

## **HARP 1.4e Change Details**

1. Bug Fix: In the Air Dispersion Module, a user has the option not to use buoyancy-induced dispersion, a non-default option found on the Control worksheet. It was discovered that when this option was selected, it was not enabled in the air dispersion analysis. This bug has been corrected.
2. The default color scheme in Windows 7 makes some text fields in the Emission Inventory Module difficult to read. These text fields have been adjusted.
