of free allocation of allowances to prevent leakage of emissions and economic activity of energy intensive trade exposed industries. (CALCHAMBER4)

Response: We disagree that we are using the benchmark methodology to "serve unrelated goals." We believe our benchmark stringency will reward efficient facilities that have taken early actions to reduce their greenhouse gas emissions, as required by AB 32.

C-8. (multiple comments)
Comment: Protecting against leakage of emissions and jobs must continue to be the paramount cap-and-trade design issue for CARB. With none of California's neighboring states committing to climate targets and policies, emissions leakage will continue to be a risk for the program and a risk for California businesses. Unlike their out-of-state competitors, California's industries will face carbon costs that will make them less competitive. While CARB appears to recognize the need to protect California's carbon intensive trade exposed industries by proposing direct allowance distribution to these industries, the proposed arbitrary 10 percent "haircut" is completely inconsistent with the need to protect these industries and California jobs. CARB should not arbitrarily withhold up to 10 percent of the allowances that trade exposed and energy intensive industries need in order to minimize costs and leakage. Yet, CARB continues to propose an arbitrary 10 percent reduction in the number of allowances to be distributed to leakage prone industries. This is inequitable, does not minimize costs, and does not minimize leakage. It is not necessary or even helpful in ensuring the stringency of the overall cap. CARB should discontinue this proposal, and should not arbitrarily withhold allowances that it has already determined these industries need. (AB32IG3)

Comment: Rather than developing a "soft start" to the Cap and Trade program as previously approved by CARB, the 10 percent reduction (termed 10 percent haircut) poses potential problems for the availability of allowances at the onset of the program when uncertainty is expected to be greatest. At the very least, this will lead to severe inefficiency of the Cap and Trade Market, and likely will increase the already significant cost burdens to all industry sectors. No documentation or information substantiating the need for the haircut has been presented. In reality, the reductions originally planned during the first compliance period now occur up front instead of staggered over a three to five year period. Also, the reduction in allowances has no relevant air quality benefit or emission reductions. It basically will generate hundreds of millions of dollars for no stated purpose and is a hidden tax on industry. (CIPA2)

Comment: In the proposed regulation, the benchmark is set at a level of 90 percent of industry average for the refining sector and most other industries. Setting the benchmark at this level will create an immediate shortage of free allowances, introducing this level of stringency at the outset of the program will create immediate harsh impacts, dilute the impact of the assistance factor, and be redundant with the cap reduction factor. The only clearly stated need for allowance withholdings during the first compliance period are one percent for the price containment reserve and 0.5 percent for renewable electricity emission reductions. We do not believe there is any justifiable reduction in free allowances beyond 1.5 percent in the first compliance period. Because the cap reduction factor already provides for a two percent year reduction in free allowances, we maintain that the 90 percent initial reduction is overreaching, beyond the needs of the program, and will cause unintended consequences like leakage. (TESORO3)

Comment: The current cap-and-trade proposal continues to arbitrarily set the benchmark for industry sectors at 90 percent of the industry average, which would require regulated entities to purchase ten percent of their allowances at the start of the program. CARB's proposal to withhold ten percent of emission allowances (the 'haircut') is an unjustified tax on business that will lead to leakage of production and jobs while failing to reduce GHG emissions required under AB 32. The ten percent haircut puts California companies at an immediate competitive disadvantage and runs contrary to CARB's recognition of a 'soft start' transition intended to mitigate economic and emissions leakage. So long as California continues to move forward by itself in a cap-and-trade program, the risk of economic leakage remains high; CARB must take every step to avoid this scenario. The best way to avoid these impacts and to mitigate risk to energy intensive trade exposed industries is through the free allocation of allowance. 100 percent allowance will provide the necessary transition to a lower-carbon economy, and allows businesses to stay competitive and keep investments in the State. (CALCHAMBER4)

Comment: ARB should provide 100 percent free allowances to industry to prevent leakage of jobs and emissions out of the state, consistent with the December 16, 2010, cap and trade rule. One way the agency can provide a soft start to benchmarking and still achieve its objectives is to set the benchmarks at 98 percent of the industry average in the first compliance period, followed by 93 percent in the second period and 90 percent in the last compliance period. This will allow transition time for reductions to be made and for offset supply to be developed. (CHEVRON4)

Comment: ARB's modified cap-and-trade draft regulations allocate significant levels of permits to covered entities in the early years of the program, moving to an auction of greater volumes of allowances over time. In a more recent development, the draft regulation now includes significant additional reductions in allocation to industrial entities, through the benchmarking design approach, starting on day one of the program. This recently enacted 10 percent " haircut" significantly increases the compliance obligation for the industrial sector early in the program—and runs counter to the very carefully thought-out and justified "soft start" to the program. At this rate, industry will find it very difficult to adjust to the increased costs of auction, threatening competitiveness, and jobs, and impacting consumer energy prices, and potentially affecting public support for the program. Simply put, allocating allowances helps to minimize leakage and prevent California industries from being put at a competitive disadvantage. It is important to keep in mind that for companies who have been designated as trade exposed, free allocation of allowances is a way to mitigate their exposure and to lessen the impact of a transition to a low carbon economy. With input from the Governor's office, ARB has concluded that free allocation of allowances, especially early in the program, is necessary and warranted, and has as a result provided for a transition period. Therefore, when considering a method to distribute these free allowances, it is important that the method chosen and the design elements of that method do not run counter to the intentions of freely allocating allowances. Of most concern in this regard is the intention to reduce initial allocation by 10 percent (either through the benchmarking process or in other ways), which is suggested by staff to be necessary in order to fund various accounts or programs. This is a significant reduction in allocations and it would increase compliance obligations for affected regulated parties by 250 percent (from four percent to 14 percent) in the first compliance period—this increase being in a period that had been designed as providing a "soft start" and transition period for regulated entities. The justification for, and design of, a "soft start" to the cap and trade program was very carefully considered in the earliest scoping discussions for Cap-and-Trade. The need for a soft start was clearly articulated by then Governor Schwarzenegger and subsequently affirmed by ARB Leadership and their Board. The upshot was a policy of full allocation in the first compliance period to sectors determined to be trade exposed. To the contrary, the current rules do not square with that determination, so it is very inconsistent for there to be such a significant reduction in first compliance period allocation with the resulting 250 percent increase in the compliance obligation at the outset of the program, as highlighted above. Significant time and capital investment are needed to meet long-term emissions reductions goals and transition California to a lower-carbon economy. IETA recommends this ten percent haircut be removed, and that the regulation adheres to the concept of a soft start. This will better help participants acclimate to the market and permit time for large capital investments to yield emissions reductions, keeping costs down, reducing trade exposure, and improving efficiency. We strongly urge ARB to rescind any consideration of a reduced allowance allocation (or "haircut" as it has been referred to). The use of the first compliance period should continue to be viewed as a period that while it will deliver real, tangible emission reductions, allows regulated parties to transition to a low carbon economy. (IETA4)

Comment: The proposed initial 10 percent reduction and set-aside of allowances is unexpected and unnecessary. A graduated start of the program, as presented in the Scoping Plan, would give California consumers and businesses time to adjust to the cost impacts of this regulation. This is particularly relevant given the now truncated first Compliance Period of the program which is now two instead of three years. ConocoPhillips opposed this 10 percent cut in our August comments when it first appeared in proposed public rulemaking and has met with staff to communicate our competitive concerns. Our position is supported as follows:

- Not a Slow Start: This is not the “slow start” that was discussed for the start of the program.
- Change not anticipated: ConocoPhillips, and in our opinion the refining sector in general, did not anticipate this proposed late change in the regulation. To the best of our knowledge, it was only made clear for the refining sector in the July 25 public release.
- Not aligned with prior ARB/WSPA discussion: During the cooperative workgroup meetings on refining benchmarking earlier this year, the documents and examples on allocations discussed with ARB staff clearly assumed only a four percent or less (3.7 percent) cut in allowances due to the cap reduction during the first Compliance Period. Discussions did not include the 10 percent cut plus the 3.7 percent cap reduction now proposed by ARB. This 13.7 percent total initial cut is not a slow start.
- Step Change in Costs: This significant loss in allowances to ConocoPhillips and the accompanying high costs would hit on January 1, 2013, only 14 months from now. Based on current refining sector benchmarking these costs could range from $5 to $10 million per year based on ARB’s minimum 2013 carbon market price of $10 per tonne (because this is the minimum price, the actual costs are expected to be much greater). These costs have not been assumed in our business planning and allocation of funds. Actual costs may be higher with higher carbon market prices.
- Importing Refineries not Subject to this Cap-and-Trade Cost: No refinery outside of California is subject to this requirement to buy allowances or offsets for refinery emissions. This creates a competitive disadvantage for California refineries that will be quickly exploited by foreign and out-of-state refineries.
- Immediate Trade Exposure: ARB recognizes the refining sector as heavily trade-exposed in the first compliance period by granting the sector a 100 percent “Industry Assistance Factor” in the Regulation’s section 95870. The newly proposed 10 percent cut is inconsistent with this recognition and degrades the protection ARB previously realized was necessary for our heavily trade-exposed industry. As a result of the 10 percent cut, trade exposure, which is already present, would increase on January 1, 2013. ARB has acknowledged potential leakage in industry operations in earlier rulemaking documents and that it can actually increase global emissions.
- Refinery Viability and Jobs Impact: Any additional trade exposure puts our refineries at a disadvantage, impacting viability, and potentially putting high-paying manufacturing jobs at risk. Further, a refiner will be less inclined to invest in the sites and that could put construction and other trade union work in jeopardy.
- Heavy Overlay of Programs: The 10 percent cut in allowances poses yet another overlay of AB 32 programs on the refining industry. This overlay includes at least five regulations that include the Low Carbon Fuel Standard for gasoline and diesel fuels, penalties for high carbon-intensity crude oils, Cap-and-Trade for refinery emissions in 2013, Cap-and-Trade for consumer product emissions in 2015, and the AB32 Implementation Fee regulation. This year alone we will pay $3.7 MM in fees to ARB for AB 32 regulation and program development. The

imposition of Cap-and-Trade for product emissions in 2015 is problematic and we look forward to discussing this with ARB in future Cap-and-Trade rulemaking improvements.

- Revenue Take for Unclear Uses: It is not clear how the revenues from the 10 percent cut in allowances will be used. ARB does state that the proceeds from the sale of these allowances will be deposited into the Air Pollution Control Fund and will be available for appropriation by the Legislature for the purpose designated in California Health and Safety Code sections 38500 et seq. The uses of this significant additional revenue from the 10 percent cut should be made more transparent. Only 1.5 percent of the total is clear for use in the Allowance Price Containment Reserve and Voluntary Renewable Electricity Reserve Account. ARB has stated publicly that the AB 32 program should raise approximately $500 million in revenue from the sale of allowances in 2013. (CONOCO3)

Comment: The United Steel Workers (USW) and our members are opposed to a Cap and Trade scenario for refining that does not recognize full trade exposure when granting allowances to trade exposed refining. Full trade exposure means 100 percent granting of allowances for all refineries in initial years, while companies have time to permit and build out their projects. These projects will enable refineries to secure high paying jobs while at the same time moving toward greener production methods. Since the passage of AB 32 in 2006, refineries have not had adequate time to make step changes in energy efficiency. Compliance will materialize as in-state investment in energy efficiency projects. Statewide energy improvements will not happen if leakage is at the center point of the program. The reduction in the cap on greenhouse gases will drive carbon prices up, you don't need a big cash call in the first year of the program to meet the goals of AB 32. The 10 percent reduction of free allowances for some facilities is a tragic invitation for refiners to leave the State or increase imports therefore jeopardizing jobs. As Cap and Trade revisions are proposed, eight facilities are required to pay fees reaching $20 million per facility creating an unlevel playing field starting day one of this regulation. A slow and steady start of the program, as initially envisioned to allow time for investment and permitting, will preserve California jobs and minimize imports of intermediates and finished products. Policies favoring imports from other states or countries that have done little or nothing to regulate greenhouse gas emissions hurts our members and does not help the overall environment as it relates to greenhouse gases. Don't invite a flood of new imported product into California that will compete at reduced costs and will place our members out of work. CARB must protect California refineries from imports that will result from a poorly designed in-state Cap and Trade Program. If CARB fails, the result will be a severe loss of California jobs and failure to reach our collective goal of greenhouse gas emission reduction. USW requests that CARB more carefully protect against trade exposure. Petroleum refineries will comply with reductions through energy efficiency investments. This can only happen if there is a level playing field with in-state refining because imports currently do not, and should not be invited to play a role in California's manufacturing sector. CARB must not pick and choose winners and losers in the first year of the program because no company has had time to prepare for reductions. We ask CARB for three important deliverables:

- Eliminate the 10 percent allowance take away from certain California refineries in the early years;
- Revise classification and timelines for the downstream refining sector, from medium trade exposure to high trade exposure. Such action is consistent with upstream exploration and production currently classified as high trade exposure; and
- Close the import loophole and associated leakage by providing a slow start and level playing field for California refineries in the Cap and Trade Program. Protect in-state refineries from unfair competition from refineries in other states and nations outside CARB's enforcement jurisdiction. (USW)

Comment: WSPA is very concerned, and joins others in opposing, ARB's imposition of a 10 percent reduction in allowances at the start of the cap and trade program. Rather than encouraging a "soft start" to the program and improve the chances of the program's success, the 10 percent reduction works to frustrate that effort by increasing costs and uncertainties to participants at a time when the economy cannot support additional costs. The reduction also poses a unique, additional hurdle for trade-exposed industries such as the oil and gas production and refining industries by imposing costs to operations in California that are not imposed on those operating outside the State. In fact, the proposed reduction in free allowances is a policy decision that is in direct conflict with ARB's recognition, and stated intent, to mitigate the impacts of the C/T program on trade-exposed industries. Again, this is so because the proposed reduction exacerbates the impact of trade exposure to facilities within California because it imposes immediate and obvious costs to California operators that are not imposed on those operations outside the State. Because importers are not affected by allowance costs, this inequity can lead to leakage of goods and/or services to operators outside the State—again an outcome that ARB indicated it wished to avoid. Finally, the immediate reduction in free allowances, in reality, simply represents an abrupt transfer of millions if not billions of dollars of revenue whose justification and ultimate use is both undefined and undocumented. While, we have been told that the 10 percent reduction is to provide incentive to be more GHG efficient, it seems obvious that the cap and trade program itself provides the necessary incentives. This additional 10 percent "incentive" is an unnecessary "add-on" that may cause a sudden unnecessary disruption that could negate a soft start to this program. The reduction has no impact to air quality nor will it contribute to emission reductions. Rather, it will generate literally hundreds of millions of dollars from participants for undefined and unidentified uses. In fact, up to this time, ARB has simply not been transparent in developing the requirements of the 10 percent reduction nor has the agency fulfilled the requirements to clearly document the need for that element within the Cap and Trade Program. ARB should remove the 10 percent reduction in allocations from its program. Should it wish to pursue it in the future, the Agency should document: 1) the need for this element; 2) the anticipated environmental benefit; and 3) that the supply of allowances and offsets will be sufficient to ensure companies can comply with AB 32 limits. (WSPA4)

Response: We do not agree. We believe that benchmark stringency should reflect the emissions intensity of highly efficient, low-emitting facilities within each sector. Our approach to allowance allocation will minimize leakage by incentivizing continued production and improved emissions efficiency from all facilities in California.

We strongly disagree with the comments that characterize the approach to benchmark stringency as unexpected. The use of "90 percent of average" stringency for product-based emissions efficiency benchmark was initially indicated in the Staff Report released in October 2010. The following is a quote from page J-35 of that document:

"Staff believes benchmark stringency should reflect the emissions intensity of highly efficient, low-emitting facilities within each sector. Our current thinking is that the targeted level of stringency would be created by evaluating each industrial sector's emissions intensity during a historical base period and targeting the benchmark to allocate 90 percent of this level per unit product."

The benchmark stringency was explicitly discussed at the December 16, 2010, Board hearing, at which the Board directed staff to develop benchmarks based on the overall approach outlined in the Staff Report and to determine whether a benchmark stringency of 90 percent of average is appropriate for all sectors. In the subsequent work of evaluating the benchmark values, we found that the stringency approach proposed in the Staff Report worked for many sectors but, in some cases, would set the benchmark at a level that was more stringent than the current emissions intensity of any existing Californian facility. For the sectors for which this occurred, we selected a benchmark based on the "best-in-class" value (i.e., the emissions intensity of the most GHG-efficient California facility). This change in approach was indicated on page 3 of Appendix B of the first 15-day notice entitled *Development of Product Benchmarks for Allowance Allocation*.

We developed this approach to benchmark stringency after careful analysis of California emissions intensity data and approaches used in other successful cap-and-trade programs. In selecting benchmark stringency, we are balancing the need to provide adequate transition assistance and minimize leakage with the necessity to meet AB 32's emission-reduction goals and prevent windfall profits through excessive free allocation.

Within each sector, facilities with efficiencies better than the benchmark, will be receiving more allowances than they will need, and can sell their excess allowances. Less efficient facilities will need to purchase allowances to fulfill their compliance obligations. Beyond the initial allocation period, the level of free allowances will decline through the use of a cap-declining factor and an assistance factor. Because allowances can be traded, the program provides incentives for those with the most cost-effective reduction opportunities to reduce emissions quickly.

Treatment of Energy Flows

C-9. Comment: There is a lack of transparency in development of the product-based emissions efficiency benchmarks. Table 9-1 of the regulation lists product-based emissions efficiency benchmarks for numerous activities. The development of individual benchmarks has not been a transparent public process due to the use of commercially sensitive data provided by the affected industries. The CCC appreciates the need for confidentiality, but is concerned that the lack of transparency prohibits validation of the data used to develop these benchmarks. For example, it is impossible to determine if all, some, or none of the benchmarks include steam imported from an off-site CHP unit as an input to the benchmark. In the 2nd 15-day modified regulation, the energy-based allocation calculation methodology in section 95891(c) was modified to clarify that the CHP exclusion in the “steam consumed” term applies only to steam produced from CHP units on-site. Allocations for on-site CHP are captured in the FConsumed terms, and steam imported from an off-site CHP unit is included in the SConsumed term. It is not clear if these same principles apply to the product-based emissions efficiency benchmarks calculation methodology. Since the off-site CHP unit is not involved in the benchmark development, there is no opportunity for the off-site CHP owner to validate the data that may or may not be used in the calculation and are being attributed to that CHP unit. While the “electricity sold” term appears to include all power exported or sold from a facility, it is not clear if electricity sold not to a utility, but rather to a host pursuant to Public Utilities Code Section 218(b), is included in the product-based benchmark for any particular industrial activity. CCC recommends that ARB explicitly state how CHP outputs produced both onsite and offsite are treated in terms of each type of benchmark. Such transparency is particularly important if the outputs are treated differently for different activities. If the thermal or electricity produced offsite by a third party is included in the benchmark calculation, the third party CHP owner should be given the opportunity to validate the data being attributed to their facility. This is important from the perspective of negotiating third party agreements to include cost recovery of the GHG emissions associated with the energy sold to the thermal/electricity host. (CACC3)

Response: We recognize the importance of properly considering indirect carbon costs in developing benchmarks for free allocation. In both the Staff Report and Appendix B to the first 15-day changes to the regulation, we clearly describe how energy flows and associated indirect costs impact benchmark values. Heat and power exported from a facility reduce the benchmark value because the operators of these facilities will be able to recover some of their carbon costs through the price of energy sold. Conversely, heat purchased will incur an additional indirect carbon cost for that facility, and thus emissions intensity values used in development of product benchmarks were increased to account for heat that was purchased.

