Veeder-Root shall not be liable for errors contained herein or for incidental or consequential damages in connection with the furnishing, performance, or use of this publication.

Veeder-Root reserves the right to change system options or features, or the information contained in this publication as approved by ARB.

This publication contains proprietary information which is protected by copyright. All rights reserved. No part of this publication may be modified or translated to another language without the prior written consent of Veeder-Root.

Contact TLS Systems Technical Support for additional troubleshooting information at 800-323-1799.

DAMAGE CLAIMS / LOST EQUIPMENT

Thoroughly examine all components and units as soon as they are received. If any cartons are damaged or missing, write a complete and detailed description of the damage or shortage on the face of the freight bill. The carrier’s agent must verify the inspection and sign the description. Refuse only the damaged product, not the entire shipment.

Veeder-Root must be notified of any damages and/or shortages within 30 days of receipt of the shipment, as stated in our Terms and Conditions.

VEEDER-ROOT’S PREFERRED CARRIER

1. Contact Veeder-Root Customer Service at 800-873-3313 with the specific part numbers and quantities that were missing or received damaged.
2. Fax signed Bill of Lading (BOL) to Veeder-Root Customer Service at 800-234-5350.
3. Veeder-Root will file the claim with the carrier and replace the damaged/missing product at no charge to the customer. Customer Service will work with production facility to have the replacement product shipped as soon as possible.

CUSTOMER’S PREFERRED CARRIER

1. It is the customer’s responsibility to file a claim with their carrier.
2. Customer may submit a replacement purchase order. Customer is responsible for all charges and freight associated with replacement order. Customer Service will work with production facility to have the replacement product shipped as soon as possible.
3. If “lost” equipment is delivered at a later date and is not needed, Veeder-Root will allow a Return to Stock without a restocking fee.
4. Veeder-Root will NOT be responsible for any compensation when a customer chooses their own carrier.

FCC INFORMATION

This equipment complies with the requirements in Part 15 of the FCC rules for a Class A computing device. Operation of this equipment in a residential area may cause unacceptable interference to radio and TV reception requiring the operator to take whatever steps are necessary to correct the interference.

RETURN SHIPPING

For the parts return procedure, please follow the appropriate instructions in the "General Returned Goods Policy" pages in the "Policies and Literature" section of the Veeder-Root North American Environmental Products price list. Veeder-Root will not accept any return product without a Return Goods Authorization (RGA) number clearly printed on the outside of the package.

FOR INSTALLATIONS IN THE STATE OF CALIFORNIA

Please refer to the California Air Resources Board Vapor Recovery Certification Phase II EVR Executive Order web site (www.arb.ca.gov/vapor/eo-evrphasesll.htm) for the latest manual revisions pertaining to Executive Order VR202 (Healy Phase II EVR System Including ISD System), VR 203 (VST Phase II EVR System) and VR 204 (VST Phase II EVR System Including ISD System).

Introduction

This manual describes site preparation and installation procedures for the Veeder-Root TLS RF Wireless 2 System (W2) for Vapor Recovery monitoring. The TLS RF Wireless 2 System (W2) features two-way communication utilizing a client/server architecture resulting in improved data collection.

Veeder-Root strongly recommends the use of hard wiring for connecting Veeder-Root sensors to the TLS Console. Wired connections provide a robust communication link that is far superior to wireless networks.

A wide variety of devices can be integrated into the TLS RF Wireless 2 System (W2) network depending on the console(s) installed as shown in Table 1. Wireless component kit part numbers are shown in Table 2.

Procedures Contained Within This Manual

• Mounting the TLS RF and connecting power wiring.
• Installing Receiver, Repeater and Transmitters.
• Connecting the TLS RF to the TLS console.
After installing the TLS RF Wireless System devices, you must configure the sensors in the console following instructions contained in the TLS console’s System Setup Manual.

Contractor Certification Requirements

Veeder-Root requires the following minimum training certifications for contractors who will install and setup the equipment discussed in this manual:

**Installer (Level 1) Certification:** Contractors holding valid Installer Certification are approved to perform wiring and conduit routing; equipment mounting; probe, sensor and carbon canister vapor polisher installation; wireless equipment installation; tank and line preparation; and line leak detector installation.

**ATG Technician (Level 2/3 or 4) Certification:** Contractors holding valid ATG Technician Certifications are approved to perform installation checkout, startup, programming and operations training, system tests, troubleshooting and servicing for all Veeder-Root Series Tank Monitoring Systems, including Line Leak Detection. In addition, Contractors with the following sub-certification designations are approved to perform installation checkout, startup, programming, system tests, troubleshooting, service techniques and operations training on the designated system.

- Wireless 2
- Tall Tank

**VR Vapor Products Certification:** Contractors holding a certification with the following designations are approved to perform installation checkout, startup, programming, system tests, troubleshooting, service techniques and operations training on the designated system.

- ISD – In Station Diagnostics
- PMC – Pressure Management Control
- CCVP - Veeder-Root Vapor Polisher
- Wireless – ISD/PMC Wireless
- A current Veeder-Root Technician Certification is a prerequisite for the VR Vapor Products course.

**Warranty Registrations** may only be submitted by selected Distributors.

RF Transmitter Considerations

Installation of this equipment in wet or below grade locations requires that the installer take steps to ensure that the equipment is mounted above the maximum water level.

**CAUTION!** – The Transmitter will not function properly in water. Also, submersion of the Transmitter in water can cause permanent damage to the internal electronics.

Wireless 2 devices will not function properly if certain conditions arise such as, but not limited to, the following:

- Ambient Interference – Due to site layout or vehicles parked in the RF transmission path. For example, CSLD will not function if the transmission path is blocked for more than a few minutes.
- Improper equipment installation – Keep objects from improperly coming in contact with the antenna. Follow these installation instructions and mount the transmitter in a fixed position to ensure maximum RF connectivity. Antenna orientation is significant in achieving an optimal transmission path.
- Equipment Sump Parameters – Sumps intended for use with RF equipment must accommodate the worst case rainfall condition that could reasonably occur. The RF Transmitter and the antenna must not come in contact with liquids from any source.

TLS System performance will be degraded should any of the above conditions occur and is not covered under the Veeder-Root Product Warranty. Corrective actions to such conditions are the responsibility of the station-site owner. Veeder-Root is not liable for any event that is a result of an improper installation or use of this equipment.
It is important that installers have knowledge of all relevant procedures before installing a wireless system. Read and understand all manuals thoroughly. If you do not understand a procedure, contact a certified contractor or contact Veeder-Root. Each TLS Console has its own setup and installation manuals.

Safety Precautions

Retain and follow all product safety and operating instructions. Observe all warnings on the product and in the operating instructions. To reduce the risk of bodily injury, electric shock, fire, or damage to the equipment, observe the following precautions.

FAILURE TO COMPLY WITH THE FOLLOWING WARNINGS AND SAFETY PRECAUTIONS COULD CAUSE DAMAGE TO PROPERTY, ENVIRONMENT, RESULTING IN SERIOUS INJURY OR DEATH.

GENERAL PRECAUTIONS

Heed service markings: Opening or removing the console cover may expose you to electric shock. Servicing of Veeder-Root equipment must be done by Veeder-Root authorized service contractors.

Use product with approved equipment: This product should be used only with Veeder-Root components identified as suitable for use with the TLS RF Wireless System.

Use the correct external power sources: This product should be operated only from the type of power sources indicated on the electrical ratings labels affixed to the components. If you are not sure of the type of power source required, consult your Veeder-Root authorized service contractor.

When not in use, a longer battery life can be achieved by keeping the battery pack in a cool, dry location where the temperature never exceeds 30°C or 86°F and does not go below 10° C or 50° F.

SPECIAL TOOLS REQUIRED

- #15 Torx screwdriver
- Small blade screwdriver (maximum blade width 3/32")
- Wire strippers

Safety Symbols

The following safety symbols may be used throughout this manual to alert you to important safety hazards and precautions.

**EXPLOSIVE**
Fuels and their vapors are extremely explosive if ignited.

**FLAMMABLE**
Fuels and their vapors are extremely flammable.

**ELECTRICITY**
High voltage exists in, and is supplied to, the device. A potential shock hazard exists.

**TURN POWER OFF**
Live power to a device creates a potential shock hazard. Turn Off power to the device and associated accessories when servicing the unit.
National Electrical Code Compliance

The following information is for general reference and is not intended to replace recommended National Electric Code (NEC) procedures. It is important for the installer to understand that electrical equipment and wiring located in Class I, Division 1 and 2 installations shall comply with the latest appropriate articles found in the National Electric Code (NFPA 70) and the Code for Motor Fuel Dispensing Facilities and Repair Garages (NFPA 30A), or other local code such as the CEC, Canadian Electrical Code.

TLS RF-TO-TLS CONSOLE WIRING

Wire Type
To ensure the best operating systems available, Veeder-Root REQUIRES the use of shielded cable.

Wire Length
Improper system operation could result in undetected potential environmental and health hazards if the TLS RF-to-TLS Console wire runs exceed 1000 feet. Wire runs must be less than 1000 feet to meet intrinsic safety requirements.

Splices
Veeder-Root recommends that a minimum number of splices are used in the wire run between the TLS RF and the TLS Console. Each splice degrades signal strength and could result in poor system performance.

Wire Gauges - Color coded
Shielded cable must be used in all installations. TLS RF-to-TLS Console wires must be #14 to #18 AWG stranded copper wire and installed as a Class 1 circuit.

Alternate Method
When approved by the local authority having jurisdiction, 22 AWG wire such as Belden 88761 may be suitable in installations with the following provisions:
- Wire run is less than 750 feet
- Capacitance does not exceed 100 pF/foot
- Inductance does not exceed 0.2 µH/foot

TLS RF AC POWER WIRING

Wires carrying 120 or 240 Vac from the power panel to the TLS RF must be at least #14 AWG copper wire for line, neutral and chassis ground (3); and #12 AWG copper wire for barrier ground (1).

NOTE: Note: See page 26 for details of Repeater Power Wiring.
**TLS RF Wireless System Site Layout**

Figure 1 illustrates an example TLS RF Wireless System installation. The Repeater component may be required if the system Receiver, mounted on building’s outside wall, has difficulty receiving signals from any of the Transmitters. See page 26 for Repeater installation.

![TLS RF Wireless System Site Layout Diagram](image)

**LEGEND FOR NUMBERED BOXES IN Figure 1**

To be installed in accordance with the National Electrical Code, NFPA 70 and the Code for Motor Fuel Dispensing Facilities and Repair Garages (NFPA 30A), or other local codes such as the CEC, Canadian Electrical Code.

**WARNING! Substitution of components may impair intrinsic safety.**

Circuitry within the console barrier forms an intrinsically safe, energy-limited system. This system is intrinsically safe for use in a Class I, Group D hazardous location.

1. **Receiver (1 per RF System)**
2. **RS-485 Cable (Belden #3107A or equiv.)**
3. **NOTE:** Intrinsically safe wiring shall be installed in accordance with Article 504-20 of the NEC, ANSI/ NFPA 70. Max cable length 1000 ft. (304 m). W2 Receiver (1 per RF System)
4. **TLS-RF**
5. **Conduit that enters power wiring knockout.**
6. **TLS console (Vm = 250 V)**
7. **120 or 230 Vac from power panel**
8. **Non-hazardous area**
9. **Repeater (1 per RF System)**
10. **Hazardous area (Class I, Div. 1, Group D)**
11. **Transmitter**
12. **Battery pack**
13. **Vapor Flow meter**
14. **Dispenser sump**
Equipment Dimensions

Dimensions of the TLS RF are shown in Figure 2.

Pre-Installation Component Setup and Functional Check

The steps below describe the process of verifying the Wireless System component functionality; listed steps are only for one TLS RF. If there are more than 8 Sensors installed at the site, refer to Appendix B on how to setup the DIP Switches for auxiliary TLS RF(s).

1. Remove all the hardware from their boxes; lay the TLS RF, Receiver, Repeater, and all the Transmitters on a table.

2. Set Site ID for the Receiver, Repeater, and all the Transmitters (refer to Appendix B on how to set up the Site ID). Typically the Site ID is set to 0 (default). If there is a nearby wireless site, the Site ID’s must be different.

3. Set all Transmitter’s IDs and connect the battery cables to all the Transmitters. Label each Transmitter with its set ID.
   a. Using a #15 torx driver, remove the cover of the Transmitter.
   b. Remove the nut from the battery cable cord grip (right side cord grip) and slide it over the non-connector end of the battery cable.
   c. Make sure the battery/dc power cable is not connected to the battery pack or dc power source at this time. Push the battery cable through the battery cable cord grip bushing and into the Transmitter.
   d. Strip back the cable jacket and wires as shown in Figure 4.
   e. Connect the battery pack/dc power cable to the BATTERY terminal block (white to +IN and black to -IN) as shown in Figure 5.
   f. **Hand tighten both cable entry cord grip nuts to prevent water entry!**
   g. Replace the cover of the Transmitter, but do not tighten down cover screws at this time.

![Figure 4. Connecting wiring to device terminal blocks](image)

</tr>
</thead>
<tbody>
<tr>
<td>1. Strip back cable and wire jackets the amount shown.</td>
</tr>
<tr>
<td>2. Use a screwdriver with the proper blade width.</td>
</tr>
<tr>
<td>3. Both wires must be tight in terminals!</td>
</tr>
</tbody>
</table>

![Figure 5. Connecting battery pack/dc power](image)
4. Using a #15 torx driver, open the covers of the TLS RF, Repeater and Receiver. Make a temporary ac power cord with a grounded plug on one end. Connect the ac power cord to the TLS RF’s input power terminals and ground terminal (refer to Figure 6 and Figure 7). Connect a necessary length of RS-485 cable from the TLS RF’s RS-485 terminals to the Receiver’s RS-485 terminals (refer to Figure 18). Connect a necessary length of 2-conductor cable from the Receiver’s Repeater terminals to the Repeater’s Repeater terminals (refer to Figure 19).