An adjustment was not made for power purchased in establishing the benchmarks. This is because purchased power may not create an indirect carbon cost in all California utility service territories. It is ARB's goal to see a carbon price properly embedded in all utility rates. We will revisit this issue once the California Public Utilities Commission Proceeding addressing utility costs and revenue issues associated with greenhouse gas emissions (R.11-03-012) concludes.

With respect to concerns about the transparency of energy flows at individual facilities, energy purchases and sales information for each facility are collected in a confidential fashion as part of our program for the mandatory reporting of greenhouse gases. We cannot share energy flow data submitted by one entity with another entity even if the second entity is the counterparty in the energy transaction.

Cap Adjustment Factor

C-10. Comment: Design the program elements to ensure a smooth transition. CCEEB believes that because it is unlikely that California's program will be broadly linked with other State, federal or international programs in the early years, the combined effects of the cap slope and the allowance reserve deductions in the first and second compliance periods are likely to result in serious impacts to the economy. In the Functional Equivalency Document for the Cap-and-Trade, ARB reported 2010 emissions, which are far below projections made to justify the capped reductions. Since there are no linkages and there is a reduced need for emission reductions, CCEEB recommends that the cap slope be revised to reflect a smoother transition of one percent in 2013 and 2014, and two percent per year in the second compliance period and that benchmarking design elements that further reduce allocation to trade exposed industry early in the program be re-thought. This creates a smoother transition and realistically addresses the potential that California's cap-and-trade program will operate without the possibility of broad linkage to other State or federal programs in the first five years. (CCEEB4)

Response: We disagree. We believe the current allocation approach, including cap-decline factors, appropriately minimizes leakage. As stated in the responses to the 45-day and first 15-day comments to the regulation, the main difference between the estimated cap of 365 $MMTCO_2e$ in the Scoping Plan and the 334 $MMTCO_2e$ cap in the regulation is that the Scoping Plan estimate was based on entire sectors. It did not consider sources that are not addressed by the regulation or certain types of transportation fuels that are used in small quantities.

We disagree with the commenter's assumption regarding projected emissions for 2012, and adjusted our estimates to take into account for the economic downturn. The changes in fuel use are reflected in the baseline levels. The initial 2012 allowance budget of 165 $MMTCO_2e$ per year was selected based on projected 2012 emission levels and by using mandatory reporting data to ensure accuracy in cap setting.

C-11. (multiple comments)
Comment: We remain concerned over the greatly reduced cap adjustment factors for cement manufacturing. The latest version of Table 9-2 in the regulation adds two other sectors to this special category achieving just 7.5 percent carbon reductions in 2020 versus a 15 percent carbon reduction expected from all other sectors. The rational that these three sectors (Nitrogenous fertilizer manufacturing, cement manufacturing and lime manufacturing) have a high level of carbon emissions inherent to their process is not a sufficient explanation for an excessively weak cap reduction factor. These sectors could employ cleaner fuels, efficiency measures and greater use of alternatives to make significant carbon reductions. Special treatment for these three sectors is unwarranted and increases the compliance costs for other sectors. We recommend maintaining the same cap adjustment factors for all direct allocations. (KUSTIN18)

Comment: We propose that Table 9-2 be amended to recognize the following cap adjustment factor for glass manufacturing in recognition of the fact that approximately 25 percent of our GHG emissions are process-related. See attached chart for proposed amendment to Table 9-2. (SMITHS2)

Comment: GPI requests that CARB allow container glass to use the same Cap Adjustment Factor as has been provided to the cement manufacturing sector to account for the limited opportunity to control this portion of our emissions. (GLASSPI)

Comment: CARB staff has provided no justification for the selection of a 50 percent cutoff for eligibility for the lower cap adjustment factor. Thirty percent of “process emissions for which no cost-effective abatement opportunities are currently available” seems to PPG also to be “a significant level.” Flat glass manufacturers such as PPG will have only 70 percent of total CO_2E emissions available for potential reductions, while other industries subject to the same cap adjustment factor will have most or all of their CO_2E emissions available. PPG urges CARB to further revise Table 9-2 to include flat glass manufacturing as one of the sectors eligible for the lower cap adjustment factor. (PPGI2)

Comment: PPG’s comments on the proposed additional 15-day modifications to the regulation are focused on one issue: The need to include the flat glass industry in the group of industries eligible for the lower cap adjustment factor in Table 9-2. The flat glass industry is similarly situated to the three industries to which CARB has assigned the lower cap adjustment factor. A very significant proportion of CO_2E emissions from flat glass manufacturing – approximately 30 percent, based on PPG’s data result from the use of raw materials for which no substitute is available. (PPGI2)

Comment: Hydrogen production should be subject to the cap adjustment factors for sectors with process emissions greater than 50 percent. (IGPACC2)

Comment: Approximately 80 percent of carbon dioxide emissions from hydrogen production are process emissions. Hydrogen is produced using a chemical reaction in which a hydrocarbon feedstock reacts with steam to produce hydrogen, carbon dioxide and carbon monoxide. It is stoichiometrically impossible to reduce process emissions; they are determined by the chemical reaction used to produce hydrogen. Carbon dioxide emissions associated with energy production during the hydrogen production process are only about 20 percent of total hydrogen production emissions. CARB has determined that industries with more than 50 percent process emissions should be subject to lower cap adjustment factors than industries with less than 50 percent process emissions. CARB explained its rationale in the Notice accompanying the September 12 draft: In section 95891, Table 9-2 was modified to define "sectors and activities associated with process emissions greater than 50%", rather than "cement manufacturing". In the previous proposal, staff identified only cement manufacturing as an activity associated with significant level of process emissions for which no cost-effective abatement opportunities are currently available. However, stakeholders in other sectors whose activities also release process emissions raised a concern in comments. After careful consideration, staff determined that sectors with activities that are associated with process emissions greater than 50% are eligible for a lower cap adjustment factor taking into consideration the potential impact from the emissions that do not currently have cost-effective abatement opportunities. Because the process emissions from hydrogen production far exceed the 50 percent threshold that CARB has set, hydrogen production should be included in the group of industries subject to the lower cap adjustment factor. (ALLI2)

> **Response:** We believe a more gradual cap adjustment factor is appropriate for sectors where the majority of emissions are from process rather than combustion (greater than 50 percent of total emissions) and those that face a high leakage risk due to high emissions intensity. Except for carbon sequestration, a technology that is not yet fully developed, few options exist to reduce the process emissions in these sectors. We do not dispute that some cost-effective greenhouse gas abatement opportunities still exist at these facilities.
>
> Our decision to reduce the cap adjustment factor in Table 9-2 for three industries—nitric acid manufacturing, lime manufacturing, and cement manufacturing—was based on two criteria. The first was the magnitude of the process emissions as the majority of the total. The three industries where we provided a modified cap adjustment factor have process emissions in excess of fifty percent of total emissions. The second factor in our decision to reduce the cap adjustment factor for these three sectors was leakage risk and overall emission intensity. The three industries are all at a "high" leakage risk due to a "high" or "very high" level of emissions intensity. As we discussed in Appendix K to the Staff Report, high emissions intensity creates greater leakage potential since cap-and-trade compliance costs are relatively more significant for these sectors.

While flat and container glass manufacturing activities are at high risk of leakage, it is not due to high emissions intensity. For example, the emission intensity for the flat glass sector is less than twenty-five percent of the emission intensity of the least emission-intensive sector for which a reduced cap adjustment factor is provided. In addition, the process emissions from glass manufacturing are less than 50 percent of their total emissions.

The two hydrogen-production activities (gaseous hydrogen production and liquefied hydrogen production) are currently classified as at medium risk of leakage because the primary use of hydrogen is as an intermediate to production of transportation fuels by petroleum refineries. Petroleum refining faces a medium leakage risk. We are aware that the hydrogen producers would like a separate leakage risk evaluation of the non-refinery-based market for liquefied hydrogen. We will conduct such an evaluation and update the classification, if necessary, in a future rulemaking. This updated analysis may or may not make the production of liquefied hydrogen eligible for the reduced cap adjustment factor in future rulemakings.

In accordance with Board Resolutions 10-42 and 11-32, we will continue to monitor the emissions leakage risk for California production and recommend adjustments to allocation, as appropriate, to minimize this risk.

Price Containment Reserve

C-12. Comment: We would note the irony in CARB's intent to provide an allowance reserve (from which allowances will be sold at arbitrarily high prices) as a cost containment mechanism, and then propose to fund that reserve by withholding allowances that it should be directly allocating to leakage prone industries without charge. In this framework, the allowance reserve is not a cost-containment measure, but an arbitrary cost increase with no overall program benefit. (AB32IG3)

Response: We disagree and believe that the commenter has misinterpreted the design of the allowance price containment reserve. The allowances that are withheld to create the reserve are balanced against additional offset credits that are allowed to be used in the system. The design of the allowance reserve allows for an additional infusion of compliance instruments if allowance prices increase beyond initially anticipated levels.

Leakage: General

C-13. Comment: We are concerned that the analysis for trade exposure on a State level is an untested new process with potential for inadvertent oversight and errors and/or the cumulative impact of the other technology forcing complementary measures on California businesses may impact trade exposure in ways not fully accounted. To remedy this problem, CCEEB recommends that ARB establish a test to determine if an industry remains trade exposed. ARB's trade exposure test should rely on two criteria:

(1) is there a federal program; and (2) is there linkage to broad markets (i.e., larger or equal to the California market)? Allocations should be evaluated every three years in relation to the trade exposure test and other market indicators, such as the reports and recommendations by an independent market monitoring committee. (CCEEB4)

Response: Although we did not adopt the trade exposure test that the commenter suggests, we will continue to monitor leakage risk in the context of an evolving global and federal climate change policy framework.

C-14. Comment: It is disappointing CARB continues to propose less than 100 percent allowance allocation to the industrial sector in future compliance periods. The leakage analysis is insufficient to justify this. It is also premature to make this decision when there is time to do such analysis prior to the 2015 compliance time period. This decision should depend on the level of participation by other states and jurisdictions in the program as a key metric for how much each industry sector is at risk for leakage. (AB32IG3)

Response: We do not agree. We believe that our leakage analysis is sufficient to justify our approach to allowance allocation. We will continue to monitor leakage risk in the context of an evolving global and federal climate change policy framework.

C-15. Comment: Table 8-1 discusses the disposition of allowances for various industries that meet specific criteria under the Cap and Trade regulations. We understand that ARB is continuing to review where industries are placed on Table 8-1 as it relates to later compliance periods and we intend to further dialogue with ARB regarding the appropriate placement of our industry. (UNITEDAIRLINES3)

Response: We will continue to monitor leakage risk in the context of an evolving global climate change policy framework. We look forward to further dialogue with stakeholders on this issue.

C-16. Comment: CARB has reclassified the sectors, “all other petroleum and coal products manufacturing” and “tissue manufacturing” as high leakage risk and so these sectors now get many more free allowances in the second and third compliance periods. There is no supporting documentation or analysis to explain this change and its impacts. CARB should provide appropriate analysis prior to changing the categorization of these sectors to high leakage. (KUSTIN18, UCS8)

Response: We updated our leakage risk assessment for the “coke calcining” activity in the “all other petroleum and coal products manufacturing” based on new trade exposure information provided by the industry. There was no categorization for this sector or activity prior to the first 15-day changes to the regulation, and in the first 15-day changes to the regulation we were still gathering information to finalize our leakage risk assessment. We initially classified coke calcining as medium leakage risk based on our understanding that this sector and activity generally fell within the refining sector. However, through the dialogue with stakeholders, we found that calcined coke, which is a dry pure form of carbon, has different functionality and faces different market risk as compared to that of petroleum-derived fuels. Calcined coke is primarily used as anodes for aluminum smelting. Since there is no aluminum smelting in California, almost all calcined coke produced in California is exported.

We used the same methodology (evaluate emission intensity and trade intensity, then combine the two to determine leakage risk) that was applied to other industrial sectors as described in the Staff Report. Below are the values for coke calcining:

Emission intensity: We applied the same intensity as all other petroleum manufacturing products: 2,720 MTons CO_2 / $Million value added

Trade intensity: (import + export) / (domestic production + import) = (780,055 + 4,039,654)/(5,429,000 + 780,055) = 77.6%

Therefore, calcined coke is classified high leakage risk category because its emission intensity is medium and trade intensity is high.

We did not alter the classification of the “tissue manufacturing” activity within the “paper manufacturing” sector. We will continue to monitor leakage risk and adapt the program to new information through future rulemakings, as necessary.

C-17. Comment: To properly protect against leakage, it is imperative that CARB move forward in a way that does not have the unintended consequences of closing California manufacturing plants, eliminating thousands of California jobs, and reducing California’s income and property tax bases, while at the same time causing a shift / increase in GHG emissions because production has been moved to another jurisdiction (domestic or global) with less stringent requirements. (SMITHS2)

Response: This comment does not address a specific change in the second 15-day changes to the regulation. However, we agree, and designed the program to reduce leakage.

Food Manufacturing

C-18. Comment: Ag Council’s central issue of concern with the regulation still remains, and that is the designation of food manufacturing being categorized in the “medium” Leakage Risk Classification in Table 8-1. As stated in our previous comments, dated December 14, 2010, “the regulation states that the Industry Assistance Factor is essentially the ability an industry has to pass-on carbon costs. With low-cost competitors throughout the world, even a minimal increase in cost could displace certain market segments as demonstrated in the previously listed reports.” As stated in our comments submitted on August 10, 2011, “Ag Council believes the formula

for trade exposure and emissions leakage should be reevaluated to give special consideration to agricultural import and export markets. Food processing should be moved to the “high” leakage risk category, due to increasing international and domestic markets as stated in data points provided in our December comments. Additionally, food manufacturing is located in the second Industry Assistance Factor tier (Industry Assistance Factor of 100 percent; 75 percent; 50 percent), and should be moved to the top industry assistance factor tier due to price pressures from international markets. Even a minimal increase in costs could displace U.S. markets, giving more ground to domestic and international competitors. The EU’s ETS recognized the food processing industry as being especially vulnerable to leakage. While some food processing sectors were given 100 percent free allowances, others were considered under the de minimis category and therefore do not have to participate. California is no different, as many of our commodities compete for market space in a domestic and global economy. As such, by working within this regulatory system, we support moving food processors from the “medium” to the “high” leakage category in Table 8-1. Without our food processors, many sectors of production agriculture would not have a home in the marketplace.
Ag Council agrees with staff assessments in the December report, regarding domestic competition as being problematic as it relates to the food and agricultural industry. A different approach should be taken for food processing in determining compliance costs and/or emissions intensity. The emissions intensity variable in the product-based allocation calculation should be replaced with another variable that truly represents the cost of compliance for the food industry. Staff should take more time to work with the food processing industry to determine an appropriate factor for this variable.”
According to ARB staff, analysis has been conducted which demonstrates that the food processing industry will benefit from the cap and trade program during the first compliance period, therefore, food manufacturing remains in the “medium” leakage category. However, we have not been given the opportunity to review staff’s analysis of these findings, so our request to move to the “high” leakage category remains at the forefront. (ACC5)

> **Response:** We did not make changes to the leakage risk classification of the food processing sector at this time. However, we will continue to conduct additional analysis to further refine the leakage risk faced by the sector. As stated in Board Resolution 11-32, the Executive Officer is directed to initiate a study to analyze the ability of the agricultural industry, including food processors, to pass on regulatory costs to consumers. The Executive Officer will identify and propose regulatory amendments, as appropriate.

C-19. Comment: Food manufacturing is the only industry for which the CARB has aggregated up to the three-digit level per the North American Industry Classification System (NAICS). Every other industry is disaggregated at least to the four-digit level. Using three-digit level data obscures important differences among industry segments. For example, sector 3114 food processors are grouped with poultry processors in sector 3116, which have a very different energy use pattern. Food processors appear to be more energy intensive than the rest of the food manufacturing sector. Thus, the energy intensity measure for sector 3114 is diluted unless the NAICS code designations are expanded. CLFP recommends that the NAICS Code designation covering food processors be expanded. (CALFP4)

> **Response:** We agree and will work with the industry to conduct additional analysis at a greater level of disaggregation and make recommendations for changes in future rulemakings as appropriate. As stated in Board Resolution 11-32, the Executive Officer is directed to initiate a study to analyze the ability of the agricultural industry, including food processors, to pass on regulatory costs to consumers. The Executive Officer will identify and propose regulatory amendments, as appropriate.

C-20. Comment: Uncapped establishments will not be subject to any form of direct GHG regulation and thus will not incur any costs, either in implementing reductions or buying and selling allowances, or in regulatory compliance, associated with AB 32. This situation is identical to what was foreseen for implementing an EITE adjustment—regulated facilities are likely to face a competitive cost disadvantage to firms that provide a close substitute. The uncapped facilities, smaller emitters in this case, can increase their output and attendant GHG emissions, thus defeating the intent of AB 32 to reduce overall GHG emissions. Providing free allowances to large food processing emitters only partially mitigates this situation however. In an industry where so much of the competitive in-state production will fall below the regulatory threshold, and so few of the capped facilities have large emissions (only a half dozen of the sector 3114 plants emit more than 50,000 tons), better public policy is to uncap the entire food processing sector and leave the emission reduction strategies to other means. For food processors, almost all emissions come through either natural gas or electricity use. The load serving entities for both natural gas and electricity will be under the cap and trade program by 2015. The energy utilities will have strong incentives to encourage their customers, including food processors, to reduce their emissions through utility-based programs and measures. Thus, the food processing sectors will be regulated through an alternative means, but in a less costly manner. CARB should designate food processors (NAICS 3114) as an uncapped sector. (CALFP4)

> **Response:** We did not designate food processors as an uncapped sector. If we removed the sector from direct coverage they would no longer be eligible for free allocation, and free allocation is our primary tool to address leakage risk. We agree that coverage of natural gas providers in 2015 will provide greater equity between facilities that emit more than 25,000 metric tons of CO_2e per year and those below this threshold for direct inclusion. At that time, all emissions from natural gas combustion at a food processing facility will face a carbon price. As a result, we anticipate that smaller food processors (those emitting less than 25,000 metric tons of CO_2e per year) may wish to opt-in to direct coverage to become eligible for free allocation once natural gas providers are covered.

C-21. Comment: The purpose of distribution benchmarks is to establish equitable bases for distribution of free allowances within industries, taking into account the higher complexity and existing energy efficiency of California industrial facilities. CARB should continue to work with trade exposed and energy intensive industries to develop benchmarking methods that are supported by the impacted sectors. CARB should not be using benchmarking and other distribution methods to undercut the free allocation of allowances to energy intensive and trade exposed industries. CARB should not, for secondary reasons, adopt benchmarking methods which penalize the superior energy efficiency of California industries relative to competitors in other states, or methods which distort the distribution of allowances among industry members without regard to energy efficiency. To be fair to California industries, energy benchmarks should be set based upon a national standard. Setting industry-wide benchmarks, using only California facilities after nearly 30 plus years of energy efficiency efforts and expenditures by California industries, will only further exacerbate the trade exposure of California industrial facilities. Industry in California will be even more susceptible to competitors or startups in states choosing not to enact climate change regulations on their industrial base. Unfortunately, CARB's most recent proposals on benchmarking create increasing concern on the part of industry, that the basic principle of free allowance allocation is being subordinated to secondary concerns. This will likely result in large allowance shortages for many facilities and significant adverse impacts for California businesses and their workers. (CALFP4)

> **Response:** We do not believe that our allocation approach will have adverse impacts for California businesses and their workers. We developed the approach to benchmark stringency after careful analysis of California emissions intensity data and approaches used in other successful cap-and-trade programs.
>
> In selecting benchmark stringency, we are balancing the need to provide adequate transition assistance and minimize leakage with the necessity to meet AB 32's emission-reduction goals and prevent windfall profits through excessive free allocation.
>
> In developing the existing benchmarks we did consider national and international data where available. The energy-based benchmarks assume natural gas as a benchmark fuel and an 85 percent efficient benchmark boiler for steam generation. We believe both of these benchmarks are appropriate for use in a national context. We will consider additional national data as it becomes available.
>
> Furthermore, pursuant to Board Resolution 11-32, the Board directed the Executive Officer to continue to review information concerning the emissions intensity, trade exposure, and in-state competition of industries in California to the recommend changes, if needed.