5. The steps below are to verify the communication between the TLS RF Unit and the Receiver.
   a. Plug the TLS RF’s ac power cord into a 120 Vac outlet. Confirm the Green /Red LEDs (refer to item 2 in Figure 12), are flashing rapidly. This is an indication there is RS-485 network activity between the TLS RF and the Receiver.
   b. If it is, continue to Step 6.
   c. If it is not, check PWR LED (refer to item 3 in Figure 12), if not lit; check power wiring. If the wiring is correct, measure the voltage across the twisted pair power wires, it should read +15Vdc. If it is not, the TLS RF is bad.
Pre-Installation Component Setup and Functional Check

TLS RF Wireless System Site Layout

d. If the Red LED (refer to item 2 in Figure 12) is not flashing, confirm the TLS RF address is set to Master (refer to Appendix B, Figure B-1 on how to set the TLS RF Device ID). If it is, the TLS RF has failed.

e. If the Red LED is flashing and the Green LED is not flashing, the TLS RF is not receiving a response from the Receiver.

f. Confirm the Receiver PWR LED is lit (refer to item 1 in Figure 18). If not check the power wiring.

   • If the power wiring is correct, measure across the +15V and GND (refer to item 4 in Figure 18), it should be +15Vdc. If it is not, measure the voltage across the +15V and GND terminals in the TLS RF, it should read +15Vdc. If it does, replace the twisted pair power wires. If it does not, the Receiver is bad.

   • Check the RS-485 Green LED (refer to item 1 (PWR LED) in Figure 18), if it is flashing; it is receiving Data from the TLS RF. If it is not flashing, check the RS-485 cabling between the TLS RF and the Receiver.

   • Check the Red LED (XMIT LED), if it is flashing; check the cabling. If it is not flashing, the Receiver is at fault; replace the Receiver.

6. This step is to verify to make sure Data from the Transmitter is being received by the TLS RF. Make sure the power to the Repeater is off.

a. Connect the first Transmitter’s battery cable to a battery pack; noting the Red LED should be flashing momentarily then followed by the Green LED (refer to item 2 and 3 in Figure 5). Since there is no Sensor connected, the two LEDs should be flashing. This is an indication a Sensor communication error and is acceptable at this step.

   TIP - Normal flashing is when an LED turns On for over 1 second and turns Off for over 1 second. Error flashing is when an LED turns On and Off every 1/2 second or less.

b. Go to the TLS RF, open its cover. One of the 8 Red received LEDs should be flashing (refer to item 5 in Figure 12). Observe which LED is lit and compare it against the Transmitter ID; they should match. For example, if the Transmitter ID is set to 1, the LED number 1 in the TLS RF should be flashing.

c. If the Transmitter ID and the LED in the TLS RF do not match, disconnect the Transmitter’s battery cable from the battery pack. Move this DIP switches back and forth a few times to make sure they are set properly. Reset this DIP Switch to the correct setting; reconnect the battery cable; confirm that the correct LED is flashing.

d. If they still do not match, disconnect the Transmitter’s battery cable from the battery pack; change the Transmitter ID to different setting and repeat Step 6.

e. If resetting the Transmitter to a different device ID and the LED position in the TLS RF matches; that DIP Switch position is bad, the Transmitter is at fault.

f. If resetting the Transmitter to a different device ID and the LEDs in the TLS RF and the Transmitter are not matched; remove the power from the Transmitter and put it aside.

g. Repeat Step 6 with the next Transmitter.

h. If both Transmitters have the same problems, it could be the Receiver or the TLS RF.

i. In the case where the LED in the TLS RF is not flashing, check the site ID in the Receiver and the Transmitter to make sure they are correct. If the site IDs are correct, the Transmitter or the Receiver is at fault. NOTE: Sometimes it is necessary to disconnect the battery cable from the battery pack and wait for 2 minutes and retry again to make sure the connection is established properly.

7. If all the Transmitters have been verified to be working properly, they are now ready to be installed.

8. Unplug the TLS RF, disconnect the temporary power cable and RS-485 cable to the Receiver and close the cover of the TLS RF, but do not tighten the cover screws at this time.

9. Disconnect the temporary RS-485 and 2-conductor cables from the Receiver and replace its cover, but do tighten at this time. Disconnect the temporary 2-conductor cable from the Repeater and replace its cover, but do not tighten at this time.
TLS RF Installation

Selecting A Location

**WARNING**

Explosive vapors or flammable liquids could be present near locations where fuels are stored or being dispensed. The TLS RF is not explosion proof.

An explosion or fire resulting in serious injury or death, property loss and equipment damage could occur if the console is installed in a volatile, combustible or explosive atmosphere (Class I, Division 1 or 2).

Do not install this unit in a volatile, combustible, or explosive atmosphere.

The TLS RF must be mounted indoors, protected from severe vibration, extremes in temperature and humidity, and other conditions that could harm computerized electronic equipment.

Ensure that the TLS RF is located where neither it nor its associated cabling will be damaged by doors, furniture, etc. Consider the ease of routing wiring, and ducting to the TLS console. Check that the mounting surface is strong enough to support the unit’s weight of about 4 pounds.

Mounting the TLS RF

Install the unit’s fastening devices to the mounting surface using the hole pattern (6.7" x 5.7") shown in Figure 2. Mounting screws up to 3/16" diameter may be used.

Install metal conduit (1/2-inch I.P.S.) between the upper power side knockout on the unit and the power panel. Figure 2 shows the three designated knockouts (one each on top, left side, and bottom) through which power wiring can safely enter the unit.

Also install metal conduit (1/2-inch I.P.S.) between the lower intrinsically-safe wiring knockout on the TLS RF and an intrinsically-safe wiring knockout on the TLS console for device data wiring.

Wiring the TLS RF

**WARNING**

The unit contains voltages which can be lethal.

Connecting power wires to a live circuit can cause electrical shock that may result in serious injury or death.

Turn power off at the circuit breaker before connecting wiring to the TLS RF.

Attach conduit from the power panel to the unit’s power wiring knockouts only (1 on top and 1 on bottom, ref. Figure 2)

To connect power wiring see Figure 6. To connect Receiver wiring see Figure 7. To daisy chain two TLS RFs, see Figure 9 and Figure 10. To connect TLS RF data output wiring to the TLS console see Figure 11.
WARNING! Do not apply power to the TLS RF Console until all device wiring is complete. This includes the wiring for the Receiver, Repeater, the probes and additional TLS RF Consoles.

Figure 6. Wiring AC power to the TLS RF

LEGEND FOR NUMBERED BOXES IN Figure 6

1. Attach chassis ground wire (#14 AWG) to ground lug.
2. Protective earthing conductor (green and yellow). Attach #12AWG barrier ground wire to ground lug. Ground must be the same as the supply and less than 1.0 ohms to ground.
3. AC power input wires (#14 AWG) to AC INPUT terminals.
4. POWER WIRING NOTES:
   • Barrier ground must be #12 AWG or larger diameter.
   • Check to be sure that the electrical resistance between the unit ground lug and a known good earth ground is less than 1 ohm.
   • Connect the power supply wires in the power panel to a separate dedicated circuit.
   • Electrical rating power input - 120 Vac or 240 Vac, 50/60 Hz, 2 A max.
   • See Figure 2 for actual locations of power conduit knockouts into the unit. Power wiring must enter only in one of these knockouts.
5. Intrinsically-safe side
6. Power side
7. RS-232 diagnostic port:
   • Baud rate - 9600
   • Data length - 8
   • Parity - None
   • Stop bits - 1

4. Power side
5. Intrinsically-safe side
6. NOTE: Attach one end of RS-485 cable to RS-485 terminals in the TLS RF and other end to RS-485 terminals in the Receiver. One twisted pair connects to terminals - and + (RS-485 signals) and the second twisted pair connects to terminals +15 and G (Receiver power).

6 (Cont’d.). You must connect each wire of each pair to the same terminals in the Receiver (e.g., white w/blue stripes to "-" and white w/blue stripes to "+". (ref. Figure 18).

NOTE: see Figure 4 for wire connection tips. NOTE: In sites with more than one TLS RF, the Receiver is only connected to the master TLS RF.
Figure 8. Connecting RS-485 Wiring

1. **POWER WIRING NOTES:**
   - Barrier ground must be #12 AWG or larger diameter.
   - Check to be sure that the electrical resistance - between the unit ground lug and a known good earth ground is less than 1 ohm.
   - Connect the power supply wires in the power panel to a separate dedicated circuit.
   - Electrical rating power input - 120 Vac or 240 Vac, 50/60 Hz, 2 A max.
   - See Figure 2 for actual locations of power conduit knockouts into the unit. Power wiring must enter only in one of these knockouts.

2. AC power input wires (#14 AWG) to AC input terminals.

3. Protective earthing conductor (green and yellow). Attach #12AWG barrier ground wire to ground lug. Ground must be the same as the supply and less than 1.0 ohms to ground.

4. Attach chassis ground wire (#14 AWG) to ground lug.

5. Connect the shield of the RS-485 cable to the ground lug.

6. RS-485 cable from master TLS RF.

7. See Figure 10 for connections.

Figure 11. Wiring Data Outputs from TLS RF to TLS Console

LEGEND FOR NUMBERED BOXES IN Figure 11

1. Received Transmitter data output terminals (1-8).
2. In this example, device output 1 is a Flow Meter - Observe polarity. Note: each time a transmission is received from this device, LED 1 (see item 5 in Figure 12) will flash.
3. In this example, device output 2 is a Flow Meter - Observe polarity. Note: each time a transmission is received from this device, LED 2 (see item 5 in Figure 12) will flash.
4. 1/2” i.p.s. conduit to TLS console
5. SmartSensor interface module in TLS console
6. Intrinsically-safe side
7. Power side

Note: Output wiring from the TLS RF to the TLS console is an intrinsically safe circuit.

NOTE: Intrinsically safe wiring shall be installed in accordance with Article 504-20 of the NEC, ANSI/NFPA 70.
Figure 12 locates the diagnostic lights and setup switches in the TLS RF.

Each TLS RF in the site network must have a unique device set number (0, 1, 2 or 3). The factory default setting is ‘0’. You must select ‘0’ for the master TLS RF. The site’s Receiver must also be connected to the master TLS RF.

If a second TLS RF is required, enter ‘1’ in the auxiliary TLS RF. For additional TLS RFs, enter ‘2’ for the third and ‘3’ for the fourth.

---

**Figure 12. TLS RF diagnostic LEDs and switch locations**

**LEGEND FOR NUMBERED BOXES IN Figure 12**

1. These LEDs flash when there is comm activity on RS-232 port (Red = TX, Green = RX).
2. These LEDs flash when there is comm activity on the RS-485 network (between TLS RF and Receiver).
3. Red LED is lit when TLS RF is powered on.
4. Device timeout rotary switch selects the maximum allowed time to wait for communication from Transmitter before an Comm alarm is posted by TLS console (see Appendix B for selections). Position 1 (10 minutes) is the factory default setting.
5. These red LEDs flash when a message is received from a Transmitter in the monitored device set. LED 1 is the device wired to I.S. output terminal 1. LED 2 is the device wired to output terminal 2, etc.
6. Red LED flashes when TLS console is polling for device data.
7. S2 DIP switches 1–2 enter device set address (see Appendix B).
**ISD Component Installation**

**Vapor Flow Meter Installation - Dispenser**

1. A Transmitter/battery pack pair must be installed with the Veeder-Root Vapor Flow Meter (VFM) in the dispenser cabinet.
2. Install the VFM in the dispenser following instructions accompanying the VFM.
3. Using two tap tight screws from the kit, attach the Transmitter housing to the side of the battery support bracket that has the two circular slots (see Figure 13). Do not tighten screws at this time.
4. Remove the cover from the transmitter. Attach the non-connector end of the cable from the VFM to the transmitter as described in the section below entitled "Connecting Sensor Cables To The Transmitter" on page 20, then attach the transmitter/L bracket assembly to the back mounting surface using two #10 tap tight screws from the kit.
5. Determine a support location within the dispenser cabinet that will allow you room for the transmitter/battery support bracket. Clamp the bracket to an available support structure (see Figure 14).
6. Rotate the Transmitter antenna as close as possible to a horizontal position then tighten two mounting screws in housing.
7. Insert the battery pack into its support bracket - do not connect the battery cable to the battery pack at this time.

![Figure 13. Attaching Transmitter to battery support bracket](image)

**LEGEND FOR NUMBERED BOXES IN Figure 13**

1. Transmitter
2. #10 x 1/2" tap tight screws (2)
3. Battery support bracket
Connecting Sensor Cables To The Transmitter

Note: The dip switches in each transmitter must be set to the proper dip switch settings listed in Appendix B. If the dip switches are set incorrectly, this device will fail to operate properly.
1. Using a #15 torx driver, remove the cover of the Transmitter.
2. Make sure the battery/dc power cable is not connected to the battery pack or dc power source at this time.

**WARNING! To prevent ignition of flammable or combustible atmosphere disconnect power before servicing.**

3. Remove the nut from the sensor cable cord grip (left side cord grip) and slide it over the non-connector end of the sensor cable. Push the end of the cable into the Transmitter.
4. Strip back cable jacket and wires as shown in Figure 15.
5. All sensor cables connect to the PROBE terminal block the SAME WAY - the white wire to the PWR terminal and the black wire to the GND terminal as shown in Figure 16.