Glass

C-22. Comment: It was pointed out during our meeting that in some facilities material is used in air pollution abatement equipment for SOx control which can contribute to CO_2 emissions. These emissions have not been reported by facilities in the past and

GPI wanted to know if this needed to be included moving forward and if so how would that effect the benchmark already established as the numbers are not included in the survey data collected to date. ARB staff indicated that they would investigate this issue and get back to us and that if reporting of this emission source would be required, the benchmark would be raised to account for the new data. We ask that CARB clarify this issue for us in writing. To aid in your analysis, please note that reporting of such emissions is required by 40 CFR 98.33(d). (GLASSPI)

> **Response:** Industry-submitted data indicates that only one facility in California employed such a control device. Emissions were small relative to overall emissions from the sector, and when the emissions from that control device were included in the benchmark calculation, the benchmark did not change. Upon further inquiry, the industry found that other facilities in California have, or may have in the future, these control devices. The total emission level from these devices is still small relative to the total sector emissions, approximately 0.1 percent of the total. However, this information may be considered in future rulemakings.

Container Glass

C-23. Comment: Members of GPI are gravely concerned about Cap and Trade and the proposed benchmark set by CARB. We believe it will have an enormous impact on the few remaining container glass facilities left in the state. Twenty years ago, there were 14 container glass manufacturing facilities in California, today there are only five. This shrinkage is the direct result of the high cost of doing business in the State and has resulted in the loss of thousands of jobs and millions dollars in revenue to the State. (GLASSPI)

> **Response:** This comment does not address a change made in the second 15-day changes to the regulation. However, we believe our benchmark stringency is set at an appropriate level to minimize leakage from the glass sector. As we previously have stated, we will continue to monitor leakage risk and recommend appropriate changes if necessary to minimize the risk. Furthermore, pursuant to Board Resolution 11-32, the Board directed the Executive Officer to continue to review information concerning the emissions intensity, trade exposure, and in-state competition of industries in California to the recommend changes, if needed.

C-24. (multiple comments)
Comment: Madera facility employs a state-of-the-art combustion technology and utilizes high levels of cullet which combined result in one of the lowest GHG emission rates per ton of glass produced of any container glass manufacturing facility in the country. The container glass industry in California has been using post-consumer cullet for many years pursuant to the 35 percent recycled content requirement set forth in the California Beverage Container Recycling and Litter Reduction Act, section l4549(b). Our industry should not be punished by limiting or reducing free allocation allowances,

but should instead be rewarded through full allocation of free allowances for these early reduction actions. (SMITHS2)

Comment: The most effective way for CARB to recognize the early reductions achieved by our industry sector is to utilize the emissions data provided to CARB staff for the years 2005-2007 as submitted to CARB in response to its 2009 Glass Container Manufacturers Survey. That Survey includes emissions data prior to industry efforts to further reduce GHG emissions, instead of that data, CARB staff calculated the Benchmark for our industry sector using 2009 emissions data which it collected in a second informal survey. The data initially submitted to CARB in the 2005-2007 comprehensive survey supports an Energy Efficiency Benchmark of 0.31 $MTCO_2E$/ton of glass produced, reflecting GHG emission rates prior to early reduction efforts by our industry sector. We therefore urge that in approving the final rule, CARB amend Table 9-1 of the proposed rule, by replacing the Benchmark value of 0.264 with the value 0.31 in order to properly credit our industry for its early reduction efforts. (SMITHS2)

Comment: GPI strongly urges CARB utilize the 2005-2007 data collected from the first round of surveys which shows a .31 metric tons of CO_2/ton of glass pulled emission rate or in lieu of that provide an amendment to the current benchmark value to add an additional .013 metric tons of CO_2/ton of glass pulled to account for the early action measures. To the extent that staff requests verification of the Survey data, such verification will be submitted upon request. (GLASSPI)

> **Response:** We believe our benchmarks appropriately recognize early action. While all of the data for years 2005-2007 was collected by survey, it is incorrect to state that this is also the case for year 2009 data. Verified MRR data for combustion emissions for 2009 was used to calculate the benchmark, along with data for process emissions and production provided by the industry. This was the most accurate data available. In some cases, due to the economic downturn, data available in the MRR was not representative of typical operation, and would have produced a skewed benchmark. This was not the case for the container glass industry. Therefore, we used the most accurate data available. We will re-evaluate additional data years for use in benchmark calculation as new, high-quality data become available.
>
> The commenters state that the benchmark value calculated from the 2005-2007 survey data would be 0.31, while that calculated using 2009 data is 0.264 in the Regulation, and recommends that we replace the benchmark in the Regulation with 0.31. This comparison is misleading. The benchmark in the Regulation represents ninety percent of the California average, while 0.31 was the average for glass container manufacturers for the period of 2005-2007. Therefore, if we used data from the period of 2005-2007, the average would be adjusted to the ninety-percent level, and the benchmark would be 0.279.
>
> Finally, the commenters state that a value of 0.013 metric tons of CO_2/ton of glass pulled should be added to the benchmark to account for early actions if we

do not change the benchmark in the Regulation to 0.31. It is not clear what assumptions were used to determine the value of 0.013.

C-25. Comment: We are very disappointed CARB will be recommending a California-only benchmark, even though such a benchmark is insufficient to protect the State's container glass facilities from leakage due to national and global competition. (GLASSPI)

Response: We believe the selected benchmark stringency is sufficient to minimize leakage. Furthermore, pursuant to Resolution 11-32, the Board directed the Executive Officer to continue to review information concerning the emissions intensity, trade exposure, and in-state competition of industries in California to the recommend changes, if needed.

Flat Glass

C-26. Comment: Under the harmonization of the MRR rule with federal GHG reporting requirements, CO_2E emissions resulting from carbon in the raw materials used to make glass (i.e., process emissions from glass production) will be included in a glass production facility's total reported CO_2E emissions. This poses a significant challenge for flat glass manufacturers because there are no lower-carbon substitutes for the raw materials used in the production of flat glass. While a higher proportion of cullet may reduce the carbon content of the raw material batch, significantly increasing cullet usage is not a viable option for flat glass manufacturers due to product quality impacts. In this regard, flat glass manufacturing is quite different from other types of glass manufacturing. (PPGI2)

Response: Our understanding is that given a high-quality cullet source, there may still be an opportunity for flat glass manufacturer to increase the use of cullet, albeit most likely less of an opportunity than for the other glass manufacturing sectors. However, this is not the only strategy available to reduce emissions from the industry, as there are opportunities to reduce combustion emissions as well.

Gypsum

C-27. Comment: Comments submitted by the Gypsum Association on the MRR regarding the correct unit benchmarks for gypsum board caused a dialog to occur between the Association and ARB staff regarding the proper definition for stucco. On the basis of the conversations, the MRR now includes a definition for stucco. Since our proposed modification to identify that the benchmark unit for plasterboard production is based on the mass quantity of stucco used to produce salable plasterboard, and incorporates the use of the term stucco, the cap-and-trade regulation should incorporate the definition for stucco that is contained in the Proposed Second 15 Day Modifications for the MRR. We propose that the following definition be added:

“Stucco means hemihydrate plaster (CaSO4●1/2H2O) produced by heating (“calcining”) raw gypsum, thereby removing three-quarters of its chemically combined water.” (GA2)

> **Response:** The addition of the stucco definition was inadvertently left out of the second 15-day revisions to the regulation, but will be incorporated when we make further changes to the regulation. The units have been changed in the Mandatory Reporting Regulation, which is the basis for allocation, so the oversight will not affect the industry’s manufacturing allocation.

C-28. Comment: The listed unit for the proposed benchmarks for plasterboard is incorrect. Our review indicates that the documents posted by the ARB on July 25, 2011, incorrectly identify the unit for the proposed plasterboard benchmark as “Allowances / Short Ton of Plaster Board” in the cap-and-trade regulations and incorrectly identify the production reporting requirement as “the amount of plaster board produced” in the mandatory reporting requirements. The Gypsum Association and its members request that ARB change the relevant references to correctly identify that the benchmark unit for plasterboard production is based on the mass quantity of stucco used to produce salable plasterboard and not the quantity of plasterboard produced. It is noted that the units of the EU ETS benchmark should also be changed to reflect the mass quantity of stucco used to produce plasterboard rather than mass of plasterboard itself as is currently listed in ARB’s 15-day change documents. Specifically, ARB needs to correct the errors in the following sections of the cap-and-trade regulations, and other 15-day change documents:

- Cap-and-Trade Regulations: Subchapter 10, Article 5, Subarticle 9, section 95891. Allocation for Industry Assistance, Table 9-1: Product Based Emissions Efficiency Benchmarks. Units should be changed for the benchmark in the “Plaster Board Manufacturing” activity from “Allowance / Short Ton of Plaster Board” to “Allowance / Short Ton of Stucco Used to Produce Saleable Plasterboard”.
- Appendix B: Development of Product Benchmarks for Allowance Allocation, Table B. Comparison of California and EU ETS Product Benchmarks. Units should be changed for all benchmarks (CA Imperial Units, CA SI Units, and EU ETS) in the “Plaster Board Manufacturing” activity from “…Ton of Plaster Board” to “…Ton of Stucco Used to Produce Saleable Plasterboard.” (GA2)

> **Response:** This change in the benchmark units was inadvertently left out of second 15-day changes to the regulation, but will be incorporated when we make further changes to the regulation. The units have been changed in the Mandatory Reporting Regulation, which is the basis for allocation, so the oversight will not affect the industry’s manufacturing allocation.

C-29. Comment: The base year selected by ARB should reflect both present and future production constraints. The Gypsum Association wants to ensure that the base year that the ARB selects to allocate 2013 allowances for each gypsum board manufacturing plant reflects a fair and reasonable production level. Specifically, the base year should acknowledge both the current economic recession and its impacts on the gypsum board industry and the impact on allocations that will occur when idled capacity is brought back on line at a future date. The Proposed Regulations do not appear to address this very important issue. In May of this year, The Gypsum Association submitted a chart that displays monthly shipments of gypsum board to locations in the State of California for the period 2005 to 2010. This data points out the precipitous decline in shipments in the state during the period noted and reinforces the need for ARB to be judicious when it establishes a base year for the gypsum board manufacturing facilities located in the State of California. The Gypsum Association requests further information from ARB on whether or not this base year has been determined for 2013 and would value the opportunity to enter into discussions with ARB regarding the importance of setting an achievable allocation for 2013 and years beyond. (GA2)

> **Response:** We are unclear what the commenter means with respect to determination of 2013 as a "base year." The true-up term in the allocation equation ensures allocation is based on actual production for any given year. If the level of production goes up, the amount of free allocation to the facility increases. Conversely, if production goes down, the level of free allocation decreases. We modified section 95891(b) to clarify our approach.

C-30. Comment: The Industry Assistance Factor for the Gypsum Product Manufacturing Industry in Table 8-1 should be higher. The Gypsum Association believes that the annual Industry Assistance Factor for the Gypsum Product Manufacturing (GPM) industry should be 100 percent for the entire period 2013 through 2020. It is our position that in assigning a "medium" leakage risk classification to the GPM industry the ARB has understated the risk leakage for the industry. In assigning a leakage risk classification to an industry, ARB applies a methodology that assigns equal weight to the concepts of emissions intensity and trade exposure. While we are of the opinion that the GPM industry should not be evaluated as an "emissions intense" industry, we are concerned that ARB may be understating the local trade exposure risk to the industry. Gypsum board is a consistent quality, commodity material that is often transported by rail. As a consequence, gypsum board can be produced in a specific state or country and transported over land and sold in a different state or country. While ARB is correct in its assessment that gypsum board is not readily imported from or into the State of California from locations outside of North America, it is our opinion that the Appendix K methodology and its reliance on national and regional data may be understating the potential intra-regional trade exposure for gypsum products in the State of California. Our concern is that ARB has not taken this attribute fully into account when assigning the risk leakage classification to the GPM industry. (GA2)

> **Response:** This comment falls outside the scope of the second 15-day changes to the regulation. However, we believe that we correctly classified the gypsum sector and related activities as facing a "medium" risk of leakage.

Hydrogen

Benchmark Stringency

C-31. (multiple comments)
Comment: The allocation benchmark for hydrogen produced by industrial gas manufacturers must be equitable. The allocation benchmark for hydrogen must be based on a consistent performance challenge with all other product-based benchmarks. (IGPACC2)

Comment: Air Products submitted comments to the First 15-Day Amendments to the cap and trade rule indicating the inequitable treatment that would result from a hydrogen benchmark derived from a small and biased subset (6 of 26) of the hydrogen production facilities operating in the state. CARB staff has indicated it was not able to assemble the necessary data from all these production facilities with which to derive a representative benchmark. As such, Air Products endorses CARB's decision to instead apply the EU ETS hydrogen benchmark, one that was derived from a more representative cross-section of production facility sizes, ages and efficiencies. This decision, coupled with CARB's commitment (beginning with the Second Compliance Period) to apply the refinery benchmark derived under the ETS program, provides greater assurance that the allowances allocated to hydrogen production under the program will be the same, regardless of whether the production is undertaken by a refinery or an associated independent industrial gas facility. Since the ETS hydrogen benchmark was derived from within the ETS refinery benchmark, it shares the same large (98 facilities) database from which to obtain emission intensity data and derive the performance curves which define the benchmark performance challenge. Further, adoption of the ETS refinery benchmark ensures proper treatment for refinery steam consumption, regardless of whether the steam is self-produced or imported from an independent supplier. This facilitates fair treatment when the cost of carbon is imposed on the production of imported steam. In these ways, equitable treatment is preserved, regardless of the ownership structure for the production activities (hydrogen and steam) supporting refineries. Air Products supports the joint application of the two ETS-derived benchmarks. (APC3)

Comment: The allocation benchmark for hydrogen must be based on a consistent performance challenge with all other product-based benchmarks. CARB describes the benchmark stringency criteria used for deriving product-based benchmarks from actual facility performance data in Appendix B of the First 15-Day Amendment package issued in July 2011. On page 3 of that document, CARB described a targeted level of stringency created by evaluating each industrial sector's production-weighted average emissions intensity during a historical base period and targeting the benchmark to allocate 90 percent of this level per unit product. CARB further refined this approach for sectors where the 90 percent performance challenge would set the benchmark at a level that was more stringent than the current emissions intensity of any existing Californian facility. For the sectors for which this occurs, the benchmark would be based on the "best-in-class" value. In contrast, the EU ETS benchmark process employs a benchmark stringency defined as "the average of the top 10 percent" emission intensity for production facilities in that sector. Depending on the shape of the performance curve for a particular sector, this stringency can represent various degrees of performance challenge. It is this fundamental difference in benchmark stringency criteria between the California and EU ETS programs that leads to a fairness issue in the application of the ETS hydrogen benchmark "as is" under the California program. In this instance, the "performance challenge" inherent in the ETS hydrogen benchmark is stricter than that which CARB is employing for the other product-based benchmarks under the California program. This fairness issue can be easily remedied by making an adjustment to the benchmark value to reflect a performance challenge consistent with the State's default 90 percent standard approach. Correction of the ETS hydrogen benchmark to reflect a consistent 90 percent performance challenge is straightforward. The adjustment factor is just the ratio of the two alternative performance challenges, in this case, 0.9/0.797, or a factor of 1.13. By multiplying the proposed ETS hydrogen benchmark value of 8.85 tonnes CO_2-e/tonne hydrogen by the adjustment factor, a hydrogen benchmark reflecting the states default 90 percent standard would be 9.99 tonnes CO_2-e/tonne of hydrogen. Air Products strongly recommends CARB adjust the proposed hydrogen benchmark to the 9.99 tonne CO_2-e/tonne hydrogen produced in order to provide fairness with respect to the economic impact of the cap and trade program across all California industrial sectors. Omitting such an adjustment will serve to reduce the sectors competitiveness, contrary to the intent of the industry assistance recommended under the ISOR. (APC3)

Response: We believe that benchmark stringency should reflect the emissions intensity of highly efficient, low-emitting facilities within each sector. This is equivalent to the stated policy goal of the European Union's in the Emissions Trading Scheme's benchmarking work.

Within each sector, facilities with efficiencies better than the benchmark, will be receiving more allowances than they will need, and can sell their excess allowances. Less-efficient facilities will need to purchase allowances to fulfill their compliance obligations.

We believe the hydrogen benchmarks incorporated in the cap-and-trade regulation accomplish our goal, in that there are Californian facilities with emissions intensity better than the selected benchmark value.

We recognize that there is a difference in the performance challenge created by selecting the average of the top decile (the average of the best 10 percent) as done in the EU and 90 percent of the total sector average emissions intensity. We believe the EU's approach to setting benchmark stringency is preferable when there is a robust data set for each sector.

However, the lack of robust North American data sets for all covered industries is what led us to develop the "90 percent of average or best-in-class" approach that relied heavily on California data.

Liquid Hydrogen

C-32. (multiple comments)
Comment: Liquid hydrogen should receive an independent benchmark and should be categorized as a high leakage risk. (IGPACC2)

Comment: The September 12, 2011, version of the cap-and-trade regulation purposefully established a distinction between liquefied and gaseous hydrogen products, but assigned the same benchmark value to both: 8.85 Allowances. Praxair respectfully disagrees with this position for three reasons. First, while liquefied hydrogen is a more electricity intensive product than gaseous hydrogen, there are also direct emissions attributable to the liquefaction process (i.e. converting gaseous hydrogen to liquefied hydrogen). Liquefied hydrogen plants are smaller than gaseous hydrogen plants, and as such are not as efficient as gaseous hydrogen production. Moreover, there are also inefficiencies associated with the liquefaction process and with handling liquefied hydrogen after the liquefaction process. Second, it is not clear that R.11-03-012 will be resolved in time to allow meaningful resolution for liquefied hydrogen producers. The recent Scoping Ruling in R.11-03-012 projects that a proposed decision will be available in May of 2012, but the actual release and final adoption of a proposed decision could be much later, especially given the scope of issues and controversial nature of GHG cost allocation. Meanwhile, the cap-and-trade program will effectively start when the first auction takes place in July 2012. This timeframe provides liquefied hydrogen producers with little certainty regarding how they should participate in the initial auctions. Third, R.11-03-012 will not consider cost allocation decisions by publicly owned utilities (POU). GHG cost allocations decisions are left to the discretion of the POUs, and liquefied hydrogen producers in POU service territories may never receive any rate reduction for their indirect emissions costs. In sum, Praxair believes it is not appropriate to wait to develop an accurate efficiency benchmark until R.11-03-012 is resolved. Therefore, Praxair requests that before the start of the program, CARB conduct a benchmarking study of the two facilities located in California to determine an accurate emission profile for liquid hydrogen production employing the Steam Methane Reformer (SMR) technology. (PRAXAIR3)

Comment: Praxair believes that further analysis of liquefied hydrogen production is necessary to ensure that this product not unfairly disadvantaged in relation to out-of-state competitors. Moreover, the Board’s recognition of the need for an accurate leakage risk assessment and efficiency factor for liquefied hydrogen will help preserve jobs at the two liquid hydrogen facilities in the State and in the industries that are dependent on the products availability (aerospace, biofuels, fuel cell vehicles, electronics and metals). Recognition will avoid the unintended emissions impacts from competitive product shipped into the State by truck. (PRAXAIR3)

Comment: Praxair is very concerned that the September 12, 2011, version of the cap-and-trade regulation does not recognize the unique leakage risk for liquid hydrogen production. Liquefied hydrogen should be characterized as a high leakage risk because the liquefaction process can be replicated in states or countries adjacent to California, liquefied hydrogen is readily transportable across California's borders, and out-of-state liquefied hydrogen producers will not be subject to a GHG emissions obligations. To avoid the detrimental impact to in-state employment, Praxair requests that CARB re-evaluate the leakage risk for liquefied hydrogen production. Specifically, Praxair requests that the Board's resolutions specifically acknowledge that liquid hydrogen production be viewed differently from production of gaseous hydrogen in terms of allocation and leakage risk. (PRAXAIR3)

Comment: Liquid hydrogen is a different product from the gaseous hydrogen used in refining applications. While both liquid and gaseous hydrogen are very energy (and emission) intensive, liquid hydrogen serves different end-markets, is easily transported and is subject to trade (currently, primarily exports) between California and other non-WCI states and provinces not subject to a comparable cost of carbon. If CARB were to apply the energy/emissions intensity and trade exposure analysis intended under Appendix K of the December 2010 Proposed Rule, we believe the analysis will yield a leakage risk aligned with those industry sectors currently designated as high risk, rather than the medium risk CARB has proposed for liquid hydrogen. (APC3)

> **Response:** We recognize that purchased electricity used in the production of liquid hydrogen could potentially create indirect carbon costs. We will revisit the issue of carbon costs embedded in purchased electricity once the California Public Utilities Commission Proceeding addressing utility costs and revenue issues associated with greenhouse gas emissions (R.11-03-012) concludes. We will also evaluate the carbon costs faced in publicly owned utility service territories once the governing boards of these utilities determine how carbon pricing will impact industrial electricity rates.
>
> In developing the product benchmarks, we avoid differentiating by technology, fuel mix, size and age of the facility, climatic circumstances, or raw material quality wherever possible. This allows all methods of greenhouse gas abatement to remain available to the covered entities. Therefore, we do not agree that a smaller hydrogen production facility deserves a more generous benchmark based solely on the size of the facility.
>
> We look forward to continued dialogue with stakeholders relating to the leakage risk associated with the market for liquid hydrogen. We will continue to evaluate this issue and will recommend appropriate changes, as necessary, to the assigned leakage risk in a future rulemaking.