**6. Hand tighten both cable entry cord grip nuts to prevent water entry!**

![Figure 15. Connecting sensor wiring to sensor terminal block](image)

### LEGEND FOR NUMBERED BOXES IN Figure 15

| 1. Strip back cable and wire jackets the amount shown. | 2. Use a screwdriver with the proper blade width. | 3. Both wires must be tight in terminals! |
To assure a water-tight seal between the cover and the enclosure, follow these steps:

a. Insert the four cover screws through the cover and then press on the retaining washers to hold the screws in place.

b. Make sure that the cover gasket is free of dirt and debris on both sides of the gasket and that the inside of the cover is clean in the gasket area.

c. Position the gasket into the cover groove, assuring that it is pressed fully into the groove and sitting completely flat.

d. Assemble the cover onto the enclosure, tightening the screws in a couple of turns each. Using an alternating ‘X’ pattern, continue to tighten the screws until they are all tight.

8. If you haven’t done so already, attach the red battery ID labels from the installation kit to the battery cable at both ends.

9. Push the battery cable connector onto the battery housing threaded fitting and hand tighten.
**Receiver Installation**

1. One Receiver is required per site and it is mounted in the vertical position (antenna up) on the outer wall of the same building housing the TLS RF. The Receiver is attached to its mounting bracket with #10 x 1/2” taptite screws from its install kit (see Figure 17). The L-bracket is then mounted on the outer wall of the building using appropriate fasteners (customer supplied). If the Receiver will be exposed to the weather, attach the L-bracket to the mounting surface inside a weatherproof enclosure. This enclosure is not required when mounting the Receiver under a roof overhang and shielded from the weather.

   NOTE: When locating the mounting position, keep in mind that the RS-485 cable connecting the Receiver to the TLS RF must be less than 250 feet in length. Avoid placing the Receiver near motors (e.g., power roof vents), fluorescent lighting (min. 1 foot separation), pumps, welders.

   Locate the Receiver on the same side of the building as the underground transmitters. If there are additional tanks either too far away or on the opposite side of the building, the Repeater can be located either on a structure near the remote tanks or on the opposite side of the building facing those tanks - see Repeater installation.

   The Receiver is only suitable for use in a non-hazardous location.

2. Run the RS-485 cable (Belden #3107A or equiv.) from the TLS RF through the building’s wall to the Receiver. Caulk the cable where it passes through wall openings. Use cable clamps at appropriate intervals to secure the cable to the walls.

3. Note that the Receiver cover label indicates the cord grip to be used for the RS-485 cable from the TLS RF and the cable to the Repeater (if used). Remove the cover of the Receiver and set it aside.

4. Set S1 and S2 DIP settings as desired (ref. Appendix B, Figure B-2). NOTE: set all dip switches prior to attaching the TLS RF RS-485 cable as the dip switches are only read during power up.

5. Slide the nut over the cable. Choose the correct size bushing and slide it over the cable. Dress the cable jacket according to the dimensions in Figure 15. Insert the cable into the appropriate opening at the bottom of the housing. Insert each wire into the appropriate terminal and tighten. Leave a small amount of slack in each wire. Slide the bushing into the bottom of the housing. Hand tighten the nut.

6. Note that there are two twisted pair color-coded wires in the cable (e.g., a white with blue stripe and blue with white stripe pair and a white with orange strip and orange with white stripe pair). One of the pairs is for RS-485 communication (- & + terminals) and the other pair is for Receiver power (+15 Vdc & Gnd). Using Figure 18 as a guide, attach the wires of the two twisted pairs to the RS-485 terminals.

   Record which wire attaches to each terminal to help you attach the other end of that wire to the identically marked terminal in the TLS RF.
7. Referring to your connection notes in step 5 above, connect the other end of the RS-485 cable to the RS-485 terminal block in the TLS RF (ref. Figure 7 on page 13).

8. If a Repeater is used and powered by the Receiver, push the two wire power cable (to Repeater) through the +15 Vdc cord grip of the Receiver (item 7 in Figure 18).

9. Slide the nut over the cable. Choose the correct size bushing and slide it over the cable. Dress the cable jacket according to the dimensions in Figure 15. Insert the cable into the appropriate opening at the bottom of the housing. Insert each wire into the appropriate terminal and tighten. Leave a small amount of slack in each wire. Slide the bushing into the bottom of the housing. Hand tighten the nut.

10. Attach the dc power cable (white to +15 Vdc and black to GND) to the Repeater terminal block (item 9 in Figure 18).

11. Hand tighten both cable entry cord grip nuts to prevent water entry!

12. To assure a water-tight seal between the cover and the enclosure, follow these steps:
   a. Insert the four cover screws through the cover and then press on the retaining washers to hold the screws in place.
   b. Make sure that the cover gasket is free of dirt and debris on both sides of the gasket and that the inside of the cover is clean in the gasket area.
   c. Position the gasket into the cover groove, assuring that it is pressed fully into the groove and sitting completely flat.
   d. Assemble the cover onto the enclosure, tightening the screws in a couple of turns each. Using an alternating ‘X’ pattern, continue to tighten the screws until they are all tight.
Figure 18. Wiring the Receiver

**LEGEND FOR NUMBERED BOXES IN Figure 18**

1. RS-485 Comm Activity:
   - XMIT (Red) LED — flashes when message transmitted to TLS-RF
   - RCV (Green) LED — flashes when message received from TLS-RF
   - PWR (Red) LED — Receiver power on indicator
2. Green LED — Unit status
3. Red LED — Radio status
4. Connect the color pairs of the RS-485/power cable to the same RS-485 terminals in both the Receiver and the master TLS RF (ref. "Connecting RS-485 Wiring" on page 14).
5. S1 DIP switch
6. RS-485 cable - Maximum cable length is 500 feet if a communication grade cable is used.
7. A solid bushing must be installed to seal the Receiver when this cord grip is unused. In sites where a Repeater is powered from the Receiver, the Repeater's power cable enters through this cord grip and attaches to the Repeater terminal block (item 9).

**Hand tighten both cable entry cord grip nuts to prevent water entry!**

8. S2 DIP switch
9. +15 Vdc power source for the Repeater.

**Pay close attention to the polarity of the +15 Vdc. Reversing the connections can cause damage to the TLS RF.**
Repeater Installation

1. Use of a single repeater is optional but may improve system performance when installed correctly. The Repeater should be located closer to the device transmitters to rebroadcast messages to the Receiver. Use the 15 Vdc power source provided in the Receiver to power the Repeater, or use a customer supplied non-interruptible, Class 2, 15 Vdc power source. The most common method of powering the Repeater power is to use the Repeater power terminal block J4 in the Receiver (see item 9 in Figure 18).

When device transmitters are on the opposite side of the building from the Receiver, the Repeater should be mounted on the side of the building facing those transmitters. Mount the Repeater with its transmitter antenna in the up or vertical orientation.

2. The Repeater is attached to its mounting bracket with #10 x 1/2" taptite screws from its install kit (ref. Figure 17 on page 24). The L-bracket is then attached to the outer wall of the building using appropriate fasteners (customer supplied). If the Repeater will be exposed to the weather, attach the L-bracket to the mounting surface inside a weatherproof enclosure. This enclosure is not required when mounting the Repeater under a roof overhang and shielded from the weather.

The Repeater is only suitable for use in a non-hazardous location.