Feedstocks Used for Hydrogen Production

C-33. Comment: CARB has proposed allocating allowances for gaseous and liquid hydrogen production based on a benchmark of 8.85 allowances per metric ton of hydrogen gas. The proposed benchmark is based on the benchmark for hydrogen production adopted under the European Union (EU) Emissions Trading System. The proposed benchmark, does not account for the carbon content of the different feedstocks used in hydrogen production, which may be either refinery fuel gas or natural gas. Air Liquide is not opposed to CARB's reliance on the EU benchmark in this phase of the regulatory process, but it should be adjusted to account for the feedstocks used by particular facilities. Many hydrogen production facilities use natural gas as a feedstock. However, in California, some hydrogen producers, including Air Liquide, use refinery fuel gas as a feedstock. Refinery fuel gas has higher carbon content and creates greater emissions than natural gas when used as a feedstock, but the use of refinery fuel gas in the hydrogen production process actually generates lower overall CO_2 emissions because the refinery fuel gas would otherwise be flared and burned by the refinery. The use of refinery fuel gas also avoids the emissions associated with extracting, purifying and transporting natural gas to the hydrogen plant, as the refinery fuel gas is a by-product of the petroleum refining process. A hydrogen plant's productive use of refinery fuel gas that would otherwise be flared is therefore environmentally beneficial, and should not be discouraged. Unless CARB addresses the differing feedstocks used by California hydrogen production facilities, market distortions will result. Again, there is a simple solution that will encourage the use of refinery fuel gas, with its attendant benefits, and will avoid market distortions. Air Liquide requests that the Board direct staff to develop adjustments to the hydrogen production benchmark that address the feedstock used by the producer. For hydrogen plants that use natural gas as a feedstock, the proposed benchmark is appropriate. For hydrogen plants that use refinery fuel gas, an adjustment factor for the benchmark that accounts for the greater carbon content of refinery fuel gas should be developed. Air Liquide would be pleased to work with CARB staff to develop such an adjustment factor. (ALLI2)

> **Response:** In developing the product benchmarks, we avoid differentiating by technology, fuel mix, size and age of the facility, climatic circumstances, or raw material quality wherever possible. This allows all methods of greenhouse gas abatement to remain available to the covered entities. As the commenter notes, the choice of refinery fuel gas is a more greenhouse gas-intensive feedstock when compared to the use of natural gas in the production of hydrogen. We do not wish to incentivize a switch to this feedstock so we did not differentiate the feedstock based on feedstock type.

Natural Gas

C-34. Comment: Section 95870(d)(2) and 95890(c) should be included and not deleted. Since ARB has not yet decided how to allocate allowances to natural gas utilities for the protection of their small customers as evidenced by section 95893 being "Reserved for Allocation to Natural Gas Distribution Utilities for Protection of Natural Gas Customers," it is premature to delete sections that support an allocation to natural gas utilities on behalf of their customers. SoCalGas and SDG&E reiterate their position that ARB should allocate a significant percent of the sector emissions to gas local distribution companies (LDC) for the benefit of their customers when the sector enters the cap-and-trade in 2015. Such an allocation will protect low income customers and small business, will avoid double payment by LDC customers for energy efficiency and research and development programs, and will avoid rate shock. Gas LDCs are rate regulated in such a manner that allowance value can be designated for the benefit of the small natural gas consumers who face the incidence of the carbon price. ARB should retain sections reserved for an allocation to natural gas utilities until ARB has adequately considered the issue, just as it has done in Section 95893. Modify section 95870(d)(2) as follows:

> <u>(2) Reserved for Natural Gas Distribution Utilities.</u> (SEMPRA4)
>
> **Response:** We did not add the language requested by the commenter. However, as indicated in the Staff Report and Board Resolutions 10-42 and 11-32, we are continuing to evaluate all proposals presented. We will initiate a public process to determine how, and if, allowances should be allocated for natural gas distribution utilities, prior to coverage of the sector beginning in 2015. We note the importance of transparent price signals for fuel consumers in achieving reductions in this sector.

Oil and Gas

C-35. (multiple comments)
Comment: WSPA appreciates ARB's replacement of the heavy oil/light oil approach used in the prior 15-day change package with a thermal/non-thermal approach. However, several serious concerns still remain:

- The proposed oil and gas extraction sector benchmarks (0.0816 for thermal and 0.0082 for non-thermal) are derived from a process that remains undocumented by ARB and thus unsubstantiated to upstream producers. There has been no published protocol or methodology describing how the benchmarking calculations were performed. Further, no data, calculations or other information used to derive the benchmarks have been published. This lack of transparency has made it impossible for upstream oil and gas producers to examine the approach, to duplicate benchmark results or validate the ultimate conclusions.
- ARB has indicated that the benchmarks are based on data from MRR reports and a voluntary 2007 survey. However, the 2007 data has not been subject to any form of validation/verification, and would not meet verification protocols that are required for MRR data.
- EPA's 40 CFR Part 98, Subpart W language, which has been included into MRR, will require reporting emissions from equipment types that were not included in ARB's upstream oil & gas extraction sector benchmark calculations. ARB has not addressed this inequity.
- The data ARB used to determine the oil and gas production benchmarks failed to incorporate indirect GHG emissions, e.g., those emissions associated with electricity and heat used/produced in the production process. For California oil and gas producers, electricity and heat consumed in oil and gas production can vary widely, and for some facilities represents a significant portion of energy consumed. The lack of appropriate consideration in the calculated benchmarks represents a systemic error in ARB's approach. This error will likely have

significant impact when allowances are allocated, which will likely create an incentive for companies to favor purchasing power from the grid and/or outsourcing thermal purchases.

WSPA recommends that ARB work with industry to ensure the appropriateness and accuracy of the petroleum and natural gas sector benchmark values through confirmation of the reported and verified data and the calculation methodologies. (WSPA4)

Comment: Other than the initial guidelines on how sector benchmarking would identify allowance allocation to various industries, CARB staff has not provided information on the individual protocols. For example, the proposed oil and gas extraction benchmarks (0.0816 for thermal and 0.0082 for non-thermal) are derived from a process that remains a “black box” to the regulated community. The generation of these benchmark values cannot be duplicated by the public sector. The methods and protocols used by CARB staff should undergo the same scrutiny and verification that all of industry is required to follow for reporting emissions. (CIPA2)

Comment: ARB's September 12 changes contain the second set of changes to benchmark values since July 2011, leaving little time to analyze and understand how these evolving benchmarks were derived. Occidental has not been able to confirm that the recent changes to the benchmarks are based on a complete and accurate representation of any of its facilities' greenhouse gas emissions. Occidental's facilities are complex and the Cap and Trade rule is not sufficiently definite to determine whether ARB segmented comparable Occidental facilities based on appropriate consideration of key operational parameters. The process used by ARB staff to develop the benchmarks has not yet fully demonstrated adherence to fundamental principles of equity, transparency and reproducibility, and has not shown that it fulfills ARB's objective of minimizing leakage. The proposed benchmarks are derived in a way that remains a "black box" to upstream producers. There has been no published protocol or methodology describing how staff performed the benchmarking calculations. Further, essentially no data, calculations or other information used to derive the benchmarks have been published by ARB staff. This lack of transparency has made it impossible for Occidental and other upstream oil and gas producers to examine the approach taken by Staff, to duplicate benchmark results or validate Staff conclusions. Further, ARB Staff has indicated that the benchmarks are based on data from California's regulation for greenhouse gas emissions reporting (MRR) and a voluntary 2007 survey. However, the 2007 data have not been subject to any form of validation/verification, and would certainly not meet verification protocols that are required for MRR data. Occidental believes that the benchmarks should be based on the most recent verified MRR data. (OPC3)

Comment: The unverified data CARB used to determine the oil & gas production benchmarks did not incorporate indirect GHG emissions, e.g., emissions associated with electricity and heat used/produced in the production process. For California oil & gas producers, the electricity and heat consumed in their operations can vary widely.

For some facilities this represents a significant portion of energy used. Not considering this energy consumption in the calculated benchmarks is a gross error in ARB's approach and will skew the allocation with harmful economic repercussions. This error will have significant impact on how allowances are allocated. In fact, ARB currently is allocating no allowances to Cogeneration facilities in California and the indirect energy use for some of these facilities represents most of their GHG emissions. Coupled with the "haircut", there will be operators who fold because their margins will not support these increased costs and there is no opportunity to pass the costs along. This inequity must be corrected. (CIPA2)

Comment: We appreciate that ARB has adopted an energy based upstream benchmark that recognizes California's unique oil and gas resources. However, since much of the rulemaking and public participation was delayed in 2011, it is not clear how the actual calculations were performed. Since benchmarking data were gathered before verified data collection was completed, and because the benchmark is an average of industry information, it is impossible to reproduce the data and the table in the rulemaking. We understand that ARB is willing to work with stakeholders to ensure that the benchmark, as well as the assumptions behind the supporting data, are both consistent and correct, and we look forward to working with ARB on this issue. (CHEVRON4)

Comment: The data ARB used to determine the oil & gas production benchmarks failed to incorporate indirect GHG emissions, e.g., those emissions associated with purchased electricity and heat used/produced in the production process. The lack of appropriate consideration in the calculated benchmarks of the differences in the way electricity is used and produced between California oil and gas facilities represents an important, systemic error in ARB's approach. ARB's failure to capture in the benchmarks the full GHG emissions burden for equipment powered by electricity purchased from outside a facility creates an arbitrary bias against any facility using electric equipment powered by electricity generated on-site. This error will likely have significant impact in how allowances are allocated, creating an incentive for companies to shut-down on-site electricity generating units (even those operating at marginal heat rates equivalent to that of a state-of-the-art combined cycle gas turbine facility) in favor of purchasing power from the grid and/or outsourcing thermal purchases . Benefits provided by on-site generation include reduced GHG emissions resulting from lower effective heat rates (generation efficiency), reduced transmission losses, increased electric system resource adequacy, and reduced spinning reserve and peaking capacity requirements. In short, ARB's failure to develop an accurate benchmark—one that reflects both direct emissions and those emissions associated with grid-sourced electricity—will likely spur more imports of out-of-state electricity, place additional load on the state's transmission system and will not result in any greenhouse emissions reductions. Certainly, this cannot reflect the intent of ARB. EPA's 40 CFR Part 98, Subpart W rule for GHG reporting from upstream petroleum and natural gas systems, which has been incorporated into ARB's GHG emissions reporting rule, will require reporting emissions from more equipment types and use a facility definition that that was not included in ARB's upstream oil & gas extraction sector benchmark calculations.

The consequences of these inconsistencies and the impact of the significantly expanded geographical scope in the EPA Subpart W facility definition have not been thoroughly addressed by staff during the rulemaking process. These reporting anomalies will compound the errors in the 2007 voluntary reporting data and the other benchmarking issues noted above. Occidental alone, and as a member of the Western States Petroleum Association (WSPA) and the Energy Producers and Users Coalition (EPUC), has met several times with ARB staff to address specific concerns and propose approaches to resolve these matters. For additional information, Occidental references and incorporates herein its earlier comments (dated November 15, 2010, December 15, 2010 and August 11, 2011), and supports and incorporates herein the related comments submitted by WSPA and EPUC in response to the 15-day changes issued July 25 and 27, 2011 under the cap and trade rulemaking. Occidental recommends that ARB staff work with the oil and gas industry to ensure the appropriateness and accuracy of the sector benchmark values through confirmation of the reported and verified data and the calculation methodologies. (OPC3)

Response: Multiple commenters state that the benchmarks did not incorporate indirect GHG emissions. This is not correct. As explained in Appendix B to the first 15-day changes to the regulation, the product benchmarks account for indirect carbon costs (generated due to indirect emissions). Adjustment factors were used to account for the indirect carbon costs embedded in heat purchased or sold and electricity sold. An adjustment factor was not made for power purchased in establishing the product-based benchmarks. This is because purchased power from a utility may not create an indirect carbon cost in all California utility service territories. It is ARB's goal to see a carbon price properly embedded in all utility rates. We will revisit this issue after the CPUC proceeding R.11-03-012 concludes.

We will continue to work with the CPUC and stakeholders to ensure that the cap-and-trade carbon pricing creates the correct incentives for efficient combined heat and power. We disagree that there is "no opportunity to pass the costs along" in the price of heat or power sold from these facilities. The Qualifying Facilities and Combined Heat and Power Settlement will guarantee some level of carbon cost pass-through for many combined heat and power facilities.

We recognize concerns about the transparency of benchmark development. However, production data and energy purchases and sales information for each facility were collected in a confidential fashion. Because we cannot share data submitted confidentially, we cannot publish the full benchmarking calculations.

We believe we have provided sufficient detail regarding our benchmarking approach in the Staff Report and Appendix B to the first 15-day changes to the regulation, as well as through continued dialogue with stakeholders, to provide an understanding of the results of our analysis. Further, publication of this type of data could lead to a variety of market manipulations.

We disagree that the additional emissions captured by the move to U.S. EPA Subpart W coverage for the sector will significantly change the benchmark values. However, we will continue to work with the oil and gas industry to ensure the appropriateness and accuracy of the sector benchmark values through future rulemakings as needed.

C-36. (multiple comments)
Comment: The latest regulation modification has further loosened requirements for oil drilling (extraction). It provides more lax requirements for the most intensive oil drilling operations, which effectively subsidizes and encourages these practices. Wilmington California, already the location of severely concentrated pollution sources, is also the third biggest oil field in the U.S. The cap and trade regulation provides such practices as 100 percent free allocations throughout the entire cap and trade program through 2020. It also provides more credits to higher polluting practices compared to other types of drilling (for example, Table 9-1 now allows thermal drilling ten times the allowances/barrel compared to non-thermal drilling). This type of thermal extraction that is being encouraged and subsidized by the cap and trade regulation, provides extra, and free allocations. CARB should absolutely remove the free, and increased allocations that are present at 100 percent throughout the entire cap and trade program to 2020. The most intensive practices, located in the most polluted communities, which are low-income communities and communities of color, will receive the greatest subsidies to pollute. This is environmental racism and violates California law. Oil drilling in Wilmington is a perfect example of operations that cause CO_2 emissions where CARB has the ability to reduce co-pollutant emissions, especially those not addressed by local regulators. Instead, CARB is allowing these operations extra and free credits for these polluting operations. CARB must evaluate the impacts of the ten times higher allocations for the most polluting practices. (CBE3)

Comment: CARB has revised an initial proposal to grant allocations based on crude type to, instead, proposed benchmarks with an almost 10 fold increase for producers that use a highly carbon and emissions intensive production process, steam injection, compared to less carbon and emissions intensive production processes of air and water injection or primary production. There is no justification for this perverse incentive to increase emissions, which conflicts with the goals of AB 32 to reduce GHG emissions and associated criteria pollutant emissions and transition industry to cleaner alternatives. In addition, this incentive would almost entirely benefit heavy crude oil with higher refining criteria and GHG emissions as noted earlier. Finally, the proposal would be difficult to implement due to questions about which underground crude oil production zones are subject to the influence of underground steam injection wells. Of greatest concern, a more generous benchmark for the carbon intense use of steam could lead to increased use of steam, particularly in wells that are not steamed presently, in order to qualify for the nearly 10 times higher level of free allowances. The best approach is a flat benchmark of 5 grams CO_2/MJ (or 0.020 to 0.025 allowances/barrel), with bonuses available to companies that implement advanced technology such as solar steam production. While we prefer a single process-neutral benchmark for this sector, the original proposal of lower subsidies for light oil and higher subsidies for more carbon intensive heavy crude is more appropriate than the current proposal to scale up free GHG allowances based on the carbon intensity of the production process. CARB should allocate allowances based on a flat benchmark of 5 g/MJ, and commence the necessary technical studies to reassess the leakage risk for domestic captive producers of petroleum output. (KUSTIN18)

> **Response:** As noted in Appendix J to the Staff Report, although ARB prefers to apply a “one product, one benchmark” principle, an exception was made for oil extraction because non-thermal alternative techniques are not usually substitutable in the wells where thermal enhanced oil recovery (EOR) is applied.
>
> We disagree that this approach creates a subsidy for more emission intensive processes. As the commenter notes, solar thermal extraction techniques are under development. These techniques produce steam to extract oil that requires thermally enhanced EOR with a much lower greenhouse gas footprint. This extraction technology will be heavily incentivized under the current benchmarking approach.
>
> We do not believe the allocation approach provides “100 percent free allocations throughout the entire cap and trade program through 2020.” Rather, we begin with ambitious benchmarks that reward only the current best performers. The allocation per barrel then declines approximately two percent per year due to the cap adjustment factor found in Table 9-2.
>
> We will continue to monitor emissions leakage risk for the oil and gas sector in the context of an evolving global climate change policy framework.

Paper

C-37. Comment: CARB is proposing to use product based benchmarks as the basis of allowance allocations for the Paperboard sector. As discussed in the comments submitted by AF&PA on December 14, 2010, an industry-wide analysis of pulp and paper manufacturing showed no correlation between greenhouse gas emissions and product type; therefore, we support the use of actual emissions as the basis of allowance allocations. (TI2)

> **Response:** This comment falls outside the scope of the second 15-day changes to the regulation; therefore, no further response is needed. Please refer to the response in Chapter III, starting with Comment C-80.

C-38. (multiple comments)
Comment: CARB established product benchmarks for both products made at the Ontario Mill, linerboard and medium. Since the sample size for these two products (one and two mills, respectively) is so small, we do not believe it is appropriate to establish product based benchmarks, instead it would be more accurate to use actual emissions for allowance allocations. (TI2)

Comment: CARB used data from the Ontario Mill to establish product benchmarks even though the April 2011 decision on the European Union's Emissions Trading Scheme (EU ETS) for the paperboard sector states that it is not feasible to assign GHG emissions to individual products using data from mills where multiple products are produced. Since the Ontario Mill is the only producer of linerboard, there would be no valid data to support a product based benchmark for this activity and actual emissions should be used. (TI2)

> **Response:** We believe it is consistent with the goal of AB 32 to include as many industrial activities as possible under product-based benchmark to minimize leakage. Under the product-based approach free allocation is based on product level that will be updated annually to ensure that the compensation is provided as production increases. We disagree that historical emissions would form a better basis for allowance allocation. Allocating based solely on historical emission levels does not create the proper incentives to minimize leakage.
>
> For the sectors for which there are only two facilities, the best facility's historical performance level is considered to be "best in class." At this point, we are not aware of any robust national emissions intensity data set available for the paper sector. The lack of robust North American data sets for all covered industries is what led us to rely heavily on California data. We will continue to evaluate benchmark stringency across all sectors and may propose changes in future rulemakings should sufficient high-quality data sets develop.

C-39. Comment: CARB developed and revised the product benchmarks for the Paperboard sector without providing any supporting documentation in the proposed rulemaking; therefore, we do not have sufficient information to provide specific comments on the numerical values themselves. (TI2)

> **Response:** We recognize concerns about the transparency of benchmark development. However, production data, energy purchases, and sales information for each facility were collected in a confidential fashion. Because we cannot share data submitted confidentially, we cannot publish the full benchmarking calculations.
>
> We believe that we have provided sufficient detail regarding our benchmarking approach in the Staff Report and Appendix B to the first 15-day changes to the regulation, as well as through continued dialogue with stakeholders, to provide an understanding of the results of our analysis.

C-40. Comment: We are pleased that CARB is proposing modifications which clarify the definition of Tissue manufacturing and the products included therein. We are also pleased that CARB staff acknowledges that individual facilities may produce multiple products which span various industrial sectors and activities, and as such have provided their inclusion in the Industry Allowance Allocation methodology. Additionally, we are pleased that CARB staff has been receptive to industry input which clarifies that paper products manufacturing employs differing production technology and that there are distinctions between conventional and Through-Air Drying (TAD) paper making processes. (PGPPC2)

Response: Thank you for your support.

C-41. Comment: We are deeply concerned with staff's conclusion that tissue produced from TAD and conventional paper making have a reasonably comparable functionality. We believe that these technologies produce substantially different products. As previously communicated, we agree that CARB should assign emissions intensity benchmarks based on different products between or within industrial facilities. As such, we respectfully urge CARB to recognize the functionality differences between TAD and conventional tissues and thus appropriately assign different emissions intensity benchmarks for each. At a minimum we encourage CARB to define what constitutes sufficiently different product functionality such that presumably similar products can be evaluated to determine if different benchmarks should be applied to each. We continue to believe that our Oxnard facility should be assigned an allowance emissions intensity product benchmark unique to Through Air Drying tissue manufacturing. (PGPPC2)

Response: We worked with stakeholders to assess different technologies used to manufacture tissue (e.g., conventional and through-air drying (TAD) processes), and found that final products that use TAD are lighter, fluffier, and more absorbent. However, the functionality of the product is still the same despite these differences. Therefore, we believe that it makes sense to group tissue products, regardless of the technology. We intend to continue working on the tissue sector to further investigate this issue.

Refineries

C-42. Comment: The change to oil refinery benchmarks in the latest cap and trade regulation modifications allows increased emissions from oil refineries, which is are the largest industrial source of GHGs in California and in the cap and trade program. This sector is also is a major emitter of toxic emissions and smog precursors, and located mostly in low income communities of color. Cap and trade is squandering the opportunity of AB 32 to clean up this industry. Moreover, because the credits would be mostly given away for free, the regulation would both increase the current massive, record-breaking profits for this sector and also fail to force or even encourage emission reductions. (CBE3)

Response: We disagree. The cap-and-trade program will provide a robust incentive for greenhouse gas emission reductions in the refining sector. During the regulatory development process, we also evaluated the potential for localized increases in co-pollutant emissions in impacted communities due to a cap-and-trade program to the best of our ability. The findings of this analysis can be found in the *Staff Report: Initial Statement of Reasons* and its Appendix P: Co-Pollutant Emissions Assessment. Since the distribution of changes in co-pollutant emissions resulting from the cap-and-trade program are dependent on how individual facilities choose to comply with the program, we evaluated how co-pollutant emissions could change in three hypothetical scenarios within four environmental justice communities—Wilmington, Oildale/Bakersfield, Richmond, and Apple Valley/Oro Grande. Under the three hypothetical scenarios, we found that co-pollutant emissions could, in the absence of district permits and existing controls, increase or decrease a very small amount. However, most compliance approaches are expected to result in a reduction in co-pollutants through increased efficiency and decreased combustion of fossil fuel. It is important to note that the mere presence of a cap-and-trade program for greenhouse gas emissions will not weaken or reduce facility specific requirements or permits for co-pollutants. All facilities will continue to be subject to existing local ordinances and rules.

C-43. Comment: ConocoPhillips supports ARB's proposal for New Entrants. There is no definition of New Entrants provided in the definitions section of the regulation. We will assume that this also applies to very significant expansions of a facility that have or will require CEQA review and exceed a significant threshold that is considered and approved by the Executive Officer. For the refining sector, ConocoPhillips recommends a threshold of 10 percent increase in clean product volume (gasoline, diesel, jet fuel) or a 10 percent increase in crude capacity. WSPA has also presented a similar recommendation to ARB staff. (CONOCO3)

Response: We thank you for your support. However, we do not agree with your interpretation of the term "new entrants" to be inclusive of facility expansions. We did not add an expansion threshold to the first period refining allocation approach. The CWT approach used in the second and third compliance period recognizes facility expansion due to updated measurement of facility throughput.

C-44. Comment: Among the various modifications made to the proposed regulation was a dramatic change in the methodology for distribution of allowances to individual facilities in the refining sector. This change in methodology provides a significant departure from the previously proposed "Simple Barrel" approach. WIRA believes that the Simple Barrel approach recognized those facilities which produced refined product with the lowest GHG per unit volume and that that approach should have been kept in the regulation. But WIRA also understands CARB staff's view that the diverse and individualized nature of the refining industry does not lend itself to a single, simple output-based benchmark. As such, the newly proposed allocation methodology for the first compliance period appropriately bifurcates the refining sector by the complexity level of the affected facilities. This two-tier approach prevents the smaller, less capitalized refiners from being disadvantaged through the use of an allocation methodology metric not based on GHG efficiency. The new First Compliance Period methodology for smaller, less complex refiners is outlined in section 95891(d)(1). These equations provide California's smaller refiners with the basic assistance necessary to transition into this new program. WIRA supports the regulatory requirement for the Executive Officer to determine the representativeness of a facility's baselines and/or EII prior to allowance allocation. This determination is a key component of the two-tier system. Inclusion of WIRA members into an EII approach sponsored by the Western States Petroleum Association (WSPA) would have been inappropriate and would have placed an artificial competitive disadvantage on them. (WIRA4)

> **Response:** We thank you for your support. Simple refineries that do not have an EII value or those without a representative EII value as determined by the Executive Officer are allocated to using the "simple barrel" product benchmark proposed in the first 15-day changes to the regulation for the first compliance period. The value for this simple benchmark was updated from 0.0465 allowances/barrel of primary refinery products to 0.0462 allowances/barrel. This change was made to reflect additional data provided by covered refineries and the inclusion of 2010 data in the development of the benchmark. A limit on the amount of allowances that a facility can receive was imposed based on historical emission levels, consistent with stakeholder comments. This approach will prevent a facility from receiving excessive rewards due to free allocation under the simple barrel metric.

C-45. Comment: A key aspect in determining allocation levels for both the refining sector and individual non-EII refiners is the definition of a primary refinery product. This definition is used to establish the sector benchmark, and this benchmark has been adjusted in these revisions. CARB staff acknowledges in Appendix A (footnote #2) that the dataset for establishing the sector benchmark will be monitored and could be changed as needed. WIRA recommends that additional analysis be conducted regarding inclusion of bunker fuel for large oceangoing vessels into the definition of a Primary Refinery Product. (WIRA4)

> **Response:** We do not currently believe that bunker fuel represents a primary refinery product that is in need of free allocation to prevent leakage risk. However, beginning with the 2011 data year, ARB will collect detailed, third-party verified, refinery product data as part of the effort to monitor for emissions leakage in this sector. We will monitor the production of bunker fuel in the state using this data set and consider changes to free allocation as needed to address any potential leakage issues.

Leakage Risk

C-46. (multiple comments)
Comment: CARB is overestimating the likelihood of leakage risk, especially in the refining sector, and this is resulting in the subsidization (via free allocations) of carbon intensive industries. There are significant costs from the free allocation of valuable allowances since these public monies could instead be spent on lowering the costs of the cap-and-trade program. A reassessment of leakage risk must be undertaken to

take into account transportation costs and the ability of non-Californian companies to compete with California producers. As the Economic and Allocation Advisory Committee (EAAC) report suggests leakage concerns are very unlikely to occur unless carbon prices reach over $50/ton. In addition, subsidies for carbon intensive products and processes are a barrier to cleaner alternatives. CARB should redo the leakage risk analysis to fully consider the cost differential between imports and California production, the barriers to entry such as California specific requirements and transportation costs. This should be completed before the second compliance period. (KUSTIN18)

Comment: For the refining sector in particular, UCS is concerned that CARB has overestimated the likelihood of leakage risk, and this will result in subsidizing these carbon intensive facilities. We reiterate the need for a re-assessment of the leakage analysis to fully account for transportation costs and competitiveness of non-Californian products. We strongly support CARB's use of the simple barrel output based method (Appendix A, page 2) for the allocation of allowances for the refining sector as a whole in the first compliance period, and a move to full auctioning in the second and third compliance periods with rebates for investments in targeted carbon reduction technologies. (UCS8)

Comment: We are concerned about the changes in leakage assessment for certain categories of products with no explanation or supporting documentation. UCS feels that CARB is overestimating the likelihood of leakage risk, especially in the refining sector, and this will result in subsidizing (via free allocations) carbon-intensive industries. There are significant costs from the free allocation of valuable allowances. If auctioned as we recommend, these allowances could produce public monies rather than private assets and could be spent on lowering the costs of the cap-and-trade program. A reassessment of leakage risk is needed and should include transportation costs and the ability of non-Californian companies to compete with California producers, resulting in a more accurate assessment of actual risk. Imports of refined oil products are not competitive with domestically produced products because of transportation costs into California and the costs of adapting facilities to meet California's stringent fuel standards. Neither of these factors were analyzed when CARB assessed leakage risk for the refining sector. A reassessment of leakage risk categories should be done once this important research work is complete. Leakage risk analysis, especially for the refining sector, needs to fully consider the cost differential between imports and California production. This analysis should be completed before the start of the second compliance period. (UCS8)

Comment: The California refining industry is heavily exposed to leakage and should be classified as a High Energy Intensity Trade Exposed Industry, and not as a Moderately Trade Exposed Industry. Refined products can enter the state from refineries in other states and international sources. (TESORO3)

> **Response:** We will continue to monitor leakage risk of the petroleum refining sector in the context of an evolving global climate change policy framework. We agree that additional analysis could help further clarify the barriers to imports

created by transportation costs and California specifications for transportation fuels. We look forward to further dialogue with stakeholders on this issue.

Baseline Year

C-47. Comment: The proposed regulation uses the period 2008-2010 to determine sector quantity. However, ARB proposes to use 2008 year emissions to determine the sector quantity for other sectors including utilities. WSPA recommends that the 2008 year be used to determine sector quantity for all sectors in the cap and trade program. (WSPA4)

Response: We believe that the emissions data collected for the period 2008-2010 through our mandatory reporting program for greenhouse gases is accurate and representative for the refining sector. Therefore, we used these emissions data and product data from a similar period in calculating the sector-level benchmark in the first compliance period. We note that WSPA's current position on this issue has shifted, and that they originally proposed the use of 2006-2010 data for this purpose. We did not believe that we had accurate emissions data for all California refineries for the 2006 and 2007 data years, so we did not use these years in developing the benchmark for sector allocation.

However, for the EII allocation method of the first compliance period, we note that we will still consider 2006 and 2007 data from individual refiners, provided the data are representative, accurate and third-party verified.

Benchmark Stringency

C-48. Comment: We understand that ARB wishes to lead other jurisdictions to reduce greenhouse gases and that it also wants to reward companies for doing business in California in order to avoid leakage. However, rushing into an overly stringent program too early may work against both of these goals. It is widely understood that it takes time, often several years, to make physical and equipment changes in industrial operations in California due to permitting and public review processes, both of which will be required before any significant actual emission reductions can be achieved. Consequently, companies will not be able to make emission reductions quickly and will have to rely on offsets and allowances in the short term. The cap and trade program provides flexible options to minimize the cost. This is the most important strength of a market mechanism. The current benchmarks/hard start will result in significantly higher prices for both allowances and offsets because companies will need time to develop and implement less expensive emission reductions. These high prices will create further competitive disadvantages for California companies compared to their out-of-state competitors. This, in turn, will discourage other states and provinces from adopting a similar program, decreasing the likelihood of linking to them. The result is a growing negative impact on the California trade-exposed companies who remain in the state. A slow transition period that increases the benchmarks in the second and third compliance periods over the duration of the program would allow for both a reasonable economic transition and the development of a robust offset supply and cost-effective emission reduction investments. (CHEVRON4)

> **Response:** We disagree with the characterization of our initial benchmarks as a "hard start" that will raise allowance prices. The prices of allowances and offsets are set by the total aggregate supply of these instruments and the demand to emit. We carefully considered these factors in setting the aggregate cap (allowance budget) levels. The level of free allocation to an individual entity does not impact the price of these instruments. We believe our allocation approach is sufficient to minimize leakage from all emissions intensive and trade-exposed sectors.

C-49. (multiple comments)
Comment: Tesoro favors a benchmark that strongly considers baseline emissions for each refinery, and considers an indicator of energy efficiency, but tempers the results such that differences between refineries are reasonable relative to opportunities for improvement. We believe that the WSPA proposal met these objectives, but the stringency of the ARB benchmark has eliminated the effectiveness of the tempering factor. By reducing the stringency of the benchmark, the tempering could be restored and the allocation methodology would meet ARB's primary objective of setting a correct incentive for the initial period and allowing the program to start with minimal interruptions. (TESORO3)

Comment: One element that ARB has not accepted is the need to temper the influence of calculated refinery efficiency. Figure 2, of Appendix A to 2nd 15-day Cap-and-Trade Regulatory Text: Refinery Allocation Methodology illustrated a roughly 25 percent difference in allocation among members of the sector. As discussed in the following paragraph, this difference is 3 to 5 times too large. The WSPA methodology included a tempering factor, limited to zero or a positive number to reduce the impact of the raw calculated efficiency. But this tempering factor disappears, and likely become negative as applied by ARB in conjunction with the stringent treatment of the benchmark. As a minimum, Tesoro recommends that the Adjt factor as described in the following equation from section 95891 (d)(2)(A), be limited to a positive number:

Adjt=((Avg/EII Best)*Ft-1)/(1 Ft) (TESORO3)

> **Response:** We disagree. Our current approach already significantly reduces the spread between the best and the worst facilities relative to our initial simple barrel proposal. As shown in Appendix A to the second 15-say changes to the regulation, the best performers in the state have taken a reduced allocation to support additional allocation to the worst performers. We believe this level of "tempering" is sufficient to address concerns about intra-sector equity and the change to the current competitive playing field between California refineries.
>
> Board Resolution 11-32 directs the Executive Officer to continue to review information concerning the emissions intensity, trade exposure, and in-state

competition of industries in California and to recommend to the Board changes, if needed.

C-50. Comment: Amend the refinery benchmarking methodology to recognize new cuts in allowances. ConocoPhillips conditionally supports the proposal advanced by WSPA. ConocoPhillips offers only conditional support because the WSPA methodology, as proposed to ARB for the first compliance period, was constructed and negotiated by WSPA members before ARB's addition of the 10 percent cut. It assumed that the cut in free allowances would be in the range of ARB's stated 2012-2014 cap reduction of 3.7 percent. The much larger and additional 10 percent cut in allowances described makes the model operate in ranges that it was not designed for. This creates very large competitive differences of up to 20 percent or more in allowances provided to individual refineries. These misaligned competitive differences not only create severe competitive inequities between California refineries but also impose costs that are not placed on importing refineries as described above. Consequences unintended by ARB will most likely occur with the large disparities between in-state refiners and with international refineries created by this added burden. If CARB proceeds with the additional 10 percent cut in initial allowances, ARB and WSPA should again work cooperatively to further refine the EII-based methodology to address the new competitive concerns.

Further, ConocoPhillips strongly disagrees with ARB's statement in Appendix A that this methodology "should address concerns expressed by refinery stakeholders about transition risk and short-term competition issues between in-state refining facilities." The 20 percent difference in allowances shown in Figure 2 of Appendix A does not at all address short-term competition issues. Further, Figure 3 can be misleading in that it assumes that every California refinery will be able to secure the full 8 percent of allowable offsets during the first Compliance period that starts in only 15 months. (CONOCO3)

Response: We do not agree. We believe that benchmark stringency should reflect the emissions intensity of highly efficient, low-emitting facilities within each sector.

We strongly disagree with comments that characterize the approach to benchmark stringency as unexpected. The use of "90 percent of average" stringency for product-based emissions efficiency benchmark was initially indicated in the Staff Report released in October 2010. The following is a quote from page J-35 of that document:

"Staff believes benchmark stringency should reflect the emissions intensity of highly efficient, low-emitting facilities within each sector. Staff's current thinking is that the targeted level of stringency would be created by evaluating each industrial sector's emissions intensity during a historical base period and targeting the benchmark to allocate 90 percent of this level per unit product."

We developed this approach to benchmark stringency after careful analysis of California emissions intensity data and approaches used in other successful cap-and-trade programs. In selecting benchmark stringency, we are balancing the need to provide adequate transition assistance and minimize leakage with the necessity to meet AB 32's emission-reduction goals and prevent windfall profits through excessive free allocation.

Our current approach already significantly reduces the spread between the best and the worst facilities relative to our initial simple barrel proposal. As shown in Appendix A to the second 15-day changes to the regulation, the best performers in the state have taken a reduced allocation to support additional allocation to the worst performers. We believe this level of "tempering" is sufficient to address concerns about intra-sector equity and the change to the current competitive playing field between California refineries.

We believe sufficient offset supply will be available to meet the demand for offsets in the first compliance period. We are considering additional protocols to take advantage of low-cost greenhouse gas reductions from non-capped sources and increase offset supply in the second and third compliance periods.

Third-Party Cogeneration

C-51. (multiple comments)
Comment: ARB's current approach is discriminatory against refineries that rely on 3rd Party Cogeneration Operators for a portion of their power supply. There is currently no mechanism for these plants, or the Cogeneration Operators, to receive any quantity of free allowances. This is in contrast to refineries operating internal cogeneration units, who will receive allowances related to their baseline emissions including the cogeneration operation, and refineries purchasing power from utilities who will receive rate consideration associated with the utilities sale of free allowances at auction. We propose that emissions related to power provided by a Cogeneration Operator to a refinery be included in the refinery baseline emissions. One way to accomplish this would be a simple modification to the equation for baseline average annual GHG emissions. Modify section 95891 (d)(2)(A) as follows:

BEY=GHG+(SPurchased-SSold)*0.06244 ~~-eSold~~<u>(ePurchased Cogen-eSold)</u>*0.431

Where ePurchased Cogen is the power, in MWhr purchased by the refinery from the third party cogen plant.