3. Set S1 and S2 as desired (refer to Appendix B). NOTE: set all dip switches prior to connecting the +15 Vdc power cable as the dip switches are only read during power up.

4. Note the cover of the Repeater indicates the cord grip to be used for the cable connecting the Repeater to its dc power source (item 5 in Figure 19). Remove the cover of the Repeater and set it aside.

5. Slide the nut over the cable. Choose the correct size bushing and slide it over the cable. Dress the cable jacket according to the dimensions in Figure 15. Insert the cable into the appropriate opening at the bottom of the housing. Insert each wire into the appropriate terminal and tighten. Leave a small amount of slack in each wire. Slide the bushing into the bottom of the housing. Hand tighten the nut.

6. Connect the 2-wire dc power cable to the Repeater terminal block, white to +15 Vdc and black to GND (see item 7 in Figure 19).

7. Hand tighten both cable entry cord grip nuts to prevent water entry!

8. To assure a water-tight seal between the cover and the enclosure, follow these steps:
   a. Insert the four cover screws through the cover and then press on the retaining washers to hold the screws in place.
   b. Make sure that the cover gasket is free of dirt and debris on both sides of the gasket and that the inside of the cover is clean in the gasket area.
   c. Position the gasket into the cover groove, assuring that it is pressed fully into the groove and sitting completely flat.
   d. Assemble the cover onto the enclosure, tightening the screws in a couple of turns each. Using an alternating ‘X’ pattern, continue to tighten the screws until they are all tight.

9. The other end of the Repeater’s dc power cable connects to the Receiver’s +15 Vdc output terminal (ref. item 9 in Figure 18), or to a non-interruptible, Class 2, 15 Vdc power source.
Figure 19. Wiring the Repeater

LEGEND FOR NUMBERED BOXES IN Figure 19

⚠️ Pay close attention to the polarity of the +15 Vdc. Reversing the connections can cause damage to the TLS RF.
Network Setup

Hardware Overview

An example TLS RF Wireless System site network illustrating a 32 Transmitter configuration is shown in Figure 20. The maximum number of Transmitters permissible in a site is 32 (requires 4 TLS RFs).

![Figure 20. Example Site Network diagram](image)

**LEGEND FOR NUMBERED BOXES IN Figure 20**

2. Wireless network
3. VR bus
4. Transmitters
5. Repeater
6. Receiver
7. TLS RF, one required per 8 Transmitters
8. TLS console
## Identifying Devices in the TLS RF Wireless Site Network

The Site ID must be identical for all Transmitters, the Repeater, and the Receiver in the site’s wireless network. Each Transmitter in the site’s wireless network must have a unique device ID number (from 1 – 32). Each TLS RF in the site’s network must have a unique Device ID (Master at 0 and Auxiliaries at 1, 2, and/or 3).

All ID numbers are converted into binary form and entered using DIP switches located in each device.

You must enter the IDs in each device before it is installed.

Making up a site network worksheet before actually setting device DIP switches or connecting signal wires will help prevent mistakes when entering Site/Device IDs or making wiring connections between the TLS RF(s) and the TLS console.

## Entering Device ID Numbers for the Site Network

### TRANSMITTER ID NUMBER

Each of the transmitters must have a unique Device ID number (1 – 32). Enter this number by setting DIP switches 4 – 8 on S1 (see Figure 16 on page 22) in the ‘off’ position or ‘on’ position as shown below.

<table>

964-43.eps
Network Setup

Entering the Site ID Number

TLS RF DEVICE SET NUMBER

Each TLS RF in the site network must have a unique Device Set number (0 – 3). You must select 0 if it is the only TLS RF in the site, or if it is the TLS RF in a site with multiple TLS RFs that is monitoring the first Device Set (transmitters 1 – 8). You would enter a 1 for the TLS RF monitoring the second Device Set (transmitters 9 – 16), etc. The site’s receiver must also be connected to the TLS RF having Device Set ‘0’. The factory default setting is ‘0’.

Enter this number by setting DIP switches 1 – 2 on S2 (see Figure 12 on page 18) in the ‘off’ position or ‘on’ position as shown below.

<table>
<thead>
<tr>

<td>on</td>
</tr>
</tbody>
</table>

Entering the Site ID Number

All of the site’s Transmitters, Repeater and Receiver must have the same Site ID number (0 – 15) entered in S2 DIP switches 5 - 8 (see settings below). The TLS RF does not require a Site ID. The factory default Site ID number for all components is set to 0. You would only need to change the factory set Site ID when another site is nearby. Adjoining sites could experience data reception ‘crosstalk’ if both were left at the same number.

Site Startup Procedure

Depending on the site layout, it is permissible to install RF devices in a variety of locations including dispensers and containment sumps. After all the wireless equipment has been installed, follow the steps below to verify the final setup. It is necessary not to close the dispenser’s cover after installing the Transmitter in case the signal strength is a problem. Close the dispenser’s cover only after the Transmitter went through the second verification process.

1. Go to the first Transmitter and connect the battery cable to the battery pack.

2. Return to the TLS RF, open its cover; you should see one of the 8 red LEDs flashing (item 5 in Figure 12). This is an indication the transmission from the Transmitter is being received. If it is, go to Step 2a. If one of the 8 LEDs is not flashing go to Step 2b.

   a. Go back to the Transmitter, and if applicable, replace the dispenser’s cover. Return to the TLS RF and verify that the same LED is still flashing.

      i. If it is, disconnect the battery cable from the battery pack and repeat Step 1 on the next Transmitter.

      ii. If it is not, the Receiver is not picking up the Transmitter’s signal. Go back to the Transmitter; remove the dispenser’s cover, reorient the antenna or lower the Transmitter, then go back to the TLS RF to verify that the same LED is flashing.

      iii. If reorienting the antenna or moving the Transmitter doesn’t help, disconnect the battery cable from the battery pack and make a note that the signal is not being received at this particular dispenser.

      iv. Repeat Step 1 with the next Transmitter.

   b. If applicable, go back to the dispenser, remove the Transmitter’s cover; the green LED (item 2 in Figure 5) should be flashing indicating that the sensor is being read. If the green LED is not flashing, check the sensor cable’s wiring connections. If the wiring is correct, check site ID. If it is correct, it means either the Transmitter is bad or there is a problem with the sensor, disconnect the battery cable from the battery pack and continue to Step 1 with the next Transmitter.

3. After verifying that each Transmitter is being received at the TLS RF(s), go around to each Transmitter; reconnect the Transmitters’ battery cable to the battery pack. Replace dispenser’s cover as appropriate. Go to the TLS console and configure all site sensors. Check for any comm alarms. If none are observed, the startup is complete.

NOTE: If some Transmitters are not being received at the TLS RF, relocating the Receiver and/or the Repeater may improve reception.
Diagnostics

Alarms

During normal operation when the TLS Console and monitored PMC and ISD System is functioning properly and no warning or alarm conditions exist, the "ALL FUNCTIONS NORMAL" message will appear in the system status (bottom) line of the console display. Regardless of the TLS Console in use at this site, record the software part number as well as the software revision.