Another possible solution would be to provide allowances directly to Cogeneration Operators for emissions related to power sales to refineries. As written, the regulation places refineries associated with third party cogeneration operators at a significant disadvantage and in fact discourages continued operation of the third party cogeneration plants. (TESORO3)

Comment: ARB has made no provision for allowances for power provided to the refining industry by industrial cogeneration plants. Emissions from these plants related to sales of steam and power to refineries should be included in baseline quantities and allowances. We recommend ARB revise the equation as follows:

To BE_Y, purchased electricity from third party cogens should be added as follows:

$$BEY = GHG + (S_{Purchased} - S_{Sold})*0.0663 + (E_{PurchasedCogen} - e_{Sold})*0.431$$

where:

"$E_{PurchasedCogen}$" is the annual arithmetic mean amount of electricity purchased from third party cogens by the refinery in MWh. This assumes that these cogens do not receive any allowances on their own. (WSPA4)

Response: We recognize the importance of indirect carbon costs. We aim to correctly incent the lowest greenhouse gas option among independently owned CHP, self-owned CHP, and separate production of heat and grid electricity.

We include adjustments for purchased heat and for heat and power sold in the refining benchmarking. We believe it is premature to add a uniform adjustment for power purchased at this time. This is because purchased power may not create an indirect carbon cost in all cases. It is ARB's goal to see a carbon price properly embedded in all purchased power. We believe a direct allocation to third-party cogeneration operators would potentially be counter to this goal because, given this free allocation, the operators may choose not to incorporate a carbon price into their rates.

If proper carbon pricing occurs in all purchased power, the compensation for these indirect carbon costs could be incorporated into the product benchmarks, if necessary, to help minimize leakage. We will revisit this issue once the California Public Utilities Commission Proceeding addressing utility costs and revenue issues associated with greenhouse gas emissions (R.11-03-012) concludes.

EII Methodology: Support

C-52. Comment: ARB's inclusion of the Solomon EII index within the allocation process is an important improvement in ARB's efforts to define an equitable allocation methodology. WSPA supports its inclusion in the allocation process because it rewards early action and energy efficiency without punishing California's more complex refining configurations, which are necessary to produce California's unique and cleaner fuels. Use of the EII is beneficial because the index recognizes the many products including many specialty chemicals and gases that are involved in the efficient transformation of crude oil into valuable products. Use of the EII is critical to the appropriate allocation of allowances in an emerging cap and trade program. If ARB proceeds with the additional 10 percent cut in allowances, ARB should agree to work with WSPA to further refine the

EII-based methodology and address new concerns that place California refiners at an unfair disadvantage. (WSPA4)

> **Response:** We thank you for your support. Moving forward, we prefer to focus the discussion on the refinery allocation approach for the second and third compliance periods. Board Resolution 11-32 directs the Executive Officer to continue to review information concerning the emissions intensity, trade exposure, and in-state competition of industries in California and to recommend to the Board changes, if needed. Board Resolution 11-32 also directs the Executive Officer to further develop the allowance allocation approach for the petroleum refining sector for the second and third compliance periods. This evaluation should include additional analysis of the Carbon Weighted Tonne approach.

C-53. Comment: The proposed regulations require that ARB choose the EII data from information submitted by refineries. This poses uncertainty as refiners are already in the process of developing their compliance strategy based on EII data already developed for their facilities. In addition, the proposed language also requires EII data for years that are not part of the biennial program. For example, while EII data for 2008 and 2010 data have been developed, data for 2009 and 2011 have not. The rule also requests EII data for years after the benchmark is set in the first compliance period. There is no basis for requiring this data after the EII benchmark is set. We recommend ARB use 2008-year EII data validated and reviewed by Solomon unless that year is not representative of normal facility operations. If data for 2008 are not representative of normal facility operations, then 2010 data can be used. Alternatively, companies may choose to submit 2009 EII information for use by ARB. (WSPA4)

> **Response:** WSPA proposed the use of the EII metric as a basis for allowance allocation in the first compliance period. This implies that this metric is a highly valuable in evaluating the energy efficiency of refinery operations. Therefore, we believe this is a metric ARB should monitor, and we will continue to collect EII data for years after the benchmark is set. We offered the flexibility to report odd-year EII data (e.g., 2009) for facilities that choose to do so. If no odd-year EII values are available for a facility, the facility may report the most recent even-year value.

C-54. Comment: In what is probably an inadvertent omission in the provision describing use of the EII index, ARB has not described a process for protecting EII information as competitively sensitive Confidential Business Information (CBI). ARB should develop provisions governing handling of facility-specific EII information so that such data are not used inappropriately or released outside of the agency. ARB should develop language to protect EII data as confidential business information. (WSPA4)

> **Response:** This concern does not require additional rule language. ARB has procedures in place for protecting data that are claimed as confidential. ARB's

regulations for confidential information can be found at Title 17, California Code of Regulations section 91000 et seq.

C-55. Comment: The methodology used for calculating the first compliance period refining sector allocation should match the methodology used for calculating individual petroleum refinery first compliance period allocations. Section 95870(d)(2)(A) addresses the first compliance period sector allocation using a “simple barrel" approach, but the individual petroleum refinery first compliance period allocations for facilities with a Solomon Energy Intensity Index (Ell) covered in Section 95891(d)(2) utilize an Ell weighting. In order to ensure consistency between the sector allocation and individual refinery allocations, Valero suggests that ARB apply the EII weighting approach for facilities with an Ell in establishing that portion of the refining sector allocation. As stated by ARB in the Summary of Proposed Modifications, the Ell is the most appropriate performance metric for complex facilities in the first compliance period. (VALERO3)

Response: We did not take the approach recommended by the commenter. It is unclear from the comment how we would “apply the EII weighting approach for facilities with an Ell in establishing that portion of the refining sector allocation.” Past methods of selecting a total sector amount have included selecting a sector-wide historical emission level, summing emission baselines from all facilities, or setting a sector benchmark and evaluating sector-wide production. We elect to use the benchmarking methodology.

By using the simple barrel benchmark to evaluate GHG intensity for the sector as a whole, the sector allocation is transparent and based on information that can generally be made publicly available. The total amount of allowances to the sector can increase or decrease automatically in response to future production levels of refinery products consistent with the product-based allocation approach for producers in other sectors. Likewise, the initial performance goal (benchmark stringency) for the sector is directly comparable to what is required for other industrial sectors. The sector allocation remains product based, creating an incentive to continue efficient production of primary refinery products in California and minimize emissions leakage.

EII Methodology: Oppose

C-56. (multiple comments)
Comment: In the first compliance period CARB proposes to use a simple barrel output based metric to allocate allowances for the refining sector overall. Coupled with a cap adjustment factor of two percent, the benchmark is estimated to limit the total allocation to the refinery sector. We strongly support a benchmark that reduces emissions below baseline to provide some level of incentive for emission reductions at the start, and the proposed 10 percent below sector-wide emissions from 2008-2010 (adjusted in future years by the level of the cap decline) represents a modest minimum reduction. The chosen benchmark however is fairly weak being solely based on California refinery

performance. According to U.S. Energy Information Administration data, California refineries emit up to 35 percent more CO_2 per barrel of oil refined than refineries in any other major U.S. refining region, (Karras, 2011) and significantly more than EU refineries (ICCT, 2011). Although we support the overall allocation to reduce the refinery sector allowances in the first compliance period, we remain very concerned over the proposed “two-pronged” method for distributing allowances among refineries, with a simple barrel approach for small refineries and a new *non-output* based approach for large, complex refineries in the sector. The individual allocation methodology for large refineries is problematic as it relies on grandfathering. This grandfathering level of free allowances is adjusted upwards for future increases and downwards for emissions with a tweak based on the Solomon Energy Intensity Index with the result that good and poor performers get about the same proportion of their emissions as free allocations. This methodology for large, complex refiners was originally proposed by WSPA. The narrow range in the distribution of allowances dilutes incentives for carbon reductions and minimizes the returns from investing in carbon reduction technologies. The impact of shifting the large refinery benchmark focus from carbon intensity of the final products to energy efficiency of the process rewards refineries that may utilize more modern equipment yet could have a much more carbon intensive overall process. Dampening the spread of refinery performance in the staff proposal compounds the potential resulting environmental and economic effects of this proposal. The net result is that overall GHG reductions in this sector are not sufficiently encouraged, missing an opportunity to encourage reductions in criteria and air toxic co-pollutants. Furthermore, as pointed out in earlier comments, the use of the Solomon EII index component of the grandfathering proposal is flawed since the rankings are based on energy rather than carbon efficiency. This can encourage use of high carbon feedstocks which would undermine the carbon reduction objectives of AB 32. In addition this index is an industry sponsored and funded benchmarking service which is proprietary. The black box rankings lack public accountability since they are both non-transparent and based on confidential information. Revert to the CARB original proposal for allowance allocation for all refineries instead of the two-pronged approach relying on primarily on grandfathering, updated for future emissions increases and decreases, as the large refinery GHG performance benchmark. Utilize a single benchmark which reflects national best practice carbon intensities. (KUSTIN18)

Comment: In the first compliance period, CARB proposes to use a simple barrel output-based metric to allocate allowances for the refining sector overall. UCS supports the use of an output-based metric which addresses leakage concerns and provides incentives for continued production of primary products in California. The adopted benchmark however is weak, being solely based on California refinery performance, which is much more carbon intensive than other U.S. regions (Karras, 2011). According to U.S. Energy Information Administration data, California refineries emit up to 35 percent more CO_2 per barrel of oil refined than refineries in any other major U.S. refining region (Karras, 2011). The benchmark adopted in the simple barrel output-based metric should be made much stronger to reflect national best practices and performance. CARB is proposing different methods for the distribution of the allowances among small and large complex refineries. The approach adopted for large refineries is very problematic as it relies on the Solomon Energy Intensity Index (EII) plus an adjustment factor used to reduce the spread of allowances between good and poor performers. This ‘tempering’ methodology for refineries originally proposed by the Western States Petroleum Association (WSPA) is troublesome as it deliberately narrows the distribution of allowances among refineries and so dilutes incentives for carbon reductions and minimizes the returns from investing in carbon reduction technologies. If facilities with both high and low emissions get virtually the same number of free allowances then there is little incentive for poor performers to invest in cost effective emission abatement technology. CARB argues that this adjustment is necessary to reduce the competiveness impacts of allowance allocation between in-state refineries (Appendix A, page 3), even though these economic impacts are a consequence of some refineries acting early to adopt more efficient technologies. The tempering adjustment is counter to the spirit and mandate in AB 32 to fully recognize early actions for emission reductions. In addition, as pointed out in earlier comments, the use of the Solomon EII index is flawed since the rankings are based on energy rather than carbon efficiency. Also, the proprietary methodology of the EII index results in a ‘black box’ ranking system which lacks public accountability, is non-transparent, and based on confidential information. We recommend that ARB adopt an output based benchmark that reflects national or worldwide emission intensity performance. Revert to the CARB original proposal for allowance allocation among all refineries and do not use the Solomon EII index as the large refinery GHG performance benchmark. Mitigate refinery distributional concerns (if deemed necessary) through financial aid specifically targeted to improve the carbon efficiency of poorer performers. (UCS8)

> **Response:** The total refinery sector allocation amount for the two years of the first compliance period will be set using the simple barrel benchmark. The value for this simple benchmark was updated from 0.0465 allowances/barrel of primary refinery products to 0.0462 allowances/barrel. We believe that this initial benchmark stringency is appropriate to minimize leakage. We will consider national data in the context of benchmark stringency as a robust national data set is developed by the United States Environmental Protection Agency’s greenhouse gas reporting program.
>
> For the first compliance period, simple refineries that do not have an EII value or those without a representative EII value as determined by the Executive Officer are allocated to using the “simple barrel” product benchmark proposed in the first 15-day changes to the regulation. A limit on the amount of allowances a facility can receive was imposed based on historical emission levels consistent with stakeholder comments. This approach will prevent a facility from receiving any excessive rewards due to free allocation under the simple barrel metric.
>
> Complex refiners’ first period allowances are allocated based on a methodology initially proposed by the Western States Petroleum Association. This approach allocates allowances based on the following factors: (1) historical emissions from for each refinery, (2) the Solomon Energy Intensity Index (EII) for each refinery, (3) an adjustment factor to reduce competitiveness impacts of allowance

allocation between in-state refineries, and (4) future emissions for each refinery. The Solomon EII is a complexity-adjusted measurement of refinery energy efficiency developed by Solomon Associates. Solomon Associates has been developing energy-efficiency benchmarking for energy-intensive industries for the past 29 years. They maintain an extensive database for refineries' energy consumption and process data covering over 70 percent of global refining capacity. We believe that the EII is the most appropriate performance metric for complex facilities in the first compliance period despite the fact that it is based on energy efficiency and not greenhouse gas efficiency. This metric is well understood by all complex facilities, and has been recognized under the U.S. EPA's ENERGY STAR Program. We believe that the allocation stringency correctly provides all facilities with the correct incentives to make greenhouse gas reductions. We do not agree that our approach supports poor performance.

The EII approach does significantly reduce the spread between the best and the worst facilities relative to our initial simple barrel proposal. As shown in Appendix A to the second 15-day changes to the regulation the best performers in the state have taken a reduced allocation to support additional allocation to the worst performers. We believe this level of "tempering" is appropriate to address short-term concerns about intra-sector equity and to create a gradual change to the current competitive playing field between California refineries (transition risk).

For the second and subsequent compliance periods, we will allocate to all refiners using the "Carbon Dioxide Weighted Tonne" approach. This metric is based on the refinery benchmarking conducted for the European Union's Emissions Trading Scheme and does not contain a "tempering" provision.

We recognize concerns about benchmark transparency associated with the EII values. However, other product benchmarks, such as the "simple barrel" approach that the commenter supports, also face transparency challenges because they are built on confidential information. EII values reported by each facility will be independently confirmed by third-party verifiers.

We do not agree that our approach creates an incentive to switch to lower-quality sources of crude. We agree that it is necessary to continue to review the allowance allocation to refineries as part of ongoing program review. Appendix A of the second 15-day changes to the regulation details the approach and analysis of the modified refinery allocation.

CWT Methodology

C-57. (multiple comments)
Comment: We recognize that a well-designed cap and trade program that is effectively linked with other programs around the world can be the most cost-effective mechanism that ARB has in its arsenal to achieve the goals of AB 32. We appreciate that the second 15-day package includes benchmarks for refining and oil and gas production

that are based on energy efficiency and reward early action, without penalizing complex refineries or California's unique oil and gas industry. We believe that by using complexity weighted approaches similar to those used in the European Union (EU), even better methods can be developed to promote refining efficiency. (CHEVRON4)

Comment: The proposed regulation cites the future use of a carbon-weighted index CWT. While WSPA agrees that some carbon-weighted index is appropriate, the use of the term CWT refers to a specific index used in Europe that may not be appropriate for use in the United States. ARB has indicated that they will review the various candidate carbon-weighted indexes in 2012. We recommend that ARB change the references to CWT with the term (CW) to allow the full evaluation of all appropriate carbon-weighted indexes for use in the second compliance period and thereafter. WSPA will work with ARB to identify an appropriate approach. (WSPA4)

Comment: Though discussed in general terms, the specific methodology, performance benchmark, and calculation details for the second compliance period allowance allocation were not placed in proposed regulatory language prior to this second 15-day packet, from which changes to the regulation cannot be accommodated prior to its finalization. Additionally, the effect of this approach could not be viewed in totality with the first compliance period allocation methodology presented during the first 15-day comment period. This new methodology is referred to as the Carbon Dioxide Weighted Tonne (CWT). The fact that the actual details of the CWT approach are not provided in this regulatory package, but are provided in the revised language for the MRR, only adds to the procedural obstacles in providing robust comments that can be acted upon by the CARB Board. CARB briefly outlines the rationale for choosing this CWT approach in Appendix A. One aspect of the proposal is to use a European Union benchmark as the performance standard for California refineries. This performance benchmark needs to be revised. WIRA agrees with Appendix A which states: [CARB] Staff plans to conduct additional technical work on the CWT approach in 2012 and will recommend any appropriate changes to the Board resulting from this analysis in a future regulatory package. As it is currently proposed this value will have a dramatic effect on WIRA, it will impact our members both directly and in terms of competitiveness relative to the state's larger, more complex refiners and therefore must be vetted in a more complete and robust public process. It is imperative that when this additional technical work is completed, that it be done in a timely manner such that all parties have sufficient understanding of its implications and have appropriate time to comment. When such additional technical work is initiated, WIRA will actively participate in the process. Even though the proposed CWT approach will not be in effect until 2015, for planning purposes, it is imperative that this work commence early in 2012. (WIRA4)

Comment: UCS is also concerned by the proposal to use the Carbon dioxide Weighted Tonne (CWT) measure in the second and third compliance periods. A report prepared for UCS in September 2011, provides empirical analysis that evaluates the factors driving the high emission intensity of California refineries. The key finding of the report is that California refineries work with much dirtier, lower-quality crude oils which require greater processing and produce greater carbon emissions and co-pollutants on average than refineries in other refining regions of the US. This research finding supports our concerns that CARB's proposal to use CWT will lead to subsidizing the refining of dirtier, lower-quality crudes and this will increase the costs of achieving the overall carbon reduction goals of AB 32. We recommend that CARB re-evaluate the use of the CWT and present documentation and analysis of how the CWT allowance allocations compare to the simpler output based methodology. In addition the adopted benchmarks should not support the use of dirtier lower quality crude feedstocks. UCS commends CARB for recognizing the need for this additional technical work and looks forward to participating and reviewing the analysis that will inform the future regulatory package mentioned in Appendix A, page 7. (UCS8)

Comment: In the second and third compliance period CARB is proposing to use an allocation methodology for individual refiners (small and large) that has been adopted in the European Union's Emission Trading Scheme (EU ETS), the EU carbon trading program. The proposal is to give refineries 0.0295 allowances per CWT they produce. The use of this benchmark is still in the implementation stages in the EU ETS, and it is slated to be introduced in 2013, at the start of the third phase of the EU carbon trading program. There is limited documentation available on the proposed benchmark which is derived from confidential non-transparent data. The underlying methodology is based on the proprietary Solomon Complexity Weighted Barrel (CWB) approach. The carbon efficiency basis of this metric is an improvement over the energy efficiency approach; however both are black box methodologies. From the limited documentation it is clear that more allowances are generated the higher the level of CWT, and CWT increases with greater process utilization; so if you increase the processing of your crude feedstock you get more allowances. These subsidies for greater processing of crudes will lower the cost of refining lower quality crude feedstocks. As is shown in Karras, 2011 the main reason why California refineries have much higher emissions intensity is because they use much lower quality crudes which require greater processing and produce greater carbon emissions as well as increased co-pollutants. California refineries use more "aggressive processing" than refineries in other parts of the US. These carbon intensive units, such as cokers and hydro-crackers, add to a refinery's "complexity" and also have the highest factors in the CWT system (e.g. a flexicoker has a CWT that is 16 times that for a regular distillation column). Some of the additional complexity used by California refineries may be necessary to meet the stringent fuel standards. However, it appears that most of the carbon intense aggressive processing in California refineries is driven by the use of lower quality crude oils. Figure 3 compares the use of processes for crude vs. product processing in California refineries versus those in other regions. Note the very heavy reliance of California refineries on crude stream coking and hydrocracking, two of the most energy intensive processes, while the product stream processing is similar across all regions. Thus the use of the CWT will subsidize and support the use of lower quality and more carbon intensive crudes. This is a serious concern which could lead to underinvestment in lower carbon emitting refining configurations, and conflicts with a key goal of AB 32. CARB should evaluate alternative benchmarks which do not subsidize the use of lower quality crude feedstocks. CARB should re-evaluate the use of the CWT and present documentation and analysis of how the CWT allowance allocations compare to the simpler output based methodology. We strongly support CARB's intention to undertake further technical analysis in the use of the CWT and look forward to participating in the review of the analysis that will inform the future regulatory package mentioned in Appendix A, page 7 to meet the goals of AB32. (KUSTIN18)

> **Response:** The petroleum-refining benchmark method we adopted for the second and third compliance period is the Carbon Dioxide Weighted Tonne metric initially developed for the European Union's Emission Trading Scheme. We recognize that this is a specific index. Currently, we believe this approach is appropriate for use in California, as specified in the regulation. However, we will continue to work with stakeholders to evaluate the robustness of this method prior to implementing it for the second compliance period. We do not believe this approach subsidizes the refining of dirtier, lower-quality crudes.

Other Allocation-Related Comments

C-58. Comment: ARB developed these [petroleum refinery] benchmarks and proposes to implement them using industry data that would be kept secret from the public. (CBE4)

> **Response:** By using the simple-barrel metric to evaluate GHG intensity for the sector as a whole, the sector allocation is transparent and based on information that can generally be made publicly available. The total amount of allowances to the sector can increase or decrease automatically in response to future production levels of refinery products consistent with the product-based allocation approach for producers in other sectors. Likewise, the initial performance goal (benchmark stringency) for the sector is directly comparable to what is required for other industrial sectors.
>
> We recognize concerns about benchmark transparency associated with the EII values. However, other product benchmarks, including the simple-barrel approach, also face transparency challenges because they are built on confidential information. EII values reported by each facility will be independently confirmed by third-party verifiers. Because we cannot share data submitted confidentially, we cannot publish the full benchmarking calculations. We believe we have provided sufficient detail regarding our benchmarking approach in the Staff Report, Appendix B to the first 15-day notice, Appendix A to the second 15-day notice, and through continued dialogue with stakeholders, to provide an understanding of the results of our analysis.

C-59. Comment: Elements of ARB's proposal (cap–and–trade instead of direct control, free allowances, and emission benchmarks) must be evaluated together for two reasons. First, ARB's cap, allowances, and benchmarks interact via mathematical equations (section 95891). Second, ARB's rationales for proposing cap-and-trade and free emission allowances rely on the same assertion. ARB asserts that both of these elements of its proposal improve climate protection because controlling industrial emissions here may have the negative effect of increasing emissions elsewhere so that total emissions are not reduced and may increase. ARB claims this could happen because companies could shift their production outside California instead of cleaning up, and that shift—according to ARB's assertion—increases emissions as much or more elsewhere. ARB calls this "emissions leakage."

Thus, ARB assigns free allowances to 100 percent of refinery emissions because ARB estimates a 100 percent risk that making refineries curb emissions will cause refinery emissions elsewhere to increase as much as or more than those emissions are reduced in California. (CBE4)

> **Response:** We do not "assign free allowances to 100 percent of refinery emissions." We are allocating allowances to the industrial sector for *two* purposes: (1) to provide transition assistance, and (2) to prevent leakage. Transition assistance provides free allocation to the industrial sector at the outset of the program to avoid sudden or undue short-term economic impacts and to promote a transition to a low-carbon economy. This transition assistance will decline as covered entities gradually adjust to the carbon price and adopt energy-and carbon-saving strategies.
>
> Free allocations will decline over time based on two main factors. One is the "cap decline" or "cap adjustment" factor. This ensures that we will reduce emissions to meet the 2020 goal. The cap declines at two percent each year for the first compliance period, and then at three percent a year from 2015 through 2020.
>
> The second factor is based on the risk of emissions leakage. We have conducted an extensive analysis of leakage risk with a peer-reviewed methodology used in existing cap-and-trade programs. This methodology combines two considerations—trade exposure and the degree to which greenhouse gas emissions influence the cost of the end product. The methodology is described in greater detail in the *Staff Report: Initial Statement of Reasons* and its Appendix K.
>
> Sectors that have high leakage risk will continue to receive a high percentage of allowances for free through 2020. Sectors with medium or low leakage risk will see reductions in their free allocations beginning with the second compliance period in 2015. These percentages of free allowances are detailed in the regulation. Per Board direction in Resolutions 10-42 and 11-32, we are committed to revisit the leakage analysis before 2015, and to adjust leakage risk as necessary to reflect the results of the revisited analysis. Petroleum refining is classified as medium leakage risk. The assistance factor for this category is 100 percent for the years 2013 and 2014, 75 percent for the period 2015–2017, and 50 percent for the period 2018–2020.

The total decline to the refining allocation created by the cap adjustment factor and the assistance factor is shown in the following table.

Year	2013	2014	2015	2016	2017	2018	2019	2020
Cap Adjustment Factor (From Table 9-2)	98.1%	96.3%	94.4%	92.5%	90.7%	88.8%	86.9%	85.1%
Petroleum Refining Assistance Factor (from Table 8-1)	100.0%	100.0%	75.0%	75.0%	75.0%	50.0%	50.0%	50.0%
Combined Adjustment to Refining Allocation	**98.1%**	**96.3%**	**70.8%**	**69.4%**	**68.0%**	**44.4%**	**43.5%**	**42.6%**

C-60. Comment: ARB's position that its proposal to allow continuing or increasing refinery emissions will not disparately impact low income communities of color because other existing requirements prohibit increasing GHG co-pollutant emissions is disingenuous and wrong. California refinery GHG co-pollutant emissions already cause disparately high, health-threatening exposures to particulate matter in nearby low-income communities of color. ARB allows this disparate impact. It allows extremely high refinery emissions on average. By further allowing these high emissions to continue, let alone increase, ARB's proposal would worsen this disparate impact. (CBE4)

Response: We disagree. We evaluated the potential for localized increases in co-pollutant emissions in affected communities due to a cap-and-trade program to the best of our ability during the regulatory development process. The findings of this analysis can be found in the *Staff Report: Initial Statement of Reasons* and its Appendix P: Co-Pollutant Emissions Assessment. Since the distribution of changes in co-pollutant emissions resulting from the cap-and-trade program are dependent on how individual facilities choose to comply with the program, we evaluated how co-pollutant emissions could change in three hypothetical scenarios within four environmental justice communities—Wilmington, Oildale/Bakersfield, Richmond, and Apple Valley/Oro Grande. Under the three hypothetical scenarios, we found that co-pollutant emissions could, in the absence of district permits and existing controls, increase or decrease a very small amount. However, most compliance approaches are expected to result in a reduction in co-pollutants through increased efficiency and decreased combustion of fossil fuel. It is important to note that the mere presence of a cap-and-trade program for greenhouse gas emissions will not weaken or reduce facility specific requirements or permits for co-pollutants. All facilities will continue to be subject to existing local ordinances and rules. A brief discussion of key existing air quality laws that minimize potential adverse impacts is presented below.

The federal Clean Air Act (CAA) of 1970, as amended in 1977 and 1990 (42 USC section 7506(c)), establishes National Ambient Air Quality Standards (NAAQS) for air pollutants that pose a threat to human health and welfare. California has adopted more stringent air quality standards for most of the federal criteria pollutants under the California Clean Air Act of 1988. Similar to the federal standards, the California standards have been designed to protect the health of the most sensitive persons with a margin of safety.

New Source Review (NSR) is a title applied to programs regulating the new construction of, and/or modifications to, industrial sources that emit, or will emit, air pollutants. NSR requirements under State law are codified in Division 26 of the California Health and Safety Code. Specific to NSR, each local air district is to include in its attainment plan a stationary source control program designed to achieve no net increase in emissions of nonattainment pollutants or their precursors for all new or modified sources that exceed particular emission thresholds. Each of the 35 air districts in California has its own NSR program and issues permits to construct and operate. The permit requirements are dependent on the California AAQS or NAAQS designation (attainment, nonattainment, and unclassifiable areas), and the amount and type of pollutants that the source will emit. In addition, most new and modified stationary sources are required to use Best Available Control Technology. Furthermore, all the air districts have either a policy or regulation that addresses toxic air pollutants for new and modified sources.

The California Environmental Quality Act (CEQA) review of local projects may identify and require mitigation for mobile and other emission sources. CEQA requires that, where a project will have significant impacts, the lead agencies (in this context, cities, counties, and air districts) must consider alternatives (including, where appropriate, alternative locations that would have fewer impacts) and require feasible mitigation to reduce those impacts to less than significant levels. Mitigation for a given project could include additional pollution control technologies, off-site measures, and mobile source mitigation that would reduce cumulative pollution in the area affected. Further analysis of what may be appropriate for specific, future energy-related projects must be analyzed in response to a specific proposal.

Facilities whose toxic air contaminant emissions and risk potential exceed a certain threshold must prepare a Health Risk Assessment under the “Hot Spots” Information and Assessment Act. This and other regulations will continue to result in significant reductions in co-pollutant emissions, exposure, and health-based risk.

Moreover, through the Energy Efficiency and Co-benefits Assessment Regulation for Large Stationary Sources, we are currently collecting information on opportunities for further GHG and co-pollutant emission reductions. We are scheduled to receive these data by the end of 2011. We will initiate a process to ensure that large industrial sources subject to the regulation be required to take cost-effective actions identified under those audits. The audit results, due to ARB by the end of 2011, will inform the development of regulatory requirements that staff intends to propose to the Board in 2012. We plan to initiate a separate public process in fall 2011 to discuss metrics and actions to implement this commitment.

Although we anticipate that co-pollutant emissions would decrease, ARB is committed to monitoring the implementation of regulation to identify and to address any situations where the program has caused an increase in criteria air pollutant or toxic emissions. In Resolution 11-32, the Board approved an Adaptive Management Plan to monitor and respond to unanticipated adverse localized air quality impacts of the proposed cap-and-trade program. Under this plan, at least once each compliance period, we would use information collected through the mandatory reporting regulation, the proposed cap-and-trade regulation, the industrial efficiency audit, and other sources of information to evaluate how individual facilities are complying with the regulation. If any adverse impacts are identified we would, if feasible, modify the program to lessen the impacts.

A separate but related concern is that a greenhouse gas emission trading program could increase existing inequities related to the burden of air pollution exposure; that is, low-income and minority communities would bear a disproportionate share of the impact of unforeseen increases in air pollution and/or would experience less of the benefits from a cap-and-trade program. Data and research clearly indicate that a disproportionate share of facilities with high GHG emissions are located in low-income communities with a high percentage of minorities, and the annual co-pollutant emissions burden from large GHG emitting facilities is larger for minorities. However, this is entirely different than finding that facilities located in minority neighborhoods are more likely to buy allowances or offsets instead of reducing emissions on site, and are therefore going to incur less benefit than other communities. In fact, numerous studies have evaluated the potential for inequitable impacts from emissions trading programs on minority neighborhoods, racial and ethnic groups, and general community demographics, and found that trading did not have a disproportionate impact. As noted by the Market Advisory Committee, “U.S. Environmental Protection Agency staff analysis found that under the SO_2 emission trading program, the largest reductions occurred in areas with the highest emission levels. This finding was true both regionally and at individual plants.” Thus, it is possible that the areas with highest emissions could observe disproportionate benefits from a cap-and-trade program.

The most effective way to reduce the impacts of co-pollution emissions in low-come and disadvantaged communities is to implement programs that target reductions in co-pollutant emissions directly. While a GHG focused program would likely reduce co-pollutant emissions along with GHG emissions, it is not the most effective mechanism for decreasing exposure to co-pollutants.

C-61. Comment: Figure 1 shows average production-weighted GHG emissions (lb/barrel crude) in California, other major U.S. refining regions, and Europe. The California and other U.S. emissions are verified based on publicly reported data. The European emissions are reported as verified by the EU. Statewide, average 2004–2008 California refinery emission intensity exceeds that of any other major U.S. refining region by 19–36 percent and exceeds the average 2005–2008 emission intensity of European refineries by 89–120 percent.

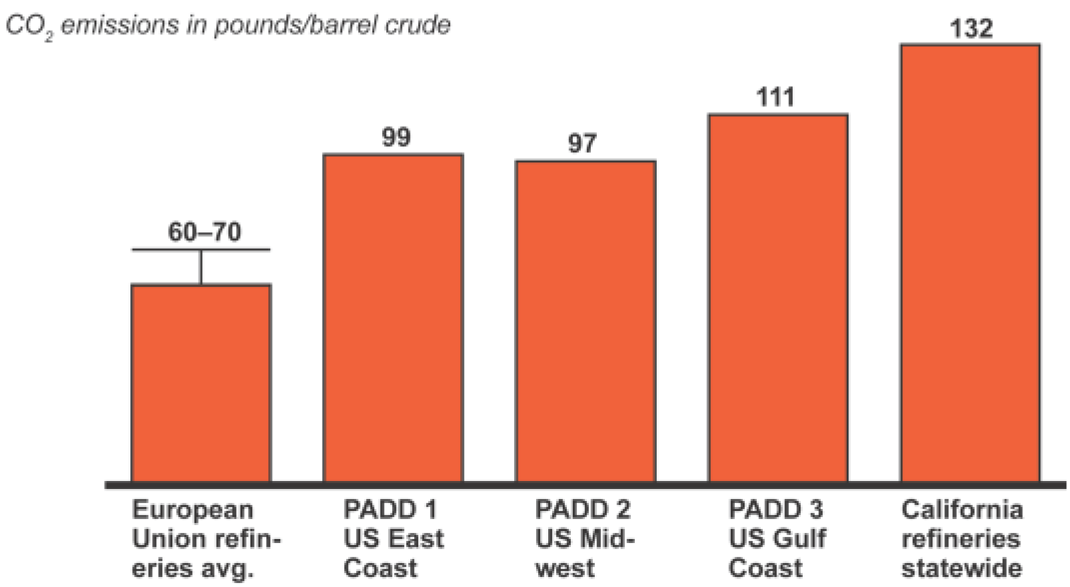

Figure 1. Average refinery emissions intensity by region. PADD: Petroleum Administration Defense District. California and U.S. emissions, 2004–2008, from fuels consumed in refineries including third-party hydrogen production; data given in Attachment 1 to these comments. European Union emissions, 2005–2008, from average of CITL and CONCAWE "verified" emissions and crude volume refined in countries included for emissions based on 85–100 percent of crude charge capacities from Oil & Gas Journal. The 60–70 lb/b range shown for Europe reflects this 85–100 percent range in capacity utilization. This bounding range is used because refinery capacity utilization was not reported for Europe.

Causal analysis further confirms California's extreme-high average refinery emissions. The quality of crude oil refined is the major driver of differences in average refinery emission intensity nationwide and in California. This is because making gasoline, diesel, and jet fuel from denser, higher sulfur crude requires putting more of the crude barrel through aggressive processing that takes more energy and burns more fuel for this energy, thus boosting refinery energy and emission intensities. The impact on energy intensity is illustrated in Figure 2. Crude feed density and sulfur content can explain 90–96 percent of increasing CO_2 emissions from the lowest to highest emitting refineries across the U.S. and California, and predict the extreme-high 2004–

2009 average emission intensity of California refineries within 1 percent.

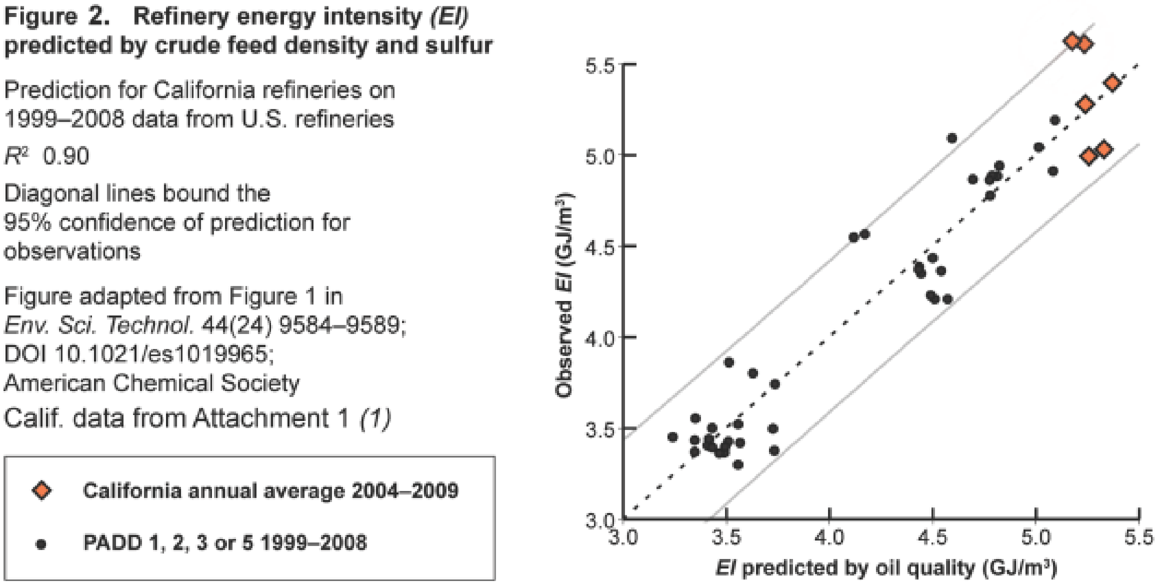
Calif. data from Attachment 1 *(1)*



ARB now proposes “benchmarks” designed by oil industry consultants to assign higher emission expectations to more “complex” refineries with more capacity to further process the oils from their initial crude distillation. ARB’s refinery “complexity” benchmarks are a polluter’s dream. They are designed to reward the refining practice that boosts emissions the most. They artificially make the resultant high refinery emission intensity look like “good” environmental performance. They keep data secret so that refineries can hide their polluting practices from the public.

Benchmarking emissions against refinery complexity predicts very high average emissions for California refining based on its very high primary processing equivalent capacity (Figure 3).

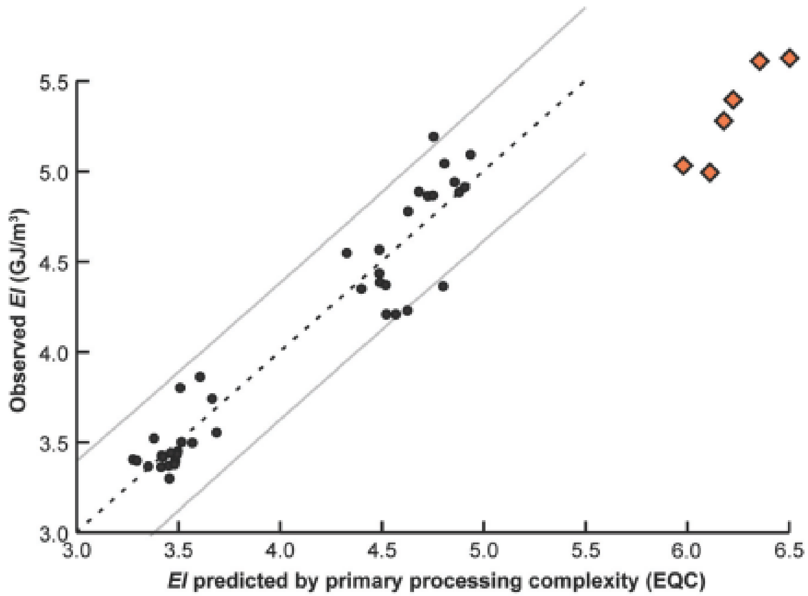


Figure 3. Energy intensity *(EI)* predicted by primary processing equivalent capacity

Prediction for Calif. on 1999–2008 data from U.S.