There is an additional alarm, battery replacement, when wireless equipment is used in place of wires. ISD, PMC and Smart Sensor warnings and alarm are the same. If a warning or alarm condition occurs as a result of a failure in the wireless communication hardware the system displays the communication failure for the effected Smart Sensor. If more than one condition exists, the display will alternately flash the appropriate messages. The system automatically prints an alarm report showing the warning or alarm type, its location and the date and time the warning or alarm condition occurred.

Any break in link between transmitter and sensor, or between TLS and TLS RF results in Communication Alarm. All other alarms related to individual sensor types, such as sensor fault alarm, are supported as they are with a wired system. When the Sensor Transmitter has determined the communication with the RF box has failed it will command the Vapor Valve to close. The valve will remain closed until an open command is sent (from the TLS) after communication is reestablished.

Battery Diagnostics

You can get the battery status from the TLS-350 (with software Version 30A or higher). The battery status is displayed for the wireless sensors, from the Smart Sensor Diagnostics (see Figure 21). The wireless sensors's battery status can also be printed from this screen.

The battery status for the wireless sensors is reported as Full, Medium, Low or Replace.

- Full: greater than or equal to 3.4 Volts
- Medium Range: 3.2V to 3.4 Volts
- Low range: 3.0V to 3.2V
- Replace: Below 3.0V

When the Smart Sensor battery reports a status ‘Replace’ continuously for 24 hours, a Smart Sensor warning will be posted on the TLS to alert the operator that the battery requires replacement. The warning will persist in the TLS until the battery reports 'Medium' or 'Full'. The alarm will clear at that time. This is a low priority TLS warning which will sound the beeper, flash the yellow warning light, post on the two line display, print on the printer and be recorded in the non-priority alarm history. The warning can be accessed remotely and be reported remotely similar to all TLS warnings and alarms. This warning will not appear in the ISD or PMC reports (only sensor failures are recorded in the ISD and PMC reports).

WIRELESS SENSOR DIAGNOSTIC MENU (TLS-350 CONSOLES)

The Battery Status for all wireless Smart Sensors will be displayed in the menu after the Serial Number (see Figure 21).
Figure 21. Device Battery Status in SmartSensor Diagnostic Menu
Appendix A: Regulatory Information

Federal Communications Commission Notice

This equipment has been tested and found to comply with the limits for a Class B digital device, pursuant to Part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference in a residential installation. This equipment generates, uses, and can radiate radio frequency energy and, if not installed and used in accordance with the instructions, may cause harmful interference to radio communications. However, there is no guarantee that interference will not occur in a particular installation. If this equipment does cause harmful interference to radio or television reception, which can be determined by turning the equipment off and on, the user is encouraged to try to correct the interference by one or more of the following measures:

- Reorient or relocate the receiving antenna
- Increase the separation between the equipment and receiver
- Connect the equipment into an outlet on a circuit different from that to which the receiver is connected
- Consult the dealer or an experienced radio or television technician for help.

MODIFICATIONS

The FCC requires the user to be notified that any changes or modifications made to this device that are not expressly approved by Veeder-Root Company may void the authority to operate the equipment.

CABLES

Connections to this device must be made with shielded cables with metallic RFI/EMI connector hoods in order to maintain compliance with FCC Rules and Regulations.

DECLARATION OF CONFORMITY FOR PRODUCTS MARKED WITH THE FCC LOGO—UNITED STATES ONLY

This device complies with Part 15 of the FCC Rules. Operation is subject to the following two conditions: (1) this device may not cause harmful interference, and (2) this device must accept any interference received, including interference that may cause undesired operation.

For questions regarding your product, contact:

Veeder-Root Company
125 Powder Forest Drive
Simsbury, CT 06070
Or, call 1-800-652-6672

For questions regarding this FCC declaration, contact:

Veeder-Root Company

Or, call 1-800-652-6672

To identify this product, refer to the Part, Series, or Model number found on the product.
Appendix A: Regulatory Information

Canadian Notice

This Class B digital apparatus meets all requirements of the Canadian Interference-Causing Equipment Regulations.

AVIS CANADIEN

Cet appareil numérique de la classe B respecte toutes les exigences du Règlement sur le matériel brouilleur du Canada.

Battery Warning

WARNING: The TLS RF Wireless System Battery Pack contains lithium batteries. To reduce the risk of fire or burns, do not disassemble, crush, puncture, short external contacts, or dispose of in fire or water.

Because of the type of batteries used in TLS RF Wireless System, follow local regulations regarding the safe disposal of the battery. Consult Appendix D of this manual for more information on battery disposal.

Wireless Notices

In some environments, the use of wireless devices may be restricted. Such restrictions may apply aboard airplanes, in hospitals, near explosives, in hazardous locations, etc. If you are uncertain of the policy that applies to the use of this device, please ask for authorization to use it prior to turning it on.

U.S. Regulatory Wireless Notice

WARNING: Exposure to Radio Frequency Radiation. The radiated output power of this device is below the FCC radio frequency exposure limits. Nevertheless, the device should be used in such a manner that the potential for human contact during normal operation is minimized. To avoid the possibility of exceeding the FCC radio frequency exposure limits, human proximity to the antenna should be minimized.

Canadian Regulatory Wireless Notice

Operation is subject to the following two conditions: (1) this device may not cause interference, and (2) this device must accept any interference, including interference that may cause undesired operation of the device. The term “IC:” before the certification/registration number only signifies that the Industry Canada technical specifications were met.

System Specifications

Note: Not all models described are available in all regions.
Appendix B: Device DIP Switch Settings

TLS RF Number Settings

The Dip Switch Locations to set the unique Device number for the TLS RF(s) are shown in the Figure B-1. The TLS RF that monitors the Receiver and Transmitter IDs 1 - 8 is considered the site's master TLS RF and must have its Device ID set to 0 (default).

CAUTION: Setting the Device Timeout delay to less than 10 minutes may result in Device Out errors since the transmitter's transmit time intervals are programmable and may have been set to a value greater than the Device Timeout you set here.

Figure B-7. S2: DIP switch positions 5-8 — (W2) All Devices
Appendix C: Lithium Battery Safety Data

This appendix contains the manufacturer supplied Transportation Certificate and Material Safety Data Sheet for the lithium batteries used in the TLS RF Wireless 2 (W2) System.

**Lithium Battery Disposal Considerations**

1. Waste disposal must be in accordance with the applicable regulations.
2. Disposal of the Lithium batteries should be performed by permitted, professional disposal firms knowledgeable in Federal, State or Local requirements of hazardous waste treatment and hazardous waste transportation.
3. Incineration should never be performed by battery users, but by trained professionals in an authorized facility with proper gas and fume containment.
4. Recycling of battery can be done in authorized facility, through licensed waste carrier.
TRANSPORTATION CERTIFICATE
Ref. TC-LS 33600 11/2008-87

This is to certify that the Saft cell type, LS 33600, has been subjected and has met the requirements of the UN Recommendations on the Transport of Dangerous Goods, Part III, sub-section 38.3. Manual of Tests and Criteria, 4th Revised edition - 2003 - Ref. ST/SG/AC.10/11/Rev. 4), as detailed in Saft-Poitiers internal reports P 0256/03, dated 06/2003.