◆ **California annual average 2004–2009**

● **PADD 1, 2, 3 or 5 1999–2008**

This prediction (Figure 3) makes sense because primary processing capacity enables refining dirtier crude, which is the main driver of refinery emission intensity as discussed above. Further, the over-prediction of California refinery emissions by this complexity benchmark (California data are shifted to the right in Figure 3 as compared with Figure 2) makes sense because California refineries use much more gas oil hydrotreating to pretreat catalytic cracking feeds than other regions on average. By treating more of the oil before cat-cracking (and reforming) it in this way, California refineries could reduce the energy and emission intensities of those other individual processes marginally. That would cause their total refinery emissions to be slightly lower than predicted by nationwide refinery complexity data (Figure 3) even though their emissions stay right in line with those predicted by their more energy-intensive, lower quality crude feeds (Figure 2). The result is that ARB's benchmark, which compares actual refinery emissions only to the diagonal lines in Figure 3 that it predicts based on complexity, and is blind to whether actual emissions are higher or lower than those of other refineries in this chart, predicts California refinery emissions that are even higher than their extreme-high actual levels.

The trick in ARB's proposal is that it turns this limited and partly inaccurate complexity-based prediction into a performance expectation that assigns more emissions allowances to more complex refineries. ARB's benchmark could thereby tell ARB to expect even higher emissions than those observed in California, and artificially assign "better than expected" emissions performance to the highest average refinery emission intensity in the country.

Worse, because increasing primary processing capacity enables refining lower quality crude, by awarding more free emission allowances to more complex refineries with expanded capacity to process this inherently dirtier crude, ARB would encourage the very same refining practice that increases refinery emissions the most.

Our summary of crude quality and processing intensity impacts on refinery energy and emission intensities here is based on peer reviewed work that accounted for and verified the relationships of these factors and also other refinery processing, product slates, and fuels burned for energy in refineries, using data from operating plants across 97 percent of the U.S. industry, and extended the same methods to California-specific data. ARB's erroneous claim that this work does not account for impacts of processing capacity and product slates (Supp. FED RTC at 106-67,106-68) should be corrected for the record, and further suggests a key weakness in the agency. It suggests that ARB misunderstands the major cause of the extremely poor emission performance it has allowed across the highest-emitting industry in California. ARB's weakness will be compounded if critical data for assessing refinery emissions performance are kept secret. (CBE4)

> **Response:** We believe that complexity-adjusted allocation methods are neutral to crude quality. That is, they neither excessively penalize nor reward refineries sourcing poorer quality crude. We do not believe these methods create an incentive to switch to poorer quality crudes. The phase-out of free allocation and switch to auctioning as the primary method for allocation to the refining sector by the third compliance period will penalize facilities with more emission-intensive processing, including more emissions-intensive processing due to crude quality.
>
> During the first two years of the cap-and-trade program, the complex refineries will receive their allowance allocation according to an allocation method based on the Solomon EII, which is a complexity-adjusted measurement of refinery energy efficiency developed by Solomon Associates. Solomon Associates has been developing energy-efficiency benchmarking relied upon by the industry for the past 30 years. They maintain an extensive database of more than 500 refineries' energy consumption and process data, covering over 85 percent of global refining capacity, which is used to develop the EII values. The Solomon EII is the industry standard for comparing energy efficiency across refineries globally. California refineries that have a Solomon EII value represent over 90 percent of refining capacity in the State.
>
> Under the Solomon EII benchmark, the facility with the best (most efficient) EII will receive the greatest portion of their historical emissions baseline. Less-efficient facilities will receive smaller portions of their individual historical emissions baseline. This benchmark methodology, along with the prospect of a decreasing percentage of free allocation in the second and third compliance period, will incentivize refineries to decrease their GHG emissions.
>
> After the first compliance period, all refineries will receive a reduced level of free allocation. This reduction in free allocation is due to the cap adjustment factor and the assistance factor. The refinery benchmark methodology will also change to the Carbon Dioxide Weighted Tonne (CWT) metric initially developed for the European Union's Emission Trading Scheme. Extensive work has been conducted using a robust data set of European refineries to create the CWT

approach. This metric is preferable to the EII approach proposed in the first compliance period because it is based on greenhouse gas intensity, adjusts to recognize refinery complexity, and can provide equity between all possible ownership structures for hydrogen production, electricity, and heat production, and coke-calcining facilities.

The method also is not dependent on a proprietary index and, therefore, is somewhat more transparent. However, the information necessary to calculate the metric is still generally confidential business information.

Some stakeholders noted a concern that the use of the EII metric only considers energy efficiency and not greenhouse gas efficiency. A move to the CWT allocation methodology in the second compliance period addresses this concern. Staff plans to conduct additional technical work on the CWT approach in 2012 and will recommend any appropriate changes to the Board resulting from this analysis in a future regulatory package.

In its response (Supp. FED RTC at 106-67,106-68), ARB staff did not assert that the peer-reviewed work referenced by the commenter "does not account for impacts of processing capacity and product slates." ARB replied that "California refineries are far more complex and create higher percentages of highly refined products than refineries in the rest of the nation." This point is borne out by publically available statistics, and it is one of the reasons that California refineries emit more GHG emissions per barrel of crude charged. Furthermore, in its response, ARB staff said: "The commenter's premise—that heavier, higher sulfur crudes require more energy to refine, and therefore result in higher GHG emissions per unit of output—is valid." We agree on that point.

C-62. Comment: ARB's proposals come at the worst time. California refineries are beginning a major crude supply switch now. Only about 25–30 percent of their crude feed will be from existing sources of California production by 2020. This means they will retool for different "new" crude oils—and lower quality crude is cheaper. They will target the highest-profit balance between cheaper feedstock, and the costs and liabilities of adding capacity for and refining dirtier crude. But ARB would protect them from liability for their pollution with emission allowances that are free now and cheaper than the profits from dirtier crude later, and subsidize retooling for lower quality oil with benchmarks that give more allowances to refineries with more capacity to process it. ARB's cap–and–trade scheme, free allowances and benchmarks would thereby allow, support, and ensure a switch to refining "dirtier" oil. That oil could be much dirtier (Figure 4).

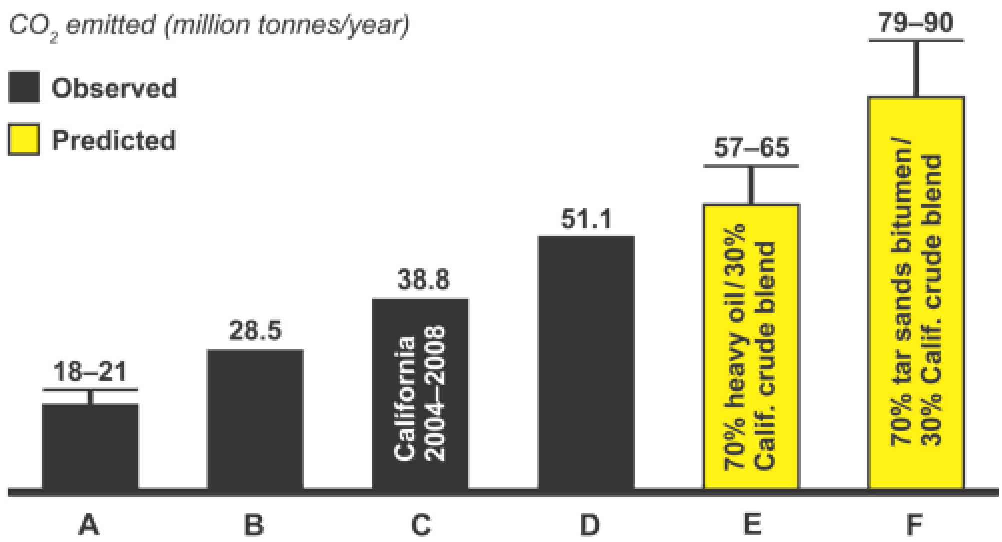

Figure 4. Refinery mass emissions from California's current production rate at observed and predicted potential refinery emission intensities. All emissions shown for the California statewide average crude input observed 2004–2009 (647.44 MM barrels/yr).

A: European Union refineries average emission intensity observed 2005–2008
B: U.S. Midwest PADD 2 refineries average emission intensity observed 2004–2008
C: California statewide refineries average emission intensity observed 2004–2008
D: Emission intensity based on 2008 data reported by Shell Martinez refinery
E: 95 percent confidence of prediction for 70 percent heavy oil/30 percent California-sourced crude feed
F: 95 percent confidence of prediction for 70 percent natural bitumen/30 percent Calif.-sourced crude feed

Emissions in the E–F range are foreseeable if current, declining California production is replaced by low-quality crude. Predictions based on the average density and sulfur content of heavy oil, natural bitumen and 2004–2009 California crude production by the method from Karras 2010.

Recent work found a switch to dirtier crude could double or triple refinery emissions. Figure 4 shows some of that potential has been realized, and applies the prediction method from this peer reviewed work to the California crude switch. Because crude quality is the major driver of refinery emission intensity, the emissions increment will depend on how far refiners shift the 70–75 percent of their feed that will no longer be from existing California sources of production toward the densest, dirtiest oils. Replacing 70 percent of their crude feed with the average "heavy oil" as defined by USGS could increase statewide refinery emissions by 18–26 million tonnes/year (Column E). Though huge, this emission intensity increment is already approached by least one California refinery (Column D) and represents the low end of the potential to pollute.

Replacing that same 70 percent of California refinery crude feed with the average-quality natural bitumen could boost emissions by 40–51 million tonnes/year (Column F). This worst-case scenario is plausible to the extent that ARB finds it cannot monitor and control production activities in other nations, especially if the planned Alberta–British Colombia tar sands pipeline and port expansions are built. The dirty oil switch would most likely include some combination of heavy oil and tar sands inputs—which would emit somewhere between the low and high cases shown by columns E and F in Figure 4.

Other existing policies will not prevent this crude quality-driven emissions increase. This is starkly evident in the extreme-high average refinery crude feed density and emissions that these policies allow on ARB's watch. But ARB's claim that existing controls on "criteria" pollutants will prevent a crude quality-driven emissions increase is both wrong and specious. By using up the limited remaining capacity of emissions capture technology, the crude switch that ARB would allow would foreclose otherwise available emission reductions.

Thus, ARB's proposal is likely to increase California refinery emissions by some 18–50 million tonnes/year. Even the low end of this estimate could overwhelm other planned efforts here and—if copied elsewhere—impede or foreclose the total cut in emissions from all sources that is needed to avoid severe climate disruption. Since burning more fuel to refine low quality oil emits toxic and smog-forming combustion products along with CO_2, it would worsen existing disparately high exposures to harmful refinery GHG-co-pollutants in low income communities of color. The sunk costs invested in refinery capacity tooled for dirtier crude would commit us to those emission increments for decades. Impacts on climate from those decades of added CO_2 emissions would be cumulative over generations. Therefore, ARB's proposal would result in significant and disparate impacts on environmental health in low income communities of color, and significant cumulative and irreversible impacts on future generations' ability to avert catastrophic climate disruption. (CBE4)

> **Response:** We do not agree that our approach creates an incentive to switch to lower quality sources of crude, or that this regulation comes at a bad time. We believe that this regulation will incentivize refineries to reduce GHG emissions through the imposition of a price on those emissions. Furthermore, the high-carbon-intensity crude oil provision in the Low Carbon Fuel Standard regulation penalizes additional processing of heavier crudes that take more energy to extract (e.g., bitumen mining, thermally enhanced oil recovery techniques).
>
> Only during the first two years of the program will some refineries receive most of the allowances they will require for compliance with the program. By the third year of the program, refineries will be required to purchase over one quarter of required compliance instruments, and by 2018 will be required to purchase over half of the compliance instruments required for program compliance.

The cap-and-trade program is not intended to prohibit any and all refining expansion. The goal of the program is to ensure that refining facilities incorporate carbon costs associated with future emissions when planning capital investments. After weighing these costs, some facilities may still choose to make these investments.

We believe that existing programs for control of criteria pollutants will prevent a pollutant emissions increase driven by crude feed quality criteria.

C-63. Comment: Newly disclosed facts prove that ARB's basis for exempting California oil refineries from emissions control measures cannot possibly be valid. As described above, ARB's rationales for proposing cap-and-trade and free emission allowances rely on the assertion that controlling industrial emissions here could shut down production here and increase emissions elsewhere so that total emissions are not reduced. ARB maintains this "emissions leakage" assertion at the same time that it accepts the higher emission intensity of California refineries, the crude quality-driven cause of higher refinery emissions here, and the ongoing California refinery crude supply switch documented above as true. ARB ignores what these newly disclosed facts mean about its comparison of climate protection alternatives.

California refineries could achieve the lower emission rates achieved on average in other major U.S. refining regions by switching to crude feed of the quality refined across these other major U.S. refining regions today (see figures 1–4). California refineries must adjust to a changing crude supply anyway. They can be required to adjust to a less-dirty crude supply instead of an inherently dirtier one. The only reason they might not (and those elsewhere might "catch up" to their pollution rate) would be if refineries are allowed to pollute in violation of environmental rights, and that policy would clearly be improper, so it would be an invalid rationale.

Thus, other major U.S. refining regions achieve lower emission rates by doing what can be done here while continuing production, in direct contradiction to ARB's claim that refiners here would shut down production instead of cleaning up. Together with the product transport and marketing logistics that drive refineries to be near their markets rather than their crude supplies in general—and insulate California refiners from competitors who would have to ship across the Rocky Mountains or the Pacific in particular—this proof that other refineries continue production while achieving lower emission rates debunks ARB's emissions leakage claim.

Moreover, even if California refineries reduced emissions by reducing production and this caused refineries elsewhere to increase production by the same amount to supply constant demand here, the "reduction in GHG emissions within the state that is offset by an increase in GHG emissions outside the state" asserted by ARB's emissions leakage claim is mathematically impossible. California refining emits more GHG per barrel: shifting its production to other regions would reduce total emissions. Based on the data in Figure 1, a barrel-for-barrel production shift from California to the Midwest, or to Europe, cuts bi-regional refinery emissions by 26 percent, or 47 percent, respectively.

Newly disclosed facts that ARB accepts as accurate prove ARB's assertion of refinery emissions leakage risk is false. ARB's decisions to apply its cap-and-trade scheme to refineries and to give refineries free emission allowances instead of reducing their emissions more effectively through direct control measures rely upon this false emissions leakage assertion. Therefore, ARB's decisions to develop and propose a cap-and-trade scheme instead of direct industrial emissions control measures and to give refineries free emissions allowances instead of controlling their emissions are based on factual findings that are false and are invalid. (CBE4)

> **Response:** ARB has never maintained that emissions-control measures should not be implemented alongside the cap-and-trade regulation. In fact, as part of ARB's AB 32 programs, we are requiring large industrial facilities, including petroleum refineries, to conduct an energy efficiency assessment of sources of greenhouse gases to determine the potential emissions-reduction opportunities, including those for criteria pollutants and toxic air contaminants. ARB will use results from the *Regulation for Energy Efficiency and Co-Benefits Assessment of Large Industrial Facilities* audit to determine if certain emissions sources within a facility can make cost-effective reductions of greenhouse gas emissions that also provide reductions in other criteria or toxic pollutants. Where this is the case, rule provisions or permit conditions would be considered to ensure the best combination of pollution reductions.
>
> Our stringent cap-and-trade program, which requires petroleum refineries to buy over half of the compliance instruments required for program compliance within six years of the start of the program, will incentivize cost-effective GHG emissions reductions at these refineries. Further, the program will ensure that the State reaches the AB 32 goal of cutting our emissions to 1990 GHG levels by the year 2020.
>
> The commenter asserts that it is mathematically impossible for out-of-state refineries to increase GHG emissions equal to an emissions reduction from California refineries. However, AB 32 requires that ARB minimize leakage, defined as a reduction in GHG emissions in California offset by an emissions increase outside the State, in the design of the program. In addition, the commenter's assertion relies on the assumption that out-of-state refineries—most with less stringent GHG and co-pollutant regulations than California's—would not utilize the crude that California refineries currently process. We believe that this is an unlikely scenario, as oil producers would likely find refineries to take the crude currently refined in California if GHG constraints incentivized crude switching or closure of the California facilities.

D. AUCTION

Unsold Allowances

D-1. Comment: We ask that ARB direct at least half of all unsold allowances when an auction clears at the reserve price to the Allowance Price Containment Reserve (Reserve). In place of the Reserve, staff is now proposing to make these allowances available at subsequent auctions. We support staff's proposal to hold back any unsold allowances from auction until two consecutive auctions clear above the reserve price to guard against the risk of consistent over-allocation. By directing *all* unsold allowances back into the auction holding account, however, ARB has left the program without a provision to backfill the Reserve. We are concerned this could expose the program to undue political pressure should market conditions lead to the Reserve being accessed. With no other mechanism built-in to resupply the Reserve, stop-gap proposals to provide additional cost containment will in all likelihood seriously undermine the integrity of the cap. We are also not persuaded by ARB's rationale for making the proposed change. ARB cites to stakeholder concerns that directing unsold allowances to the Reserve would unnecessarily reduce the supply of allowances to the market. In our view, the very fact that allowances are remaining unsold at auction provides clear indication that the market is *already* oversupplied. Entities can also readily guard against the risk of future allowance shortages through the program's unlimited banking provisions. Accordingly, we maintain that the most appropriate use of unsold allowances is to backfill the Reserve, and ask that ARB direct at least half of unsold allowances to that end. (KUSTIN19)

> **Response:** We never intended sending unsold allowances to the reserve to be a way of backfilling the reserve. The reserve would need to be replenished if there were a chronic shortage of allowances in the market. Instead, sending unsold allowances to the reserve was a method of removing an initial oversupply of allowances. However, we became convinced that an initial oversupply could be followed by a market that is too short of allowances. For example, emissions may be much lower than the cap in the first few years of the program if the current economic recession continues or if our forecasts of emissions are wrong. This situation would lead to an initial oversupply. However, we believe that the cap set in 2020 represents a significant reduction in emissions. In addition, if the direct measures fail to achieve their expected emissions reductions, then the demand for allowances will be higher than forecast. Thus, an initial oversupply could be consistent with a tighter market later in the program. We intend to return the unsold allowances to auction at prices below the reserve, since we designed the reserve as a source of last resort.
>
> The Board has directed staff to monitor any depletion of the reserve and to make recommendations for modification of the program. We appreciate the concern for the pressures that may be brought to bear if the program must be revised. However, the basic concept for the reserve is that it is not a hard price cap.

Auction Frequency/Schedule

D-2. Comment: The Utilities support the clarifying changes to section 95910(c)(1). (MID4)

Response: No response is needed.

D-3. (multiple comments)
Comment: IETA reiterates its recommendation that purchase limits and holding limits be replaced with more frequent auctions, for example on a monthly basis. Based on recent experience, many will point to RGGI's quarterly frequency and bidding rules as a relatively simple and straight-forward auction design, which is well understood and accessible to a host of entities. While a quarterly auction might be appropriate for small jurisdictions with low demand, IETA believes the implementation of a quarterly auction schedule becomes inconsistent with recent research and analysis conducted in connection with the management of allowance auctions in the EU ETS. Based on analyses, starting in 2013 the EU requires that all regional allowance auctions be conducted on a weekly basis (if not more frequently). The European Commission's decision to hold frequent auctions was driven by the large volume of allowances going to auction in the future, as well as the desire to curb potential price spikes, price volatility, and opportunities for market manipulation. In light of the above, California officials might want to consider timing the frequency of its allowance auctions based on the number of allowances to be auctioned over each period. Weekly auctions are likely to work well in jurisdictions with a large pool of allowances, such as the EU ETS. However, in jurisdictions with constrained coverage and/or large gratis allocations, weekly/monthly auctions could exhibit such small available volumes as to make auction participation high-cost with relatively low-value. IETA welcomes the opportunity to meet with officials to discuss auction design, frequency options and trade-offs. (IETA4)

Comment: Holdings limits are intended to prevent one entity from cornering the market. However, this also places significant strain on many compliance entities. Auction frequency would ostensibly alleviate the concern of one entity concerning the market while creating more liquidity within the market. CCEEB recommends moving towards monthly auctions in order to avoid the need for holding limits. (CCEEB4)