Concerned Part Numbers
All the part numbers relative to single LS 33600 cells, whatever their finish mode (with and without end-taps or wiring and connector assemblies, etc.)

Product Description
Primary (non-rechargeable), Lithium-Thionyl Chloride (Li-SOCl2) D-sized single cell
- Nominal Voltage: 3.6 Volts
- Nominal Capacity: 17.0 Ah
- Lithium metal content: 4.5 grams
- Nominal energy: \(17.0 \times 3.6 = 61.2\) Wh
- Maximum recommended continuous discharge current: 250 mA

Product Classification
Worldwide, besides the United States of America
Since it passes the UN-defined transport tests but because its lithium content is above the 1 gram limit, the LS 33600 individual cell, in all of its finish versions, according to the current UN Recommendations on the Transport of Dangerous Goods - Model regulations, is declared non-exempt from the Dangerous Goods Regulations. It is restricted to transport/ assigned to Class 9, and must be packed in accordance with the relevant packing instructions of the applicable Handbooks and Codes issued by the bodies (IATA-ICAO, IMO, ADR, US-DOT, etc.) in charge of regulating the transportation of dangerous goods.

Within the United States of America
The U.S. DOT CFR 49 Regulations, Parts 171, 172, 173 and 175, are governing the transportation of lithium cells and batteries. Special Provision 188 (in Part 172.102) defines the LS 33600 single lithium metal cell, in all of its finished versions, as belonging to the "medium primary lithium cell" category, and details the requirements to be met for the different transportation conditions.

1. Identification of the Substance or Preparation and Company

<table>
<thead>
<tr>
<th>Product</th>
<th>Primary Lithium/Thionyl chloride unit cells and multi-cell battery packs (Li-SOCl₂)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Production sites</td>
<td>Lithium/Thionyl chloride batteries described in this Safety Data Sheet are sealed units which are not hazardous when used according to the recommendations of the manufacturer. Under normal conditions of use, the electrode materials and liquid electrolyte they contain are not exposed to the outside, provided the battery integrity is maintained and seals remain intact. Risk of exposure only in case of abuse (mechanical, thermal, electrical) which leads to the activation of safety valves and/or the rupture of the battery container. Electrolyte leakage, electrode materials reaction with moisture/water or battery vent/explosion/fire may follow, depending upon the circumstances.</td>
</tr>
</tbody>
</table>

4. First Aid Measures

<table>
<thead>
<tr>
<th>Condition</th>
<th>Actions</th>
</tr>
</thead>
<tbody>
<tr>
<td>Inhalation</td>
<td>Remove from exposure, rest and keep warm. In severe cases obtain medical attention.</td>
</tr>
<tr>
<td>Skin contact</td>
<td>Wash off skin thoroughly with water. Remove contaminated clothing and wash before reuse. In severe cases obtain medical attention.</td>
</tr>
<tr>
<td>Eye contact</td>
<td>Irrigate thoroughly with water for at least 15 minutes. Obtain medical attention.</td>
</tr>
<tr>
<td>Ingestion</td>
<td>Wash out mouth thoroughly with water and give plenty of water to drink. Obtain medical attention.</td>
</tr>
<tr>
<td>Further treatment</td>
<td>All cases of eye contamination, persistent skin irritation and casualties who have swallowed this substance or been affected by breathing its vapours should be seen by a doctor.</td>
</tr>
</tbody>
</table>

5. Fire Fighting Measures

CO₂ extinguishers or, even preferably, copious quantities of water or water-based foam, can be used to cool down burning Li-SOCl₂ cells and batteries, as long as the extent of the fire has not progressed to the point that the lithium metal they contain is exposed (marked by deep red flames). Do not use for this purpose sand, dry powder or soda ash, graphite powder or fire blankets.

**Use only metal (Class D) extinguishers on raw lithium.**

| Extinguishing media | Use water or CO₂ on burning Li-SOCl₂ cells or batteries and class D fire extinguishing agent only on raw lithium. |

6. Accidental Release Measures

Remove personnel from area until fumes dissipate. Do not breathe vapours or touch liquid with bare hands. If the skin has come into contact with the electrolyte, it should be washed thoroughly with water.

Sand or earth should be used to absorb any exuded material. Seal leaking battery and contaminated absorbent material in plastic bag and dispose of as Special Waste in accordance with local regulations.
7. Handling and Storage

**Handling**

Do not crush, pierce, short (+) and (-) battery terminals with conductive (i.e. metal) goods. Do not directly heat or solder. Do not throw into fire. Do not mix batteries of different types and brands. Do not mix new and used batteries. Keep batteries in non conductive (i.e. plastic) trays.

**Storage**

Store in a cool (preferably below 30°C) and ventilated area, away from moisture, sources of heat, open flames, food and drink. Keep adequate clearance between walls and batteries. Temperature above 100°C may result in battery leakage and rupture. Since short circuit can cause burn, leakage and rupture hazard, keep batteries in original packaging until use and do not jumble them.

**Other**

Lithium-Thionyl chloride batteries are not rechargeable and should not be tentatively charged. Follow Manufacturers recommendations regarding maximum recommended currents and operating temperature range. Applying pressure on deforming the battery may lead to disassembly followed by eye, skin and throat irritation.

8. Exposure Controls & Personal Protection

<table>
<thead>
<tr>
<th>Occupational exposure standard</th>
<th>Compound</th>
<th>8hr TWA</th>
<th>15min TWA</th>
<th>SK</th>

<td>1 ppm</td>
<td>-</td>
<td></td>
</tr>
<tr>
<td>Hydrogen chloride</td>
<td>1 ppm</td>
<td>5 ppm</td>
<td>-</td>
<td></td>
</tr>
</tbody>
</table>

**Respiratory protection**

In all fire situations, use self-contained breathing apparatus.

**Hand protection**

In the event of leakage wear gloves.

**Eye protection**

Safety glasses are recommended during handling.

**Other**

In the event of leakage, wear chemical apron.

9. Physical and Chemical Properties

| Hazardous decomposition Products | Hydrogen (H₂) as well as Lithium oxide (Li₂O) and Lithium hydroxide (LiOH) dust is produced in case of reaction of lithium metal with water. Chlorine (Cl₂), Sulfur dioxide (SO₂) and Disulfur dichloride (S₂Cl₂) are produced in case of thermal decomposition of thionyl chloride above 140°C. Hydrochloric acid (HCl) and Sulfur dioxide (SO₂) are produced in case of reaction of Thionyl chloride with water at room temperature. Hydrochloric acid (HCl) fumes, Lithium oxide, (Li₂O), Lithium hydroxide (LiOH) and Aluminum hydroxide (Al(OH)₃) dust are produced in case of reaction of Lithium tetrachloroaluminate (LiAlCl₄) with water. |

11. Toxicological Information

<table>
<thead>
<tr>
<th>Signs &amp; symptoms</th>
